Cerebrovascular disease • elderly (reduce initial dose)

**Specific Cautions**
With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**Side-Effects**

- **Common or very common** Anxiety • hypersalivation • malaise
- **Uncommon** Depression • dry mouth
- **Frequency Not Known** Alopecia • anorexia • bradycardia • hepatitis • hyponatraemia • infection • laryngospasm • myalgia • oedema • oropharyngeal spasm • pancreatitis • pathological gambling • respiratory disorders • rhabdomyolysis • suicidal ideation • sweating • urinary disorders

Aripiprazole

**Drug Action**
Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT₁₅ partial agonism and 5-HT₂A receptor antagonism.

**Indications and Dose**

### Maintenance in Schizophrenia in Patients Stabilised with Oral Aripiprazole

- **Initially by Intramuscular Injection**
  - Adult: 400 mg every month, to be injected into the gluteal muscle, minimum of 26 days between injections, for dose adjustment due to side effects or concomitant use of interacting drugs, consult product literature and (by mouth) 10–20 mg daily continued for 14 consecutive days after the first injection, for missed depot doses consult product literature

### Schizophrenia

- **By Mouth**
  - Adult: 10–15 mg once daily; usual dose 15 mg once daily (max. per dose 30 mg once daily), for dose adjustments due to concomitant use of interacting drugs—consult product literature

### Treatment and Recurrence Prevention of Mania

- **By Mouth**
  - Adult: 15 mg once daily, increased if necessary up to 30 mg once daily, for dose adjustments due to concomitant use of interacting drugs—consult product literature

### Control of Agitation and Disturbed Behaviour in Schizophrenia

- **By Intramuscular Injection**
  - Adult: Initially 5.25–15 mg for 1 dose, alternatively usual dose 9.75 mg for 1 dose, followed by 5.25–15 mg after 2 hours if required, maximum 3 injections daily; maximum daily combined oral and parenteral dose 30 mg, for dose adjustments due to concomitant use of interacting drugs—consult product literature

**Contra-Indications**
CNS depression • comatose state • phaeochromocytoma

**Cautions**

**General Cautions**
Cerebrovascular disease • elderly (reduce initial dose)

**Specific Cautions**
With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

**Side-Effects**

- **Common or very common** Anxiety • hypersalivation • malaise
- **Uncommon** Depression • dry mouth
- **Frequency Not Known** Alopecia • anorexia • bradycardia • hepatitis • hyponatraemia • infection • laryngospasm • myalgia • oedema • oropharyngeal spasm • pancreatitis • pathological gambling • respiratory disorders • rhabdomyolysis • suicidal ideation • sweating • urinary disorders
SPECIFIC SIDE-EFFECTS
- With intramuscular use:ERYTHEMA • nodules • pain at injection site • swelling

SIDE-EFFECTS, FURTHER INFORMATION
- With intramuscular use: If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma–drug concentration may not fall for some time after reducing the dose of the depot injection, therefore it may be a month or longer before side-effects subside.

PREGNANCY
Use only if potential benefit outweighs risk.

BREAST FEEDING
Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT
Use with caution in severe impairment (oral treatment preferred to intramuscular administration).

MONITORING REQUIREMENTS
- Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- With intramuscular use: Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION
- With oral use: Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- With intramuscular use: Correct injection technique (including the use of x-track technique) and rotation of injection sites are essential.

PATIENT AND CARER ADVICE
- With oral use: Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

Clozapine

DRUG ACTION
Clozapine is a dopamine D2, dopamine D3, 5-HT2A, alpha1-adrenoceptor, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

BY MOUTH

Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dosedose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose at to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

Psychosis in Parkinson’s disease

BY MOUTH

Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

CONTRA-INDICATIONS
Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy
CAUTIONS  Age over 60 years; prostatic hypertrophy; susceptibility to angle-closure glaucoma; taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

- Agranulocytosis  Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozarine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

- Myocarditis and cardiomyopathy  Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.
- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy
- Intestinal obstruction  Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g., antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

INTERACTIONS  Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

SIDE-EFFECTS

- Common or very common  Anorexia; constipation; hypersalivation; malaise; speech disorders; urinary incontinence
- Uncommon  Agranulocytosis
- Rare  Circulatory collapse; dysphagia; hepatitis; myocarditis; pancreatitis; pericarditis; pneumonia; pulmonary aspiration
- Very rare  Cardiomyopathy; hypercholesterolaemia; hypertriglyceridaemia; interstitial nephritis; intestinal obstruction (including fatal cases); myocardial infarction; obsessive compulsive disorder; parotid gland enlargement; respiratory depression
- Frequency not known  Hepatic disorders; hepatic failure; muscle disorders; renal failure

SIDE-EFFECTS, FURTHER INFORMATION

- Hypersalivation  Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

PREGNANCY  Use with caution.

BREAST FEEDING  Avoid.

RENAL IMPAIRMENT  Avoid in severe impairment.

MONITORING REQUIREMENTS  

- Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
- Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.
- Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

TREATMENT CESSATION  On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

DIRECTIONS FOR ADMINISTRATION  Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

PRESCRIBING AND DISPENSING INFORMATION  Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer clozapine oral suspension.

MEDICINAL FORMS  

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

| CAUTIONARY AND ADVISORY LABELS | 2, 10 |

| Clozapine 50 mg per 1 ml | 100 ml | £39.60 |
Lurasidone hydrochloride

**DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT₂A, 5-HT₇, alpha₂A- and alpha₂C-adrenoceptor antagonist, and is a partial agonist at 5-HT₁A receptors.

**INDICATIONS AND DOSE**

- **Schizophrenia**
  - **BY MOUTH**
  - **Adult:** Initially 37 mg once daily, increased if necessary up to 148 mg once daily

- **Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)**
  - **BY MOUTH**
  - **Adult:** Initially 18.5 mg once daily (max. per dose 74 mg once daily)

**CAUTIONS** High doses in elderly. Susceptibility to QT-interval prolongation

**INTERACTIONS** Contra-indicated with concomitant use of potent CYP3A4 inhibitors and potent CYP3A4 inducers. Caution with concomitant use of drugs that prolong the QT interval.

**SIDE-EFFECTS**

- **Common or very common** Anxiety, musculoskeletal stiffness
- **Uncommon** Catatonia, decreased appetite, dysarthria, dysuria, hot flush, myalgia, nightmares
- **Frequency not known** Angina, AV block, bradycardia, dysphagia, panic attacks, pruritus, suicidal behaviour, vertigo

**PREGNANCY** Use only if potential benefit outweighs risk—limited information available.

**HEPATIC IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.

**RENAL IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m². Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 2, 21, 25
  - **Latuda** (Sunovion Pharmaceuticals Europe Ltd)
    - Lurasidone (as Lurasidone hydrochloride) 18.5 mg Latuda 18.5mg tablets | 28 tablet | £90.72
    - Lurasidone (as Lurasidone hydrochloride) 37 mg Latuda 37mg tablets | 28 tablet | £90.72
    - Lurasidone (as Lurasidone hydrochloride) 74 mg Latuda 74mg tablets | 28 tablet | £90.72

Olanzapine

**DRUG ACTION** Olanzapine is a dopamine D₁, D₂, D₄, 5-HT₂, histamine-1, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

- **Schizophrenia | Combination therapy for mania**
  - **BY MOUTH**
  - **Adult:** 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Preventing recurrence in bipolar disorder**

- **BY MOUTH**
  - **Adult:** 10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Monotherapy for mania**

- **BY MOUTH**
  - **Adult:** 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Control of agitation and disturbed behaviour in schizophrenia or mania**

- **BY INTRAMUSCULAR INJECTION**
  - **Adult:** Initially 5–10 mg for 1 dose; usual dose 10 mg for 1 dose, followed by 5–10 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase
  - **Elderly:** Initially 2.5–5 mg, followed by 2.5–5 mg after 2 hours if required, maximum 3 injections daily for 3 days; maximum daily combined oral and parenteral dose 20 mg, when one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS**
  - With intramuscular use Acute myocardial infarction, bradycardia, recent heart surgery, severe hypotension, sick sinus syndrome, unstable angina

**CAUTIONS**

- Bone-marrow depression, diabetes mellitus (risk of exacerbation or ketoacidosis), hypereosinophilic disorders, low leucocyte count, low neutrophil count, myeloproliferative disease, paralytic ileus

**CAUTIONS, FURTHER INFORMATION**

- CNS and respiratory depression
  - With intramuscular use Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving a benzodiazepine or another antipsychotic (leave
at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** Arthralgia - hypercholesterolaemia - hypertyglyceridaemia - increased appetite - malaise - oedema
    - **Uncommon** Alopecia - amnesia - bradycardia - epistaxis
    - **Rare** Hepatitis - pancreatitis - rhabdomyolysis

- **SPECIFIC SIDE-EFFECTS**
  - With intramuscular use
    - Hypoventilation - sinus pause
  - **PREGNANCY** Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.
  - **BREAST FEEDING** Avoid—present in milk.
  - **HEPATIC IMPAIRMENT** Consider initial dose of 5 mg daily.
  - **RENAL IMPAIRMENT** Consider initial dose of 5 mg daily.

- **MONITORING REQUIREMENTS**
  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

- **DIRECTIONS FOR ADMINISTRATION**
  - Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With intramuscular use When prescribing, dispensing, or administering check that this injection is the correct preparation—this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer orodispersible tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Paliperidone

- **DRUG ACTION** Paliperidone is a metabolite of risperidone.

- **INDICATIONS AND DOSE**
  - **Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone**
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle, for missed doses see product literature
  - **Schizophrenia | Psychotic or manic symptoms of schizoaffective disorder**
    - **BY MOUTH**
      - Adult: 6 mg once daily, dose to be taken in the morning, then adjusted in steps of 3 mg if required, dose to be adjusted over at least 5 days; usual dose 3–12 mg daily
Quetiapine

- **DRUG ACTION** Quetiapine is a dopamine D₂, dopamine D₆, 5-HT₂, alpha-1-receptor, and histamine-1 receptor antagonist.

- **INDICATIONS AND DOSE**
  - **Schizophrenia**
    - **By mouth using immediate-release medicines**
      - Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day
    - **By mouth using modified-release medicines**
      - Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day
      - Elderly: Initially 50 mg once daily, adjusted according to response, adjusted in steps of 50 mg daily

- **Treatment of mania in bipolar disorder**
  - **By mouth using immediate-release medicines**
    - Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then 150 mg twice daily for day 3, then 200 mg twice daily for day 4, then adjusted in steps of up to 200 mg daily, adjusted according to response, usual dose 400–800 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day
  - **By mouth using modified-release medicines**
    - Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily
    - Elderly: Initially 50 mg once daily, adjusted according to response, adjusted in steps of 50 mg daily

- **SIDE-EFFECTS**
  - **Common or very common** Anxiety, appetite changes, arthralgia, depression, epistaxis, hypertension, infection, malaise, myalgia, oedema, respiratory disorders, sleep disorders, toothache, urinary disorders
  - **Rare** Alopecia, elevated plasma-cholesterol concentrations, elevated plasma-triglyceride concentrations, hypoaesthesia, paraesthesia, taste disturbances, tinnitus, visual disorders

- **MONITORING REQUIREMENTS**
  - With intramuscular use Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
  - With oral use Always take with breakfast or always take on an empty stomach.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer paliperidone tablets.

  - **Missed doses**
    - With intramuscular use For missed doses see product literature.

- **CAUTIONS**
  - **General Cautions**
    - Cataract surgery (risk of intraoperative floppy iris syndrome) - elderly patients with dementia - elderly patients with risk factors for stroke - predisposition to gastrointestinal obstruction - prolactin-dependent tumours

- **Specific Cautions**
  - With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

- **MEDICINAL FORMS**
  - **There can be variation in the licensing of different medicines containing the same drug.**

  - **Modified-release tablet**
    - **Cautionary and advisory labels** 2, 25
      - **Paliperidone (Non-proprietary)**
        - **Paliperidone 3 mg** Paliperidone 3mg modified-release tablets
        - **Paliperidone 6 mg** Paliperidone 6mg modified-release tablets
        - **Paliperidone 9 mg** Paliperidone 9mg modified-release tablets
      - **Invega** (Janssen-Cilag Ltd)
        - Paliperidone 3 mg Invega 3mg modified-release tablets
        - Paliperidone 6 mg Invega 6mg modified-release tablets
        - Paliperidone 9 mg Invega 9mg modified-release tablets

  - **Suspension for injection**
    - **Xeplion** (Janssen-Cilag Ltd)
      - Paliperidone (as Paliperidone palmitate) 100 mg per 1 ml Xeplion 150mg/1.5ml suspension for injection pre-filled syringes
      - Paliperidone 75mg/0.75ml suspension for injection pre-filled syringes
      - Paliperidone 100mg/1ml suspension for injection pre-filled syringes

  - **Price per pack**
    - £392.59
    - £314.07
    - £183.92

- **General Side-effects**
  - **Common or very common** Anxiety, appetite changes, arthralgia, depression, epistaxis, hypertension, infection, malaise, myalgia, oedema, respiratory disorders, sleep disorders, toothache, urinary disorders

- **Renal Impairment**
  - Adults: 50–80 mL/minute/1.73 m². Initially 1.5 mg once daily if eGFR 10–50 mL/minute/1.73 m² (max. 3 mg once daily). Avoid if eGFR less than 10 mL/minute/1.73 m².
  - With intramuscular use Initial dose 100 mg on day 1 and then 75 mg on day 8 if eGFR 50–80 mL/minute/1.73 m²; recommended maintenance dose 50 mg (range 25–100 mg) monthly if eGFR 50–80 mL/minute/1.73 m². Avoid if eGFR less than 50 mL/minute/1.73 m².

- **Monitoring Requirements**
  - With intramuscular use Treatment requires careful monitoring for optimum effect.

- **Directions for Administration**
  - With intramuscular use Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.
  - With oral use Always take with breakfast or always take on an empty stomach.

- **Patient and carer advice** Patients or carers should be given advice on how to administer paliperidone tablets.

  - **Missed Doses**
    - With intramuscular use For missed doses see product literature.
Treatment of depression in bipolar disorder
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

Prevention of mania and depression in bipolar disorder
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

Adjunctive treatment of major depression
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily
  - Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

DOSE EQUIVALENT AND CONVERSION
- Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

- CAUTIONS  Cerebrovascular disease • elderly • patients at risk of aspiration pneumonia • treatment of depression in patients under 25 years (increased risk of suicide)
- SIDE-EFFECTS
  - Common or very common  Asthenia • dysarthria • dyspnoea • elevated plasma–cholesterol concentrations • elevated plasma–triglyceride concentrations • increased appetite • irritability • peripheral oedema • sleep disorders
  - Uncommon  Hyponatraemia • hypothyroidism • restless legs syndrome • rhinitis
  - Rare  Hepatitis • pancreatitis
  - Very rare  Angioedema • inappropriate secretion of antidiuretic hormone • rhabdomyolysis • Stevens-Johnson syndrome
  - Frequency not known  Suicidal behaviour (particularly on initiation) • toxic epidermal necrolysis
- PREGNANCY  Use only if potential benefit outweighs risk.
- BREAST FEEDING  Manufacturer advises avoid.
- HEPATIC IMPAIRMENT  For immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg. For modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 2
- Quetiapine (Non-proprietary)
  - Quetiapine (as Quetiapine fumarate) 25 mg  Quetiapine 25mg tablets | 60 tablet (Pos) £38.05 DT price = £1.04
  - Quetiapine (as Quetiapine fumarate) 100 mg  Quetiapine 100mg tablets | 60 tablet (Pos) £107.45 DT price = £1.50

  - Quetiapine (as Quetiapine fumarate) 400 mg  Psyquet XL 400mg tablets | 60 tablet (Pos) £93.99 DT price = £226.20
Risperidone

**INDICATIONS AND DOSE**

### Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

**BY DEEP INTRAMUSCULAR INJECTION**

- **Adult:** Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

### Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone over 4 mg daily

**BY DEEP INTRAMUSCULAR INJECTION**

- **Adult:** Initially 37.5 mg every 2 weeks, adjusted in steps of 12.5 mg (max. per dose 50 mg every 2 weeks) at intervals of at least 4 weeks, during initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

### Acute and chronic psychosis

**BY MOUTH**

- **Adult:** 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients, usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

### Elderly

- **Initially:** 500 micrograms twice daily, then increased in steps of 500 micrograms twice daily, increased to 1–2 mg twice daily

### Short-term treatment (up to 6 weeks) of persistent aggression in patients with moderate to severe Alzheimer’s dementia unresponsive to non-pharmacological interventions and when there is a risk of harm to self or others

**BY MOUTH**

- **Adult:** Initially 250 micrograms twice daily, then increased in steps of 250 micrograms twice a day on alternate days, adjusted according to response; usual dose 500 micrograms twice daily (max. per dose 1 mg twice daily)

### CAUTIONS

**GENERAL CAUTIONS**

Avoid in acute porphyrias p. 930 - cataract surgery (risk of intra-operative floppy iris syndrome) - dehydro- dementia with Lewy bodies - prolactin-dependent tumours

**SPECIFIC CAUTIONS**

- With intramuscular use When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

### SIDE-EFFECTS

**GENERAL SIDE-EFFECTS**

- **Common or very common** Anxiety - appetite changes - arthralgia - depression - epistaxis - hypertension - infection - malaise - myalgia - oedema - respiratory disorders - sleep disorders - toothache - urinary disorders

- **Uncommon** Alopecia - elevated plasma-cholesterol concentrations - elevated plasma-triglyceride concentrations - hypoesthesia - paraesthesia - taste disturbances - tinnitus - visual disorders

- **Rare** Inappropriate antidiuretic hormone secretion - intestinal obstruction - intra-operative floppy iris syndrome - pancreatitis - pulmonary embolism - rhabdomyolysis

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use Erythema - nODULES - pain at injection site - swelling

**SIDE-EFFECTS, FURTHER INFORMATION**

- With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Use only if potential benefit outweighs risk—small amount present in milk.

**HEPATIC IMPAIRMENT**

- With intramuscular use If an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks.
- With oral use Initial and subsequent oral doses should be halved.

**RENAL IMPAIRMENT** Initial and subsequent oral doses should be halved.

**MONITORING REQUIREMENTS**

- With intramuscular use Treatment requires careful monitoring for optimum effect.
Olanzapine embonate
(Olanzapine pamoate)

**INDICATIONS AND DOSE**

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

- **CAUTIONS**
  - Bone-marrow depression, diabetes mellitus (risk of exacerbation or ketoacidosis), hyperesinophilic disorders, low leucocyte count, low neutrophil count, myeloproliferative disease, paralytic ileus, when transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

### ANTIPSYCHOTICS > SECOND-GENERATION (DEPOT INJECTIONS)

See under individual antipsychotics, second-generation monographs above for details of other depot injections.
4 Movement disorders

4.1 Dystonias and other involuntary movements

Other drugs used for Dystonias and other involuntary movements
- Chlorpromazine hydrochloride, p. 361
- Clonidine hydrochloride, p. 361
- Clozapine, p. 371
- Diazepam, p. 321
- Haloperidol, p. 363
- Orphenadrine hydrochloride, p. 384
- Pericyazine, p. 364
- Pramipexole, p. 395
- Prochlorperazine, p. 365
- Procyclidine hydrochloride, p. 384
- Ropinirole, p. 396
- Rotigotine, p. 398
- Trifluoperazine, p. 366
- Trihexyphenidyl hydrochloride, p. 385

ANTIPSYCHOTICS > FIRST-GENERATION

Promazine hydrochloride

- INDICATIONS AND DOSE
  - Short-term adjunctive management of psychomotor agitation
    - BY MOUTH
    - Adult: 100–200 mg 4 times a day
    - Agitation and restlessness in elderly
      - BY MOUTH
      - Elderly: 25–50 mg 4 times a day

- CONTRA-INDICATIONS
  - CNS depression - comatose states - phaeochromocytoma
  - CAUTIONS
    - Cerebral arteriosclerosis
  - SIDE-EFFECTS
    - Haemolytic anaemia
  - HEPATIC IMPAIRMENT
    - Can precipitate coma;
      - phenothiazines are hepatotoxic.
  - REPRODUCTIVE IMPAIRMENT
    - Start with small doses in severe renal impairment because of increased cerebral sensitivity.
  - LESS SUITABLE FOR PRESCRIBING
    - Promazine hydrochloride is less suitable for prescribing.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  Tablet
  - Promazine hydrochloride (Non-proprietary)
    - Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet DT price = £47.99
    - Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet DT price = £64.49
  - Promazine hydrochloride 100 mg Promazine 100mg tablets | 100 tablet DT price = £132.00

  Oral solution
  - Promazine hydrochloride (Non-proprietary)
    - Promazine hydrochloride 5 mg per 1 ml Promazine 25mg/5ml syrup | 150 ml DT price = £13.00
    - Promazine hydrochloride 10 mg per 1 ml Promazine 50mg/5ml syrup | 150 ml DT price = £15.24

CNS STIMULANTS

Piracetam

- INDICATIONS AND DOSE
  - Adjunctive treatment of cortical myoclonus
    - BY MOUTH
    - Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- CONTRA-INDICATIONS
  - Cerebral haemorrhage - Huntington’s chorea
  - CAUTIONS
    - Gastric ulcer - history of haemorrhagic stroke - increased risk of bleeding - major surgery - underlying disorders of haemostasis
  - INTERACTIONS
    - Caution with concomitant drugs that increase bleeding.

- SIDE-EFFECTS
  - Common or very common
    - Hyperkinesia - nervousness - weight gain
Uncommon Abdominal pain · anxiety · asthenia · ataxia · confusion · depression · dermatitis · diarrhoea · drowsiness · haemorrhagic disorder · hallucination · headache · insomnia · nausea · pruritus · urticaria · vertigo · vomiting

PREGNANCY Avoid.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Adjust dose if both hepatic and renal impairment.

RENAL IMPAIRMENT Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².

TREATMENT CESSATION Avoid abrupt withdrawal.

DIRECTIONS FOR ADMINISTRATION Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

PRESCRIBING AND DISPENSING INFORMATION Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 3

Nootropil (UCB Pharma Ltd)

Piracetam 1.2 gram Nootropil 1.2g tablets | 60 tablet £10.97

Piracetam 800 mg Nootropil 800mg tablets | 90 tablet £11.75

Oral solution CAUTIONARY AND ADVISORY LABELS 3

Piracetam (Non-proprietary)

Piracetam 333.3 mg per 1 mL Piracetam 333.3mg/ml oral solution sugar free sugar-free | 300 mL £16.31

Nootropil (UCB Pharma Ltd)

Piracetam 333.3 mg per 1 mL Nootropil 33% oral solution sugar-free | 300 mL £16.31

MUSCLE RELAXANTS > MUSCLE RELAXANTS, PERIPHERALLY ACTING > NEOUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

INDICATIONS AND DOSE Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) | Blepharospasm (specialist use only) | Hemifacial spasm (specialist use only) | Spasmodic torticolis (specialist use only) | Severe hyperhidrosis of the axillae (specialist use only) | Prophylaxis of headaches in adults with chronic migraine (specialist use only) | Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) | Ankle disability due to lower limb spasticity associated with stroke (specialist use only) | Management of bladder dysfunctions (specialist use only) | Temporary improvement of moderate to severe crow’s feet (specialist use only) | By subcutaneous injection, or by intramuscular injection (consult product literature)

DOSE EQUIVALENCE AND CONVERSION Important: information is specific to each individual preparation.

CONTRA-INDICATIONS Acute urinary retention (specific to use in bladder disorders only) | Catheterisation difficulties (specific to use in bladder disorders only) | Generalised disorders of muscle activity · infection at injection site · myasthenia gravis · presence of bladder calculi (specific to use in bladder disorders only) | Urinary tract infection (specific to use in bladder disorders only)

CAUTIONS GENERAL CAUTIONS Atrophy in target muscle · chronic respiratory disorder · elderly · excessive weakness in target muscle · history of

Rhabdomyolysis

Very rare Agitation · amnesia · ataxia · bradycardia · disorientation · dizziness · dry mouth · dyspepsia

PREGNANCY Avoid unless essential—toxicity in animal studies.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.

RENAL IMPAIRMENT Use with caution.

TREATMENT CESSATION Avoid abrupt withdrawal.

PATIENT AND CARER ADVICE Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet CAUTIONARY AND ADVISORY LABELS 2

Revocon (Sun Pharmaceuticals UK Ltd)

Tetrabenazine 25 mg Revocon 25mg tablets | 112 tablet £100.00 DT price = £100.00

Tetmodis (Beacon Pharmaceuticals Ltd)

Tetrabenazine 25 mg Tetmodis 25mg tablets | 112 tablet £100.00 DT price = £100.00

Xenazine (Alliance Pharmaceuticals Ltd)

Tetrabenazine 25 mg Xenazine 25 tablets | 112 tablet £100.00 DT price = £100.00

MONOAMINE DEPLETING DRUGS

Tetrabenazine

INDICATIONS AND DOSE Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions

BY MOUTH

Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day

Elderly: Lower initial dose may be necessary

Moderate to severe tardive dyskinesia

BY MOUTH

Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

CONTRA-INDICATIONS Depression · parkinsonism · phaeochromocytoma · prolactin-dependent tumours

CAUTIONS Susceptibility to QT-interval prolongation

INTERACTIONS Appendix 1 (tetrabenazine).

Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

Common or very common Anxiety · confusion · constipation · depression · diarrhoea · drowsiness · dysphagia · hypotension · insomnia · nausea · parkinsonism · vomiting

Uncommon Altered consciousness level · extrapyramidal disorders · hyperthermia

Rare Neuroleptic malignant syndrome

Appendix 1

Appendix 3
aspiration · history of dysphagia · inflammation in target muscle · neurological disorders · neuromuscular disorders · off-label use (fatal adverse events reported)

**SPECIFIC CAUTIONS**

- When used for blepharospasm or hemifacial spasm Risk of angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.

- Blepharospasm or hemifacial spasm When used for blepharospasm and hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Excessive doses may paralyse distant muscles · increased electrophysiologic jitter in some distant muscles · influenza-like symptoms · misplaced injections may paralyse nearby muscle groups

- Rare Antibody formation (substantial deterioration in response) · arrhythmias · myocardial infarction · seizures

- Very rare Aspiration · dysphagia · dysphonia · exaggerated muscle weakness · respiratory disorders

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - When used for axillary hyperhidrosis Abnormal skin odour · alopecia · hot flushes · non-axillary sweating · paraesthesia · pruritus · subcutaneous nodule
  - When used for blepharospasm Dry eye · ecchymosis · facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
  - When used for focal upper-limb spasticity associated with stroke Dysphagia · hypertonia · purpura
  - When used for hemifacial spasm Dry eye · ecchymosis · facial oedema · irritation · keratitis · lacrimation · lagophthalmos · photophobia · ptosis
  - When used for spasmodic torticollis Back pain · dizziness · drowsiness · dry mouth · dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle) · headache · hypertonia · malaise · nausea · numbness · rhinitis · stiffness · weakness
  - When used for temporary improvement of moderate to severe wrinkles between the eyebrows Facial oedema · headache · ptosis
  - When used for axillary hyperhidrosis Pain in extremities

- Uncommon
  - When used for axillary hyperhidrosis Joint pain · myalgia
  - When used for blepharospasm Conjunctivitis · dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
  - When used for focal upper-limb spasticity associated with stroke Amnesia · arthralgia · bursitis · cough · depression · dry mouth · dysaesthesia · haematoma · headache · insomnia · malaise · pain in extremities · paraesthesia · peripheral oedema · vertigo
  - When used for focal upper-limb specificity associated with stroke Nausea
  - When used for hemifacial spasm Conjunctivitis · dermatitis · diplopia · dizziness · drooping · dry mouth · ectropion · entropion · facial weakness · headache · paraesthesia · tiredness · visual disturbances
  - When used for spasmodic torticollis Collitis · diarrhoea · diplopia · dysphonia · eye pain · myalgia · ptosis · skeletal pain · sweating · tremor · voice alteration · vomiting

- When used for temporary improvement of moderate to severe wrinkles between the eyebrows Anxiety · asthenia · blepharitis · dizziness · dry mouth · dry skin · muscle cramp · nausea · paraesthesia · photosensitivity reactions · tinnitus · visual disturbances

- Rare
  - When used for blepharospasm Eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)
  - When used for hemifacial spasm Eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)

- Very rare
  - When used for blepharospasm Angle-closure glaucoma · corneal epithelial defect · corneal perforation · corneal ulceration
  - When used for hemifacial spasm Angle-closure glaucoma · corneal epithelial defect · corneal perforation · corneal ulceration

- Frequency not known
  - When used for focal lower-limb spasticity associated with stroke Arthralgia · peripheral oedema · rash

- CONCEPTION AND CONTRACEPTION Avoid in women of child-bearing age unless using effective contraception.

- PREGNANCY Avoid unless essential—toxicity in animal studies (manufacturer of Botox® advise avoid).

- BREAST FEEDING Low risk of systemic absorption but avoid unless essential.

- PRESCRIBING AND DISPENSING INFORMATION Preparations are not interchangeable.

- PATIENT AND CARER ADVICE Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

- NATIONAL FUNDING/access decisions

**NICE technology appraisals (Tas)**

- Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012) NICE TA260

Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

- Scottish medicines consortium (SMC) decisions

The Scottish Medicines Consortium has advised (March 2011 and March 2013) that Botox® is not recommended for use within NHS Scotland for prophylaxis of headaches in adults with chronic migraine.

- The Scottish Medicines Consortium has advised that Azzalure® and Vistabel® (December 2010), and Bocouture® (February 2011) are not recommended for use within NHS Scotland.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Azzalure®** (Galderna (UK) Ltd)
  - Botulinum toxin type A 125 unit Powder for solution for injection vials | 1 vial | £64.00 | 2 vial | £128.00

- **Bocouture®** (Merz Pharma UK Ltd)
  - Botulinum toxin type A 50 unit Powder for solution for injection vials | 1 vial | £72.00

- **Botox®** (Allergan Ltd)
  - Botulinum toxin type A 50 unit Powder for solution for injection vials | 1 vial | £77.50
Botulinum toxin type B

**INDICATIONS AND DOSE**

- **Spasmodic torticollis (cervical dystonia)** (specialist use only)
  - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 5000–10 000 units, adjusted according to response, dose to be divided between 2–4 most affected muscles
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Important: information specific to each individual preparation.

- **CONTRA-INDICATIONS** Neuromuscular disorders - neuromuscular junctional disorders

- **CAUTIONS** History of dysphagia or aspiration - off-label use (risk of toxin spread) - tolerance may occur

- **SIDE-EFFECTS**
  - Common or very common
    - Dry mouth - dyspepsia - dysphagia - dysphonia - headache - increased electrophysiologic jitter in some distant muscles - influenza-like symptoms - myasthenia - neck pain - taste disturbances - visual disturbances - worsening torticollis
  - Frequency not known
    - Aspiration pneumonia - constipation - exaggerated muscle weakness - malaise - ptosis - respiratory disorders - vomiting

- **PREGNANCY** Low risk of systemic absorption but avoid unless essential.

- **BREAST FEEDING** Low risk of systemic absorption but avoid unless essential.

- **DIRECTIONS FOR ADMINISTRATION** Injection may be diluted with sodium chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Important: not interchangeable with other botulinum toxin preparations.

- **PATIENT AND CARER ADVICE** Patients should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **NeuroBloc** (Eisai Ltd)
      - Botulinum toxin type B 5000 unit per 1 ml NeuroBloc 5 000 units/1ml solution for injection vials | 1 vial £148.27 (Hospital only)
      - NeuroBloc 10 000 units/2ml solution for injection vials | 1 vial £197.69 (Hospital only)
      - NeuroBloc 2 500 units/0.5ml solution for injection vials | 1 vial £111.20 (Hospital only)

# NEUROPROTECTIVE DRUGS

**Tafamidis**

- **INDICATIONS AND DOSE**
  - Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)
    - BY MOUTH
      - Adult: 20 mg once daily

- **SIDE-EFFECTS** Abdominal pain - diarrhoea - urinary tract infection - vaginal infection

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.

- **PREGNANCY** Avoid (toxicity in animal studies).

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 25
    - **Vyndaqel** (Pfizer Ltd)
    - **Tafamidis 20 mg** Vyndaqel 20 mg capsules | 30 capsules £10,685.00

## 4.2 Parkinson’s disease

### Parkinson’s disease and related disorders

#### Parkinson’s disease

In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

Patients with suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. **Levodopa, non-ergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors** can be prescribed for initial treatment in early Parkinson’s disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.
Elderly
Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

Dopaminergic drugs used in Parkinson's disease

Dopamine-receptor agonists
The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson's disease is often with the dopamine–receptor agonists pramipexole p. 395, ropinirole p. 396, and rotigotine p. 398. The ergot-derivative dopamine–receptor agonists bromocriptine p. 391, cabergoline p. 393, and pergolide p. 394 are rarely used because of the risk of fibrotic reactions.

When used alone, dopamine–receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine–receptor agonists are associated with more psychiatric side-effects than levodopa.

Dopamine–receptor agonists are also used with levodopa in more advanced disease. If a dopamine–receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced.

Apomorphine hydrochloride p. 390 is a potent dopamine–receptor agonist that is sometimes helpful in advanced disease for patients experiencing unpredictable 'off' periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an 'off' episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an 'off' episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

Levodopa
Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 387) and carbidopa (in co-careldopa p. 388).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 402 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the 'on' period, and weakness and restricted mobility during the 'off' period. 'End-of-dose' deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with 'end-of-dose' deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

Monoamine-oxidase-B inhibitors
Rasagiline p. 399 and selegiline hydrochloride p. 399 are monoamine-oxidase-B inhibitors used in Parkinson's disease. Early treatment with selegiline hydrochloride alone can delay the need for levodopa therapy.

Antimuscarinic drugs used in parkinsonism
Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson's disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride p. 384, procyclidine hydrochloride p. 384, and trihexyphenidyl hydrochloride p. 385 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson's disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea. There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 321 can be given for life-threatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders
Tetrabenazine p. 380 is mainly used to control movement disorders in Huntington's chorea and related disorders. Tetrabenazine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 363 [unlicensed indication], olanzapine p. 373 [unlicensed indication], risperidone p. 377 [unlicensed indication], and quetiapine p. 375 [unlicensed indication], can also be used to suppress chorea in Huntington's disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 364 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 136 [unlicensed indication], and sulpiride p. 366 [unlicensed indication]. Trihexyphenidyl hydrochloride in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 361 and haloperidol are used to relieve intractable hiccup.

Propranolol hydrochloride p. 142 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primidone p. 313 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 379 is used as an adjunctive treatment for myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 983 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Torsion dystonia and other involuntary movements
Treatment with botulinum toxin type A p. 380 can be considered after an acquired non-progressive brain injury if
rapid-onset spasticity causes postural or functional difficulties.

**ANTIMUSCARINICS**

**Orphenadrine hydrochloride**

- **DRUG ACTION** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **INDICATIONS AND DOSE**
  - **Parkinsonism** | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)
    - **BY MOUTH**
      - Adult: Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
      - Elderly: Preferably dose at lower end of range

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 | gastrointestinal obstruction | myasthenia gravis
- **CAUTIONS** Cardiovascular disease | elderly | hypertension | in patients susceptible to angle-closure glaucoma | liable to abuse | prostatic hypertrophy | psychotic disorders | pyrexia
- **INTERACTIONS** → Appendix 1 (antimuscarinics).
  Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urinary retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.
- **SIDE-EFFECTS**
  - Common or very common | Urinary retention
  - Uncommon | Drowsiness | impaired coordination | insomnia | seizures
  - Very rare | Angle-closure glaucoma
  - Frequency not known | Anxiety | blurred vision | confusion | constipation | dizziness | dry mouth | euphoria | hallucinations | impaired memory | nausea | rash | restlessness | tachycardia | vomiting
- **PREGNANCY** Caution.
- **BREAST FEEDING** Caution.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Use with caution.
- **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
  - **Tablet**
    - **EXCIPIENTS**: May contain Tartrazine
      - **Orphenadrine hydrochloride (Non-proprietary)**
        - Orphenadrine hydrochloride 50 mg. Orphenadrine 50mg tablets | 100 tablet PO | £0.80 | 250 tablet PO | no price available
      - **Oral solution**
        - **Orphenadrine hydrochloride (Non-proprietary)**
          - Orphenadrine hydrochloride 10 mg per 1 ml Orphenadrine 50mg/5ml oral solution sugar free sugar-free | 150 ml PO | £36.80 DT price = £35.65
  - **Procyclidine hydrochloride**
    - **DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.
    - **INDICATIONS AND DOSE**
      - Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)
        - **BY MOUTH**
          - Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day
          - Elderly: Lower end of range preferable
      - **Acute dystonia**
        - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
          - Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
          - Elderly: Lower end of range preferable
    - **CONTRA-INDICATIONS** Gastro-intestinal obstruction | myasthenia gravis
    - **CAUTIONS** Cardiovascular disease | elderly | hypertension | liable to abuse | prostatic hypertrophy | psychotic disorders | pyrexia | those susceptible to angle-closure glaucoma
    - **INTERACTIONS** → Appendix 1 (antimuscarinics).
      Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urinary retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.
    - **SIDE-EFFECTS**
      - Angle-closure glaucoma | anxiety | blurred vision | confusion | constipation | dizziness | dry mouth | euphoria | gingivitis | hallucinations | impaired memory | nausea | rash | restlessness | tachycardia | urinary retention | vomiting
    - **PREGNANCY** Use only if potential benefit outweighs risk.
    - **BREAST FEEDING** No information available.
    - **HEPATIC IMPAIRMENT** Use with caution.
    - **RENAL IMPAIRMENT** Use with caution.
    - **TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.
    - **PATIENT AND CARER ADVICE**
      - Driving and skilled tasks
        May affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Tablet**
    - **Procyclidine hydrochloride (Non-proprietary)**
      - Procyclidine hydrochloride 5 mg. Procyclidine 5mg tablets | 28 tablet PO | £14.25 DT price = £13.40 | 100 tablet PO | £50.00 | 500 tablet PO | £239.29
      - Kemadrin (Aspen Pharma Trading Ltd)
        - Procyclidine hydrochloride 5 mg. Kemadrin 5mg tablets | 100 tablet PO | £4.72 | 500 tablet PO | £23.62
  - **Oral solution**
    - **Procyclidine hydrochloride (Non-proprietary)**
      - Procyclidine hydrochloride 1 mg per 1 ml Procyclidine 5mg/5ml oral solution sugar free sugar-free | 150 ml PO | £11.54 DT price = £11.54
      - Procyclidine hydrochloride 500 microgram per 1 ml Procyclidine 2.5mg/5ml oral solution sugar free sugar-free | 150 ml PO | £6.22 DT price = £6.22
Trihexyphenidyl hydrochloride

(Benzhexol hydrochloride)

**DRUG ACTION**: Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

**Parkinson’s disease (if used in combination with co-careldopa or co-beneldopa)**
- **Adult**: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia.
- **Parkinsonism**: Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)
  - **BY MOUTH**: Adult: 1 mg daily, then increased in steps of 2 mg every 3–5 days, adjusted according to response; maintenance 5–15 mg daily in 3–4 divided doses, not recommended for use in Parkinson’s disease because of toxicity in the elderly and the risk of aggravating dementia; maximum 20 mg per day.
  - **Elderly**: Lower end of range preferable, not recommended for use in Parkinson’s disease because of toxicity in the elderly and the risk of aggravating dementia.

**CONTRA-INDICATIONS**: Gastro-intestinal obstruction · myasthenia gravis

**CAUTIONS**: Cardiovascular disease · elderly · hypertension · liable to abuse · prostatic hypertrophy · psychotic disorders · pyrexia · those susceptible to angle-closure glaucoma

**INTERACTIONS**: Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

**SIDE-EFFECTS**
- **Very rare** · Angle-closure glaucoma
- **Frequency not known** · Anxiety · blurred vision · confusion · constipation · dizziness · dry mouth · euphoria · hallucinations · impaired memory · nausea · rash · restlessness · tachycardia · urinary retention · vomiting

**PREGNANCY**: Use only if potential benefit outweighs risk.

**BREAST FEEDING**: Avoid.

**HEPATIC IMPAIRMENT**: Use with caution.

**RENAL IMPAIRMENT**: Use with caution.

**TREATMENT CESSATION**: Avoid abrupt withdrawal in patients taking long-term treatment.

**DIRECTIONS FOR ADMINISTRATION**: Tablets should be taken with or after food.

**PATIENT AND CARER ADVICE**: Driving and skilled tasks may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**DOPAMINERGIC DRUGS** > CATECHOL-O-METHYLTRANSFERASE INHIBITORS

Entacapone

**DRUG ACTION**: Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**

**Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations (under expert supervision)**
- **BY MOUTH**: Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day.

**CONTRA-INDICATIONS**: History of neuroleptic malignant syndrome · history of non-traumatic rhabdomyolysis · phaeochromocytoma

**CAUTIONS**: Concurrent levodopa dose may need to be reduced by about 10–30% · ischaemic heart disease

**INTERACTIONS**: Appendix 1 (entacapone). Avoid iron-containing products at the same time of day.

**SIDE-EFFECTS**
- **Common or very common** · Abdominal pain · abnormal dreams · confusion · constipation · diarrhoea · dizziness · dry mouth · dyskinesia · dystonia · fatigue · hallucinations · insomnia · ischaemic heart disease · nausea · sweating · urine may be coloured reddish-brown · vomiting
- **Uncommon** · Myocardial infarction
- **Rare** · Rash
- **Very rare** · Agitation · anorexia · urticaria · weight loss
- **Frequency not known** · Colitis · hepatitis · neuroleptic malignant syndrome · rhabdomyolysis · skin, hair, and nail discoloration

**PREGNANCY**: Avoid—no information available.

**BREAST FEEDING**: Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**: Avoid.

**TREATMENT CESSATION**: Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**: Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

**MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

**Combinations available**: Carbidopa with entacapone and levodopa, p. 386
Tolcapone

- **DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

- **INDICATIONS AND DOSE**
  Adjunct to co-beneldopa or co-careldopa in Parkinson’s disease with ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)
  - **BY MOUTH**
  - Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances

- **CONTRA-INDICATIONS** Phaeochromocytoma · previous history of hyperthermia · previous history of neuroleptic malignant syndrome · previous history of rhabdomyolysis · severe dyskinesia

- **CAUTIONS** Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

- **CAUTIONS, FURTHER INFORMATION**
  - Hepatotoxicity: Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not re-introduce tolcapone once discontinued.

- **INTERACTIONS** \(\rightarrow\) Appendix 1 (tolcapone).

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · anorexia · chest pain · confusion · constipation · diarrhoea · dizziness · drowsiness · dyskinesia · dyspepsia · dystonia · excessive dreaming · hallucinations · headache · hepatotoxicity · nausea · sleep disturbances · sweating · syncope · urinary discoloration · vomiting · xerostomia
  - Frequency not known Neuroleptic malignant syndrome reported on dose reduction or withdrawal · rhabdomyolysis reported on dose reduction or withdrawal

- **PREGNANCY** Toxicity in animal studies—use only if potential benefit outweighs risk.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAI PROIRMENT** Caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

- **TREATMENT CESSATION** Avoid abrupt withdrawal.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**DOPAMINERGIC DRUGS > DOPAMINE PRECURSORS**

**Carbidopa with entacapone and levodopa**

The properties listed below are those particular to the combination only. For the properties of the components please consider, co-careldopa p. 388, entacapone p. 385.

- **INDICATIONS AND DOSE**
  - **STALEVO® 100/25/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 10 tablets per day
  - **STALEVO® 125/31.25/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 10 tablets per day
  - **STALEVO® 150/37.5/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 10 tablets per day
  - **STALEVO® 175/43.75/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 8 tablets per day
  - **STALEVO® 200/50/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 7 tablets per day
  - **STALEVO® 50/12.5/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 10 tablets per day
  - **STALEVO® 75/18.75/200**
    Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment
    - **BY MOUTH**
    - Adult: 1 tablet for each dose; maximum 10 tablets per day

- **PRESCRIBING AND DISPENSING INFORMATION** Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate Stalevo® at a dose that provides similar (or slightly lower) amount of levodopa.

  Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring.
to Stalevo® (levodopa dose may need to be reduced by 10–30% initially).

Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate Stalevo® at a dose that provides similar (or slightly higher) amount of levodopa.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with carbidopa with entacapone and levodopa. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Co-beneldopa**

**INDICATIONS AND DOSE**

**Parkinson's disease**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 50 mg 3–4 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses
  - Elderly: Initially 50 mg 1–2 times a day, then increased in steps of 50 mg daily, dose to be increased every 3–4 days according to response

**Parkinson's disease (in advanced disease)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

**Parkinson's disease (patients not taking levodopa/dopa-decarboxylase inhibitor therapy)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams, anorexia, anxiety, arrhythmias, chorea, confusion, dementia, depression, dizziness, drowsiness, dry mouth, dyskinesia, dystonia, euphoria, fatigue, insomnia, nausea, palpitations, postural hypotension, psychosis, syncope, taste disturbances, vomiting

- **Uncommon** Ataxia, chest pain, constipation, diarrhoea, dysphagia, flatulence, hand tremor, hoarseness, hypersalivation, hypertension, malaise, muscle cramps, oedema, reddish discoloration of the urine and other body fluids, weakness, weight changes

- **Rare** Abdominal pain, activation of Homer's syndrome, activation of malignant melanoma, agitation, agranulocytosis, alopecia, blepharospasm, blurred vision, bruxism, convulsions, diplopia, disorientation, duodenal ulcer, dyspepsia, dysphonia, exanthema, flushing, gastro-intestinal bleeding, haemolytic anaemia, headache, Henoch-Schönlein purpura, hiccup, leucopenia, neuroleptic malignant syndrome (associated with abrupt withdrawal), non-haemolytic anaemia, oculogyric crisis, paraesthesia, phlebitis, priapism, pupil dilatation, reduced mental acuity, sweating, thrombocytopenia, trismus, urinary incontinence, urinary retention

- **Very rare** Angle-closure glaucoma, suicidal ideation

- **Frequency not known** Compulsive behaviour

**PREGNANCY** Caution in pregnancy—toxicity has occurred in animal studies.

**BREAST FEEDING** May suppress lactation; present in milk—avoid.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT** Use with caution.

**Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

**DOSE EQUIVALENT AND CONVERSION**

- **Dose is expressed as levodopa.**
EFFECT ON LABORATORY TESTS False positive tests for urinary ketones have been reported.

TREATMENT CESSION Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

DIRECTIONS FOR ADMINISTRATION The dispersible tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole.

PRESCRIBING AND DISPENSING INFORMATION Co-beneldopa is a mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa.

When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter).

When switching from modified-release levodopa to dispersible co-beneldopa, reduce dose by approximately 30%.

When administered as an adjunct to other antiparkinsonian drugs, once therapeutic effect apparent, the other drugs may be reduced or withdrawn.

PATIENT AND CARER ADVICE Patients or carers should be counselled on improving sleep behaviour.

Driving and skilled tasks Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution dispersible tablet.

Co-careldopa

INDICATIONS AND DOSE Parkinson’s disease

BY MOUTH

Adult: Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, alternatively increased in steps of 25/100 mg once daily or on alternate days, dose to be adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

Parkinson’s disease—alternative regimen

BY MOUTH

Adult: Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response, dose increased until 800 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects

DOSE EQUIVALENCE AND CONVERSION

The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

- 2 tablets Sinemet® 12.5/50 mg is equivalent to 1 tablet Sinemet® Plus 25 mg/100 mg.

CARAMET® CR Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)

BY MOUTH USING MODIFIED-RELEASE TABLETS

Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

BY MOUTH USING MODIFIED-RELEASE TABLETS

Adult: Discontinue previous preparation at least 12 hours before first dose of CarameT® CR; substitute CarameT® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days.

DUODOPA®

Severe Parkinson’s disease inadequately controlled by other preparations

Adult: Administered as intestinal gel, for use with enteral tube (consult product literature)
HALF SINEMET® CR
Parkinson’s disease (for fine adjustment of Sinemet® CR dose)
▶ BY MOUTH
▶ Adult: (consult product literature)

SINEMET® CR
Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)
▶ BY MOUTH
▶ Adult: Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)
▶ BY MOUTH
▶ Adult: 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet® tablets (substitute Sinemet® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

IMPORTANT SAFETY INFORMATION
IMPULSE CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

● CAUTIONS
  - Cushing’s syndrome
  - Diabetes mellitus
  - Endocrine disorders
  - History of convulsions
  - History of myocardial infarction with residual arrhythmia
  - History of peptic ulcer
  - Hypothyroidism
  - Osteomalacia
  - Phaeochromocytoma
  - Psychiatric illness (avoid if severe and discontinue if deterioration)
  - Severe cardiovascular disease
  - Severe pulmonary disease
  - Susceptibility to angle-closure glaucoma

● INTERACTIONS
  ▶ Appendix 1 (co-careldopa, levodopa).

● SIDE-EFFECTS
  ▶ Common or very common
    - Abnormal dreams
    - Anorexia
    - Anxiety
    - Arrhythmias
    - Chorea
    - Confusion
    - Dementia
    - Depression
    - Dizziness
    - Drowsiness
    - Dry mouth
    - Dyskinesia
    - Dystonia
    - Euphoria
    - Fatigue
    - Insomnia
    - Nausea
    - Palpitations
    - Postural hypotension
    - Psychosis
    - Syncope
    - Taste disturbances
    - Vomiting

  ▶ Uncommon
    - Ataxia
    - Chest pain
    - Constipation
    - Diarrhoea
    - Dysphagia
    - Flatulence
    - Hand tremor
    - Hoarseness
    - Hypersalivation
    - Hypertension
    - Malaise
    - Muscle cramps
    - Oedema
    - Reddish discoloration of the urine and other body fluids
    - Weakness
    - Weight changes

  ▶ Rare
    - Abdominal pain
    - Activation of Horner’s syndrome
    - Activation of malignant melanoma
    - Agitation
    - Agranulocytosis
    - Alopecia
    - Blepharospasm
    - Blurred vision
    - Bruxism
    - Convulsions
    - Diplopia
    - Disorientation
    - Duodenal ulcer
    - Dyspepsia
    - Dysphonia
    - Exanthema
    - Flushing
    - Gastro-intestinal bleeding
    - Haemolytic anaemia
    - Headache
    - Henoch–Schönlein purpura
    - Hiccups
    - Leucopenia
    - Neuropathic pain
    - Neuroleptic malignant syndrome (associated with abrupt withdrawal)
    - Non-haemolytic anaemia
    - Oculogyric crisis
    - Paraesthesia
    - Phlebitis
    - Priapism
    - Pupil dilatation
    - Reduced mental acuity
    - Sweating
    - Thrombocytopenia
    - Trismus
    - Urinary incontinence
    - Urinary retention

  ▶ Very rare
    - Angio-oedema
    - Suicidal ideation

  ▶ Frequency not known
    - Compulsive behaviour

● PREGNANCY
  - Use with caution—toxicity has occurred in animal studies.

● BREAST FEEDING
  - May suppress lactation; present in milk—avoid.

● HEPATIC IMPAIRMENT
  - Use with caution.

● RENAL IMPAIRMENT
  - Use with caution.

● EFFECT ON LABORATORY TESTS
  - False positive tests for urinary ketones have been reported.

● TREATMENT CESSION
  - Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

● PRESCRIBING AND DISPENSING INFORMATION
  - Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

  - When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

  - Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed.

● PATIENT AND CARER ADVICE

Driving and skilled tasks
Sudden onset of sleep
  - Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

  - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or comitant medication. Patients should be counselled on improving sleep behaviour.

● NATIONAL FUNDING/ACCESS DECISIONS

DUODOPA®

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2016) that Duodopa® intestinal gel is accepted for restricted use within NHS Scotland, within its licensed indication, only in patients not eligible for deep brain stimulation. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Amantadine hydrochloride

- DRUG ACTION Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.

- INDICATIONS AND DOSE Parkinson’s disease
  - BY MOUTH
    - Adult: 100 mg daily for 1 week, then increased to 100 mg twice daily, usually administered in conjunction with other treatment. Some patients may require higher doses; maximum 400 mg per day
    - Elderly: 100 mg daily, adjusted according to response

Post-herpetic neuralgia
- BY MOUTH
  - Adult: 100 mg twice daily for 14 days (continued for another 14 days if necessary)

Treatment of influenza A (but not recommended)
- BY MOUTH
  - Adult: 100 mg daily 4–5 days

Prophylaxis of influenza A (but not recommended)
- BY MOUTH
  - Adult: 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

- CONTRA-INDICATIONS Epilepsy · history of gastric ulceration
- CAUTIONS Confused or hallucinatory states · congestive heart disease (may exacerbate oedema) · elderly · tolerance to the effects of amantadine may develop in Parkinson’s disease
- INTERACTIONS → Appendix 1 (amantadine).
- SIDE-EFFECTS
  - Common or very common Anorexia · anxiety · dizziness · dry mouth · gastrointestinal disturbances · hallucinations · headache · impaired concentration · insomnia · lethargy · livedo reticularis · mood changes · myalgia · palpitation · peripheral oedema · postural hypotension · slurred speech · sweating
  - Uncommon Confusion · movement disorders · neuroleptic malignant syndrome · psychosis · rash · seizure · tremor · urinary incontinence · urinary retention · visual disturbances
  - Frequency not known Heart failure · leucopenia · photosensitisation

- PREGNANCY Avoid; toxicity in animal studies.
- BREAST FEEDING Avoid; present in milk; toxicity in infant reported.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Reduce dose. Avoid if eGFR less than 15 mL/minute/1.73 m².
- TREATMENT CESSATION Avoid abrupt withdrawal in Parkinson’s disease.

- PATIENT AND CARER ADVICE Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158 Amantadine is not recommended for prophylaxis of influenza.

Apomorphine hydrochloride

- INDICATIONS AND DOSE

Refactory motor fluctuations in Parkinson’s disease (off” episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (for capable and motivated patients) (under expert supervision)
- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 1 mg, dose to be administered at the first sign of “off” episode, then 2 mg after 30 minutes, dose to be given if inadequate or no response following initial dose, thereafter increase dose at minimum 40-minute intervals until satisfactory response obtained, this determines threshold dose; usual dose 3–30 mg daily in divided doses (max. per dose 10 mg), subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses; maximum 100 mg per day
Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

**INDICATIONS AND DOSE**

- **Prevention of lactation**
  - **BY MOUTH**
    - Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

**DRUG ACTION**

- Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

**TREATMENT CESSION**

- Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PATIENT AND CARER ADVICE**

- **Driving and skilled tasks**
  - **Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.
    - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

- **Drugs and driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to apomorphine, see Drugs and driving under Guidance on prescribing p. 1.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

- **CAUTIONARY AND ADVISORY LABELS**
- **EXCIPIENTS**: May contain Sulfites
- **APO-go (Britannia Pharmaceuticals Ltd)**
  - Apomorphine hydrochloride 10 mg per 1 ml APO-go 50mg/5ml solution for injection ampoules | 5 ampoule | £73.11 DT price = £73.11
  - Apomorphine hydrochloride 10 mg per 1 ml APO-go Pen 30mg/3ml solution for injection | 5 pre-filled disposable injection | £123.91 DT price = £123.91

**Solution for infusion**

- **CAUTIONARY AND ADVISORY LABELS**
- **EXCIPIENTS**: May contain Sulfites
- **APO-go PFS (Britannia Pharmaceuticals Ltd)**
  - Apomorphine hydrochloride 5 mg per 1 ml APO-go PFS 50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection | £73.11 DT price = £73.11

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

- Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS** Avoid if ‘on’ response to levodopa marred by severe dyskinesia or dystonia · dementia · psychosis · respiratory depression.

**CAUTIONS** Cardiovascular disease · history of postural hypotension (special care on initiation) · neuropsychiatric conditions · pulmonary disease · susceptibility to QT-interval prolongation.

**INTERACTIONS** → Appendix 1 (apomorphine).

**SIDE-EFFECTS**

- **Common or very common** Confusion · drowsiness · hallucinations · nausea · sudden onset of sleep · vomiting · yawning.
- **Uncommon** Dyskinesia during ‘on’ periods (may require discontinuation) · dysphagia · haemolytic anaemia (with levodopa) · postural hypotension · rash · thrombocytopenia (with levodopa).
- **Rare** Eosinophilia.
- **Frequency not known** Compulsive behaviour · dizziness · peripheral oedema.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to opioids.

**PREGNANCY** Avoid unless clearly necessary.

**BREAST FEEDING** No information available; may suppress lactation.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**

- Monitor hepatic, haemopoietic, renal, and cardiovascular function.
- With concomitant levodopa test initially and every 6 months for haemolytic anaemia and thrombocytopenia (development calls for specialist haematological care with dose reduction and possible discontinuation).

**REFRACTORY MOTOR FLUCTUATIONS** In Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-careldopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
- Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day
Suppression of lactation
- **BY MOUTH**
- **Adult:** Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility
- **BY MOUTH**
- **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, increased dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly
- **BY MOUTH**
- **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma
- **BY MOUTH**
- **Adult:** Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson’s disease
- **BY MOUTH**
- **Adult:** Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

**IMPORTANT SAFETY INFORMATION**

**FIBROTIC REACTIONS**
Bromocriptine has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

**IMPALE CONTROL DISORDERS**
Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia, cardiac valvulopathy (exclude before treatment), hypertension in postpartum women or in puerperium

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
- Postpartum or puerperium: Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression — caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop.

- **CAUTIONS** Acute porphyrias. p. 930 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud’s syndrome

- **CAUTIONS, FURTHER INFORMATION**
- Hyperprolactinaemic patients. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e., exclude pituitary tumour before treatment).

- **INTERACTIONS** → Appendix 1 (bromocriptine).
- Tolerance may be reduced by alcohol.

- **SIDE-EFFECTS**
- **Common or very common** Constipation · headache · nasal congestion · nausea
- **Uncommon** Confusion (particularly with high doses) · dizziness · dry mouth · fatigue · hallucinations (particularly with high doses) · postural hypotension · psychomotor excitation (particularly with high doses) · vomiting
- **Rare** Abdominal pain · arrhythmia · bradycardia · diarrhea · gastric ulcer · gastrointestinal bleeding · insomnia · paraesthesia · psychosis · tachycardia · tinnitus · visual disturbances
- **Very rare** Neuroleptic malignant syndrome on withdrawal · vasospasm of fingers and toes (particularly in patients with Raynaud’s syndrome)

- **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constrictive pericarditis · drowsiness · dryness · dyskinesia · hypersexuality · hyponatraemia · hypotension · increased libido · leg cramps · leucopenia · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis · reversible hearing loss · thrombocytopenia · urinary incontinence

- **SIDE-EFFECTS, FURTHER INFORMATION**
- Gastro-intestinal bleeding · Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGIC AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Caution — provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

- **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary.

- **MONITORING REQUIREMENTS**
- Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
- Monitor for fibrotic disease.
- Monitor blood pressure for a few days after starting treatment and following dosage increase.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks**
  Sudden onset of sleep · Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have
experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 10, 21**

- **Bromocriptine** (as Bromocriptine mesilate) 1 mg Bromocriptine 1mg tablets | 100 tablet | price = £76.62
- **Bromocriptine** (as Bromocriptine mesilate) 2.5 mg Bromocriptine 2.5mg tablets | 30 tablet | price = £74.89

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 10, 21**

- **Parlodol** (Meda Pharmaceuticals Ltd) Bromocriptine (as Bromocriptine mesilate) 5 mg Parlodol 5mg capsules | 100 capsule | price = £37.57

**INDICATIONS AND DOSE**

**Prevention of lactation**

- **BY MOUTH**
- Adult: 1 mg, to be taken as a single dose on the first day postpartum

**Suppression of established lactation**

- **BY MOUTH**
- Adult: 250 micrograms every 12 hours for 2 days

**Hyperprolactinaemic disorders**

- **BY MOUTH**
- Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on separate days, then increased in steps of 500 micrograms every month until optimal therapeutic response reached, increase dose following monthly monitoring of serum prolactin levels; usual dose 0.25–2 mg once weekly, usually 1 mg weekly; reduce initial dose and increase more gradually if patient intolerant, doses over 1 mg weekly to be given as divided dose; maximum 4.5 mg per week

**Alone or as adjunct to co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate**

- **BY MOUTH**
- Adult: Initially 1 mg daily, then increased in steps of 0.5–1 mg every 7–14 days, concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased; maximum 3 mg per day

**Cabergoline**

**DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

**INDICATIONS AND DOSE**

**FIBROTIC REACTIONS**

Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS** Avoid in pre-eclampsia · cardiac valvulopathy (exclude before treatment) · history of pericardial fibrotic disorders · history of puerperal psychosis · history of pulmonary fibrotic disorders · history of retroperitoneal fibrotic disorders

**CAUTIONS** Acute porphyrias p. 930 · cardiovascular disease · history of peptic ulcer (particularly in acromegalic patients) · history of serious mental disorders (especially psychotic disorders) · Raynaud’s syndrome

**CAUTIONS, FURTHER INFORMATION**

Hyperprolactinaemic patients in hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

**INTERACTIONS** → Appendix 1 (cabergoline). Tolerance may be reduced by alcohol.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · angina · breast pain · confusion · constipation · depression · dyspepsia · epigastric pain · gastritis · hallucinations · headache · nausea · syncope
- **Rare** Digital vasospasm · epistaxis · hot flushes · muscle weakness · palpitation · paraesthesia · transient hemianopia · vomiting
- **Frequency not known** Allergic skin reactions · alopecia · cardiac valvulopathy · constictive pericarditis · drowsiness · dyskinesia · erythroamelalgia · hypersexuality · hypotension · increased libido · leg cramps · pathological gambling · pericardial effusion · peripheral oedema · pleural effusion · pleural fibrosis · pleuritis · pulmonary fibrosis · retroperitoneal fibrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

**ALLERGY AND CROSS-SENSITIVITY** Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.
CONCEPTION AND CONTRACEPTION  Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).

PREGNANCY  Discontinue if pregnancy occurs during treatment (specialist advice needed).

BREAST FEEDING  Suppresses lactation; avoid breast-feeding if lactation prevention fails.

HEPATIC IMPAIRMENT  Reduce dose in severe hepatic impairment.

MONITORING REQUIREMENTS

Monitor for

- MONITORING REQUIREMENTS

TREATMENT CESSATION  Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PRESCRIBING AND DISPENSING INFORMATION  Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE

Driving and skilled tasks

Sudden onset of sleep  Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions  Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

**INDICATIONS AND DOSE**

Monotherapy in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate

BY MOUTH

Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

**IMPORTANT SAFETY INFORMATION**

**FIBROTIC REACTIONS**

Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS**

Cardiac valvulopathy (exclude before treatment) - history of fibrotic disorders

**CAUTIONS**

Acute porphyrias p. 930 - arrhythmias - dyskinesia (may exacerbate) - hallucinations - history of confusion - psychosis - underlying cardiac disease

**INTERACTIONS**  Appendix 1 (pergolide).

**SIDE-EFFECTS**  Abdominal pain - atrial premature contractions - compulsive behaviour - confusion - constipation - diarrhoea - diplopia - dizziness - drowsiness - dyskinesia - dyspepsia - dysphoria - erythromelalgia - fever - hallucinations - hiccup - hypotension - insomnia - nausea -
palpitation · rash · Raynaud’s phenomenon · rhinitis · sudden onset of sleep · syncope · tachycardia · vomiting

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** May suppress lactation.
- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks**

  Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery.   | Pergolide (as Pergolide mesilate) | 250 microgram | Pergolide | 250 microgram tablets | 100 tablet (PO) | £36.00–£39.00 DT price = £38.00

### Pramipexole

- **INDICATIONS AND DOSE**

  **Parkinson’s disease, used alone or as an adjunct to cobeneldopa or co-careldopa**

  ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

  - **Adult:** Initially 88 micrograms 3 times a day, if tolerated dose to be increased by doubling dose every 5–7 days, increased to 350 micrograms 3 times a day, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

  ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

  - **Adult:** Initially 260 micrograms once daily, dose to be increased by doubling dose every 5–7 days, increased to 1.05 mg once daily, then increased in steps of 520 micrograms every week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day

  **Moderate to severe restless legs syndrome**

  ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

  - **Adult:** Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days if necessary, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

  **DOSE EQUIVALENCE AND CONVERSION**

  ▶ Doses and strengths are stated in terms of pramipexole (base).

  ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:

    - 88 micrograms base = 125 micrograms salt
    - 180 micrograms base = 250 micrograms salt
    - 350 micrograms base = 500 micrograms salt
    - 700 micrograms base = 1 mg salt.

  ▶ Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:

    - 260 micrograms base = 375 micrograms salt
    - 520 micrograms base = 750 micrograms salt
    - 1.05 mg base = 1.5 mg salt
    - 1.57 mg base = 2.25 mg salt
    - 2.1 mg base = 3 mg salt
    - 2.62 mg base = 3.75 mg salt
    - 3.15 mg base = 4.5 mg salt.

### IMPORTANT SAFETY INFORMATION

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine–receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Psychotic disorders · risk of visual disorders (ophthalmological testing recommended) · severe cardiovascular disease

- **INTERACTIONS** → Appendix 1 (pramipexole).

- **SIDE-EFFECTS**

  ▶ **Common or very common** Confusion · constipation · decreased appetite · dizziness · drowsiness · dyskinesia · hallucinations · headache · hyperkinesia · hypotension · nausea · peripheral oedema · postural hypotension · restless sleep disturbances · sudden onset of sleep · visual disturbances · vomiting · weight changes

  ▶ **Uncommon** Amnesia · binge eating · cardiac failure · compulsive behaviour · delusion · dysphoria · hiccup · paranoia · pneumonia · pruritus · rash · syncope

  ▶ **Frequency not known** Paroxysmal worsening of restless legs syndrome

- **PREGNANCY** Use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** May suppress lactation; avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT** For immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR. For immediate-release tablets in restless legs syndrome, reduce dose if eGFR less than 20 mL/minute/1.73 m². For modified-release tablets, initially 260 micrograms on alternate days if eGFR

  - **Pramipexole** 700 microgram tablets: 30 tablet pack = £18.26 DT price = £2.14 | 100 tablet pack = £117.63

**CAUTIONARY AND ADVISORY LABELS**

Some patients taking dopamine-receptor agonists; these should refrain from driving or operating machinery until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive Reactions**

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

### Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS**

- **Pramipexole**
  - **Pramipexole (as Pramipexole dihydrochloride monohydrate)**
    - 260 microgram tablets: 30 tablet pack = £30.87–£32.49 DT price = £32.49

  - **Pramipexole** 2.62 mg tablets: 30 tablet pack = £389.87 DT price = £389.87

### Ropinirole

**INDICATIONS AND DOSE**

Parkinson's disease, either used alone or as an adjunct to co-beneldopa or co-careldopa.

- **By mouth using immediate-release medicines**
  - **Adult**: Initially 750 micrograms daily in 3 divided doses, then increased in steps of 750 micrograms daily, dose
to be increased at weekly intervals, increased to 3 mg daily in 3 divided doses, then increased in steps of 1.5–3 mg daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 9–16 mg daily in 3 divided doses, higher doses may be required if used with levodopa, when administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, daily maximum dose to be given in 3 divided doses; maximum 24 mg per day

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Adult:** Initially 2 mg once daily for 1 week, then 4 mg once daily, increased in steps of 2 mg at intervals of at least 1 week, adjusted according to response, increased to up to 8 mg once daily, dose to be increased further if still no response; increased in steps of 2–4 mg at intervals of at least 2 weeks if required; maximum 24 mg per day

**Parkinson's disease in patients transferring from ropinirole immediate-release tablets**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Adult:** Initially ropinirole modified-release once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, titrate dose, consider slower titration in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

**Moderate to severe restless legs syndrome**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Adult:** Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

---

**UNLICENSED USE**

Doses in the BNF may differ from those in product literature.

---

**IMPORTANT SAFETY INFORMATION**

**IMPULSE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CAUTIONS**

- Elderly • major psychotic disorders • severe cardiovascular disease (risk of hypotension—monitor blood pressure)

**INTERACTIONS**

- Appendix 1 (ropinirole).

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain • confusion • constipation • dizziness • drowsiness • dyskinesia • dyspepsia • fatigue • gastro-oesophageal reflux disease • hallucinations • hypotension • nausea • nervousness • peripheral oedema • sudden onset of sleep • syncope • vomiting

- **Uncommon**
  - Compulsive behaviour • psychosis

- **Very rare**
  - Hepatic disorders

- **Frequency not known**
  - Paradoxical worsening of restless legs syndrome

- **PREGNANCY**
  - Avoid unless potential benefit outweighs risk—toxicity in animal studies.

- **BREAST FEEDING**
  - May suppress lactation—avoid.

- **HEPATIC IMPAIRMENT**
  - Avoid—no information available.

- **RENAL IMPAIRMENT**
  - Avoid if eGFR less than 30 ml/minute/1.73 m².

- **TREATMENT CESSATION**
  - Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks**

  - Sudden onset of sleep
  - Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or comitant medication. Patients should be counselled on improving sleep behaviour.

- **Hypotensive reactions**

  - Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (June 2006) that Adartrel™ should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

Rotigotine

**INDICATIONS AND DOSE**

**Monotherapy in Parkinson's disease**

- **Adult:** Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 8 mg/24 hours per day

**Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson's disease**

- **Adult:** Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every week if required; maximum 16 mg/24 hours per day

**Moderate to severe restless legs syndrome**

- **By transdermal application using patches**

  - Adult: Initially 1 mg/24 hours, then increased in steps of 1 mg/24 hours every week if required; maximum 3 mg/24 hours per day

**IMPORTANT SAFETY INFORMATION**

**IMPALE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CAUTIONS**

- Avoid exposure of patch to heat - remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

**INTERACTIONS**

- → Appendix 1 (rotigotine)

**SIDE-EFFECTS**

- **Common or very common** Abnormal behaviour - abnormal thinking - aggression - application site reactions - confusion - constipation - dizziness - drowsiness - dry mouth - dyskinesia - dyspepsia - hallucinations - headache - hiccup - hypertension - malaise - nausea - palpititation - paranoea - peripheral oedema - postural hypotension - pruritus - psychosis - rash - sleep disturbances - sudden onset of sleep - sweating - syncope - vomiting - weight changes

- **Uncommon** Abdominal pain - atrial fibrillation - erectile dysfunction - hypotension - impulse control disorders - visual disturbances

- **Rare** Irritability - obsessive compulsive disorder - seizures - tachycardia

**PREGNANCY**

- Avoid — no information available.

**BREAST FEEDING**

- May suppress lactation; avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Caution in severe impairment — no information available.

**MONITORING REQUIREMENTS**

- Ophthalmic testing recommended.

**TREATMENT CESSATION**

- Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**DIRECTIONS FOR ADMINISTRATION**

- Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days).

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

- Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

  - Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

  - Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as
depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypnotic reactions Hypnotic reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium (SMC) has advised that Neupro® is accepted for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

  The Scottish Medicines Consortium has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007). The Scottish Medicines Consortium has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Transdermal patch**

   » **Frequency not known** Hypersexuality

   **SIDE-EFFECTS, FURTHER INFORMATION**

   Side-effects of levodopa may be increased—concurrent levodopa dosage can be reduced by 10–30% in steps of 10% every 3–4 days.

  » **PREGNANCY** Avoid—no information available.

  » **BREAST FEEDING** Avoid—no information available.

  » **HEPATIC IMPAIRMENT** Use with caution in severe impairment.
400 Nausea and labyrinth disorders

5 Nausea and labyrinth disorders

Nausea and labyrinth disorders

Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 103 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another. Evidence that any one antihistamine is superior to another is based on many underlying conditions. There is no evidence that any one antihistamine is superior to another.

Other antipsychotic drugs including haloperidol p. 363 and levomepromazine p. 411 are used for the relief of nausea and vomiting in terminal illness.

Metoclopramide hydrochloride p. 403 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease.

Domperidone p. 402 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 405 and ondansetron p. 406 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 407 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy. Palonosetron is also available in combination with netupitant, a neurokinin 1-receptor antagonist, for the prevention of acute and delayed nausea and vomiting associated with moderately emetogenic chemotherapy and highly emetogenic cisplatin-based chemotherapy.

Dexamethasone p. 618 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine, lorazepam p. 317, or a 5HT3-receptor antagonist.

Aprepitant p. 404 and fosaprepitant p. 404 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT3-receptor antagonist.

Nabilone p. 402 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support.

Supplementation with thiamine p. 950 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent...
postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol p. 410, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

**Motion sickness**

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 409. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 408 is preferred. Domperidone, metoclopramide hydrochloride, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

**Other vestibular disorders**

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat.

Betahistine dihydrochloride p. 411 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

**Cytotoxic chemotherapy, palliative care, and migraine**

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

**Other drugs used for Nausea and labyrinth disorders**

Paracetamol with metoclopramide, p. 439. Promethazine hydrochloride, p. 269

**Nausea and vomiting of known cause**

**Nausea and vomiting associated with vestibular disorders and palliative care**

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
  - Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
  - Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
- **BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION**
  - Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2–5 years: 12.5 mg up to 3 times a day
  - Child 6–11 years: 25 mg up to 3 times a day
  - Child 12–17 years: 50 mg up to 3 times a day

**Nausea and vomiting associated with palliative care**

- **BY SUBCUTANEOUS INFUSION**
  - Adult: 150 mg, dose to be given over 24 hours
- **BY MOUTH**
  - Adult: 50 mg up to 3 times a day

**UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.

**CONTRA-INDICATIONS** Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)

**CAUTIONS** Epilepsy - glaucoma (in children) - may counteract haemodynamic benefits of opioids - neuromuscular disorders—increased risk of transient paralysis with intravenous use - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - severe heart failure—may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - susceptibility to angle-closure glaucoma (in adults) - urinary retention

**INTERACTIONS** → Appendix 1 (antihistamines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Drowsiness
- **Rare** Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - paradoxical stimulation (especially with high doses in children) - paradoxical stimulation (especially with high doses in the elderly) - photosensitivity reactions - rashes - sleep disturbances - tremor
- **Frequency not known** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - hallucinations - headache - hypertension - movement disorders - oculogyric crisis - paraesthesia - psychomotor impairment - tachycardia - transient speech disorders - twitching - urinary retention

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With intravenous use: Transient paralysis
  - Frequency not known
  - With subcutaneous use: Local irritation
SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **PATIENT AND CARER ADVICE**

  **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g., cycling, driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

  - **INDICATIONS AND DOSE**

    **Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)**

    - **BY MOUTH**

      - **Adult:** Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

    - **CAUTIONS** Adverse effects on mental state can persist for 48–72 hours after stopping • elderly • heart disease • history of psychiatric disorder • hypertension

  - **SIDE-EFFECTS**

    - **Common or very common** Ataxia • concentration difficulties • drowsiness • dry mouth • dysphoria • euphoria • headache • hypotension • nausea • sleep disturbance • vertigo • visual disturbance

    - **Frequency not known** Abdominal pain • confusion • decreased appetite • decreased coordination • depression • disorientation • hallucinations • psychosis • tachycardia • tremors

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Drowsiness and dizziness occur frequently with standard doses.

  - **PREGNANCY** Avoid unless essential.

  - **BREAST FEEDING** Avoid—no information available.

  - **HEPATIC IMPAIRMENT** Avoid in severe impairment.

  - **PATIENT AND CARER ADVICE**

    **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g., driving). Effects of alcohol enhanced.

    For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1. Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

  - **MEDICINAL FORMS**

    There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
● Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be, impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;

● The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;

● The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;

● Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy. This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

● CONTRA-INDICATIONS Cardiac disease - conditions where cardiac conduction is, or could be, impaired (in adults) - gastro-intestinal haemorrhage (in children) - if increased gastrointestinal motility harmful (in adults) - mechanical obstruction (in children) - mechanical perforation (in children) - predisposition to cardiac conduction disorders (in children) - prolactinoma

● CAUTIONS Children - if there are cardiac concerns, obtain ECG before and during treatment (in children) - patients over 60 years - increased risk of ventricular arrhythmia (in adults)

● INTERACTIONS ▶ Appendix 1 (domperidone). Contra-indicated with concomitant use of drugs that prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 inhibitors.

● SIDE-EFFECTS

▶ Common or very common Drowsiness - dry mouth - malaise

▶ Uncommon Anxiety - breast pain - decreased libido - diarrhoea - galactorrhoea - headache - pruritus - rash

▶ Frequency not known Agitation - amenorrhoea - convulsions - extrapyramidal disorders - gynaecomastia - nervousness - oculogyric crisis - QT-interval prolongation - sudden cardiac death - urinary retention - ventricular arrhythmias

● PREGNANCY Use only if potential benefit outweighs risk.

● BREAST FEEDING Amount too small to be harmful.

● HEPATIC IMPAIRMENT Avoid in moderate or severe impairment.

● RENAL IMPAIRMENT Reduce frequency.

● PRESCRIBING AND DISPENSING INFORMATION Palliative care For further information on the use of domperidone in palliative care, see www.palliativedrugs.com/formulary/en/domperidone.html.

● PATIENT AND CARER ADVICE Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncpe develop.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

## Metoclopramide hydrochloride 21-Nov-2016

● INDICATIONS AND DOSE
Symptomatic treatment of nausea and vomiting including that associated with acute migraine | Delayed (but not acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of postoperative nausea and vomiting

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

Adult (body-weight up to 60 kg): Up to 500 micrograms/kg daily in 3 divided doses, when administered by slow intravenous injection, to be given over at least 3 minutes

Adult (body-weight 60 kg and above): 10 mg up to 3 times a day, when administered by slow intravenous injection, to be given over at least 3 minutes

Hiccups in palliative care

▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

Adult: 10 mg every 6–8 hours

Nausea and vomiting in palliative care

▶ BY MOUTH

Adult: 10 mg 3 times a day

▶ BY SUBCUTANEOUS INFUSION

Adult: 30–100 mg/24 hours

## IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)
The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose, and duration of use have been made:

● In adults over 18 years, metoclopramide should only be used for prevention of postoperative nausea and vomiting, radiotherapy-induced nausea and vomiting, delayed (but not acute) chemotherapy-induced nausea and vomiting, and symptomatic treatment of nausea and vomiting, including that associated with acute migraine (where it may also be used to improve absorption of oral analgesics);

● Metoclopramide should only be prescribed for short-term use (up to 5 days);

Usual dose is 10 mg, repeated up to 3 times daily; max. daily dose is 500 micrograms/kg;

Intravenous doses should be administered as a slow bolus over at least 3 minutes;

Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy. This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

● CONTRA-INDICATIONS 3–4 days after gastrointestinal surgery · gastro-intestinal haemorrhage · gastro-intestinal obstruction · gastro-intestinal perforation · phaeochromocytoma

## Oral suspension

| CAUTIONARY AND ADVISORY LABELS 22 |
| Domperidone (non-proprietary) ▼ |
| Domperidone 1 mg per 1 ml Domperidone 5mg/5ml oral suspension sugar free sugar-free | 200 ml (PoS) £13.43 DT price = £13.43 |
Nervous system

404 Nausea and labyrinth disorders

**CAUTIONS** Asthma - atopic allergy - bradycardia - cardiac conduction disturbances - children - elderly - epilepsy - may mask underlying disorders such as cerebral irritation - Parkinson’s disease - uncorrected electrolyte imbalance - young adults (15–19 years old)

**INTERACTIONS** → Appendix 1 (metoclopramide).

Caution with concomitant use of other drugs affecting cardiac conduction.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

▶ **Common or very common** Extrapyramidal effects (especially in children and young adults (15–19 years old)) - galactorrhoea - gynaecomastia - hyperprolactinaemia - menstrual changes

▶ Very rare Depression - methaemoglobinaemia (more severe in G6PD deficiency) - neuroleptic malignant syndrome

▶ Frequency not known Anxiety - confusion - diarrhoea - dizziness - drowsiness - dysphoria - hypotension - oedema - pruritus - rash - restlessness - tardive dyskinesia on prolonged administration - tremor - urticaria - visual disturbances

**SPECIFIC SIDE-EFFECTS**

▶ Very rare

▶ With intravenous use Cardiac conduction abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Small amount present in milk; avoid.

**HEPATIC IMPAIRMENT** Reduce dose.

**RENAL IMPAIRMENT** Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.

**DIRECTIONS FOR ADMINISTRATION** Oral liquid preparation to be given via a graduated oral dosing syringe.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of metoclopramide hydrochloride in palliative care, see www.palliativemedic.com/formulary/en/metoclopramide.html.

**PATIENT AND CARER ADVICE** Counselling on use of pipette advised with oral solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

▶ Metoclopramide hydrochloride (Non-proprietary) Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet [Pcm] £1.23 DT price = £0.74

**Oral solution**

▶ Metoclopramide hydrochloride (Non-proprietary) Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml [Pcm] £19.77 DT price = £13.77

**Solution for injection**

▶ Metoclopramide hydrochloride (Non-proprietary) Metoclopramide hydrochloride 5 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule [Pcm] £1.31 | 10 ampoule [Pcm] £3.30 DT price = £3.29

▶ Maxolon (AMCo) Metoclopramide hydrochloride 5 mg per 1 ml Maxolon 10mg/2ml solution for injection ampoules | 12 ampoule [Pcm] £3.21 Maxolon High Dose 100mg/20ml solution for injection ampoules | 10 ampoule [Pcm] £26.68

**COMBINATIONS AVAILABLE** Metoclopramide hydrochloride 10 mg

**ANTIEMETICS AND ANTIAGUSTANTS**

**NEUROKININ RECEPTOR ANTAGONISTS**

**Aprepitant**

**INDICATIONS AND DOSE** Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ BY MOUTH

▶ Adult: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, consult product literature for dose of concomitant corticosteroid and 5HT3-antagonist

**SIDE-EFFECTS**

▶ Very rare

▶ With intravenous use Cardiac conduction abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

Fosaprepitant is a prodrug of aprepitant.

▶ **Common or very common** Anorexia - asthenia - constipation - diarrhoea - dizziness - dyspepsia - headache - hiccups

▶ **Frequency not known** Dysarthria - dysphoria - insomnia - Stevens-Johnson syndrome - urticaria - visual disturbances

**CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

**PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

**MEDITICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

▶ Emend (Merck Sharp & Dohme Ltd) Aprepitant 80 mg Emend 80mg capsules | 2 capsule [Pcm] £31.61 Aprepitant 125 mg Emend 125mg capsules | 1 capsule [Pcm] no price available | 5 capsule [Pcm] £79.03

**Fosaprepitant**

**DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

**INDICATIONS AND DOSE** Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

▶ BY INTRAVENOUS INFUSION

▶ Adult: 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only, consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist
Treatment of postoperative nausea and vomiting
▶ BY INTRAVENOUS INJECTION
▶ Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy
▶ BY MOUTH
▶ Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours
▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
▶ Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

Antiemetics and Antinauseants (5HT3) Receptor Antagonists

Granisetron

Drug Action
Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

INDICATIONS AND DOSE
Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used
▶ BY TRANSDERMAL APPLICATION USING PATCHES
▶ Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment. Patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting
▶ BY INTRAVENOUS INJECTION
▶ Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Medicinal forms

Granisetron (as Granisetron hydrochloride)

1 mg
Granisetron 1mg tablets | 10 tablet | £51.20
Granisetron 2mg tablets | 5 tablet | £52.39

Nausea and labyrinth disorders 405

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
▶ Ivemend (Merck Sharp & Dohme Ltd)
Ivemend 150mg powder for solution for infusion vials | 1 vial | £47.42

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

Contra-indications
Acute porphyrias p. 930

Interactions
▶ Appendix 1 (fosaprepitant).

Side-effects

Common or very common Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccup

Uncommon Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hypotension · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes

Frequency not known Dysarthria · dysphagia · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances

Conception and contraception Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

Pregnancy
Avoid unless potential benefit outweighs risk—no information available.

Breast feeding
Avoid—present in milk in animal studies.

Hepatic impairment
Caution in moderate to severe impairment.

Directions for administration
For intravenous infusion (Ivemend®), give interminently in Sodium chloride 0.9%; reconstitute each 150-mg vial with 5 mL Sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

National funding/access decisions

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

**Nervous system**

**Adult:** Initially 8 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days

**BY MOUTH**

**Adult:** Initially 16 mg, dose to be taken 1–2 hours before treatment, then 16 mg daily for up to 5 days

**INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**

**Adult:** Initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INITIALLY BY INTRAMUSCULAR INJECTION, OR BY INTRAVENTRICULAR INJECTION**

**Elderly:** Initially 8 mg, dose to be administered immediately before treatment, intravenous infusion to be given over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)**

**BY MOUTH**

**Adult:** 24 mg, dose to be taken 1–2 hours before treatment, then 8 mg every 12 hours for up to 5 days

**BY RECTUM**

**Adult:** 16 mg, dose to be administered 1–2 hours before treatment, then 16 mg daily for up to 5 days

**INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**

**Adult:** Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INITIALLY BY INTRAMUSCULAR INJECTION**

**Adult 65–74 years:** Initially 8 mg, to be given immediately before treatment, followed by (by intramuscular injection) 8 mg every 4 hours if required for 2 doses, alternatively, followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INITIALLY BY INTRAVENOUS INFUSION**

**Adult:** Initially 16 mg, immediately before treatment (over at least 15 minutes), followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Adult 75 years and over:** Initially 8 mg, immediately before treatment (over at least 15 minutes), followed by (by intravenous infusion) 8 mg every 4 hours if required for 2 doses, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**Prevention of postoperative nausea and vomiting**

**INITIALLY BY MOUTH**

**Adult:** 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

**BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**

**Adult:** 4 mg for 1 dose

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Constipation • flushing • headache • injection site-reactions
- **Uncommon** Arrhythmias • bradycardia • chest pain • hiccups • hypotension • movement disorders • seizures

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With intravenous use Dizziness • transient visual disturbances
  - With intravenous use Transient blindness
  - Frequency not known
  - With rectal use Rectal irritation

**PREGNANCY** No information available; avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Present in milk in animal studies—avoid.

**HEPATIC IMPAIRMENT** Maximum 8 mg daily in moderate or severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Zofran®), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes
- With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**Palonosetron with netupitant**

The properties listed below are those particular to the combination only. For the properties of the components please consider, palonosetron above.

**Indications and dose**

**Moderately emetogenic chemotherapy**

- **Initially by mouth**
  - Adult: 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment
- **Severely emetogenic chemotherapy**
  - Adult: 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

**Side-effects**

- **Common or very common** Fatigue
- **Uncommon** Alopecia - blood disorders - cardiomyopathy - conduction disorder - decreased appetite - urticaria - vertigo
- **Rare** Back pain - blurred vision - conjunctivitis - cystitis - dysphagia - hypoaesthesia - hypokalaemia - non-cardiac chest pain - psychosis (acute) - sleep disorder

**Conception and contraception**

Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.

**Clinical trials**

- **Summary**
  - 375 patients with moderately emetogenic chemotherapy
  - 51 patients with severely emetogenic chemotherapy

**Pharmacological properties**

- **Drug action**
  - Palonosetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**Pharmacological properties**

- **Drug action**
  - Palonosetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

- **Indications and dose**
  - **Moderately emetogenic chemotherapy**
    - **Initially by mouth**
      - Adult: 500 micrograms, dose to be taken 1 hour before treatment, alternatively (by intravenous injection) 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment
  - **Severely emetogenic chemotherapy**
    - **By intravenous injection**
      - Adult: 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

**Side-effects**

- **Common or very common**
  - Fatigue
- **Uncommon**
  - Alopecia - blood disorders - cardiomyopathy - conduction disorder - decreased appetite - urticaria - vertigo
- **Rare**
  - Back pain - blurred vision - conjunctivitis - cystitis - dysphagia - hypoaesthesia - hypokalaemia - non-cardiac chest pain - psychosis (acute) - sleep disorder

**Conception and contraception**

Manufacturer recommends exclude pregnancy before treatment in females of childbearing age; ensure effective contraception during treatment and for one month after treatment.
Nervous system

**SIDE-EFFECTS, FURTHER INFORMATION**
Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

**RENA L IMPAIRMENT** Use with caution—no information available.

**PATIENT AND CARER ADVICE**

- **Driving and skilled tasks**
  - Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

| BNF 73 |
| Nausea and labyrinth disorders |

**Antihistamines**

### Cinnarizine

**INDICATIONS AND DOSE**
Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease

- **BY MOUTH**
  - Child 5–11 years: 15 mg 3 times a day
  - Child 12–17 years: 30 mg 3 times a day
  - Adult: 30 mg 3 times a day

**Motion sickness**

- **BY MOUTH**
  - Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
  - Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
  - Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

**CONTRA-INDICATIONS**
Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)

**CAUTIONS**
Epilepsy · glaucoma (in children) · Parkinson’s disease (in adults) · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention

**SIDE-EFFECTS**

- **Common or very common**
  - Drowsiness
  - Dry mouth
  - Gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Antimuscarinic effects**
  - Blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention

**Promethazine teoclolate**

**INDICATIONS AND DOSE**

- **NAUSEA | VOMITING | LABYRINTHINE DISORDERS**
  - **BY MOUTH**
    - Child 5–9 years: 12.5–37.5 mg daily
    - Child 10–17 years: 25–75 mg daily; maximum 100 mg per day
    - Adult: 25–75 mg daily; maximum 100 mg per day

**Antihistamines**

- **SEDATING ANTIHISTAMINES**

### Cinnarizine with dimenhydrinate

The properties listed below are those particular to the combination only. For the properties of the components please consider, cinnarizine above.

**INDICATIONS AND DOSE**

- **VERTIGO**
  - **BY MOUTH**
    - Adult: 1 tablet 3 times a day

**MEDICINAL FORMS**

- **Tablet**
  - **Cinnarizine 15 mg**
    - Cinnarizine 15 mg tablets: 84 tablet £15.40
  - **Stugeron**
    - Stugeron 20 mg capsules: 930 tablet £24.00

**Antihistamines**

- **SEDATING ANTIHISTAMINES**

### Cinnarizine

**INDICATIONS AND DOSE**
Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease

- **BY MOUTH**
  - Child 5–11 years: 15 mg 3 times a day
  - Child 12–17 years: 30 mg 3 times a day
  - Adult: 30 mg 3 times a day

**Motion sickness**

- **BY MOUTH**
  - Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
  - Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
  - Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

**CONTRA-INDICATIONS**
Avoid in acute porphyrias p. 930 (some antihistamines are thought to be safe)

**CAUTIONS**
Epilepsy · glaucoma (in children) · Parkinson’s disease (in adults) · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma (in adults) · urinary retention

**SIDE-EFFECTS**

- **Common or very common**
  - Drowsiness
### Motion sickness prevention (acts longer than promethazine hydrochloride)

- **BY MOUTH**
  - Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
  - Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
  - Adult: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel

### Motion sickness treatment (acts longer than promethazine hydrochloride)

- **BY MOUTH**
  - Child 5–9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
  - Child 10–17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime
  - Adult: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN**

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CAUTIONS** Acute porphyrias p. 930 · asthma · bronchiectasis · bronchitis · epilepsy · prostatic hypertrophy (in adults) · pyloroduodenal obstruction · Reye’s syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1 (antihistamines).

- **SIDE-EFFECTS**
  - Rare: Anaphylaxis · angioedema · angle-closure glaucoma · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor

- **Frequency not known** Antimuscarinic effects · blurred vision · drowsiness · dry mouth · gastro-intestinal disturbances · headache · injection pain · psychomotor impairment · restlessness · urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

SCOPODERM (Novartis Consumer Health UK Ltd)
Hyoscine 1 mg per 72 hour Scopoderm 1.5mg patches
2 patch (P) £4.52 DT price = £4.52

ANTIPSYCHOTICS > FIRST-GENERATION

**Droperidol**

**DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

**INDICATIONS AND DOSE**
Prevention and treatment of postoperative nausea and vomiting

- **BY INTRAVENOUS INJECTION**
  - Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
  - Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)

- **BY INTRAVENOUS INJECTION**
  - Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

**CONTRA-INDICATIONS**
Bradycardia • CNS depression • comatose states • hypokalaemia • hypomagnesaemia • phaeochromocytoma • QT-interval prolongation

**CAUTIONS**
Chronic obstructive pulmonary disease • electrolyte disturbances • history of alcohol abuse • respiratory failure

**INTERACTIONS**
- Appendix 1 (droperidol). Avoid concomitant administration of drugs that prolong QT interval.

**SIDE-EFFECTS**
Anxiety • cardiac arrest • hallucinations • inappropriate antidiuretic hormone secretion

**BREAST FEEDING**
Limited information available—avoid repeated administration.

**HEPATIC IMPAIRMENT**
In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

**RENAL IMPAIRMENT**
In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.

**MONITORING REQUIREMENTS**
Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**RENAL IMPAIRMENT**
Use with caution.

**BREAST FEEDING**
Amount too small to be harmful.

**PREGNANCY**
Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.

**HEPATIC IMPAIRMENT**
Use with caution.

**DIRECTIONS FOR ADMINISTRATION**
With transdermal use in children. Patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.

With oral use in children. For administration by mouth, injection solution may be given orally.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of chewable tablet formulations may include raspberry.

**Palliative care**
For further information on the use of hyoscine hydrobromide in palliative care, see www.palliativedrugs.com/formulary/en/hyoscine-hydrobromide.html.

**PATIENT AND CARER ADVICE**
With transdermal use. Explain accompanying instructions to patient and in particular emphasis to wash hands after handling and to wash application site after removing, and to use one patch at a time.

Driving and skilled tasks
Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.

Levomepromazine
(Methotrimeprazine)

12-Dec-2016

● INDICATIONS AND DOSE

Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)
- By continuous subcutaneous infusion, or by intramuscular injection, or by intravenous injection
- Adult: Seek specialist advice

Restlessness and confusion in palliative care
- By continuous subcutaneous infusion
- Child 1–11 years: 0.35–3 mg/kg, to be administered over 24 hours
- Child 12–17 years: 12.5–200 mg, to be administered over 24 hours
- By mouth
- Adult: 6 mg every 2 hours as required
- By subcutaneous infusion
- Adult: 6.25 mg every 2 hours as required
- By subcutaneous infusion
- Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

Nausea and vomiting in palliative care
- By continuous intravenous infusion, or by subcutaneous infusion
- Child 1 month–11 years: 100–400 micrograms/kg, to be administered over 24 hours
- Child 12–17 years: 5–25 mg, to be administered over 24 hours
- By mouth
- Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
- By subcutaneous injection
- Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
- By subcutaneous infusion
- Adult: 5–25 mg/24 hours, sedation can limit the dose

Schizophrenia (bed patients)
- By mouth
- Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily

Schizophrenia
- By mouth
- Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary

● CONTRA-INDICATIONS

- CNS depression • comatose states • phaeochromocytoma

- CAUTIONS

- Diabetes • patients receiving large initial doses should remain supine

- CAUTIONS, FURTHER INFORMATION

- In adults: Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.

- SIDE-EFFECTS

- Raised erythrocyte sedimentation rate

- HEPATIC IMPAIRMENT

- Can precipitate coma; phenothiazines are hepatotoxic.

- RENAL IMPAIRMENT

- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- DIRECTIONS FOR ADMINISTRATION

- With subcutaneous use in children: For administration by subcutaneous infusion dilute with a suitable volume of Sodium Chloride 0.9%.

● PRESCRIBING AND DISPENSING INFORMATION

Palliative care
For further information on the use of levomepromazine in palliative care, see www.palliativedrugs.com/formulary/en/levomepromazine.html.

5.1 Menière’s disease

HISTAMINE ANALOGUES

Betaistine dihydrochloride

● INDICATIONS AND DOSE

Vertigo, tinnitus and hearing loss associated with Ménière’s disease
- By mouth
- Adult: Initially 16 mg 3 times a day, dose preferably taken with food; maintenance 24–48 mg daily

● CONTRA-INDICATIONS

- Phaeochromocytoma

● CAUTIONS

- Asthma • history of peptic ulcer

● INTERACTIONS

- Appendix 1 (betaistine).

● SIDE-EFFECTS

- Gastro-intestinal disturbances • headache • pruritus • rashes

● PREGNANCY

- Avoid unless clearly necessary—no information available.

● BREAST FEEDING

- Use only if potential benefit outweighs risk—no information available.

6 Pain

Analgesics

Drugs used for pain
The non-opioid drugs, paracetamol p. 414 and aspirin p. 114 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease
The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine phosphate p. 421, or dihydrocodeine tartrate p. 423. Severe crises may require the use of morphine p. 429 or diamorphine hydrochloride p. 423; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine hydrochloride p. 434 should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine hydrochloride necessitates frequent injections.

Dental and orofacial pain
Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-osseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride mouthwash or spray p. 1069 until the cause of the mucosal disorder has been dealt with. However, where a patient is febrile, the antipyretic action of paracetamol or ibuprofen p. 999 is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the patient. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs). NSAIDs that are used for dental pain include ibuprofen, diclofenac sodium p. 993, and aspirin.

Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect. Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant. Paracetamol, ibuprofen, or aspirin are adequate for most cases of dental pain and an opioid is rarely required.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen or aspirin is usually continued for about 24 to 72 hours.

Temporomandibular dysfunction can be related to anxiety in some patients who may clench or grind their teeth (bruxism) during the day or night. The muscle spasm (which appears to be the main source of pain) may be treated empirically with an overlay appliance which provides a free sliding occlusion and may also interfere with grinding. In addition, diazepam p. 321, which has muscle relaxant as well as anxiolytic properties, may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin or ibuprofen may also be required.

Dysmenorrhoea
Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate p. 82) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

Non-opioid analgesics and compound analgesic preparations
Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea, and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties. Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly.

Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium p. 131 is a special hazard.

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Nefopam hydrochloride p. 416 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase–2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.
Compound analgesic preparations
Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 114 or paracetamol p. 414) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol or aspirin with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate p. 421 per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration.

Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable. Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets (unlicensed) may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics
Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids
Morphine p. 429 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 417 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 1214.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care.

Diamorphine hydrochloride p. 423 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Allentanil p. 1187, fentanyl p. 424 and remifentanil p. 1188 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 464 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 431 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum p. 434 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 434 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine tartrate p. 423 or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 434 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tapentadol p. 435 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 435 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids
Codeine phosphate can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen p. 999 have proved ineffective.

Dihydrocodeine tartrate has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 428 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Postoperative analgesia
A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not
recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with codeine or morphine p. 429.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analogesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analogesics to patients with opioid dependence for relief of pain due to organic disease or injury.

Other drugs used for Pain

- Diclofenac potassium, p. 992
- Fenoprofen, p. 997
- Levomepromazine, p. 411
- Mefenamic acid, p. 1004

**NON-OPIOID**

### Paracetamol

(Paracetamol)

#### INDICATIONS AND DOSE

**Mild to moderate pain | Pyrexia**

- **By mouth**
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
  - By intravenous infusion
  - Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours; dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - Adult (body-weight 50 kg and above): 1 g every 4–6 hours; dose to be administered over 15 minutes; maximum 4 g per day
  - By rectum
  - Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

**Mild to moderate pain in patients with risk factors for hepatotoxicity | Pyrexia in patients with risk factors for hepatotoxicity**

- By intravenous infusion
  - Adult (body-weight up to 50 kg): 15 mg/kg every 4–6 hours; dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - Adult (body-weight 50 kg and above): 1 g every 4–6 hours; dose to be administered over 15 minutes; maximum 3 g per day

**Pain | Pyrexia with discomfort**

- By mouth
  - Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day
  - Child 6 months–1 year: 120 mg every 4–6 hours; maximum 4 doses per day
  - Child 2–3 years: 180 mg every 4–6 hours; maximum 4 doses per day
  - Child 4–5 years: 240 mg every 4–6 hours; maximum 4 doses per day
  - Child 6–7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
  - Child 8–9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day

- By rectum
  - Child 2 months: 60 mg after 60 mg every 6 hours; dose to be taken not more often than every 4 hours
  - Child 12–17 years: 500 mg every 4–6 hours

**Post-immunisation pyrexia in infants**

- By mouth
  - Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours
  - Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours

**PANADOL OA™**

Mild to moderate pain | Pyrexia

- By mouth
  - Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

**UNLICENSED USE**

Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine.

**CAUTIONS**

Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours. Body-weight under 50 kg, chronic alcohol consumption, chronic dehydration, chronic malnutrition, hepatocellular insufficiency, long-term use (especially in those who are malnourished)

**INTERACTIONS**

- Appendix 1 (paracetamol).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare: Acute generalised exanthematous pustulosis - malaise - skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known: Blood disorders - leucopenia - neutropenia - thrombocytopenia

**SPECIFIC SIDE-EFFECTS**

- Rare
  - With intravenous use: Flushing - tachycardia
  - Frequency not known:
  - With intravenous use: Hypotension
Overdose

**Important:** Liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 1204

- **Pregnancy** Not known to be harmful.
- **Breast Feeding** Amount too small to be harmful.
- **Hepatic Impairment** Dose-related toxicity—avoid large doses.
- **Renal Impairment**
  - In adults: Increase infusion dose interval to every 6 hours if eGFR less than 30 mL/minute/1.73 m².
  - In children: Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **Directions for Administration**
  - With intravenous use: For *intravenous infusion* (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
- **Prescribing and Dispensing Information** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.
- **Patient and Carer Advice** Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtome moderate-pain
- **Profession Specific Information**
  - Dental practitioners’ formulary: Paracetamol Tablets may be prescribed.
  - Paracetamol Soluble Tablets 500 mg may be prescribed.
  - Paracetamol Oral Suspension may be prescribed.
- ** Exceptions to Legal Category** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository.

**Tablet**

  - **Aspirin with codeine (Non-proprietary)**
    - Codeine phosphate 8 mg, Aspirin 400 mg
      - Co-codaprin 8mg/400mg dispersible tablets | 100 tablet [PO] £97.55 DT price = £92.18 [CD]

**OPIOIDS**

- **CONTRA-INDICATIONS** Acute respiratory depression - comatose patients - head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment)
Dependence and withdrawal

Respiratory depression

Hyperalgesia

▶

Common or very common

Palliative care

Dependence

▶

CAUTIONS

Use of opioid analgesics.

Respiratory depression and withdrawal can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

HEPATIC IMPAIRMENT

Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.

TREATMENT CESSATION

Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

Buprenorphine

DRUG ACTION

Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

INDICATIONS AND DOSE

Moderate to severe pain

▶ BY SUBLINGUAL ADMINISTRATION

Child (body-weight 16-25 kg): 100 micrograms every 6–8 hours

Child (body-weight 25-37.5 kg): 100–200 micrograms every 6–8 hours

Child (body-weight 37.5-50 kg): 200–300 micrograms every 6–8 hours

Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours

Adult: 200–400 micrograms every 6–8 hours

▶ BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION

Child 6 months-11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)

Child 12-17 years: 300–600 micrograms every 6–8 hours

Adult: 300–600 micrograms every 6–8 hours

Premedication

▶ BY SUBLINGUAL ADMINISTRATION

Adult: 400 micrograms

▶ BY INTRAMUSCULAR INJECTION

Adult: 300 micrograms

Intra-operative analgesia

▶ BY SLOW INTRAVENOUS INJECTION

Adult: 300–450 micrograms

Adjunct in the treatment of opioid dependence

▶ BY SUBLINGUAL ADMINISTRATION

Adult: Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day

DOSE EQUIVALENCE AND CONVERSION

For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 30 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, buprenorphine can be started at a dose of 2 mg daily.

BUTRANS®

Moderate, non-malignant pain unresponsive to non-opioid analgesics

▶ BY TRANSDERMAL APPLICATION USING PATCHES

Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, continued
analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time

**HAPOTASIN**

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic** | **Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

> **BY TRANSDERMAL APPLICATION USING PATCHES**
> **Adult:** Initially 35 micrograms/hour up to every 72 hours, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**PHARMACOKINETICS**

For Hapotasin®: It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**TRANSTEC®**

**Moderate to severe chronic cancer pain in patients who have not previously received strong opioid analgesic** | **Severe pain unresponsive to non-opioid analgesics in patients who have not previously received strong opioid analgesic**

> **BY TRANSDERMAL APPLICATION USING PATCHES**
> **Adult:** The initial dose should be based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**IMPORTANT SAFETY INFORMATION**

Do not confuse the formulations of transdermal patches which are available as 72-hourly, 96-hourly and 7-day patches, see Prescribing and dispensing information.

**UNLICENSED USE** Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

**INTERACTIONS** Caution with concomitant use of hepatotoxic drugs.

**SIDE-EFFECTS**

**Common or very common** Abdominal pain · agitation · anorexia · anxiety · asthenia · diarrhoea · dyspepsia · dysphonia · fatigue · mild withdrawal symptoms in patients dependent on opioids · paraesthesia · vasodilatation

**Uncommon** Angina (in adults) · cough · depersonalisation · dry eye · dry skin · dysarthria · flattulence · hypertension · hypoaesthesia · hypoxia · impaired memory · influenza-like symptoms · muscle cramp · myalgia · pyrexia · restlessness · rhinitis · rigors · syncope · taste disturbance · tinnitus · tremor · wheezing

**Rare** Diverticulitis (in children) · dysphagia · impaired concentration · paralytic ileus · psychosis

**Very rare** Hiccups · hyperventilation · muscle fasciculation · retching

**Frequency not known** Hepatic necrosis · hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Fever or external heat**

With transdermal use in adults Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).

**Overdose**

The effects of buprenorphine are only partially reversed by naloxone.
**Methadone and buprenorphine for the management of opioid dependence**

**NATIONAL FUNDING/ACCESS DECISIONS**

**PATIENT AND CARER ADVICE**

*With transdermal use in adults*

**BREAST FEEDING**

Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRE-TREATMENT SCREENING**

Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

**MONITORING REQUIREMENTS**

Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

**DIRECTIONS FOR ADMINISTRATION**

- With sublingual use in children. For administration by mouth, tablets may be halved.

**TRANSTEC®**

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and sitting replacement patch on a different area (avoid same area for at least 6 days).

**BUTRANS®**

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and sitting replacement patch on a different area (avoid same area for at least 7 days).

**HAPOCTASIN®**

Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and sitting replacement patch on a different area (avoid same area for at least 3 weeks).

**PRESCRIBING AND DISPENSING INFORMATION**

- With transdermal use in adults. Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.

Transdermal patches are available as 72-hourly, 96-hourly and 7-day formulations; prescribers and dispensers must ensure that the correct preparation is prescribed and dispensed. Preparations that should be applied up to every 72 hours include **Hapoctasin®**. Preparations that should be applied up to every 96 hours include **Transtec®**. Preparations that should be applied up to every 7 days include **BuTrans®**.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer buprenorphine transdermal patches.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA14

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

[www.nice.org.uk/TA114](http://www.nice.org.uk/TA114)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**

**CAUTIONARY AND ADVISORY LABELS 2, 26**

- **Buprenorphine (Non-proprietary)**

**Co-codamol**

**INDICATIONS AND DOSE**

**Mild to moderate pain (using co-codamol 8/500 preparations only)**
- **BY MOUTH**
  - Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

**Mild to moderate pain (using co-codamol 15/500 preparations only)**
- **BY MOUTH**
  - Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

**Severe pain (using co-codamol 30/500 preparations only)**
- **BY MOUTH**
  - Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

**KAPAKE® 15/500**
- **Mild to moderate pain**
  - **BY MOUTH**
    - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**SOLPADOL® CAPLETS**
- **Severe pain**
  - **BY MOUTH**
    - Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**SOLPADOL® CAPSULES**
- **Severe pain**
  - **BY MOUTH**
    - Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

**SOLPADOL® EFFERVESCENT TABLETS**
- **Severe pain**
  - **BY MOUTH USING EFFERVESCENT TABLETS**
    - Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

**CONTRA-INDICATIONS**
- Acute ulcerative colitis · antibiotic-associated colitis · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

**CAUTIONS**
- Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatocellular insufficiency

**CAUTIONS, FURTHER INFORMATION**
- Variation in metabolism · The capacity to metabolise codeine to morphine can vary considerably between individuals · there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

**INTERACTIONS**
- Appendix 1 (paracetamol).

**SIDE-EFFECTS**
- Abdominal pain · anorexia · blood disorders · depression (with larger doses) · hypothermia · leucopenia · malaise · muscle fasciculation · neutropenia · pancreatitis · seizures · thrombocytopenia

**Overdose**
- Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING**
- Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**HEPATIC IMPAIRMENT**
- Dose-related toxicity with paracetamol—avoid large doses.

**RENAL IMPAIRMENT**
- Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION**
- Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x:y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

  When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

  The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa.

**LESS SUITABLE FOR PRESCRIBING**
- Co-codamol is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY**
- Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 2 (does not apply to the 8/500 tablet), 29, 30

  - **Co-codamol (Non-proprietary)**
    - Codeine phosphate 8 mg, Paracetamol 500 mg Co-codamol 8mg/500mg tablets | 32 tablet £1.02 | Co-codamol 8mg/500mg tablets | 100 tablet £2.36
    - £4.43 | Co-codamol 8mg/500mg tablets | 1000 tablet £13.15 | Co-codamol 8mg/500mg tablets | 10000 tablet £30.30
    - Codeine phosphate 15 mg, Paracetamol 500 mg Co-codamol 15mg/500mg tablets | 100 tablet £15.00
    - £4.58

    - £4.03
    - Co-codamol 30mg/500mg tablets | 30 tablet £1.21
    - £1.21
    - Co-codamol 30mg/500mg tablets | 100 tablet £7.52 | £4.03
### Codeine phosphate

#### INDICATIONS AND DOSE

**Acute diarrhoea**
- **BY MOUTH**
  - Child 12–17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day
  - Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

**Mild to moderate pain**
- **BY MOUTH**
  - Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day
  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 30–60 mg every 4 hours if required

**Short-term treatment of acute moderate pain**
- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION**
  - Child 12–17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

**Dry or painful cough**
- **BY MOUTH USING LINCTUS**
  - Adult: 15–30 mg 3–4 times a day

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (JULY 2013)** CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:
- in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
- codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
- codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
- codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
- codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk
- parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, ‘pin-point’ pupils, nausea, vomiting)

**MHRA/CHM ADVICE (APRIL 2015)** CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contra-indicated in:
- children younger than 12 years old
patients of any age known to be CYP2D6 ultra-rapid metabolisers
breastfeeding mothers

CONTRA-INDICATIONS  Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

CAUTIONS  Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

SIDE-EFFECTS  Abdominal pain - anorexia - antidiuretic effect - hypothermia - malaise - muscle fasciculation - pancreatitis - seizures

BREAST FEEDING  Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

RENAI IMPAIRMENT  Avoid use or reduce dose; opioid effects increased and prolonged, and increased cerebral sensitivity occurs.

PRESCRIBING AND DISPENSING INFORMATION  BP directs

INDICATIONS AND DOSE  Mild to moderate pain (using co-dydramol 10/500 preparations only)

BY MOUTH

Adult: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using co-dydramol 20/500 preparations only)

BY MOUTH

Adult: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using co-dydramol 30/500 preparations only)

BY MOUTH

Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

DOSE EQUIVALENT AND CONVERSION  A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

CAUTIONS  Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency - pancreatitis - severe cor pulmonale

INTERACTIONS  → Appendix 1 (paracetamol).

Overdose  Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

CAUTIONS  Alcohol dependence - before administering, check whether paracetamol is prescribed; Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled ‘Diabetic Codeine Linctus’, shall be dispensed or supplied.

PATIENT AND CARER ADVICE  Medicines for Children leaflet: Codeine phosphate for pain  www.medicinesforchildren.org.uk/codeine-phosphate-pain-0

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Co-dydramol (Non-proprietary)

| Dihydrocodeine tartrate 10 mg, Paracetamol 500 mg | Co-dydramol 10mg/500mg tablets | 30 tablet [P] | £1.01  CDS | 100 tablet [P] | £3.37  DT price = £3.37  CDS | 500 tablet [P] | £16.85  CDS |
Diamorphine hydrochloride (Heroin hydrochloride)

**INDICATIONS AND DOSE**

**Acute pain**
- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: 5 mg every 4 hours if required
  - BY SLOW INTRAVENOUS INJECTION
  - Adult: 1.25–2.5 mg every 4 hours if required

**Acute pain (heavier, well-muscled patients)**
- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: Up to 10 mg every 4 hours if required
  - BY SLOW INTRAVENOUS INJECTION
  - Adult: 2.5–5 mg every 4 hours if required

**Chronic pain not currently treated with a strong opioid analgesic**
- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
  - BY SUBCUTANEOUS INFUSION
  - Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

**Acute pulmonary oedema**
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

**Myocardial infarction**
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
  - Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Myocardial infarction (frail patients)**
- BY SLOW INTRAVENOUS INJECTION
  - Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**CONTRA-INDICATIONS**
- Delayed gastric emptying
- Phaeochromocytoma

**CAUTIONS**
- CNS depression
- Severe cor pulmonale
- Severe diarrhoea
- Toxic psychosis

**SIDE-EFFECTS**
- Anorexia
- Asthenia
- Myocardial infarction
- Raised intracranial pressure
- Syncope
- Taste disturbance

**BREAST FEEDING**
- Therapeutic doses unlikely to affect anorexia
- Effects increased and prolonged; increased cerebral sensitivity

**RENAL IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity

**MEDI-cal forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Powder for solution for injection**
- Diamorphine hydrochloride (Non-proprietary)
  - Diamorphine hydrochloride 5 mg: Diamorphine 5mg powder for solution for injection vials | 5 vial | £12.00–£15.00 (C02)
  - Diamorphine 5mg powder for solution for injection ampoules | 5 ampoule | £11.36 DT price = £11.36 (C02)

  - Diamorphine hydrochloride 10 mg: Diamorphine 10mg powder for solution for injection ampoules | 5 ampoule | £16.56 DT price = £13.72 (C02)
  - Diamorphine 10mg powder for solution for injection vials | 5 vial | £12.49–£19.00 (C02)

**Dihydrocodeine tartrate**

**INDICATIONS AND DOSE**

**Moderate to severe pain**
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12–17 years: 30 mg every 4–6 hours
  - Adult: 30 mg every 4–6 hours as required

  - BY DEEP SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Adult: Up to 50 mg every 4–6 hours if required

**Chronic severe pain**
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12–17 years: 60–120 mg every 12 hours
  - Adult: 60–120 mg every 12 hours

**DF118 FORTE**
- Severe pain
  - BY MOUTH
  - Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
  - Adult: 40–80 mg 3 times a day; maximum 240 mg per day

**UNLICENSED USE**
- Most preparations not licensed for use in children under 4 years.

**CAUTIONS**
- Pancreatitis
- Severe cor pulmonale

**SIDE-EFFECTS**
- Abdominal pain
- Diarrhoea
- Parasthesia
- Paralytic ileus
- Seizures

**BREAST FEEDING**
- Use only if potential benefit outweighs risk.

**RENA1 IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PROFESSIONAL INFORMATION**
- Dental practitioners’ formulary

**MEDI-cal forms**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**
- Dihydrocodeine tartrate (Non-proprietary)
  - Dihydrocodeine tartrate 30 mg: Dihydrocodeine 30mg tablets | 28 tablet | £1.33 DT price = £1.15 (C05) | 30 tablet | £1.56 (C05)
  - 100 tablet | £4.75 DT price = £4.11 (C05) | 500 tablet | £20.89 (C05)

  - DF 118 (Martindale Pharmaceuticals Ltd)
  - Dihydrocodeine tartarate 40 mg: DF 118 Forte 40mg tablets | 100 tablet | £9.78 DT price = £9.78 (C05)

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 2**
- DHC Continus (Napp Pharmaceuticals Ltd)
  - Dihydrocodeine tartrate 60 mg: DHC Continus 60mg tablets | 56 tablet | £5.20 DT price = £5.20 (C05)
  - Dihydrocodeine tartrate 90 mg: DHC Continus 90mg tablets | 56 tablet | £8.66 DT price = £8.66 (C05)
Dihydrocodeine tartrate 120 mg  DHC Continus 120mg tablets  |  56 tablet  

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 2

- **Dihydrocodeine tartrate (Non-proprietary)**
- **Dihydrocodeine tartrate 2 mg per 1 ml** Dihydrocodeine 10mg/5ml oral solution  |  150 ml  

**Solution for injection**

- **Dihydrocodeine tartrate (Non-proprietary)**
- **Dihydrocodeine tartrate 50 mg per 1 ml** Dihydrocodeine 50mg/1ml solution for injection ampoules  |  10 ampoule  

**INDICATIONS AND DOSE**

**Adult:** Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- **CAUTIONS**  Diabetes mellitus  •  palliative care (not recommended)  •  phaeochromocytoma
- **SIDE-EFFECTS**  Psychosis  •  raised intracranial pressure  •  restlessness
- **BREAST FEEDING**  No information available.
- **RENAL IMPAIRMENT**  Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Dipipanone hydrochloride with cyclizine (Non-proprietary)**
- **Dipipanone hydrochloride 10 mg**, Cyclizine hydrochloride 30 mg  Dipipanone 10mg / Cyclizine 30mg tablets  |  50 tablet  

**Fentanyl**

**INDICATIONS AND DOSE**

**Chronic intractable pain not currently treated with a strong opioid analgesic**

- **BY TRANSDERMAL APPLICATION**
  - **Child 2-17 years:** Initially based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under **Chronic intractable pain not currently treated with a strong opioid analgesic**, for conversion from long term oral morphine to transdermal fentanyl, see **Pain management with opioids**  p. 22.
  - **Adult:** Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see **Chronic intractable pain not currently treated with a strong opioid analgesic**, for conversion from long term oral morphine to transdermal fentanyl, see **Pain management with opioids**  p. 22.

**Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation**

- **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** Initially 50–100 micrograms (max. per dose 200 micrograms), dexametadon specialist advice, then 25–50 micrograms as required

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

- **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** Initially 300–3500 micrograms, then 100–200 micrograms as required

**Assisted ventilation: analgesia and respiratory depression in intensive care**

- **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** Initially 300–3500 micrograms, then 100–200 micrograms as required

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

- **BY BUCAL ADMINISTRATION USING LOZENGES**
  - **Child 16-17 years:** Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain at least 15 minutes each day, adjust background analgesia
  - **Adult:** Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 12 hours or more for the plasma-fentanyl concentration to decrease by 50%— replacement opioid therapy should be initiated at a low dose and increased gradually)
required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

BY INTRANASAL ADMINISTRATION
Adult: Fentanyl preparations for the treatment of breakthrough pain in patients receiving opioid therapy are not bioequivalent to other fentanyl preparations. Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSE EQUIVALENCE AND CONVERSION
- Fentanyl films are not bioequivalent to other fentanyl preparations.
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

ABSTRAL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY MOUTH USING SUBLINGUAL TABLETS
- Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

EFFENTORA®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY MOUTH USING SUBLINGUAL TABLETS
- Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 133 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

INSTANYL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY INTRANASAL ADMINISTRATION
- Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

PECFENT®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY INTRANASAL ADMINISTRATION
- Adult: Initially 200 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

RECVIT® SUBLINGUAL TABLETS
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
- BY MOUTH
- Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units, 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day, adjust background analgesia; maximum 4 doses per day

DOSE EQUIVALENCE AND CONVERSION
- Fentanyl preparations for the treatment of breakthrough pain are not bioequivalent; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

CAUTIONS
GENERAL CAUTIONS
Cerebral tumour - diabetes mellitus (with Actiq® lozenges) - impaired consciousness

SPECIFIC CAUTIONS
- With buccal use Mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)

CAUTIONS, FURTHER INFORMATION
- With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
- With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Common or very common Abdominal pain - aesthesia - anorexia - anxiety - appetite changes - application-site reactions - diarrhoea - dysgeusia - dysphonia - gastrooesophageal reflux disease - hypertension - myoclonus - paraesthesia - pharyngitis - rhinitis - stomatitis - tremor - vasodilation
- Rare Hiccups
- Very rare Appnoea - arrhythmia - ataxia - bladder pain - delusions - haemoptysis

SPECIFIC SIDE-EFFECTS
- Common or very common With intravenous use Myoclonic movements
- Uncommon With intravenous use Laryngospasm
- Rare With intravenous use Asystole - insomnia
**SIDE-EFFECTS, FURTHER INFORMATION**

- **Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

- **Muscle rigidity** Intravenous administration of fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **BREAST FEEDING** Monitor infant for opioid-induced side-effects.

- **RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use For patches, apply to dry, non-irritated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).

- With intravenous use in adults For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.

- With buccal use in adults For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.

- With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

**INSTANYL®** Patient should sit or stand during administration.

**EFFENTORA®** Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

**PRESCRIBING AND DISPENSING INFORMATION**

- With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write 'Fentanyl 25 patches' to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

**PATIENT AND CARER ADVICE**

- **Medicines for Children leaflet:** Fentanyl lozenges for pain www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain

- **Medicines for Children leaflet:** Fentanyl patches for pain www.medicinesforchildren.org.uk/fentanyl-patches-for-pain

- With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdosage. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

- In adults Patients or carers should be given advice on how to administer fentanyl nasal spray. Patients or carers should be given advice on how to administer Instanyl® spray.

**INSTANYL®** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer Instanyl® spray.

**PECFENT®** Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer PecFent® spray.

**EFFENTORA®** Patients or carers should be given advice on how to administer Effentora® buccal tablets. Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**ABSTRAL®** Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**RECVIT® SUBLINGUAL TABLETS** Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**NATIONAL FUNDING/ACCESS DECISIONS**

**INSTANYL®**

**Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**PECFENT®**

**Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (September 2008) that PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**EFFENTORA®**

**Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised that Effentora® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**ABSTRAL®**

**Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (January 2009) that Abstral® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**MEDIACIAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Hydromorphone hydrochloride

- **INDICATIONS AND DOSE**
  - **Severe pain in cancer**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Child 12–17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
    - Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Child 12–17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
    - Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

- **CONTRA-INDICATIONS** Acute abdomen
- **CAUTIONS** Pancreatitis, toxic psychosis
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • anorexia • anxiety
  - **Uncommon** Agitation • diarrhoea • dysgeusia • dyskinesia • myoclonus • paraesthesia • paralytic ileus • peripheral oedema • seizures • tremor
- **BREAST FEEDING** Avoid—no information available.
- **RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **DIRECTIONS FOR ADMINISTRATION** For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Capsole

**CAUTIONARY AND ADVISORY LABELS**

- **Palladone (Napp Pharmaceuticals Ltd)**
  - Hydromorphone hydrochloride 1.3 mg Palladone 1.3mg capsules
    - 56 capsule (Pom) £8.82 (C02)
  - Hydromorphone hydrochloride 2.6 mg Palladone 2.6mg capsules
    - 56 capsule (Pom) £17.64 (C02)

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS**

- **Palladone SR (Napp Pharmaceuticals Ltd)**
  - Hydromorphone hydrochloride 2 mg Palladone SR 2mg capsules
    - 56 capsule (Pom) £20.98 (C02)
  - Hydromorphone hydrochloride 4 mg Palladone SR 4mg capsules
    - 56 capsule (Pom) £28.75 (C02)
  - Hydromorphone hydrochloride 8 mg Palladone SR 8mg capsules
    - 56 capsule (Pom) £56.08 (C02)
  - Hydromorphone hydrochloride 16 mg Palladone SR 16mg capsules
    - 56 capsule (Pom) £106.53 (C02)
  - Hydromorphone hydrochloride 24 mg Palladone SR 24mg capsules
    - 56 capsule (Pom) £159.82 (C02)
● INDICATIONS AND DOSE

Pain

BY SUBCUTANEOUS INJECTION

Adult: Initially 50–100 micrograms/kg every 6 hours, adjusted according to response

Child 1–5 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response

Child 6 months–1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response

Child 2–11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response

Child 12–17 years: Initially 200–300 micrograms/kg every 4 hours, adjusted according to response

BY INTRAMUSCULAR INJECTION

Adult: Initially 50–200 micrograms/kg every 4 hours, adjusted according to response

Child 1–2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response

Child 3–5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response

Child 6–11 months: 200 micrograms/kg every 4 hours, adjusted according to response

Child 1 year: 200–300 micrograms/kg every 4 hours, adjusted according to response

Child 2–11 years: 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response

Child 12–17 years: Initially 5–10 mg every 4 hours, adjusted according to response

Opioid requirements should be reviewed if the brand is altered.

Pain with modified-release 24-hourly preparations

BY MOUTH, USING MODIFIED-RELEASE MEDICINES

Adult: Every 24 hours, dose adjusted according to daily morphine requirements. Dosage requirements should be reviewed if the brand is altered.

Pain management in palliative care (starting dose for opioid-naïve patients)

BY MOUTH

Adult: 20–30 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids p. 22.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

BY MOUTH

Adult: 40–60 mg daily in divided doses, using immediate-release preparation 4-hourly or a 12-hourly modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids p. 22. continued →
Pain in palliative care (following initial titration)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Usual dose 30 mg every 4 hours; up to 200 mg every 4 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see Pain management with opioids p. 22.

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Usual dose 100 mg every 12 hours; up to 600 mg every 12 hours, higher dose may be required for some patients (occasionally more is needed); for management of breakthrough pain and other general advice, see Pain management with opioids p. 22.

Cough in terminal disease

- **BY MOUTH**
  - Adult: Initially 5 mg every 4 hours

Premedication

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

Patient controlled analgesia (PCA)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

Myocardial infarction

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
  - Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
  - Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Dyspnoea at rest in palliative care

- **BY MOUTH**
  - Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

DOSAGE EQUVALENCE AND CONVERSION

- The doses stated refer equally to morphine hydrochloride and sulfate.

**UNLICENSSED USE**

  - With rectal use in children Suppositories are not licensed for use in children.

**CONTRA-INDICATIONS** Acute abdomen - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS** Cardiac arrhythmias - pancreatitis - severe cor pulmonale

**BREAST FEEDING** Therapeutic doses unlikely to affect infant.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For *continuous intravenous infusion*, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With oral use For *modified release capsules*—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION**

- Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include Filnarine® SR, MST Continus®, Morphgesic® SR and Zomorph®. Prescriptions must specify the ‘form’.

- With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**Palliative care**

- In adults For further information on the use of morphine in palliative care, see www.palliativedrugs.com/formulary/en/morphine.html.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

- With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules.

**EXCEPTIONS TO LEGAL CATEGORY**

Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

- Morphine hydrochloride 5 mg
- Chloroform water to 5 mL

**MEdICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

**Tablet**

CAUTIONARY AND ADVISORY LABELS

- **Sevredol** (Napp Pharmaceuticals Ltd)
  - Morphine sulfate 10 mg Sevredol 10 mg tablets | 56 tablet POM £5.31 DT price = £5.31 CD
  - Morphine sulfate 20 mg Sevredol 20 mg tablets | 56 tablet POM £10.61 DT price = £10.61 CD
  - Morphine sulfate 50 mg Sevredol 50 mg tablets | 56 tablet POM £28.02 DT price = £28.02 CD

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS

- **MST Continus** (Napp Pharmaceuticals Ltd)
  - Morphine sulfate 5 mg MST Continus 5 mg tablets | 60 tablet POM £3.29 DT price = £3.29 CD
  - Morphine sulfate 10 mg MST Continus 10 mg tablets | 60 tablet POM £5.20 DT price = £5.20 CD
  - Morphine sulfate 15 mg MST Continus 15 mg tablets | 60 tablet POM £9.10 DT price = £9.10 CD
  - Morphine sulfate 20 mg MST Continus 20 mg tablets | 60 tablet POM £12.47 DT price = £12.47 CD
  - Morphine sulfate 60 mg MST Continus 60 mg tablets | 60 tablet POM £24.32 DT price = £24.32 CD
  - Morphine sulfate 100 mg MST Continus 100 mg tablets | 60 tablet POM £38.50 DT price = £38.50 CD
  - Morphine sulfate 200 mg MST Continus 200 mg tablets | 60 tablet POM £81.34 DT price = £81.34 CD
**Morphine with cyclizine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 429, cyclizine p. 401.

### INDICATIONS AND DOSE

#### CYCLIMORPH-10®

**Moderate to severe pain (short-term use only)**

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- **Adult:** 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

#### CYCLIMORPH-15®

**Moderate to severe pain (short-term use only)**

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- **Adult:** 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

### CAUTIONS

Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### Morphine (Non-proprietary)

| Morphine sulfate 1 mg per 1 mL | Morphine sulfate 5mg/5mL solution for injection ampoules | 10 ampoule (PoM) £135.50 (CD2) |
| Morphine sulfate 3 mg per 1 mL | Morphine sulfate 1mg/1mL solution for injection ampoules | 10 ampoule (PoM) £61.10 (CD2) |
| Morphine sulfate 10 mg per 1 mL | Morphine sulfate 10mg/10ml solution for injection ampoules | 10 ampoule (PoM) £15.00-38.00 (CD2) |
| Morphine sulfate 20 mg per 1 mL | Morphine sulfate 10mg/10ml solution for injection ampoules | 10 ampoule (PoM) £9.36 DT price = £9.36 (CD2) |
| Morphine sulfate 25 mg per 1 mL | Morphine sulfate 15mg/1ml solution for injection ampoules | 10 ampoule (PoM) £8.95 DT price = £8.95 (CD2) |
| Morphine sulfate 30 mg per 1 mL | Morphine sulfate 20mg/1ml solution for injection ampoules | 10 ampoule (PoM) £51.69 (CD2) |

### Oxycodeone hydrochloride

#### INDICATIONS AND DOSE

**Postoperative pain | Severe pain | Moderate to severe pain in palliative care**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - **Adult:** Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Adult:** Initially 10 mg every 12 hours (max. per dose 200 mg every 12 hours), dose to be increased if necessary according to severity of pain, some patients might require higher doses than the maximum daily dose

CONTRA-INDICATIONS Acute abdomen · chronic constipation · cor pulmonale · delayed gastric emptying

CAUTIONS Pancreatitis · toxicty psychosis

SIDE-EFFECTS

Common or very common Abdominal pain · anoxemia · anxiety · asthenia · bronchospasm · chills · diarrhoea · dyspepsia · dysphoae · impaired cough reflex

Uncommon Agitation · amnorrhoea · amnesia · belching · cholestasis · dehydration · disorientation · dry skin · dysphagia · flatulence · gastritis · hiccups · hypoaesthesia · hypotonia · malaise · muscle fasciculation · paraesthesia · paralytic ileus · pyrexia · restlessness · seizures · speech disorder · supraventricular tachycardia · syncope · taste disturbance · thirst · tremor · vasodilatation

BREAST FEEDING Present in milk—avoid.

HEPATIC IMPAIRMENT Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.

RENAL IMPAIRMENT Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment. Opioid effects increased and prolonged and increased cerebral sensitivity occurs. Avoid if eGFR less than 10 mL/min/1.73 m².

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Oxynorm®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

PRESCRIBING AND DISPENSING INFORMATION

Palliative care

For further information on the use of oxycodone in palliative care, see www.palliativedrugs.com/formulary/en/oxycodone.html.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2004 and November 2010) that OxNorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for infusion

Modified-release tablet

OXOCODONE HYDROCHLORIDE (Non-proprietary)

Oxycodone with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, oxycodone hydrochloride p. 431, naloxone hydrochloride p. 1214.

- INDICATIONS AND DOSE
  - Severe pain requiring opioid analgesia in patients not currently treated with opioid analgesics
    - BY MOUTH
    - Adult: Initially 10/5 mg every 12 hours (max. per dose 40/20 mg every 12 hours), dose to be increased according to response; patients already receiving opioid analgesics can start with a higher dose
    - Second-line treatment of symptomatic severe to very severe idiopathic restless legs syndrome after failure of dopaminergic therapy
    - BY MOUTH
    - Adult: Initially 5/2.5 mg every 12 hours, adjusted weekly according to response, usual dose 10/5 mg every 12 hours; maximum 60/30 mg per day
  - DOSE EQUIVALENCE AND CONVERSION
    - Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of oxycodone and naloxone respectively.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Modified-release tablets
    - CAUTIONARY AND ADVISORY LABELS. 2
    - Targan (Napp Pharmaceuticals Ltd)

**Papaveretum**

- **INDICATIONS AND DOSE**
  - Postoperative analgesia | Severe chronic pain
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 7.7–15.4 mg every 4 hours if required
  - Elderly: Initially 7.7 mg every 4 hours if required
  - **BY INTRAVENOUS INJECTION**
  - Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

**Premedication**
- **BY INTRAVENOUS INJECTION**
- Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

**IMPORTANT SAFETY INFORMATION**
Do not confuse with papaverine.

- **CONTRA-INDICATIONS** Heart failure secondary to chronic lung disease • phaeochromocytoma
- **CAUTIONS** Supraventricular tachycardia
- **SIDE-EFFECTS** Hypothermia
- **BREAST FEEDING** Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** The name Omnopon® was formerly used for papaveretum preparations.
- Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.
- **LESS SUITABLE FOR PRESCRIBING** Papaveretum is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 2, 21
    - **Pentazocine (Non-proprietary)**
      - Pentazocine hydrochloride 25 mg | 28 tablet [PO] £24.27 DT price = £24.27 [CD3]
    - **Capsule**
      - **CAUTIONARY AND ADVISORY LABELS** 2, 21
      - **Pentazocine (Non-proprietary)**
        - Pentazocine hydrochloride 50 mg | 28 capsule [PO] £28.50 DT price = £28.50 [CD3]
    - **Solution for injection**
      - **Pentazocine (Non-proprietary)**
        - Pentazocine (as Pentazocine lactate) 30 mg per 1 ml | Pentazocine 60mg/2ml solution for injection ampoules | 10 ampoule [PO] £32.14 DT price = £32.14 [CD3]

**Pentazocine**

- **INDICATIONS AND DOSE**
  - Moderate to severe pain
    - **BY MOUTH**
      - Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day
  - Moderate pain
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 30 mg every 3–4 hours as required; maximum 360 mg per day
  - Severe pain
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 • heart failure secondary to chronic lung disease • patients dependent on opioids (can precipitate withdrawal)

- **CAUTIONS** Arterial hypertension • cardiac arrhythmias • myocardial infarction • pancreatitis • phaeochromocytoma • pulmonary hypertension
- **SIDE-EFFECTS** Abdominal pain • blood disorders • chills • disorientation • hypertension • hypothermia • myalgia • paraesthesia • raised intracranial pressure • seizures • syncope • toxic epidermal necrolysis • tremor
- **Overdose** Effects only partially reversed by naloxone.
- **BREAST FEEDING** Use with caution—limited information available.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **LESS SUITABLE FOR PRESCRIBING** Pentazocine is less suitable for prescribing.

**Pethidine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Acute pain**
    - **BY MOUTH**
      - Adult: 50–150 mg every 4 hours
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients
      - Elderly: Initially 25 mg, then 25–100 mg after 4 hours
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients
      - Elderly: Initially 25 mg, then 25–50 mg after 4 hours
  - **Obstetric analgesia**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day
  - **Premedication**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients
      - Elderly: 25 mg, dose to be given 1 hour before operation
Postoperative pain
▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
▶ Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients
▶ Elderly: Initially 25 mg every 2–3 hours if required

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Accumulation of metabolites may result in neurotoxicity - cardiac arrhythmias - not suitable for severe continuing pain - severe cor pulmonale
- **SIDE-EFFECTS** Hypothermia - restlessness - tremor
- **OVERDOSE** Convulsions reported in overdosage.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection

**Tablet**
- **Pethidine hydrochloride** (Non-proprietary)
  - Pethidine hydrochloride 50 mg

**Solution for injection**
- **Pethidine hydrochloride** (Non-proprietary)
  - Pethidine hydrochloride 10 mg per 1 ml

**INSTRUCTIONS FOR USE**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

**Severe chronic pain**
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
▶ Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

**SIDE-EFFECTS** Abdominal discomfort - anxiety - ataxia - decreased appetite - diarrhoea - dysarthria - dyspepsia - hypoaesthesia - malaise - muscle spasms - paraesthesia - seizures - tremor - weight loss

**BREAST FEEDING** Avoid - no information available.

**HEPATIC IMPAIRMENT** For immediate-release tablets, initial max. daily dose 150 mg; for modified-release tablets, initial max. daily dose 50 mg.

**RENAL IMPAIRMENT** Manufacturer advises no dose adjustment needed in mild or moderate impairment. Avoid in severe impairment; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (May 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

**MEDICINAL FORMS**

**INDICATIONS AND DOSE**

**Moderate to severe pain**
▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
▶ Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

**Moderate to severe acute pain**
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours
▶ Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; Usual maximum 400 mg/24 hours

**Moderate to severe chronic pain**
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 12–17 years: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours
▶ Adult: Initially 50 mg, then, adjusted according to response; Usual maximum 400 mg/24 hours

**Postoperative pain**
▶ BY INTRAVENOUS INJECTION
▶ Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day
DIRECTIONS FOR ADMINISTRATION

- **HEPATIC IMPAIRMENT**
- **BREAST FEEDING**

Rare

- **Embryotoxic in**
- **speech disorders**
- **hypertension**
- **bronchospasm**
- **Abnormal coordination**
- **Diarrhoea**

Excessive bronchial secretions

**Child 12-17 years**: Initially 100–150 mg once daily; increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**Adult**: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**ZYDOL® XL**

Moderate to severe pain

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Child 12-17 years**: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours
  - **Adult**: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily, doses exceeding the usual maximum not generally required; Usual maximum 400 mg/24 hours

**Moderate to severe pain (with modified-release 24-hour preparations)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - **Child 12-17 years**: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours
  - **Adult**: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; Usual maximum 400 mg/24 hours

**ZYDOL® XL**

Moderate to severe pain

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - **Child 12-17 years**: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
  - **Adult**: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

IMMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

- **CONTRA-INDICATIONS** Acute intoxication with alcohol • acute intoxication with analgesics • acute intoxication with hypnotics • acute intoxication with opioids • not suitable for narcotic withdrawal treatment • uncontrolled epilepsy

- **CAUTIONS** Excessive bronchial secretions • history of epilepsy—use tramadol only if compelling reasons • impaired consciousness • not suitable as a substitute in opioid-dependent patients • not suitable in some types of general anaesthesia • susceptibility to seizures—use tramadol only if compelling reasons

CAUTIONS, FURTHER INFORMATION

- **General anaesthesia** Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

- **SIDE-EFFECTS**
  - **Common or very common** Malaise
  - **Uncommon** Diarrhoea • flatulence • gastritis • retching
  - **Rare** Abnormal coordination • anorexia • anxiety • bronchospasm • changes in appetite • delirium • dypsnoea • hypertension • muscle weakness • nightmares • paraesthesia • seizures • syncope • tremor • wheezing
  - **Frequency not known** Blood disorders • hypoglycaemia • speech disorders

- **PREGNANCY** Embryotoxic in animal studies—manufacturers advise avoid.

- **BREAST FEEDING** Amount probably too small to be harmful, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Caution (avoid for oral drops) in severe impairment.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing—check individual preparations.

- **For intravenous infusion**, dilute in Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include Invodol® SR, Mabron®, Maneo®, Marol®, Maxitran®, SR, Oldaram®, Tilodol® SR, Tramquel® SR, Tramulief® SR, Zamadol® SR, Zeridame® SR and Zydol SR®. Preparations that should be given 24-hourly include Tradacril® SR, Zamadol® 24hr, and Zydol XL®.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

| Manufacturers include: oral suspension |

### 6.1 Headache

Other drugs used for Headache

- Clonidine hydrochloride, p. 136
- Sumatriptan, p. 444
- Verapamil hydrochloride, p. 155
Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin p. 114, paracetamol p. 414 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist (‘triptan’). Ergot alkaloids are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, decreasing consumption of these medicines needs careful management.

Analgesics
Most migraine headaches respond to analgesics such as aspirin or paracetamol but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 440 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 992, flurbiprofen p. 998, and ibuprofen p. 999 are also licensed for use in migraine.

5HT1-receptor agonists
A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1-receptor agonists (‘triptans’) act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT1B/1D-receptor agonists. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

The 5HT1-receptor agonists available for treating migraine are almogreltriptan p. 441, eleetrotriptan p. 442, frovatriptan p. 442, naratriptan p. 443, rizatriptan p. 443, sumatriptan p. 444, and zolmitriptan p. 445. If a patient does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids
The value of ergotamine tartrate p. 441 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine tartrate should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

Antiemetics
Antiemetics, such as metoclopramide hydrochloride p. 403 or domperidone p. 402, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.
**Prophylaxis of migraine**

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction.

The beta-blockers propranolol hydrochloride p. 142, atenolol p. 143, metoprolol tartrate p. 145, nadolol p. 141, and timolol maleate p. 142 are all effective. Propranolol hydrochloride is the most commonly used.

Tricyclic antidepressants [unlicensed indication], valproic acid p. 331 [unlicensed indication], and gabapentin p. 295 [unlicensed indication] are also effective for preventing migraine.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

**Cluster headache and the trigeminal autonomic cephalalgias**

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 155 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 622 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride during verapamil titration.

Ergotamine tartrate, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 1001), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

### Other drugs used for Migraine

- Amitriptyline hydrochloride, p. 349
- Botulinum toxin type A, p. 380
- Clonidine hydrochloride, p. 136
- Trifluoperazine, p. 366

### ANALGESICS > NON-OPIOID

#### Paracetamol with isometheptene

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414.

**INDICATIONS AND DOSE**

**Treatment of acute attacks of migraine**

- **BY MOUTH**
  - Adult: 2 capsules, dose to be taken at onset of attack, followed by 1 capsule every 1 hour if required, maximum of 5 capsules in 12 hours

**PATIENT AND CARER ADVICE**

Patient counselling is advised (dosage).

**LESS SUITABLE FOR PRESCRIBING**

Isometheptene with paracetamol is less suitable for prescribing (more effective treatments available).

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

#### Paracetamol with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414, metoclopramide hydrochloride p. 403.

**INDICATIONS AND DOSE**

**Acute migraine**

- **BY MOUTH USING TABLETS**
  - Adult: 2 tablets, to be taken at the onset of attack, followed by 2 tablets every 4 hours if required; maximum 6 tablets per day
  - **BY MOUTH USING EFFERVESCENT POWDER SACHETS**
    - Adult: 2 sachets, to be taken at the onset of attack, followed by 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

**IMPORTANT SAFETY INFORMATION**

Metoclopramide can cause severe extrapyramidal effects, particularly in young adults.

**CAUTIONS**

Treatment should not exceed 3 months due to risk of tardive dyskinesia.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

ANALGESICS > NON-STERoidal ANTI-INFLAMMATORY DRUGS

Aspirin with metoclopramide

The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 114, metoclopramide hydrochloride p. 403.

INDICATIONS AND DOSE

Acute migraine

Adult: 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day

IMPORTANT SAFETY INFORMATION

Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults.

CAUTIONS

Treatment should not exceed 3 months due to risk of tardive dyskinesia

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral powder formulations may include lemon.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

CAUTIONARY AND ADVISORY LABELS 13, 21, 32

EXCIPIENTS: May contain Aspartame

Metoclopramide hydrochloride 10 mg, Aspirin DL-Lysine

900 mg MigraMax oral powder sachets sugar-free | 6 sachet POM

DT price = £6.61

Tolfenamic acid

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required

CONTRA-INDICATIONS

Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal haemorrhage (two or more distinct episodes) • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

CAUTIONS

Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

INTER ACTIONS → Appendix 1 (NSAIDs).

SIDE-EFFECTS

Rare: Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis

Frequency not known: Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • confusion • Crohn's disease (induction of or exacerbation of) • depression • diarrhea • dizziness • drowsiness • dysuria (most commonly in men) • euphoria • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • hallucination • headache • hearing disturbances • hypersensitivity reactions • insomnia • malaise • nausea • nervousness • paraesthesia • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • tremor • vertigo • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects. For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING

Amount too small to be harmful. Use with caution during breast-feeding.

HEPATIC IMPAIRMENT

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT

The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

ANTIHISTAMINES > SEDATING ANTIHISTAMINES

Paracetamol with buclizine hydrochloride and codeine phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 414, codeine phosphate p. 421.

INDICATIONS AND DOSE

MIGRALEVE®

Acute migraine

BY MOUTH

Child 12–14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed
ERGOT ALKALOIDS

Ergotamine tartrate

- **INDICATIONS AND DOSE**
  - **Management of cluster headache**
    - **BY MOUTH USING TABLETS**
    - Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- **UNLICENSED USE** Not licensed for the management of cluster headache.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930 - coronary heart disease - hyperthyroidism - inadequately controlled hypertension - obliterative vascular disease - peripheral vascular disease - Raynaud’s syndrome - spondylosis - severe hypertension - temporal arteritis
- **CAUTIONS** Anaemia - cardiac disease - dependence - elderly - risk of peripheral vasospasm
- **INTERACTIONS** → Appendix 1 (ergot alkaloids).
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - dizziness - nausea - vomiting
  - Uncommon Cyanosis - diarrhoea - hypoaesthesia - pain in extremities - paraesthesia - peripheral vasocnstriction - weakness in extremities
  - Rare Arrhythmias - bradycardia - dyspnoea - ergotism (including absence of pulse and numbness in extremities) - increased blood pressure - intestinal ischaemia - myalgia - rash - tachycardia - urticaria
  - Very rare Gangrene - heart-valve fibrosis - myocardial infarction - myocardial ischaemia
- **Frequency not known** Anxiety - arthralgia - blood disorders - blurred vision - cerebral ischaemia - confusion - constipation - depression - drowsiness - dry mouth - extrapyramidal effects - hallucinations - renal artery spasm - seizures - sleep disturbances - thrombosis - tremor - urinary retention
- **PREGNANCY** Avoid; ocytotic effect on the uterus.
- **BREAST FEEDING** Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment — risk of toxicity increased.

- **RENAL IMPAIRMENT** Avoid; risk of renal vasocnstriction.
- **PATIENT AND CARER ADVICE** Peripheral vasospasm Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.
- **LESS SUITABLE FOR PRESCRIBING** Ergotamine tartrate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. 

**Tablet**

**Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergotamine tartrate above, cyclizine p. 401.

- **INDICATIONS AND DOSE** Treatment of acute migraine and migraine variants unresponsive to analgesics
  - **BY MOUTH**
  - Adult: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

- **PATIENT AND CARER ADVICE** Patient counselling is advised for cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate tablets (dosage).
- **LESS SUITABLE FOR PRESCRIBING** Cyclizine hydrochloride with caffeine hydrate and ergotamine tartrate (Migril®) is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

| CAUTIONARY AND ADVISORY LABELS | 2, 18 |
| Migril (Wockhardt UK Ltd) | Ergotamine tartrate 2 mg, Cyclizine hydrochloride 50 mg, Caffeine hydrate 100 mg |
| Migril tablets | 100 tablet (POM) £1.00 |

**TRIPTANS**

Almotriptan

- **INDICATIONS AND DOSE** Treatment of acute migraine
  - **BY MOUTH**
  - Adult: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 25 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm - ischaemic heart disease - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina - severe hypertension - uncontrolled hypertension
- **CAUTIONS** Conditions which predispose to coronary artery disease - elderly
- **INTERACTIONS** → Appendix 1 (SHT, agonists).
- **SIDE-EFFECTS**
  - Common or very common Drowsiness - transient increase in blood pressure
Uncommon
Bone pain · chest pain · diarrhoea · dry mouth · dyspepsia · headache · myalgia · palpitation · paraesthesia · tinnitus

Very rare
Myocardial infarction · tachycardia

Frequency not known
Dizziness · fatigue · feeling of weakness · flushing · hypertension · ischaemic colitis · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

ALLERGY AND CROSS-SENSITIVITY
Caution in patients with sensitivity to sulfonamides.

PREGNANCY
There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

BREAST FEEDING
Present in milk—avoid breast-feeding for 24 hours.

HEPATIC IMPAIRMENT
Caution in mild to moderate impairment. Avoid in severe impairment.

RENAI IMPAIRMENT
Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Nervous system

**Sumatriptan**

### INDICATIONS AND DOSE

**Treatment of acute migraine**

- **BY MOUTH**
  - Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day
  - **BY INTRANASAL ADMINISTRATION**
  - Adult 18–65 years: Initially 10–20 mg, dose to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

**Treatment of acute cluster headache**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

- **BY INTRANASAL ADMINISTRATION**
  - Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.

- **CONTRA-INDICATIONS** Coronary vasospasm · ischaemic heart disease · mild uncontrolled hypertension · moderate and severe hypertension · peripheral vascular disease · previous cerebrovascular accident · previous myocardial infarction · previous transient ischaemic attack · Prinzmetal’s angina

- **CAUTIONS** Conditions which predispose to coronary artery disease · elderly · history of seizures · mild, controlled hypertension · pre-existing cardiac disease · risk factors for seizures

- **INTERACTIONS** → Appendix 1 (5HT₁ agonists).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
  - **SPECIFIC SIDE-EFFECTS**
  - **INTERACTIONS**
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  - Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

- **PREGNANCY** There is limited experience of using 5HT₁ receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

- **HEPATIC IMPAIRMENT** Reduce oral dose to 25–50 mg. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g. driving).

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With oral use Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Nervous system**

**Patient and carer advice**

Patients or carers should be given advice on how to administer rizatRIPTAN orodispersible tablets and oral lyophilisates.

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. driving).

Lyophilisates should be placed on the tongue and allowed to dissolve.

**SIDE-EFFECTS**

- **COMMON OR VERY COMMON**
  - Fatigue · head nausea · nasal congestion · vomiting · visual disturbances
  - **COMMON**
  - Nausea · visual disturbances · palpitations · chest discomfort 
  - **SUGGESTED SIDE-EFFECTS**
  - An increased blood pressure (safety signal).
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  - Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

- **PREGNANCY** There is limited experience of using 5HT₁ receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

- **HEPATIC IMPAIRMENT** Reduce oral dose to 25–50 mg. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
  - **SPECIFIC SIDE-EFFECTS**
  - **INTERACTIONS**
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  - Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or anaphylaxis).

  - Dizziness · drowsiness · dysphonia · fatigue · flushing · myalgia · nausea · sensory disturbances · transient increase in blood pressure · vomiting · weakness
  - **COMMON**
  - Nausea · visual disturbances · palpitations · Raynaud’s syndrome · seizures · sweating · tachycardia · transient ischaemic ECG changes · tremor · visual disturbances
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  - Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or anaphylaxis).
Zolmitriptan

- **INDICATIONS AND DOSE**

  Treatment of acute migraine

  **BY MOUTH**

  Adult: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs; then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day.

  **BY INTRanasAL ADMINISTRATION**

  Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day.

  **TREATMENT OF ACUTE CLUSTER HEADACHE**

  **BY INTRanasAL ADMINISTRATION**

  Adult: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day.

  **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

  Max. 5 mg in 24 hours with concomitant cimetidine, fluvoxamine, moclobemide, or quinolone antibiotics.

  **DOSE EQUIVALENCe AND CONVERSION**

  1 spray of Zomig™ nasal spray = 5 mg zolmitriptan.

- **UNLICENSED USE** Not licensed for use in elderly. Not licensed for treatment of cluster headaches.

**CONTRA-INDICATIONS** Arrhythmias associated with accessory cardiac conduction pathways - coronary vasospasm - ischaemic heart disease - previous cerebrovascular accident - previous myocardial infarction - Prinzmetal’s angina - severe hypertension - transient ischaemic attack - uncontrolled hypertension - Wolff-Parkinson-White syndrome

- **CAUTIONS** Conditions which predispose to coronary artery disease - elderly - should not be taken within 24 hours of any other 5HT1-receptor agonist

- **INTERACTIONS** → Appendix 1 (5HT1 agonists).

- **SIDE-EFFECTS**

  - **GENERAL SIDE-EFFECTS**
    - Common or very common Abdominal pain - drowsiness - dry mouth - dysphagia - headache - muscle weakness - myalgia - palpitation - paraesthesia
    - Uncommon Polyuria - tachycardia - transient increase in blood pressure
    - Rare: Urticaria
    - Very rare Angina - gastrointestinal infarction - ischaemic colitis - myocardial infarction - splenic infarction
    - Frequency not known Dizziness - fatigue - feeling of weakness - flushing

  **SPECIFIC SIDE-EFFECTS**

  - With intranasal use Epistaxis - taste disturbance

  **SIDE-EFFECTS, FURTHER INFORMATION**

  Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **PREGNANCY**

  There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING**

  Use with caution—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**

  Max. 5 mg in 24 hours in moderate or severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**

  Zolmitriptan orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed.

- **PATIENT AND CARER ADVICE**

  Patients or carers should be given advice on how to administer zolmitriptan orodispersible tablets.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Zolmitriptan (Non-proprietary) Zolmitriptan 2.5 mg** Zolmitriptan 2.5mg tablets | 6 tablet £1.41 DT price = £1.38 | 12 tablet £2.82

6.2 Neuropathic pain

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to diabetes p. 625, chronic excessive alcohol intake, HIV infection p. 590, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs.

Amitriptyline hydrochloride p. 349 [unlicensed indication] and pregabalin p. 304 are effective treatments for neuropathic pain. Amitriptyline hydrochloride and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 355 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 295 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 435, morphine p. 429, and oxycodone hydrochloride p. 431; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine hydrochloride p. 97 medicated plasters, while awaiting specialist review.

Capsaicin below is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision. A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neuromodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 291 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 302; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 294) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Other drugs used for Neuropathic pain

Amanadine hydrochloride, p. 390

ANALGESICS > PLANT ALKALOIDS

Capsaicin

- INDICATIONS AND DOSE

AXSAIN®

Post-herpetic neuralgia

- TO THE SKIN
  - Adult: Apply 3–4 times a day, dose to be applied sparingly; important; after lesions have healed, not more often than every 4 hours

PAINFUL DIABETIC NEUROPATHY (UNDER EXPERT SUPERVISION)

- TO THE SKIN
  - Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

OUTENZA®

Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)

- BY TRANSDERMAL APPLICATION USING PATCHES
  - Adult: (consult product literature)

ZACIN®

Symptomatic relief in osteoarthritis

- TO THE SKIN
  - Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

- CAUTIONS

GENERAL CAUTIONS

Avoid contact with broken skin • avoid contact with inflamed skin

SPECIFIC CAUTIONS

- With topical use • Avoid contact with eyes • avoid hot shower or bath just before or after application (burning sensation enhanced) • avoid inhalation of vapours • not to be used under tight bandages
- With transdermal use • avoid contact with the face, scalp or in proximity to mucous membranes • avoid holding near eyes or mucous membranes • recent cardiovascular events • uncontrolled hypertension

- SIDE-EFFECTS

- Common or very common
  - With topical use • Transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)
  - With transdermal use • Application site reactions • erythema • pruritus • transient burning
  - Uncommon
  - With transdermal use • Burning sensation • cough • dysgeusia • eye irritation • first degree AV block • hypertension • hypoaesthesia • muscle spasm • nausea • pain in extremities
Hypnotics and anxiolytics

Overview
Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate p. 324 and barbiturates are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdose.

Benzodiazepine indications
- Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or causing the patient unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
- The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate.
- Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or causing the patient extreme distress.

Dependence and withdrawal
Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens. The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:
- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg
- alprazolam 250 micrograms
- clobazam 10 mg
- clonazepam 250 micrograms
- flurazepam 7.5–15 mg
- clordiazepoxide 12.5 mg
- loprazolam 0.5–1 mg
- lorazepam 500 micrograms
- lormetazepam 0.5–1 mg
- nitrazepam 5 mg
- oxazepam 10 mg
- temazepam 10 mg

Withdrawal symptoms for long-term benzodiazepine patients usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible.

Counselling can be of considerable help both during and after the taper.
Hypnotics
Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.
Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.
Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.
Chronic insomnia is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 351 or mirtazapine p. 349 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.
Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome.
Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.
Elderly
Benzodiazepines and the Z–drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.
Dental patients
Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 451 or diazepam p. 321. Temazepam is preferred when it is important to minimise any residual effect the following day.
Benzodiazepines
Benzodiazepines used as hypnotics include nitrazepam p. 450 and flurazepam p. 449 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.
Lorazepam p. 449, lormetazepam p. 450, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.
If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.
Zaleplon, zolpidem, and zopiclone
Zaleplon p. 453, zolpidem tartrate p. 454 and zopiclone p. 454 are non-benzodiazepine hypnotics (sometimes referred to as Z-drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.
Chloral and derivatives
There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.
Clomethiazole
Clomethiazole p. 452 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.
Antihistamines
Some antihistamines such as promethazine hydrochloride p. 269 are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.
Alcohol
Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.
Melatonin
Melatonin p. 453 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.
Anxiolytics
Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.
Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.
Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 268) for their sedative effect in anxiety is not appropriate.
Beta-adrenoceptor blocking drugs do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.
Benzodiazepines

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided. Diazepam, alprazolam p. 320, chlordiazepoxide hydrochloride p. 321, and clozazepam p. 314 have a sustained action. Shorter-acting compounds such as lorazepam p. 317 and oxazepam p. 324 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms. In panic disorders (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

Buspirone

Buspirone hydrochloride p. 320 is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

Meprobamate

Meprobamate p. 324 is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

Barbiturates

The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis.

The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 316 is used in anaesthesia. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Hypnotics, Sedatives and Anxiolytics > Benzodiazepines

Flurazepam

- INDICATIONS AND DOSE

Insomnia (short-term use)

- BY MOUTH

- Adult: 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose

- Elderly: 15 mg once daily, dose to be taken at bedtime

- CONTRA-INDICATIONS

Not for use alone to treat chronic psychosis - not for use alone to treat depression (or anxiety associated with depression) - respiratory depression

- CAUTIONS

Acute porphyrias p. 930 - hypoalbuninaemia - marked personality disorder - muscle weakness

CAUTIONS, FURTHER INFORMATION

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the

IDANTS-EFFECTS

- Common or very common Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness - muscle weakness - paradoxical increase in aggression

- Rare Apnoea - blood disorders - jaundice - respiratory depression - skin reactions

- BREAST FEEDING

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- HEPATIC IMPAIRMENT

Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer.

- AVOID in severe impairment.

- PATIENT AND CARER ADVICE

Driving and skilled tasks May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

- NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Flurazepam capsules are not prescribable under the NHS.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- **Common or very common** Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- **Uncommon** Changes in libido - dizziness - dysarthria - gastro-intestinal disturbances - gynaecostasia - headache - hypotension - incontinence - salivation changes - slurred speech - tremor - urinary retention - vertigo - visual disturbances
- **Rare** Apnoea - blood disorders - jaundice - respiratory depression - skin reactions

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
**Hepatic Impairment**  Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer.  Avoid in severe impairment.

**Renal Impairment**  Start with small doses in severe impairment.

**Patient and Carer Advice**

**Driving and skilled tasks**  May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 19**

- Temazepam (Non-proprietary)
- Nitrazepam 5 mg Nitrazepam 5mg tablets  | 28 tablet  | £5.00  
- Mogadon (Meda Pharmaceuticals Ltd)  
- Nitrazepam 5 mg Mogadon 5mg tablets  | 30 tablet  | £5.76

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 19**

- Temazepam (Non-proprietary)
- Nitrazepam 500 microgram per 1 ml Nitrazepam 2.5mg/5ml oral suspension  | 70 ml  | £114.00  DT price = £114.00

---

**Temazepam**

**Indications and Use**

**Insomnia (short-term use)**

- **By mouth**
  - Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose.
  - Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime.

**Conscious sedation for dental procedures**

- **By mouth**
  - Adult: 15–30 mg, to be administered 30–60 minutes before procedure.

**Premedication before surgery or investigatory procedures**

- **By mouth**
  - Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances.
  - Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances.

**Unlicensed Use**  Temazepam doses in BNF may differ from those in product literature.  Not licensed for conscious sedation for dental procedures.

**Contra-Indications**  CNS depression • compromised airway • hyperkinesia • not for use alone to treat chronic psychosis • not for use alone to treat depression (or anxiety associated with depression) • obsessional state • phobic states • respiratory depression

**Caution**  Hypoalbuninaemia • muscle weakness • organic brain changes • personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

**Cautions, Further Information**

- Paradoxical effects  A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**Side-Effects**

- Common or very common  Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression

- Uncommon  Changes in libido • dizziness • dysarthria • gastrointestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances

- Rare  Apnoea • blood disorders • jaundice • skin reactions

- Frequency not known  Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)

**Breast Feeding**  Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**Hepatic Impairment**  Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

 If treatment is necessary, benzodiazepines with shorter half-lives are safer.

**Renal Impairment**  Start with small doses in severe impairment.

**Patient and Carer Advice**

**Driving and skilled tasks**  May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

 Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**Profession Specific Information**

Dental practitioners’ formulary

Temazepam Tablets and Oral Solution may be prescribed.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Chloral hydrate

- **INDICATIONS AND DOSE**
  - **Insomnia (short-term use) using Chloral Mixture, BP 2000**
    - **BY MOUTH USING ORAL SOLUTION**
      - Adult: 0.5–2 g daily, dose to be taken at bedtime
  - **Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution**
    - **BY MOUTH USING ORAL SOLUTION**
      - Adult: 15–30 mL, alternatively 430–860 mg once daily, dose to be taken with water or milk at bedtime; maximum 70 mL per day; maximum 2 g per day
  - **Insomnia (short-term use), using chloral betaine 707 mg (= 414 mg chloral hydrate) tablets**
    - **BY MOUTH USING TABLETS**
      - Adult: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · gastritis · severe cardiac disease
- **CAUTIONS** Avoid contact with mucous membranes · avoid contact with skin · avoid prolonged use (and abrupt withdrawal thereafter) · reduce dose in debilitated · reduce dose in elderly
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS** Abdominal distention · delirium (especially on abrupt withdrawal) · dependence · excitement · flatulence · gastric irritation · headache · ketonuria · nausea · rash · tolerance · vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Risk of sedation in infant—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration **by mouth** dilute liquid with plenty of water or juice to mask unpleasant taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.
  - When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 mL in a suitable vehicle.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - **LESS SUITABLE FOR PRESCRIBING** Chloral hydrate is less suitable for prescribing in insomnia.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

**CAUTIONARY AND ADVISORY LABELS** 19, 27
- **Chloral hydrate (Non-proprietary)**

  - Cloral betaine 707 mg Cloral betaine 707mg tablets | 30 tablet [Pot] £68.00–£138.59 DT price = £138.59

### Clomethiazole

(Chlormethiazole)

- **INDICATIONS AND DOSE**
  - **Severe insomnia (short-term use)**
    - **BY MOUTH USING CAPSULES**
      - Elderly: 192–384 mg once daily, dose to be taken at bedtime
    - **BY MOUTH USING ORAL SOLUTION**
      - Elderly: 5–10 mL once daily, dose to be taken at bedtime
  - **Restlessness and agitation**
    - **BY MOUTH USING CAPSULES**
      - Elderly: 192 mg 3 times a day
    - **BY MOUTH USING ORAL SOLUTION**
      - Elderly: 5 mL 3 times a day
  - **Alcohol withdrawal**
    - **BY MOUTH USING CAPSULES**
      - Adult: Initially 2–4 capsules, to be repeated if necessary after some hours. 9–12 capsules daily in 3–4 divided doses on day 1 (first 24 hours), then 6–8 capsules daily in 3–4 divided doses on day 2, then 4–6 capsules daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days
    - **BY MOUTH USING ORAL SOLUTION**
      - Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses on day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses on day 2, then 20–30 mL daily in 3–4 divided doses on day 3, dose then to be gradually reduced over days 4–6, total duration of treatment for no more than 9 days

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency · alcohol-dependent patients who continue to drink
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) · cardiac disease (confusional state may indicate hypoxia) · chronic pulmonary insufficiency · elderly · excessive sedation may occur (particularly with higher doses) · history of drug abuse · marked personality disorder · respiratory disease (confusional state may indicate hypoxia) · sleep apnoea syndrome
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS**
  - **Common or very common** Conjunctival irritation · headache · increased bronchial secretions · increased nasopharyngeal secretions · nasal congestion · nasal irritation
  - **Rare** Alterations in liver enzymes · anaphylaxis · bullous eruption · confusion · dependence · gastro-intestinal disturbances · paradoxical excitement · rash · urticaria
- **PREGNANCY** Avoid if possible—especially during the first and third trimesters.
- **BREAST FEEDING** Use only if benefit outweighs risk—present in breast milk but effects unknown.
- **HEPATIC IMPAIRMENT** Reduce dose. Can precipitate coma.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment. Increased cerebral sensitivity.
**Melatonin**

### INDICATIONS AND DOSE

**Insomnia (short-term use)**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Adult 55 years and over: 2 mg once daily for up to 2 weeks, dose to be taken 1–2 hours before bedtime

### CAUTIONS

Autoimmune disease (manufacturer advises avoid—no information available)

### INTERACTIONS

→ Appendix 1 (melatonin).

### SIDE-EFFECTS

- **Uncommon** Abdominal pain · abnormal dreams · anxiety · chest pain · dizziness · dry mouth · dry skin · dyspnea · dysuria · headache · hypertension · irritability · malaise · mouth ulceration · nausea · nervousness · proteinuria · pruritus · rash · restlessness · weight gain

- **Rare** Aggression · angina · arthritis · electrolyte disturbances · flatulence · gastritis · haematuria · halitosis · hot flushes · hypervigilidemia · impaired memory · increased libido · lacrimation · leucopenia · mood changes · muscle spasm · nail disorder · palpitation · paraesthesia · polyuria · priapism · prostatitis · restless legs syndrome · salivation · syncope · thirst · thrombocytopenia · visual disturbances · vomiting

- **Frequency not known** Galactorrhoea · mouth oedema · tongue oedema

### PREGNANCY

No information available—avoid.

### BREAST FEEDING

Present in milk—avoid.

### HEPATIC IMPAIRMENT

Clearance reduced—avoid.

### RENAL IMPAIRMENT

No information available—use with caution.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release tablet**
  - Melatonin 3 mg Melatonin 3mg modified-release tablets | 120 tablet (PoD) no price available
  - Circadin (Flynn Pharma Ltd)
  - Melatonin 2 mg Circadin 2mg modified-release tablets | 30 tablet (PoD) £15.39 DT price = £15.39

**Zaleplon**

### INDICATIONS AND DOSE

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 10 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep
  - Elderly: 5 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep

### CONTRA-INDICATIONS

Marked neuromuscular respiratory weakness · sleep apnoea syndrome · unstable myasthenia gravis

### CAUTIONS

Avoid prolonged use (risk of tolerance and withdrawal symptoms) · depression (risk of suicidal ideation) · history of alcohol abuse · history of drug abuse · muscle weakness · myasthenia gravis · respiratory insufficiency (avoid if severe)

### INTERACTIONS

→ Appendix 1 (anxiolytics and hypnotics).

### SIDE-EFFECTS

- **Common or very common** Amnesia · drowsiness · dysmenorrhea · paraesthesia

- **Uncommon** Anorexia · asthenia · confusion · depersonalisation · depression · disturbances of hearing · disturbances of smell · disturbances of speech · disturbances of vision · dizziness · hallucinations · impaired concentration · incoordination · nausea · photosensitivity

- **Frequency not known** Paradoxical effects · sleep-walking

**SIDE-EFFECTS, FURTHER INFORMATION**

Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

### PREGNANCY

Use only if necessary and restrict to occasional short-term use. Risk of withdrawal symptoms in neonate if used in late pregnancy.

### BREAST FEEDING

Present in milk but amount probably too small to be harmful.

### HEPATIC IMPAIRMENT

Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.

### RENAL IMPAIRMENT

Avoid in severe impairment.

### PATIENT AND CARER ADVICE

Patients should be advised not to take a second dose during a single night.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

Zaleplon is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only. [www.nice.org.uk/TA77](http://www.nice.org.uk/TA77)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.
### Zolpidem tartrate

#### INDICATIONS AND DOSE

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
  - Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

- **CONTRA-INDICATIONS**
  - Acute respiratory depression
  - Marked neuromuscular respiratory weakness
  - Obstructive sleep apnoea
  - Psychotic illness
  - Severe respiratory depression
  - Unstable myasthenia gravis

- **CAUTIONS**
  - Avoid prolonged use (and abrupt withdrawal thereafter)
  - Depression
  - History of drug abuse
  - History of alcohol abuse
  - Muscle weakness
  - Myasthenia gravis

- **INTERACTIONS**
  - Paradoxical effects
  - Antihistamines
  - Atopy
  - CNS depressants
  - Opioids
  - Barbiturates
  - Alcohol

#### SIDE-EFFECTS

- Paradoxical effects
  - A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY**
  - Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g., driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.
  - **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

  - £4.48 DT price = £1.19 [CD4-1]

### Zopiclone

#### INDICATIONS AND DOSE

**Insomnia (short-term use)**

- **BY MOUTH**
  - Adult: 7.5 mg once daily for up to 4 weeks, dose to be taken at bedtime
  - Elderly: Initially 3.75 mg once daily for up to 4 weeks, dose to be taken at bedtime, increased if necessary to 7.5 mg daily

- **CONTRA-INDICATIONS**
  - Marked neuromuscular respiratory weakness
  - Respiratory failure
  - Severe sleep apnoea syndrome
  - Unstable myasthenia gravis

- **CAUTIONS**
  - Avoid prolonged use (risk of tolerance and withdrawal symptoms)
  - Chronic pulmonary insufficiency (increased risk of respiratory depression)
  - Elderly
  - History of drug abuse
  - Muscle weakness
  - Myasthenia gravis (avoid if unstable)
  - Psychiatric illness

- **INTERACTIONS**
  - Paradoxical effects
  - Antihistamines
  - Atopy
  - CNS depressants
  - Opioids
  - Barbiturates
  - Alcohol

#### SIDE-EFFECTS

- **CONTRA-INDICATIONS**
  - Marked neuromuscular respiratory weakness
  - Respiratory failure

  - Incoordination
  - Light headedness

- **SIDE-EFFECTS**

- **FURTHER INFORMATION**

- **Paradoxical effects**
  - A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY**
  - Not recommended (risk of neonatal withdrawal symptoms). Use during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Reduce dose to 3.75 mg in mild to moderate impairment, dose can be increased with caution if necessary. Avoid in severe impairment—can precipitate encephalopathy.

- **RENAL IMPAIRMENT**
  - Start with reduced dose of 3.75 mg. Increased cerebral sensitivity.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may persist the next day and affect performance of skilled tasks (e.g., driving); effects of alcohol enhanced.
Narcolepsy 455

7.2 Narcolepsy

Other drugs used for Narcolepsy Dexamfetamine sulfate, p. 328 - Methylphenidate hydrochloride, p. 326

CENTRAL NERVOUS SYSTEM DEPRESSANTS

Sodium oxybate

- **DRUG ACTION** A central nervous system depressant.

- **INDICATIONS AND DOSE**
  
  **Narcolepsy with cataplexy (under expert supervision)**
  
  **BY MOUTH**
  
  **Adult:** Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

- **CONTRA-INDICATIONS** Major depression · succinic semialdehyde dehydrogenase deficiency

- **CAUTIONS** Body mass index of 40 kg/m² or greater (higher risk of sleep apnoea) · elderly · epilepsy · heart failure (high sodium content) · history of depression · history of drug abuse · hypertension (high sodium content) · respiratory disorders · risk of discontinuation effects including rebound cataplexy and withdrawal symptoms

- **INTERACTIONS** → Appendix 1 (sodium oxybate). If sodium oxybate and sodium valproate or valproic acid used concomitantly, reduce initial dose of sodium oxybate to 1.8 g on retiring and repeat 2.5–4 hours later.

- **SIDE-EFFECTS**
  
  Common or very common Abdominal pain · anorexia · anxiety · arthralgia · asthenia · back pain · blurred vision · confusion · depression · diarrhoea · disorientation · dizziness · drowsiness · dyspnoea · headache · hypertension · hypoaesthesia · impaired attention · muscle spasm · nasal congestion · nausea · nocturnal enuresis · palpitation · paraesthesia · peripheral oedema · rash · sleep disorders · sleep paralysis · sleep walking · sweating · taste disturbance · tremor · urinary incontinence · vertigo · vomiting

- **Uncommon** Agitation · amnesia · faecal incontinence · hallucination · myoclonus · paranoia · psychosis · restless legs syndrome · suicidal behaviour

- **Frequency not known** Dependence · euphoria · respiratory depression · seizures · sleep apnoea · suicidal ideation · urticaria

- **PREGNANCY** Avoid.

- **BREAST FEEDING** No information available.

- **HEPATIC IMPAIRMENT** Halve initial dose.

- **RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL.

- **DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium oxybate oral solution.

- **Driving and skilled tasks** Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

**CNS STIMULANTS**

**Centrally Acting Sympathomimetics**

Modafinil

- **INDICATIONS AND DOSE**
  
  **Excessive sleepiness associated with narcolepsy with or without cataplexy**
  
  **BY MOUTH**
  
  **Adult:** Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
  
  **Elderly:** Initially 100 mg daily

- **CONTRA-INDICATIONS** Arrhythmia · history of clinically significant signs of CNS stimulant–induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate uncontrolled hypertension · severe uncontrolled hypertension

- **CAUTIONS** History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence

- **INTERACTIONS** → Appendix 1 (modafinil).

- **SIDE-EFFECTS**
  
  Common or very common Abdominal pain · anxiety · appetite changes · asthenia · chest pain · confusion · constipation · depression · diarrhoea · dizziness · dry mouth · dyspepsia · gastrointestinal disturbances · headache · nausea · palpitation · paraesthesia · sleep disturbances · tachycardia · vasodilatation · visual disturbances
Uncommon Abnormal dreams, acne, aggression, agitation, amnesia, arrhythmia, arthralgia, bradycardia, decreased libido, dry eye, dyskinesia, dysphagia, dyspnoea, emotional lability, eosinophilia, epistaxis, flatulence, glossitis, hypercholesterolaemia, hyperglycaemia, hypertension, hypertonia, hypotension, leucopenia, menstrual disturbances, migraine, mouth ulcers, muscle cramps, myalgia, myasthenia, peripheral oedema, pruritus, rash, reflux, rhinitis, sinusitis, suicidal ideation, sweating, taste disturbance, thirst, tremor, urinary frequency, vomiting, weight changes

Rare Hallucinations, mania, psychosis

Frequency not known Multi-organ hypersensitivity reaction, psychiatric symptoms, Stevens-Johnson syndrome, toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Rash Discontinue treatment if rash develops.

Psychiatric symptoms Discontinue treatment if psychiatric symptoms develop.

PREGNANCY Avoid.

BREAST FEEDING Avoid — present in milk in animal studies.

HEPATIC IMPAIRMENT Halve dose in severe impairment.

RENAL IMPAIRMENT Use with caution — limited information available.

PRE-TREATMENT SCREENING ECG required before initiation.

MONITORING REQUIREMENTS Monitor blood pressure and heart rate in hypertensive patients.

MEDICINAL FORMS

8 Substance dependence

Substance dependence

Guidance on treatment of drug misuse

Alcohol dependence

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by the Severity of Alcohol Dependence Questionnaire (SADQ); other assessment questionnaires are also available.

Acute alcohol withdrawal

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually clorazepoxide hydrochloride p. 321, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with decompensated liver disease should be treated under specialist supervision.

Carbamazepine p. 291 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 452 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 363 or olanzapine p. 373 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 317 [unlicensed indication] or rectal diazepam p. 321) should be prescribed; thereafter an increase in the dose of oral benzodiazepine should be considered to prevent further seizures from occurring.

Alcohol dependence

Acamprosate calcium p. 459 and naltrexone hydrochloride p. 460 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 459 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram. Nalmefene p. 460 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have uncompensated liver disease. Parenteral thiamine p. 950 (as Pabrinex®) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom.

Corticosteroids are used in patients with severe acute alcohol-related hepatitis.
Drugs used in alcohol dependence

Acamprosate
Acamprosate calcium, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year; treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium is not effective in all patients, so efficacy should be regularly assessed.

Disulfiram
Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

Nalmefene
Nalmefene should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene is not recommended for patients aiming to achieve immediate abstinence.

Naltrexone
Naltrexone hydrochloride is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride should be stopped if drinking continues for 4–6 weeks after starting treatment.

Nicotine dependence
Smoking cessation interventions are a cost–effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. Nicotine replacement therapy, bupropion hydrochloride p. 461, and varenicline p. 464 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

Concomitant medication
Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline p. 256, cinacalcet p. 918, ropinirole p. 396, and some antipsychotics (including clozapine p. 371, olanzapine p. 373, chlorpromazine hydrochloride p. 361, and haloperidol p. 363, may need to be reduced. Regular monitoring for adverse effects is advised.

Drugs used in nicotine dependence
Bupropion hydrochloride has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

Nicotine replacement therapy
Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice
Nicotine p. 462 patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

Side-effects of specific nicotine preparations
Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patches, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation.

Paraesthesia is a common side-effect of oral spray. Abnormal dreams may occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.

Opioid dependence
The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber.

Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at...
Nervous system

usually takes up to of loss of tolerance. Complete withdrawal from opioids ineffective for sustained abstinence, and it increases the risk after careful consideration. Enforced withdrawal is hydrochloride or buprenorphine should be attempted only and during titration. be told to be aware of warning signs of toxicity on initiation should monitor for signs of toxicity, and the patient should

starts within circulation. Precipitated opioid withdrawal, if it occurs, is administered when other opioid agonist drugs are in

are milder, and patients generally require fewer adjunctive are used in conjunction with other sedating drugs, and has fewer reductions made every weeks. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute. Signs of neonatal withdrawal from opioids usually develop 

36–72 hours; symptoms subside substantially after 5 days. Methadone hydrochloride p. 464 or buprenorphine p. 417 withdrawal occurs later, with longer-lasting symptoms.

Opioid substitution therapy

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration. A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

Missed doses

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients. If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine because of the risk of precipitated withdrawal.

Buprenorphine

Buprenorphine is preferred by some patients because it is less sedating than methadone hydrochloride; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 460 for prevention of relapse. Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine p. 417 is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride p. 466, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride p. 464. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful. A combination preparation containing buprenorphine with naloxone p. 466 (Suboxone®) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1214 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

Methadone

Methadone hydrochloride, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus, titration to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

Opioid substitution during pregnancy

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued [buprenorphine is not licensed for use in pregnancy]. Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute. Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

Opioid substitution during breastfeeding

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed
babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

**Adjunctive therapy and symptomatic treatment**
Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 63 may be used for the control of diarrhoea; mebeverine hydrochloride p. 82 for controlling stomach cramps; paracetamol p. 414 and non-steroidal anti-inflammatory drugs for muscular pains and headaches; metoclopramide hydrochloride p. 403 or prochlorperazine p. 365 may be useful for nausea or vomiting. Topical rubefacients can be helpful for relieving muscle pain associated with methadone hydrochloride withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines or zopiclone p. 454 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

**Lofexidine**
Lofexidine hydrochloride may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lofexidine hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

**Opioid-receptor antagonists**
Patients dependent on opioids can be given a supply of naloxone hydrochloride to be used in case of accidental overdose.

Naltrexone hydrochloride p. 460 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

**Opioid dependence in children**
In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

### 8.1 Alcohol dependence

**Other drugs used for Alcohol dependence**
Carbamazepine, p. 291 • Chlordiazepoxide hydrochloride, p. 321 • Clomethiazole, p. 452 • Diazepam, p. 321

#### ALDEHYDE DEHYDROGENASE INHIBITORS

**Disulfiram**

- **INDICATIONS AND DOSE**
  Adjunct in the treatment of alcohol dependence (under expert supervision)

  - **BY MOUTH**
  - Adult: 200 mg daily, increased if necessary up to 500 mg daily

  - **UNLICENSED USE**
    Disulfiram doses in BNF may differ from those in product literature.

  - **CONTRA-INDICATIONS**
    Cardiac failure • coronary artery disease • history of cerebrovascular accident • hypertension • psychosis • severe personality disorder • suicide risk

  - **CAUTIONS**
    Alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) • avoid in Acute porphyrias p. 930 • diabetes mellitus • epilepsy • respiratory disease

  - **INTERACTIONS**
    → Appendix 1 (disulfiram).

  Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.

  - **SIDE-EFFECTS**

    - Common or very common
      Drowsiness • fatigue • halitosis • nausea • reduced libido • vomiting

    - Rare
      Allergic dermatitis • depression • hepatic cell damage • mania • paranoia • peripheral neuritis • psychotic reactions • schizophrenia

  - **PREGNANCY**
    High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.

  - **BREAST FEEDING**
    Avoid—no information available.

  - **HEPATIC IMPAIRMENT**
    Use with caution.

  - **RENAL IMPAIRMENT**
    Use with caution.

  - **PRE-TREATMENT SCREENING**
    Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

  - **MONITORING REQUIREMENTS**
    During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

  - **PATIENT AND CARER ADVICE**
    Patient counselling is advised (alcohol reaction).

  - **MEDICINAL FORMS**
    There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **CAUTIONARY AND ADVISORY LABELS**

SIDE-EFFECTS

Common or very common Abdominal pain • diarrhoea • flatulence • frigidity • impotence • maculopapular rash • nausea • pruritus • vomiting

Very rare Angioedema • hypersensitivity reactions • urticaria

Frequency not known Fluctuation in libido • vesiculobullous skin reactions

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Use with caution—avoid in severe impairment.

RENAL IMPAIRMENT Use with caution—avoid in severe impairment.

PRE-TREATMENT SCREENING Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

MONITORING REQUIREMENTS During treatment, patients should be monitored regularly and the need for continued treatment assessed.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325

Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:

- who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization’s drinking risk levels) without physical withdrawal symptoms, and
- who do not require immediate detoxification.

The marketing authorisation states that nalmefene should:

- only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption, and
- be initiated only in patients who continue to have a high drinking risk level 2 weeks after initial assessment.

OPINIONS

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

INDICATIONS AND DOSE

Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification

BY MOUTH

Adult: 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

CONTRA-INDICATIONS

Recent history of acute alcohol withdrawal syndrome • recent or current opioid use

CAUTIONS

Continued treatment for more than 1 year • history of seizure disorders (including alcohol withdrawal seizures) • psychiatric illness

INTERACTIONS

Avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for opioid intoxication).

SIDE-EFFECTS

Common or very common Confusion • decreased appetite • decreased libido • disturbance in attention • dizziness • dry mouth • headache • hyperhidrosis • hypoaesthesia • malaise • muscle spasms • nausea • palpitation • paraesthesia • restlessness • sleep disorders • somnolence • tachycardia • tremor • vomiting • weight loss

Frequency not known Dissociation • hallucinations

PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Use with caution—avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution—avoid in severe impairment.

PRE-TREATMENT SCREENING

Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

INDICATIONS AND DOSE

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

- **BY MOUTH USING CHEWING GUM**
  - Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose.

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

- **BY MOUTH USING CHEWING GUM**
  - Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose.

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

- **BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
  - Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day.

Nicotine replacement therapy

- **BY INHALATION USING INHALATOR**
  - Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily.

- **BY MOUTH USING LOZENGES**
  - Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; if attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day.

- **BY MOUTH USING OROMUCOSAL SPRAY**
  - Adult: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day.

- **BY INTRanasal ADMINISTRATION USING NASAL SPRAY**
  - Adult: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day.

- **BY TRANSDERMAL APPLICATION USING PATCHES**
  - Adult: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks.

CAUTIONS

GENERAL CAUTIONS

Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment.

- Haemodynamically unstable patients hospitalised with cerebrovascular accident
- Haemodynamically unstable patients hospitalised with myocardial infarction
- Haemodynamically unstable patients hospitalised with severe arrhythmias
- Phaeochromocytoma
- Uncontrolled hyperthyroidism

SPECIFIC CAUTIONS

- When used by inhalation
  - Bronchospastic disease
  - Chronic throat disease
  - Obstructive lung disease

- With intranasal use
  - Bronchial asthma (may exacerbate)

- With oral (topical) use
  - Gum may also stick to and damage dentures

- With oral use
  - Gastritis (can be aggravated by swallowed nicotine)
  - Oesophagitis (can be aggravated by swallowed nicotine)
  - Peptic ulcers (can be aggravated by swallowed nicotine)

- With transdermal use
  - Patches should not be placed on broken skin

CAUTIONS, FURTHER INFORMATION

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

INTERACTIONS

Appendix 1 (nicotine).

SIDE-EFFECTS

- **Common or very common**
  - Bloating
  - Blurred vision
  - Constipation
  - Coughing
  - Diarrhoea
  - Dry mouth
  - Dyspepsia
  - Dysphagia
  - Epistaxis
  - Flatulence
  - Gastritis
  - Gastrointestinal disturbances (may be caused by swallowed nicotine)
  - Hiccups
  - Increased salivation
  - Irritation of the throat
  - Mild local reactions at the beginning of treatment

- **Rare**
  - Arrhythmia
  - Uncommon
  - Gingival bleeding
  - Halitosis
  - Thirst

- **Very rare**
  - Reversible atrial fibrillation

- **Frequency not known**
  - Abdominal pain
  - Abnormal dreams (may occur with patches, removal of the patch before bed may help)
  - Arthralgia
  - Chest pain
  - Flatulence
  - Hot flushes

**Sympathetic nervous system**
myalgia • palpitations • rash • sweating • taste disturbance • ulcerative stomatitis

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Nicotine replacement therapy, under Substance dependence p. 456 for further details on individual preparations.

- Nicotine withdrawal  Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

- PREGNANCY  The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferably to patches but should be avoided if pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

- BREAST FEEDING  Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

- HEPATIC IMPAIRMENT  Use with caution in moderate to severe hepatic impairment.

- RENAL IMPAIRMENT  Use with caution in severe renal impairment.

- DIRECTIONS FOR ADMINISTRATION  Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy. Administration by transdermal patch  Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days. Administration by nasal spray  Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril. Administration by oral spray  The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration. Administration by sublingual tablet  Each tablet should be placed under the tongue and allowed to dissolve. Administration by lozenge  Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size. Administration by inhalation  Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum  Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION  Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

- PATIENT AND CARER ADVICE  Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

- MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

| CAUTIONARY AND ADVISORY LABELS 26 |
| Nicotine (Non-proprietary) |
| Nicotine (as Nicotine cyclodextrin complex) 2 mg Nicotine 2mg sublingual tablets sugar-free | 100 tablet GSL | no price available DT price = £13.12 |
| Brands may include Nicorette Microtab |

| Brands may include Nicorette, Nicorette QuickMist |
Varenicline

**DRUG ACTION** Varenicline is a selective nicotine-receptor partial agonist.

**INDICATIONS AND DOSE**

To aid smoking cessation

- **BY MOUTH**
  - Adult: Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse.

**CAUTIONS** Conditions that may lower seizure threshold: history of cardiovascular disease, history of psychiatric illness (may exacerbate underlying illness including depression), predisposition to seizures.

**SIDE-EFFECTS**

- Common or very common Taste disturbance, abnormal dreams, appetite changes, dizziness, drowsiness, dry mouth, gastrointestinal disturbances, headache, sleep disorders.
- Uncommon Acne, anxiety, apathy, somnolence, arthralgia, asthma, atrial fibrillation, chest pain, depression, dysarthria, dysuria, eye pain, gingival pain, hallucinations, hypotension, hypertonia, hypoaesthesia, impaired temperature regulation, incoordination, lacrimation, menorrhagia, mood swings, muscle spasm, palpitation, panic attack, pruritus, rash, restlessness, seizure, sexual dysfunction, sweating, tachycardia, thirst, tinnitus, tremor, vaginal discharge, visual disturbances, weight gain.
- Rare Cerebrovascular accident.
- Frequency not known Aggression, diabetes mellitus, hyperglycaemia, irritable behaviour, myocardiard infarction, psychosis, sleep-walking, Stevens-Johnson syndrome, suicidal ideation.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**RENAL IMPAIRMENT** If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.

**TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Varenicline for smoking cessation (July 2007) NICE TA123
  Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support. www.nice.org.uk/TA123

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVISE: SUICIDAL BEHAVIOUR AND VARENICLINE

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

**SIDE-EFFECTS**

- Rare
- Uncommon
- Common or very common

**IMPORTANT SAFETY INFORMATION**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

8.3 Opioid dependence

Other drugs used for Opioid dependence Naltrexone hydrochloride, p. 460

**ANALGESICS**

**Methadone hydrochloride**

**INDICATIONS AND DOSE**

Severe pain

- **BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours.

Adjunct in treatment of opioid dependence

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily.

Adjunct in treatment of opioid dependence if tolerance low or not known

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: Initially 20–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily.

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: Initially up to 40 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily.

Cough in terminal disease

- **INITIALLY BY MOUTH USING LINCTUS**
  - Adult: 1–2 mg every 4–6 hours, (by mouth) reduced to 1–2 mg twice daily, use twice daily frequency if prolonged use

**DOSE EQUIVALENCE AND CONVERSION**

- See p. 417 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.
**UNLICENSED USE** Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

**IMPORTANT SAFETY INFORMATION**
Methadone oral solution 1 mg/mL is at least 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS** Family history of sudden death (ECG monitoring recommended) · history of cardiac conduction abnormalities

**CAUTIONS, FURTHER INFORMATION**
- QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

**SIDE-EFFECTS** Dry eyes · dysmenorrhoea · hyperprolactinaemia · hypothermia · QT-interval prolongation · raised intracranial pressure · restlessness · tarsode de pointes

**SIDE-EFFECTS, FURTHER INFORMATION**
Methadone is a long-acting opioid therefore effects may be cumulative.

Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

**Overdose**
Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

**BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

**METHADOSE** The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

Important—care is required in prescribing and dispensing the correct strength since any confusion could lead to an overdose; this preparation should be dispensed only after dilution as appropriate with Methadose Diluent (life of diluted solution 3 months) and is for drug dependent persons.

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
- Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114
- Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

**LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

OPPIOID RECEPTOR ANTAGONISTS

Buprenorphine with naloxone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 417, naloxone hydrochloride p. 1214.

● INDICATIONS AND DOSE
Adjuvant in the treatment of opioid dependence (dose expressed as buprenorphine)

▷ BY SUBLINGUAL ADMINISTRATION
▷ Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement, increased in steps of 2–8 mg; adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

● NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

● MEDICINAL FORMS

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Lofexidine hydrochloride

● DRUG ACTION
Lofexidine is an alpha₂-adrenergic agonist.

● INDICATIONS AND DOSE
Management of symptoms of opioid withdrawal

▷ BY MOUTH
▷ Adult: Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required recommended duration of treatment 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

● CAUTIONS
Bradycardia · cerebrovascular disease · depression · history of QT prolongation · hypotension (monitor pulse rate and blood pressure) · metabolic disturbances · recent myocardial infarction · severe coronary insufficiency

● INTERACTIONS
Appendix 1 (lofexidine).
Caution with concomitant administration of drugs that prolong QT interval.

● SIDE-EFFECTS
Bradycardia · dizziness · drowsiness · dry mucous membranes · hypotension · QT-interval prolongation

● PREGNANCY
Use only if benefit outweighs risk—no information available.

● BREAST FEEDING
Use only if benefit outweighs risk—no information available.

● RENAL IMPAIRMENT
Caution in chronic impairment.

● MONITORING REQUIREMENTS
Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

● TREATMENT CESSATION
Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

● PRESCRIBING AND DISPENSING INFORMATION
Lofexidine has been used in children over 12 years in the management of symptoms of opioid withdrawal.

● PATIENT AND CARER ADVICE
The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- UNLICENSED USE Not licensed for use in giardiasis.

2 Bacterial infection

Antibacterials, principles of therapy

Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a
Infection

Samples should be taken for culture and sensitivity before starting therapy. Viral infections should not be treated with antibacterials. Antibacterial policies permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases. A policy may indicate a range of drugs for general use, and local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

Antibacterial policies

Local policies often limit the antibacterials that may be used to treat infections, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infections (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is clear evidence of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

Superinfection

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. fungal infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Note: It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Antibacterials, use for prophylaxis

Prevention of recurrence of rheumatic fever

- Phenoxyemethylenicillin p. 505 or sulfadiazine p. 520.

Prevention of secondary case of invasive group A streptococcal infection

- Phenoxyemethylenicillin.
  Patients who are penicillin allergic, either erythromycin p. 497 or azithromycin p. 495 [unlicensed indication].
  For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Prevention of secondary case of meningococcal meningitis

- Ciprofloxacin p. 514 or rifampicin p. 535 or i/m ceftriaxone p. 489 [unlicensed indication].
For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of **Haemophilus influenzae** type b disease

- Rifampicin or (if rifampicin cannot be used) i/m or i/v ceftriaxone [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive **Haemophilus influenzae** type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive **Haemophilus influenzae** type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against **Haemophilus influenzae** type b disease.

Prevention of secondary case of diphtheria in non-immune patient

- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 496).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

Prevention of pertussis

- Clarithromycin (or azithromycin or erythromycin).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

- Phenoxybenzylpenicillin.

  If penicillin-allergic, erythromycin.

  Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- Isoniazid p. 541 or isoniazid + rifampicin or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

Prevention of infection from animal and human bites

- Co-amoxiclav p. 508 alone (or doxycycline p. 521 + metronidazole p. 499 if penicillin-allergic).

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1143 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Prevention of early-onset neonatal infection

- i/v benzylpenicillin sodium p. 504 (or i/v clindamycin p. 493 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Prevention of infection in gastro-intestinal procedures

**Operations on stomach or oesophagus**

- Single dose of i/v gentamicin p. 479 or i/v cefuroxime p. 486 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 491 (or vancomycin p. 492) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Open biliary surgery**

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*. 

---

**BNF 73**

**Bacterial infection** 469

---
Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole p. 499 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 491 (or vancomycin p. 492) if high risk of meticillin-resistant Staphylococcus aureus.

Endoscopic retrograde cholangiopancreatography

- Single dose of i/v gentamicin p. 479 or oral i/v ciprofloxacin p. 514.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 506 or i/v teicoplanin (or vancomycin).

Percutaneous endoscopic gastrostomy or jejunostomy

- Single dose of i/v co-amoxiclav p. 508 or i/v cefuroxime p. 486.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus.

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee

- Single dose of i/v cefuroxime alone or i/v flucloxacin p. 511 + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Closed fractures

- Single dose of i/v cefuroxime or i/v flucloxacillin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus, use single dose of i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole (or i/v clindamycin p. 493 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant Staphylococcus aureus, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Prevention of infection in urological procedures

Transrectal prostate biopsy

- Single dose of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Transurethral resection of prostate

- Single dose of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin if high risk of meticillin-resistant Staphylococcus aureus (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Prevention of infection in obstetric and gynaecological surgery

Caesarean section

- Single dose of i/v cefuroxime (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant Staphylococcus aureus.

Hysterectomy

- Single dose of i/v cefuroxime + i/v metronidazole or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin (or vancomycin) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Termination of pregnancy**

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 521 postoperatively.

**Prevention of infection in cardiology procedures**

**Cardiac pacemaker insertion**

- Single dose of i/v cefuroxime alone or i/v flucloxacillin + i/v gentamicin or i/v teicoplanin (or vancomycin) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in vascular surgery**

**Reconstructive arterial surgery of abdomen, pelvis or legs**

- Single dose of i/v cefuroxime p. 486 alone or i/v flucloxacillin p. 511 + i/v gentamicin p. 479 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 499 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin p. 491 (or vancomycin p. 492) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of endocarditis**

**NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)**

- Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastrointestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Dermatological procedures**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

**Joint prosthesis and dental treatment**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Immunosuppression and indwelling intraperitoneal catheters**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.
Blood infections, bacterial

Antibacterial therapy for septicaemia: community-acquired
- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 503, ticarcillin with clavulanic acid p. 504) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 486)
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 492 (or teicoplanin p. 491).
- If anaerobic infection suspected, add metronidazole p. 499 to broad-spectrum cephalosporin.
- If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibacterial (e.g. meropenem p. 483).

Antibacterial therapy for septicaemia: hospital-acquired
- A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam, ticarcillin with clavulanic acid, ceftazidime p. 488, imipenem with cilastatin p. 482, or meropenem).
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to broad-spectrum cephalosporin.

Septicaemia related to vascular catheter
- Vancomycin (or teicoplanin).
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

Meningococcal septicaemia
If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 504 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 487 may be an alternative in penicillin allergy; chloramphenicol p. 524 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 489).
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol.
- To eliminate nasopharyngeal carriage, ciprofloxacin p. 514, or rifampicin p. 535, or ceftriaxone may be used.

Cardiovascular system infections, bacterial

Antibacterial therapy for endocarditis: initial ‘blind’ therapy
- *Native valve endocarditis*, amoxicillin p. 506 (or ampicillin p. 507)
- Consider adding low-dose gentamicin p. 479
- If penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected, or if severe sepsis, use vancomycin p. 492 + low-dose gentamicin
- If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 483
- If *prosthetic valve endocarditis*, vancomycin + rifampicin p. 535 + low-dose gentamicin

Antibacterial therapy for native-valve endocarditis caused by staphylococci
- Flucloxacillin p. 511
- *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- If penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin
- *Suggested duration of treatment* 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Antibacterial therapy for prosthetic valve endocarditis caused by staphylococci
- Flucloxacillin + rifampicin + low-dose gentamicin
- *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*, vancomycin + rifampicin + low-dose gentamicin
- *Suggested duration of treatment* at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Antibacterial therapy for endocarditis caused by fully-sensitive streptococci
- Benzylpenicillin sodium p. 504
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic, vancomycin (or teicoplanin p. 491) + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (stop gentamicin after 2 weeks)

Antibacterial therapy for endocarditis caused by less-sensitive streptococci
- Benzylpenicillin sodium + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Antibacterial therapy for endocarditis caused by enterococci
- Amoxicillin (or ampicillin) + low dose gentamicin or benzylpenicillin sodium + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + low-dose gentamicin
- *Suggested duration of treatment* 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
- Add streptomycin p. 480 (if susceptible) for 2 weeks
- *Suggested duration of treatment* at least 6 weeks
Antibacterial therapy for endocarditis caused by *Haemophilus, Actinobacillus, Cardiobacterium, Eikenella,* and *Kingella* species (‘HACEK’ micro-organisms)

- Amoxicillin (or ampicillin) + low-dose gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- If amoxicillin -resistant, ceftriaxone p. 489 (or cefotaxime p. 487) + low-dose gentamicin
- **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

**Central nervous system infections, bacterial**

**Antibacterial therapy for meningitis: initial empirical therapy**

- Transfer patient to hospital urgently.
- If *meningococcal disease* (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 504 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 487 may be an alternative in penicillin allergy; chloramphenicol p. 524 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 618 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery.
  - In hospital, if aetiology unknown:
    - **Adult and child 3 months–50 years**, cefotaxime (or ceftriaxone p. 489)
      - Consider adding vancomycin p. 492 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
      - **Suggested duration of treatment** at least 10 days
    - **Adult over 50 years** cefotaxime (or ceftriaxone) + amoxicillin p. 506 (or ampicillin p. 507)
      - Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
      - **Suggested duration of treatment** at least 10 days

**Antibacterial therapy for meningitis caused by *meningococci***

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- **Suggested duration of treatment** 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- **Suggested duration of treatment** 7 days.

**Antibacterial therapy for meningitis caused by pneumococci**

- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - **Suggested duration of antibacterial treatment** 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
    - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
    - **Suggested duration of antibacterial treatment** 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

**Antibacterial therapy for meningitis caused by *Listeria***

- Amoxicillin (or ampicillin) + gentamicin p. 479
  - **Suggested duration of treatment** 21 days.
  - Consider stopping gentamicin after 7 days.
  - If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 518
  - **Suggested duration of treatment** 21 days.

**Ear infections, bacterial**

**Antibacterial therapy for otitis externa**

For topical treatments, consider *Otitis externa,* under Ear p. 1050.
- Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.
  - Flucloxacillin p. 511
  - If *penicillin-allergic,* clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
  - If *pseudomonas suspected,* ciprofloxacin p. 514 (or an aminoglycoside)

**Antibacterial therapy for otitis media**

Many infections are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression,
Eye infections, bacterial

Antibacterial therapy for purulent conjunctivitis
- Chloramphenicol eye drops p. 524.

Gastro-intestinal system infections, bacterial

**Antibacterial therapy for gastro-enteritis**
Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated

**Antibacterial therapy for campylobacter enteritis**
Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- Alternative, ciprofloxacin p. 514
- Strains with decreased sensitivity to ciprofloxacin isolated frequently

**Antibacterial therapy for salmonella (non-typhoid)**
Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin or cefotaxime p. 487

**Antibacterial therapy for shigellosis**
Antibacterial not indicated for mild cases.
- Ciprofloxacin or azithromycin
- Alternatives if micro-organism sensitive, amoxicillin p. 506 or trimethoprim p. 529

**Antibacterial therapy for typhoid fever**
Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime (or ceftriaxone p. 489)
- Azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- Alternative if micro-organism sensitive, ciprofloxacin

**Antibacterial therapy for Clostridium difficile infection**
- For first episode of mild to moderate infection, oral metronidazole p. 499
- Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in patients intolerant of metronidazole, oral vancomycin p. 492
- For severe infection in patients with multiple co-morbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 525 can replace vancomycin
- Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
- For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
- Suggested duration of treatment 10–14 days

**Antibacterial therapy for biliary-tract infection**
- Ciprofloxacin or gentamicin p. 479 or a cephalosporin

**Antibacterial therapy for peritonitis**
- A cephalosporin + metronidazole or gentamicin + metronidazole or gentamicin + clindamycin p. 493 or piperacillin with tazobactam p. 503 alone

**Antibacterial therapy for peritonitis: peritoneal dialysis-associated**
- Vancomycin (or teicoplanin p. 491) + ceftazidime p. 488 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
- Suggested duration of treatment 14 days or longer

Genital system infections, bacterial

**Antibacterial therapy for bacterial vaginosis**
- Oral metronidazole p. 499
- Suggested duration of treatment 5–7 days (or high-dose metronidazole as a single dose)
- Alternatively, topical metronidazole for 5 days or topical clindamycin p. 493 for 7 days

**Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**
Contact tracing recommended.
- Azithromycin p. 495 or doxycycline p. 521
- Suggested duration of treatment azithromycin as a single dose or doxycycline for 7 days
- Alternatively, erythromycin p. 497.
- Suggested duration of treatment 14 days

**Antibacterial therapy for gonorrhoea: uncomplicated**
Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
- Azithromycin + i/m ceftriaxone p. 489
- Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, when parenteral administration is not possible, cefixime p. 487 + azithromycin
- Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 514 + azithromycin
**Antibacterial therapy for pelvic inflammatory disease**

Contact tracing recommended.

- Doxycycline + metronidazole + single-dose of i/m ceftriaxone or ofloxacin p. 517 + metronidazole
- **Suggested duration of treatment** 14 days (except i/m ceftriaxone).
- In severely ill patients initial treatment with doxycycline + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

**Antibacterial therapy for early syphilis (infection of less than 2 years)**

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- **Suggested duration of treatment** single-dose (repeat dose after 7 days for women in the third trimester of pregnancy)
- Alternatively, doxycycline or erythromycin
- **Suggested duration of treatment** 14 days

**Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)**

Contact tracing recommended.

- Benzathine benzylpenicillin [unlicensed]
- **Suggested duration of treatment** once weekly for 2 weeks
- Alternatively, doxycycline
- **Suggested duration of treatment** 28 days

**Asymptomatic contacts of patients with infectious syphilis**

- Doxycycline
- **Suggested duration of treatment** 14 days

**Musculoskeletal system infections, bacterial**

**Antibacterial therapy for osteomyelitis**

Seek specialist advice if chronic infection or prostheses present.

- Flucloxacillin p. 511
- Consider adding fusidic acid p. 527 or rifampicin p. 535 for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection
- If penicillin-resistant, clindamycin p. 493
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 492 (or teicoplanin p. 491)
- Consider adding fusidic acid or rifampicin for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection

**Antibacterial therapy for septic arthritis**

Seek specialist advice if prostheses present.

- Flucloxacillin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).

- If penicillin-allergic, clindamycin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If meticillin-resistant Staphylococcus aureus, vancomycin (or teicoplanin)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 487 (or ceftriaxone p. 489)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

**Nose infections, bacterial**

**Antibacterial therapy for sinusitis**

Antibacterial therapy should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial therapy for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 506 (or ampicillin p. 507) or doxycycline p. 521 or clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- **Suggested duration of treatment** 7 days.
- Consider oral co-amoxiclav p. 508 if no improvement after 48 hours.
- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 486 may be required.

**Oral bacterial infections**

**Antibacterial drugs**

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be...

- If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be...

- In severely ill patients initial treatment with amoxicillin + i/v ceftriaxone + i/v metronidazole, then switch to oral treatment with amoxicillin + metronidazole to complete 14 days’ treatment
Infection treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 501 is licensed for the treatment of acute ulcerative gingivitis.

**Penicillins**
Phenoxyethylpenicillin p. 505 is effective for dentoalveolar abscess.

**Broad-spectrum penicillins**
Amoxicillin p. 506 is as effective as phenoxyethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxyethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases. Amoxicillin may be useful for short course oral regimens.

Co-amoxiclav p. 508 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

**Cephalosporins**
The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) has reduced their usefulness for the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 521 has a longer duration of action than tetracycline p. 523 or oxytetracycline p. 523 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

**Macrolides**
The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

**Clindamycin**
Clindamycin p. 493 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin p. 497-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

**Metronidazole and tinidazole**
Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 499 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

**Respiratory system infections, bacterial**

**Antibacterial therapy for *Haemophilus influenzae* epiglottitis**
- Cefotaxime p. 487 (or ceftriaxone p. 489)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 524

**Antibacterial therapy for chronic bronchitis: acute exacerbations**
Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.
- Amoxicillin p. 506 (or ampicillin p. 507) or a tetracycline p. 523
- Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant
- **Suggested duration of treatment** 5 days; longer treatment may be necessary in severely ill patients
- **Alternative**, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- **Suggested duration of treatment** 5 days; longer treatment may be necessary in severely ill patients

**Antibacterial therapy for pneumonia: low-severity community-acquired**
- Amoxicillin (or ampicillin)
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If typical pathogens suspected, add clarithromycin (or azithromycin or erythromycin).
- If staphylococci suspected (e.g. in influenza or measles), add flucoxacillin p. 511.
- **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)
- **Alternatives**, doxycycline p. 521 or clarithromycin (or azithromycin or erythromycin)
- **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)

**Antibacterial therapy for pneumonia: moderate-severity community-acquired**
- Amoxicillin (or ampicillin) + clarithromycin (or azithromycin or erythromycin) or doxycycline alone
- Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 492 (or teicoplanin p. 491).
- **Suggested duration of treatment** 7 days (14–21 days for infections caused by staphylococci)

**Antibacterial therapy for pneumonia: high-severity community-acquired**
- Benzylpenicillin sodium p. 504 + clarithromycin (or azithromycin or erythromycin) or benzylpenicillin sodium + doxycycline
Skin infections, bacterial

Antibacterial therapy for impetigo: small areas of skin infected
Seek local microbiology advice before using topical treatment in hospital.
- Topical fusidic acid p. 527
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant Staphylococcus aureus, topical mupirocin p. 1086
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection
- Oral flucloxacillin p. 511
  - If streptococci suspected in severe infection, add penicillin p. 505.
  - Suggested duration of treatment 7 days.
- If penicillin–allergic, oral clarithromycin p. 496 or erythromycin p. 497
  - Suggested duration of treatment 7 days.

Antibacterial therapy for erysipelas
- Phenoxybenzamine p. 504
  - If severe infection, replace phenoxybenzamine or benzylpenicillin with high-dose flucloxacillin
  - Suggested duration of treatment at least 7 days.
- If penicillin–allergic, clindamycin p. 493 or clarithromycin (or erythromycin)
  - Suggested duration of treatment at least 7 days.

Antibacterial therapy for cellulitis
- Flucloxacillin (high-dose)
  - If streptococcal infection confirmed, replace flucloxacillin with phenoxybenzamine or benzylpenicillin sodium
  - If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- If penicillin–allergic, clindamycin or clarithromycin (or erythromycin) or vancomycin p. 492 (or teicoplanin p. 491)
  - If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Antibacterial therapy for animal and human bites
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1143 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.
- Co-amoxiclav p. 508
- If penicillin–allergic, doxycycline p. 521 + metronidazole p. 499

Antibacterial therapy for mastitis during breastfeeding
Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.
- Flucloxacillin, if penicillin–allergic, erythromycin
  - Continue breast-feeding or expressing milk during treatment.
  - Suggested duration of treatment 10–14 days.

Antibacterial therapy for pneumonia possibly caused by atypical pathogens
- Clarithromycin (or azithromycin or erythromycin)
  - If high-severity Legionella infection, add rifampicin p. 535 for the first few days.
  - Suggested duration of treatment 14 days (usually 7–10 days for Legionella)
- Alternative if Legionella infection suspected, a quinolone
  - If high–severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
  - Suggested duration of treatment usually 7–10 days
- Alternative for chlamydial or mycoplasma infections, doxycycline
  - Suggested duration of treatment 14 days.

Antibacterial therapy for pneumonia: hospital-acquired
- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav or cefuroxime
  - If life-threatening infection, or if history of antibiotic treatment in the last 3 months, or if resistant microorganisms suspected, treat as for late-onset hospital-acquired pneumonia.
  - Suggested duration of treatment 7 days
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 503) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 488) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 514)
  - If meticillin-resistant Staphylococcus aureus suspected, add vancomycin.
  - For severe illness caused by Pseudomonas aeruginosa, consider adding an aminoglycoside.
  - Suggested duration of treatment 7 days (longer if Pseudomonas aeruginosa confirmed)

- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 508 + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 486 + clarithromycin (or azithromycin or erythromycin) or ceftaxime (or ceftriaxone) + clarithromycin (or azithromycin or erythromycin)
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- Suggested duration of treatment 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)

Antibacterial therapy for cellulitis
- Oral clindamycin or clarithromycin (or erythromycin)
  - If penicillin–allergic, clindamycin p. 493 or clarithromycin (or erythromycin)
  - Suggested duration of treatment at least 7 days.

- If high–severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
- Suggested duration of treatment usually 7–10 days
- Alternative for chlamydial or mycoplasma infections, doxycycline
  - Suggested duration of treatment 14 days.

Antibacterial therapy for pneumonia possibly caused by atypical pathogens
- Clarithromycin (or azithromycin or erythromycin)
  - If high-severity Legionella infection, add rifampicin p. 535 for the first few days.
  - Suggested duration of treatment 14 days (usually 7–10 days for Legionella)

Antibacterial therapy for pneumonia: hospital-acquired
- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav or cefuroxime
  - If life-threatening infection, or if history of antibiotic treatment in the last 3 months, or if resistant microorganisms suspected, treat as for late-onset hospital-acquired pneumonia.
  - Suggested duration of treatment 7 days
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 503) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 488) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 514)
  - If meticillin-resistant Staphylococcus aureus suspected, add vancomycin.
  - For severe illness caused by Pseudomonas aeruginosa, consider adding an aminoglycoside.
  - Suggested duration of treatment 7 days (longer if Pseudomonas aeruginosa confirmed)
Aminoglycosides

Overview

These include amikacin p. 479, gentamicin p. 479, neomycin sulfate p. 480, streptomycin p. 480, and tobramycin p. 481. Aminoglycosides are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against Pseudomonas aeruginosa; streptomycin is active against Mycobacterium tuberculosis and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 499 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Tobramycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against Ps. aeruginosa but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Once daily dosage

Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations

Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related); conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside - whenever possible, parenteral treatment should not exceed 7 days
- **INTERACTIONS** → Appendix 1 (aminoglycosides).
  - If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.
- **SIDE-EFFECTS**, **FURTHER INFORMATION**
  - **Nephrotoxicity**
    - Rare Antibiotic-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
  - **Very rare** Blood disorders - CNS effects - convulsions - encephalopathy - headache
  - **Frequency not known** Auditory damage - impaired neuromuscular transmission - irreversible ototoxicity - nephrotoxicity - transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery - vestibular damage
  - **SIDE-EFFECTS** Further information:
    - Nephrotoxicity
      - In adults Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.
      - In children Occurs most commonly in children with renal failure.
  - **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.
    - If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.
  - **RENAL IMPAIRMENT** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment.
    - Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.
      - In adults A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.
      - In children A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over
1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Serum concentrations: Serum concentration monitoring avoids both excessive and subtherapeutic concentrations and hence preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.
- In adults: Serum aminoglycoside concentrations must be determined in the elderly. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
- In children: In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen. Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.
- Renal function should be assessed before starting an aminoglycoside and during treatment.
- Auditory and vestibular function should also be monitored during treatment.

### Amikacin

**INDICATIONS AND DOSE**

**Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)**

- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
- **Adult:** 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses for up to 10 days, higher dose to be used in severe infections; maximum 1.5 g per day; maximum 15 g per course

**Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)**

- **By intravenous infusion**
- **Adult:** Initially 15 mg/kg (max. per dose 1.5 g once daily), dose to be adjusted according to serum-amikacin concentration; maximum 15 g per course

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely.

**SIDE-EFFECTS**

- Uncommon: Rash

**MONITORING REQUIREMENTS**

- **Multiple daily dose regimen:** one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre.
- **Once daily dose regimen:** pre-dose ('trough') concentration should be less than 5 mg/litre.

### Gentamicin

**INDICATIONS AND DOSE**

**Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)**

- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
- **Adult:** 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

**Septicaemia | Meningitis and other CNS infections | Biliary tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis**

- **By intravenous infusion, or by slow intravenous injection, or by intramuscular injection**
- **Adult:** 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes

- **By intravenous infusion**
- **Adult:** Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

**CNS infections (administered on expert advice)**

- **By intrathecal injection**
- **Adult:** 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

**Surgical prophylaxis**

- **By slow intravenous injection**
- **Adult:** 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures; up to 3 further doses may be given

**Surgical prophylaxis (including joint replacement surgery)**

- **By intravenous infusion**
- **Adult:** 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.

**SIDE-EFFECTS**

- Uncommon: Rash

**MONITORING REQUIREMENTS**

- For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.
- For multiple daily dose regimen in endocarditis, one-hour ('peak') serum concentration should be 3–5 mg/litre;
pre-dose (‘trough’) concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment).

- For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

**DIRECTIONS FOR ADMINISTRATION**
- With intrathecal use For intrathecal injection, use preservative-free intrathecal preparations only.
- With intravenous use For intravenous infusion (Cidomycin®); Gentamicin paediatric injection, Beacon; Gentamicin injection Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

**PRESCRIBING AND DISPENSING INFORMATION**
- With intravenous use Local guidelines may vary in the dosing advice provided for once daily administration.
- With intrathecal use Only preservative-free intrathecal preparation should be used.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules 15 ampoule (POM) £36.28 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules 5 ampoule (POM) £11.25
    - Gentamicin Paediatric 20mg/2ml solution for injection vials 5 vial (POM) £11.25 DT price = £11.25
    - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials 5 vial (POM) £20.00
    - Gentamicin 80mg/2ml solution for injection ampoules 5 ampoule (POM) £6.88 10 ampoule (POM) £10.00
- **Cidomycin (Sanofi)**
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules 5 vial (POM) £6.88
  - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules 5 ampoule (POM) £6.88

**Infusion**

- **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml Gentamicin 80mg/80ml infusion bags 20 bag (POM) £39.00
  - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 240mg/80ml infusion bags 20 bag (POM) £119.00
  - Gentamicin 360mg/120ml infusion bags 20 bag (POM) £169.00

**SIDE-EFFECTS**
- Uncommon Rash
- Frequency not known Impaired intestinal absorption with steatorrhoea and diarrhoea - increased salivation

**SIDE-EFFECTS, FURTHER INFORMATION**

Although neomycin is associated with the same side effects as other aminoglycosides it is generally considered too toxic for systemic use and is poorly absorbed after oral administration.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.
- **HEPATIC IMPAIRMENT** Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity.
- **RENAL IMPAIRMENT** Avoid—risk of ototoxicity and nephrotoxicity.

- **MONITORING REQUIREMENTS**
  - Renal function should be assessed before starting an aminoglycoside and during treatment.
  - Auditory and vestibular function should also be monitored during treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

- **Neomycin sulfate (Non-proprietary)**
  - Neomycin sulfate 500 mg Neomycin 500mg tablets 100 tablet (POM) £34.69 DT price = £34.69

**Oral solution**

- **Neomycin sulfate (Non-proprietary)**
  - Neomycin sulfate 25 mg per 1 ml Neo-Fradin 125mg/5ml oral solution 480 ml (POM) no price available

**Streptococcal endocarditis**
- Adult: (consult local protocol)

**SBE**
- Common or very common Rash
- Frequency not known Hypersensitivity reactions - paraesthesia of mouth

**RENAI IMPAIRMENT**
- Should preferably be avoided. If essential, use with great care and consider dose reduction.

**MONITORING REQUIREMENTS**
- One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

**Neomycin sulfate**

**INDICATIONS AND DOSE**

**Bowel sterilisation before surgery**

- **BY MOUTH**
  - Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days

**Hepatic coma**

- **BY MOUTH**
  - Adult: Up to 4 g daily in divided doses usually for 5–7 days

**CONTRA-INDICATIONS**
Intestinal obstruction - myasthenia gravis (aminoglycosides may impair neuromuscular transmission)

**CAUTIONS**
Avoid prolonged use

**CAUTIONS, FURTHER INFORMATION**

Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.

**INTERACTIONS**
Appendix 1 (aminoglycosides).
**Tobramycin**

**INDICATIONS AND DOSE**

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients

- By intramuscular injection, or by slow intravenous injection, or by intravenous infusion
  - Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg daily as soon as clinically indicated

**Urinary-tract infection**

- By intramuscular injection
  - Adult: 2–3 mg/kg for 1 dose

**Chronic Pseudomonas aeruginosa infection in patients with cystic fibrosis**

- By inhalation of nebulised solution
  - Adult: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
  - By inhalation of powder
  - Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

**VANTOBRA® NEBULISER SOLUTION**

**Chronic pulmonary Pseudomonas aeruginosa infection in patients with cystic fibrosis**

- By inhalation of nebulised solution
  - Adult: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**CAUTIONS**

- When used by inhalation: Conditions characterised by muscular weakness—may impair neuromuscular transmission—history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of ototoxicity • renal impairment—limited information available • severe haemoptysis—risk of further haemorrhage

**SIDE-EFFECTS**

- Common or very common
  - When used by inhalation: Malaise • rhinitis • tinnitus
  - Uncommon
  - With systemic use: Rash
  - Rare
  - When used by inhalation: Aphonía • hearing loss
  - Very rare
  - When used by inhalation: Pruritus • urticaria
  - Frequency not known
  - When used by inhalation: Bronchospasm • cough (more frequent by inhalation of powder) • dysphonia • epistaxis • haemoptysis • laryngitis • mouth ulcers • pharyngitis • salivary hypersecretion • taste disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Ear effects
- When used by inhalation: Manufacturer advises monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

**VANTOBRA® NEBULISER SOLUTION**

- Uncommon: Dyspnoea
- Rare: Anorexia • asthenia • asthma • chest discomfort • dizziness • headache • nausea • pyrexia • vomiting
- Very rare: Abdominal pain • back pain • diarrhoea • ear pain • fungal infection • hyperventilation • hypoxia • lymphadenopathy • sinusitis • somnolence

**RENAL IMPAIRMENT**

- When used by inhalation: Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops—discontinue treatment until serum concentration falls below 2 mg/litre.

**MONITORING REQUIREMENTS**

- With intramuscular use or intravenous use: One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
- When used by inhalation: Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
- When used by inhalation: Other inhaled drugs should be administered before tobramycin.

**PATIENT AND CARER ADVICE**

- When used by inhalation: Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

**VANTOBRA® NEBULISER SOLUTION**

**Missed doses**

Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276

Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contraindications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for Injection**

- Tobramycin (Non-proprietary)
- Tobramycin (as Tobramycin sulphate) 40 mg per 1 ml
- Tobramycin 40 mg/1 ml solution for injection vials | 10 vial £37.00
- Tobramycin 80 mg/2 ml solution for injection vials | 5 vial £20.80
- Tobramycin 240 mg/6 ml solution for injection vials | 1 vial £19.20

**Bacterial infection**

841

5
Overview

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; imipenem (imipenem with cilastatin below) and meropenem p. 483 have good activity against Pseudomonas aeruginosa. The carbapenems are not active against metillin-resistant Staphylococcus aureus and Enterococcus faecium.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against Pseudomonas or against Acinetobacter spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with cilastatin (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

Ertapenem

- **INDICATIONS AND DOSE**
  - Abdominal infections
  - Acute gynaecological infections
  - Community-acquired pneumonia
  - BY INTRAVENOUS INFUSION
  - Adult: 1 g once daily

Diabetic foot infections of the skin and soft-tissue

- BY INTRAVENTOUS INFUSION
  - Adult: 1 g once daily

Surgical prophylaxis, colorectal surgery

- BY INTRAVENOUS INFUSION
  - Adult: 1 g for 1 dose, to be completed within 1 hour before surgery

**CAUTIONS** CNS disorders—risk of seizures · elderly

**INTERACTIONS** → Appendix 1 (ertapenem).

**SIDE-EFFECTS**

- Common or very common Diarrhoea · headache · injection-site reactions · nausea · pruritus · raised platelet count · rash (also reported with eosinophilia and systemic symptoms) · vomiting

- Uncommon Abdominal pain · anorexia · antibiotic-associated colitis · asthenia · bradycardia · chest pain · confusion · constipation · dizziness · dry mouth · dyspepsia · dyspnoea · hypotension · melaena · oedema · pectechiae · pharyngeal discomfort · raised glucose · seizures · sleep disturbances · taste disturbances

- Rare Agitation · anxiety · arrhythmia · blood disorders · cholecystitis · cough · depression · dysphagia · electrolyte disturbances · haemorrhage · hypoglycaemia · increase in blood pressure · jaundice · liver disorder · muscle cramp · nasal congestion · neutropenia · pelvic peritonitis · renal impairment · scleral disorder · syncope · thrombocytopenia · tremor · wheezing

- Frequency not known Dyskinesia · hallucinations

- ALLERGY AND CROSS-SENSITIVITY Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

- BREAST FEEDING Present in milk—manufacturer advises avoid.

- RENAL IMPAIRMENT Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Invanz®), give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL. Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

- MEDICINAL FORMS

  - There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for infusion

  - ELECTROLYTES: May contain Sodium
  - Invanz (Merck Sharp & Dohme Ltd)
    - Ertapenem (as Ertapenem sodium) 1 gram Invanz 1g powder for solution for infusion vials | 1 vial £31.65

Imipenem with cilastatin

- **INDICATIONS AND DOSE**
  - Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) · Hospital-acquired septicemia
  - BY INTRAVENOUS INFUSION
  - Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours

  - Infection caused by Pseudomonas or other less sensitive organisms · Empirical treatment of infection in febrile patients with neutropenia · Life-threatening infection
  - BY INTRAVENOUS INFUSION
  - Adult: 1 g every 6 hours
DOSE EQUIVALENCE AND CONVERSION

- Dose expressed in terms of imipenem.

- **CAUTIONS**  CNS disorders • epilepsy
- **INTERACTIONS**  Appendix 1 (imipenem with cilastatin).
- **SIDE-EFFECTS**
  - Common or very common  Diarrhoea • eosinophilia • nausea (may reduce rate of infusion) • rash • vomiting
  - Uncommon  Confusion • dizziness • drowsiness • hallucinations • hypotension • leucopenia • myoclonic activity • seizures • thrombocytopenia • thrombocytosis
  - Rare  Acute renal failure • anaphylactic reactions • antibiotic–associated colitis • encephalopathy • hearing loss • hepatitis • paraesthesia • polyuria • Stevens–Johnson syndrome • taste disturbances • tooth, tongue or urine discoloration • toxic epidermal necrosis • tremor
  - Very rare  Abdominal pain • aggravation of myasthenia gravis • asthenia • cyanosis • dyspnoea • flushing • glossitis • haemolytic anaemia • headache • heartburn • hyperhidrosis • hypersalivation • hyperventilation • palpitation • polyarthralgia • tachycardia • tinnitus
- **FREQUENCY not known**  Neurotoxicity (at high dose, renal failure, CNS disease)
- **ALLERGY AND CROSS-SENSITIVITY**  Avoid if history of immediate hypersensitivity reaction to beta-lactam antibiotics.
  - Use with caution in patients with sensitivity to beta-lactam antibacterials.
- **PREGNANCY**  Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING**  Present in milk but unlikely to be absorbed.
- **RENAL IMPAIRMENT**  Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m² — consult product literature.
- **EFFECT ON LABORATORY TESTS**  Positive Coombs’ test.
- **DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion dilute to a concentration of 5 mg/asaline (imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - **ELECTROLYTES:**  May contain Sodium
      - **Imipenem with cilastatin (Non-proprietary)**
        - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg powder for solution for infusion vials | 1 vial (£80.00 (Hospital only) | 5 vial (£500.00 (Hospital only) | 10 vial (£875.45
      - **Primevac I.V. (Merck Sharp & Dohme Ltd)**
        - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg Primerax IV 500mg powder for solution for infusion vials | 1 vial (£42.00

  - **Meropenem**

  - **INDICATIONS AND DOSE**
    - **Aerobic and anaerobic Gram-positive and Gram-negative infections • Hospital-acquired septicaemia**
      - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
        - Adult: 0.5–1 g every 8 hours
    - **Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis**
      - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
        - Adult: 2 g every 8 hours

  - **Antibacterials • Cephalosporins**

    - **Cephalosporins**

      - **Overview**
        - The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally...
renal. Cefalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 487 and ceftriaxone p. 489 are suitable cefalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cefalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cefalosporins. If a cefalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 487, cefotaxime, cefazidime p. 488, ceftriaxone, or cefuroxime p. 486 can be used with caution; cefaclor p. 486, cefadroxil below, cefalexin p. 485, cefadrine p. 485, and cefetamet fosamil p. 490 should be avoided.

The orally active ‘first generation’ cefalosporins, cefalexin, cefadroxil and the ‘second generation’ cefalosporin, cefaclor, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against H. influenzae. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against H. influenzae. Cefuroxime axetil, an ester of the ‘second generation’ cefalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active ‘third generation’ cefalosporin. It has a longer duration of action than the other cefalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a ‘second generation’ cefalosporin that is less susceptible than the earlier cefalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against Haemophilus influenzae.

Cefotaxime, cefazidime and ceftriaxone are ‘third generation’ cefalosporins with greater activity than the ‘second generation’ cefalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Cefetamet fosamil is a ‘fifth generation’ cefalosporin with bactericidal activity similar to cefotaxime; however, cefetamet fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant Staphylococcus aureus and multi-drug resistant Streptococcus pneumoniae. Cefetamet fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant S. aureus.

### Antibacterials

#### Cefuroxime

- **Indications and Dose**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
    - **By Mouth**
      - Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily
      - Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily
      - Adult: 0.5–1 g twice daily
  - **Skin infections / Soft-tissue infections / Uncomplicated urinary-tract infections**
    - **By Mouth**
      - Child 6–17 years (body-weight 40 kg and above): 1 g once daily
      - Adult: 1 g daily

- **Pregnancy** Not known to be harmful.
- **Breast Feeding** Present in milk in low concentration, but appropriate to use.
- **Renal Impairment**
  - In adults 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².
  - In children Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

#### Side-effects

- **Rare** Antibiotic-associated colitis
- **Frequency not known** Abdominal discomfort, agranulocytosis, allergic reactions, anaphylaxis, aplastic anaemia, blood disorders, confusion, diarrhoea, disturbances in liver enzymes, dizziness, eosinophilia, haemolytic anaemia, hallucinations, headache, hyperactivity, hypertension, leucopenia, nausea, nervousness, pruritus, rashes, reversible interstitial nephritis, serum sickness–like reactions with rashes, fever and arthralgia, sleep disturbances, Stevens–Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, transient cholestatic jaundice, transient hepatitis, urticaria, vomiting

#### Drug Action

Cefalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.

#### Interactions

Appendix 1 (cephalosporins).
Cefalexin
(Cephalexin)

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 1-11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
  - Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
  - Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
  - Child 12-17 years: 500 mg 2–3 times a day
  - Adult: 250 mg every 6 hours, alternatively 500 mg every 8–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 1 month-11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
  - Child 12-17 years: 1–1.5 g 3–4 times a day

Prophylaxis of recurrent urinary-tract infection

- **BY MOUTH**
  - Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
  - Adult: 125 mg once daily, dose to be taken at night

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- In adults Max. 3 g daily if eGFR 40–50 mL/minute/1.73 m². Max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m². Max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m².
- In children Reduce dose in moderate impairment.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Cefalexin for bacterial infections www.medicinesforchildren.org.uk/cefalexin-bacterial-infections-0

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Cefalexin Capsules may be prescribed. Cefalexin Tablets may be prescribed. Cefalexin Oral Suspension may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **Cefadroxil** (Non-proprietary)
    - Cefadroxil (as Cefadroxil monohydrate) 500 mg Cefadroxil 500 mg capsules | 20 capsule | £11.90
  - **Cefalexin** (Non-proprietary)
    - Cefalexin 250 mg Cefalexin 250 mg capsules | 100 capsule | £11.50
    - Cefalexin 500 mg Cefalexin 500 mg capsules | 100 capsule | £22.38

**Cefalexin 500 mg**

Keflex 500 mg tablets | 21 tablet | £1.60 DT price = £1.80

**Capsule**

Cefalexin 500 mg | 28 capsule | £1.92

**Cefradine (Cephradine)**

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis

- **BY MOUTH**
  - Child 7-11 years: 25–50 mg/kg daily in 2–4 divided doses
  - Child 12-17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
  - Adult: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- In adults Use half normal dose if eGFR 5–20 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m².
- In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Cefradine Capsules may be prescribed.
**Cefaclor**

**Lower urinary-tract infection**
- **BY MOUTH**
  - Child 12-17 years: 125 mg twice daily
  - Adult: 125 mg twice daily

**Pyelonephritis**
- **BY MOUTH**
  - Adult: 250 mg twice daily

**Surgical prophylaxis**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

**Open fractures, prophylaxis**
- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

**Antibacterials > Cephalosporins, Third-Generation**

**Cefuroxime (as Cefuroxime sodium)**
- **1.5 gram** Zinacef 1.5g powder for injection vials | 1 vial (£0.52) | £5.00
- **750 mg** Zinacef 750mg powder for injection vials | 5 vial (£0.52) | £25.20

**Cefuroxime**

- **INDICATIONS AND DOSE**
  - **Acute infections due to sensitive Gram-positive and Gram-negative bacteria**
    - **BY MOUTH**
      - Child 6–11 months: 75 mg daily
      - Child 1–4 years: 100 mg daily
      - Child 5–9 years: 200 mg daily
      - Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
    - **Adult:** 200–400 mg daily in 1–2 divided doses

**Uncomplicated gonorrhoea**
- **BY MOUTH**
  - Adult: 400 mg for 1 dose

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS 9**
  - Suprax (Sanofi)
  - Cefuroxime 200 mg Suprax 200mg tablets | 7 tablet (£0.52) | £13.22 DT price = £13.23

**Cefotaxime**

- **INDICATIONS AND DOSE**
  - **Uncomplicated gonorrhoea**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: 500 mg for 1 dose

  - **Infections due to sensitive Gram-positive and Gram-negative bacteria** | Surgical prophylaxis | Haemophilus influenzae
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - **Adult:** 1 g every 12 hours

- **Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria** | Meningitis
  - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - **Adult:** 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

---

**Medication Administration**

- **According to patients’ medical condition**
  - For intravenous use in children
    - Single doses over 750 mg should be administered by the intravenous route only.
      - With intravenous use in children: Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.
      - With intravenous use in adults: For intravenous infusion (Zinacef®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg; 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.

- **Open fractures, prophylaxis**
  - Adult: 1.5 g every 8 hours until soft tissue closure (maximum duration 72 hours)

- **Pyelonephritis**
  - Adult: 250 mg twice daily

- **Surgical prophylaxis**
  - Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)

- **With intravenous use in children**
  - Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

- **With intravenous use in adults**
  - For intravenous infusion (Zinacef®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (at least 2 mL for each 250 mg; 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes.
Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1 month–11 years: 50 mg/kg for 1 dose
  - Child 12–17 years: 1 g for 1 dose
  - Adult: 1 g for 1 dose

- **SIDE-EFFECTS**
  - Rare  Arrhythmias (following rapid injection)

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **RENAL IMPAIRMENT**
  - In adults If eGFR less than 5 mL/minute/1.73 m², initial dose of 1 g then use half normal dose.
  - In children Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.
  - With intravenous use in adults For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Cefotaxime (Non-proprietary)**
  - Cefotaxime (as Cefotaxime sodium) 2 gram Cefotaxime 2g powder for solution for injection vials | 1 vial (£1.50) 10 vial (£25.20)
  - Cefotaxime (as Cefotaxime sodium) 500 mg Cefotaxime 500mg powder for solution for injection vials | 1 vial (£1.50) 10 vial (£25.50–£30.00)
  - Cefotaxime (as Cefotaxime sodium) 1 gram Cefotaxime 1g powder for solution for injection vials | 1 vial (£3.00) 10 vial (£35.00)

**Ceftazidime**

- **INDICATIONS AND DOSE**

  **Prophylaxis for transurethral resection of prostate**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 g, single dose to be administered up to 30 minutes before procedure and may be repeated if necessary when catheter removed

  **Pseudomonal lung infection in cystic fibrosis**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

  **Complicated urinary-tract infection**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–79 years: 1–2 g every 8–12 hours
  - Adult 80 years and over: 1–2 g every 8–12 hours; maximum 3 g per day

  **Septicaemia | Hospital-acquired pneumonia**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–79 years: 2 g every 8 hours
  - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day

  **Febrile neutropenia**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–79 years: 2 g every 8 hours
  - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day

  **Meningitis**
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–79 years: 2 g every 8 hours
  - Adult 80 years and over: 2 g every 8 hours; maximum 3 g per day

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult 18–79 years: 1–2 g every 8 hours
  - Adult 80 years and over: 1–2 g every 8 hours; maximum 3 g per day

- **SIDE-EFFECTS** Paraesthesia · taste disturbances

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only.
  - With intravenous use For intravenous infusion give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For Fortum® dilute further to a concentration of 40 mg/mL. For Kefadin® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Powder for solution for injection**

- **Cefotaxime (Non-proprietary)**
  - Cefotaxime (as Cefotaxime pentahydrate) 500 mg Cefotaxime 500mg powder for solution for injection vials | 1 vial (£1.50) 10 vial (£25.50–£30.00)
  - Cefotaxime (as Cefotaxime pentahydrate) 2 gram Cefotaxime 2g powder for solution for injection vials | 1 vial (£2.50) 10 vial (£40.00)
  - Cefotaxime (as Cefotaxime pentahydrate) 1 gram Cefotaxime 1g powder for solution for injection vials | 1 vial (£3.50) 10 vial (£35.00)
  - Cefotaxime (as Cefotaxime pentahydrate) 10 gram Cefotaxime 10g powder for solution for injection vials | 1 vial (£45.00) 10 vial (£395.00)
  - Cefotaxime (as Cefotaxime pentahydrate) 50 gram Cefotaxime 50g powder for solution for injection vials | 1 vial (£200.00) 10 vial (£2000.00)

- **Fortum** (GlaxoSmithKline UK Ltd)
  - Cefotaxime (as Cefotaxime pentahydrate) 1 gram Fortum 1g powder for solution for injection vials | 1 vial (£8.79) 10 vial (£87.90)
  - Cefotaxime (as Cefotaxime pentahydrate) 2 gram Fortum 2g powder for solution for injection vials | 1 vial (£17.59) 10 vial (£175.90)
  - Cefotaxime (as Cefotaxime pentahydrate) 3 gram Fortum 3g powder for solution for injection vials | 1 vial (£25.76) 10 vial (£257.60)
  - Cefotaxime (as Cefotaxime pentahydrate) 50 gram Fortum 50g powder for solution for injection vials | 1 vial (£4.40) 10 vial (£44.00)
Ceftriaxone

**INDICATIONS AND DOSE**

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections | Acute exacerbations of chronic obstructive pulmonary disease

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

Complicated skin and soft tissue infections | Infections of bones and joints

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 2 g once daily

**Suspected bacterial infection in neutropenic patients**

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

**Bacterial meningitis | Bacterial endocarditis**

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - By intravenous infusion
  - Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
  - Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - By intravenous injection
  - Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - By deep intramuscular injection
  - Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day
  - Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
  - Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

**Surgical prophylaxis**

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure

**Uncomplicated gonorrhoea | Pelvic inflammatory disease**

- By deep intramuscular injection
  - Adult: 500 mg for 1 dose

**Syphilis**

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 0.5–1 g once daily for 10–14 days, dose increased to 2 g once daily for neurosyphilis

**Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])**

- By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Adult: 2 g once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration

**Prevention of secondary case of meningococcal meningitis**

- By intramuscular injection
  - Adult: 250 mg for 1 dose

**Prevention of secondary case of Haemophilus influenzae type b disease**

- By intramuscular injection
  - Adult: 1 g daily for 2 days

**Acute otitis media**

- By deep intramuscular injection
  - Adult: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed

**UNLICENSED USE**

Not licensed for prophylaxis of Haemophilus influenzae type b disease. Not licensed for prophylaxis of meningococcal meningitis.

Dose not licensed for treatment of pelvic inflammatory disease in adults.

**CAUTIONS**

**GENERAL CAUTIONS**

History of hypercalciuria | history of kidney stones

**SPECIFIC CAUTIONS**

- With intravenous use | concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) (in adults)

**SIDE-EFFECTS**

**Common or very common**

Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic.

Calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobile—consider discontinuation if symptomatic.

**Uncommon**

Gental fungal infection

**Rare**

Bronchospasm | glycosuria | haematuria | prolongation of prothrombin time

**Frequency not known**

Convulsion | glossitis | oliguria | pancreatitis | stomatitis | toxic epidermal necrolysis | vertigo

**PREGNANCY**

Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. Specialist sources indicate suitable for use in pregnancy.

**BREAST FEEDING**

Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant.

**RENAL IMPAIRMENT**

Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available.

In adults

Manufacturer advises reduce dose if eGFR less than 10 mL/minute/1.73 m^2 (max. 2 g daily).

In children

Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m^2 max. 50 mg/kg daily or max. 2 g daily.

**MONITORING REQUIREMENTS**

Manufacturer advises to monitor full blood count regularly during prolonged treatment.

**DIRECTIONS FOR ADMINISTRATION**

- With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.

- With intravenous use in children For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%;
give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.

For intravenous injection, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.

- With intramuscular use in children For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous injection (see above). Displacement value may be significant, consult local guidelines.

- With intravenous use in adults For intravenous infusion (preferred route) (Rocephin®, Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes. Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.

For intravenous injection, give over 5 minutes.

- With intramuscular use in adults For intramuscular injection, doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous administration. Displacement value may be significant, consult local guidelines.

### Powder for solution for injection

#### ELECTROLYTES: May contain Sodium

- Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for injection vials | 1 vial £1.80–£2.30 DT price = £2.40
- Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial no price available DT price = £9.58 | 5 vial £45.75 | 10 vial £11.00
- Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial £18.40 DT price = £19.18 | 10 vial £21.00
- Rocephin (Roche Products Ltd) Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial £2.40 DT price = £2.40
- Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial £9.58 DT price = £9.58
- Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial £19.18 DT price = £19.18

### Ceftaroline fosamil

#### INDICATIONS AND DOSE

- Community-acquired pneumonia
  - BY INTRAVENOUS INFUSION
    - Adult: 600 mg every 12 hours for 5–7 days
- Complicated skin infections | Complicated soft-tissue infections
  - BY INTRAVENOUS INFUSION
    - Adult: 600 mg every 12 hours for 5–14 days

#### CAUTIONS

- Seizure disorders
- PREGNANCY Manufacturer advises avoid unless essential—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.

### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (Dec 2012) that ceftaroline fosamil (Zinforo®) is accepted for restricted use within NHS Scotland when meticillin-resistant S. aureus is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

- Ceftriaxone (Non-proprietary) Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial £1.80–£2.30 DT price = £2.40
- Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial no price available DT price = £9.58 | 5 vial £45.75 | 10 vial £11.00
- Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial £18.40 DT price = £19.18 | 10 vial £21.00
- Ceftriaxone 2g powder for solution for infusion vials | 1 vial £17.70 DT price = £19.18
- Rocephin (Roche Products Ltd) Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial £2.40 DT price = £2.40
- Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial £9.58 DT price = £9.58
- Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial £19.18 DT price = £19.18

### Ceftobiprole

#### INDICATIONS AND DOSE

Hospital-acquired pneumonia (excluding ventilator-associated pneumonia) | Community-acquired pneumonia

- BY INTRAVENOUS INFUSION
  - Adult: 500 mg every 8 hours

#### CAUTIONS

Pre-existing seizure disorder—increased risk of seizures · supra-normal creatinine clearance

#### CAUTIONS, FURTHER INFORMATION

Supra-normal creatinine clearance Manufacturer advises to measure baseline renal function and increase duration of infusion if creatinine clearance greater than 150 mL/minute.

#### SIDE-EFFECTS

- Common or very common Dysgeusia · dyspepsia
- Uncommon Agitation · asthma · dyspnoea · muscle spasm · pharyngolaryngeal pain · renal failure
- Frequency not known Convulsions
- PREGNANCY Manufacturer advises avoid unless essential—no information available.
Teicoplanin

**DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

**INDICATIONS AND DOSE**

### Clostridium difficile infection

- **BY MOUTH**
  - Adult: 100–200 mg twice daily for 10–14 days

### Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft-tissue infections, pneumonia)

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily
  - Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

### Streptococcal or enterococcal endocarditis (in combination with another antibiotic)

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection

### Bone and joint infections

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily, subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg

**Surgical prophylaxis**

- **BY INTRAVENOUS INJECTION**
  - Adult: 400 mg, to be administered up to 30 minutes before the procedure

**Surgical prophylaxis in open fractures**

- **BY INTRAVENOUS INFUSION**
  - Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

**Peritonitis associated with peritoneal dialysis (added to dialysis fluid)**

- **BY INTRAPERITONEAL INFUSION**
  - Adult: (consult local protocol)

**PHARMACOKINETICS**

Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for infusion

**ELECTROLYTES:** May contain Sodium

- **Zetera** (Basilea Pharmaceutica International Ltd) ▼
  - Cefotibiprole (as Cefotibiprole medocaril sodium) 500 mg Zetera 500mg powder for concentrate for solution for infusion vials | 10 vial £396.30 (Hospital only)

**ANTIBACTERIALS > GLYCOPEPTIDE ANTIBACTERIALS**

**UNLICENSED USE** Not licensed for surgical prophylaxis. Teicoplanin doses in BNF may differ from those in product literature.

**INTERACTIONS** → Appendix 1 (teicoplanin). If other nephrotoxic or neurotoxic drugs given, monitor renal and auditory function on prolonged administration.

**SIDE-EFFECTS**

- **Common or very common** Pruritus • rash
- **Uncommon** Bronchospasm • diarrhoea • dizziness • eosinophilia • fever • headache • leucopenia • mild hearing loss • nausea • thrombocytopenia • thrombophlebitis • tinnitus • vestibular disorders • vomiting
- **Frequency not known** Exfoliative dermatitis • nephrotoxicity • renal failure • Stevens-Johnson syndrome • toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Nephrotoxicity** Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

**ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

**MONITORING REQUIREMENTS**

- With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers.
  - Pre-dose ('trough') concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre.
  - Plasma-teicoplanin concentration should be measured in elderly patients.
  - Blood counts and liver and kidney function tests required.
Telavancin

**Drug Action** Telavancin is a glycopeptide antibiotic; it has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

**Indications and Dose**

*Hospital-acquired pneumonia, known or suspected to be caused by meticillin-resistant Staphylococcus aureus when other antibacterials cannot be used*

- **By Intravenous Infusion**
  - Adult: 10 mg/kg once daily for 7–21 days

**Cautions** Conditions that predispose to renal impairment predisposition to QT interval prolongation (including electrolyte disturbances, congenital long QT syndrome, uncompensated heart failure, severe left ventricular hypertrophy)

**Interactions** → Appendix 1 (telavancin). Use with caution if concomitant use with nephrotoxic drugs, drugs that prolong the QT interval or potentially ototoxic drugs.

**Side-effects**

- **Common or very common** Acute renal failure, chills, constipation, diarrhoea, dizziness, fungal infection, headache, insomnia, malaise, nausea, pruritus, rash, taste disturbances, vomiting
- **Uncommon** Abdominal pain, agitation, altered sense of smell, angina, antibiotic-associated colitis, anxiety, arthralgia, atrial fibrillation, back pain, blood disorders, blurred vision, bradyarrhythmia, confusion, congestive cardiac failure, decreased appetite, depression, dry mouth, dyspepsia, dysphagia, dysuria, electrolyte disturbances, erythema, eye irritation, flatulence, flushing, haematuria, hepatitis, hiccups, hyperhidrosis, hypertension, hypotension, increased INR, microalbuminuria, myalgia, nasal congestion, oedema, oliguria, oral hypoesthesia, palpitation, paraesthesia, pharyngolaryngeal pain, phlebitis, polyuria, pyrexia, QT interval prolongation, sinus tachycardia, somnolence, supraventricular extrasystoles, tinnitus, tremor, respiratory tract infection, urticaria, ventricular extrasystoles
- **Rare** Deafness
- **Frequency not known** Flushing of the upper body (‘red man’ syndrome), non-cardiac chest pain

**Allergy and Cross-sensitivity** Use with caution in patients with vancomycin or teicoplanin sensitivity.

**Conception and Contraception** Effective contraception required during treatment.

**Pregnancy** Avoid (teratogenic in animal studies).

**Breast Feeding** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**Hepatic Impairment** Manufacturer advises caution in severe impairment—no information available.

**Renal Impairment** In chronic renal failure, use 7.5 mg/kg once daily if eGFR 30–50 mL/minute/1.73 m². Avoid in acute renal failure—risk of mortality increased. In chronic renal failure, avoid if eGFR less than 30 mL/minute/1.73 m².

**Monitoring Requirements** Monitor renal function daily for at least the first 3–5 days, then every 2–3 days thereafter.

**Directions for Administration** For *intravenous infusion* (Vibativ®). Avoid rapid infusion (can cause ‘red man’ syndrome). Give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 750 mg with 45 mL glucose 5%, sodium chloride 0.9%, or water for injections to produce a 15 mg/mL solution; for doses of 150–800 mg, dilute requisite dose in 100 to 250 mL infusion fluid; for doses outside this range, dilute to a final concentration of 0.6–8 mg/mL; give over at least 60 minutes.

**Medicinal Forms**

- **Powder and solvent for solution for infusion**
  - Targocid (Sanofi)
  - Teicoplanin 200 mg Targocid 200 mg powder and solvent for solution for injection vials 1 vial £3.93
  - Teicoplanin 400 mg Targocid 400 mg powder and solvent for solution for injection vials 1 vial £7.32

**Vancomycin**

**Drug Action** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

**Indications and Dose**

*Clostridium difficile infection*

- **By Mouth**
  - Adult: 125 mg 4 times a day for 10–14 days; dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

**Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicemia and soft-tissue infections**

- **By Intravenous Infusion**
  - Adult: 1–1.5 g every 12 hours
  - Elderly: 500 mg every 12 hours, alternatively 1 g once daily

**Surgical prophylaxis (when high risk of MRSA)**

- **By Intravenous Infusion**
  - Adult: 1 g for 1 dose

**Peritonitis associated with peritoneal dialysis**

- **By Intraperitoneal Administration**
  - Adult: (consult local protocol)

**Pharmacokinetics**

Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.
UNLICENSED USE Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

CAUTIONS

GENERAL CAUTIONS
Avoid if history of deafness - elderly

SPECIFIC CAUTIONS
- With oral use systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses
- INTERACTIONS → Appendix 1 (vancomycin).

SIDE-EFFECTS
- Common or very common
  - With intravenous use Blood disorders, including neutropenia (usually after 1 week or cumulative dose of 25 g) - interstitial nephritis - nephrotoxicity - ototoxicity (discontinue if tinnitus occurs) - renal failure
- Rare
  - With intravenous use Agranulocytosis - thrombocytopenia
  - Frequency not known
  - With intravenous use Anaphylaxis - cardiac arrest on rapid infusion - chills - dyspnoea - eosinophilia - exfoliative dermatitis - fever - flushing of the upper body ('red man' syndrome) - nausea - pain and muscle spasm of back and chest - phlebitis (irritant to tissue) - pruritus - rashes - severe hypotension on rapid infusion - shock on rapid infusion - Stevens-Johnson syndrome - toxic epidermal necrolysis - urticaria - vasculitis - wheezing

SIDE-EFFECTS, FURTHER INFORMATION
- Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

ALLERGY AND CROSS-SENSITIVITY Caution if teicoplanin sensitivity.

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

BREAST FEEDING Present in milk—significant absorption following oral administration unlikely.

RENAL IMPAIRMENT Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.

MONITORING REQUIREMENTS
- All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
- With intravenous use Pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant Staphylococcus aureus or for complicated infections caused by S. aureus). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.
- All patients require blood counts, urinalysis, and renal function tests.
- Monitor auditory function in elderly.

DIRECTIONS FOR ADMINISTRATION
- With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites.
- With intravenous use For intravenous infusion (Vancocin ®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 ml water for injections and dilute with infusion fluid to a concentration of up to 5 mg/ml (10 mg/ml in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
- With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pastille, solution for injection, infusion

Capsule

CAUTIONARY AND ADVISORY LABELS
- Vancomycin (Non-proprietary)
  - Vancomycin (as Vancomycin hydrochloride) 125 mg
  - Vancomycin 125mg capsules
  - 28 capsule (POM) £132.47 DT price = £132.47
  - Vancomycin (as Vancomycin hydrochloride) 250 mg
  - Vancomycin 250mg capsules
  - 28 capsule (POM) £140.08 DT price = £140.08

Powder for solution for infusion

- Vancomycin (Non-proprietary)
  - Vancomycin (as Vancomycin hydrochloride) 500 mg
  - Vancomycin 500mg powder for solution for infusion vials
  - 1 vial (POM) £7.25
  - (Hospital only) 1 vial (POM) £7.25
  - Vancomycin 500mg powder for concentrate for solution for infusion vials
  - 1 vial (POM) £8.50
  - 10 vial (POM) £62.50

Antibacterial Agents

Lincosamides

Clindamycin

DRUG ACTION Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially Bacteroides fragilis. It is well concentrated in bone and excreted in bile and urine.

INDICATIONS AND DOSE
Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Meticillin-resistant Staphylococcus aureus (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipeloid or cellulitis in penicillin-allergic patients (alternative to macrolides)
- BY MOUTH
  - Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
  - Adult: 150–300 mg every 6 hours; increased if necessary up to 450 mg every 6 hours if required, increased dose used in severe infection
- BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
  - Adult: 0.6–2.7 g daily in 2–4 divided doses; increased if necessary up to 4.8 g daily, increased dose used in life-threatening infection, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

Treatment of mild to moderate pneumocystis pneumonia (in combination with primaquine)
- BY MOUTH
  - Adult: 600 mg every 8 hours

continued →
Treatment of falciparum malaria (to be given with or following quinine)

▶ BY MOUTH
- Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
- Adult: 450 mg every 8 hours for 7 days

UNLICENSED USE Not licensed for treatment of falciparum malaria. Not licensed for treatment of mild to moderate pneumocystis infection.

CONTRA-INDICATIONS Diarrhoeal states

CAUTIONS Avoid in acute porphyrias p. 930 • middle-aged and elderly women, especially after an operation (antibiotic-associated colitis more common)

INTERACTIONS → Appendix 1 (clindamycin).

SIDE-EFFECTS
- With intramuscular use Abscess • induration • pain
- With intravenous use Thrombophlebitis
- With systemic use Abdominal discomfort • anaphylactoid reactions • antibiotic-associated colitis • diarrhoea (discontinue treatment) • eosinophilia • exfoliative dermatitis • jaundice • leucopenia • nausea • oesophageal ulcers • oesophagitis • polyarthritits • pruritus • rash • Stevens-Johnson syndrome • taste disturbances • thrombocytopenia • toxic epidermal necrolysis • urticaria • vesiculobullous dermatitis • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Antibiotic-associated colitis Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

PREGNANCY Not known to be harmful.

BREAST FEEDING Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

MONITORING REQUIREMENTS
- Monitor liver and renal function if treatment exceeds 10 days.
- In children Monitor liver and renal function in neonates and infants.

DIRECTIONS FOR ADMINISTRATION Avoid rapid intravenous administration. For intravenous infusion (Dalacin™ Phosphate), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).

PATIENT AND CARER ADVICE Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue treatment and contact doctor if diarrhoea develops.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Clindamycin capsules may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

Dalacin C Phosphate 600mg/4ml solution for injection ampoules | 5 ampoule (PSt) £61.75

ANTIBACTERIALS › MACROLIDES

**Macrolides**

**Overview**

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many–penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 497 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 495 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 496 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 533.

Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

**Macrolides**

**CAUTIONS** Electrolyte disturbances (predisposition to QT interval prolongation) • may aggravate myasthenia gravis • predisposition to QT interval prolongation

**SIDE-EFFECTS**

Common or very common Abdominal discomfort • diarrhoea • nausea • vomiting

Uncommon Cholestatic jaundice • hepatotoxicity • rash

Rare Antibiotic-associated colitis • arrhythmias • pancreatitis • QT interval prolongation • Stevens-Johnson syndrome • toxic epidermal necrolysis
Azithromycin

**INDICATIONS AND DOSE**

- **Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin**
  - **BY MOUTH**
    - Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
    - Child 12-17 years: 500 mg once daily for 5 days
    - Adult: 500 mg once daily for 5 days

- **Respiratory-tract infections, otitis media, skin and soft-tissue infections**
  - **BY MOUTH**
    - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
    - Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
    - Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
    - Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
    - Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
    - Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
    - Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

- **Uncomplicated genital chlamydial infections**
  - **Non-gonococcal urethritis**
    - **BY MOUTH**
      - Child 12-17 years: 1 g for 1 dose
      - Adult: 1 g for 1 dose

- **Uncomplicated gonorrhoea**
  - **BY MOUTH**
    - Adult: 1 g for 1 dose

- **Lyme disease (under expert supervision)**
  - **BY MOUTH**
    - Adult: 500 mg once daily for 7–10 days

- **Mild to moderate typhoid due to multiple-antibacterial resistant organisms**
  - **BY MOUTH**
    - Adult: 500 mg once daily for 7 days

- **Community-acquired pneumonia, low to moderate severity**
  - **BY MOUTH**
    - Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

- **Community-acquired pneumonia, high severity**
  - **INITIALLY BY INTRAVENOUS INFUSION**
    - Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days

- **Antibacterial prophylaxis for insertion of intra-uterine device**
  - **BY MOUTH**
    - Adult: 1 g for 1 dose

**UNLICENSED USE**

- In children: Not licensed for typhoid fever or prophylaxis of group A streptococcal infection.
- In adults: Oral azithromycin not licensed for trachoma which results from chronic infection with *Chlamydia trachomatis*. Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

**INTERACTIONS**

- Appendix 1 (macrolides).
- Caution with concomitant use of drugs that prolong the QT interval.

**SIDE-EFFECTS**

- **Common or very common** Anorexia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy
- **Uncommon** Anxiety · chest pain · constipation · gastritis · hypoesthesia · leucopenia · oedema · photosensitivity · sleep disturbances
- **Rare** Agitation
- **Frequency not known** Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration

**PREGNANCY**

- Manufacturers advise use only if adequate alternatives not available.

**BREAST FEEDING**

- Present in milk; use only if no suitable alternatives.

**HEPATIC IMPAIRMENT**

- Manufacturers advise avoid in severe liver disease—no information available.

**RENAL IMPAIRMENT**

- In adults: Use with caution if eGFR less than 10 mL/minute.1.73 m².
- In children: Use with caution if estimated glomerular filtration rate less than 10 mL/minute.1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion (Zebdac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include cherry or banana.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary
  - Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

- Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - Adult: 500 mg twice daily |

**Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole**

- **BY MOUTH**
  - Adult: 250 mg twice daily

---

**SIDE-EFFECTS**

- **Common or very common** Dyspepsia, headache, hyperhidrosis, insomnia, taste disturbances
- **Uncommon** Anorexia, anxiety, blood disorders, chest pain, constipation, dizziness, dry mouth, flatulence, gastritis, glossitis, hepatic dysfunction including jaundice, leucopenia, malaise, myalgia, myopathy, nephritis, paraesthesia, psychotic disorders, renal failure, smell disturbances, tongue discoloration, tooth discoloration
- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.
- **RENAI IMPAIRMENT** Avoid if severe hepatic impairment also present.
  - In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid Klaricid XL® or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m².
  - In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid Klaricid XL® or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Klaricid® I.V.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

**Erythromycin**

**INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
  - Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
- **BY INTRAVENOUS INFUSION**
  - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Dosing**

**Adult:**
- 6.25 mg/kg every 6 hours, for mild infections when oral treatment not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Adult: 500 mg 4 times a day for 14–21 days

**Early syphilis**

- **BY MOUTH**
  - Adult: 500 mg 4 times a day for 14 days

**Uncomplicated genital chlamydia | Non-gonococcal urethritis**

- **BY MOUTH**
  - Adult: 500 mg twice daily for 14 days

**Chronic prostatitis**

- **BY MOUTH**
  - Adult: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 4 g daily in divided doses, dose increase may be used in severe infections
- **BY INTRAVENOUS INFUSION**
  - Adult: 6.25 mg/kg every 6 hours, for mild infections when oral treatment is not possible, increased to 12.5 mg/kg every 6 hours, dose increase may be used in severe infections

**Prevention and treatment of pertussis**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
  - Adult: (consult local protocol)

**Prevention of secondary case of diphtheria in non-immune patient**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Adult: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

**Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg every 6 hours for 10 days
  - Child 2-7 years: 250 mg every 6 hours for 10 days
  - Child 8-17 years: 250–500 mg every 6 hours for 10 days
  - Adult: 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - Child 2-7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell...
disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

- Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
- Adult: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

**Prevention of recurrence of rheumatic fever**

- **BY MOUTH**
  - Child 1 month–1 year: 125 mg twice daily
  - Child 2–17 years: 250 mg twice daily

**Rosacea**

- **BY MOUTH**
  - Adult: 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

**Acne**

- **BY MOUTH**
  - Adult: 500 mg twice daily

- **CAUTIONS** Avoid in acute porphyrias p. 930
- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.
- **RENAL IMPAIRMENT**
  - In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
  - In children Reduce dose in severe renal impairment (ototoxicity).
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
  - With intravenous use in adults For intravenous infusion (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 9

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin ethyl succinate) 500 mg Erythromycin ethyl succinate 500 mg tablets | 28 tablet (Pom) £15.95–£19.50 DT price = £10.78
  - Erythromycin (AMCo)
    - Erythromycin (as Erythromycin stearate) 250 mg Erythromycin 250 tablets | 100 tablet (Pom) £18.20 DT price = £18.20

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS** 5, 9, 25

- **Erythromycin (Non-proprietary)**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant capsules | 28 capsule (Pom) no price available DT price = £5.61 | 30 capsule (Pom) no price available
  - Erymax (Teva UK Ltd)
    - Erythromycin 250 mg Erymax 250mg gastro-resistant capsules | 28 capsule (Pom) £5.61 DT price = £5.61 | 22 capsule (Pom) £22.44
  - Tiloryth (Tilomed Laboratories Ltd)
    - Erythromycin 250 mg Tiloryth 250mg gastro-resistant capsules | 30 capsule (Pom) £5.65 | 100 capsule (Pom) £18.66

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 9

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythromycin ethyl succinate 125mg/5ml oral suspension | 100 ml (Pom) £4.05 DT price = £4.05
    - Erythromycin ethyl succinate 125 mg/5 ml oral suspension sugar free sugar-free | 100 ml (Pom) £4.99 DT price = £3.58
  - Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythromycin ethyl succinate 250mg/5ml oral suspension | 100 ml (Pom) £6.38 DT price = £6.38
    - Erythromycin ethyl succinate 250 mg/5 ml oral suspension sugar free sugar-free | 100 ml (Pom) £7.99 DT price = £5.27
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythromycin ethyl succinate 500mg/5ml oral suspension | 100 ml (Pom) £11.24 DT price = £11.24
    - Erythromycin ethyl succinate 500 mg/5 ml oral suspension sugar free sugar-free | 100 ml (Pom) no price available
  - Erythroped (AMCo)
    - Erythromycin (as Erythromycin ethyl succinate) 25 mg per 1 ml Erythroped PI SF 125mg/5ml oral suspension sugar-free | 140 ml (Pom) £3.06
    - Erythromycin (as Erythromycin ethyl succinate) 50 mg per 1 ml Erythroped SF 250mg/5ml oral suspension sugar-free | 140 ml (Pom) £5.95
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythroped Forte SF 500mg/5ml oral suspension sugar-free | 140 ml (Pom) £10.56 DT price = £10.56

**Powder for solution for infusion**

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin lactobionate)
    - 1 gram Erythromycin 1g powder for solution for infusion vials | 1 vial (Pom) £22.92
ANTIBACTERIALS > MONOBACTAMS

Aztreonam

- **DRUG ACTION** Aztreonam is a monobactam beta-lactam antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

- **INDICATIONS AND DOSE**
  - Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*
    - By deep intramuscular injection, or by intravenous infusion, or by intravenous injection
    - Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g intravenous route only
  - Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis
    - By intravenous infusion, or by intravenous injection
    - Adult: 2 g every 6–8 hours
  - Gonorrhoea | Cystitis
    - By intramuscular injection
    - Adult: 1 g for 1 single dose
  - Urinary-tract infections
    - By deep intramuscular injection, or by intravenous infusion, or by intravenous injection
    - Adult: 0.5–1 g every 8–12 hours
  - Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis
    - By inhalation of nebulised solution
    - Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

- **CAUTIONS**
  - When used by inhalation Haemoptysis — risk of further haemorrhage

- **INTERACTIONS**
  - Antibiotics

- **SIDE-EFFECTS**
  - General side-effects
    - Bronchospasm, rash
  - Specific side-effects
    - Rare
    - With systemic use
      - Antibiotic-associated colitis
      - Asthenia
      - Blood disorders
      - Breast tenderness
      - Chest pain
      - Confusion
      - Diplopia
      - Dizziness
      - Dyspnoea
      - Gastro-intestinal bleeding
      - Hallitosis
      - Headache
      - Hepatitis
      - Hypotension
      - Insomnia
      - Jaundice
      - Myalgia
      - Neutropenia
      - Paraesthesia
      - Seizures
      - Thrombocytopenia
      - Tinnitus
  - Frequency not known
    - When used by inhalation
      - Arthralgia
      - Cough
      - Haemoptysis
      - Pharyngolaryngeal pain
      - Pyrexia
      - Rhinorrhoea
      - Wheezing
    - With systemic use
      - Abdominal pain
      - Diarrhoea
      - Erythema multiforme
      - Flushing
      - Mouth ulcers
      - Nausea
      - Taste disturbances
      - Toxic epidermal necrolysis
      - Vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity.
  - Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

- **PREGNANCY**
  - With systemic use
    - No information available; manufacturer of injection advises avoid
  - When used by inhalation
    - No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

- **HEPATIC FEEDING**
  - Amount in milk probably too small to be harmful.

- **RENAI IMPAIRMENT**
  - With systemic use
    - If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

- **MONITORING REQUIREMENTS**
  - When used by inhalation
    - Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous injection, give over 3–5 minutes.
  - With intravenous use
    - For intravenous infusion (Azactam®), give intermittently in Glucose 5% or Sodium chloride 0.9%.
    - Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
  - When used by inhalation
    - Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (*Cayston®*) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - Azactam (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Aztreonam 1 gram
      - Azactam 1g powder for solution for injection vials | £3.90 (Hospital only)
    - Aztreonam 2 gram
      - Azactam 2g powder for solution for injection vials | 1 vial POM £18.82 (Hospital only)
  - **Powder and solvent for nebuliser solution**
    - Cayston (Gilead Sciences International Ltd)
    - Aztreonam (as Aztreonam lysine) 75 mg
      - Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vials POM £2,181.53

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

- **INDICATIONS AND DOSE**
  - **Anaerobic infections**
    - By mouth
      - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
      - Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
Infection

- **Child 12-17 years**: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
- **Adult**: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - **BY RECTUM**
  - **Child 1-11 months**: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
  - **Child 1-4 years**: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
  - **Child 5-9 years**: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
  - **Child 10-17 years**: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
  - **Adult**: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
  - **BY INTRAVENOUS INFUSION**
  - **Adult**: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

*Helicobacter pylori* eradication; in combination with clarithromycin and esomprazole; or in combination with clarithromycin and lansoprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole
  - **BY MOUTH**
  - **Adult**: 400 mg twice daily

*Helicobacter pylori* eradication; in combination with amoxicillin and omeprazole
  - **BY MOUTH**
  - **Adult**: 400 mg 3 times a day

*Helicobacter pylori* eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dicitrato-bismuthate plus tetracycline)
  - **BY MOUTH**
  - **Adult**: 400–500 mg 3 times a day for 2 weeks

**Fistulating Crohn’s disease**
  - **BY MOUTH**
  - **Adult**: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

**Leg ulcers and pressure sores**
  - **BY MOUTH**
  - **Adult**: 400 mg every 8 hours for 7 days

**Bacterial vaginosis (notably *Gardnerella vaginalis* infection)**
  - **BY MOUTH**
  - **Adult**: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Bacterial vaginosis**
  - **BY VAGINA USING VAGINAL GEL**
  - **Adult**: 1 applicatorful daily for 5 days, dose to be administered at night

**DOSE EQUIVALENT AND CONVERSION**
  - 1 applicatorful delivers a 5g dose of metronidazole 0.75%.

**Pelvic inflammatory disease**
  - **BY MOUTH**
  - **Adult**: 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**
  - **BY MOUTH**
  - **Child 1-2 years**: 50 mg every 8 hours for 3 days
  - **Child 3-6 years**: 100 mg every 12 hours for 3 days
  - **Child 7-9 years**: 100 mg every 8 hours for 3 days
  - **Child 10-17 years**: 200–250 mg every 8 hours for 3–7 days
  - **Adult**: 400 mg every 8 hours for 3–7 days

**Acute oral infections**
  - **BY MOUTH**
  - **Child 1-2 years**: 50 mg every 8 hours for 3–7 days
  - **Child 3-6 years**: 100 mg every 12 hours for 3–7 days
  - **Child 7-9 years**: 100 mg every 8 hours for 3–7 days
  - **Child 10-17 years**: 200–250 mg every 8 hours for 3–7 days
  - **Adult**: 400 mg every 8 hours for 3–7 days

**Surgical prophylaxis**
  - **BY MOUTH**
  - **Adult**: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

  - **BY RECTUM**
  - **Adult**: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

  - **BY INTRAVENOUS INFUSION**
  - **Adult**: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

**Invasive intestinal amoebiasis | Extra-intestinal amoebiasis (including liver abscess)**
  - **BY MOUTH**
  - **Child 1-2 years**: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - **Child 3-6 years**: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - **Child 7-9 years**: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - **Child 10-17 years**: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - **Adult**: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**
  - **BY MOUTH**
  - **Child 1-2 years**: 50 mg 3 times a day for 7 days
  - **Child 3-6 years**: 100 mg twice daily for 7 days
  - **Child 7-9 years**: 100 mg 3 times a day for 7 days
  - **Child 10-17 years**: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
  - **Adult**: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**
  - **BY MOUTH**
  - **Child 1-2 years**: 500 mg once daily for 3 days
  - **Child 3-6 years**: 600–800 mg once daily for 3 days
  - **Child 7-9 years**: 1 g once daily for 3 days
  - **Child 10-17 years**: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days
  - **Adult**: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

**Established case of tetanus**
  - **BY INTRAVENOUS INFUSION**
  - **Adult**: (consult product literature)

- **UNLICENSED USE**
- With systemic use in adults Metronidazole doses in the BNF may differ from those in product literature.
**Cautions**
- With vaginal use  Not recommended during menstruation • some systemic absorption may occur with vaginal gel

**Interactions**
- With systemic use  → Appendix 1 (metronidazole).  Caution—disulfiram-like reaction with alcohol.

**Side-effects**
- **Very rare**
  - With systemic use  Arthralgia • ataxia • darkening of urine • dizziness • drowsiness • erythema multiforme • headache • hepatitis • jaundice • leucopenia (on prolonged or intensive therapy) • myalgia • pancreatitis • pancytopenia • peripheral neuropathy (on prolonged or intensive therapy) • pruritus • psychiatric disorders • rash • thrombocytopenia • transient epileptiform seizures (on prolonged or intensive therapy) • visual disturbances

- **Frequency not known**
  - With systemic use  Anorexia • aseptic meningitis • furred tongue • gastro-intestinal disturbances • nausia • optic neuropathy • oral mucositis • taste disturbances • vomiting

- With vaginal use  Abnormal vaginal discharge • local irritation • pelvic discomfort • vaginal candidiasis

**Pregnancy**
- With systemic use  Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

**Breast Feeding**
- With systemic use  Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

**Hepatic Impairment**
- With systemic use  In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.

**Monitoring Requirements**
- With systemic use  Clinical and laboratory monitoring advised if treatment exceeds 10 days.

**Directions for Administration**
- For intravenous infusion, give over 20–30 minutes.

**Prescribing and Dispensing Information**
- Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

---

**Tinidazole**

**Drug Action**
- Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

**Indications and Dose**
- **Anaerobic infections**
  - **By mouth**
    - Adult: Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days

**Bacterial Vaginosis**
- **Acute ulcerative gingivitis**
  - **By Mouth**
    - Adult: 2 g for 1 single dose

**Abdominal Surgery Prophylaxis**
- **By Mouth**
  - Adult: 2 g for 1 single dose, to be administered approximately 12 hours before surgery

**Intestinal amoebiasis**
- **By Mouth**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
  - Child 12–17 years: 2 g once daily for 2–3 days
  - Adult: 2 g once daily for 2–3 days

**Amebic involvement of liver**
- **By Mouth**
  - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
  - Child 12–17 years: 1.5–2 g once daily for 3–6 days
  - Adult: 1.5–2 g once daily for 3–6 days

**Urogenital trichomoniasis**
- **Giardiasis**
  - **By Mouth**
    - Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
    - Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
    - Adult: 2 g for 1 single dose

**Helicobacter pylori eradication**
- **By Mouth**
  - Adult: (consult local protocol)
Infection

Benzylpenicillin sodium p.

Penicillins

MONITORING REQUIREMENTS

BREAST FEEDING

▶ Very rare

SIDE-EFFECTS

▷ Common or very common Anorexia · furred tongue · gastrointestinal disturbances · nausea · oral mucositis · taste disturbances · vomiting

▷ Very rare Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances

▷ Frequency not known Aseptic meningitis · optic neuropathy

PREGNANCY

Manufacturer advises avoid in first trimester.

BREAST FEEDING

Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

MONITORING REQUIREMENTS

Clinical and laboratory monitoring advised if treatment exceeds 10 days.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

  DT price = £11.04

ANTIBACTERIALS > PENICILLINS

Penicillins

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium p. 504 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 499 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection. Benzathine benzylpenicillin is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin p. 505 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 511, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 512 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against Pseudomonas aeruginosa or Acinetobacter spp.

Broad-spectrum penicillins

Ampicillin p. 507 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by Staphylococcus aureus and by common Gram-negative bacilli such as Escherichia coli. Almost all staphylococci, approx. 60% of E. coli strains and approx. 20% of Haemophilus influenzae strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to Streptococcus pneumoniae and H. influenzae, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 506) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat.

The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Ampicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Ampicillin may also be used for the treatment of Lyme disease (not licensed).

Co-amoxiclav p. 508 consists of amoxicillin with the betalactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staph. aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil p. 508) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 503 has activity against a wider range of Gram-negative
organisms than ticarcillin with clavulanic acid p. 504 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 479) since they have a synergistic effect.

**Mecillinams**

Pivmecillinam hydrochloride p. 510 has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

---

**Penicillins**

- **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.
- **CAUTIONS** History of allergy
- **INTERACTIONS** → Appendix 1 (penicillins).
- **SIDE-EFFECTS**
  - Common or very common
    - Anaphylaxis • angioedema • diarrhoea • fever • hypersensitivity reactions • joint pains • rash • serum sickness–like reaction • urticaria
  - Rare
    - Cerebral irritation • CNS toxicity (including convulsions) • coagulation disorders • encephalopathy • haemolytic anaemia • interstitial nephritis • leucopenia • thrombocytopenia
  - Frequency not known
    - Antibiotic–associated colitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - CNS toxicity A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.
  - Diarrhoea Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic–associated colitis.
- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

---

**Antibacterials > Penicillins, Antipseudomonal with beta-lactamase inhibitor**

**Piperacillin with tazobactam**

- **INDICATIONS AND DOSE**
  - Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues
  - By intravenous infusion
    - Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
  - Infections in neutropenic patients
    - By intravenous infusion
    - Adult: 4.5 g every 6 hours

- **CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)
- **SIDE-EFFECTS**
  - Common or very common
    - Nausea • vomiting
  - Uncommon
    - Constipation • dyspepsia • headache • hypotension • injection-site reactions • insomnia • jaundice • stomatitis
  - Rare
    - Abdominal pain • eosinophilia • hepatitis
  - Very rare
    - Hypoglycaemia • hypokalaemia • pancytopenia • Steven–Johnson syndrome • toxic epidermal necrolysis
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.
- **BREAST FEEDING** Trace amount in milk, but appropriate to use.
- **RENAL IMPAIRMENT**
  - Max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m². Max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.5 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (*Tazocin*® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion
  - **Powder for solution for injection**
    - **ELECTROLYTES:** May contain Sodium
      - Piperacillin with tazobactam (Non-proprietary)
        - Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg
        - Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial(P) £7.96 DT price + £7.91 (Hospital only) | 1 vial(P) £7.91 DT price + £7.91 | 10 vial(P) £10.31-£50.80
Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials | 1 vial | £15.77–£15.79
| (hospital only) | 1 vial | £12.90

- **Tazocin** (Pfizer Ltd)
  - Piperacillin (as Piperacillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg Tazocin 2.25g powder for solution for injection vials | 1 vial | £6.65 DT price + £7.91
  - Piperacillin (as Piperacillin sodium) 4 gram, Tazobactam (as Tazobactam sodium) 500 mg Tazocin 4.5g powder for solution for injection vials | 1 vial | £15.17 (Hospital only)

### Ticarcillin with clavulanic acid

#### INDICATIONS AND DOSE

**Infections due to *Pseudomonas* and *Proteus* spp.**

- **BY INTRAVENOUS INFUSION**
- **Child:** 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

- **CAUTIONS**
  - High doses may lead to hypernatraemia (owing to sodium content of preparations)

- **CAUTIONS, FURTHER INFORMATION**
  - **Cholestatic jaundice**
    - Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **SIDE-EFFECTS**
  - Eosinophilia, haemorrhagic cystitis (more frequent in children), hypokalaemia, injection-site reactions, nausea, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting

- **PREGNANCY**
  - Not known to be harmful.

- **BREAST FEEDING**
  - Trace amounts in milk, but appropriate to use.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT**
  - Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

- **EFFECT ON LABORATORY TESTS**
  - False-positive urinary glucose (if tested for reducing substances).

- **DIRECTIONS FOR ADMINISTRATION**
  - For **intravenous infusion** (Timentin®), give intermittently in glucose 5%. Suggested volume (depending on dose) 100–150 mL; give over 30–40 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

#### MEDICINAL FORMS

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain potassium, sodium
    - Timentin (GlaxoSmithKline UK Ltd)
      - Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial | £21.32

### ANTIBACTERIALS > PENICILLINS, BETA-LACTAMASE SENSITIVE

#### Benzylpenicillin sodium

*(Penicillin G)*

#### INDICATIONS AND DOSE

- **Mild to moderate susceptible infections**
  - **Throat infections**
    - **Otis media**
    - **Cellulitis**
    - **Pneumonia**
      - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
        - **Adult:** 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only
      - **Endocarditis (in combination with other antibacterial if necessary)**
        - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
        - **Adult:** 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis
      - **Anthrax (in combination with other antibacterials)**
        - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
        - **Adult:** 2.4 g every 4 hours
    - **Intraperitoneal prophylaxis against group B streptococcal infection**
      - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - **Adult:** Initially 3 g for 1 dose, then 1.5 g every 4 hours until delivery
    - **Meningitis | Meningococcal disease**
      - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - **Adult:** 2.4 g every 4 hours
      - **BY INTRAVENOUS INFUSION**
        - **Child:** 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)
    - **Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital**
      - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
        - **Child 1–11 months:** 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
        - **Child 1–9 years:** 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
        - **Child 10–17 years:** 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
      - **BY INTRAVENOUS INFUSION**
        - **Adult:** 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer
        - **Child 1–11 months:** 300 mg, administer as single dose prior to transfer to hospital
        - **Child 1–9 years:** 600 mg, administer as single dose prior to transfer to hospital
        - **Child 10–17 years:** 1.2 g, administer as single dose prior to transfer to hospital
      - **Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently**
        - **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
        - **Child 1–11 months:** 300 mg, administer as single dose prior to transfer to hospital
        - **Child 1–9 years:** 600 mg, administer as single dose prior to transfer to hospital
        - **Child 10–17 years:** 1.2 g, administer as single dose prior to transfer to hospital
      - **Adult:** 1.2 g, administer as single dose prior to transfer to hospital
**Phenoxymethylpenicillin**

(Penicillin V)

### INDICATIONS AND DOSE

**Oral infections** | **Tonsillitis** | **Otitis media** | **Erysipelas** | **Cellulitis**
---|---|---|---|---
**BY MOUTH**
- **Child 1-11 months:** 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day.
- **Child 1-5 years:** 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day.
- **Child 6-11 years:** 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day.
- **Child 12-17 years:** 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day.
- **Adult:** 500 mg every 6 hours, increased if necessary up to 1 g every 6 hours.

---

**Prevention of recurrence of rheumatic fever**

- **BY MOUTH**
  - **Child 1 month–5 years:** 125 mg twice daily
  - **Child 6-17 years:** 250 mg twice daily
  - **Adult:** 250 mg twice daily

**Prevention of secondary case of invasive group A streptococcal infection**

- **BY MOUTH**
  - **Child 1-11 months:** 62.5 mg every 6 hours for 10 days
  - **Child 1-5 years:** 125 mg every 6 hours for 10 days
  - **Child 6-11 years:** 250 mg every 6 hours for 10 days
  - **Child 12-17 years:** 250–500 mg every 6 hours for 10 days
  - **Adult:** 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**

- **BY MOUTH**
  - **Child 1-11 months:** 62.5 mg twice daily
  - **Child 1-4 years:** 125 mg twice daily
  - **Child 5-17 years:** 250 mg twice daily
  - **Adult:** 250 mg twice daily

---

**Phenoxymethylpenicillin**

(Penicillin V)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:

- **Powder for solution for injection**
  - **Benzylpenicillin sodium (Non-proprietary)**
    - **Benzylpenicillin sodium 1.2 gram** Phenoxymethylpenicillin 1.2g powder for solution for injection vials | 25 vial | £78.64–£92.01 DT price = £85.33
    - **Benzylpenicillin sodium 600 mg** Phenoxymethylpenicillin 600mg powder for solution for injection vials | 2 vial | £4.67–£5.46 DT price = £5.46

**ELECTROLYTES:** May contain Sodium

- **Benzylpenicillin sodium (as Phenoxymethylpenicillin potassium)**
  - **250 mg** Phenoxymethylpenicillin potassium 250mg tablets | 28 tablet | £5.00 DT price = £1.04

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium)**
  - **25 mg per 1 ml** Phenoxymethylpenicillin 125mg/5ml oral solution | 100 ml | £34.00 DT price = £14.73
  - **50 mg per 1 ml** Phenoxymethylpenicillin 250mg/5ml oral solution sugar free sugar-free | 100 ml | £55.00 DT price = £16.02

**Oral solution**

- **Phenoxymethylpenicillin (as Phenoxymethylpenicillin potassium)**
  - **25 mg per 1 ml** Phenoxymethylpenicillin 125mg/5ml oral solution | 100 ml | £34.00 DT price = £14.73
  - **50 mg per 1 ml** Phenoxymethylpenicillin 250mg/5ml oral solution sugar free sugar-free | 100 ml | £55.00 DT price = £16.02
**Antibacterials > Penicillins, Broad-Spectrum**

**Amoxicillin**

**(Amoxicillin)**

- **Indications and Dose**

  **Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)**

  - **By Mouth**
    - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
    - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
    - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
    - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g every 8 hours, increased dose in severe infections
    - Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections
  
  - **By Intramuscular Injection**
    - Adult: 500 mg every 8 hours

  - **By Intravenous Infusion, or by Intravenous Infusion, or by Intravenous Infusion**
    - Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, used increased dose in severe infections

- **Lyme disease (under expert supervision)**

  - **By Mouth**
    - Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
    - Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

- **Anthrax (treatment and post-exposure prophylaxis)**

  - **By Mouth**
    - Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
    - Child (body-weight 20 kg and above): 500 mg 3 times a day
    - Adult: 500 mg 3 times a day

- **Dental abscess (short course)**

  - **By Mouth**
    - Adult: 3 g, then 3 g after 8 hours

- **Urinary-tract infections (short course)**

  - **By Mouth**
    - Adult: 3 g, then 3 g after 10–12 hours

- **Listerial meningitis (in combination with another antibiotic)**

  - **By Intravenous Infusion**
    - Adult: 2 g every 4 hours

- **Endocarditis (in combination with another antibiotic if necessary)**

  - **By Intravenous Infusion**
    - Adult: 2 g every 4 hours

- **Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease—if cover also needed for Haemophilus influenzae**

  - **By Mouth**
    - Child 1 month–4 years: 125 mg twice daily
    - Child 5–11 years: 250 mg twice daily
    - Child 12-17 years: 500 mg twice daily

- **Helicobacter pylori eradication in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

  - **By Mouth**
    - Adult: 1 g twice daily

**Helicobacter pylori eradication**

- **Unlicensed Use** Amoxicillin doses in BNF Publications may differ from those in product literature.

- **Cautions**

  **General Cautions**

  Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parenteral therapy)

  **Specific Cautions**

  - With intravenous use Accumulation of sodium can occur with high parenteral doses

- **Side-Effects**

  - **Common or very common** Nausea - vomiting

  **Side-Effects, Further Information**

  Rash If rash occurs, discontinue treatment.

- **Pregnancy** Not known to be harmful.

- **Breast Feeding** Trace amount in milk, but appropriate to use.

- **Renal Impairment** Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). With intravenous use Accumulation of sodium from injection can occur in patients with renal failure.

- **Directions for Administration** For intravenous infusion (Amoxil®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

- **Prescribing and Dispensing Information** Flavours of oral liquid formulations and sachets may include peach, strawberry, or lemon.

- **Patient and Carer Advice**

  Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

  Medicines for Children Leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0

- **Profession Specific Information**

  Dental practitioners' formulary

  Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

- **Medicinal Forms**

  There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Cautionary and Advisory Labels**

- **Amoxicillin (Non-proprietary)**

  Amoxicillin (as Amoxicillin trihydrate) 250 mg Amoxicillin 250mg capsules | 15 capsule [PO] £5.00 DT price = £0.77 | 21 capsule [PO] £5.00 DT price = £1.08 | 500 capsule [PO] £120.00

  Amoxicillin (as Amoxicillin trihydrate) 500 mg Amoxicillin 500mg capsules | 15 capsule [PO] £7.50 DT price = £0.90 | 21 capsule [PO] £15.00 DT price = £1.26 | 100 capsule [PO] £75.00
Ampicillin

**INDICATIONS AND DOSE**

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

- **By mouth**
  - Child 1–11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
  - Child 1–4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
  - Child 5–11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)
  - Child 12–17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection
  - Adult: 0.5–1 g every 6 hours
  - **By intravenous injection, or by intravenous infusion**
  - Adult: 500 mg every 4–6 hours
  - **By intramuscular injection**
  - Adult: 500 mg every 4–6 hours

**Endocarditis** (in combination with another antibiotic if necessary) | **Listerial meningitis** (in combination with another antibiotic)

- **By intravenous infusion**
  - Adult: 2 g every 4 hours

- **UNLICENSED USE** Ampicillin doses in BNF may differ from those in product literature.

**CAUTIONS**

**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) • chronic lymphocytic leukaemia (increased risk of erythematous rashes) • cytomegalovirus infection (increased risk of erythematous rashes) • glandular fever (erythematous rashes common)

**SPECIFIC CAUTIONS**

- With intravenous use: Accumulation of electrolytes contained in parenteral preparations can occur with high doses

**SIDE-EFFECTS**

- Common or very common: Nausea, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash: If rash occurs, discontinue treatment

**PREGNANCY** Not known to be harmful

**RENAL IMPAIRMENT**

- In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common
- In children: If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common
- With intravenous use: Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use: Administer at least 30 minutes before food
- With intravenous use: For intravenous infusion (Penbritin®), give intermittently in glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in glucose 5% or Sodium chloride 0.9%. Continuous infusion not usually recommended.

- **Ampicillin (Non-proprietary)**
  - Amoxicillin (as Ampicillin sodium) 1 gram | 1 vial POM £16.50 DT price = £10.96
  - Amoxicillin (as Ampicillin sodium) 250 mg | 10 vial POM £4.65
  - Amoxicillin (as Ampicillin sodium) 500 mg | 10 vial POM £8.55

**SUGGESTED VOLUME**

- In adults: 500–1000 mL given over 60–90 minutes via drip tubing in glucose 5% or Sodium chloride 0.9%.

**DRUG-INTERACTIONS**

- May increase plasma concentration of other drugs

**PRESENTATION**

- Capsule
- Oral suspension
- Powder for solution for injection

**BNF**

503
Co-fluampicil

**INDICATIONS AND DOSE**

**Mixed infections involving beta-lactamase-producing staphylococci**

- **By mouth**
  - Child 1 month–9 years: 125/250 mg every 6 hours
  - Child 10–17 years: 250/500 mg every 6 hours
  - Adult: 500/500 mg every 6 hours
- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - Adult: 250/250 mg every 6 hours

**Severe mixed infections involving beta-lactamase-producing staphylococci**

- **By mouth**
  - Child 1 month–9 years: 250/250 mg every 6 hours
  - Adult: 500/500 mg every 6 hours
- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - Adult: 500/500 mg every 6 hours

**INDICATIONS AND DOSE**

- **Co-fluampicil**
  - Mixed infections involving beta-lactamase-producing staphylococci
  - Severe mixed infections involving beta-lactamase-producing staphylococci

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Magnapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

**INDICATIONS AND DOSE**

**Flucloxacillin**

**Mixed infections involving beta-lactamase-producing staphylococci**

- **By mouth**
  - Child 1 month–9 years: 125/250 mg every 6 hours
  - Child 10–17 years: 250/500 mg every 6 hours
  - Adult: 500/500 mg every 6 hours
- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - Adult: 250/250 mg every 6 hours

**Severe mixed infections involving beta-lactamase-producing staphylococci**

- **By mouth**
  - Child 1 month–9 years: 250/250 mg every 6 hours
  - Adult: 500/500 mg every 6 hours
- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - Adult: 500/500 mg every 6 hours

**IMPORTANT SAFETY INFORMATION**

**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**CAUTIONS**

**GENERAL CAUTIONS**

Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common)

**SPECIFIC CAUTIONS**

- With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses

**SIDE-EFFECTS**

- Common or very common Gastro-intestinal disturbances - nausea - vomiting
- Very rare Cholestatic jaundice - hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash If rash occurs, discontinue treatment.
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Trace amount in milk, but appropriate to use.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT**

- **In adults** Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.
- **In children** Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**ANTIBACTERIALS **

**PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR**

**Co-amoxiclav**

**INDICATIONS AND DOSE**

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites**

- **By mouth using tablets**
  - Child 12–17 years: 250/125 mg every 8 hours; increased to 500/250 mg every 8 hours, increased dose used for severe infection
  - Adult: 250/125 mg every 8 hours; increased to 500/250 mg every 8 hours, increased dose used for severe infection
- **By intravenous injection, or by intravenous infusion**
  - Child 2–3 months: 30 mg/kg every 12 hours
  - Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)
  - Adult: 1.2 g every 8 hours

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)**

- **By mouth using oral suspension**
  - Child 1–11 months: 0.25 mL/kg/3 times a day, dose doubled in severe infection
  - Child 1–5 years: 0.25 mL/kg/3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Magnapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

**INDICATIONS AND DOSE**

- **Co-amoxiclav**
  - (Non-proprietary)
    - Ampicillin (as Amoxicillin trihydrate) 25 mg per 1 mL, Flucloxacillin (as Flucloxacillin sodium) 250 mg Co-fluampicil
  - 250 mg Co-fluampicil 250mg/250mg capsules [28 capsule (£10.31 DT price = £2.06] 100 capsule (£9.47–£42.99

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 9, 22

- **Co-amoxiclav** (Non-proprietary)
  - Ampicillin (as Amoxicillin trihydrate) 25 mg per 1 mL, Flucloxacillin (as Flucloxacillin sodium magnesium) 25 mg per 1 mL Co-fluampicil
  - 125mg/125mg/5ml oral suspension | 100 ml (£23.93 DT price = £23.93

**Powder for solution for injection**

**ELECTROLYTES: May contain Sodium**

- **Co-amoxiclav** (Non-proprietary)
  - Ampicillin (as Amoxicillin sodium) 250 mg, Flucloxacillin (Flucloxacillin sodium) 250 mg Co-fluampicil 250mg/250mg powder for solution for injection vials | 10 vial (£13.33

**ANTIBACTERIALS**

**PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR**

**Co-amoxiclav**

**INDICATIONS AND DOSE**

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites**

- **By mouth using tablets**
  - Child 12–17 years: 250/125 mg every 8 hours; increased to 500/250 mg every 8 hours, increased dose used for severe infection
  - Adult: 250/125 mg every 8 hours; increased to 500/250 mg every 8 hours, increased dose used for severe infection
- **By intravenous injection, or by intravenous infusion**
  - Child 2–3 months: 30 mg/kg every 12 hours
  - Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)
  - Adult: 1.2 g every 8 hours

**Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)**

- **By mouth using oral suspension**
  - Child 1–11 months: 0.25 mL/kg/3 times a day, dose doubled in severe infection
  - Child 1–5 years: 0.25 mL/kg/3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Magnapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes. Via drip tubing in Glucose 5% or Sodium chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Dose expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.
Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genitourinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Child 6–11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection
  - Child 2 months–1 year: 0.15 mL/kilogram twice daily, doubled in severe infection
  - Child 2–6 years (body-weight 13–21 kg): 2.5 mL twice daily, doubled in severe infection
  - Child 7–12 years (body-weight 22–40 kg): 5 mL twice daily, doubled in severe infection
  - Child 12–17 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection
  - Adult: 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

**Severe dental infection with spreading cellulitis** | **Dental infection not responding to first-line antibacterial**

- **BY MOUTH USING TABLETS**
  - Child 12–17 years: 250/125 mg every 8 hours for 5 days
  - Adult: 250/125 mg every 8 hours for 5 days

**Surgical prophylaxis**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

**DOSE EQUIVALENCE AND CONVERSION**

- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- **CONTRA-INDICATIONS** History of co-amoxiclav–associated jaundice or hepatic dysfunction
- **CAUTIONS**
  - **GENERAL CAUTIONS** Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)
  - **SPECIFIC CAUTIONS**
  - With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

- **CAUTIONS, FURTHER INFORMATION** Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Cholestatic jaundice · hepatitis · nausea · vomiting
    - Rare Dizziness · headache · prolongation of bleeding time
    - Frequency not known Exfoliative dermatitis · Steven–Johnson syndrome · toxic epidermal necrolysis · vasculitis
  - **SPECIFIC SIDE-EFFECTS**
    - Rash If rash occurs, discontinue treatment.
    - **PREGNANCY** Not known to be harmful.
    - **BREAST FEEDING** Trace amount in milk, but appropriate to use.
  - **HEPATIC IMPAIRMENT** Monitor liver function in liver disease.
  - **RENAL IMPAIRMENT** Risk of crystalluria with high doses (particularly during parenteral therapy).
    - With oral use in adults Co-amoxiclav 250/125 tablets or 500/125 tablets: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours.
    - Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².
    - With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.
    - With intravenous use in adults Co-amoxiclav injection (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours.
    - With oral use in children Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
    - Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
    - With intravenous use in children Co-amoxiclav injection: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.
  - With intravenous use in adults For intravenous infusion (Augmentin®), give intermittently in Sodium chloride 0.9%. Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes. For intravenous injection, administer over 3–4 minutes. Via drip tubing in Sodium chloride 0.9%.
  - **PRESCRIBING AND DISPENSING INFORMATION** Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the
trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- With oral use Flavours of oral liquid formulations may include raspberry and orange.

- **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Co-amoxiclav for bacterial infections [www.medicinesforchildren.org.uk/co-amoxiclav-bacterial-infections-0](http://www.medicinesforchildren.org.uk/co-amoxiclav-bacterial-infections-0)

### MEDICINAL FORMS

#### With oral use

- **Augmentin-Duo**
- **EXCIPIENTS:** May contain Aspartame

- **CAUTIONARY AND ADVISORY LABELS**
  - Oral suspension
  - **Augmentin**
  - **Co-amoxiclav (Non-proprietary)**

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Co-amoxiclav 250/125 Tablets may be prescribed.
  - Co-amoxiclav 125/31 Suspension may be prescribed.
  - Co-amoxiclav 250/62 Suspension may be prescribed.

- **MEDICINAL FORMS**

  There can be variation in the licensing of the same medicines containing the same drug. Forms available from special-order manufacturers include: infusion

### Tablet

**CAUTIONARY AND ADVISORY LABELS 9**

- **Co-amoxiclav (Non-proprietary)**
  - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 250 mg Co-amoxiclav 250mg/125mg tablets | 21 tablet [Pom] £6.00 DT price = £2.03 | 100 tablet [Pom] no price available
  - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 500 mg Co-amoxiclav 500mg/125mg tablets | 21 tablet [Pom] £12.00 DT price = £1.98
  - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 875 mg Co-amoxiclav 875mg/125mg tablets | 14 tablet [Pom] £18.00 DT price = £8.60
  - **Augmentin** (GlaxoSmithKline UK Ltd)
    - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 250 mg Augmentin 375mg tablets | 21 tablet [Pom] £5.03 DT price = £2.03
    - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 500 mg Augmentin 625mg tablets | 21 tablet [Pom] £9.60 DT price = £1.98

- **Oral suspension**

  **CAUTIONARY AND ADVISORY LABELS 9**

  - **Co-amoxiclav (Non-proprietary)**
    - Clavulanic acid (as Potassium clavulanate) 6.25 mg per 1 ml, Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml Co-amoxiclav 250mg/5ml oral suspension | 100 ml [Ps] £5.00 DT price = £5.00
    - Clavulanic acid (as Potassium clavulanate) 12.5 mg per 1 ml, Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml Co-amoxiclav 500mg/5ml oral suspension | 100 ml [Ps] £10.00 DT price = £5.00
    - Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin trihydrate) 600 mg Co-amoxiclav 600mg/5ml oral suspension | 100 ml [Ps] £20.00 DT price = £5.00
    - **Augmentin** (GlaxoSmithKline UK Ltd)
      - Clavulanic acid (as Potassium clavulanate) 1.14 mg per 1 ml, Amoxicillin (as Amoxicillin trihydrate) 8.75 mg per 1 ml Augmentin 8.75mg tablets | 50 tablet [Ps] £1.14 DT price = £0.29
      - Clavulanic acid (as Potassium clavulanate) 2.20 mg per 1 ml, Amoxicillin (as Amoxicillin trihydrate) 17.5 mg per 1 ml Augmentin 17.5mg tablets | 50 tablet [Pom] £2.20 DT price = £0.29

### Powder for solution for injection

**ELECTROLYTES:** May contain Potassium, sodium

- **Co-amoxiclav (Non-proprietary)**
  - Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin trihydrate) 500 mg Co-amoxiclav 500mg/100mg powder for solution for injection vials | 10 vial [Pom] £11.39–£14.90
  - Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Co-amoxiclav 1000mg/200mg powder for solution for injection vials | 10 vial [Pom] £29.70

- **Augmentin Intravenous** (GlaxoSmithKline UK Ltd)
  - Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg Augmentin Intravenous 600mg powder for solution for injection vials | 10 vial [Pom] £10.60
  - Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Augmentin Intravenous 1.2g powder for solution for injection vials | 10 vial [Pom] £10.60

## Pivmecillinam hydrochloride

### INDICATIONS AND DOSE

**Acute uncomplicated cystitis**

- **BY MOUTH**
  - Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days
  - Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

**Chronic or recurrent bacteriuria**

- **BY MOUTH**
  - Child (body-weight 40 kg and above): 400 mg every 6–8 hours
  - Adult (body-weight 40 kg and above): 400 mg every 6–8 hours

**Urinary-tract infections**

- **BY MOUTH**
  - Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

### UNLICENSED USE

Not licensed for use in children under 3 months.

### CONTRA-INDICATIONS

- Carnitine deficiency - gastrointestinal obstruction - infants under 3 months - oesophageal strictures

### CAUTIONS

- Avoid in acute porphyrias p. 930

### SIDE-EFFECTS

- **Common or very common** Abdominal pain - dizziness - headache - nausea - vomiting

- **Frequency not known** Mouth ulcers - oesophagitis - reduced serum and total body carnitine (especially with long-term or repeated use)

### PREGNANCY

- Not known to be harmful, but manufacturer advises avoid.

### BREAST FEEDING

- Trace amount in milk, but inappropriate to use.

### MONITORING REQUIREMENTS

- Liver and renal function tests required in long-term use.

### EFFECT ON LABORATORY TESTS

- False-positive urinary glucose (if tested for reducing substances).

### DIRECTIONS FOR ADMINISTRATION

- Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).
Flucloxacillin

**INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis

- **BY MOUTH**
  - Child 1 month-1 year: 62.5–125 mg 4 times a day
  - Child 2–9 years: 125–250 mg 4 times a day
  - Child 10–17 years: 250–500 mg 4 times a day
  - Adult: 250–500 mg 4 times a day

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 250–500 mg every 6 hours

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 0.25–2 g every 6 hours

Endocarditis (in combination with other antibiotic if necessary)

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 85 kg): 8 g daily in 4 divided doses
  - Adult (body-weight 85 kg and above): 12 g daily in 6 divided doses

Osteomyelitis

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Up to 8 g daily in 3–4 divided doses

Surgical prophylaxis

- **INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 1–2 g, to be administered up to 30 minutes before the procedure, then (by mouth or by intramuscular injection or by slow intravenous injection or by intravenous infusion) 500 mg every 6 hours if required for up to 4 further doses in high risk procedures

Staphylococcal lung infection in cystic fibrosis

- **BY MOUTH**
  - Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—primary prevention

- **BY MOUTH**
  - Child 1 month-3 years: 125 mg twice daily

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis—secondary prevention

- **BY MOUTH**
  - Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

**UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

**SIDE-EFFECTS**

- Common or very common: Gastrointestinal disturbances
- Very rare: Cholestatic jaundice - hepatitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT**

- In adults: Reduce dose if eGFR less than 10 mL/minute/1.73 m².
- In children: Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- With intravenous use: Accumulation of electrolytes can occur in patients with renal failure.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (FloxaPen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

### Temocillin

- **INDICATIONS AND DOSE**
  - Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria
  - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection

- **CAUTIONS** Accumulation of sodium from injection can occur with high doses
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk.
- **RENAI IMPAIRMENT** 1 g every 12 hours if eGFR 30–60 mL/minute/1.73 m², 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m², 1 g every 48 hours or 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of sodium from injection can occur in patients with renal failure.

### DIRECTIONS FOR ADMINISTRATION

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection

- **EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Negaban®), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for injection**
    - ELECTROLYTES: May contain Sodium
    - **Negaban** (Eumedica Pharmaceuticals)
      - Temocillin (as Temocillin sodium) 1 gram
        - Negaban 1g powder for solution for injection vials | 1 vial £25.45

### ANTIBACTERIALS

- **Colistimethate sodium** (Colistin sulphomethate sodium)
  - **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulphomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa, Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

  - **INDICATIONS AND DOSE**
    - Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa, Acinetobacter baumanii* and *Klebsiella pneumoniae*
    - **BY INTRAVENOUS INFUSION**
      - Adult (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
      - Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day

  - **CONTRA-INDICATIONS** Myasthenia gravis
  - **CAUTIONS**
    - Acute porphyrias p. 930
  - **SPECIFIC CAUTIONS**
    - When used by inhalation Severe haemoptysis—risk of further haemorrhage
  - **INTERACTIONS** → Appendix 1 (polymyxins).
  - **SIDE-EFFECTS**
    - Common or very common
    - When used by inhalation Bronchospasm · cough · dysphonia · nausea · sore mouth · Sore throat · taste disturbances · vomiting
    - Uncommon
      - When used by inhalation Hypersalivation · thirst
    - Rare
      - With intravenous use Vasomotor instability
    - Frequency not known
      - With intravenous use Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Dose-related side-effects The major adverse effects are dose-related neurotoxicity and nephrotoxicity.
  - **PREGNANCY**
    - When used by inhalation Clinical use suggests probably safe.
    - With intravenous use Use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

### Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis

- **BY INHALATION OF NEBULISED SOLUTION**
  - Adult: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*

- **BY INHALATION OF POWDER**
  - Adult: 1.66 million units twice daily

### PROMIXIN® INJECTION

- **Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa, Acinetobacter baumanii*, and *Klebsiella pneumoniae***
  - **BY SLOW INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION**
  - Adult: 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection, an initial loading dose of 9 million units (up to max. 12 million units, if adequate renal function) should be used in those who are critically ill, consult product literature for details

### PROMIXIN® NEBULISER SOLUTION

- **Management of chronic pulmonary infections due to *Pseudomonas aeruginosa* in patients with cystic fibrosis**
  - **BY INHALATION OF NEBULISED SOLUTION**
    - Child 2-17 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
    - Adult: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
RENAL IMPAIRMENT

- With intravenous use: Reduce dose. Monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose (‘trough’) concentration 2–6 mg/litre.

MONITORING REQUIREMENTS

- With intravenous use: Monitor renal function.
- When used by inhalation: Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

DIRECTIONS FOR ADMINISTRATION

- When used by inhalation: Other inhaled drugs should be administered before colistimethate sodium. For nebulisation: Administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
- With intravenous use: For intravenous infusion (Colomycin®, Promixin®), give intermittently in Sodium chloride 0.9% (or Glucose 5% for Promixin® brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

COLOMYCIN® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

PRESCRIBING AND DISPENSING INFORMATION

Colistimethate sodium is included in some preparations for topical application.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

- When used by inhalation: Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)

NICE TA276

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

ANTIBACTERIALS > QUINOLONES

Quinolones

Overview

Nalidixic acid p. 517 and norfloxacin p. 517 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin p. 514 is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin p. 517 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and nongonococcal urethritis and cervicitis.

Levofloxacin p. 515 is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 516, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active
Quinolones

**IMPORTANT SAFETY INFORMATION**

The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

**TENDON DAMAGE**

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**CONTRA-INDICATIONS**  History of tendon disorders related to quinolone use

**CAUTIONS**  Can prolong the QT interval - children or adolescents (arthropathy has developed in weight-bearing joints in young animals) - conditions that predispose to seizures - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) - G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation)

**CAUTIONS, FURTHER INFORMATION**

- **in children**  Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

**INTERACTIONS**  Appendix 1 (quinolones).

**SIDE-EFFECTS**

- **Common or very common**  Diarrhoea - dizziness - headache - nausea - vomiting
- **Uncommon**  Abdominal pain - anorexia - anxiety - arthralgia - asthenia - blood disorders - confusion - depression - disturbances in taste - disturbances in vision - dyspepsia - eosinophilia - hallucinations - leucopenia - myalgia - rash - sleep disturbances - thrombocytopenia - tremor
- **Rare**  Antibiotic-associated colitis - convulsions - disturbances in hearing - disturbances in smell - dyspnoea - hepatic dysfunction - hepatitis - hypotension - interstitial nephritis - jaundice - photosensitivity - psychoses - renal failure - symptoms of peripheral neuropathy (sometimes irreversible) - tendon damage - tendon inflammation - vasculitis
- **Very rare**  Stevens-Johnson syndrome - toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

**ALLERGY AND CROSS-SENSITIVITY**  Use of quinolones contra-indicated in quinolone hypersensitivity.

**PREGNANCY**  Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

---

**Ciprofloxacin**

**INDICATIONS AND DOSE**

**Fistulating Crohn’s disease**

- **BY MOUTH**
  - Adult: 500 mg twice daily

**Respiratory-tract infections**

- **BY MOUTH**
  - Adult: 500–750 mg twice daily
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Pseudomonal lower respiratory-tract infection in cystic fibrosis**

- **BY MOUTH**
  - Adult: 750 mg twice daily

**Urinary-tract infections**

- **BY MOUTH**
  - Adult: 250–750 mg twice daily
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Acute uncomplicated cystitis in women**

- **BY MOUTH**
  - Adult: 250 mg twice daily for 3 days

**Acute or chronic prostatitis**

- **BY MOUTH**
  - Adult: 500 mg twice daily for 28 days
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Gonorrhoea**

- **BY MOUTH**
  - Adult: 500 mg for 1 dose

**Most other infections**

- **BY MOUTH**
  - Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 8–12 hours, to be given over 60 minutes

**Surgical prophylaxis**

- **BY MOUTH**
  - Adult: 750 mg, to be taken 60 minutes before procedure

**Anthrax (treatment and post-exposure prophylaxis)**

- **BY MOUTH**
  - Adult: 500 mg twice daily
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg every 12 hours, to be given over 60 minutes

**Prevention of secondary case of meningococcal meningitis**

- **BY MOUTH**
  - Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
  - Child 5–11 years: 250 mg for 1 dose
  - Child 12–17 years: 500 mg for 1 dose
  - Adult: 500 mg for 1 dose

**UNLICENSED USE**

**CAUTIONS**  Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - ensure adequate fluid intake (risk of crystalluria) - heart
failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

- INTERACTIONS Caution if concomitant use with other drugs known to prolong the QT interval.

- SIDE-EFFECTS
  - Common or very common Flatulence
  - Rare Abnormal dreams - chest pain - dysphagia - dyspnoea - erythema nodosum - hot flushes - hyperglycaemia - hypoglycaemia - oedema - pancreatitis - sweating - syncope - tachycardia
  - Very rare Intracranial hypertension - movement disorders - tenosynovitis - tinnitus - vasculitis (in children)

- EFFECTS on the FLUID ELECTROLYTES: May contain Sodium

- PREGNANCY A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

- BREAST FEEDING Amount too small to be harmful but manufacturer advises avoid.

- RECURRENT IMPAIRMENT
  - With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
  - With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
  - In children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — consult product literature.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

- PATIENT AND CARER ADVICE

  - Driving and skilled tasks May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.
  - Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infection

- MEDICINAL FORMS

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Levofloxacin

- INDICATIONS AND DOSE

  - Acute sinusitis
    - BY MOUTH
      - Adult: 500 mg once daily for 10–14 days
  - Acute exacerbation of chronic bronchitis
    - BY MOUTH
      - Adult: 500 mg once daily for 7–10 days
  - Community-acquired pneumonia
    - BY MOUTH
      - Adult: 500 mg 1–2 times a day for 7–14 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes
  - Urinary-tract infections
    - BY MOUTH
      - Adult: 500 mg once daily for 7–14 days
  - Urinary-tract infections (uncomplicated infection)
    - BY MOUTH
      - Adult: 250 mg once daily for 3 days
  - Complicated urinary-tract infections
    - BY INTRAVENOUS INFUSION
      - Adult: 500 mg once daily, to be given over at least 60 minutes
  - Chronic prostatitis
    - BY MOUTH
      - Adult: 500 mg once daily for 28 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg once daily, to be given over at least 60 minutes
  - Complicated skin infections | Complicated soft-tissue infections
    - BY MOUTH
      - Adult: 500 mg 1–2 times a day for 7–14 days
      - BY INTRAVENOUS INFUSION
      - Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes
Inhalation of anthrax (treatment and post-exposure prophylaxis)

- **BY MOUTH**
- Adult: 500 mg once daily for 8 weeks
- **BY INTRAVENOUS INFUSION**
- Adult: 500 mg once daily, to be given over at least 60 minutes

- **CAUTIONS**
  - Acute myocardial infarction (risk factor for QT interval prolongation)
  - Bradycardia (risk factor for QT interval prolongation)
  - Congenital long QT syndrome (risk factor for QT interval prolongation)
  - Electrolyte disturbances (risk factor for QT interval prolongation)
  - Heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation)
  - History of psychiatric illness
  - History of symptomatic arrhythmias
  - Hypersensitivity

- **SIDE-EFFECTS**
  - Abnormal dreams
  - Constipation
  - Flatulence
  - Hyperhidrosis
  - Frequency not known
  - Local reactions
  - Transient hypotension

- **INTERACTIONS**
  - Caution if concomitant use with other drugs known to prolong the QT interval.

- **BREAST FEEDING**
  - Manufacturer advises avoid.

- **RENAI IMPAIRMENT**
  - Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; consult product literature if eGFR less than 20 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

    - Stomatitis
    - Syncope
  - **Very rare**
    - Potentially life-threatening hepatic failure
    - Rhabdomyolysis

- **Frequency not known**
  - With intravenous use
    - Pain at injection site
    - Phlebitis at injection site

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks**
    - May impair performance of skilled tasks (e.g. driving).
Norfloxacin

**INDICATIONS AND DOSE**

**Lower urinary-tract infections**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

**Chronic relapsing lower urinary-tract infections**

- **BY MOUTH**
  - Adult: 400 mg twice daily for up to 12 weeks; reduced to 400 mg once daily, if adequate suppression within first 4 weeks

**Chronic prostatitis**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 28 days

**CAUTIONS**

- Acute myocardial infarction (risk factor for QT interval prolongation) • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • electrolyte disturbances (risk factor for QT interval prolongation) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS**

- Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**

- Common or very common • Epiphora • tinnitus
- Rare • Pancreatitis
- Very rare • Arrhythmias
- Frequency not known • Exfoliative dermatitis • polyneuropathy

**BREAST FEEDING**

- No information available—manufacturer advises avoid.

**RENAI IMPAIRMENT**

- Use 400 mg once daily if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 7, 9, 23
  - Norfloxacin (Non-proprietary)

- **Norfloxacin 400 mg** Norfloxacin 400mg tablets | 14 tablet [POM] no price available

---

Ofloxacin

**INDICATIONS AND DOSE**

**Urinary-tract infections**

- **BY MOUTH**
  - Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

**Complicated urinary-tract infection**

- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg daily, increased if necessary to 400 mg twice daily, dose increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

**Acute or chronic prostatitis**

- **BY MOUTH**
  - Adult: 200 mg twice daily for 28 days

---

**Nalidixic acid**

**INDICATIONS AND DOSE**

**Urinary-tract infections**

- **BY MOUTH**
  - Adult: 900 mg every 6 hours for 7 days, then reduced to 600 mg every 6 hours for prolonged therapy in chronic infections

**CAUTIONS**

- Acute myocardial infarction (risk factor for QT interval prolongation) • avoid in Acute porphyrias p. 930 • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • electrolyte disturbances (risk factor for QT interval prolongation) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS**

- Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**

- Cranial nerve palsy • increased intracranial pressure • metabolic acidosis • peripheral neuropathy • toxic psychosis

**BREAST FEEDING**

- Risk to infant very small but one case of haemolytic anaemia reported.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in liver disease.

**RENAI IMPAIRMENT**

- Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

**EFFECT ON LABORATORY TESTS**

- False positive urinary glucose (if tested for reducing substances).

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include raspberry and strawberry.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- No licensed medicines identified.
Lower respiratory-tract infections
- **BY MOUTH**
  - Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily
- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg twice daily, increased to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections
- **BY MOUTH**
  - Adult: 400 mg twice daily
  - **BY INTRAVENOUS INFUSION**
  - Adult: 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea
- **BY MOUTH**
  - Adult: 400 mg as a single dose

Uncomplicated genital chlamydial infection | Non-gonococcal urethritis
- **BY MOUTH**
  - Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease
- **BY MOUTH**
  - Adult: 400 mg twice daily for 14 days

Septicaemia
- **BY INTRAVENOUS INFUSION**
  - Adult: 200 mg twice daily, increased if necessary to 400 mg twice daily, dose to be increased for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation); bradycardia (risk factor for QT interval prolongation); congenital long QT syndrome (risk factor for QT interval prolongation); electrolyte disturbances (risk factor for QT interval prolongation); heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation); history of psychiatric illness; history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**
- Common or very common Cough; eye irritation; nasopharyngitis
- Rare Abnormal dreams; arrhythmias; bronchospasm; dyspnoea; hot flushes; hyperhidrosis
- Very rare Extrapyramidal symptoms; neuropathy; tinnitus
- Frequency not known
- With intravenous use Hypotension; local reactions; thrombophlebitis
- With intravenous use or oral use Changes in blood sugar; myopathy; pneumonitis; rhabdomyolysis

**BREAST FEEDING** Amount probably too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Use with caution; elimination may be reduced in severe impairment.

**RENAL IMPAIRMENT** Usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m²; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m²

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks
  - May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 6, 9, 11
- **Ofloxacin** (Non-proprietary)
  - **Ofloxacin 200 mg** Ofloxacin 200 mg tablets | 10 tablet [Pot] £6.75
  - **DT price** = £6.68
  - **Ofloxacin 400 mg** Ofloxacin 400 mg tablets | 5 tablet [Pot] £12.80
  - **DT price** = £12.52
- **Tarivid** (Sandofi)
  - **Tarivid 200 mg** Tarivid 200 mg tablets | 10 tablet [Pot] £7.53
  - **DT price** = £6.68
  - **Tarivid 400 mg** Tarivid 400 mg tablets | 5 tablet [Pot] £15.05
  - **DT price** = £12.52

**Solution for infusion**
- **Tarivid** (Sandofi)
  - Ofloxacin (as Ofloxacin hydrochloride) 2 mg per 1 ml Tarivid 200 mg/100 ml solution for infusion bottles | 1 bottle [Pot] £16.16

**ANTIBACTERIALS › SULFONAMIDES**

**Co-trimoxazole**
- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

**INDICATIONS AND DOSE**
- **Treatment of susceptible infections**
  - **BY MOUTH**
    - Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
    - Child 12–17 years: 960 mg twice daily
    - Adult: 960 mg twice daily
  - **BY INTRAVENOUS INFUSION**
    - Adult: 960 mg every 12 hours, increased to 1.44 g every 12 hours, increased dose used in severe infection

**Treatment of Pneumocystis jirovecii (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)**
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children
  - Adult: 120 mg/kg daily in 2–4 divided doses for 14–21 days

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**
- **BY MOUTH**
  - Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines
  - Adult: 960 mg once daily, reduced if not tolerated to 480 mg once daily, alternatively 960 mg once daily on alternate days, alternate day dose to be given 3 times weekly, alternatively 960 mg twice a day on alternate days, alternate day dose to be given 3 times weekly

**DOSE EQUIVALENCE AND CONVERSION**
- 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.
**SIDE-EFFECTS**

- **Common or very common** Diarrhoea • headache • hyponatraemia • myalgia • myelitis • phototoxicity • pulmonary infiltrates • renal disorders • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo

- **Frequency not known** Rhabdomyolysis reported in HIV-infected patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- Blood disorders or rash • Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.

**IMPORTANT SAFETY INFORMATION**

**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

**CONTRA-INDICATIONS** Acute porphyrias p. 930

**CAUTIONS** Asthma • avoidance in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus • elderly (increased risk of serious side-effects) • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency • predisposition to hyperkalaemia (in adults)

**INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea • headache • hyponatraemia • nausea • rash

- **Uncommon** Vomiting

- **Rare** Agranulocytosis • bone marrow depression

- **Very rare** Anorexia • antibiotic-associated colitis • arthralgia • asptic menigitis • ataxia • blood disorders • convulsions • cough • depression • eosinophilia • glossitis • hallucinations • hepatic necrosis • hypoglycaemia • hyponatraemia • interstitial nephritis • jaundice • leucopenia • liver damage • megaloblastic anaemia • myalgia • myocardiitis • pancreatitis • peripheral neuropathy • photosensitivity • pulmonary infiltrates • renal disorders • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo

- **Frequency not known** Rhabdomyolysis reported in HIV-infected patients

**DIRECTIONS FOR ADMINISTRATION**

- **In children** Recommended dose: 100 or 200 mg twice daily (trimethoprim, sulfamethoxazole) in a single dose. In children, monitor blood counts on prolonged treatment.

**PRESCRIBING AND DISPENSING INFORMATION**

Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.

*Flavours of oral liquid formulations may include banana, or vanilla.*

**RENAL IMPAIRMENT**

- **In adults** Use half normal dose if eGFR 15–30 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

- **In children** Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored.

**MONITORING REQUIREMENTS**

- **In children** Plasma concentration monitoring may be required with high doses; seek expert advice.

- **Monitor blood counts on prolonged treatment.**

**PRECAUTIONS**

- With intravenous use in children For intermittent intravenous infusion, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In severe fluid restriction may be given undiluted via a central venous line.

- With intravenous use in adults For intravenous infusion (Septrin® for infusion), give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Co-trimoxazole (Non-proprietary)**

- **Trimeprin® (80 mg, Sulfamethoxazole 400 mg)**

- **Co-trimoxazole 80mg/400mg tablets** | 100 tablet | £15.50 DT price + £2.29 | £13.21

- **Trimeprin® (160 mg, Sulfamethoxazole 800 mg)**

- **Co-trimoxazole 160mg/800mg tablets** | 100 tablet | £23.40–£24.00 DT price + £23.46

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS**

- **Co-trimoxazole (Non-proprietary)**

- **Trimeprin® (8 mg per 1 mL, Sulfamethoxazole 40 mg per 1 mL)**

- **Co-trimoxazole 40mg/200mg/5ml oral suspension sugar free**

- **Trimeprin® (16 mg per 1 mL, Sulfamethoxazole 80 mg per 1 mL)**

- **Co-trimoxazole 80mg/400mg/5ml oral suspension** | 100 ml | £9.95 DT price + £9.95

**Solution for infusion**

**EXCIPIENTS:** May contain Alcohol, propylene glycol, sulfites

**ELECTROLYTES:** May contain Sodium

- **Co-trimoxazole (Non-proprietary)**

- **Trimeprin® (16 mg per 1 mL, Sulfamethoxazole 80 mg per 1 mL)**

- **Co-trimoxazole 80mg/400mg/5ml solution for infusion ampoules** | 10 ampoule | £35.00
Sulfadiazine ( Sulphadiazine )

**Drug action** Sulfadiazine is a short-acting sulphonamide with bacteriostatic action against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

**Indications and dose** Prevention of rheumatic fever recurrence

- **By mouth**
  - Adult (body-weight up to 30 kg): 500 mg daily
  - Adult (body-weight 30 kg and above): 1 g daily

**Contra-indications** Acute porphyrias p. 930

**Caution** Asthma, avoid in blood disorders (unless under specialist supervision) - elderly - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia

**Interactions** → Appendix 1 (sulphonamides).

**Side-effects**
- Common or very common Diarrhoea - headache - hyperkalaemia - nausea - rash
- Uncommon Vomiting
- Rare Agranulocytosis - bone marrow depression
- Frequency not known Benign intracranial hypertension - hypothyroidism - optic neuropathy - oedema - pericarditis - photosensitivity - reported in HIV-infected patients

**Side-effects, further information**
- Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- Pregnancy Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- Breast feeding Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- Hepatic impairment Use with caution in mild to moderate impairment; avoid in severe impairment.
- Renal impairment Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- Monitoring requirements Monitor blood counts on prolonged treatment.

**Medicinal forms**

- **Tablet**
  - Sulfadiazine (Non-proprietary)
  - Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet £138.62 DT price = £93.47

**Antibacterials** Tetracyclines and related drugs

**Tetracyclines**

**Overview** The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 521 with either streptomycin p. 480 or rifampicin p. 535), and the spirochaete, Borrelia burgdorferi (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 497).

Tetracyclines have a role in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 522 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

**Contra-indications** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

**Caution** Myasthenia gravis (muscle weakness may be increased) - systemic lupus erythematosus (may be exacerbated)

**Interactions** → Appendix 1 (tetracyclines).

Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.

**Side-effects**
- Rare Anaphylaxis - angioedema - blood disorders - exfoliative dermatitis - hepatotoxicity - hypersensitivity reactions - pancreatitis - pericarditis - photosensitivity (particularly with demeclocycline) - rash - Stevens-Johnson syndrome - urticaria
- Frequency not known Antibioc-associated colitis - benign intracranial hypertension - bulging fontanelles (in infants and in children) - diarrhoea - dysphagia - headache - nausea - oesophageal irritation - visual disturbances - vomiting

**Side-effects, further information**
- Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).
Demeclocycline hydrochloride

**INDICATIONS AND DOSE**
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH**
  - Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable
- **BY MOUTH**
  - Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

**CAUTIONS**
Photosensitivity more common than with other tetracyclines

**INTERACTIONS**
Milk reduces absorption.

**SIDE-EFFECTS**
Acute renal failure - reversible nephrogenic diabetes insipidus

**HEPATIC IMPAIRMENT**
Max. 1 g daily in divided doses.

**RENAL IMPAIRMENT**
May exacerbate renal failure and should not be given to patients with renal impairment.

**PATIENT AND CARER ADVICE**
Patients should be advised to avoid exposure to sunlight or sun lamps.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Demeclocycline hydrochloride (Non-proprietary)
- Demeclocycline hydrochloride 150 mg
- Demeclocycline 150mg tablets | 100 tablet [PSt] no price available

**Capsule**
- CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 23
- Demeclocycline hydrochloride (Non-proprietary)
- Demeclocycline hydrochloride 150 mg
- Demeclocycline 150mg capsules | 28 capsule [PSt] £160.89 DT price = £160.89
- Demeclocycline hydrochloride 300 mg
- Ledermycin 300mg capsules | 16 capsule [PSt] no price available

Doxycycline

**INDICATIONS AND DOSE**
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily
  - Adult: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

**SEVERE INFECTIONS (INCLUDING REFRACTORY URINARY-TRACT INFECTIONS)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 200 mg daily
  - Adult: 200 mg once daily

**ACNE**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily
  - Adult: 100 mg once daily

**ROSAEA**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 100 mg once daily

**PAPULOPUSTULAR FACIAL ROSacea (W/OUT OCULAR INVOLVEMENT)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily for 28 days

**NEUROSYphilis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily for 28 days

**UNCOMPLICATED GENITAL CHLAMYDIA | Non-gonococcal urethritis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 7 days
  - Adult: 100 mg twice daily for 7 days

**PELVIC INFLAMMATORY DISEASE**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 14 days
  - Adult: 100 mg twice daily for 14 days

**LYME DISEASE (UNDER EXPERT SUPERVISION)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)
  - Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

**ANTHRAX (TREATMENT OR POST-EXPOSURE PROPHYLAXIS)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily for 14 days
  - Adult: 100 mg twice daily for 14 days

**PROPHYLAXIS OF MALARIA**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
  - Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

**ADJUNCT TO QUININE IN TREATMENT OF Plasmodium falciparum MALARIA**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 200 mg daily for 7 days
  - Adult: 200 mg daily for 7 days

**PERIODONTITIS (AS AN ADJUNCT TO GINGIVAL SCALING AND ROOT PLANING)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 20 mg twice daily for 3 months
  - Adult: 20 mg twice daily for 3 months

**UNLICENSED USE**
Not licensed for use in children under 12 years. Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for malaria
prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax.

- in adults Immediate-release doxycycline not licensed for treatment of rosacea.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.
- **RENAI IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary
Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 6, 11, 27
- **Periostat** (Alliance Pharmaceuticals Ltd)
  - Doxycycline (as Doxycycline hyclate) 20 mg Periostat 20mg tablets | 56 tablet 8p £17.30 DT price = £17.30

### Dispersible tablet

**CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 13
- **Vibramycin-D** (Pfizer Ltd)
  - Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets sugar-free | 8 tablet 8p £4.91 DT price = £4.91

### Capsule

**CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 12, 27
- **Doxycycline (Non-proprietary)**
  - Doxycycline (as Doxycycline hyclate) 50 mg Doxycycline 50mg capsules | 28 capsule 8p £2.26 DT price = £1.39
  - Doxycycline (as Doxycycline hyclate) 100 mg Doxycycline 100mg capsules | 5 capsule 8p £5.44

### Modified-release capsule

**CAUTIONARY AND ADVISORY LABELS** 6, 11, 27
- **Efracea** (Galderma (UK) Ltd)
  - Doxycycline (as Doxycycline monohydrate) 40 mg Efracea 40mg modified-release capsules | 14 capsule 8p £7.99 DT price = £7.99 | 56 capsule 8p £21.71

### Lymecycline

- **INDICATIONS AND DOSE**
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
    - By mouth using immediate-release medicines
      - Child 12-17 years: 100 mg twice daily
      - Adult: 100 mg twice daily
    - Acne
      - By mouth using immediate-release medicines
      - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
      - Adult: 100 mg once daily, alternatively 50 mg twice daily
    - By mouth using modified-release medicines
      - Child 12-17 years: 100 mg daily
      - Adult: 100 mg daily

### Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended)

- By mouth using immediate-release medicines
  - Adult: 100 mg twice daily for 5 days, minocycline treatment is usually followed by administration of rifampicin

- **CAUTIONS** Systemic lupus erythematosus
- **SIDE-EFFECTS**
  - Rare Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
  - Very rare Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
  - Frequency not known Dizziness (more common in women) · vertigo (more common in women)
- **RENAI IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus
erythematous—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 7, 9, 23
  - Oxytetracycline (Non-proprietary) 50 mg 50mg tablets  | 28 tablet  price = £6.19
  - Oxytetracycline (as Oxytetracycline dihydrate) 100 mg 100mg tablets  | 28 tablet  price = £14.01

  **Capsule**
  CAUTIONARY AND ADVISORY LABELS 7, 9, 23
  - Aknemin (Almirall Ltd) 50 mg 56 capsule  price = £15.27
  - Aknemin (as Minocycline hydrochloride) 100 mg 100mg capsules  | 28 capsule  price = £13.09

  **Modified-release capsule**
  CAUTIONARY AND ADVISORY LABELS 6, 25
  - Minocycline (as Minocycline hydrochloride) 100 mg 100mg modified-release capsules  | 56 capsule  price = £20.08
  - Acmamino MR (Almus Pharmaceuticals Ltd, Dexcel-Pharma Ltd) 28 capsule

- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners’ formulary
  Oxytetracycline Tablets may be prescribed.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

  **Tablet**
  CAUTIONARY AND ADVISORY LABELS 7, 9, 23
  - Oxytetracycline (Non-proprietary) 250 mg Oxytetracycline 250mg tablets  | 28 tablet  price = £3.45

**Tetracycline**

- **INDICATIONS AND DOSE**
  **Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)**
  - BY MOUTH
    - Child 12-17 years:  250–500 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections.
    - Adult:  250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections.

- **Rosacea**
  - BY MOUTH
    - Adult:  500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

- **Acne**
  - BY MOUTH
    - Adult:  500 mg twice daily usually for 6–12 weeks (course may be repeated intermittently)

- **Non-gonococcal urethritis**
  - BY MOUTH
    - Adult:  500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)
    - Adult:  500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

- **Diabetic diarrhoea in autonomic neuropathy**
  - BY MOUTH
    - Adult:  250 mg for 2 or 3 doses

- **Helicobacter pylori eradication failure in combination with a proton pump inhibitor, tripotassium dicitratobismuthate, and metronidazole**
  - BY MOUTH
    - Adult:  500 mg 4 times a day for 2 weeks

- **UNLICENSED USE** Not licensed for treatment of diabetic diarrhoea in autonomic neuropathy.

- **INTERACTIONS** Milk reduces absorption.

- **SIDE-EFFECTS** Acute renal failure - skin discoloration

- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.

- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.
Tigecycline

**DRUG ACTION**  Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline.

**INDICATIONS AND DOSE**  Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

- **BY INTRAVENOUS INFUSION**  
- **Adult:** Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes.

**CAUTIONS**  Cholestasis

**SIDE-EFFECTS**

- **Common or very common**  Abdominal pain, anorexia, bilirubinaemia, diarrhoea, dizziness, dyspepsia, headache, hypoglycaemia, injection-site reactions, nausea, prolonged activated partial thromboplastin time, prolonged prothrombin time, pruritus, rash, vomiting.
- **Uncommon**  Cholestatic jaundice, hypoproteinaemia, pancreatitis.
- **Frequency not known**  Antibiotic-associated colitis, hepatic failure, Stevens-Johnson syndrome, thrombocytopenia.

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects similar to those of the tetracyclines can potentially occur.

**ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in patients hypersensitive to tetracyclines.

**PREGNANCY**  Tetracyclines should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

**BREAST FEEDING**  Manufacturer advises caution—present in milk in animal studies.

**HEPATIC IMPAIRMENT**  Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (Tigacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Tygacil** (Pfizer Ltd)
  - Tigecycline 50 mg
  - Tigacil 50mg powder for solution for infusion vials 10 vial (POM) £323.10 (Hospital only)

**ANTIBACTERIALS > OTHER**

**Chloramphenicol**

**DRUG ACTION**  Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**  Life threatening infections particularly those caused by *Haemophilus influenzae* / Typhoid fever

- **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**  
  - Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated.

**CONTRA-INDICATIONS**  Acute porphyrias p. 930

**CAUTIONS**  Avoid repeated courses and prolonged treatment.

**INTERACTIONS**  → Appendix 1 (chloramphenicol).

**SIDE-EFFECTS**  Blood disorders, depression, diarrhoea, dry mouth, erythema multiforme, glossitis, headache, nausea, nocturnal haemoglobinuria, optic neuritis, peripheral neuritis, reversible and irreversible aplastic anaemia (with reports of resulting leukaemia); stomatitis; urticaria; vomiting.

**SIDE-EFFECTS, FURTHER INFORMATION**  Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

**PREGNANCY**  Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

**BREAST FEEDING**  Manufacturer advises avoid; use another antibiotic may cause bone–marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

**HEPATIC IMPAIRMENT**  Reduce dose. Avoid if possible—increased risk of bone–marrow depression. Monitor plasma–chloramphenicol concentration in hepatic impairment.

**RENAL IMPAIRMENT**  Avoid in severe renal impairment unless no alternative; dose–related depression of haematopoiesis.

**MONITORING REQUIREMENTS**

- Plasma concentration monitoring preferred in the elderly.
- Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre.
- Blood counts required before and periodically during treatment.

**DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (Kemicetine®), give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
**Daptomycin**

**DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

**INDICATIONS AND DOSE**

Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including meticillin-resistant *Staphylococcus aureus* (MRSA)

- By slow intravenous injection, or by intravenous infusion
- Adult: 4 mg/kg once daily; increased to 6 mg/kg once daily, increased dose only if associated with *Staphylococcus aureus* bacteraemia

*Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials)*

- By slow intravenous injection, or by intravenous infusion
- Adult: 6 mg/kg once daily

**UNLICENSED USE** Not licensed for use in left-sided endocarditis.

**INTERACTIONS** → Appendix 1 (daptomycin).

Monitor creatine kinase more frequently than weekly during treatment if receiving another drug known to cause myopathy (preferably avoid concomitant use).

**SIDE-EFFECTS**

- Common or very common Abdominal pain · anaemia · anxiety · arthralgia · asthenia · constipation · diarrhoea · dizziness · flatulence · headache · hypertension · hypotension · injection-site reactions · insomnia · nausea · pruritus · rash · vomiting
- Uncommon Anorexia · arrhythmias · dyspepsia · electrolyte disturbances · esophagitis · flushing · glossitis · hyperglycaemia · muscle effects · muscle weakness · myalgia · myositis · paraesthesia · renal failure · taste disturbance · thrombocytopenia · tremor
- Rare Jaundice · rhombomylitis
- Frequency not known Antibiotic-associated colitis · elevated creatine kinase · eosinophilic pneumonia · peripheral neuropathy · syncope · wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**

- Muscle effects If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m². If eGFR less than 80 mL/minute/1.73 m², monitor renal function, and monitor creatine kinase before treatment and then at least weekly during treatment.

**MONITORING REQUIREMENTS** Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment).

**EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion *(Cubicin)*, give intermittently in Sodium chloride 0.9%; reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For intravenous injection, give over 2 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that daptomycin *(Cubicin)* is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

**Fidaxomicin**

**DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

**INDICATIONS AND DOSE**

*Clostridium difficile* infection

- By mouth
- Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

**CAUTIONS** Inflammatory bowel disease · severe or life-threatening *C. difficile* infection

**INTERACTIONS** → Appendix 1 (fidaxomicin).

**SIDE-EFFECTS**

- Common or very common Constipation · nausea · vomiting
- Uncommon Abdominal distension · decreased appetite · dizziness · dry mouth · flatulence · headache · taste disturbance

**ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.
Infection

Frequency not known

Common or very common

RENAL IMPAIRMENT  Manufacturer advises caution in severe impairment—no information available.

With intravenous use

CAUTIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that fidaxomicin (Dificlir®) is accepted for restricted use within NHS Scotland to treat the first recurrence of C. difficile infection, on the advice of a microbiologist or specialist in infectious diseases.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

Dificlir (Astellas Pharma Ltd)

Fidaxomicin 200 mg Dificlir 200mg tablets | 20 tablet £1,350.00

Indications and Dose

Acute uncomplicated lower urinary-tract infections

BY MOUTH USING GRANULES

Adult: 3 g for 1 dose

Prophylaxis of urinary-tract infections in transurethral surgical procedures

BY MOUTH USING GRANULES

Adult: 3 g, to be given 3 hours before surgery. Dose may be repeated once, 24 hours after surgery

Osteomyelitis when first-line treatments are inappropriate or ineffective

Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

BY INTRAVENOUS INFUSION

Adult: 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

CAUTIONS

With intravenous use Cardiac insufficiency · elderly (high doses) · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

INTERACTIONS  Appendix 1 (fosfomycin).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Gastro-intestinal disturbances

Uncommon Diarrhoea · nausea · rash · vomiting

Frequency not known Abdominal pain · antibiotic-associated colitis

SPECIFIC SIDE-EFFECTS

Common or very common

With oral use Diarrhoea · dizziness · headache

Uncommon

With intravenous use Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo

Rare

With intravenous use Aplastic anaemia · blood disorders · eosinophilia

Very rare

With intravenous use Fatty liver · visual impairment

Frequency not known

With intravenous use Bronchospasm · confusion · hepatitis · jaundice · tachycardia

PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING  Manufacturer advises use only if potential benefit outweighs risk—present in milk.

RENAL IMPAIRMENT

With oral use Avoid oral treatment if eGFR less than 10 mL/minute/1.73 m².

With intravenous use Use intravenous treatment with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

MONITORING REQUIREMENTS

With intravenous use Monitor electrolytes and fluid balance.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For Intravenous infusion (Fomicyt®), give intermittently in Glucose 5% or 10% or Water for Injections; reconstitute each 2-g vial with 50 mL infusion fluid; give 2 g over 15 minutes.

With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.

PRESCRIBING AND DISPENSING INFORMATION  Doses expressed as fosfomycin base.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2015) that Fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

MEDIcular FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule Granules

CAUTIONARY AND ADVISORY LABELS 9, 13, 23

EXCIPIENTS: May contain Sucrose

Fosfomycin (Non-proprietary)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monurol 3g granules sachets | 1 sachet £0.45

Fosfomycin 3g granules sachets | 1 sachet £75.45

Monuril (Zambon S.p.A.)

Fosfomycin (as Fosfomycin trometamol) 3 gram Monuril 3g granules sachets | 1 sachet £4.86

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

Fomicyt (Nordic Pharma Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial £300.00

Fosfomycin 12-Dec-2016

Drug Action

Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including Staphylococcus aureus and Enterobacteriaceae.
Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

### INDICATIONS AND DOSE

#### Staphylococcal skin infection
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 250 mg every 12 hours for 5-10 days
  - Adult: 250 mg every 12 hours for 5-10 days
- **TO THE SKIN**
  - Child: Apply 3–4 times a day usually for 7 days
  - Adult: Apply 3–4 times a day

**Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials**
- **BY MOUTH USING ORAL SUSPENSION**
  - Child 1-11 months: 15 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day
  - Child 12-17 years: 750 mg 3 times a day
  - Adult: 750 mg 3 times a day
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections
  - Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

**DOSE EQUIVALENCE AND CONVERSION**
- **With oral use**
  - Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

### CAUTIONS
- With topical use Avoid contact of cream or ointment with eyes.

**CAUTIONS, FURTHER INFORMATION**
- **Avoiding resistance** To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

### INTERACTIONS
- **Appendix 1 (fusidic acid).**

### SIDE-EFFECTS
- **Common or very common**
  - With oral use Abdominal pain · diarrhoea · dizziness · drowsiness · dyspepsia · nausea · vomiting
  - **Uncommon**
  - With oral use Anorexia · headache · malaise · pruritus · rash
  - **Rare**
  - With topical use Hypersensitivity reactions
  - **Frequency not known**
  - With oral use Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)

### PREGNANCY
- With oral use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

### BREAST FEEDING
- With oral use Present in milk—manufacturer advises caution.

### HEPATIC IMPAIRMENT
- With oral use Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose.
  - Elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction.
  - Monitor liver function in hepatic impairment.

### MONITORING REQUIREMENTS
- With oral use Monitor liver function with high doses or on prolonged therapy.

### PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include banana and orange.

### PROFESSION SPECIFIC INFORMATION
- Dental practitioners' formulary
  - May be prescribed as Sodium Fusidate ointment.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Tablet
- **CAUTIONARY AND ADVISORY LABELS**
  - **Fucidin (Sodium fusidate)** (LEO Pharma)
    - Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet £6.02 DT price = £6.02 | 100 tablet £54.99

#### Oral suspension
- **CAUTIONARY AND ADVISORY LABELS**
  - **Fucidin (Fusidic acid)** (LEO Pharma)
    - Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 50 ml £6.73 DT price = £6.73

#### Cream
- **EXCIPIENTS:** May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)
  - **Fucidic acid (Non-proprietary)**
    - Fusidic acid 20 mg per 1 g Fusidic acid 2% cream | 15 gram £1.92 DT price = £1.77 | 30 gram £3.62 DT price = £3.54
  - **Fucidin (Fusidic acid)** (LEO Pharma)
    - Fusidic acid 20 mg per 1 g Fucidin 20mg/g cream | 15 gram £1.92 DT price = £1.77 | 30 gram £3.59 DT price = £3.54

#### Ointment
- **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin
  - **Fucidin (Sodium fusidate)** (LEO Pharma)
    - Sodium fusidate 20 mg per 1 g Fucidin 20mg/g ointment | 15 gram £2.68 DT price = £2.68 | 30 gram £4.55 DT price = £4.55

---

**Linezolid**

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

### INDICATIONS AND DOSE

**Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision)**
- **Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)**
  - **BY MOUTH**
    - Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)
  - **BY INTRAVENOUS INFUSION**
    - Adult: 600 mg every 12 hours

### IMPORTANT SAFETY INFORMATION

**CHM ADVICE (OPTIC NEUROPATHY)**
- Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:
  - patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;

visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS
Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

CAUTIONS
Acute confusional states, bipolar depression, carcinoid tumour, elderly (increased risk of blood disorders), history of seizures, phaeochromocytoma, schizophreneia, thyrotoxicosis, uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

Close observation. Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

INTERACTIONS → Appendix 1 (MAOIs).

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, bupivacaine, and possibly other opioid analgesics.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Diarrhoea, eosinophilia, headache, nausea, taste disturbances, vomiting

Uncommon Abdominal pain, blurred vision, constipation, diaphoresis, dizziness, dry mouth, dyspepsia, electrolyte disturbances, fatigue, fever, gastricul, glossitis, hypertension, hypoaesthesia, insomnia, leucopenia, pancreatitis, paraesthesia, polyuria, pruritus, rash, stomatitis, thirst, thrombocytopenia, tinnitus, tongue discoloration

Rare Renal failure, tachycardia, transient ischaemic attacks

Frequency not known Anaemia, antibiotic-associated colitis, convulsions, hypotension, lactic acidosis, optic neuropathy reported on prolonged therapy, pancytopenia, peripheral neuropathy reported on prolonged therapy, Stevens-Johnson syndrome, tooth discoloration, toxic epidermal necrolysis

SPECIFIC SIDE-EFFECTS

Uncommon

With intravenous use Injection-site reactions

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk—no information available.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

In severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk.

RENAL IMPAIRMENT

Manufacturer advises metabolites may accumulate if eGFR less than 30 ml/minute/1.73 m².

MONITORING REQUIREMENTS

Monitor full blood count (including platelet count) weekly.

DIRECTIONS FOR ADMINISTRATION

Infusion to be administered over 30–120 minutes.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include orange.

PATIENT AND CARER ADVICE

Patients should be advised to read the patient information leaflet given with linezolid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 10

Linezolid (Non-proprietary)

Linezolid 600 mg Linezolid 600mg tablets | 10 tablet £228.86–£445.00 DT price = £392.86

Zyvox (Pfizer Ltd)

Linezolid 600 mg Zyvox 600mg tablets | 10 tablet £445.00 DT price = £392.86

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 10

EXCIPIENTS: May contain Aspartame

Zyvox (Pfizer Ltd)

Linezolid 20 mg per 1 ml 200mg/5ml granules for oral suspension | 150 ml £222.90

Infusion

EXCIPIENTS: May contain Glucose

ELECTROLYTES: May contain Sodium

Linezolid (Non-proprietary)

Linezolid 2 mg per 1 ml Linezolid 600mg/300ml infusion bags | 10 bag £445.00 (Hospital only)

Zyvox (Pfizer Ltd)

Linezolid 2 mg per 1 ml Zyvox 600mg/300ml infusion bags | 10 bag £445.00

Tedizolid

26-Sep-2016

DRUG ACTION

Tedizolid is an oxazolidinone antibacterial, which inhibits bacterial protein synthesis.

INDICATIONS AND DOSE

Treatment of acute bacterial skin and skin structure infections

BY INTRAVENOUS INFUSION, OR BY MOUTH

Adult: 200 mg once daily for 6 days, patients should be switched from the intravenous to the oral route when clinically appropriate

CAUTIONS

Neutropenia—limited clinical experience. Patients aged 75 years and over—limited clinical experience

INTERACTIONS → Appendix 1 (MAOIs).

Monoamine-oxidase inhibition Tedizolid is a reversible, non-selective monoamine-oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, tedizolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, bupivacaine, and possibly other opioid analgesics.
Trimethoprim

**INDICATIONS AND DOSE**

**Urinary-tract infections**  
**Respiratory tract infections**

- **BY MOUTH**
  - Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
  - Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
  - Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
  - Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
  - Child 12–17 years: 200 mg twice daily
  - Adult: 200 mg twice daily

**Prophylaxis of urinary-tract infection** (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

- **BY MOUTH**
  - Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
  - Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
  - Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
  - Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
  - Child 12–17 years: 100 mg once daily, dose to be taken at night
  - Adult: 100 mg once daily, dose to be taken at night

**Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)**

- **BY MOUTH**
  - Child: 5 mg/kg every 6–8 hours
  - Adult: 5 mg/kg every 6–8 hours

**Acne resistant to other antibacterials**

- **BY MOUTH**
  - Adult: 300 mg twice daily

**Prostatitis**

- **BY MOUTH**
  - Adult: (consult product literature)

**Shigellosis | Invasive salmonella infection**

- **BY MOUTH**
  - Adult: (consult product literature)

**UNLICENSED USE**

**CONTRA-INDICATIONS**

- Blood dyscrasias

**CAUTIONS**

- Elderly · acute porphyrinas p. 930 · predisposition to folate deficiency

**INTERACTIONS**

- Appendix 1 (trimethoprim).

**SIDE-EFFECTS**

- Rare Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis

- Frequency not known Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · uvetitis (in adults) · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.
\* **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

\* **BREAST FEEDING** Present in milk—short-term use not known to be harmful.

\* **RENAL IMPAIRMENT**
  - In adults Use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m². Use half normal dose if eGFR less than 15 mL/minute/1.73 m².
  - In children Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m².

\* **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

\* **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

\* **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- **CAUTIONARY AND ADVISORY LABELS 9**
  - **Trimethoprim (Non-proprietary)**
    - **Trimethoprim 100 mg** Trimethoprim 100mg tablets | 28 tablet (PO) £9.99 DT price = £1.27
    - **Trimethoprim 200 mg** Trimethoprim 200mg tablets | 6 tablet (PO) £2.15 DT price = £0.73 | 14 tablet (PO) £9.99 DT price = £1.71

Oral suspension
- **CAUTIONARY AND ADVISORY LABELS 9**
  - **Trimethoprim (Non-proprietary)**
    - **Trimethoprim 10 mg per 1 ml** Trimethoprim 50mg/5ml oral suspension sugar-free | 100 ml (PO) £2.03 DT price = £2.00
    - **Monotrim** (Chemidex Pharma Ltd)
      - **Trimethoprim 10 mg per 1 ml** Monotrim 50mg/5ml oral suspension sugar-free | 100 ml (PO) £1.77 DT price = £2.00

\* **ANTIMYCOBACTERIALS › RIFAMYCINS**

\* **Rifabutin**

\* **INDICATIONS AND DOSE**
  - **Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count**
    - **BY MOUTH**
    - Adult: 300 mg once daily, also consult product literature
  - **Treatment of non-tuberculous mycobacterial disease, in combination with other drugs**
    - **BY MOUTH**
    - Adult: 450–600 mg once daily for up to 6 months after cultures negative
  - **Treatment of pulmonary tuberculosis, in combination with other drugs**
    - **BY MOUTH**
    - Adult: 150–450 mg once daily for at least 6 months

\* **CAUTIONS** Acute porphyrias p. 930. discosolurs soft contact lenses

\* **INTERACTIONS** → Appendix 1 (rifamycins).

\* **SIDE-EFFECTS**
  - **Common or very common** Anaemia · blood disorders · leucopenia · malabsorption · myalgia · nausea · pyrexia · rash · thrombocytopenia
  - **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasm · congeal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urinary orange-red · urethritis (especially following high doses or concomitant use with drugs that increase plasma concentration) · vomiting
  - **Rare** Haemolysis
  - **Frequency not known** Chest pain · dyspnoea · hepatitis · influenza-like symptoms

\* **SIDE-EFFECTS, FURTHER INFORMATION** Discontinue permanently if serious side-effects develop.

\* **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

\* **CONCEPTION AND CONTRACEPTION** Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

\* **PREGNANCY** Manufacturer advises avoid—no information available.

\* **BREAST FEEDING** Manufacturer advises avoid—no information available.

\* **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

\* **RENAL IMPAIRMENT** Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

\* **MONITORING REQUIREMENTS**
  - **Renal function** should be checked before treatment.
  - **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
  - Blood counts should be monitored on prolonged therapy.
  - Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

\* **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

\* **PATIENT AND CARER ADVICE**
  - Soft contact lenses Patients or their carers should be advised that rifabutin discoulours soft contact lenses. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

\* **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule
- **CAUTIONARY AND ADVISORY LABELS 8, 14**
  - **Mycobutin** (Pfizer Ltd)
    - **Rifabutin 150 mg** Mycobutin 150mg capsules | 30 capsule (PO) £90.38
**Rifaximin**

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

- **INDICATIONS AND DOSE**

  **Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours**
  - **BY MOUTH**
    - Adult: 200 mg every 8 hours for 3 days

- **Reduction in recurrence of hepatic encephalopathy**
  - **BY MOUTH**
    - Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction

- **INTERACTIONS** → Appendix 1 (rifaximin).

  Rifamycins interactions in Appendix 1 do not apply to rifaximin.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • depression • diarrhoea • dizziness • dysphoria • flatulence • headache • muscle spasm • nausea • pruritus • rash • vomiting
  - **Uncommon** Anorexia • antibiotic-associated colitis • anxiety • blood disorders • convulsions • dry mouth • dysuria • glycosuria • hyperkalaemia • hypoesthesia • influenza-like symptoms • memory impairment • paraesthesia • peripheral oedema • polyneuropathy • polyuria • sleep disturbances • taste disturbances
  - **Rare** Blood pressure changes • constipation
  - **Frequency not known** Syncope

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of rifamycin hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**

  Not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - Rifaximin for preventing episodes of overt hepatic encephalopathy (March 2015) NICE TA337

    Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults.

**2.1 Anthrax**

**Anthrax**

**Treatment and post-exposure prophylaxis**

*Inhalation* or *gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 514 or, in patients over 12 years, doxycycline p. 521 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 506, benzylpenicillin sodium p. 504, chloramphenicol p. 524, clarithromycin p. 496, clindamycin p. 493, imipenem with cilastatin p. 482, rifampicin p. 535 [unlicensed indication], and vancomycin p. 492). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

---

**2.2 Leprosy**

**Leprosy**

**Management**

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease).

Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone p. 532, rifampicin p. 535, and clofazimine p. 532. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 517, minocycline p. 522 and clarithromycin p. 496, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary* leprosy (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 622 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 856 [unlicensed] is also useful in patients who

---
have become corticosteroid dependent, but it should be used only under specialist supervision. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

**ANTIMYCOBACTERIALS**

**Clofazimine**

- **INDICATIONS AND DOSE**

  Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) (administered on expert advice)
  - **BY MOUTH**
  - Adult: 300 mg once a month, to be administered under supervision and 50 mg daily, to be self-administered, alternatively 300 mg once a month, to be administered under supervision and 100 mg once daily on alternate days, to be self-administered

  Lepromatous lepra reactions (administered on expert advice)
  - **BY MOUTH**
  - Adult: 300 mg daily for max. 3 months
  - Severe type II (erythema nodosum leprosum) reactions (administered on expert advice)
  - **BY MOUTH**
  - Adult: 100 mg 3 times a day for one month, subsequent dose reductions are required, may take 4–6 weeks to attain full effect

- **CAUTIONS**

  Avoid if persistent abdominal pain and diarrhoea · may discolour soft contact lenses

- **SIDE-EFFECTS**

  Abdominal pain · acne-like eruptions · anorexia · bowel obstruction · brownish-black discoloration of lesions and skin including areas exposed to light · dimmed vision · dry eyes · dry skin · elevation of blood sugar · eosinophilic enteropathy · headache · lymphadenopathy · macular corneal pigmentation · nausea · photosensitivity · pruritus · rash · red discoloration of body fluids · red discoloration of faeces · red discoloration of urine · reversible hair discoloration · splenic infarction · subepithelial corneal pigmentation · tiredness · vomiting (hospitalise if persistent) · weight loss

- **PREGNANCY**

  Use with caution.

- **BREAST FEEDING**

  May alter colour of milk; skin discoloration of infant.

- **HEPATIC IMPAIRMENT**

  Use with caution.

- **RENAL IMPAIRMENT**

  Use with caution.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

  - **Capsule**
    - CAUTIONARY AND ADVISORY LABELS 8, 14, 21
    - Clofazimine (Non-proprietary)
      - Clofazimine 50 mg Lamprene 50mg capsules | 100 capsule [POM]
        - no price available

**Dapsone**

- **INDICATIONS AND DOSE**

  Multibacillary leprosy in combination with rifampicin and clofazimine (3-drug regimen) · Paucibacillary leprosy in combination with rifampicin (2-drug regimen)
  - **BY MOUTH**
  - Adult (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
  - Adult (body-weight 35 kg and above): 100 mg daily, may be self-administered

  **Dermatitis herpetiformis**
  - **BY MOUTH**
  - Adult: (consult product literature or local protocols)

  **Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia (in combination with trimethoprim)**
  - **BY MOUTH**
  - Adult: 100 mg once daily

  **Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia**
  - **BY MOUTH**
  - Adult: 100 mg daily

- **UNLICENSED USE**

  Not licensed for treatment of pneumocystis (P. jirovecii) pneumonia.

- **CAUTIONS**

  Anaemia (treat severe anaemia before starting) · avoid in acute porphyrias p. 930 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis

- **INTERACTIONS**

  → Appendix 1 (dapsone).

- **SIDE-EFFECTS**

  Rare Stevens-Johnson syndrome · toxic epidermal necrolysis

- **Frequency not known**

  Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Dapsone syndrome If dapsone syndrome occurs (rash with photosensitivity) → consult product literature or local protocols

- **Frequency not known**

  Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Dapsone syndrome If dapsone syndrome occurs (rash with photosensitivity) → consult product literature or local protocols

- **Frequency not known**

  Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Dapsone syndrome If dapsone syndrome occurs (rash with photosensitivity) → consult product literature or local protocols

- **Frequency not known**

  Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinemia · nausea · neuropathy · psychosis · tachycardia · vomiting

- **PREGNANCY**

  Folic acid p. 989 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.

- **BREAST FEEDING**

  Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.

- **PATIENT AND CARER ADVICE**

  Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**

  - CAUTIONARY AND ADVISORY LABELS 8
  - Dapsone (Non-proprietary)
    - Dapsone 50 mg Dapsone 50mg tablets | 28 tablet [POM] £58.89 DT price = £32.68
    - Dapsone 100 mg Dapsone 100mg tablets | 28 tablet [POM] £117.80 DT price = £105.07
2.3 Lyme disease

Lyme disease

Treatment

Lyme disease should generally be treated by those experienced in its management. Doxycycline p. 521, amoxicillin p. 506 [unlicensed indication] or cefuroxime p. 486 (as cefuroxime axetil) are the antibacterials of choice for early Lyme disease or Lyme arthritis. If these antibacterials are contra-indicated, a macrolide (e.g. clarithromycin p. 496) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 489, cefotaxime p. 487, or benzylpenicillin sodium p. 504 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.4 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 511 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 535 or fusidic acid p. 527 should not be used alone because resistance may develop rapidly. A tetracycline alone or a combination of rifampicin and fusidic acid can be used for skin and soft-tissue infections caused by MRSA; clindamycin p. 493 alone is an alternative. A glycopeptide (e.g. vancomycin p. 492) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 527 can be used on expert advice. As linezolid is not active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline p. 524 and daptomycin p. 525 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for *bronchiectasis* caused by MRSA. A glycopeptide can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A tetracycline can be used for *urinary-tract infections* caused by MRSA; trimethoprim p. 529 or nitrofurantoin p. 544 are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for *septicaemia* associated with MRSA.

See the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 491 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in *Nose* p. 1055.

2.5 Tuberculosis

Tuberculosis

Treatment phases, overview

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success.

Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 541, rifampicin p. 535, pyrazinamide p. 542 and ethambutol hydrochloride p. 540. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 480 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase

After the initial phase, treatment is continued for a further 4 months with rifampicin with isoniazid p. 537 (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.
### Recommended dosage for standard unsupervised 6-month treatment

Pregnancy and breast-feeding
The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Supervised treatment
Drug administration needs to be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Immunocompromised patients
Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Conflated M. tuberculosis infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Corticosteroids
In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Prevention of tuberculosis
Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months; longer chemoprophylaxis is not recommended.

Corticosteroids
In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Indications and use of rifampicin in children
Children are given isoniazid p. 541, rifampicin below, pyrazinamide p. 542, and ethambutol hydrochloride p. 540 for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

Antimycobacteria > rifamycins
Rifampicin

- Indications and dose
  Brucellosis in combination with other antibiotics | Legionnaires disease in combination with other antibiotics | Serious staphylococcal infections in combination with other antibiotics
  - By mouth, or by intravenous infusion
  - Child 1–11 months: 5–10 mg/kg twice daily
  - Child 1–17 years: 10 mg/kg twice daily (max. per dose 600 mg)
  - Adult: 0.6–1.2 g daily in 2–4 divided doses

Endocarditis in combination with other drugs
  - By mouth, or by intravenous infusion
  - Adult: 0.6–1.2 g daily in 2–4 divided doses

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)
  - By mouth
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
  - Adult: 600–900 mg 3 times a week for 6 months (initial and continuation phases)
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
- **BY MOUTH**
  - Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
  - Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
  - Adult (body-weight up to 50 kg): 450 mg once daily for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid
- **BY MOUTH**
  - Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day
  - Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day
  - Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
  - Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
  - Adult (body-weight up to 50 kg): 450 mg daily for 6 months
  - Adult (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant
- **BY MOUTH**
  - Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day
  - Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day
  - Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
  - Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease
- **BY MOUTH**
  - Child 1–2 months: 10 mg/kg once daily for 4 days
  - Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days
  - Child 12–17 years: 600 mg once daily for 4 days
  - Adult: 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis
- **BY MOUTH**
  - Child 1–11 months: 5 mg/kg every 12 hours for 2 days
  - Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg) for 2 days
  - Child 12–17 years: 600 mg every 12 hours for 2 days
  - Adult: 600 mg every 12 hours for 2 days

**Multibacillary leprosy in combination with dapsone and clofazimine (3-drug regimen)**
- **BY MOUTH**
  - Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
  - Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

- **UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930 - jaundice
- **CAUTIONS** Discourages soft contact lenses
- **INTERACTIONS** → Appendix 1 (rifamycins). Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

**SIDE-EFFECTS**

### GENERAL SIDE-EFFECTS

**SPECIFIC SIDE-EFFECTS**

*With intravenous use* Thrombophlebitis reported if infusion used for prolonged period

### SED-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop.

- **Intermittent therapy** Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure

### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with rifamycin hypersensitivity.

### CONCEPTION AND CONTRACEPTION

Important. Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

### PREGNANCY

Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

### BREAST FEEDING

Amount too small to be harmful.

### HEPATIC IMPAIRMENT

Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

### RENAL IMPAIRMENT

- In children Use with caution if doses above 10 mg/kg daily.
- In adults Use with caution if dose above 600 mg daily.

### MONITORING REQUIREMENTS

* Renal function should be checked before treatment.
* Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary
MEDICINAL FORMS

PATIENT AND CARER ADVICE

▷ Blood counts should be monitored in patients on prolonged therapy.
▷ In adults Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.

DIRECTIONS FOR ADMINISTRATION

▷ With oral use in children
▷ With intravenous use in adults

DIRECTIONS FOR ADMINISTRATION

▷ In adults

Blood counts should be monitored in patients on Rifampicin (Non-proprietary), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.

▷ With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

PRESCRIBING AND DISPENSING INFORMATION

If treatment interruption occurs, re-introduce with low dosage and increase gradually. Flavours of syrup may include raspberry.

▷ With oral use in children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/ rifampicin-for-meninococcal-prophylaxis

Soft contact lenses Patients or their carers should be advised that rifampicin discoulers soft contact lenses.

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

INDICATIONS AND DOSE

Initial treatment of tuberculosis

▷ By mouth
▷ Adult (body-weight 30–39 kg): 2 tablets daily for 2 months (initial phase)
▷ Adult (body-weight 40–54 kg): 3 tablets daily for 2 months (initial phase)
▷ Adult (body-weight 55–69 kg): 4 tablets daily for 2 months (initial phase)
▷ Adult (body-weight 70 kg and above): 5 tablets daily for 2 months (initial phase)

DOSE EQUIVALENCE AND CONVERSION

Tablet quantities refer to the number of Voractiv ® Tablets which should be taken. Each Voractiv ® Tablet contains ethambutol hydrochloride 275 mg, isoniazid 75 mg, pyrazinamide 400 mg and rifampicin 150 mg.

CAUTIONS

CAUTIONS, FURTHER INFORMATION

Peripheral neuropathy The risk of peripheral neuropathy may be increased by high doses of isoniazid; pyridoxine should, therefore, be considered for those receiving Voractiv ® 5 tablets daily.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

▷ Rifampicin (Non-proprietary)
  Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule £44.84 DT price = £44.65
  Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule £103.25 DT price = £102.77
  Rifadin (Sanofi)
  Rifampicin 150 mg Rifadin 150mg capsules | 100 capsule £18.32 DT price = £44.65
  Rifampicin 300 mg Rifadin 300mg capsules | 100 capsule £36.63 DT price = £102.77
  Rimactane (Sandoz Ltd)
  Rifampicin 300 mg Rimactane 300mg capsules | 60 capsule £21.98

Oral suspension

CAUTIONARY AND ADVISORY LABELS 8, 14, 23

EXCIPIENTS: May contain Sucrose

▷ Rifadin (Sanofi)
  Rifampicin 20 mg per 1 ml Rifadin 100mg/5ml syrup | 120 ml £4.27

Powder and solvent for solution for injection

▷ Rifampicin (Non-proprietary)
  Rifampicin 300 mg RIFA parenteral 300mg powder and solvent for solution for injection vials | 1 vial no price available

If the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.

Rifampicin with ethambutol, isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 535, ethambutol hydrochloride p. 540, isoniazid p. 541, pyrazinamide p. 542.

INDICATIONS AND DOSE

Treatment of tuberculosis (continuation phase)

▷ By mouth
▷ Adult (body-weight up to 50 kg): 450/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifinah ® 150/100 Tablets, preferably taken before breakfast.
▷ Adult (body-weight 50 kg and above): 600/300 mg daily for 4 months (continuation phase after 2-month initial phase), use Rifinah ® 300/150 Tablets, preferably taken before breakfast.

DOSE EQUIVALENCE AND CONVERSION

▷ Rifinah ® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
Infection

**583 Bacterial infection**

- Each Rifater® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
- Each Rifinah® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Rifampicin with isoniazid and pyrazinamide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 535, isoniazid p. 541, pyrazinamide p. 542.

**INDICATIONS AND DOSE**

Initial unsupervised treatment of tuberculosis (in combination with ethambutol)

- **BY MOUTH**
  - Adult (body-weight up to 40 kg): 3 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 40–49 kg): 4 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 50–64 kg): 5 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.
  - Adult (body-weight 65 kg and above): 6 tablets daily for 2 months (initial phase), use Rifater® Tablets, preferably taken before breakfast.

**DOSE EQUVALENCE AND CONVERSION**

Tablet quantities refer to the number of Rifater® Tablets which should be taken. Each Rifater® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · bloating · diarrhea · nausea · rash · vestibular syndrome · vomiting
- **Uncommon** Anorexia
- **Rare** Gastrointestinal bleeding · hypothyroidism · jaundice · malabsorption syndrome · metallic taste · peptic ulcer · urticaria
- **Very rare** Agranulocytosis · anaemia · crystalluria · dizziness · headache · hypoglycaemia · leucopenia · methemoglobinemia · peripheral neuropathy · purpura · tendon pain · thrombocytopenia · visual abnormalities · weight loss
- **Frequency not known** Hepatitis · hypersensitivity

**PREGNANCY**

Manufacturer advises avoid unless essential—toxicity in animal studies (highest risk during first trimester).

**BREAST FEEDING**

Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Use with caution.

**RENAL IMPAIRMENT**

Use with caution in mild to moderate impairment. Avoid in severe impairment due to accumulation of inactive metabolites.

**MONITORING REQUIREMENTS**

- Monitor for hypersensitivity reaction during the first 3 months of treatment— for desensitisation dosing regimen consult product literature.
- Monitor liver function—discontinue immediately if signs or symptoms of hepatic toxicity (including rash, fever and gastrointestinal disturbance).

**DIRECTIONS FOR ADMINISTRATION**

Disperse granules in orange or tomato juice and take immediately (granules will not dissolve, ensure all granules are swallowed). Granules can be sprinkled on apple sauce or yoghurt for administration.

**PATIENT AND CARER ADVICE**

Patients should be advised that the skeletons of the granules may be seen in the stools. Counselling advised on administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant granules**

*CAUTIONARY AND ADVISORY LABELS* 9, 25

**Antimycobacterials**

**Aminosalicylic acid**

**INDICATIONS AND DOSE**

Multiple-drug resistant tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day
- **Desensitisation regimen**
  - **BY MOUTH**
  - Adult: (consult product literature)

**CAUTIONS**

Peptic ulcer

**Bedaquiline**

**INDICATIONS AND DOSE**

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

**CONTRA-INDICATIONS**

- QTc interval more than 500 milliseconds (derived using Fridericia’s formula) · ventricular arrhythmia

**CAUTIONS**

Hypothyroidism · QTc interval (derived using Fridericia’s formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds · risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)
**INTERACTIONS** → Appendix 1 (bedaquiline).
Caution with concomitant use of hepatotoxic drugs.

**SIDE-EFFECTS** Arthralgia - diarrhoea - dizziness - headache - myalgia - nausea - QT interval prolongation - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Syncope if syncope occurs, obtain ECG.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risks.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available. Avoid concomitant use of hepatotoxic drugs unless essential.

**RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
- Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
- Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

**PATIENT AND CARER ADVICE**
- Missed doses
  If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.
- Driving and skilled tasks
  Dizziness may affect performance of skilled tasks (e.g. driving)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cycloserine**

**INDICATIONS AND DOSE**
Tuberculosis resistant to first-line drugs, in combination with other drugs

**BY MOUTH**
- Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

**PHARMACOKINETICS**
Cycloserine penetrates the CNS.

**CONTRA-INDICATIONS**
- Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

**INTERACTIONS** → Appendix 1 (cycloserine).

**SIDE-EFFECTS** Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
- CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
- Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

**BREAST FEEDING** Present in milk—amount too small to be harmful.

**RENAL IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute. Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.

**MONITORING REQUIREMENTS**
- Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre.
- Monitor haematological, renal, and hepatic function.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capreomycin**

**INDICATIONS AND DOSE**
Tuberculosis resistant to first-line drugs, in combination with other drugs

**BY DEEP INTRAMUSCULAR INJECTION**
- Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

**CAUTIONS** Auditory impairment

**INTERACTIONS** → Appendix 1 (capreomycin).

**SIDE-EFFECTS** Induration at injection site · changes in liver function tests · electrolyte disturbances · hearing loss with tinnitus and vertigo · hypersensitivity reactions · leucocytosis · leucopenia · nephrotoxicity · neuromuscular block after large doses · pain at injection site · rashes · thrombocytopenia · urticaria

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—teratogenic in animal studies.

**BREAST FEEDING** Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT** Reduce dose—consult product literature. Nephrotoxic · ototoxic.

**MONITORING REQUIREMENTS** Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Capreomycin (Non-proprietary)
  Capreomycin (as Capreomycin sulfate) 1 gram
  Capreomycin 1g powder for solution for injection vials  | 1 vial [POM] £28.61

**BNF 73**

**Tuberculosis 539**
Delamanid

**INDICATIONS AND DOSE**
Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

- **CONTRA-INDICATIONS** QTc interval more than 500 milliseconds (derived using Fridericia’s formula) - serum albumin less than 28 g/litre

- **CAUTIONS** Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias)

- **INTERACTIONS** → Appendix 1 (delamanid).

  Caution when concomitant use with other drugs known to prolong the QT interval. Contra-indicated with concomitant use of potent CYP3A4 inducers.

- **SIDE-EFFECTS**
  - Uncommon Arrhythmias - balance disorder - dehydration - dysphagia - herpes zoster - hypocalcaemia - leucopenia - nocturia - renal impairment - retinopathy - vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor serum albumin and electrolytes before starting treatment and then during treatment—discontinue treatment if serum albumin less than 28 g/litre.
  - Obtain ECG before starting treatment and then monthly during treatment (more frequently if serum albumin 28–34 g/litre, or if concomitant use of potent CYP3A4 inhibitors, or if risk factors for QT interval prolongation, or if QTc interval 450–500 milliseconds in men or 470–500 milliseconds in women)—discontinue treatment if QTc interval more than 500 milliseconds (derived using Fridericia’s formula).

- **HANDLING AND STORAGE** Dispense in original container (contains desiccant).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 8, 21

    - Delamanid 50 mg Deltyba 50mg tablets | 48 tablet [Pack] £1,250.00

Ethambutol hydrochloride

**INDICATIONS AND DOSE**
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- **BY MOUTH**
  - Child: 20 mg/kg once daily for 2 months (initial phase)
  - Adult: 15 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- **BY MOUTH**
  - Child: 30 mg/kg 3 times a week for 2 months (initial phase)
  - Adult: 30 mg/kg 3 times a week for 2 months (initial phase)

- **CONTRA-INDICATIONS** Optic neuritis - poor vision

- **CAUTIONS** Elderly - young children

- **INTERACTIONS**
  - **FURTHER INFORMATION**
    - Understand warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **SIDE-EFFECTS**
  - Rare Pruritus - rash - thrombocytopenia - urticaria
  - **Frequency not known** Colour blindness - loss of visual acuity - optic neuritis - peripheral neuritis - red/green colour blindness - restriction of visual fields - visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Ocular toxicity Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute, monitor plasma-ethambutol concentration.
  - In adults If creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week.
  - In children If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week.

- **MONITORING REQUIREMENTS**
  - “Peak” concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); “trough” (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).
  - Renal function should be checked before treatment.
  - Visual acuity should be tested by Snellen chart before treatment with ethambutol.
  - In children In young children, routine ophthalmological monitoring recommended.

- **PATIENT AND CARER ADVICE**
  - Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

INTERACTIONS  
Peripheral neuropathy

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

PATIENT AND CARER ADVICE
Hepatic disorders  Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise, jaundice or unexplained deterioration during treatment.

PRESCRIBING AND DISPENSING INFORMATION
With oral use in children  In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.

PATIENT AND CARER ADVICE
Hepatic disorders  Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise, jaundice or unexplained deterioration during treatment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS
Hepatitis  Hepatitis more common in those aged over 35 years.

PREGNANCY
Not known to be harmful; prophylactic pyridoxine recommended.

BREAST FEEDING
Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.

HEPATIC IMPAIRMENT
Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

RENAL IMPAIRMENT
Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 950 recommended.

MONITORING REQUIREMENTS
Renal function should be checked before treatment.

Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

In adults  Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

CONTRA-INDICATIONS
Drug-induced liver disease

CAUTIONS
Acute porphyrias p. 930  alcohol dependence  diabetes mellitus  epilepsy  history of psychosis  HIV infection  malnutrition  slow acetylator status (increased risk of side-effects).

CAUTIONS, FURTHER INFORMATION
Peripheral neuropathy  Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 950 should be given prophylactically from the start of treatment.

INTERACTIONS
  ➔ Appendix 1 (isoniazid).
When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

SIDE-EFFECTS
  ➔ Common or very common  Peripheral neuropathy
  ➔ Rare  Hepatitis  psychotic episodes
  ➔ Frequency not known  Agranulocytosis  aplastic anaemia  blood disorders  constipation  convulsions  difficulty with

  ➔ Common or very common  Peripheral neuropathy
  ➔ Rare  Hepatitis  psychotic episodes
  ➔ Frequency not known  Agranulocytosis  aplastic anaemia  blood disorders  constipation  convulsions  difficulty with

CAUTIONARY AND ADVISORY LABELS
Hepatitis  Hepatitis more common in those aged over 35 years.

PREGNANCY
Not known to be harmful; prophylactic pyridoxine recommended.

BREAST FEEDING
Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.

HEPATIC IMPAIRMENT
Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

RENAL IMPAIRMENT
Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 950 recommended.

MONITORING REQUIREMENTS
Renal function should be checked before treatment.

Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

In adults  Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

CONTRA-INDICATIONS
Drug-induced liver disease

CAUTIONS
Acute porphyrias p. 930  alcohol dependence  diabetes mellitus  epilepsy  history of psychosis  HIV infection  malnutrition  slow acetylator status (increased risk of side-effects).

CAUTIONS, FURTHER INFORMATION
Peripheral neuropathy  Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 950 should be given prophylactically from the start of treatment.

INTERACTIONS
  ➔ Appendix 1 (isoniazid).
When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

SIDE-EFFECTS
  ➔ Common or very common  Peripheral neuropathy
  ➔ Rare  Hepatitis  psychotic episodes
  ➔ Frequency not known  Agranulocytosis  aplastic anaemia  blood disorders  constipation  convulsions  difficulty with
Solution for injection
- Isoniazid (Non-proprietary)
  Isoniazid 20 mg per 1 ml Tebesium-S 100mg/5ml solution for injection ampoules | 2 ampoule Pack, no price available
  Isoniazid 25 mg per 1 ml Tebesium-S 50mg/2ml solution for injection ampoules | 10 ampoule Pack, £329.08

Combinations available: Rifampicin with ethambutol, isoniazid and pyrazinamide, p. 537 · Rifampicin with isoniazid, p. 537 · Rifampicin with isoniazid and pyrazinamide, p. 538

Pyrazinamide

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)
- BY MOUTH
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
  - Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)
- BY MOUTH
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
  - Adult (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
  - Adult (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

PRESCRIBING AND DISPENSING INFORMATION
- In children, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Pyrazinamide for treatment of tuberculosis www.medicinesforchildren.org.uk/pyrazinamide-for-tuberculosis

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 8

2.6 Urinary tract infections

Urinary-tract infections

Overview
Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; Staphylococcus saprophyticus is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. Pseudomonas aeruginosa infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. Staphylococcus epidermidis and Enterococcus faecalis infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;
- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.
Antibacterial therapy for lower urinary-tract infections

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 529 or nitrofurantoin p. 544, or alternatively, amoxicillin p. 506, ampicillin p. 507 or oral cephalosporin.

Suggested duration of treatment is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 508 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam hydrochloride p. 510, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Long-term low dose therapy may be required in selected patients to prevent recurrence of infection; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 485 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Antibacterial therapy for upper urinary-tract infections

Acute pyelonephritis can lead to septicemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 486) or a quinolone if the patient is severely ill; gentamicin p. 479 can also be used.

Suggested duration of treatment is 10–14 days (longer treatment may be necessary in complicated pyelonephritis).

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 514 or ofloxacin p. 517), or alternatively, trimethoprim.

Suggested duration of treatment is 28 days.

Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

Urinary-tract infections in children

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime p. 487 or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

ANTIBACTERIALS

Methenamine hippurate

(Hexamine hippurate)

- INDICATIONS AND DOSE
  - **Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**
    - **BY MOUTH**
      - Adult: 1 g every 12 hours
  - **Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**
    - **BY MOUTH**
      - Adult: 1 g every 8–12 hours

- CONTRA-INDICATIONS
  - Gout · metabolic acidosis · severe dehydration

- INTERACTIONS
  - Appendix 1 (methenamine). Caution—avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents.

- SIDE-EFFECTS
  - Bladder irritation · gastro-intestinal disturbances · rash

- PREGNANCY
  - Use with caution.

- BREAST FEEDING
  - Amount too small to be harmful.

- HEPATIC IMPAIRMENT
  - Avoid.

- RENAL IMPAIRMENT
  - Avoid if eGFR less than 10 mL/minute/1.73 m²—risk of hippurate crystalluria.

- LESS SUITABLE FOR PRESCRIBING
  - Methenamine (hexamine) hippurate should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- Hiprex (Meda Pharmaceuticals Ltd)
  - Methenamine hippurate 1 gram Hiprex 1g tablets | 60 tablet £19.74 DT price + £19.74
Nitrofurantoin

**INDICATIONS AND DOSE**

**Acute uncomplicated urinary-tract infections**
- **By mouth using immediate-release medicines**
  - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
  - Child 12–17 years: 50 mg 4 times a day for 3–7 days
  - Adult: 50 mg 4 times a day for 3–7 days, dose to be taken with food
- **By mouth using modified-release medicines**
  - Child 12–17 years: 100 mg twice daily, dose to be taken with food
  - Adult: 100 mg twice daily, dose to be taken with food

**Severe chronic recurrent urinary-tract infections**
- **By mouth using immediate-release medicines**
  - Child 12–17 years: 100 mg 4 times a day for 3–7 days
  - Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

**Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**
- **By mouth using immediate-release medicines**
  - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
  - Child 12–17 years: 50–100 mg once daily, dose to be taken at night
  - Adult: 50–100 mg once daily, dose to be taken at night

**Genito-urinary surgical prophylaxis**
- **By mouth using modified-release medicines**
  - Adult: 100 mg twice daily on day of procedure and for 3 days after

**CONTRA-INDICATIONS**
- Acute porphyrias p. 390 - G6PD deficiency - infants less than 3 months old

**CAUTIONS**
- Anaemia - diabetes mellitus - electrolyte imbalance - folate deficiency - pulmonary disease - susceptibility to peripheral neuropathy - urination may be coloured yellow or brown - vitamin B deficiency

**INTERACTIONS**
- Appendix 1 (nitrofurantoin).

**SIDE-EFFECTS**
- Rare: Agranulocytosis - aplastic anaemia - arthralgia - benign intracranial hypertension - blood disorders - cholestatic jaundice - erythema multiforme - exfoliative dermatitis - hepatitis - pancreatitis - thrombocytopenia - transient alopecia
- Frequency not known: Acute pulmonary reactions - anaphylaxis - angioedema - anorexia - chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) - diarrhoea - hypersensitivity reactions - nausea - peripheral neuropathy - pruritus - rash - sialadenitis - urticaria - vomiting

**PREGNANCY**
- Avoid at term—may produce neonatal haemolysis.

**BREAST FEEDING**
- Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.

**HEPATIC IMPAIRMENT**
- Use with caution; cholestatic jaundice and chronic active hepatitis reported.

**RENAL IMPAIRMENT**
- Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.
  - In adults: Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
  - In children: Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

**MONITORING REQUIREMENTS**
- On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).

**EFFECT ON LABORATORY TESTS**
- False positive urinary glucose (if tested for reducing substances).

**PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 9, 14, 21
  - **Nitrofurantoin (Non-proprietary)**
    - Nitrofurantoin 50 mg Nitrofurantoin 50mg tablets | 28 tablet | £35.00 DT price = £10.62 | 100 tablet | £111.89

- **CAUTIONARY AND ADVISORY LABELS** 9, 14, 21
  - **Nitrofurantoin (Non-proprietary)**
    - Nitrofurantoin 5 mg per 1 ml Nitrofurantoin 25mg/5ml oral suspension sugar free sugar-free | 300 ml | £44.95 DT price = £44.95

---

### 3 Fungal infection

**Antifungals, systemic use**

**Common fungal infections**
- The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

**Aspergillosis**
- Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 552 is the treatment of choice for aspergillosis; liposomal amphotericin p. 547 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 546,
Itraconazole p. 550, or posaconazole p. 552 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

**Candidiasis**

Many superficial candidal infections including infections of the skin are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis may be treated with locally acting antifungals or with fluconazole p. 548 given by mouth; for resistant organisms in adults, itraconazole can be given by mouth. *Oropharyngeal candidiasis* generally responds to topical therapy; fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an echinocandin can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable patients who have not received anazole antifungal recently. Amphotericin is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida spp.* when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, fluconazole p. 554 can be used with intravenous amphotericin.

**Cryptococcosis**

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and fluconosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophyaxis against relapse until immunity recovers.

**Histoplasmosis**

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophyaxis against relapse until immunity recovers.

**Skin and nail infections**

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 1089 are used more frequently than griseofulvin p. 554 because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum spp.* Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

*Pityriasis versicolor* may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

**Immunocompromised patients**

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus spp.* Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 547 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used. Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

**Triazole antifungals**

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections. Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria. Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

**Imidazole antifungals**

The imidazole antifungals include clotrimazole p. 758, econazole nitrate p. 759, ketoconazole p. 624, and tioconazole p. 1088. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 760 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.
Polyene antifungals

The polyene antifungals include amphotericin p. 547 and nystatin p. 1073; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin below, caspofungin below and micafungin p. 547. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 554 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 554 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophytion infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 1089 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

### Anidulafungin

**INDICATIONS AND DOSE**

**Invasive candidiasis**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

**SIDE-EFFECTS**

- **Common or very common** Coagulopathy - convulsion - diarrhoea - flushing - headache - hypokalaemia - nausea - pruritis - raised serum creatinine - rash - vomiting
- **Uncommon** Abdominal pain - cholestasis - hyperglycaemia - hyperpotension - injection-site pain - urticaria
- **Frequency not known** Bronchospasm - dyspnoea - haemorrhage - hypovolaemia - pruritus - rash - sweating

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Ecalta*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- *Ecalta* (Pfizer Ltd) Anidulafungin 100 mg Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial (PFD) £298.99 (Hospital only)

### Caspofungin

**INDICATIONS AND DOSE**

**Invasive aspergillosis** | **Invasive candidiasis** | **Empirical treatment of systemic fungal infections in patients with neutropenia**

- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily
  - Adult (body-weight 81 kg and above): 70 mg once daily

**INTERACTIONS** > Appendix 1 (caspofungin).

**SIDE-EFFECTS**

- **Common or very common** Arthralgia - diarrhoea - dyspnoea - headache - hypokalaemia - injection-site reactions - nausea - pruritis - rash - sweating - vomiting
- **Frequency not known** Adult respiratory distress syndrome - anaphylaxis

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** 70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Cancidas*®), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- *Cancidas* (Merck Sharp & Dohme Ltd) Caspofungin (as Caspofungin acetate) 50 mg Cancidas 50mg powder for solution for infusion vials | 1 vial (PFD) £327.67
  - Caspofungin (as Caspofungin acetate) 70 mg Cancidas 70mg powder for solution for infusion vials | 1 vial (PFD) £416.78
Micafungin

**INDICATIONS AND DOSE**

**Invasive candidiasis**
- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
  - Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

**Oesophageal candidiasis**
- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 40 kg): 3 mg/kg once daily
  - Adult (body-weight 40 kg and above): 150 mg once daily

**Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
- **BY INTRAVENOUS INFUSION**
  - Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
  - Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - anaemia - diarrhoea - fever - headache - hypocalcaemia - hypokalaemia - hypomagnesaemia - leucopenia - nausea - phlebitis - rash - vomitinig
- **Rare** Haemolytic anaemia
- **Frequency not known** Disseminated intravascular coagulation - hepatotoxicity (potentially life-threatening) - renal failure - Stevens-Johnson syndrome - toxic epidermal necrolysis

**PREGNANCY** Manufacturer advises use avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

**MONITORING REQUIREMENTS**
- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Mycamine®), give interminently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

**INTERACTIONS**
- Appendix 1 (micafungin). Caution with concomitant use of other hepatotoxic drugs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Mycamine** (Astellas Pharma Ltd)
  - Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial £4.08
  - Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial £3.41

**ANTIFUNGALS > POLYENE ANTIFUNGALS**

Amphotericin (Amphotericin B)

**INDICATIONS AND DOSE**

**ABELCET®**
- Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients
  - **BY INTRAVENOUS INFUSION**
    - Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

**AMBISOME®**
- Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials
  - **BY INTRAVENOUS INFUSION**
    - Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Aspergillosis**
- **BY INTRAVENOUS INFUSION**
  - Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Visceral leishmaniasis (unresponsive to the antimonial alone)**
- **BY INTRAVENOUS INFUSION**
  - Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®**
- **Severe systemic fungal infections**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**UNLICENSED USE**
- **AMBISOME®** Use at the maximum dose of 5 mg/kg once daily is an unlicensed dose.

**CAUTIONS**
- Avoid rapid infusion (risk of arrhythmia) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

**CAUTIONS, FURTHER INFORMATION**
- Anaphylaxis. Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic
antipyrtes or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** Appendix 1 (amphotericin). Caution—corticosteroids (avoid except to control reactions).

- **SIDE-EFFECTS**
  - **Common** or **very common** Abdominal pain, abnormal liver function (discontinue treatment), anemia, arrhythmias, blood disorders, blood pressure changes, cardiovascular effects, chest pain, diarrhea, disturbances in renal function, dyspnoea, electrolyte disturbances, febrile reactions, headache, hypokalemia, hypomagnesemia, nausea, rash, renal tubular acidosis, thrombocytopenia, vomiting.
  - **Uncommon** Anaphylactoid reactions, bronchospasm, convulsions, diplopia, encephalopathy, hearing loss, neurological disorders, peripheral neuropathy, tremor.
  - **Frequency not known** Anorexia, arthralgia, myalgia, Stevens-Johnson syndrome, toxic epidermal necrolysis.

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

- **DIRECTIONS FOR ADMINISTRATION**

  - **ABELCET®** Amphotericin (lipid complex)
    - For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose from vial and introduce into infusion fluid (through the needle provided (fresh needle for each syringe)) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

  - **AMBISOME®** Amphotericin (liposomal)
    - For intravenous infusion (Ambisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

  - **FUNGIZONE®** Amphotericin (as sodium deoxycholate complex)
    - For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - **EXCIPIENTS:** May contain Sucrose
    - **ELECTROLYTES:** May contain Sodium

    - **Ambisome®** (Gilead Sciences International Ltd)
      - Amphotericin B liposomal 50 mg: AmBisome 50mg powder for solution for infusion (vials) 10 vials £821.87

    - **Fungizone®** (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Amphotericin B 50 mg: Fungizone Intravenous 50mg powder for solution for infusion (vials) 1 vial £3.99

  - **Suspension for infusion**
    - **ELECTROLYTES:** May contain Sodium
    - **ABELCET®** (Teva UK Ltd)
      - Abelcet® (as Amphotericin B phospholipid complex) 5 mg per 1 ml: Abelcet 100mg/20ml concentrate for suspension for infusion (vials) 10 vials £75.04 (Hospital only)

- **ANTIFUNGALS** > **TRIAZOLE ANTIFUNGALS**

**Fluconazole**

- **INDICATIONS AND DOSE**
  - **Candidal balanitis**
    - **BY MOUTH**
    - Child 16–17 years: 150 mg for 1 dose
    - Adult: 150 mg for 1 dose

  - **Vaginal candidiasis**
    - **BY MOUTH**
    - Child 16–17 years: 150 mg for 1 dose
    - Adult: 150 mg for 1 dose

  - **Vulvovaginal candidiasis (recurrent)**
    - **BY MOUTH**
    - Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

  - **Mucosal candidiasis (except genital)**
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
    - Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections
    - **BY MOUTH**
    - Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections);
bronchopulmonary infections; increased to 100 mg daily, increased dose only for unusually difficult infections

**Tinea pedis, corporis, cruris, pityriasis versicolor** | **Dermal candidiasis**

- **By mouth**
  - Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks
  - Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)
    - **By mouth, or by intravenous infusion**
      - Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
      - Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg once daily), treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

**Prevention of fungal infections in immunocompromised patients**

- **By mouth, or by intravenous infusion**
  - Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
  - Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

**Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)**

- **By mouth, or by intravenous infusion**
  - Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

**Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

- **By mouth, or by intravenous infusion**
  - Adult: 200 mg daily

### CONTRA-INDICATIONS
Acute porphyrias p. 930

### CAUTIONS
Susceptibility to QT interval prolongation

### INTERACTIONS
- Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment. Caution with concomitant use of hepatotoxic drugs.

### SIDE-EFFECTS
- **Common or very common** Abdominal discomfort, diarrhoea, flatulence, headache, nausea, rash
- **Uncommon** Alopecia, anaphylaxis, angioedema (in children), dizziness, dyspepsia, hepatic disorders, hyperlipidaemia, hypersensitivity reactions (in adults), pruritus, seizures, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, vomiting
- **Frequency not known** Hypokalaemia, leucopenia, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

### PREGNANCY
Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

### BREAST FEEDING
Present in milk but amount probably too small to be harmful.

### HEPATIC IMPAIRMENT
Toxicity with related drugs.

### RENAL IMPAIRMENT
- In adults: Usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m².
- In children: Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

### MONITORING REQUIREMENTS
Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

### DIRECTIONS FOR ADMINISTRATION
- With intravenous use in children: *For intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.

### PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include orange.

### PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Fluconazole Capsules 50 mg may be prescribed.
Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

### EXCEPTIONS TO LEGAL CATEGORY
Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 9 (50 mg and 200 mg strengths only)
  - Fluconazole (Non-proprietary)
    - Fluconazole 50 mg Fluconazole 50 mg capsules | 7 capsule £0.00 DT price = £0.90
    - Fluconazole 150 mg Fluconazole 150 mg capsules | 1 capsule £0.93 | 1 capsule £0.50 DT price = £0.93
    - Fluconazole 200 mg Fluconazole 200 mg capsules | 7 capsule £0.07 DT price = £6.02
  - Canesten (fluconazole) (Bayer Plc)
    - Fluconazole 150 mg Canesten 150 mg capsules | 1 capsule £0.83
    - Fluconazole 50 mg Canesten 50 mg capsules | 7 capsule £0.16 DT price = £0.90
    - Fluconazole 150 mg Diflucan 150 mg capsules | 1 capsule £0.83
    - Fluconazole 200 mg Diflucan 200 mg capsules | 7 capsule £0.06 DT price = £6.02

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS** 9
  - Fluconazole (Non-proprietary)
    - Fluconazole 10 mg per 1 ml Fluconazole 50 mg/5 ml oral suspension | 35 ml £0.51 DT price = £20.51
    - Diflucan (Pfizer Ltd)
      - Fluconazole 10 mg per 1 ml Diflucan 50 mg/5 ml oral suspension | 35 ml £0.16 DT price = £20.51
      - Fluconazole 40 mg per 1 ml Diflucan 200 mg/5 ml oral suspension | 35 ml £0.66 DT price = £66.42
  - **Solution for infusion**
    - **ELECTROLYTES:** May contain Sodium
      - Fluconazole (Non-proprietary)
        - Fluconazole 2 mg per 1 ml Fluconazole 200 mg/50 mL solution for infusion bottles | 5 bottle £12.60
        - Fluconazole 200 mg/100 mL solution for infusion vials | 1 vial £29.28
        - Fluconazole 50 mg/25 mL solution for infusion vials | 1 vial £7.31–7.32
        - Fluconazole 200 mg/100 mL solution for infusion vials | 5 bottle £274.50
        - Diflucan (Pfizer Ltd)
          - Fluconazole 2 mg per 1 ml Diflucan 200 mg/100 mL solution for infusion vials | 1 vial £29.28.
**Isavuconazole**

**DRUG ACTION** Isavuconazole is a triazole antifungal that blocks the synthesis of ergosterol, a key component of the fungal cell membrane.

**INDICATIONS AND DOSE**

- **Invasive aspergillosis | Mucormycosis in patients for whom amphotericin B is inappropriate**
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - **Adult:** Loading dose 200 mg every 8 hours for 48 hours (6 administrations in total), then maintenance 200 mg once daily, maintenance dose to be started at least 12 hours after the last loading dose; long-term treatment should be reviewed after 6-months

**CONTRA-INDICATIONS** Short QT syndrome

**CAUTIONS** Elderly—limited information

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · chest pain · decreased appetite · delirium · diarrhea · dyspnoea · electrolyte disturbances · headache · nausea · pruritus · rash · renal failure · somnolence · thrombophlebitis · vomiting
- **Uncommon** Abdominal distension · alopecia · arrythmias · asthenia · back pain · blood disorders · bronchospasm · constipation · convulsion · depression · dermatitis · dizziness · dyspepsia · encephalopathy · epistaxis · haemoptysis · hepatomegaly · hypersensitivity · hypotension · insomnia · malaise · paraesthesia · peripheral neuropathy · petechiae · syncope · tachynoea · vertigo
- **Frequency not known** Infusion-related reactions · Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions have been reported, including hypotension, dyspnoea, dizziness, paraesthesia, nausea, and headache—manufacturer advises discontinue treatment if these reactions occur.

**PREGNANCY** Manufacturer advises avoid unless severe or life-threatening infection—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises use with caution and monitor for toxicity in severe impairment—no information available.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute each 200 mg with 5 mL Water for Injection; dilute dose to concentration of 0.8 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give via a 0.2–1.2 micron filter over at least 1 hour.

**HANDLING AND STORAGE**
- With intravenous use Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage after reconstitution or dilution.

**PATIENT AND CARER ADVICE**
- **Driving and skilled tasks** Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of confusion, syncope and dizziness.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS 25, 3**
  - **Cresemba** (Basilea Pharmaceutica International Ltd)
  - Isavuconazole (as Isavuconazonium sulfate) 100 mg Cresemba 100 mg capsules | 14 capsule (Pack) £59.28 (Hospital only)

**Powder for solution for infusion**

- **CAUTIONARY AND ADVISORY LABELS 3**
  - **Cresemba** (Basilea Pharmaceutica International Ltd)
  - Isavuconazole (as Isavuconazonium sulfate) 200 mg Cresemba 200 mg powder for concentrate for solution for infusion vials | 1 vial (Pack) £297.84 (Hospital only)

---

**Itraconazole**

**INDICATIONS AND DOSE**

- **Vulvovaginal candidiasis**
  - **BY MOUTH**
  - **Adult:** 200 mg twice daily for 1 day

- **Vulvovaginal candidiasis (recurrent)**
  - **BY MOUTH**
  - **Adult:** 50–100 mg daily for 6 months

- **Oral or oesophageal candidiasis that has not responded to fluconazole**
  - **BY MOUTH USING ORAL SOLUTION**
  - **Adult:** 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

- **Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients**
  - **BY MOUTH USING ORAL SOLUTION**
  - **Adult:** 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

- **Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
  - **BY MOUTH**
  - **Adult:** 100–200 mg once daily
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

- **Systemic candidiasis (invasive or disseminated) where other antifungal drugs inappropriate or ineffective**
  - **BY MOUTH**
  - **Adult:** 200 mg twice daily

- **Pityriasis versicolor**
  - **BY MOUTH**
  - **Adult:** 200 mg once daily for 7 days

- **Tinea pedis | Tinea manuum**
  - **BY MOUTH**
  - **Adult:** 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

- **Tinea corporis | Tinea cruris**
  - **BY MOUTH**
  - **Adult:** 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

- **Onychomycosis**
  - **BY MOUTH**
  - **Adult:** 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

- **Aspergillosis**
  - **BY MOUTH**
  - **Adult:** 200 mg twice daily
Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

- **BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Histoplasmosis**

- **BY MOUTH**
- Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day
- **BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**CONTRA-INDICATIONS**

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

- **BY MOUTH**
- Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily
- **BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

- **BY MOUTH**
- Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

- **BY MOUTH USING ORAL SOLUTION**
- Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

**UNLICENSED USE** Itraconazole doses in BNF may differ from those in product literature.

### IMPORTANT SAFETY INFORMATION

**HEART FAILURE**

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- Patients receiving high doses and longer treatment courses;
- Older adults and those with cardiac disease;
- Patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- Patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**CONTRA-INDICATIONS** Acute porphyrias p. 930

**CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure

**INTERACTIONS** → Appendix 1 (antifungals, triazole).

**SIDE-EFFECTS**

### GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · dyspepsia · headache · hepatitis · hypokalaemia · nausea · rash · taste disturbances · vomiting

- **Uncommon** Constipation · dizziness · dyspepsia · flatulence · menstrual disorder · myalgia · oedema · peripheral neuropathy (discontinue treatment)

- **Rare** Alopecia · deafness · erectile dysfunction · heart failure · hypertriglyceridaemia · leucopenia · pancreatitis · photosensitivity · Stevens-Johnson syndrome · tinnitus · toxic epidermal necrolysis · urinary frequency · visual disturbances

- **Frequency not known** Arthralgia · blood pressure changes · confusion · drowsiness · hepatotoxicity · renal impairment · thrombocytopenia · tremor

### SPECIFIC SIDE-EFFECTS

- **With intravenous use** Hyperglycaemia

### SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if benefit outweighs risk of hepatotoxicity.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- **With oral use** Bioavailability of oral formulations possibly reduced.

- **With intravenous use** Use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

### MONITORING REQUIREMENTS

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

### DIRECTIONS FOR ADMINISTRATION

- **With intravenous use** For intravenous infusion (Sporanox®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.

- **With oral use** For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

### PRESCRIBING AND DISPENSING INFORMATION

- Flavours of oral liquid formulations may include cherry.

### PATIENT AND CARER ADVICE

- Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- Patients or carers should be given advice on how to administer itraconazole oral liquid.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Capsule

**CAPSULE**

**CAUTIONARY AND ADVISORY LABELS** 5, 9, 21, 25

- **Itraconazole (Non-proprietary)**
  - Itraconazole 100 mg [itraconazole 100mg capsules] 15 capsule [PO] £13.77 DT price = £3.44 | 60 capsule [PO] £56.21
  - S**poranox** (Janssen-Cilag Ltd)
    - Itraconazole 100 mg Sporanox-Pulse 100mg capsules 28 capsule [PO] £25.72
Posaconazole

**INDICATIONS AND DOSE**

Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole | Coccidiodomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

- **By mouth using oral suspension**
  - Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated
- **By mouth using tablets**
  - Adult: 300 mg twice daily on first day, then 300 mg once daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

- **By mouth using oral suspension**
  - Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food
- **By mouth using tablets**
  - Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole

- **By mouth using oral suspension**
  - Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food
- **By mouth using tablets**
  - Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

**DOSE EQUIVALENCE AND CONVERSION**

- Posaconazole oral suspension is not interchangeable with tablets on a milligram-for-milligram basis.

**PHARMACOKINETICS**

Posaconazole oral suspension should be taken with food (preferably a high fat meal) or nutritional supplement to ensure adequate exposure for systemic effects. Where possible, tablets should be used in preference to suspension because tablets have a higher bioavailability.

- **UNLICENSED USE** Tablets not licensed for oropharyngeal candidiasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 930
- **CAUTIONS** Body-weight over 120 kg—risk of treatment failure possibly increased; body-weight under 60 kg—risk of side effects increased; bradycardia; cardiomyopathy; history of QT interval prolongation—symptomatic arrhythmias

**INTERACTIONS** Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs known to cause QT-interval prolongation.

**SIDE-EFFECTS**

- Common or very common Abdominal pain | anaemia | anorexia | blood disorders | constipation | diarrhoea | dizziness | drowsiness | dry mouth | dyspepsia | electrolyte disturbances | fatigue | fever | flatulence | gastro-intestinal disturbances | headache | nausea | neutropenia | paraesthesia | pruritus | rash | thrombocytopenia | vomiting
- Rare Adrenal insufficiency | breast pain | cardiac failure | depression | encephalopathy | hearing impairment | ileus | myocardial infarction | pneumonitis | psychosis | Stevens-Johnson syndrome | stroke | syncope | thrombosis

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.

**PREGNANCY** Manufacturer advises avoid—present in milk in animal studies.

**BREAST FEEDING** Manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Monitor liver function in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
- Monitor liver function before and during therapy.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include cherry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant tablet**

- **Noxafil** (Merck Sharp & Dohme Ltd)
  - Posaconazole 100 mg
  - **POS** £396.96
  - **96 tablet POS** £2,387.85

**Oral suspension**

- **POS** £491.20 (Hospital only)

Voriconazole

**INDICATIONS AND DOSE**

Invasive aspergillosis | Serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

- **By mouth**
  - Adult: body-weight up to 40 kg: Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
  - Adult: body-weight 40 kg and above: Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- **By intravenous infusion**
  - Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

**CONTRA-INDICATIONS** Acute porphyrias p. 930
HEPATIC IMPAIRMENT

BREAST FEEDING

CONCEPTION AND CONTRACEPTION

Hepatotoxicity With intravenous use

Common or very common Abdominal pain · acute renal failure · agitation · alopecia · altered perception · anaemia · anxiety · asthenia · blood disorders · blurred vision · chelitis · chest pain · confusion · depression · diarrhoea · dizziness · haematuria · hallucinations · headache · hypoglycaemia · hypokalaemia · hypotension · influenza-like symptoms · jaundice · leucopenia · nausea · oedema · pancytopenia · paraesthesia · photophobia · photosensitivity · pruritus · rash · respiratory distress syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting

Uncommon Adrenocortical insufficiency · arthralgias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hypoaesthesia · hyponatraemia · nystagmus · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope

Rare Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertonia · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis

Frequency not known On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)

SPECIFIC SIDE-EFFECTS

Common or very common

With intravenous use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.

Photo toxicity Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.

PREGNANCY Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT In mild to moderate hepatic cirrhosis use usual initial dose then halve maintenance dose. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.

RENAL IMPAIRMENT Intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

CAUTIONS Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

INTERACTIONS → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs that prolong QT interval.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

MONITORING REQUIREMENTS

Monitor renal function.

Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include orange.

PATIENT AND CARER ADVICE Patients and their carers should be advised to keep the alert card with them at all times.

Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a screens with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 11, 23

Voriconazole (Non-proprietary)

Powder and solvent for solution for infusion

EXCIPIENTS: May contain Sulphobutyler beta cyclodextrin sodium ELECTROLYTES: May contain Sodium

VFEND (Pfizer Ltd)

Voriconazole 200 mg VFEND 200mg powder and solvent for solution for infusion vials | 1 vial [POM] £77.14 (Hospital only)
Flucytosine

### INDICATIONS AND DOSE

- **Systemic yeast and fungal infections | Adjunct to amphotericin B in severe systemic candidiasis and in other severe or long-standing infections**
  - By intravenous infusion
  - Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for extremely sensitive organisms

- **Cryptococcal meningitis (adjunct to amphotericin)**
  - By intravenous infusion
  - Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

### UNLICENSED USE

- Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.
- **CAUTIONS** Blood disorders - elderly

### INTERACTIONS

- **Appendix 1 (flucytosine).**

### SIDE-EFFECTS

- **Common or very common** Diarrhoea, nausea, rash, vomiting
- **Uncommon** Alterations in liver function tests - cardiotoxicity - confusion - convulsions - hallucinations - headache - sedation - toxic epidermal necrolysis - vertigo
- **Frequency not known** Aplastic anaemia, blood disorders - hepatic necrosis - hepatitis - leucopenia - thrombocytopenia
- **PREGNANCY** Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.
- **MONITORING REQUIREMENTS**
  - For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
  - Liver- and kidney-function tests and blood counts required (weekly in blood disorders).
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 20–40 minutes.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- **Electrolytes:** May contain Sodium
  - Ancotil (Meda Pharmaceuticals Ltd)
    - Flucytosine 10 mg per 1 ml
    - 25g/250ml solution for infusion bottles | 5 bottle
  - Cost: £151.67 (Hospital only)

Griseofulvin

### INDICATIONS AND DOSE

- **Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate**
  - **BY MOUTH**
  - Adult: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

### UNLICENSED USE

- Griseofulvin doses in BNF may differ from those in product literature.

### CONTRA-INDICATIONS

- Acute porphyrias p. 930 - systemic lupus erythematosus (risk of exacerbation)

### INTERACTIONS

- **Appendix 1 (griseofulvin).**

### SIDE-EFFECTS

- **Rare** Erythema multiforme - toxic epidermal necrolysis - Very rare - Headache
- **Frequency not known** Abdominal pain - agitation - confusion - depression - diarrhoea - dizziness - dyspepsia - fatigue - glossitis - hepatotoxicity - impaired coordination - impaired hearing - leucopenia - menstrual disturbances - nausea - peripheral neuropathy - photosensitivity - rash - renal failure - sleep disturbances - systemic lupus erythematosus - taste disturbances - vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration.
- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC FEEDING** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

- **CAUTIONARY AND ADVISORY LABELS 9, 21**
  - Griseofulvin (Non-proprietary)
    - 125 mg
    - 250 mg tablets
    - 500 mg tablets
  - Cost: £96.67 DT price = £99.00

### 3.1 Pneumocystis pneumonia

#### Pneumocystis pneumonia

### Overview

Pneumocystis pneumonia caused by *Pneumocystis jirovecii* (Pneumocystis carinii) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

### Treatment

**Mild to moderate disease**

- **Co-trimoxazole** p. 518 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

- **Atovaquone** p. 555 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 532 with trimethoprim p. 529 is given by mouth for the
Antiprotozoals

Treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin p. 493 and primaquine p. 571 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate below given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe infections associated with HIV infection, prednisolone p. 622 is given by mouth for 5 days (alternatively, hydrocortisone p. 620 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance.

Inhaled pentamidine is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone can be used. Atovaquone has also been used for prophylaxis [unlicensed indication].

ANTIPROTOZOALS

Atovaquone

- **INDICATIONS AND DOSE**
  
  Treatment of mild to moderate *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia in patients intolerant of co-trimoxazole
  
  - **BY MOUTH**
    
    Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food
  
  Prophylaxis against pneumocystis pneumonia
  
  - **BY MOUTH**
    
    Adult: 750 mg twice daily

- **UNLICENSED USE** Not licensed for prophylaxis against pneumocystis pneumonia.

- **CAUTIONS** Other causes of pulmonary disease should be sought and treated: elderly, initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)

- **INTERACTIONS** Appendix 1 (atovaquone).

- **SIDE-EFFECTS** Anaemia, diarrhoea, fever, headache, hypotension, nausea, neutropenia, pruritus, rash, Stevens-Johnson syndrome, vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

Pentamidine isetionate

- **INDICATIONS AND DOSE**
  
  Treatment of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia (specialist use only)

  - **BY INTRAVENOUS INFUSION**
    
    Adult: 4 mg/kg once daily for at least 14 days
  
  Prophylaxis of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia (specialist use only)

  - **BY INHALATION OF NEBULISED SOLUTION**
    
    Adult: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature
  
  Visceral leishmaniasis (specialist use only)

  - **BY DEEP INTRAMUSCULAR INJECTION**
    
    Adult: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary
  
  Cutaneous leishmaniasis (specialist use only)

  - **BY DEEP INTRAMUSCULAR INJECTION**
    
    Adult: 3–4 mg/kg 1–2 times a week until condition resolves
  
  Trypanosomiasis (specialist use only)

  - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
    
    Adult: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for primary prevention of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia by inhalation of nebulised solution.

- **CAUTIONS** Anaemia, bradycardia, coronary heart disease, history of ventricular arrhythmias, hyperglycaemia, hypertension, hypoglycaemia, hypokalaemia, hypomagnesaemia, hypotension, leucopenia, risk of severe hypotension following administration, thrombocytopenia

- **INTERACTIONS** Appendix 1 (pentamidine isetionate). Caution with concomitant use of other drugs that prolong the QT interval.

- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**

  Abnormal liver-function tests, acute renal failure, anaemia, arthralgias (can be severe and sometimes fatal), azotaemia, dizziness, flushing, hyperglycaemia, hyperkalaemia, hypocalcaemia, hypoglycaemia (can be...
severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis (can be severe and sometimes fatal) · rash · Stevens–Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting

**SPECIFIC SIDE-EFFECTS**

- When used by inhalation Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
- With intramuscular use or intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for severe renal impairment.
- **BREAST FEEDING** Manufacturer advises avoid unless essential.
- **PREGNANCY** 

**MONITORING REQUIREMENTS**

- Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- Carry out laboratory monitoring according to product literature.

**DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttck. For **intravenous infusion**, reconstitute 300 mg with 3–5 mL. Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL. Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

**HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Pentacarinat** (Sanofi)
  - Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial [ texting ] £158.86

### 4 Helminth infection

#### Helminth infections

**Specialist centres**

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

- **Birmingham** (0121) 424 0357
- **Scotland** Contact local Infectious Diseases Unit
- **Liverpool** (0151) 705 3100
- **London** 0845 155 5000 (treatment)

**Drugs for threadworms**

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 558 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Ascaridides (common roundworm infections)**

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 558 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

**Drugs for tapeworm infections**

**Taenicides**

- **Niclosamide** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 558 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albenzazole p. 557 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Drugs for hookworms**

Hookworms (anaclostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albenzazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

**Schistosomicides (bilharziasis)**

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and
mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system. Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

**Filaricides**

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

**Drugs for cutaneous larva migrans (creeping eruption)**

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (thiabendazole) by mouth [all unlicensed] (available from manufacturers or specialist importing companies).

**Drugs for strongyloidiasis**

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

### Anthelmintics

#### Albendazole

**INDICATIONS AND DOSE**

<table>
<thead>

- *Wuchereria bancrofti* infections | *Brugia malayi* infections

- BY MOUTH
- Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- *Loa loa* infections

- BY MOUTH
  - Adult: Initially 1 mg/kg daily on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

- UNLICENSED USE Diethylcarbamazine is an unlicensed drug.

- INTERACTIONS → Appendix 1 (diethylcarbamazine).

#### MEDICAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

#### Ivermectin

**INDICATIONS AND DOSE**

- **Chronic *Strongyloides* infection**
  - BY MOUTH
  - Adult: 200 micrograms/kg daily for 2 days

- **Onchocerciasis**
  - BY MOUTH
  - Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms

- Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone
  - BY MOUTH
  - Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- UNLICENSED USE Ivermectin is an unlicensed drug.

- INTERACTIONS → Appendix 1 (ivermectin).

- SIDE-EFFECTS Aggravation of itching - aggravation of rash
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**
- Ivermectin (Non-proprietary)
  - Ivermectin 3 mg | Stromectol 3mg tablets | 4 tablet POM no price available | 20 tablet POM no price available

**Levamisole**

**INDICATIONS AND DOSE**
**Roundworm infections**
- BY MOUTH
  - Adult: 120–150 mg for 1 dose

**UNLICENSED USE**
- Not licensed.

**CONTRA-INDICATIONS**
- Blood disorders

**CAUTIONS**
- Epilepsy
- Sjögren’s syndrome

**INTERACTIONS**
- Appendix 1 (levamisole).

**SIDE-EFFECTS**
- Arthralgia (on prolonged treatment) • blood disorders (on prolonged treatment) • convulsions (on prolonged treatment) • diarrhoea • dizziness • headache • influenza-like syndrome (on prolonged treatment) • insomnia (on prolonged treatment) • myalgia (on prolonged treatment) • nausea • rash (on prolonged treatment) • taste disturbances (on prolonged treatment) • vasculitis (on prolonged treatment) • vomiting

**PREGNANCY**
- Embryotoxic in animal studies, avoid if possible.

**BREAST FEEDING**
- No information available.

**HEPATIC IMPAIRMENT**
- Use with caution—dose adjustment may be necessary.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**
- Cautionary and Advisory Labels 4
  - Ergamisol (Imported (Belgium))
    - Levamisole (as Levamisole hydrochloride) 50 mg | Ergamisol 50mg tablets | 20 tablet POM no price available

**Mebendazole**

**INDICATIONS AND DOSE**
**Threadworm infections**
- BY MOUTH
  - Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
  - Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

**Whipworm infections**
- BY MOUTH
  - Child 1–17 years: 100 mg twice daily for 3 days
  - Adult: 100 mg twice daily for 3 days

**Roundworm infections**
- BY MOUTH
  - Child 1 year: 100 mg twice daily for 3 days
  - Child 2–17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
  - Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

**UNLICENSED USE**
- Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.

**INTERACTIONS**
- Appendix 1 (mebendazole).

**SIDE-EFFECTS**
- Common or very common: Abdominal pain
- Uncommon: Diarrhoea • flatulence
- Rare: Alopecia • convulsions • dizziness • hepatitis • neutropenia • rash • Stevens–Johnson syndrome • toxic epidermal necrolysis • urticaria

**PREGNANCY**
- Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**
- Amount present in milk too small to be harmful but manufacturer advises avoid.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include banana.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

**EXCEPTIONS TO LEGAL CATEGORY**
- Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Chewable tablet**
- Ovex (McNeil Products Ltd)
  - Mebendazole 100 mg | Ovex 100mg chewable tablets sugar-free | 1 tablet P | £2.03 sugar-free | 4 tablet P | £4.74
- Vermox (Janssen-Cilag Ltd)
  - Mebendazole 100 mg | Vermox 100mg chewable tablets sugar-free | 6 tablet P | £1.34 DT price = £1.34

**Oral suspension**
- Ovex (McNeil Products Ltd)
  - Mebendazole 20 mg per 1 ml | Ovex 100mg/5ml oral suspension | 30 ml P | £6.03 DT price = £1.55
- Vermox (Janssen-Cilag Ltd)
  - Mebendazole 20 mg per 1 ml | Vermox 100mg/5ml oral suspension | 30 ml P | £5.55 DT price = £1.55

**Praziquantel**

**INDICATIONS AND DOSE**
**Tapeworm infections (Taenia solium)**
- BY MOUTH
  - Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

**Tapeworm infections (Hymenolepis nana)**
- BY MOUTH
  - Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

**Schistosoma haematobium worm infections**
- BY MOUTH
  - Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

**Schistosoma japonicum worm infections**
- BY MOUTH
  - Adult: 20 mg/kg 3 times a day for 1 day

**UNLICENSED USE**
- Praziquantel is an unlicensed drug.

**INTERACTIONS**
- Appendix 1 (praziquantel).
Leishmaniasis

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 499 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tinidazole p. 501 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver.

Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 467. Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture and there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for Giardia lamblia infections. Alternative treatments are tinidazole or mebendazole hydrochloride p. 467.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin p. 547 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (AmBisome®). Abelcet®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 555 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ’special-order’ manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasmal chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 572 and sulfadiazine p. 520, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 493 or clari-thromycin p. 496 or azithromycin p. 495. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ’special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Other drugs used for Leishmaniasis Amphotericin, p. 547 • Pentamidine isetionate, p. 555

ANTIPROTOZOAIS

Sodium stibogluconate

INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

• BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

• Adult: 20 mg/kg daily for 28 days

Cutaneous leishmaniasis (specialist use only)

• BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

• Adult: 20 mg/kg daily for 20 days

CAUTIONS, FURTHER INFORMATION

• Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening
Infection

Medicinal forms

DIRECTIONS FOR ADMINISTRATION

MONITORING REQUIREMENTS

RENAL IMPAIRMENT

HEPATIC IMPAIRMENT

PREGNANCY

SIDE-EFFECTS

If pharyngeal or tracheal involvement)—may require corticosteroid.

INTERACTIONS → Appendix 1 (sodium stibogluconate).

Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

Rare Bleeding from gums · bleeding from nose · fever · flushing · jaundice · rash · substernal pain · sweating · vertigo

Frequency not known Abdominal pain · anaphylaxis · anorexia · arthralgia · coughing · diarrhoea · ECG changes · headache · lethargy · myalgia · nausea · pain on intramuscular injection · pain on intravenous administration · pancreatitis · thrombosis on intravenous administration · vomiting

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Amount probably too small to be harmful.

HEPATIC IMPAIRMENT Use with caution.

RENAL IMPAIRMENT Avoid in significant impairment.

Monitoring requirements Monitor ECG before and during treatment.

DIRECTIONS FOR ADMINISTRATION Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Pentostam (GlaxoSmithKline UK Ltd)
  * Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml. Pentostam 10g/100ml solution for injection vials [1 vial £0.03] £56.43

5.2 Malaria

Antimalarials

Artemether with lumefantrine

Artemether with lumefantrine p. 567 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 569 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 571 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 573, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine

Mefloquine p. 570 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available.

Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperazine with artemether

Artemether with lumefantrine p. 567 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperazine has a long half-life.

Primaquine

Primaquine p. 571 is used to eliminate the liver stages of P. vivax or P. ovale following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 561).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 568) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 521. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 572 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 572 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine

Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 566).

Tetracyclines

Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 561).

Malaria, prophylaxis

Prophylaxis

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

</table>
Protection against bites
Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis
In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 570) before travel into an endemic area; Malarone® or doxycycline p. 521 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 569 and proguanil hydrochloride p. 571 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria.

Specialist advice should be sought for long-term prophylaxis.

Return from malarial region
It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness, particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Epilepsy
Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance, proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.

Asplenia
Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment
Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.
Pregnancy
Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 898 (dosed as a pregnancy ‘at high-risk’ of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding
Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants
Travellers taking warfarin sodium p. 131 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas, expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See Recommended regimens for prophylaxis against malaria.

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Malaria, treatment

Advice for healthcare professionals
A number of specialist centres are able to provide advice on specific problems.

Treatment of malaria
Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 573, Malarone® (atovaquone with proguanil hydrochloride p. 568), or Riamet® (artemether with lumefantrine p. 587). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)
Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 569 which should not therefore be given for treatment.

Quinine, Malarone®, (atovaquone with proguanil hydrochloride), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the patient is seriously ill or unable to take tablets. Mefloquine p. 570 is now rarely used for treatment because of concerns about resistance.

Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 521 for 7 days or clindamycin p. 493 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 572 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, Malarone®, or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline or clindamycin).
Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named-patient' use.

**Pregnancy**

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clinamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfafoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

**Non-falciparum malaria (treatment)**

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region.

Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine, primaquine p. 571 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

**Parenteral**

If the patient is unable to take oral therapy, quinine can be given by intravenous infusion [unlicensed], changed to oral chloroquine as soon as the patient’s condition permits.

**Pregnancy**

The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly during the pregnancy.

**Antiprotozoals > Antimalarials**

Artemether with lumefantrine

- **INDICATIONS AND DOSE**
  - **Treatment of acute uncomplicated falciparum malaria**
  - **Treatment of chloroquine-resistant non-falciparum malaria**
    - **BY MOUTH**
      - Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48 and 60 hours (total 24 tablets over 60 hours)
  - **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.
  - **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation - family history of sudden death - history of arrhythmias - history of clinically relevant bradycardia - history of congestive heart failure accompanied by reduced left ventricular ejection fraction

**CAUTIONS** Avoid in acute porphyrias p. 930 - electrolyte disturbances

**INTERACTIONS** → Appendix 1 (artemether with lumefantrine). Caution if concomitant use with other drugs known to cause QT-interval prolongation.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anorexia - arthralgia - asthenia - cough - diarrhoea - dizziness - headache - myalgia - nausea - palpitation - paraesthesia - prolonged QT interval - pruritus - rash - sleep disturbances - vomiting
- **Uncommon** Ataxia - clonus - hypoaesthesia

**PREGNANCY** Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid breast-feeding for at least 1 week after last dose. Present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.

**MONITORING REQUIREMENTS**

Monitor patients unable to take food (greater risk of recrudescence).

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be crushed just before administration.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks.

Dizziness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 21
  - **Riamet** (Novartis Pharmaceuticals UK Ltd)
    - Artemether 20 mg, Lumefantrine 120 mg Riamet tablets | 24 tablet | £22.50

Artemether with piperaquine phosphate

(Piperaquine tetraphosphate with dihydroartemisinin)

- **INDICATIONS AND DOSE**
  - **Treatment of uncomplicated falciparum malaria**
    - **BY MOUTH**
      - Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
      - Child 6 months-17 years (body-weight 12-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
      - Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
      - Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
      - Child 6 months-17 years (body-weight 75-99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
      - Child 6 months-17 years (body-weight ≥100 kg): 5 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
**Protozoal infection**

- **Adult (body-weight 36-74 kg):** 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- **Adult (body-weight 75-99 kg):** 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

**CONTRA-INDICATIONS** Acute myocardial infarction - bradycardia - congenital long QT syndrome - electrolyte disturbances - family history of sudden death - heart failure with reduced left ventricular ejection fraction - history of symptomatic arrhythmias - left ventricular hypertrophy - risk factors for QT interval prolongation - severe hypertension

**INTERACTIONS** → Appendix 1 (артенимол with piperaquine).

Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.

**SIDE-EFFECTS**

**PREGNANCY** Teratogenic in animal studies — manufacturer advises use only if no other antimalarials cannot be used.

**BREAST FEEDING** Manufacturer advises avoid — present in milk in animal studies.

**HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

**MONITORING REQUIREMENTS**

- Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
- Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in females children who are vomiting, or in the elderly.

**DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperaquine phosphate with artenimol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Eurartesim** (Sigma-Tau Pharma Ltd)
  - Artenimol 40 mg, Piperaquine phosphate 320 mg
  - Eurartesim 320mg/40mg tablets | 12 tablet **£40.00**

---

**Atovaquone with proguanil hydrochloride**

**INDICATIONS AND DOSE**

**MALARONE®**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

- **BY MOUTH**
  - Adult (body-weight 41 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

Treatment of acute uncomplicated falciparum malaria | Treatment of non-falciparum malaria

- **BY MOUTH**
  - Adult: 4 tablets once daily for 3 days

**UNLICENSED USE** Not licensed for treatment of non-falciparum malaria.

**CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) - efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

**INTERACTIONS** → Appendix 1 (proguanil, atovaquone).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - abnormal dreams - anorexia - cough - depression - diarrhoea - dizziness - fever - headache - insomnia - nausea - pruritus - rash - vomiting

- **Uncommon** Anxiety - blood disorders - hair loss - hypotension - palpitation - stomatitis

- **Frequency not known** Cholestasis - hallucinations - hepatitis - mouth ulcers - photosensitivity - seizures - Stevens-Johnson syndrome - tachycardia - vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Use only if no suitable alternative available.

**RENAL IMPAIRMENT** Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

**PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - **Malaron** (GlaxoSmithKline UK Ltd)
    - Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg
    - Malaron Paediatric tablets | 12 tablet **£6.26**
    - Proguanil hydrochloride 100 mg, Atovaquone 250 mg
    - Malaron tablets | 12 tablet **£25.21**

- ****
In adults

Doses expressed as chloroquine base. Chloroquine base

Adult:

BY MOUTH

Adult:

Prophylaxis of malaria

INITIALLY BY MOUTH USING SYRUP

Child 14-5 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 6 weeks-5 months (body-weight 4.5-7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 6-11 months (body-weight 8-10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 1-2 years (body-weight 11-14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 3-4 years (body-weight 15-16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 5-7 years (body-weight 16.5-24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Child 8-13 years (body-weight 25-44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

INITIALLY BY MOUTH USING TABLETS

Child 14-17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Adult (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

BY MOUTH

Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg of base

P. vivax or P. ovale infection during pregnancy while radical cure is postponed

BY MOUTH

Adult: 310 mg once weekly

DOSE EQUIVALENCE AND CONVERSION

Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).

DOSES AT EXTREMES OF BODY-WEIGHT

In adults In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.
Infection

EXCEPTIONS TO LEGAL CATEGORY

l HEPATIC IMPAIRMENT Use with caution in moderate to severe impairment.

l RENAL IMPAIRMENT Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

l MONITORING REQUIREMENTS
  ▶ in adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
  ▶ in children Ophthalmic examination with long-term therapy.

l PATIENT AND CARER ADVICE Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

l NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

l EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

l MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Table
CAUTIONARY AND ADVISORY LABELS 5

Avloclor (Alliance Pharmaceuticals Ltd)
Chloroquine phosphate 250 mg Avloclor 250mg tablets | 20 tablet [PO] £7.95 DT price = £7.95

Oral solution
CAUTIONARY AND ADVISORY LABELS 5

Malarivon (Wallace Manufacturing Chemists Ltd)
Chloroquine phosphate 16 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml [PO] £30.00

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 569, proguanil hydrochloride p. 571.

l INDICATIONS AND DOSE

Prophylaxis of malaria
  ▶ BY MOUTH
  ▶ Adult: (consult product literature)

l EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

l MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablets

Paludrine/Avloclor (Alliance Pharmaceuticals Ltd)
Paludrine/Avloclor tablets anti-malarial travel pack | 112 tablet [P] £13.50

Mefloquine

l INDICATIONS AND DOSE

Treatment of malaria
  ▶ BY MOUTH
  ▶ Adult: (consult product literature)

Prophylaxis of malaria
  ▶ BY MOUTH
  ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
  ▶ Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

l UNLICENSED USE Mefloquine doses in BNF Publications may differ from those in product literature.
  ▶ in children Not licensed for use in children under 5 kg body-weight and under 3 months.

l CONTRA-INDICATIONS Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions • avoid for standby treatment if history of convulsions • history of blackwater fever

l CAUTIONS Cardiac conduction disorders • epilepsy (avoid for prophylaxis) • not recommended in infants under 3 months (5 kg) • traumatic brain injury

l CAUTIONS, FURTHER INFORMATION

Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.

l INTERACTIONS → Appendix 1 (mefloquine).

l SIDE-EFFECTS

▶ Common or very common Abdominal pain • diarrhoea • dizziness • headache • nausea • neuropsychiatric reactions • pruritus • visual disturbances • vomiting

▶ Very rare Optic neuropathy

▶ Frequency not known Alopecia • amnesia • anorexia • arrhythmias • arthralgia • ataxia • blood disorders • bradycardia • cataract • chest pain • confusion • drowsiness • dyspepsia • dyspnoea • encephalopathy • fever • flushing • hepatic failure • hyperhidrosis • hypertension • hypotension • leucocytosis • leucopenia • malaise • motor neuropathies • muscle weakness • myalgia • oedema • palpitation • panic attacks • pneumonitis • rash • seizures • sensory neuropathies • speech disturbances • Stevens–Johnson syndrome • syncope • tachycardia • thrombocytopenia • tremor • vestibular disorders

l ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with hypersensitivity to quinine.
Proguanil hydrochloride

**INDICATIONS AND DOSE**

**Prophylaxis of malaria**

- **BY MOUTH**
  - Adult: 30 mg daily for 14 days
  - Adult: 15 mg daily for 14 days

**Adjunct in the treatment of non-falciparum malaria caused by *P.falciparum* infection**

- **BY MOUTH**
  - Adult: 45 mg once weekly for 8 weeks

**Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)**

- **BY MOUTH**
  - Adult: 30 mg daily, this combination is associated with considerable toxicity

**UNLICENSED USE**

Proguanil doses in BNF Publications may differ from those in product literature.

**INTERACTIONS**

- **Common or very common** Constipation; diarrhoea; mild gastrointestinal intolerance
  - **Very rare** Cholestasis; hair loss; skin reactions; vasculitis
  - **Frequency not known** Mouth ulcers; stomatitis

**PREGNANCY**

Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.

**BREAST FEEDING**

Amount in milk probably too small to be harmful when used for malaria prophylaxis.
Protozoal infection

572

Pyrimethamine

**INDICATIONS AND DOSE**

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)

- **BY MOUTH**
  - Adult: 50 mg once daily until delivery

Malaria

- **BY MOUTH**
  - Adult: No dose stated because not recommended alone

**CAUTIONS**

- Avoid large loading doses - predisposition to folate deficiency

**INTERACTIONS**

- Appendix 1 (pyrimethamine).

**SIDE-EFFECTS**

- Anaemia (with high doses) - blood disorders (with high doses) - diarrohea - dizziness - headache - leucopenia (with high doses) - nausea - rash - thrombocytopenia (with high doses) - vomiting

- Abnormal skin pigmentation - fever

- Buccal ulceration - colic - convulsions

**PREGNANCY**

- Theoretical teratogenic risk in first trimester (folate antagonist).

**BREAST FEEDING**

- Significant amount in milk - avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution.

**RENAL IMPAIRMENT**

- Manufacturer advises caution.

**MONITORING REQUIREMENTS**

- Blood counts required with prolonged treatment.

**LESS SUITABLE FOR PRESCRIBING**

- Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Daraprim (GlaxoSmithKline UK Ltd)
- Pyrimethamine 25 mg Daraprim 25mg tablets 30 tablet £13.00

**Pyrimethamine with sulfadoxine**

**INDICATIONS AND DOSE**

Adjuvant to quinine in treatment of Plasmodium falciparum malaria

- **BY MOUTH**
  - Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
  - Child 5–6 years: 25/500 mg for 1 dose
  - Child 7–9 years: 37.5/750 mg for 1 dose
  - Child 10–13 years: 50/1000 mg for 1 dose
  - Child 14–17 years: 75/1500 mg for 1 dose
  - Adult: 75/1500 mg for 1 dose

**Malaria prophylaxis**

- **BY MOUTH**
  - Adult: Not recommended by UK malaria experts

**DOSE EQUIVALENCE AND CONVERSION**

- Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

**UNLICENSED USE**

- Not licensed for use in children of body-weight under 5 kg.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 930

**CAUTIONS**

- Avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks - elderly - G6PD deficiency - history of seizures - avoid large loading doses - not recommended for prophylaxis (severe side-effects on long-term use) - predisposition to folate deficiency - predisposition to hyperkalaemia (in adults)

**INTERACTIONS**

- Appendix 1 (pyrimethamine, sulfonamides).

**SIDE-EFFECTS**

- Diarrohea - headache - hyperkalaemia - nausea - rash

- Vomiting

**Frequency not known**

- Allergic alveolitis - eosinophilic alveolitis - pulmonary infiltrates

**SIDE-EFFECTS, FURTHER INFORMATION**

- Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated in patients with sulfonamide allergy.
**PREGNANCY** Possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.

**BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).

**MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

**PRESCRIBING AND DISPENSING INFORMATION** Also known as Fansidar®.

**PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.

**UNLICENSED USE** Injection not licensed.

**CONTRA-INDICATIONS** Haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus.

**CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) – cardiac disease (monitor ECG during parenteral treatment) – conduction defects (monitor ECG during parenteral treatment) – elderly (monitor ECG during parenteral treatment) (in adults) – G6PD deficiency – heart block (monitor ECG during parenteral treatment)

**SIDE-EFFECTS** Agitation, tinnitus, abdominal pain, acute renal failure, angioedema, blood disorders, cardiovascular effects, cinchonism, confusion, diarrhoea, dyspnoea, flushed skin, headache, hearing impairment, hot flush, hypersensitivity reactions, hypoglycaemia (especially after parenteral administration), intravascular coagulation, muscle weakness, nausea, photosensitivity, rashes, temporary blindness, thrombocytopenia, vertigo, visual disturbances, vomiting.

**OVERDOSE** Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 1204.

**PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.

**BREAST FEEDING** Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT** with intravenous use – For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

**RENAL IMPAIRMENT** with intravenous use – For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

**MONITORING REQUIREMENTS** with intravenous use – Monitor blood glucose and electrolyte concentration during parenteral treatment.

In adults Patients taking quinine for nocturnal leg cramps should be monitored closely during the early stages for adverse effects as well as for benefit.

**DIRECTIONS FOR ADMINISTRATION** with intravenous use in children – For intravenous infusion, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.

With intravenous use in adults – For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. To be given over 4 hours.

**PRESCRIBING AND DISPENSING INFORMATION** Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

---

**Quinine**

**INDICATIONS AND DOSE**

**Nocturnal leg cramps**

- **BY MOUTH**
  - Adult: 200–300 mg once daily, to be taken at bedtime

**Non-falciparum malaria**

- **BY INTRAVENOUS INFUSION**
  - Adult: 10 mg/kg every 4 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient's condition permits

**Falciparum malaria**

- **BY MOUTH**
  - Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin
  - Adult: 600 mg every 8 hours for 5–7 days, the quinine should be given together with or followed by either doxycycline or clindamycin

- **BY INTRAVENOUS INFUSION**
  - Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

**Falciparum malaria (in intensive care unit)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

**DOSE EQUIVALENCE AND CONVERSION**

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.
- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg.
6 Viral infection

6.1 Hepatitis

Hepatitis

Overview
Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely asymptomatic. Early treatment of acute hepatitis C with interferon alfa p. 850 can reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B
Peginterferon alfa p. 576 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contra-indicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 575, or tenofovir disoproxil p. 599 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 576, lamivudine p. 598, or telbivudine p. 575.

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or less in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 598 or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Chronic hepatitis C
Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 578 and peginterferon alfa is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Boceprevir p. 581 and telaprevir p. 583 are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing.

Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more common during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

Daclatasvir p. 577 is licensed for use in combination with sofosbuvir p. 580 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir must not be given as monotherapy.

Ombitasvir with paritaprevir and ritonavir p. 578 (Viekirax ®), is licensed for use in combination with dasabuvir p. 583, with or without ribavirin, for the treatment of chronic hepatitis C infection of genotype 1 in patients with or without compensated cirrhosis; it is also licensed for use in combination with ribavirin for the treatment of chronic hepatitis C infection of genotype 4 with or without compensated cirrhosis.

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Ledipasvir is licensed for use in combination with sofosbuvir (soshofuvir with ledipasvir p. 581), with or...
6.2a Chronic hepatitis B

Other drugs used for Chronic hepatitis B [Interferon alfa, p. 850 • Lamivudine, p. 598 • Tenofovir disoproxil, p. 599]

ANTIVIRALS  NUCLEOSIDE ANALOGUES

Entecavir

- **INDICATIONS AND DOSE**
  Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues
    - **BY MOUTH**
    - **Adult:** 500 micrograms once daily
  Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) and lamivudine–resistance
    - **BY MOUTH**
    - **Adult:** 1 mg once daily, consider other treatment if inadequate response after 6 months
  Chronic hepatitis B in patients with decompensated liver disease
    - **BY MOUTH**
    - **Adult:** 1 mg once daily

- **CAUTIONS**
  HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy' • lamivudine–resistant chronic hepatitis B—risk of entecavir resistance

- **CAUTIONS, FURTHER INFORMATION**
  Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **SIDE-EFFECTS**
  Common or very common
    - Diarrhoea, dizziness, dyspepsia, fatigue, headache, nausea, raised serum amylase, raised serum lipase, sleep disturbances, vomiting
  Uncommon
    - Alopecia, rash, thrombocytopenia

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **RENAI IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m². Consult product literature.

- **MONITORING REQUIREMENTS**
  Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **DIRECTIONS FOR ADMINISTRATION**
  To be taken at least 2 hours before or 2 hours after food.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be counselled on the administration of entecavir tablets and oral solution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  NICE technology appraisals (TAs)
  Entecavir for chronic hepatitis B (August 2008) NICE TA153
  Entecavir is an option for the treatment of chronic hepatitis B.
  www.nice.org.uk/TA153

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

Tablet
  - **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets
      - 30 tablet (POM) £36.30
    - Entecavir (as Entecavir monohydrate) 500 microgram Baraclude 0.5mg tablets
      - 30 tablet (POM) £36.30

Oral solution
  - **Baraclude** (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution sugar-free
      - 210 ml (POM) £423.80

Telbivudine

- **INDICATIONS AND DOSE**
  Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate
    - **BY MOUTH**
    - **Adult:** 600 mg once daily

- **CAUTIONS**
  Lamivudine–resistant chronic hepatitis B—risk of telbivudine resistance

- **CAUTIONS, FURTHER INFORMATION**
  Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS**
  Appendix 1 (telbivudine).

- **SIDE-EFFECTS**
  Common or very common
    - Abdominal pain, cough, diarrhoea, dizziness, fatigue, headache, nausea, raised serum amylase, raised serum lipase, rash
  Uncommon
    - Arthralgia, myalgia, myopathy (discontinue treatment) • peripheral neuropathy • taste disturbance
  Rare
    - Lactic acidosis, rhabdomyolysis

- **PREGNANCY**
  Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  Manufacturer advises avoid—present in milk in animal studies.

- **RENAI IMPAIRMENT**
  600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PATIENT AND CARER ADVICE**
  Muscle effects and peripheral neuropathy. Patients should be advised to promptly report unexplained muscle pain,
tenderness, or weakness, or numbness, tingling or burning sensations.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Telbivudine for chronic hepatitis B (August 2008)** NICE TAI54
  Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.
  www.nice.org.uk/TAI54

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Sebivo** (Novartis Pharmaceuticals UK Ltd)
  - Telbivudine 600 mg Sebivo 600mg tablets | 28 tablet £290.33

**ANTIVIRALS ▶ NUCLEOTIDE ANALOGUES**

### Adefovir dipivoxil

**INDICATIONS AND DOSE**

**Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir**

- **BY MOUTH**
  - Adult: 10 mg once daily

**CAUTIONS**

**Elderly**

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

**SIDE-EFFECTS**

Abdominal pain, asthenia, diarrhoea, dyspepsia, flatulence, headache, hypophosphataemia, nausea, pancreatitis, pruritus, rash, renal failure, vomiting.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m². Monitor renal function more frequently in patients with renal impairment.

**MONITORING REQUIREMENTS**

- Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Heptiva** (Gilead Sciences International Ltd)
  - Adefovir dipivoxil 10 mg Heptiva 10mg tablets | 30 tablet £252.22

**IMMUNOSTIMULANTS ▶ INTERFERONS**

### Peginterferon alfa

**DRUG ACTION**

Polyethylene glycol-conjugated (‘pegylated’ derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b)) are available; pegylation increases the persistence of the interferon in the blood.

**INDICATIONS AND DOSE**

**PEGASYS®**

- Combined with ribavirin for chronic hepatitis C
- Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

**VIRAFERONPEG®**

- Combined with ribavirin for chronic hepatitis C
- Combined with ribavirin and boceprevir for chronic hepatitis C
- Injection of genotype 1 in patients with compensated liver disease
- Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

**CONTRA-INDICATIONS**

For contra-indications consult product literature.

**CAUTIONS**

For cautions consult product literature.

**INTERACTIONS**

Appendix 1 (interferons).

**SIDE-EFFECTS**

- Common or very common: Anorexia, diarrhoea, influenza-like symptoms, leucopenia, nausea
- Frequency not known: Alopecia, arrhythmias, cardiovascular problems, coma (usually with high doses in the elderly), confusion, depression, hepatotoxicity, hyperglycaemia, hypersensitivity reactions, hypertension, hypertriglyceridaemia (sometimes severe), hypotension, myelosuppression (particularly affecting granulocyte counts), nephrotoxicity, ocular side-effects, palpitation, psoriasisiform rash, seizures (usually with high doses in the elderly), suicidal behaviour, thyroid abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

For information on side effects consult product literature.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment—consult product literature.

**PREGNANCY**

Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**

Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment. Close monitoring required in mild to moderate hepatic impairment.

**RENAL IMPAIRMENT**

Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.

**MONITORING REQUIREMENTS**

Monitoring of lipid concentration is recommended.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
  The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the...
disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

www.nice.org.uk/TA200

- Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk.

Patients receiving interferon alfa may be switched to peginterferon alfa.

www.nice.org.uk/TA200

- Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- Pegasys (Roche Products Ltd)

Peginterferon alfa-2a 180 microgram per 1 ml Pegasys 90micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £76.51

Peginterferon alfa-2a 270 microgram per 1 ml Pegasys 135micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £107.76

Pegasys 135micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £107.76

Peginterferon alfa-2a 360 microgram per 1 ml Pegasys 180micrograms/0.5ml solution for injection pre-filled syringes | 4 pre-filled disposable injection £497.60

Peginterferon alfa-2a 50 microgram per 1 ml Pegasys 25micrograms/0.1ml solution for injection pre-filled syringes | 21 pre-filled disposable injection £66.46

Peginterferon alfa-2a 80 microgram per 1 ml Peginterferon Peg 80microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection £106.34

Peginterferon alfa-2b 100 microgram per 1 ml Viraferon Peg 100microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection £132.92

Peginterferon alfa-2b 120 microgram per 1 ml Viraferon Peg 120microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection £159.51

Peginterferon alfa-2b 150 microgram per 1 ml Viraferon Peg 150microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection £199.38

6.2b Chronic hepatitis C

Other drugs used for Chronic hepatitis C Interferon alfa, p. 850 - Peginterferon alfa, p. 576

**Antivirals > Non-Structural Protein 5A Inhibitors**

Daclatasvir

- Drug action Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

- Indications and dose

  In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis | In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis | In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4

  - By mouth
    - Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature

- Dose adjustments due to interactions

Reduce dose to 30 mg once daily with concomitant use of potent CYP3A4 inhibitors (e.g. atazanavir boosted with ritonavir, boceprevir, clarithromycin, cobicistat, itraconazole, ketoconazole, posaconazole, telaprevir, telithromycin, and voriconazole).

Increase dose to 90 mg once daily with concomitant use of moderate CYP3A4 inducers (e.g. efavirenz).

- Cautions

Decompensated liver disease · hepatitis B virus co-infection · human immunodeficiency virus co-infection · organ transplant patients · retreatment—efficacy not established in patients with prior exposure to a NS5A inhibitor

- Interactions > Appendix 1 (daclatasvir).

- Side-effects

  - Common or very common Abdominal pain · alopecia · anaemia · anxiety · arthralgia · blurred vision · constipation · cough · decreased appetite · depression · diarrhoea · disturbance in attention · dizziness · dry mouth · dry skin · dysphoria · flatulence · gastro-oesophageal reflux · headache · hot flush · insomnia · irritable bowel syndrome · malaise · migraine · myalgia · nasal congestion · nausea · neutropenia · pruritus · pyrexia · rash · reduced visual acuity · vomiting

  - Side-effects, further information

   Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa.

  - Conception and contraception Highly effective contraception required during and for 5 weeks after treatment.

  - Pregnancy

    Manufacturer advises avoid (toxicity in animal studies).

  - Breast feeding

    Manufacturer advises avoid—present in milk in animal studies.

  - Patient and carer advice

    Missed doses

    If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

    Driving and skilled tasks

    May affect performance of skilled tasks (e.g. driving)
Ombitasvir with paritaprevir and ritonavir

The properties listed below are those particular to the combination only. For the properties of the components please consider, ritonavir p. 604.

INDICATIONS AND DOSE

Chronic hepatitis C of genotype 1 (in combination with dasabuvir, with or without ribavirin) Chronic hepatitis C of genotype 4 (in combination with ribavirin)

- BY MOUTH
  - Adult: 2 tablets once daily for duration of treatment consult product literature, to be taken with food

CONTRA-INDICATIONS

HIV co-infection without suppressive antiretroviral therapy

CAUTIONS

Retreatment—efficacy not established

INTERACTIONS

Appendix 1 (ombitasvir, paritaprevir, ritonavir).

SIDE-EFFECTS

Common or very common Anaemia - asthenia - fatigue - insomnia - nausea

Frequency not known Transient hyperbilirubinemia

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when ombitasvir with paritaprevir and ritonavir is used in combination with dasabuvir, with or without ribavirin.

CONCEPTION AND CONTRACEPTION

For women of child-bearing potential, exclude pregnancy before initiation of treatment; effective contraception should be used during treatment.

PREGNANCY

Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises avoid in moderate or severe impairment.

PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
Chronic hepatitis C genotype 2 or 3 (not previously treated, or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)

- **BY MOUTH**
  - Adult: Usual dose 400 mg twice daily

**REBETOL® CAPSULES**

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

- **BY MOUTH**
  - Adult (body-weight up to 65 kg): 400 mg twice daily
  - Adult (body-weight 65–80 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
  - Adult (body-weight 81-104 kg): 600 mg twice daily
  - Adult (body-weight 105 kg and above): 600 mg, dose to be taken in the morning and 800 mg, dose to be taken in the evening

**REBETOL® ORAL SOLUTION**

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

- **BY MOUTH**
  - Adult (body-weight up to 65 kg): 400 mg twice daily
  - Adult (body-weight 65–80 kg): 400 mg daily, dose to be taken in the morning and 600 mg daily, dose to be taken in the evening
  - Adult (body-weight 81-104 kg): 600 mg twice daily
  - Adult (body-weight 105 kg and above): 600 mg daily, dose to be taken in the morning and 800 mg daily, dose to be taken in the evening

- **UNLICENSED USE** Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

- **CONTRA-INDICATIONS**
  - With systemic use Active severe psychiatric condition (in children) - autoimmune disease (in children) - autoimmunie hepatitis (in children) - consult product literature for specific contra-indications when ribavirin p. 578 used in combination with other medicinal products - haemoglobinopathies - history of severe psychiatric condition (in children) - severe cardiac disease (in adults) - severe debilitating medical conditions - severe, uncontrolled cardiac disease in children with chronic hepatitis C - unstable or uncontrolled cardiac disease in previous 6 months (in adults)

- **CAUTIONS**
  - When used by inhalation Maintain standard supportive respiratory and fluid management therapy
  - With systemic use Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) - cardiac disease (assessment including ECG recommended before and during treatment — discontinue if deterioration) - consult product literature for specific cautions when ribavirin p. 578 used in combination with other medicinal products - gout (in adults) - haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) (in adults) - patients with a transplant — risk of rejection - risk of growth retardation in children, the reversibility of which is uncertain — if possible, consider starting treatment after pubertal growth spurt - severe dental disorders (in adults) - severe ocular disorders (in adults) - severe periodontal disorders (in adults) - severe psychiatric effects (in adults)

- **INTERACTIONS**
  - Appendix 1 (ribavirin).

- **SIDE-EFFECTS**
  - When used by inhalation Bacterial pneumonia - haemolysis - non-specific anaemia - pneumothorax - worsening respiration

**SIDE-EFFECTS, FURTHER INFORMATION**

- With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- **CONCEPTION AND CONTRACEPTION**
  - With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
  - When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

- **PREGNANCY** Avoid; teratogenicity in animal studies.
  - When used by inhalation Pregnant women should avoid exposure to aerosol.

- **BREAST FEEDING** Avoid — no information available.

- **HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.
RENAL IMPAIRMENT Plasma-ribavirin concentration increased.
- In adults Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
- In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
- When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- With systemic use Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).
- With systemic use in children Test thyroid function before treatment and then every 3 months. Eye examination also recommended during treatment if pre-existing ophthalmological disorder deteriorates or if new ophthalmological disorder develops. Manufacturer advises avoid oral ribavirin unless plasma-ribavirin concentration closely. Manufacturer advises use monthly if eGFR less than 30mL/minute/1.73m²—monitor haemoglobin concentration.
- In children Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely. Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include bubble-gum.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200 The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). www.nice.org.uk/TA200
- Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200 The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
  - not previously treated with interferon alfa or peginterferon alfa;
  - treated previously with interferon alfa alone or in combination with ribavirin;
  - whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
  - co-infected with HIV. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

LESS SUITABLE FOR PRESCRIBING Ribavirin inhalation is less suitable for prescribing.

ANTIVIRALS > NUCLEOTIDE ANALOGUES

Sofosbuvir

INDICATIONS AND DOSE
In combination with ribavirin (Copegus®), with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6 in patients with compensated liver disease | In combination with ribavirin (Copegus®) for chronic hepatitis C infection of genotype 2 in patients with compensated liver disease | In combination with daclatasvir for chronic hepatitis C infection of genotype 1, 3, or 4
- BY MOUTH
  - Adult: 400 mg once daily, for duration of treatment consult product literature

CAUTIONS, FURTHER INFORMATION
In chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

INTERACTIONS
- Appendix 1 (sofosbuvir).

SIDE-EFFECTS
Abdominal discomfort, agitation, alopecia, anaemia, anxiety, arthralgia, asthenia, blurred vision, chest pain, constipation, cough, decreased appetite, depression, diarrhoea, disturbance in attention, dizziness, dry mouth, dysphoria, gastro-oesophageal reflux, headache, influenza-like symptoms, insomnia, irritability, memory impairment, migraine, myalgia, nausea, neutropenia, rash, vomiting, weight loss

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed are reported when sofosbuvir is used in combination with ribavirin; or with ribavirin and peginterferon alfa.

PREGNANCY
Manufacturer advises avoid.

BREAST FEEDING
Manufacturer advises avoid—metabolites present in milk in animal studies.

RENAL IMPAIRMENT
Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

PRESCRIBING AND DISPENSING INFORMATION
Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE
Missed doses
If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330 Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:
Sofosbuvir is a nucleotide analogue inhibitor and ledipasvir is an HCV inhibitor; they reduce viral load by inhibiting hepatitis C virus RNA replication.

**INDICATIONS AND DOSE**

- **Chronic hepatitis C of genotypes 1, 4, 5 or 6 in patients with or without compensated cirrhosis (with or without ribavirin)**
- **Chronic hepatitis C of genotypes 1, 4, 5 or 6 in post-liver transplant patients, with or without compensated cirrhosis (with or without ribavirin)**

**TREATMENT FAILURE**

- By mouth
- Adult: 1 tablet once daily, for duration of treatment consult product literature

**CAUTIONS**

- Retreatment following treatment failure—efficacy not established

**INTERACTIONS**

- Appendix 1 (sofosbuvir, ledipasvir)

**SIDE-EFFECTS**

- Common or very common: Headache, malaise

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

- **Missed doses**
  - If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
  - Vomiting: If vomiting occurs within 5 hours of administration, an additional dose should be taken.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Ledipasvir with sofosbuvir for the treatment of chronic hepatitis C (November 2015) NICE TA363
  - Ledipasvir with sofosbuvir is recommended as an option for treating adults with chronic hepatitis C infection:
    - of genotype 1 without cirrhosis (treatment naive patients)—8 weeks' treatment
    - of genotype 1 or 4 with cirrhosis (treatment naive patients)—12 weeks' treatment
    - of genotype 1 or 4 without cirrhosis (or with cirrhosis but only if the person has a low risk of the disease getting worse) that has not responded adequately to previous treatment—12 weeks' treatment

  In addition, ledipasvir with sofosbuvir is only recommended in patients with cirrhosis for the durations mentioned above if the following criteria are met:
  - Child-Pugh class A
  - platelet count of 75 000/mm$^3$ or more
  - no features of portal hypertension
  - no history of an HCV-associated decompensation episode
  - not previously treated with an NSSA inhibitor

  Patients whose treatment with ledipasvir with sofosbuvir is not recommended in this NICE guidance, but was started within the NHS before this guidance was published, should be able to continue treatment until they and their clinician consider it appropriate to stop.

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2014) that sofosbuvir (Sovaldi®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**INDICATIONS AND DOSE**

- Chronic hepatitis C infection of genotype 1 in patients with compensated liver disease (in combination with ribavirin and peginterferon alfa)
  - By mouth
  - Adult: 800 mg 3 times a day, for duration of treatment consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Appendix 1 (boceprevir). Caution with concomitant use of other drugs known to prolong QT interval.

**CONTRA-INDICATIONS**

- Autoimmune hepatitis
In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4. In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications.

> BY MOUTH
> Adult: 150 mg once daily (for duration of treatment consult product literature)

### Simeprevir

#### INDICATIONS AND DOSE

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4. In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications.

> BY MOUTH
> Adult: 150 mg once daily (for duration of treatment consult product literature)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

### Simeprevir

#### INDICATIONS AND DOSE

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4. In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications.

> BY MOUTH
> Adult: 150 mg once daily (for duration of treatment consult product literature)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.
Telaprevir

INDICATIONS AND DOSE
In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

BY MOUTH
Adult: 1.125 g every 12 hours, alternatively 750 mg every 8 hours, for duration of treatment consult product literature

CAUTIONS
Bradycardia, congenital or family history of QT interval prolongation, electrolyte disturbances, family history of sudden death, heart failure with reduced left ventricular ejection fraction, hypoalbuminaemia, low platelets, prolongation of QT interval

CAUTIONS, FURTHER INFORMATION
Low platelets or hypoalbuminaemia. Not recommended in patients with low platelets or hypoalbuminaemia—if initiated in these patients monitor closely for signs of infection, worsening liver impairment, and anaemia (increased risk of severe morbidity and mortality).

INTERACTIONS
Caution in concomitant use with other drugs known to prolong QT interval.

SIDE-EFFECTS
Common or very common: Anaemia, anal fissure, diarrhoea, eczema, haemorrhoids, hyperbilirubinaemia, hyperuricaemia, hypokalaemia, nausea, peripheral oedema, pruritus, rash, syncope, taste disturbances, thrombocytopenia, vomiting
Uncommon: Gout, proctitis, retinopathy, urticaria
Rare: Stevens-Johnson syndrome, toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed are reported when telaprevir is used in combination with ribavirin and peginterferon alfa.

Rash
Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.

CONCEPTION AND CONTRACEPTION
Effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time.

PREGNANCY
Manufacturer advises avoid.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in moderate to severe impairment.

MONITORING REQUIREMENTS
Monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

PRESCRIBING AND DISPENSING INFORMATION
Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE
Missed doses
If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012) NICE TA252
Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA252

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines identified.

ANTIVIRALS

Dasabuvir

29-Mar-2016

DRUG ACTION
Dasabuvir is a non-nucleoside inhibitor of hepatitis C virus polymerase NS5B, which is an essential component of the hepatitis C virus replication process.

INDICATIONS AND DOSE
Chronic hepatitis C infection of genotype 1, in combination with other antiviral drugs (ombitasvir with paritaprevir and ritonavir, with or without ribavirin)

BY MOUTH
Adult: 250 mg twice daily for details of duration of treatment, consult product literature, dose to be taken in the morning and evening.

CONTRA-INDICATIONS
HIV co-infection without suppressive antiretroviral therapy

CAUTIONS
Retreatment—efficacy not established

INTERACTIONS
Appendix 1 (dasabuvir).

SIDE-EFFECTS
Common or very common: Anaemia, asthenia, fatigue, insomnia, nausea

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects listed are reported when dasabuvir is used in combination with Viekirax® (ombitasvir with paritaprevir and ritonavir), with or without ribavirin.

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises avoid in moderate to severe impairment.
PATIENT AND CARER ADVICE
Missed doses
If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Ombitasvir with paritaprevir and ritonavir with or without dasabuvir for treating chronic hepatitis C (November 2015) NICE TA365
Dasabuvir, in combination with ombitasvir with paritaprevir and ritonavir p. 578, is recommended, within its marketing authorisation, as an option for treating genotype 1 or 4 chronic hepatitis C in adults only if the manufacturer provides it with the discount agreed in the patient access scheme. www.nice.org.uk/guidance/ta365

6.3 Herpesvirus infections

Herpesvirus infections
Herpes simplex and varicella–zoster infection
The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.
Herpes simplex infections
Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.
In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.
Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.
Varicella–zoster infections
Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.
Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.
Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.
Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella–zoster immunoglobulin (see under Disease Specific Immunoglobulins).
In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.
Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice
Aciclovir p. 585 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.
Famciclovir p. 587, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.
Valaciclovir p. 587 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.
Foscarnet sodium p. 589 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.
Inosine pranobex p. 585 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection
Ganciclovir p. 588 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 601; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration. Valaciclovir is licensed for prevention of cytomegalovirus disease following renal transplantation.
Valganciclovir p. 589 is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor. Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment. See local treatment of CMV retinitis.
INOSINE COMPLEXES

Inosine pranobex
(Inosine acedoben dimepranol)

**INDICATIONS AND DOSE**

- **Mucocutaneous herpes simplex**
  - **BY MOUTH**
  - Adult: 1 g 4 times a day for 7–14 days
- **Adjunctive treatment of genital warts**
  - **BY MOUTH**
  - Adult: 1 g 3 times a day for 14–28 days
- **Subacute sclerosing panencephalitis**
  - **BY MOUTH**
  - Adult: 50–100 mg/kg daily in 6 divided doses

**CAUTIONS**

- History of gout · history of hyperuricaemia

**SIDE-EFFECTS**

- **Common or very common** Reversible increase in serum uric acid · reversible increase in urinary uric acid
- **Uncommon** Arthralgia · epigastric discomfort · fatigue · headache · itching · nausea · rashes · vertigo · vomiting
- **Rare** Anxiety · constipation · diarrhoea · polyuria · sleep disturbances

**PREGNANCY**

Manufacturer advises caution; metabolised to uric acid.

**LESS SUITABLE FOR PRESCRIBING**

Inosine pranobex is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

- **Imunovir** (KoRa Healthcare)
  - Inosine acedoben dimepranol 500 mg
  - Imunovir 500 mg tablets
  - 100 tablet [PO] £33.50

NUCLEOSIDE ANALOGUES

Aciclovir
(Acyclovir)

**INDICATIONS AND DOSE**

- **Herpes simplex, suppression**
  - **BY MOUTH**
  - Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
- **Herpes simplex, prophylaxis in the immunocompromised**
  - **BY MOUTH**
  - Child 1–2 years: 100–200 mg 4 times a day
  - Child 2–7 years: 200–400 mg 4 times a day
  - Adult: 200–400 mg 4 times a day

- **Herpes simplex, treatment (non-genital)**
  - **BY MOUTH**
  - Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **Herpes simplex, treatment (non-genital) in immunocompromised or if absorption impaired**
  - **BY MOUTH**
  - Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **Herpes simplex, treatment**
  - **BY MOUTH**
  - Child 1–2 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2–13 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **Herpes simplex, treatment, in immunocompromised or if absorption impaired**
  - **BY MOUTH**
  - Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **Herpes simplex, treatment of first episode**
  - **BY MOUTH**
  - Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **Herpes simplex, treatment, in immunocompromised or HIV-positive**
  - **BY MOUTH**
  - Adult: 400 mg 5 times a day for 7–10 days (longer if new lesions appear during treatment or if healing incomplete)
- **Severe genital herpes simplex, treatment, initial infection**
  - **Treatment of herpes simplex in the immunocompromised**
  - **BY INTRAVENOUS INFUSION**
  - Adult: Initially 5 mg/kg every 8 hours usually for 5 days, alternatively 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment, higher dose to be used only if resistant organisms suspected or in simplex encephalitis
- **Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment**
  - **BY MOUTH**
  - Child 1–23 months: 200 mg 4 times a day for 5 days
  - Child 2–5 years: 400 mg 4 times a day for 5 days
  - Child 6–11 years: 800 mg 4 times a day for 5 days
  - Child 12–17 years: 800 mg 5 times a day for 7 days
  - Adult: 800 mg 5 times a day for 7 days
BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised
- BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised
- BY MOUTH
- Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions
- Adult: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis
- BY INTRAVENOUS INFUSION
- Adult: 10 mg/kg every 8 hours usually for 10–14 days in encephalitis, possibly longer if also immunocompromised or if severe infection

Varicella zoster (chickenpox), attenuation of infection if varicella–zoster immunoglobulin not indicated
- BY MOUTH
- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure
- Adult: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

UNLICENSED USE Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children. Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

CAUTIONS Elderly (risk of neurological reactions) - maintain adequate hydration (especially with infusion or high doses)

INTERACTIONS → Appendix 1 (aciclovir).

SIDE-EFFECTS
- Common or very common Abdominal pain, diarrhea, fatigue, headache, nausea, photosensitivity, pruritus, rash, urticaria, vomiting
- Very rare Acute renal failure, anaemia, ataxia, confusion, convulsions, dizziness, drowsiness, dysarthria, dyspnoea, hallucinations, hepatitis, jaundice, leucopenia, neurological reactions, thrombocytopenia
- With intravenous use Agitation, fever, psychosis, severe local inflammation (sometimes leading to ulceration), tremors

PREGNANCY Not known to be harmful — manufacturers advise use only when potential benefit outweighs risk.

BREAST FEEDING Significant amount in milk after systemic administration — not known to be harmful but manufacturer advises caution.

RENAL IMPAIRMENT
- With systemic use Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).
- With intravenous use Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

With oral use in adults For herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

With oral use in children For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion Zovirax IV®, Aciclovir IV (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid preparations may include banana, or orange.

PATIENT AND CARER ADVICE Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ Formulary
Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

- **INDICATIONS AND DOSE**
  - **Herpes zoster infection, treatment**
    - **BY MOUTH**
      - Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days
  - **Herpes zoster infection, treatment in immunocompromised patients**
    - **BY MOUTH**
      - Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions
  - **Genital herpes, suppression**
    - **BY MOUTH**
      - Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - **Genital herpes, suppression in immunocompromised or HIV-positive patients**
    - **BY MOUTH**
      - Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - **Genital herpes infection, treatment of first episode**
    - **BY MOUTH**
      - Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete
  - **Genital herpes infection, treatment of first episode in immunocompromised or HIV-positive patients**
    - **BY MOUTH**
      - Adult: 500 mg twice daily for 10 days
  - **Genital herpes infection, treatment of recurrent infection**
    - **BY MOUTH**
      - Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day
  - **Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients**
    - **BY MOUTH**
      - Adult: 500 mg twice daily for 5–10 days

- **Herpes simplex infection (non-genital), treatment in immunocompromised patients**
  - **BY MOUTH**
    - Adult: 500 mg twice daily for 7 days

- **SIDE-EFFECTS**
  - Common or very common: Headache, nausea, vomiting
  - Rare: Confusion
  - Very rare: Dizziness, drowsiness, hallucinations, jaundice, rash, Stevens-Johnson syndrome, thrombocytopenia
  - Frequency not known: Constipation, abdominal pain, diarrhea, fatigue, fever, pruritus, sweating
  - **PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.
  - **BREAST FEEDING** No information available—present in milk in animal studies.
  - **HEPATIC IMPAIRMENT** Usual dose in well compensated liver disease (information not available on decompensated).
  - **RENAL IMPAIRMENT** Reduce dose; consult product literature.
  - **PRESCRIBING AND DISPENSING INFORMATION** Famciclovir is a pro-drug of penciclovir.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Valaciclovir

- **INDICATIONS AND DOSE**
  - **Herpes zoster infection, treatment**
    - **BY MOUTH**
      - Adult: 1 g 3 times a day for 7 days
  - **Herpes zoster infection, treatment in immunocompromised patients**
    - **BY MOUTH**
      - Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions
  - **Herpes simplex, treatment of first infective episode**
    - **BY MOUTH**
      - Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)
  - **Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients**
    - **BY MOUTH**
      - Adult: 1 g twice daily for 10 days
  - **Herpes simplex, treatment of recurrent infections**
    - **BY MOUTH**
      - Adult: 500 mg twice daily for 3–5 days
  - **Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients**
    - **BY MOUTH**
      - Adult: 1 g twice daily for 5–10 days continued 

- **UNLICENSED USE** Famciclovir doses in BNF may differ from those in product literature.
- **INTERACTIONS** ➔ Appendix 1 (famciclovir).
Herpes labialis treatment

- BY MOUTH
  - Child 12–17 years: Initially 2 g, then 2 g after 12 hours
  - Adult: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

- BY MOUTH
  - Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

- BY MOUTH
  - Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Genital herpes, reduction of transmission (administered on expert advice)

- BY MOUTH
  - Adult: 500 mg once daily, to be taken by the infected partner

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

- BY MOUTH
  - Adult: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- CAUTIONS Elderly (risk of neurological reactions) • maintain adequate hydration (especially with high doses)

- INTERACTIONS ➔ Appendix 1 (valaciclovir).

- SIDE-EFFECTS
  - Very rare: Acute renal failure • anaemia • ataxia • confusion • convulsions • dizziness • drowsiness • dysarthria • dysphonia • hallucinations • hepatitis • jaundice • leucopenia • neurological reactions • thrombocytopenia
  - Frequency not known: Abdominal pain • diarrhoea • fatigue • headache • nausea • photosensitivity • pruritus • rash • urticaria • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Neurological reactions: Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.

- PREGNANCY Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- BREAST FEEDING Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- HEPATIC IMPAIRMENT Manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available.

- RENAL IMPAIRMENT
  - In adults: For herpes zoster, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m² (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m²). For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For treatment of herpes labialis, if eGFR 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m², 500 mg as a single dose). For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m². For reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature).
  - In children: For treatment of herpes labialis, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

- PRESCRIBING AND DISPENSING INFORMATION Valaciclovir is a pro-drug of aciclovir.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- Valaciclovir (Non-proprietary)
  - Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valaciclovir 500mg tablets | 10 tablet (PoT) £20.59 DT price = £3.18 | 42 tablet (PoT) £86.30
  - Valtrex (GlaxoSmithKline Ltd)
    - Valaciclovir (as Valaciclovir hydrochloride) 250 mg Valtrex 250mg tablets | 60 tablet (PoT) £123.28 DT price = £123.28
    - Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valtrex 500mg tablets | 10 tablet (PoT) £20.59 DT price = £3.18 | 42 tablet (PoT) £86.30

6.3a Cytomegalovirus infections

ANTIVIRALS ➔ NUCLEOSIDE ANALOGUES

Ganciclovir

- INDICATIONS AND DOSE
  - Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation
    - BY INTRAVENOUS INFUSION
      - Adult: 5 mg/kg every 12 hours for 7–14 days
  - Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only
    - BY INTRAVENOUS INFUSION
      - Adult: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

- CONTRA-INDICATIONS Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

- CAUTIONS Children (possible risk of long-term carcinogenic or reproductive toxicity) • ensure adequate hydration • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy • vesicant

- INTERACTIONS ➔ Appendix 1 (ganciclovir).
  - Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature.

- SIDE-EFFECTS
  - Common or very common: Abdominal pain • abnormal thinking • anaemia • anorexia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dysphonia • ear pain • eye pain • fatigue •
flatulence • headache • hepatic dysfunction • infection • injection-site reactions • insomnia • leucopenia • macular oedema • myalgia • nausea • night sweats • pancytopenia • peripheral neuropathy • pruritus • pyrexia • renal impairment • retinal detachment • taste disturbance • thrombocytopenia • vitreous floaters • vomiting • weight loss

Uncommon Alopecia • anaphylactic reactions • arrhythmias • disturbances in hearing and vision • haematuria • hypotension • male infertility • mouth ulcers • pancreatitis • psychosis • tremor

Allergy and Cross-sensitivity Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

Conception and Contraception Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

Pregnancy Avoid—teratogenic risk.

Breast Feeding Avoid—no information available.

Renal Impairment Reduce dose if eGFR less than 70 mL/minute/1.73 m²; consult product literature.

Monitoring Requirements Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

Directions for Administration Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion (Cymevene®) give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially in water for injections (500 mg/10 mL then dilute to not more than 10 mg/mL with infusion fluid (usually 100 mL); give over 1 hour.

Handling and Storage Caution in handling. Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

Medicinal Forms There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion electrolytes: May contain Sodium

Cymevene (Roche Products Ltd)
Ganciclovir (as Ganciclovir sodium) 500 mg

Powder for solution for infusion vials | 5 vial £148.83

Valganciclovir

Indications and Dose

Cytomegalovirus retinitis, induction and maintenance treatment in patients with AIDS

By mouth

Adult: Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses

Prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus positive donor

By mouth

Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation

Dose Equivalence and Conversion

Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

Contra-indications

Abnormally low haemoglobin count (consult product literature) • abnormally low neutrophil count (consult product literature) • abnormally low platelet count (consult product literature)

Caution

Children (possible risk of long-term carcinogenic or reproductive toxicity) • history of cytopenia • potential carcinogen • potential teratogen • radiotherapy

Interactions

Appendix 1 (valganciclovir).

Side-effects

Common or very common Abdominal pain • abnormal thinking • anaemia • anxiety • arthralgia • chest pain • confusion • constipation • convulsions • cough • depression • dermatitis • diarrhoea • dizziness • dyspepsia • dysphagia • dyspnoea • ear pain • eye pain • fatigue • flatulence • headache • hepatic dysfunction • infection • insomnia • leucopenia • macular oedema • myalgia • nausea • night sweats • pancytopenia • peripheral neuropathy • pruritus • pyrexia • renal impairment • retinal detachment • taste disturbance • thrombocytopenia • vitreous floaters • vomiting • weight loss

Uncommon Alopecia • anaphylactic reactions • arrhythmias • disturbances in hearing • disturbances in vision • haematuria • hypotension • male infertility • mouth ulcers • pancreatitis • psychosis • tremor

Allergy and Cross-sensitivity Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.

Conception and Contraception Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

Pregnancy Avoid—teratogenic risk.

Breast Feeding Avoid—no information available.

Renal Impairment Reduce dose, consult product literature.

Monitoring Requirements Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

Prescribing and Dispensing Information Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.

Handling and Storage Caution in handling. Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

Medicinal Forms There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Cautionary and Advisory Labels 21

Valcyte (Roche Products Ltd)
Valganciclovir (as Ganciclovir hydrochloride) 450 mg

Valcyte 450mg tablets | 60 tablet £1,081.46

Oral solution

Cautionary and Advisory Labels 21

Valcyte (Roche Products Ltd)
Valganciclovir (as Ganciclovir hydrochloride) 50 mg per

1 ml Valcyte 50mg/ml oral solution sugar-free | 100 ml £230.32

AntiViralS

Foscarnet sodium

Indications and Dose

Cytomegalovirus disease

By intravenous infusion

Adult: Initially 60 mg/kg every 8 hours for 2–3 weeks, alternatively initially 90 mg/kg every 12 hours for 2–3 weeks, then maintenance continued
60 mg/kg daily, then increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

- By intravenous infusion
- Adult: 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**UNLICENSED USE** Licensed for CMV retinitis in AIDS patients only. Foscarnet doses in BNF may differ from those in product literature.

**CAUTIONS** Ensure adequate hydration

**INTERACTIONS** → Appendix 1 (foscarnet).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, acute renal failure, aggression, agitation, anaemia, anorexia, anxiety, changes in blood pressure, changes in ECG, confusion, constipation, convulsions, depression, diarrhoea, dizziness, dyspepsia, dysuria, electrolyte disturbances, genital irritation and ulceration (due to high concentrations excreted in urine), granulocytopenia, headache, hepatic dysfunction, hypocalcaemia, hypokalaemia, hypomagnesaemia, leucopenia, malaise, myalgia, nausea (reduce infusion rate), neurological disorders, oedema, palpitation, pancreatitis, paraesthesia (reduce infusion rate), polyuria, pruritus, rash, renal impairment, thrombocytopenia, thrombophlebitis if given undiluted by peripheral vein, tremor, vomiting

- Uncommon Acidosis

- Frequency not known Diabetes insipidus, myasthenia, myositis, oesophageal ulceration, rhabdomyolysis, ventricular arrhythmias

**CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**RENAL IMPAIRMENT** Reduce dose; consult product literature.

**MONITORING REQUIREMENTS**

- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

**DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For intravenous infusion (Foscavir®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Electrolytes:** May contain sodium
- **Foscarnet sodium 24 mg per 1 ml** Foscavir® (Clinigent Healthcare Ltd)
  - Foscavir 6g/250ml solution for infusion bottles | 1 bottle | £119.85 (Hospital only)

---

### 6.4 HIV infection

#### HIV infection

**Overview**

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment**

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

**Initiation of treatment**

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’.

Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir disoproxil p. 599 and emtricitabine p. 598 with either efavirenz p. 593 or ritonavir-boosted atazanavir p. 602, or ritonavir-boosted darunavir p. 602, or ritavgravir p. 593. Alternative regimens contain abacavir p. 596 and lamivudine p. 598 with either lopinavir with ritonavir p. 604, or ritonavir-boosted fosamprenavir p. 603, or nevirapine p. 594, or rilpivirine p. 595. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases.

**Switching therapy**

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

**Pregnancy**

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/
and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding
Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis
Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

Drugs for HIV infection
Zidovudine p. 601, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 597, emtricitabine, lamivudine, stavudine p. 598, and tenofovir disoproxil.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir p. 603, lopinavir (available as lopinavir with ritonavir), ritonavir, saquinavir p. 605, and tipranavir p. 605. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 594, nevirapine, and rilpivirine are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 606 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 592, elvitegravir p. 592 and raltegravir are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Cobicistat p. 606 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome
Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

Osteonecrosis
Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

HIV infection in children
HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide
- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.
- **INDICATIONS AND DOSE** HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens
  - By subcutaneous injection
  - Adult: 90 mg twice daily
- **INTERACTIONS** > Appendix 1 (enfuvirtide).
- **SIDE-EFFECTS**
  - Common or very common Acne · anorexia · anxiety · asthenia · conjunctivitis · diabetes mellitus · dry skin · erythema · gastro-oesophageal reflux disease · haematuria · hypertriglyceridaemia · impaired concentration · influenza-like illness · injection-site reactions · irritability · lymphadenopathy · myalgia · nightmares · pancreatitis · peripheral neuropathy · pneumonia · renal calculi · sinusitis · skin papilloma · tremor · vertigo · weight loss
  - Uncommon Hypersensitivity reactions
  - Frequency not known Osteonecrosis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.
  - Osteonecrosis For further information see HIV infection p. 590.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution— no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to...
Infection

PATIENT AND CARER ADVICE

DIRECTIONS FOR ADMINISTRATION

HEPATIC IMPAIRMENT

PREGNANCY

▶ Osteonecrosis

Hypersensitivity reactions

▶ Uncommon

Common or very common

INTERACTIONS

▶ >> Appendix 1 (dolutegravir).

Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

SIDE-EFFECTS

▶ Common or very common Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting

▶ Uncommon Hepatitis · hypersensitivity reactions

▶ Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis For further information see HIV infection p. 590.

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment—no information available.

DIRECTIONS FOR ADMINISTRATION Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

Patients or carers should be given advice on how to administer dolutegravir tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

▶ Fuzeon (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection via 60 vial £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS

Dolutegravir

DRUG ACTION Dolutegravir is an inhibitor of HIV integrase.

INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

▶ BY MOUTH

Adult: 50 mg once daily

HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs

▶ BY MOUTH

Adult: 50 mg twice daily, dose to be taken with food

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John’s wort, rifampicin, or tipranavir)

▶ BY MOUTH

Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

INTERACTIONS → Appendix 1 (dolutegravir).

ELVITEGRAVIR

DRUG ACTION Elvitegravir is an inhibitor of HIV integrase, which is an enzyme required for viral replication.

INDICATIONS AND DOSE

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and atazanavir or lopinavir

▶ BY MOUTH

Adult: 85 mg once daily, take at the same time as a once daily ritonavir-boosted regimen or with the first dose of a twice daily ritonavir-boosted regimen

HIV infection without resistance to other inhibitors of HIV integrase, in combination with low-dose ritonavir and darunavir or fosamprenavir

▶ BY MOUTH

Adult: 150 mg once daily, take with the first dose of a twice daily ritonavir-boosted regimen

CAUTIONS Elderly—limited information available

INTERACTIONS → Appendix 1 (elvitegravir).

SIDE-EFFECTS

▶ Common or very common Diarrhoea · fatigue · headache · nausea · rash · vomiting

▶ Uncommon Abdominal distension · depression · dizziness · dysgeusia · dyspepsia · flatulence · insomnia · paraesthesia · somnolence · suicidal ideation (in patients with history of depression or psychiatric illness)

▶ Frequency not known Hyperglycaemia · increased blood lipids · osteonecrosis · weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Osteonecrosis For further information see HIV infection p. 590.

PREGNANCY Manufacturer advises use with caution in severe impairment—no information available.

HEPATIC IMPAIRMENT Manufacturer advises use with caution in severe impairment—no information available.

Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

PATIENT AND CARER ADVICE

Missed doses

Manufacturer advises if a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. If vomiting occurs within 1 hour of taking a dose, a replacement dose should be taken.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Vitekta (Gilead Sciences International Ltd)

Elvitegravir 85 mg Vitekta 85mg tablets | 30 tablet £523.79

Elvitegravir 150 mg Vitekta 150mg tablets | 30 tablet £523.79
Raltegravir

**DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING TABLETS**
  - Adult: 400 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of Isentress® chewable tablets is higher than that of the 'standard' 400 mg tablets; the chewable tablets are not interchangeable with the 'standard' tablets on a milligram-for-milligram basis.

**CAUTIONS**

Psychiatric illness (may exacerbate underlying illness including depression) - risk factors for myopathy - risk factors for rhabdomyolysis

**INTERACTIONS** → Appendix 1 (raltegravir).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - abnormal dreams - asthenia - depression - diarrhoea - dizziness - dyspepsia - flatulence - headache - hyperactivity - hypertiglyceridaemia - insomnina - nausea - rash - vomiting

- **Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

- Lipodystrophy syndrome For further information see HIV infection p. 590.

- Osteonecrosis For further information see HIV infection p. 590.

**PREGNANCY** Manufacturer advises avoid — toxicity in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment — no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

**PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2010) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**RALTEGRAVIR**

**ANTIVIRALS** → NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

**Efavirenz**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING CAPSULES**
  - Adult: 600 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis.

**UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.

**CAUTIONS** Acute porphyrias p. 930. Elderly. History of psychiatric disorders. History of seizures

**INTERACTIONS** → Appendix 1 (efavirenz).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - abnormal dreams - anxiety - depression - diarrhoea - dizziness - fatigue - headache - impaired concentration - nausea - pruritus - rash - sleep disturbances - Stevens-Johnson syndrome - vomiting

- **Uncommon** Amnesia - ataxia - blurred vision - convulsions - flushing - gynaecomastia - hepatitis - hypersensitivity - mania - pancreatitis - psychosis - suicidal ideation - tinnitus - tremor - vertigo

- **Rare** Hepatic failure - photosensitivity - suicide

- **Frequency not known** Lipodystrophy syndrome - osteonecrosis - raised serum cholesterol

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption — usually resolves within 1 month.

- CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

- Lipodystrophy syndrome For further information see HIV infection p. 590.

- Osteonecrosis For further information see HIV infection p. 590.

- Immune Reconstitution Syndrome For further information see HIV infection p. 590.

**PREGNANCY** Reports of neural tube defects when used in first trimester.

**HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

**RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure — no information available.
Etravirine

- **INDICATIONS AND DOSE**
  HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)
  - **BY MOUTH**
  - Adult: 200 mg twice daily, to be taken after food

- **CONTRA-INDICATIONS**
  Acute porphyrias p. 930

- **INTERACTIONS**
  → Appendix 1 (etravirine).

- **SIDE-EFFECTS**
  - Common or very common
    - Abdominal pain · anaemia · diabetes · flatulence · gastritis · gastro-oesophageal reflux · hyperlipidaemia · hypertension · Lipodystrophy Syndrome · myocardial infarction · nausea · peripheral neuropathy · rash · renal failure
  - Uncommon
    - Angina · blurred vision · bronchospasm · drowsiness · dry mouth · gynaecomastia · haematemesis · hepatitis · malaise · pancreatitis · sweating
  - Rare
    - Stevens-Johnson syndrome
  - Very rare
    - Toxic epidermal necrolysis
  - Frequency not known
    - Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION
Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.

- **Lipodystrophy** For further information see HIV infection p. 590.
- **Osteonecrosis** For further information see HIV infection p. 590.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

- **DIRECTIONS FOR ADMINISTRATION**
  Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE**
  Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses
If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Nevirapine

- **INDICATIONS AND DOSE**
  HIV infection in combination with other antiretroviral drugs (initial dose)
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 200 mg once daily for first 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment

**HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 400 mg once daily

- **CONTRA-INDICATIONS**
  Acute porphyrias p. 930 · post-exposure prophylaxis

- **CAUTIONS**
  Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

- **CAUTIONS, FURTHER INFORMATION**
  Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.
Rilpivirine

28-Sep-2016

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

- **BY MOUTH**
  - Adult: 25 mg once daily

**INTERACTIONS** → Appendix 1 (rilpivirine).

**SIDE-EFFECTS**

- Abdominal pain - diarrhoea - fatigue - fever - granulocytopenia - headache - hepatitis - hypersensitivity reactions (may involve hepatic reactions and rash) - nausea - rash - Stevens-Johnson syndrome - toxic epidermal necrolysis - vomiting

- **Uncommon** Anaemia - arthralgia - myalgia

- **Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

- Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

- Osteonecrosis For more information see HIV infection p. 590.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use ‘immediate-release’ preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

**RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.

**MONITORING REQUIREMENTS**

- Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.

- Rash Monitor closely for skin reactions during first 18 weeks.

**PATIENT AND CARER ADVICE**

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

**Missed doses**

If a dose is more than 8 hours late with the ‘immediate-release’ preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time.

**MEDICINAL FORMS**

There can be variation in the licensing of these medicines containing the same drug.

**Oral suspension**

- Viramune (Boehringer Ingelheim Ltd)
  - Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml POM £50.40

**Tenofovir with emtricitabine and rilpivirine**, p. 601
ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

- **SIDE-EFFECTS** Abdominal pain · anaemia · anorexia · arthralgia · blood disorders · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flatulence · gastro-intestinal disturbances · headache · insomnia · liver damage · metabolic effects · myalgia · nausea · neutropenia · osteonecrosis · pancreatitis · rash · thrombocytopenia · urticaria · vomiting

SID-EFFECTS, FURTHER INFORMATION

- Osteonecrosis For further information see HIV infection p. 590.

- **PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

Abacavir

- **INDICATIONS AND DOSE** HIV infection in combination with other antiretroviral drugs
  - **BY MOUTH**
  - Adult: 600 mg daily in 1–2 divided doses

- **CAUTIONS** HIV load greater than 100 000 copies/mL · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

- **INTERACTIONS** → Appendix 1 (abacavir).

- **SIDE-EFFECTS**
  - Very rare Stevens-Johnson syndrome · toxic epidermal necrolysis
  - **Frequency not known** Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time.
  - Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.
  - Rash More common in children.

- **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

- **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

- **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

- **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.
  - Patients and their carers should be told the importance of regular dosing (interruption therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Zialegen (ViiV Healthcare UK Ltd)
    - **Abacavir (as Abacavir sulfate)** 300 mg Ziaugen tablets | 60 tablet £17.60
  - Oral solution
    - EXCIPIENTS: May contain Propylene glycol
    - Zialegen (ViiV Healthcare UK Ltd)
    - **Abacavir (as Abacavir sulfate)** 20 mg per 1 ml Ziaugen 20mg/ml oral solution sugar-free | 240 ml £47.36

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir above, lamivudine p. 598, dolutegravir p. 592.

- **INDICATIONS AND DOSE** HIV infection
  - **BY MOUTH**
  - Adult (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid Triumeq® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

- **PATIENT AND CARER ADVICE**
  - Missed doses
    - If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Triumeq (ViiV Healthcare UK Ltd)
    - **Dolutegravir (as Dolutegravir sodium)** 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg Triumeq 50mg/600mg/300mg tablets | 30 tablet £79.16
Abacavir with lamivudine
The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 596, lamivudine p. 598.

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretrovirals**
    - **BY MOUTH**
    - Adult (body-weight 40 kg and above): 1 tablet once daily

- **RENAL IMPAIRMENT** Avoid *Kivexa* if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Abacavir with lamivudine (Non-proprietary)
      - Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg: Abacavir 600 mg / Lamivudine 300 mg tablets | 30 tablet PO £194.62—£284.44 | 30 tablet PO £224.56 (Hospital only)
    - *Kivexa* (ViiV Healthcare UK Ltd)
      - Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg: *Kivexa* 600 mg/300 mg tablets | 30 tablet PO £299.41

Abacavir with lamivudine and zidovudine
The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 596, lamivudine p. 598, zidovudine p. 601.

- **INDICATIONS AND DOSE**
  - **HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)**
    - **BY MOUTH**
    - Adult: 1 tablet twice daily

- **RENAL IMPAIRMENT** Avoid *Trizivir* if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - *Trizivir* (ViiV Healthcare UK Ltd)
      - Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg: *Trizivir* tablets | 60 tablet PO £432.70

Didanosine
(ddI; DDI)

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - **BY MOUTH**
    - Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
    - Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) - hyperuricaemia - lactic acidosis - peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

- Lactic acidosis. Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** Appendix 1 (didanosine).
  - Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- **SIDE EFFECTS** Acute renal failure - alopecia - anaphylactic reactions - diabetes mellitus - dry eyes - dry mouth - hyperuricaemia (suspect if raised significantly) - hypoglycaemia - lactic acidosis - lipodystrophy - liver failure - non-cirrhotic portal hypertension - optic nerve changes - pancreatitis (less common in children) - parotid gland enlargement - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - retinal changes - rhabdomyolysis - sialadenitis

SIDE EFFECTS, FURTHER INFORMATION

- Pancreatitis. Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- Lipodystrophy syndrome. Metabolic effects may occur with antiretroviral regimens containing didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Insufficient information. In hepatic impairment, monitor for toxicity.

- **RENAL IMPAIRMENT** Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and diluted fundus examination) recommended annually or if visual changes occur.

- **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

  With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  ** Chewable tablet **

  CAUTIONARY AND ADVISORY LABELS 23

  EXCIPIENTS: May contain Aspartame

  - *Videx* (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Didanosine 25 mg: *Videx* 25 mg chewable dispersible tablets sugar-free | 60 tablet PO £25.06 (Hospital only)
Emtricitabine (FDC)

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs
- **BY MOUTH USING CAPSULES**
  - Adult: 200 mg once daily
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 240 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**
- 240 mg oral solution $\equiv$ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

**INTERACTIONS** → Appendix 1 (emtricitabine).

**SIDE-EFFECTS**
- Abnormal dreams
- Hyperpigmentation
- Pruritus

**HEPATIC IMPAIRMENT**
On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

**RENAL IMPAIRMENT**
- Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include candy.

**PATIENT AND CARER ADVICE**

Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Emtriva (Gilead Sciences International Ltd)
    - Emtricitabine 200 mg Emtriva 200mg capsules | 30 capsule £138.98

- **Oral solution**
  - Electrolytes: May contain Sodium
  - Emtriva (Gilead Sciences International Ltd)
    - Emtricitabine 10 mg per 1 ml Emtriva 10mg/ml oral solution sugar-free | 170 ml £39.53

Lamivudine (3TC)

**INDICATIONS AND DOSE**

EPIVIR® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs
- **BY MOUTH**
  - Adult: 150 mg every 12 hours, alternatively 300 mg once daily

Stavudine (d4T)

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible
- **BY MOUTH**
  - Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
l

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include cherry.

**LESS SUITABLE FOR PRESCRIBING**

Stavudine (especially in combination with didanosine) is associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 20 mg: Zerit 20mg capsules | 56 capsule POM £139.46 (Hospital only)
  - Stavudine 30 mg: Zerit 30mg capsules | 56 capsule POM £146.25 (Hospital only)
  - Stavudine 40 mg: Zerit 40mg capsules | 56 capsule POM £150.66 (Hospital only)

**Oral solution**

- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 1 mg per 1 ml: Zerit 1mg/ml oral solution | 200 ml POM £22.94 (Hospital only)

---

**Tenofovir disoproxil**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

**Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis)**

**Chronic hepatitis B infection with decompensated liver disease**

- **DOSAGE BY MOUTH**
  - Adult: 245 mg once daily

**DOSE EQUIVALENT AND CONVERSION**

- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

**INTERACTIONS**

Appendix 1 (tenofovir).

Use with caution if concomitant or recent use of nephrotoxic drugs.

**SIDE-EFFECTS**

- **Rare** Nephrogenic diabetes insipidus - proximal renal tubulopathy - renal failure
  - **Frequency not known** Hypophosphataemia - reduced bone density

**RENAL IMPAIRMENT**

Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m².

**Tablets:** 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m².

Monitor renal function — interrupt treatment if further deterioration.

**MONITORING REQUIREMENTS**

- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.

- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation — recurrent hepatitis may occur on discontinuation).

**DIRECTIONS FOR ADMINISTRATION**

Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer tenofovir granules.

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

**Tenofovir disoproxil for the treatment of chronic hepatitis B** (July 2009) NICE TA173

Tenofovir is an option for the treatment of chronic hepatitis B.

[www.nice.org.uk/TA173](http://www.nice.org.uk/TA173)

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - **Viread** (Gilead Sciences International Ltd)
    - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)
      - 123 mg: Viread 123mg tablets | 30 tablet POM £102.60
      - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)
      - 163 mg: Viread 163mg tablets | 30 tablet POM £135.98
Tenofovir with cobicistat, elvitegravir and emtricitabine

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 599, emtricitabine p. 598, cobicistat p. 606.

### INDICATIONS AND DOSE

**HIV infection**

- **By mouth**
- **Adult:** 1 tablet once daily

### INTERACTIONS

- **Appendix 1** (cobicistat, elvitegravir, emtricitabine, tenofovir).

### SIDE-EFFECTS

- **Uncommon** Depression and suicidal ideation (in patients with a history of psychiatric illness)

### CONCEPTION AND CONTRACEPTION

Women of childbearing potential should use effective contraception (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

### PREGNANCY

Manufacturer advises use only if potential benefit outweighs risks.

### HEPATIC IMPAIRMENT

Avoid *Stribild*® in severe impairment.

### RENAL IMPAIRMENT

- If eGFR less than 90 mL/minute/1.73 m², only initiate *Stribild*® if other treatments cannot be used (avoid initiating *Stribild*® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², continue *Stribild*® if potential benefit outweighs risk (discontinue *Stribild*® if eGFR less than 50 mL/minute/1.73 m²).

### MONITORING REQUIREMENTS

Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.

### DIRECTIONS FOR ADMINISTRATION

Avoid antacids 4 hours before or 4 hours after taking *Stribild*®.

### PRESCRIBING AND DISPENSING INFORMATION

Dispense in original container (contains desiccant).

### PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer *Stribild*®.

**Missed doses**

If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
- **Stribild** (Gilead Sciences International Ltd)
  - Cobicistat 150 mg, Elvitegravir 150 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg £879.51

---

Tenofovir with efavirenz and emtricitabine

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 599, efavirenz p. 593, emtricitabine p. 598.

### INDICATIONS AND DOSE

**HIV infection stabilised on antiretroviral therapy for more than 3 months**

- **By mouth**
- **Adult:** 1 tablet once daily

### HEPATIC IMPAIRMENT

Manufacturer of *Atripla*® advises caution in mild impairment; avoid *Atripla*® in moderate to severe impairment.

### RENAL IMPAIRMENT

Avoid *Atripla*® if eGFR less than 50 mL/minute/1.73 m².

### PATIENT AND CARER ADVICE

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 23, 25**
- **Atripla** (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg, Efavirenz 600 mg £352.87

---

Tenofovir with emtricitabine

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 599, emtricitabine p. 598.

### INDICATIONS AND DOSE

**HIV infection in combination with other antiretroviral drugs**

- **By mouth**
- **Adult:** 1 tablet once daily

### RENAL IMPAIRMENT

Use normal dose of *Truvada*® every 2 days if eGFR 30–50 mL/minute/1.73 m². Avoid *Truvada*® if eGFR less than 30 mL/minute/1.73 m².

### DIRECTIONS FOR ADMINISTRATION

Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).

### PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer emtricitabine with tenofovir tablets.

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
- **Truvada** (Gilead Sciences International Ltd)
  - Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg Truvada tablets £355.73
Tenofovir with emtricitabine and rilpivirine

The properties listed below are those particular to the combination only. For the properties of the components please consider, tenofovir disoproxil p. 599, emtricitabine p. 598, rilpivirine p. 595.

- **INDICATIONS AND DOSE**
  - **HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL**
    - **BY MOUTH**
    - Adult: 1 tablet once daily

- **HEPATIC IMPAIRMENT** Manufacture of Eviplera® advises caution in moderate impairment; avoid Eviplera® in severe impairment.

- **RENAL IMPAIRMENT** Avoid Eviplera® if eGFR less than 50 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids before or 4 hours after taking Eviplera®.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer Eviplera®.

  - **Missed doses**
    - If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  
  **Tablet**
  
  CAUTIONARY AND ADVISORY LABELS 21, 25

    - Rilpivirine (as Rilpivirine hydrochloride) 25 mg, Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg Eviplera® 200mg/25mg/245mg tablets | 30 tablet | £525.95
    - Eviplera® 250mg/30mg/245mg tablets | 30 tablet | £525.95

---

Zidovudine

(Azidothymidine; AZT)

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - **BY MOUTH**
    - Adult: 250–300 mg twice daily
  
  **Prevention of maternal-fetal HIV transmission**
  
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)
  
  **HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth**
  
  - **BY INTRAVENOUS INFUSION**
    - Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) • abnormally low neutrophil counts (consult product literature) • Acute porphyrias p. 930

- **CAUTIONS** Elderly • lactic acidosis • risk of haematological toxicity particularly with high dose and advanced disease • vitamin B₁₂ deficiency (increased risk of neutropenia)

  **CAUTIONS, FURTHER INFORMATION**
  
  - Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

  **INTERACTIONS** → Appendix 1 (zidovudine).

  Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature.

  **SIDE-EFFECTS** Anaemia (may require transfusion) • anxiety • chest pain • convulsions • depression • dizziness • drowsiness • gynaecomastia • influenza-like symptoms • lactic acidosis • lipodystrophy • loss of mental acuity • myopathy • neuropathy • paraesthesia • pigmentation of nails • pigmentation of oral mucosa • pigmentation of skin • pruritus • sweating • taste disturbance • urinary frequency

  **SIDE-EFFECTS, FURTHER INFORMATION**
  
  - Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.

  - Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing zidovudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

  **HEPATIC IMPAIRMENT** Accumulation may occur.

  **RENAL IMPAIRMENT** Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

  **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

  **DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

  **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  
  **Capsule**
  
  - Zidovudine (non-proprietary)
    - Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule £0.50
      - Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule £96.36
    - Retrovir® (ViiV Healthcare UK Ltd)
      - Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule £88.86
      - Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule £88.86
  
  **Oral solution**
  
  - Retrovir® (ViiV Healthcare UK Ltd)
    - Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution sugar-free | 200 ml £17.78
  
  **Solution for infusion**
  
  - Retrovir® (ViiV Healthcare UK Ltd)
    - Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial £44.61
Zidovudine with lamivudine
The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 601, lamivudine p. 598.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**
- **BY MOUTH**
  - Adult: 1 tablet twice daily

**SIDE-EFFECTS**
- **Common or very common** Abnormal dreams · alopecia · amnesia · anxiety · arthralgia · chest pain · cholelithiasis · depression · disorientation · dry mouth · dyspnoea · gynaecomastia · haematuria · hypertension · increased appetite · mouth ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsade de pointes · urinary frequency · weight changes
- **Rare** Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpitation

**DIRECTIONS FOR ADMINISTRATION**
- **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

**MEDICINAL FORMS**
- **Tablet**
  - Zidovudine with lamivudine (Non-proprietary)
    - Lamivudine 150 mg, Zidovudine 300 mg
  - **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.
- **Capsule**
  - Lamivudine 150 mg, Zidovudine 300 mg

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Osteonecrosis** For further information see HIV infection p. 590.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**
- **BY MOUTH**
  - Adult: 300 mg once daily

**INTERACTIONS**
- **Appendix 1 (atazanavir).**
  - Caution if concomitant use with drugs that prolong PR interval. Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**
- **Uncommon** Abnormal dreams · alopecia · amnesia · anxiety · arthralgia · chest pain · cholelithiasis · depression · disorientation · dry mouth · dyspnoea · gynaecomastia · haematuria · hypertension · increased appetite · mouth ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsade de pointes · urinary frequency · weight changes

**RENAL IMPAIRMENT**
- Avoid if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

**DIRECTIONS FOR ADMINISTRATION**
- **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

**MEDICINAL FORMS**
- **Tablet**
  - **Zidovudine with lamivudine (Non-proprietary)**
    - Lamivudine 150 mg, Zidovudine 300 mg
  - **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.
  - **Capsule**
    - Lamivudine 150 mg, Zidovudine 300 mg

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Osteonecrosis** For further information see HIV infection p. 590.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs—in patients previously treated with antiretroviral therapy—with low-dose ritonavir**
- **BY MOUTH**
  - Adult: 300 mg once daily, dose appropriate if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^3$ litre

**INTERACTIONS**
- **Appendix 1 (darunavir).**
- **SIDE-EFFECTS**
  - **Common or very common** Peripheral neuropathy · rash
  - **Uncommon** Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough
depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

- Rare Bradycardia · confusion · convulsions · haematemeses · palpitation · rhinorrhea · seborrhoeic dermatitis · syncope · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE**

  - Missed doses
  
  If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  
  CAUTIONARY AND ADVISORY LABELS 21

  - **Prezista** (Janssen-Cilag Ltd)
    
    Darunavir (as Darunavir ethanolate) 75 mg Prezista 75mg tablets | 480 tablet [Rx] £446.70
    
    Darunavir (as Darunavir ethanolate) 150 mg Prezista 150mg tablets | 240 tablet [Rx] £446.70
    
    Darunavir (as Darunavir ethanolate) 400 mg Prezista 400mg tablets | 60 tablet [Rx] £297.80
    
    Darunavir (as Darunavir ethanolate) 600 mg Prezista 600mg tablets | 60 tablet [Rx] £446.70
    
    Darunavir (as Darunavir ethanolate) 800 mg Prezista 800mg tablets | 30 tablet [Rx] £297.80

  **Oral suspension**
  
  CAUTIONARY AND ADVISORY LABELS 21

  - **Prezista** (Janssen-Cilag Ltd)
    
    Darunavir (as Darunavir ethanolate) 100 mg per 1 ml Prezista 100mg/ml oral suspension sugar-free | 200 ml [Rx] £248.17

**Fosamprenavir**

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

- **INDICATIONS AND DOSE**

  HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

  - **BY MOUTH**
    
    Adult: 700 mg twice daily

  **DOSE EQUIVALENCE AND CONVERSION**

  - 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1 (fosamprenavir).

- **SIDE-EFFECTS**

  - Rare Stevens-Johnson syndrome
  
  - Frequency not known Rash

  **SIDE-EFFECTS, FURTHER INFORMATION**

  - Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.

- **PREGNANCY** Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment. Manufacturer advises caution in mild impairment.

- **DIRECTIONS FOR ADMINISTRATION** In adults, oral suspension should be taken on an empty stomach.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - Telzir (ViiV Healthcare UK Ltd)
    
    Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700mg tablets | 60 tablet [Rx] £220.13

  **Oral suspension**

  EXCipients: May contain Propylene glycol

  - Telzir (ViiV Healthcare UK Ltd)
    
    Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml [Rx] £58.70

**Indinavir**

- **INDICATIONS AND DOSE**

  HIV infection in combination with nucleoside reverse transcriptase inhibitors

  - **BY MOUTH**
    
    Adult: Seek specialist advice

- **CAUTIONS**

  Ensure adequate hydration (risk of nephrolithiasis) · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · patients at risk of nephrolithiasis (monitor for nephrolithiasis)

- **INTERACTIONS** → Appendix 1 (indinavir).

- **SIDE-EFFECTS**

  - Alopecia · crystalluria · dry mouth · dry skin · dysuria · haematuria · haemolytic anaemia · hyperpigmentation · hypoaeesthesia · interstitial nephritis (with medullary calcification and cortical atrophy in...
asymptomatic severe leucocyturia) • nephrolithiasis (may require interruption or discontinuation) • paronychia • proteinuria • pyelonephritis

- **PREGNANCY** Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term.

- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Not studied in severe impairment. Increased risk of nephrolithiasis.

- **RENAL IMPAIRMENT** Use with caution. In patients with renal impairment, monitor for nephrolithiasis.

- **DIRECTIONS FOR ADMINISTRATION** Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer indinavir capsules.

- **LESS SUITABLE FOR PRESCRIBING** Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis; it is considered to be less suitable for prescribing.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Capsule**

  - **INDICATIONS AND DOSE**
  HIV infection in combination with other antiretroviral drugs

  - **BY MOUTH USING TABLETS**
  > Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors

  - **BY MOUTH USING ORAL SOLUTION**
  > Adult: 5 mL twice daily, to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

- **CAUTIONS** Cardiac conduction disorders • pancreatitis • patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) • structural heart disease

- **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir). Caution if concomitant use with drugs that prolong QT or PR interval.

- **SIDE-EFFECTS**

  - **Common or very common** Amenorrhoea • anxiety • arthralgia • colitis • hypertension • menstruation • neuropathy • night sweats • sexual dysfunction • weight changes

  - **Uncommon** Abnormal dreams • alopecia • AV block • cerebrovascular accident • convulsions • deep vein thrombosis • dry mouth • gastro-intestinal ulcer • haematuria • myocardial infarction • nephritis • rectal bleeding • stomatitis • tinnitus • tremor • visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

  - **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

- **HEPATIC IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.

- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets in severe impairment.

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**

  - **INDICATIONS AND DOSE**
  HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

  - **BY MOUTH**
  > Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

  - **Low-dose booster to increase effect of other protease inhibitors**
  > **BY MOUTH**
  > Adult: 100–200 mg 1–2 times a day

  - **CAUTIONS** Cardiac conduction disorders • pancreatitis • structural heart disease

  - **INTERACTIONS** → Appendix 1 (ritonavir). Caution if concomitant use with drugs that prolong PR interval.

  - **SIDE-EFFECTS**

    - **Common or very common** Acne • anxiety • arthralgia • blood pressure changes • blurred vision • confusion • cough • decreased blood thyroxine concentration • fever • flushing • gastro-intestinal haemorrhage • menorrhagia • mouth ulcers • oedema • peripheral neuropathy • pharyngitis • renal impairment • seizures • syncope

    - **Uncommon** Electrolyte disturbances • myocardial infarction

    - **Rare** Toxic epidermal necrolysis

    - **SIDE-EFFECTS, FURTHER INFORMATION**

    - **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

    - **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.

## Lopinavir with ritonavir

- **INDICATIONS AND DOSE**

  HIV infection in combination with other antiretroviral drugs

  - **BY MOUTH USING TABLETS**
  > Adult: 400/100 mg twice daily, alternatively 800/200 mg once daily, once daily dose to be used only in adults with a HIV strain that has less than 3 mutations to protease inhibitors

  - **BY MOUTH USING ORAL SOLUTION**
  > Adult: 5 mL twice daily, to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

- **CAUTIONS** Cardiac conduction disorders • pancreatitis • patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) • structural heart disease

- **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir). Caution if concomitant use with drugs that prolong QT or PR interval.

- **SIDE-EFFECTS**

  - **Common or very common** Amenorrhoea • anxiety • arthralgia • colitis • hypertension • menstruation • neuropathy • night sweats • sexual dysfunction • weight changes

  - **Uncommon** Abnormal dreams • alopecia • AV block • cerebrovascular accident • convulsions • deep vein thrombosis • dry mouth • gastro-intestinal ulcer • haematuria • mycardial infarction • nephritis • rectal bleeding • stomatitis • tinnitus • tremor • visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

  - **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

  - **HEPATIC IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.

  - **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content. Use tablets in severe impairment.

  - **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

  - **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**

  - **CAUTIONARY AND ADVISORY LABELS**

  - **INDICATIONS AND DOSE**
  HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

  - **BY MOUTH**
  > Adult: Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days; increased to 600 mg every 12 hours

  - **Low-dose booster to increase effect of other protease inhibitors**
  > **BY MOUTH**
  > Adult: 100–200 mg 1–2 times a day

  - **CAUTIONS** Cardiac conduction disorders • pancreatitis • structural heart disease

  - **INTERACTIONS** → Appendix 1 (ritonavir). Caution if concomitant use with drugs that prolong PR interval.

  - **SIDE-EFFECTS**

    - **Common or very common** Acne • anxiety • arthralgia • blood pressure changes • blurred vision • confusion • cough • decreased blood thyroxine concentration • fever • flushing • gastro-intestinal haemorrhage • menorrhagia • mouth ulcers • oedema • peripheral neuropathy • pharyngitis • renal impairment • seizures • syncope

    - **Uncommon** Electrolyte disturbances • myocardial infarction

    - **Rare** Toxic epidermal necrolysis

    - **SIDE-EFFECTS, FURTHER INFORMATION**

    - **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

    - **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.
Tipranavir

- **INDICATIONS AND DOSE**
  HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir
  - **BY MOUTH USING CAPSULES**
    - Adult: 500 mg twice daily

- **DOSE EQUIVALENCE AND CONVERSION**
  - The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS**
  Patients at risk of increased bleeding from trauma, surgery or other pathological conditions

- **INTERACTIONS**
  - **Appendix 1 (saquinavir).** Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS**
  - **Rare** Dehydration
  - **Frequency not known** Anorexia · dyspnoea · influenza-like symptoms · peripheral neuroathy · photosensitivity · renal impairment

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

- **PREGNANCY**
  Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Flavours of oral liquid formulations may include toffee and mint.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Cautionary and advisory labels: 5, 21
    - Excipients: May contain Ethanol
    - Tipranavir 250 mg Aptivus 250 mg capsules | 120 capsule £41.00
606 Viral infection

ANTIVIRALS ≥ OTHER

Maraviroc

- **DRUG ACTION**: Maraviroc is an antagonist of the CCR5 chemokine receptor.

- **INDICATIONS AND DOSE**: CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals
  - **BY MOUTH**
  - Adult: 300 mg twice daily

- **CAUTIONS**: Cardiovascular disease

- **INTERACTIONS**: → Appendix 1 (maraviroc).

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anaemia, anorexia, depression, diarrhoea, flatulence, headache, insomnia, malaise, nausea, rash
  - Uncommon: Myositis, proteinuria, renal failure, seizures
  - Rare: Angina, granulocytopenia, hepatitis, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis
  - Frequency not known: Eosinophilia, fever, hepatic reactions, hypersensitivity reactions, osteonecrosis, rash

- **SIDE-EFFECTS, FURTHER INFORMATION**: Osteonecrosis For further information see HIV infection p. 590.

- **PREGNANCY**: Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

- **HEPATIC IMPAIRMENT**: Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.

- **RENAL IMPAIRMENT**: If eGFR less than 80 mL/minute/1.73 m², consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**: Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (March 2008) that maraviroc (Celsentri®) is not recommended for use within NHS Scotland.

- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**: Celsentri (ViiV Healthcare UK Ltd)
    - Maraviroc 150 mg Celsentri 150mg tablets | 60 tablet PoD £441.27
    - Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet PoD £441.27

PHARMACOKINETIC ENHANCERS

Cobicistat

- **INDICATIONS AND DOSE**: Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir
  - **BY MOUTH**
  - Adult: 150 mg once daily

- **INTERACTIONS**: → Appendix 1 (cobicistat).

- **PREGNANCY**: Manufacturer advises avoid unless essential.

- **HEPATIC IMPAIRMENT**: Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT**: No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION**: Dispense in original container (contains desiccant).

- **PATIENT AND CARER ADVICE**: Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**: Cautionary and Advisory Labels 21
    - Tybost (Gilead Sciences International Ltd) ▼
    - Cobicistat 150 mg Tybost 150mg tablets | 30 tablet PoD £21.38

  Combinations available: Tenofovir with cobicistat, elvitegravir and emtricitabine, p. 600

6.5 Influenza

Influenza

Management

Oseltamivir p. 607 and zanamivir p. 608 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amantadine hydrochloride p. 390 is licensed for prophylaxis and treatment of influenza A but it is no longer recommended.

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be
overseen by healthcare professionals experienced in assessing children.

**ANTIVIRALS**

**NEURAMINIDASE INHIBITORS**

Oseltamivir

**DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**INDICATIONS AND DOSE**

**Prevention of influenza**

- **BY MOUTH**
  - Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
  - Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Child 13-17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
  - Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

**Treatment of influenza**

- **BY MOUTH**
  - Child 1-11 months: 3 mg/kg twice daily for 5 days
  - Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
  - Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
  - Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days
  - Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
  - Child 13-17 years: 75 mg twice daily for 5 days
  - Adult: 75 mg twice daily for 5 days

**UNLICENSED USE** Not licensed for use in premature infants.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, dyspepsia, headache, nausea, vomiting
- **Uncommon** Altered consciousness (usually in children and adolescents), arrhythmias, convulsions, eczema, rash
- **Rare** Gastro-intestinal bleeding, hepatitis, neuropsychiatric disorders (usually in children and adolescents), Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, visual disturbances

**PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

**BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

**RENAL IMPAIRMENT**

- In adults For treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².
- In children For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
  - Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
  - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.

- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.
This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168

Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.
- At risk patients include those aged over 65 years or those who have one or more of the following conditions:
  - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
  - chronic heart disease;
  - chronic renal disease;
  - chronic liver disease;
  - chronic neurological disease;
  - immunosuppression;
  - diabetes mellitus.

NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- CAUTIONARY AND ADVISORY LABELS 9
  - **Tamiflu** (Roche Products Ltd)
  - **Oseltamivir** (as Oseltamivir phosphate) 30 mg Tamiflu 30 mg capsules | 10 capsules [POM] £7.71
  - **Oseltamivir** (as Oseltamivir phosphate) 45 mg Tamiflu 45 mg capsules | 10 capsules [POM] £15.41
  - **Oseltamivir** (as Oseltamivir phosphate) 75 mg Tamiflu 75 mg capsules | 10 capsules [POM] £15.41

**Oral suspension**

- CAUTIONARY AND ADVISORY LABELS 9
  - **Tamiflu** (Roche Products Ltd)
  - **Oseltamivir** (as Oseltamivir phosphate) 6 mg per 1 ml Tamiflu 6 mg/ml oral suspension sugar-free | 65 ml [POM] £10.27

**Oral solution**

- CAUTIONARY AND ADVISORY LABELS 9
  - **Oseltamivir** (Non-proprietary)
  - **Oseltamivir** (as Oseltamivir phosphate) 15 mg per 1 ml Oseltamivir 15 mg/ml oral solution sugar free sugar-free | 20 ml [POM] £10.00

**Zanamivir**

- **Drug action** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

- **Indications and dose**
  - **Post-exposure prophylaxis of influenza**
    - BY INHALATION OF POWDER
    - Child 5-17 years: 10 mg once daily for 10 days
    - Adult: 10 mg once daily for 10 days
  - **Prevention of influenza during an epidemic**
    - BY INHALATION OF POWDER
    - Child 5-17 years: 10 mg once daily for up to 28 days
    - Adult: 10 mg once daily for up to 28 days

- **Treatment of influenza**
  - BY INHALATION OF POWDER
  - Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
  - Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **Unlicensed use** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **Caution** Asthma, chronic pulmonary disease, uncontrolled chronic illness

- **Further information**
  - Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.
  - Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

- **Side-effects**
  - Common or very common Rash
  - Uncommon Angioedema, bronchospasm, dyspnoea, urticaria
  - Rare Neuropsychiatric disorders (especially in children and adolescents), Stevens-Johnson syndrome, toxic epidermal necrolysis

- **Pregnancy** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **Breastfeeding** Although safety data are limited, zanamivir can be used in women who are breastfeeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **Directions for administration** Other inhaled drugs should be administered before zanamivir.

- **Prescribing and dispensing information** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

- **National funding/access decisions**
  - NICE technology appraisals (TAs)
    - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
    - Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
    - Zanamivir is not recommended for seasonal prophylaxis against influenza.
    - When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the
same household or residential setting. Amantadine should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, amantadine may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At-risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA168

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management in adults

Ribavirin p. 578 inhibits a wide range of DNA and RNA viruses. It is given by mouth for the treatment of chronic hepatitis C infection, in double therapy with peginterferon alfa p. 576, interferon alfa p. 850, or sofosbuvir p. 580, or in triple therapy with peginterferon alfa and one protease inhibitor (i.e. boceprevir p. 581, telaprevir p. 583 or simeprevir p. 582) or sofosbuvir. Ribavirin is also effective in Lassa fever [unlicensed indication].

Management in children

Ribavirin is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis.

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:
- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:
- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.

www.gov.uk/dh
Chapter 6
Endocrine system

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Vasopressin p. 613 (antidiuretic hormone, ADH) is used in the treatment of pituitary (‘cranial’) diabetes insipidus as is its analogue desmopressin p. 611. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 291 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 753, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists

Demeclocycline hydrochloride p. 521 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 613 is a vasopressin V$_2$-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Other drugs used for Diabetes insipidus: Chlortalidone, p. 219
Desmopressin

**DRUG ACTION** Desmopressin is an analogue of vasopressin.

**INDICATIONS AND DOSE**

**Diabetes insipidus, treatment**

- **BY MOUTH**
  - Child 1-23 months: Initially 10 micrograms 2-3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
  - Child 2-11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
  - Child 12-17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
  - Adult: Initially 100 micrograms 3 times a day; maintenance 100–200 micrograms 3 times a day; usual dose 0.2–1.2 mg daily
- **BY SUBLINGUAL ADMINISTRATION**
  - Child 2-17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
  - Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- **BY INTRanasAL ADMINISTRATION**
  - Child 1-23 months: Initially 2.5–5 micrograms 1-2 times a day, adjusted according to response
  - Child 2-11 years: Initially 5–20 micrograms 1-2 times a day, adjusted according to response
  - Child 12-17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
  - Adult: 10–40 micrograms daily in 1–2 divided doses
- **BY SUBCUTaneous INJECTION, OR BY INTRanasAL INJECTION, OR BY INTRamuscular INJECTION**
  - Adult: 1–4 micrograms daily

**Primary nocturnal enuresis**

- **BY MOUTH**
  - Child 5-17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
  - Adult 18-65 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- **BY SUBLINGUAL ADMINISTRATION**
  - Child 5-17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week
  - Adult 18-65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

**Postoperative polyuria or polydipsia**

- **BY MOUTH**
  - Adult: Dose to be adjusted according to urine osmolality

**Polyuria or polydipsia after hypophysectomy**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: Dose to be adjusted according to urine osmolality

**Idiopathic nocturnal polyuria in females**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 25 micrograms daily, to be taken 1 hour before bedtime

**Idiopathic nocturnal polyuria in males**

- **BY SUBLINGUAL ADMINISTRATION**
  - Adult: 50 micrograms daily, to be taken 1 hour before bedtime

**Diabetes insipidus, diagnosis (water deprivation test)**

- **BY INTRanasAL ADMINISTRATION**
  - Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before until 8 hours after administration
  - **BY INTRamuscular INJECTION, OR BY INTRanasAL INJECTION**
  - Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

**Nocturia associated with multiple sclerosis (when other treatments have failed)**

- **BY INTRanasAL ADMINISTRATION**
  - Adult 18–65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

**Renal function testing**

- **BY INTRanasAL ADMINISTRATION**
  - Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload
  - **BY SUBCUTaneous INJECTION, OR BY INTRamuscular INJECTION**
  - Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Mild to moderate haemophilia and von Willebrand’s disease**

- **BY INTRanasAL ADMINISTRATION**
  - Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may alternatively be repeated at intervals of at least 3 days, if self-administered
  - **BY INTRanasAL INJECTION, OR BY SUBCUTaneous INJECTION**
  - Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours

**Fibrinolytic response testing**

- **BY INTRanasAL ADMINISTRATION**
  - Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril
  - **BY SUBCUTaneous INJECTION, OR BY INTRanasAL INJECTION**
  - Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

**Lumbar-puncture-associated headache**

- **BY INTRamuscular INJECTION, OR BY SUBCUTaneous INJECTION**
  - Adult: (consult product literature)
PRESCRIBING AND DISPENSING INFORMATION

RENAL IMPAIRMENT

PREGNANCY

SIDE-EFFECTS

INTERACTIONS

CAUTIONS

GENERAL CAUTIONS

Asthma • avoid fluid overload • cardiovascular disease (not indicated for nocturnal enuresis or nocturia) • conditions which might be aggravated by water retention • cystic fibrosis • elderly (avoid for primary nocturnal enuresis and nocturia associated with multiple sclerosis in those over 65 years) • epilepsy • heart failure • hypertension (not indicated for nocturnal enuresis or nocturia) • migraine • nocturia • limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards • nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

CAUTIONS, FURTHER INFORMATION

Elderly patients are at increased risk of hyponatraemia and renal impairment—manufacturer advises measure baseline serum sodium concentration, then monitor regularly during treatment; discontinue treatment if levels fall below the normal range. Review treatment if no therapeutic benefit after 3 months.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common Hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake • nausea

Frequency not known Allergic reactions • emotional disturbance in children • epistaxis • fluid retention • headache • nasal congestion • stomach pain • vomiting

SPECIFIC SIDE-EFFECTS

With intranasal use Rhinitis

SIDE-EFFECTS, FURTHER INFORMATION

Hyponatraemic convulsions The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).

PREGNANCY Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

BREAST FEEDING Amount too small to be harmful.

RENAL IMPAIRMENT Use with caution; antidiuretic effect

MONITORING REQUIREMENTS In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.

DIRECTIONS FOR ADMINISTRATION

DDAVP® and Desmotabs® tablets may be crushed. DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL. DDAVP® injection may be administered orally.

Desmopressin oral lyophilisates are for sublingual administration.

For intravenous infusion (DDAVP®, Octim®), give intermittently in Sodium chloride 0.9%; dilute with 50 mL and give over 20 minutes.

PRESCRIBING AND DISPENSING INFORMATION Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given DDAVP® intranasal solution.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Desmopressin for bedwetting

www.medicinesforchildren.org.uk/desmopressin-bedwetting

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

Desmopressin (Non-proprietary)

  - Pituitary diabetes insipidus
    - By intramuscular injection, or by subcutaneous injection
    - Adult: 5–20 units every 4 hours
  - Initial control of oesophageal variceal bleeding
    - By intravenous infusion
    - Adult: 20 units, dose to be administered over 15 minutes

- **CONTRA-INDICATIONS** Chronic nephritis (until reasonable blood nitrogen concentrations attained) · vascular disease (especially disease of coronary arteries) unless extreme caution

- **CAUTIONS** Asthma · avoid fluid overload · conditions which might be aggravated by water retention · epilepsy · heart failure · hypertension · migraine

- **SIDE-EFFECTS**
  - Rare Gangrene
  - Frequency not known Abdominal cramps · anaphylaxis · anginal attacks · delirium · constriction of coronary arteries · desire to defaecate · fluid retention · headache · hypersensitivity reactions · myocardial ischaemia · nausea · pallor · peripheral ischaemia · sweating · tremor · vertigo · vomiting

- **PREGNANCY** Oxytocic effect in third trimester.

- **BREAST FEEDING** Not known to be harmful.

- **DIRECTIONS FOR ADMINISTRATION**
  For intravenous infusion (arginpressin), give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Vasopressin (Non-proprietary)**

  *Argipressin 20 unit per 1 ml Argipressin 20units/1ml solution for injection ampoules | 10 ampoule £800.00 (Hospital only)*
SIDE-EFFECTS, FURTHER INFORMATION

- Hepatic impairment: Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).
- PREGNANCY: Avoid—toxicity in animal studies.
- BREAST FEEDING: Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT: Use with caution in severe impairment—no information available.
- RENAL IMPAIRMENT: No information available in severe impairment.
- MONITORING REQUIREMENTS:
  - Monitor for dehydration in patients who are fluid-restricted.
  - Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).
- PATIENT AND CARER ADVICE: For Jinarc®, morning dose to be taken 30 minutes before food, second dose can be taken with or without food.
- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Tolvaptan for treating autosomal dominant polycystic kidney disease (October 2015) NICE TA358
  Tolvaptan (Jinarc®) is recommended as an option for the treatment of autosomal dominant polycystic kidney disease in adults if:
  - the patient has chronic kidney disease stage 2 or 3 at the start of treatment and
  - there is evidence of rapidly progressing disease
  - and the manufacturer provides tolvaptan with the discount agreed in the patient access scheme

Patients currently receiving tolvaptan (Jinarc®) whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

  - Tolvaptan 15 mg: Samsca 15mg tablets | 10 tablet (Pom) £746.80
  - Tolvaptan 30 mg: Samsca 30mg tablets | 10 tablet (Pom) £746.80

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 619 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 620 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 618 and betamethasone p. 618 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic–pituitary–adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 22); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 211. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

Corticosteroids are preferably used by inhalation in the management of asthma but systemic therapy in association
with bronchodilators is required for the emergency treatment of severe acute asthma.

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia, and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa allergic rhinitis, and aphthous ulcers.

### Side-effects

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

#### Mineralocorticoid side effects
- Hypertension
- Sodium retention
- Water retention
- Potassium loss
- Calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

#### Glucocorticoid side effects
- Diabetes
- Osteoporosis, which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae;
- In addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

### Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

### Corticosteroids, replacement therapy

#### Overview

The adrenal cortex normally secretes hydrocortisone p. 620 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid hydrocortisone acetate p. 618; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 914.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required.

Additional replacement therapy with levothyroxine sodium p. 708 and sex hormones should be given as indicated by the pattern of hormone deficiency.

### Glucocorticoid therapy

#### Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 619 is so high that its anti-inflammatory activity is of no clinical relevance.

The relatively high mineralocorticoid activity of hydrocortisone p. 620, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 622 and prednisone p. 623 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 618 and dexamethasone p. 618 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclometasone dipropionate p. 40 (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Delfazacort p. 618 has a high glucocorticoid activity; it is derived from prednisolone.

**Corticosteroids (systemic)**

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates • avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) • systemic infection (unless specific therapy given)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure • diabetes mellitus (including a family history of) • diverticulitis • epilepsy • glaucoma (including a family history of or susceptibility to) • history of steroid myopathy • history of tuberculosis or X-ray changes (frequent monitoring required) • hypertension • hypothyroidism • infection (particularly untreated) • myasthenia gravis • ocular herpes simplex (risk of corneal perforation) • osteoporosis (in children) • osteoporosis (post-menopausal women and the elderly at special risk) • peptic ulcer • psychiatric reactions • recent intestinal anastomoses • recent myocardial infarction (rupture reported) • severe affective disorders (particularly if history of steroid-induced psychosis) • should not be used long-term • thromboembolic disorders • ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

- With intra-articular use or intradermal use or intralesional use For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **INTERACTIONS** → Appendix 1 (corticosteroids).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Abdominal distension • acute pancreatitis • aggravation of epilepsy • aggravation of schizophrenia • anorexia • anaphylaxis (in children) • bruising • candidiasis • congestive heart failure • corneal thinning • Cushing’s syndrome (with moon face, striae and acne) • dyspepsia • ecchymoses • exacerbation of ophthalmic fungal disease • exacerbation of ophthalmic viral disease • exophthalmos • facial erythema • glaucoma • headache • hiccups • hirsutism • hypercholesterolaemia • hyperglycaemia • hyperhidrosis • hyperlipidaemia • hypersensitivity reactions (in children) • impaired healing • increased appetite • increased intraocular pressure • increased intracranial pressure with papilloedema (usually after withdrawal) (in children) • increased susceptibility to and severity of infection • insomnia • leucocytosis • long bone fractures • malaise • menstrual irregularities • muscle weakness • myocardial rupture following recent myocardial infarction • nausea • negative calcium balance • negative nitrogen balance • oesophageal ulceration • papilloedema (in adults) • petechiae • posterior subcapsular cataracts • potassium loss • psychological dependence • reactivation of dormant tuberculosis • scleral thinning • skin atrophy • sodium retention • suppression of growth (in children) • telangiectasia • tendon rupture • thromboembolism • urticaria • vertebral fractures • vertigo • water retention • weight gain

**SPECIFIC SIDE-EFFECTS**

- With intra-articular use Flushing • may affect the hyaline cartilage

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects associated with intra-articular, intradermal and intralesional preparations, consult product literature.

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 614

- **Adrenal suppression** During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

- **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.
Infections  Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. sepsicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral infections may also be exacerbated.

Chickenpox  Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non–immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

Measles  Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

Psychiatric reactions  Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly, in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid–induced psychosis, or who have a personal or family history of psychiatric disorders.

Pregnancy  The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

Breast feeding  The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.

Hepatic impairment  The plasma–drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.

Renal impairment  Use by oral and injectable routes should be undertaken with caution.

Monitoring requirements  The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

Effect on laboratory tests  Suppression of skin test reactions.

Treatment cessation  In adults  Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

In children  The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.
PATIENT AND CARER ADVICE

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment. A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

● Immunosuppression Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting measles;

● Adrenal suppression If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;

● Mood and behaviour changes Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;

● Other serious effects Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur. Steroid treatment cards should be issued where appropriate. Consider giving a ‘steroid card’ to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal. In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

● Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free 100 tablet (Pack) £42.60 DT price = £42.57

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

● Betamethasone (Non-proprietary)

Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule (Pack) £13.06-£15.68

Deflazacort

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

● BY MOUTH

● Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders (acute disorders)

● BY MOUTH

● Adult: Initially up to 120 mg daily

Inflammatory and allergic disorders

● BY MOUTH

● Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

● Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

RENAL IMPAIRMENT Use with caution.

PATIENT AND CARER ADVICE Patient counselling is advised for deflazacort tablets (steroid card).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

tablet

CAUTIONARY AND ADVISORY LABELS 5, 10

● Calcort (Sanofi)

Deflazacort 6 mg Calcort 6mg tablets | 60 tablet (Pack) £15.82

Dexamethasone

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

● BY MOUTH

● Adult: 0.5–10 mg daily

Mild croup

● BY MOUTH

● Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

● INITIALLY BY MOUTH

● Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Inflammatory and allergic disorders (acute disorders)

● BY MOUTH

● Adult: Maintenance 3–18 mg daily

Suppression of inflammatory and allergic disorders

● BY MOUTH

● Adult: Initially up to 120 mg daily

DIABETES MELLITUS, Glucose intolerance

● BY MOUTH

● Adult: Initially up to 120 mg daily

PREGNANCY Readily crosses the placenta. Transient effect on fetal movements and heart rate.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (as sodium phosphate) (Betnesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

PATIENT AND CARER ADVICE Patient counselling is advised for dexamethasone soluble tablets (steroid card).
With intravenous use in adults

- **Overnight dexamethasone suppression test**
- **BY MOUTH**
- Adult: 1 mg for 1 dose, to be given at night

**Adju nctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)**
- **BY INTRAVENOUS INJECTION**
- Adult: 8.3 mg every 6 hours for 4 days

**Symptom control of anorexia (in palliative care)**
- Adult: 2–4 mg daily

**Obstruction due to tumour (dysphagia in palliative care)**
- Adult: 8 mg daily

**Bronchospasm or partial obstruction (dyspnoea in palliative care)**
- Adult: 4–8 mg daily

**Nausea and vomiting (adjunct in palliative care)**
- **BY MOUTH**
- Adult: 8–16 mg daily

**Headaches due to raised intracranial pressure (in palliative care)**
- Adult: 16 mg daily for 4–5 days, then reduced to 4–6 mg daily, reduce dose if possible. To be given before 6 pm to reduce the risk of insomnia

**Pain due to nerve compression (in palliative care)**
- Adult: 8 mg daily

**Cerebral oedema associated with malignancy**
- **BY MOUTH**
- Adult: 0.5–10 mg daily

**Cerebral oedema**
- **INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 8–16 mg for 1 dose, then (by intramuscular injection or by intravenous injection) 5 mg every 6 hours until adequate response achieved then taper-off gradually, use the 3.8 mg/mL injection preparation for this dose

**Cerebral oedema associated with malignancy**
- **INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 8.3 mg for 1 dose, then (by intramuscular injection) 3.3 mg every 6 hours as required for 2–4 days, subsequently, reduce dose gradually and stop over 5–7 days, use the 3.3 mg/mL injection preparation for this dose

- Adult: 100–400 micrograms daily

#### Mineralocorticoid replacement in adrenocortical insufficiency
- **BY MOUTH**
- Adult: 50–300 micrograms once daily

---

**Fludrocortisone acetate**

#### Indications and dose

**Neuropathic postural hypotension**
- **BY MOUTH**
- Adult: 100–400 micrograms daily

**Mineralocorticoid replacement in adrenocortical insufficiency**
- **BY MOUTH**
- Adult: 50–300 micrograms once daily

---

**Patient and carer advice**

Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).
Hydrocortisone

**INDICATIONS AND DOSE**

**Thyrotoxic crisis (thyroid storm)**
- **By intravenous injection**
  - Adult: 100 mg every 6 hours, to be administered as sodium succinate

**Adrenocortical insufficiency resulting from septic shock**
- **By intravenous injection**
  - Adult: 50 mg every 6 hours, given in combination withfludrocortisone

**Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**
- **By intravenous injection**
  - Adult: 100–300 mg, to be administered as sodium succinate

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia**
- **By intravenous injection, or by intravenous infusion**
  - Adult: Initially 25–50 mg, to be administered atinduction of surgery, the patient’s usual oral corticosteroid dose is recommenced after surgery

**Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery**
- **By intravenous injection, or by intravenous infusion**
  - Adult: Initially 25–50 mg, to be administered atinduction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by 25–50 mg 3 times a day for 24 hours aftermoderate surgery and for 48–72 hours after major surgery

**Adrenocortical insufficiency in Addison’s disease or following adrenalectomy**
- **By mouth using immediate-release medicines**
  - Adult: 20–30 mg daily in 2 divided doses, the largerdose to be given in the morning and the smaller in the evening,mimicking the normal diurnal rhythm ofcortisol secretion, the optimum daily dose is determined on the basis of clinical response

**Adrenocortical insufficiency**
- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
  - Adult: 100–500 mg 3–4 times a day or when required

**Severe inflammatory bowel disease**
- **By slow intravenous injection, or by intravenous infusion**
  - Adult: 100–500 mg 3–4 times a day or when required

**Replacement in adrenocortical insufficiency**
- **By mouth using modified-release medicines**
  - Adult: 20–30 mg once daily, adjusted according toresponse, dose to be taken in the morning
- **By mouth using immediate-release medicines**
  - Adult: 20–30 mg daily in divided doses, adjustedaccording to response

**Ulcerative colitis | Proctitis | Proctosigmoiditis**
- **By rectum using rectal foam**
  - Adult: Initially 1 metered application 1–2 times a dayfor 2–3 weeks, then reduced to 1 metered applicationonce daily on alternate days, to be inserted into therectum

**Acute hypersensitivity reactions | Angioedema**
- **By intramuscular injection, or by intravenous injection**
  - Child 1–5 months: Initially 25 mg 3 times a day, adjustedaccording to response
- Child 6 months–5 years: Initially 50 mg 3 times a day,adjusted according to response
- Child 6–11 years: Initially 100 mg 3 times a day, adjustedaccording to response
- Child 12–17 years: Initially 200 mg 3 times a day, adjustedaccording to response

**Severe acute asthma | Life-threatening acute asthma**
- **By intravenous injection**
  - Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose100 mg), alternatively 25 mg every 6 hours untilconversion to oral prednisolone is possible, dose given,preferably, as sodium succinate
  - Child 2–4 years: 4 mg/kg every 6 hours (max. per dose100 mg), alternatively 50 mg every 6 hours untilconversion to oral prednisolone is possible, dose given,preferably, as sodium succinate
  - Child 5–11 years: 4 mg/kg every 6 hours (max. per dose100 mg), alternatively 100 mg every 6 hours untilconversion to oral prednisolone is possible, dose given,preferably, as sodium succinate
  - Child 12–17 years: 4 mg/kg every 6 hours (max. per dose100 mg), alternatively 100 mg every 6 hours untilconversion to oral prednisolone is possible, dose given,preferably, as sodium succinate
  - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**DOSE EQUIVALEANCE AND CONVERSION**
When switching from immediate-release hydrocortisone tablets to modified release Plenadren® use same total dailydose. Bioavailability of Plenadren® lower than immediate releasetablets—monitor clinical response.

**CONTRA-INDICATIONS**
- With rectal use Bowel perforation · extensive fistulas ·intestinal obstruction · recent intestinal anastomoses

**CAUTIONS**
- With rectal use Systemic absorption may occur

**SIDE-EFFECTS**
- With intravenous use Phosphate ester associated with painand paraesthesia (particularly in the perineal region)
- With rectal use Local irritation

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in children For intravenousadministration, dilute with Glucose 5% or Sodium Chloride0.9%. For intermittent infusion give over 20–30 minutes.
- With intravenous use in adults For intravenous infusion(SoluCortef®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.
PATIENT AND CARER ADVICE
Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

LESS SUITABLE FOR PRESCRIBING
- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

EXCEPTIONS TO LEGAL CATEGORY
- With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Methylprednisolone

INDICATIONS AND DOSE
Suppression of inflammatory and allergic disorders | Cerebral oedema associated with malignancy
- BY MOUTH
  - Adult: Usual dose 2–40 mg daily
  - BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Adult: Initially 10–500 mg

Treatment of graft rejection reactions
- BY INTRAVENOUS INFUSION
  - Adult: Up to 1 g daily for up to 3 days

CAUTIONS
- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (as sodium succinate) (Solu-Medrone®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

PATIENT AND CARER ADVICE
Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

Prednisolone

**INDICATIONS AND DOSE**

**Acute exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)**
- **BY MOUTH**
  - Adult: 30 mg daily for 7–14 days

**Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)**
- **BY MOUTH**
  - Child 1 month: 2 mg/kg
  - Child 12–17 years: 0.5 mg/kg daily for at least 7 days

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**
- **BY MOUTH**
  - Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily
  - **BY INTRAMUSCULAR INJECTION**
  - Adult: 40–50 mg daily for at least 5 days

**Suppression of inflammatory and allergic disorders (initial dose in severe disease)**
- **BY MOUTH**
  - Adult: Initially up to 60 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months

**Idiopathic thrombocytopenic purpura**
- **BY MOUTH**
  - Adult: 1 mg/kg daily, gradually reduce dose over several weeks

**Ulcerative colitis | Crohn’s disease**
- **BY MOUTH**
  - Adult: Initially 20–40 mg daily until remission occurs, followed by reducing doses, up to 60 mg daily, may be used in some cases, doses preferably taken in the morning after breakfast

**Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multibacillary leprosy)**
- **BY MOUTH**
  - Adult: Initially 40–60 mg daily, dose to be instituted at once

**Generalised myasthenia gravis (when given on alternate days)**
- **BY MOUTH**
  - Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis in ventilated patients (when given on alternate days)**
- **BY MOUTH**
  - Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

**Generalised myasthenia gravis (when giving daily)**
- **BY MOUTH**
  - Adult: Initially 5 mg daily, increased in steps of 5 mg daily, maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

**Ocular myasthenia**
- **BY MOUTH**
  - Adult: 7.5 mg daily

**Polymyalgia rheumatica**
- **BY MOUTH**
  - Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Giant cell (temporal) arteritis**
- **BY MOUTH**
  - Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

**Polyarteritis nodosa | Polymyositis | Systemic lupus erythematosus**
- **BY MOUTH**
  - Adult: Initially 60 mg daily, to be reduced gradually; maintenance 10–15 mg daily

**Anorexia (symptom control in palliative care)**
- **BY MOUTH**
  - Adult: 15–30 mg daily

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**
- **BY MOUTH**
  - Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

**Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration**
- **BY MOUTH**
  - Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

**Proctitis**
- **BY RECTUM USING RECTAL FOAM**
  - Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone
BY RECTUM USING SUPPOSITORIES
Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis
BY RECTUM USING RECTAL FOAM
Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn’s disease
BY RECTUM USING SUPPOSITORIES
Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn’s disease
BY RECTUM USING ENEMA
Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

CONTRA-INDICATIONS
• With rectal use Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses

CAUTIONS
• With systemic use Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

PREGNANCY
As it crosses the placenta 88% of prednisolone is inactivated.

With systemic use Pregnant women with fluid retention should be monitored closely.

BREAST FEEDING
Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

PATIENT AND CARER ADVICE

### Triamcinolone acetonide

#### INDICATIONS AND DOSE

**Suppression of inflammatory and allergic disorders**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 40 mg (max. per dose 100 mg), repeated if necessary, dose given for depot effect, to be administered into gluteal muscle; repeated at intervals according to patient’s response

#### CAUTIONS

- High dosage (may cause proximal myopathy), avoid in chronic therapy

#### PATIENT AND CARER ADVICE

Patient counselling is advised for triamcinolone acetonide injection (steroid card).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**CAUTIONARY AND ADVISORY LABELS**

- **EXCIPIENTS:** May contain Benzyl alcohol

**Triamcinolone acetonide 40 mg per 1 ml**

- Kenalog (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Intramuscular 40mg/1ml suspension for injection vials | 5 vial pack

**£7.45 DT price = £7.45**

### 2.1 Cushing’s syndrome and disease

#### Cushing’s Syndrome

**Management**

Most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 625 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease. It is used under specialist supervision for treatment of endogenous Cushing’s syndrome.

Other drugs used for Cushing’s syndrome and disease; Pasireotide, p. 847

#### ENZYME INHIBITORS

**Ketoconazole**

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α-hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17–20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease.

- **INDICATIONS AND DOSE**
  - **Endogenous Cushing’s syndrome (specialist use only)**
    - **BY MOUTH**
    - Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance

400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

#### IMPORTANT SAFETY INFORMATION

**CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing’s syndrome and topical products containing ketoconazole are not affected by this advice.

- **CONTRA-INDICATIONS** Acquired QTc prolongation • avoid concomitant use of hepatotoxic drugs • congenital QTc prolongation
- **CAUTIONS** Risk of adrenal insufficiency
- **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • adrenal insufficiency • diarrhoea • hepatic enzymes increased • nausea • pruritus • rash • vomiting
  - **Uncommon** Alopecia • dizziness • headache • malaise • somnolence • thrombocytopenia • urticaria
  - **Rare** Hepatic failure • hepatitis • jaundice • liver damage
  - **Very rare** Pyrexia
  - **Frequency not known** Alcohol intolerance • anorexia • arthralgia • azoospermia • dermatitis • dry mouth • dysgeusia • dyspepsia • epistaxis • erectile dysfunction • erythema • flatulence • gynaecomastia • hot flush • increased appetite • insomnia • menstrual disorder • myalgia • nervousness • paraesthesia • peripheral oedema • photophobia • photosensitivity • raised intracranial pressure • reduced testosterone concentrations • tongue discoloration • xeroderma

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported rarely.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS**
  - Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
  - Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and...
discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

- **PATIENT AND CARER ADVICE**
  - Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop.
  - Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

- **Driving and skilled tasks**
  - Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 2, 5, 21
  - Ketoconazole (non-proprietary) ▼
  - Ketoconazole 200 mg
  - Ketonazole 200 mg tablets | 60
  - Tablet P oM £48.00

### Metyrapone

- **DRUG ACTION**
  - Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

- **INDICATIONS AND DOSE**
  - Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)
    - BY MOUTH
    - Adult: 750 mg every 4 hours for 6 doses
  - Management of Cushing’s syndrome (specialist supervision in hospital)
    - BY MOUTH
    - Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed
  - Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)
    - BY MOUTH
    - Adult: 3 g daily in divided doses

- **CONTRA-INDICATIONS**
  - Adrenocortical insufficiency

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

- **INTERACTIONS**
  - Many drugs interfere with diagnostic estimation of steroids.

- **SIDE-EFFECTS**
  - Rare: Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism

  - **Frequency not known**
    - Dizziness · headache · hypotension · nausea · sedation · vomiting

  - **PREGNANCY**
    - Avoid (may impair biosynthesis of fetal-placental steroids).

  - **BREAST FEEDING**
    - Avoid—no information available.

  - **HEPATIC IMPAIRMENT**
    - Use with caution in hepatic impairment (delayed response).

  - **PATIENT AND CARER ADVICE**
    - Driving and skilled tasks
      - Drowsiness may affect the performance of skilled tasks (e.g. driving).

### 3 Diabetes mellitus and hypoglycaemia

#### 3.1 Diabetes mellitus

### Overview

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

- **Type 1 diabetes** (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

- **Type 2 diabetes** (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat p. 86 may be considered in obese patients.

### Treatment of diabetes

Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications; tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 114 and a lipid-regulating drug.

### Prevention of diabetic complications

Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy
may occur when normalising blood-glucose concentration (ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy).

A measure of the total glycosylated (or glycated) haemoglobin (HbA1c) or a specific fraction (HbA1c) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA1c (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA1c concentration at 48 mmol/mol or less. HbA1c should be measured every 3–6 months.

**Measurement of HbA1c**

HbA1c values are expressed in mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c, created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA1c, and can be used to assess control over short periods of time, particularly when HbA1c monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

**Driving**

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA ([www.gov.uk/government/publications/at-a-glance](https://www.gov.uk/government/publications/at-a-glance)).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 640, repaglinide p. 640). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

**Diabetic nephropathy**

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix*®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*® or *Microbumintest*®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

See also treatment of hypertension in diabetes.

**Diabetic neuropathy**

Optimal diabetic control is beneficial for the management of painful neuropathy in patients with type 1 diabetes. Paracetamol p. 414 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 999 may relieve *mild to moderate pain*.

Duloxetine p. 345 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 349 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 355 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 304 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 435, morphine p. 429, and oxycodone hydrochloride p. 431; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin p. 295 and carbamazepine p. 291 are sometimes used for the treatment of neuropathic pain. Capsaicin cream 0.075% p. 446 is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In autonomic neuropathy diabetic diarrhoea can often be managed by tetracycline [unlicensed use], otherwise codeine phosphate p. 421 is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin p. 497 (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation. In neuropathic postural hypotension increased salt intake and the use of the mineralcorticoid fludrocortisone acetate p. 619 [unlicensed use] may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with flurbiprofen p. 998 and ephedrine hydrochloride p. 254 [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.
Include complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:
- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. Antidiabetic drugs have a role in the management of diabetes in pregnancy.

### Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close cooperation is needed between the patient and the medical team because good control reduces the risk of complications. Insulin preparations can be divided into 3 types:
- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart p. 653, insulin lispro p. 655, and insulin glargine p. 654;
- those with an intermediate action, e.g. isophane insulin p. 649; and
- those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin p. 652, insulin detemir p. 651, and insulin glargine p. 651.

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid-acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is

### Insulins and anti-diabetic drugs

#### Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid postprandial hyperglycaemia. The dose of insulin is

#### Diabetic ketoacidosis

**Management**

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.

- When blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.

- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).

- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.

- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 651 or insulin glargine p. 651) should be continued during treatment of diabetic ketoacidosis.

- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.

- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.

- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.
increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease.

**Examples of recommended insulin regimens**

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily. With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion.

**Hypoglycaemia**

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about awareness. If a patient believes that human insulin is not con

**Intermediate-acting or long-acting insulin**

Intermediate- or long-acting insulin, once or twice daily. Examples of recommended insulin regimens include the patient’s volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose p. 915 and potassium chloride p. 929 (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

**Short-acting insulins**

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (see Diabetic ketoacidosis p. 627) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours. When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, insulin aspart p. 653, insulin glulisine p. 653, and insulin lispro p. 654 have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently.

Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion. Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

**Intermediate- and long-acting insulins**

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting
insulins (except insulin detemir p. 651, insulin glargine p. 651, and insulin degludec p. 650) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin p. 652).

Isophane insulin p. 649 is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin p. 649, biphasic insulin aspart p. 650, or biphasic insulin lispro p. 650).

Insulin zinc suspension p. 652 (30% amorphous, 70% crystalline) has a more prolonged duration of action. Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide p. 639.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

**Hypodermic equipment**

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

**Antidiabetic drugs**

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 649 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 631.

**Pregnancy and breast-feeding**

During pregnancy, women with pre-existing diabetes can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 645 resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

**Sulfonylureas**

The sulfonylureas act mainly by increasing insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin hydrochloride is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliquidone p. 645 or tolbutamide p. 647, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin;
- combining with pioglitazone;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin but weight gain and hypoglycaemia can occur.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Biguanides**

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin hydrochloride treatment fails, other options include:

- combining with a sulfonylurea;
- combining with pioglitazone p. 647;
- combining with repaglinide p. 640 or nateglinide p. 640;
- combining with alogliptin p. 633, linagliptin p. 633, saxagliptin p. 634, sitagliptin p. 635, or vildagliptin p. 636;
Postprandial hyperglycaemia in type 2 hypoglycaemics are not tolerated or are contra-indicated. Use of acarbose is usually reserved for when other oral antidiabetic drugs are continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Linaclotide is licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), or both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linaclotide may also be used in combination with insulin (with or without metformin hydrochloride) when a stable dose of insulin has not provided adequate glycaemic control.

Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride or a sulfonylurea (if metformin hydrochloride inappropriate), or pioglitazone p. 647 (when treatment with either metformin hydrochloride p. 631 or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin p. 634 or vildagliptin p. 636, and insulin (with or without metformin hydrochloride) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

Alogliptin p. 633 is also licensed for use as triple therapy in combination with metformin hydrochloride and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:
- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese. NICE has recommended that treatment with sitagliptin p. 635 or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Treatment with exenatide p. 638, liraglutide p. 639, and lixisenatide p. 639 is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin hydrochloride or a sulfonylurea, or both, or with pioglitazone, or with both metformin hydrochloride and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin hydrochloride or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin hydrochloride and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:
- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard release exenatide is continued only if HbA1c concentration is
reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Acarbose p. 636 is licensed for the treatment of type 2 diabetes mellitus, either alone (if metformin hydrochloride inappropriate) or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control).

Dulaglutide p. 637 is licensed for the treatment of type 2 diabetes mellitus alone (if metformin is inappropriate) or in combination with other antidiabetic drugs in patients who have not achieved adequate glycaemic control with these drugs.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin hydrochloride or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control. Liraglutide is licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

Lixisenatide is licensed for the treatment of type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate) or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

BLOOD GLUCOSE LOWERING DRUGS ▶ ALPHA GLUCOSIDASE INHIBITORS

Acarbose

DRUG ACTION Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

INDICATIONS AND DOSE Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

- Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

CONTRA-INDICATIONS Hernia - inflammatory bowel disease - predisposition to partial intestinal obstruction - previous abdominal surgery

CAUTIONS May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)

INTERACTIONS ▶ Appendix 1 (antidiabetics).

SIDE-EFFECTS

- Common or very common Abdominal distention and pain - diarrhoea (may need to reduce dose or withdraw) - flatulence - soft stools

- Rare Abnormal liver function tests - nausea - skin reactions

- Very rare Hepatitis - ileus - jaundice - oedema

SIDE-EFFECTS, FURTHER INFORMATION Antacids Antacids unlikely to be beneficial for treating side effects.
Diabetes mellitus and hypoglycaemia

● UNLICENSED USE
In adults Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.
In children Not licensed for use in children under 10 years.

● CONTRA-INDICATIONS KETOACIDOSIS · use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)
CONTRA-INDICATIONS, FURTHER INFORMATION
- Iodine-containing x-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

● CAUTIONS Can provoke lactic acidosis
● INTERACTIONS Appendix 1 (anti-diabetics)

● SIDE-EFFECTS
- Common or very common Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
- Rare Decreased vitamin-B12 absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
- Frequency not known Hepatitis
SIDE-EFFECTS, FURTHER INFORMATION
- Gastro-intestinal side-effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

● PREGNANCY Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

● BREAST FEEDING May be used during breast-feeding in women with pre-existing diabetes.

● HEPATIC IMPAIRMENT Withdraw if tissue hypoxia likely.

● RENAL IMPAIRMENT Use with caution in renal impairment—increased risk of lactic acidosis. Lactic acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.
In adults NICE (clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes) recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m².
In children Avoid in significant renal impairment.

● MONITORING REQUIREMENTS Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

● PRESCRIBING AND DISPENSING INFORMATION
● in adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

● PATIENT AND CARER ADVICE
Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes

● NATIONAL FUNDING/ACCESS DECISIONS

GLUCOPHAGE® SR
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet CAUTIONARY AND ADVISORY LABELS 21
- Metformin hydrochloride (Non-proprietary) Metformin hydrochloride 500 mg Metformin 500mg tablets | 28 tablet POM £1.55 DT price = £0.96 | 84 tablet POM £2.58 | 500 tablet POM £15.36

Dipeptidylpeptidase-4 inhibitors (GLIPTINS)

Alogliptin

**DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin

- **BY MOUTH**
  - Adult: 25 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced. Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

**CONTRA-INDICATIONS** Ketaendosis

**CAUTIONS** History of pancreatitis. Not recommended in moderate to severe heart failure (limited experience)

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, gastro-oesophageal reflux, headache, nasopharyngitis, pruritus, rash, upper respiratory tract infection
- Frequency not known Angioedema, hepatic impairment, pancreatitis, Stevens-Johnson syndrome, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

Pancreatitis: Discontinue if symptoms of acute pancreatitis (persistent, severe, abdominal pain).

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT** Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m². Use with caution if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

**MEDICINAL FORMS**

- **Tablet**
  - Alogliptin (as Alogliptin benzoate) 6.25 mg. Alogliptin 6.25mg tablets | 28 tablet pack | no price available DT price = £26.60

Alogliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin above, metformin hydrochloride p. 631.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either pioglitazone or insulin

- **BY MOUTH**
  - Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced. Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

Linagliptin

**DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) or Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

- **BY MOUTH**
  - Adult: 5 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Uncommon: Cough, nasopharyngitis
- Frequency not known: Pancreatitis
**SIDE-EFFECTS, FURTHER INFORMATION**

- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised that linagliptin (Trajenta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Tradjenta** (Boehringer Ingelheim Ltd)
- Linagliptin 5 mg Tradjenta 5mg tablets | 28 tablet POM £33.26

**Linagliptin with metformin**
The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin p. 633, metformin hydrochloride p. 631.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

- **BY MOUTH**
- **Adult**: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (May 2015) that linagliptin plus metformin combination tablets (Jentadueto®) are accepted for restricted use within NHS Scotland for the treatment of adult patients with type 2 diabetes mellitus in combination with insulin, as an adjunct to diet and exercise to improve glycaemic control when a combination of insulin and metformin alone is inadequate. It is restricted to use in the treatment of patients for whom a combination of linagliptin and metformin is an appropriate choice of therapy and the fixed doses are considered appropriate.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Jentadueto** (Boehringer Ingelheim Ltd)
- Linagliptin 2.5 mg, Metformin hydrochloride 850 mg Jentadueto 2.5mg/850mg tablets | 56 tablet POM £33.26
- Linagliptin 2.5 mg, Metformin hydrochloride 1000 mg Jentadueto 2.5mg/1000mg tablets | 56 tablet POM £33.26

**Saxagliptin**

**DRUG ACTION**
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

- **BY MOUTH**
- **Adult**: 5 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CAUTIONS**
Elderly

**INTERACTIONS**
→ Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- **Common or very common** Dizziness, dyspepsia, fatigue, gastritis, gastroenteritis, headache, hypoglycaemia, myalgia, nasopharyngitis, peripheral oedema, sinusitis, upper respiratory tract infection, urinary tract infection, vomiting
- **Uncommon** Anaphylaxis, arthralgia, dyslipidaemia, erectile dysfunction, hypersensitivity reactions, hypertriglyceridaemia, pancreatitis
- **Frequency not known** Rash

**SIDE-EFFECTS, FURTHER INFORMATION**
Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY**
Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Use with caution in moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
Reduce dose to 2.5 mg once daily in moderate to severe impairment. Use with caution in severe impairment.

**MONITORING REQUIREMENTS**
Determine renal function before treatment and periodically thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Onglyza** (AstraZeneca UK Ltd)
- Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg Onglyza 2.5mg tablets | 28 tablet POM £31.60

      - Metformin hydrochloride 1 gram, Sitagliptin (as Sitagliptin phosphate) 50 mg Janumet 50mg tablets 56 tablet (POM) £33.26 DT price = £33.26
Vildagliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with metformin or pioglitazone (when treatment with either metformin or pioglitazone fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control
  
  ▶ **BY MOUTH**
  
  Adult: 50 mg twice daily

  Type 2 diabetes mellitus in combination with sulfonylurea (if metformin inappropriate)
  
  ▶ **BY MOUTH**
  
  Adult: 50 mg daily, dose to be taken in the morning

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** KETOACIDOSIS

- **CAUTIONS** Manufacturer advises avoid in severe heart failure—no information available

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS**
  ▶ **Common or very common** Asthenia · dizziness · headache · nausea · peripheral oedema · tremor
  ▶ **Uncommon** Arthralgia · constipation · hypoglycaemia
  ▶ **Rare** Hepatic dysfunction
  ▶ **Very rare** Nasopharyngitis · upper respiratory tract infection
  ▶ **Frequency not known** Bullous skin reactions · exfoliative skin reactions · pancreatitis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  ▶ Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
  ▶ Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor liver function before treatment and every 3 months for first year and periodically thereafter.

- **PATIENT AND CARER ADVICE**
  Liver toxicity Patients should be advised to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

**BLOOD GLUCOSE LOWERING DRUGS**

**GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS**

**Albiglutide**

- **DRUG ACTION** Albiglutide is a GLP-1 (glucagon-like peptide-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus as monotherapy when treatment with metformin is considered inappropriate | Type 2 diabetes mellitus in combination with basal insulin and other oral glucose lowering agents
  
  ▶ **BY SUBCUTANEOUS INJECTION**
  
  Adult: 30 mg once weekly, increased if necessary up to 50 mg once weekly, to be administered on the same day each week

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastrointestinal disease—no information available
Dulaglutide

**Drug Action**
Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Eperzan (GlaxoSmithKline UK Ltd) ▼
    - Dulaglutide 30 mg Eperzan 30mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection £71.00
    - Dulaglutide 50 mg Eperzan 50mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection £71.00

**Dose for injection**
- **Adult:** 1.5 mg once weekly

**Indications and dose**
Type 2 diabetes mellitus as monotherapy if metformin inappropriate
- By subcutaneous injection
- Adult: 0.75 mg once weekly

**Dose Adjustments due to Interactions**
Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**Contra-indications**
Severe gastro-intestinal disease—no information available

**Side-effects**
- Common or very common
  - Abdominal distention, constipation, decreased appetite, diarrhoea, dyspepsia, fatigue, headache, weight loss
  - Nausea, vomiting, dyspepsia

**Conception and Contraception**
Manufacturer advises avoid—no information available.

**Pregnancy**
Manufacturer advises avoid—no information available.

**Breast Feeding**
Manufacturer advises avoid—no information available.

**Renal Impairment**
Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**Handling and Storage**
Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.

**Patient and Carer Advice**
Patients or carers should be given advice on how to administer albiglutide injection.
Acute pancreatitis
Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed Doses**
If a dose is missed it should be administered as soon as possible within 3 days; if more than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

**National Funding/Access Decisions**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2016) that albiglutide (Eperzan®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control in combination with other glucose-lowering medicines when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as an alternative once weekly GLP-1 mimetic for use in combination with oral anti-diabetic agents as a third-line pre-insulin treatment option.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**

Manufacturer advises avoid—no information available.

**Pregnancy**
Manufacturer advises avoid—no information available.

**Breast Feeding**
Manufacturer advises avoid—no information available.

**Renal Impairment**
Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**Handling and Storage**
Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.

**Patient and Carer Advice**
Patients or carers should be given advice on how to administer dulaglutide injection.
Acute pancreatitis
Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed Doses**
If a dose is missed, it should be administered as soon as possible. If less than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

**National Funding/Access Decisions**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2016) that dulaglutide (Trulicity®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in people with inadequate glycaemic control on 2 oral anti-diabetic medicines, as an alternative GLP-1 mimetic option.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Trulicity (Eli Lilly and Company Ltd) ▼
  - Dulaglutide 1.5 mg per 1 ml Trulicity 0.75mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection £73.25
  - Dulaglutide 3 mg per 1 ml Trulicity 1.5mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection £73.25
Exenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

- **INDICATIONS AND DOSE**
  Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination
  - By subcutaneous injection using immediate-release medicines
    - Adult: Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)
  - By subcutaneous injection using modified-release medicines
    - Adult: 2 mg once weekly

- **INTERACTIONS**
- **CONTRA-INDICATIONS**
- **CAUTIONS**
- **INTERACTIONS** → Appendix 1 (antidiabetics)
  Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption.

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain and distension - agitation - appetite increase - breathlessness - constipation - decreased appetite - diarrhoea - dizziness - dyspepsia - gastro-intestinal disturbances - gastro-oesophageal reflux disease - headache - hypoglycaemia - increased sweating - injection-site reactions - nausea - vomiting - weight loss
  - Uncommon Pancreatitis
  - Rare Alopecia
  - Very rare Anaphylactic reactions
  - Frequency not known Angioedema - constipation - dehydration - drowsiness - eructation - flatulence - pruritus - rash - renal impairment - taste disturbance - urticaria

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if pancreatitis is diagnosed.

- **CONCEPTION AND CONTRACEPTION**
  Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.

- **PREGNANCY**
  Avoid — toxicity in animal studies.

- **BREAST FEEDING**
  Avoid — no information available.

- **RENAI IMPAIRMENT**
  For standard-release injection, use with caution if eGFR 30–50 mL/minute/1.73 m². For standard-release injection, avoid if eGFR less than 30 mL/minute/1.73 m². For modified-release injection, avoid if eGFR less than 50 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose.
  Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection — consult product literature for details.
  Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

- **Missed doses**
  If a dose of the immediate-release medicine is missed, continue with the next scheduled dose — do not administer after a meal.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (June 2007) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.
  The Scottish Medicines Consortium has also advised (February 2011) that standard-release exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.
  The Scottish Medicines Consortium has advised (December 2011) that modified-release exenatide (Bydureon®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  **CAUTIONARY AND ADVISORY LABELS**
  - **Byetta** (Astrazeneca UK Ltd)
    - Exenatide 250 microgram per 1 ml Byetta 10 micrograms/0.04 ml solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection (P02) £68.24 DT price = £68.24
    - Byetta 5 micrograms/0.02 ml solution for injection 1.2 ml pre-filled disposable devices | 1 pre-filled disposable injection (P02) £68.24 DT price = £68.24

- **Powder and solvent for suspension for injection**
  **CAUTIONARY AND ADVISORY LABELS**
  - **Bydureon** (Astrazeneca UK Ltd)
    - Exenatide 2 mg Bydureon 2 mg powder and solvent for prolonged-release suspension for injection pre-filled pen | 4 pre-filled disposable injection (P02) £73.36
    - Bydureon 2 mg powder and solvent for suspension for prolonged-release injection vials | 4 vials (P02) £73.36
Liraglutide

01-Jun-2016

**DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination

- **Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control**
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Dose of concomitant insulin or sulfonylurea may need to be reduced.

**CONTRA-INDICATIONS** Diabetic gastroparesis, inflammatory bowel disease, ketoadiposis, moderate to severe congestive heart failure—no information available

**CAUTIONS** History of pancreatitis, mild congestive heart failure—limited experience, thyroid disease

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain and distension, bronchitis, constipation, decreased appetite, diarrhoea, dizziness, dyspepsia, flatulence, gastritis, gastrointestinal disturbances, gastro-oesophageal reflux disease, headache, hypoglycaemia, injection site reactions, malaise, nasopharyngitis, nausea, tachycardia, vomiting
- **Uncommon** Acute renal failure, dehydration, renal impairment
- **Very rare** Acute pancreatitis
- **Frequency not known** Goitre, increased blood calcitonin, thyroid neoplasm

**SIDE-EFFECTS, FURTHER INFORMATION**
- Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by primary literature).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—limited experience.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m²—limited experience.
- **HANDLING AND STORAGE** Store in a refrigerator (2°C–8°C); after first use can be stored below 30°C, discard 1 month after first use.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer liraglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms such as persistent, severe abdominal pain develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Liraglutide (Non-proprietary)**
  - Liraglutide 6 mg per 1 ml Liraglutide 6 mg/ml solution for injection 3 ml pre-filled disposable devices 2 pre-filled disposable injection £78.48 3 pre-filled disposable injection £117.72

**CONTRA-INDICATIONS** Ketoacidosis, severe gastrointestinal disease

**INTERACTIONS** → Appendix 1 (antidiabetics).

Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after liraglutide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption.

**SIDE-EFFECTS**
- **Common or very common** Diarrhoea, dizziness, drowsiness, dyspepsia, headache, hypoglycaemia, nausea, palpitation, vomiting
- **Uncommon** Tachycardia, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**
- Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m²—no information available.
- **PATIENT AND CARER ADVICE** Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

**Missed doses**
If a dose is missed, inject within 1 hour before the next meal—do not administer after a meal.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (Lyxumia®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).
Repaglinide

**DRUG ACTION** Repaglinide stimulates insulin secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

- **BY MOUTH**
  - Adult 18–74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
  - Adult 75 years and over: Not recommended

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

- **BY MOUTH**
  - Adult 18–74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
  - Adult 75 years and over: Not recommended

**CONTRA-INDICATIONS** Ketoacidosis

**CAUTIONS** Debilitated patients, malnourished patients

**CAUTIONS, FURTHER INFORMATION** Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally).

**INTERACTIONS** Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, constipation, diarrhoea, nausea, vomiting
- Rare Hypersensitivity reactions, hypoglycaemia, pruritus, rashes, urticaria, vasculitis, visual disturbances

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Repaglinide (Non-proprietary)
  - Repaglinide 1 mg Repaglinide 1mg tablets | 30 tablet [Pom] £3.92 | 90 tablet [Pom] £11.76 DT price = £10.58
  - Repaglinide 500 microgram Repaglinide 500microgram tablets | 30 tablet [Pom] £3.92 | 90 tablet [Pom] £11.76 DT price = £9.03
  - Repaglinide 2 mg Repaglinide 2mg tablets | 90 tablet [Pom] £28.00 DT price = £5.88

- Enyglid (Consilient Health Ltd)
  - Repaglinide 1 mg Enyglid 1mg tablets | 30 tablet [Pom] £3.33 | 90 tablet [Pom] £9.99 DT price = £10.58
  - Repaglinide 500 microgram Enyglid 0.5mg tablets | 30 tablet [Pom] £3.33 | 90 tablet [Pom] £9.99 DT price = £9.03
  - Repaglinide 2 mg Enyglid 2mg tablets | 90 tablet [Pom] £9.99 DT price = £5.88

- Prandin (Novo Nordisk Ltd)
  - Repaglinide 1 mg Prandin 1mg tablets | 30 tablet [Pom] £3.92
  - Repaglinide 500 microgram Prandin 0.5mg tablets | 30 tablet [Pom] £3.92
  - Repaglinide 2 mg Prandin 2mg tablets | 90 tablet [Pom] £11.76 DT price = £5.88
BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

**Canagliflozin**

**DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate)**

- **Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**
  - **BY MOUTH**
    - Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (JUNE 2016): SIGNAL OF INCREASED RISK OF LOWER EXTREMITY AMPUTATIONS OBSERVED IN TRIAL IN HIGH CARDIOVASCULAR RISK PATIENTS**

A signal of increased lower limb amputation (mostly affecting toes) has been reported in an ongoing clinical trial in high cardiovascular risk patients. The MHRA has issued the following advice while this report is under investigation:

- Consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene), at least until the condition has resolved, and continue to monitor the patient closely
- Carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- Monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer’s recommendations
- Advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- Start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- Continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

**MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPIAGLIFLOZIN)**

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor canagliflozin for type 2 diabetes. To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting, anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

**CONTRA-INDICATIONS**

- Ketoacidosis
- **CAUTIOUS** Cardiovascular disease (risk of hypotension) - elderly (risk of hypotension) - elevated haematocrit - history of hypotension

**CAUTIONS, FURTHER INFORMATION**

- Volume depletion: Correct hypovolaemia before starting treatment.
- **INTERACTIONS**
  - Appendix 1 (antidiabetics).
- **SIDE-EFFECTS**
  - Common or very common
    - Constipation
    - Dyslipidaemia
    - Genital infection
    - Hypoglycaemia (in combination with insulin or sulfonylurea)
    - Nausea
    - Polyuria
    - Raised haematocrit
    - Thirst
    - Urinary frequency
    - Urinary-tract infection
  - Uncommon
    - Dehydration
    - Dizziness
    - Hypovolaemia
    - Postural hypotension
    - Raised serum creatinine
    - Raised serum urea
    - Rash
    - Syncope

**SIDE-EFFECTS, FURTHER INFORMATION**

- Volume depletion: Consider interrupting treatment if volume depletion occurs.
- PREGNANCY: Avoid—toxicity in animal studies.
- BREAST FEEDING: Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT: Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m² and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m². Avoid if eGFR less than 45 mL/minute/1.73 m². Monitor renal function at least twice a year in moderate impairment.

**MONITORING REQUIREMENTS**

Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

**PATIENT AND CARER ADVICE**

Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Canagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA390

- Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315

Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with
metformin and a sulfonylurea or metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA315

Canagliflozin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, canagliflozin p. 641, metformin hydrochloride p. 631.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

- **BY MOUTH**
  - Adult: 1 tablet twice daily, dose based on patient’s current metformin dose, daily dose of metformin should not exceed 2 g

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 60 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that Vokanamet is accepted for restricted use within NHS Scotland in patients with type 2 diabetes mellitus for whom a combination of canagliflozin and metformin is an appropriate choice of therapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Invokana** (Janssen-Cilag Ltd ▼)
  - Canagliflozin (as Canagliflozin hemihydrate) 100 mg Invokana 100mg tablets | 30 tablet POM £39.20 DT price = £39.20
  - Canagliflozin (as Canagliflozin hemihydrate) 300 mg Invokana 300mg tablets | 30 tablet POM £39.20 DT price = £39.20

**Dapagliflozin**

- **DRUG ACTION**
  - Reversibly inhibits sodium–glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

- **INDICATIONS AND DOSE**
  - Type 2 diabetes mellitus as monotherapy (if metformin inappropriate)
  - Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)
    - **BY MOUTH**
      - Adult 18–74 years: 10 mg once daily
      - Adult 75 years and over: Initiation not recommended

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM–GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor dapagliflozin for type 2 diabetes. To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting, anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

- **CONTRA-INDICATIONS**
  - Ketoacidosis
- **CAUTIONS**
  - Cardiovascular disease (risk of hypotension) • elderly (risk of hypotension) • electrolyte disturbances • hypotension • raised haematocrit

CAUTIONS, FURTHER INFORMATION

- Volume depletion Correct hypovolaemia before starting treatment.

**INTERACTIONS**

- Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common
  - Back pain • constipation • dyslipidaemia • dysuria • genital infection • hypoglycaemia (in combination with insulin or sulphonylurea) • polyuria • sweating • thirst • urinary-tract infection
- Uncommon
  - Dehydration • dizziness • hypotension • hypovolaemia • nausea • nocturia • raised serum creatinine • raised serum urea • rash

SIDE-EFFECTS, FURTHER INFORMATION

- Volume depletion Consider interrupting treatment if volume depletion occurs.

**PREGNANCY**

Avoid—toxicity in animal studies.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Initial dose 5 mg daily in severe impairment, increased according to response.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).
Dapagliflozin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dapagliflozin p. 642, metformin hydrochloride p. 631.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs**

- **BY MOUTH**
  - Adult 18-74 years: 1 tablet twice daily, based on patient’s current metformin dose
  - Adult 75 years and over: Initiation not recommended

**INTERACTIONS** Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**HEPATIC IMPAIRMENT** Avoid.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (July 2014) that dapagliflozin plus metformin (Xigduo®) is accepted for restricted use within NHS Scotland in patients for whom a combination of dapagliflozin and metformin is an appropriate choice of therapy i.e when metformin alone does not provide adequate glycaemic control and a sulfonylurea is inappropriate, or in combination with insulin, when insulin and metformin does not provide adequate control, or in combination with a sulphonylurea, when a sulfonylurea and metformin does not provide adequate control.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Xigduo (AstraZeneca UK Ltd)**
  - Dapagliflozin 5 mg, Metformin hydrochloride 1 gram
  - Dapagliflozin 5 mg | 56 tablet pack | £36.59 DT price = £36.59
  - Dapagliflozin 5 mg | 850mg tablets | 56 tablet pack | £36.59 DT price = £36.59

**Empagliflozin**

**DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate)** / **Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

- **BY MOUTH**
  - Adult 18-84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
  - Adult 85 years and over: Initiation not recommended

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JUNE 2015): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)

Serious and potentially life-threatening cases of diabetic ketoacidosis (DKA) have been reported in patients taking the SGLT2 inhibitor empagliflozin for type 2 diabetes. To
minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- Test for raised ketones in patients presenting with symptoms of DKA, even if plasma glucose levels are near-normal; omitting this test could delay diagnosis of DKA.
- Discontinue treatment if DKA is suspected.
- If DKA is confirmed, take appropriate measures to correct the DKA and monitor glucose levels.
- Patients should be advised on how to recognise the signs and symptoms of DKA such as nausea, vomiting, anorexia, abdominal pain, excessive thirst, difficulty breathing, confusion, unusual fatigue, or sleepiness, and to seek prompt medical attention if symptoms of DKA develop.

- CONTRA-INDICATIONS Diabetic ketoacidosis
- CAUTIONS Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections - consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

CAUTIONS, FURTHER INFORMATION
- Volume depletion: Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

- INTERACTIONS Appendix 1 (antidiabetics).
- SIDE-EFFECTS
  - Common or very common: Genital infection - hypoglycaemia (in combination with insulin or sulfonylurea) - polyuria - pruritus - urinary tract infection
  - Uncommon: Dysuria - volume depletion
- PREGNANCY: Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT: Manufacturer advises avoid in severe impairment—no information available.
- RENAL IMPAIRMENT: Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².
- MONITORING REQUIREMENTS: Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
- PATIENT AND CARER ADVICE: Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

- NATIONAL FUNDING/ACCESS DECISIONS
  - NICE technology appraisals (TAs)
    - Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390
      Empagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.

      Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

      www.nice.org.uk/TA390
    - Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336
      Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
      - a sulfonylurea is contra-indicated or not tolerated, or
      - the patient is at significant risk of hypoglycaemia or its consequences.

      Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
      - metformin and a sulfonylurea or
      - metformin and a thiazolidinedione.

      Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

      Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

      www.nice.org.uk/TA336

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Jardiance (Boehringer Ingelheim Ltd)
      - Empagliflozin 10 mg Jardiance 10mg tablets 28 tablet Pack £36.59 OT price = £36.59
      - Empagliflozin 25 mg Jardiance 25mg tablets 28 tablet Pack £36.59 OT price = £36.59

Empagliflozin with metformin
25-Apr-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, empagliflozin p. 643, metformin hydrochloride p. 631.

- INDICATIONS AND DOSE
  - Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with other antidiabetic drugs or insulin
    - BY MOUTH
      - Adult 18–84 years: 5/850–5/1000 mg twice daily, based on patient’s current metformin dose, increased if necessary to 12.5/850–12.5/1000 mg twice daily
    - BY MOUTH
      - Adult 85 years and over: Initiation not recommended

DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

DOSE EQUIVALENCE AND CONVERSION
- The proportions are expressed in the form ‘x’/‘y’ where ‘x’ and ‘y’ are the strengths in milligrams of empagliflozin and metformin respectively.

- NATIONAL FUNDING/ACCESS DECISIONS
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (October 2015) that Synjardy® (empagliflozin with metformin) is accepted for restricted use within NHS Scotland in patients for whom a fixed dose combination of empagliflozin and metformin is an appropriate choice of therapy or when use of a sulfonylurea is considered inappropriate.
Goldwhite

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  
  **CAUTIONARY AND ADVISORY LABELS 21**
  
  ▶ **Glibenclamide** (Boehringer Ingelheim Ltd)

  **Empagliflozin 12.5 mg, Metformin hydrochloride 1 gram** Synjardy 12.5mg/1000mg tablets | 56 tablet (Post) £36.59
  
  **Empagliflozin 12.5 mg, Metformin hydrochloride 850 mg** Synjardy 12.5mg/850mg tablets | 56 tablet (Post) £36.59
  
  **Empagliflozin 5 mg, Metformin hydrochloride 1 gram** Synjardy 5mg/1000mg tablets | 56 tablet (Post) £36.59
  
  **Empagliflozin 5 mg, Metformin hydrochloride 850 mg** Synjardy 5mg/850mg tablets | 56 tablet (Post) £36.59

- **BLOOD GLUCOSE LOWERING DRUGS › SULFONYLUREAS**

  **Sulfonylureas**

  - **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
  
  - **CONTRA-INDICATIONS** Presence of ketoadiabetes
  
  - **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) • elderly • G6PD deficiency
  
  - **SIDE-EFFECTS**
    
  ▶ **Uncommon** Hypoglycaemia
  
  ▶ **Rare** Agranulocytosis • aplastic anaemia • blood disorders • cholestatic jaundice • haemolytic anaemia • hepatic failure • hepatitis • leucopenia • pancytopenia • thrombocytopenia
  
  ▶ **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) • constipation • diarrhoea • disturbance in liver function • erythema multiforme (usually in the first 6–8 weeks of therapy) • exfoliative dermatitis (usually in the first 6–8 weeks of therapy) • fever (usually in the first 6–8 weeks of therapy) • gastrointestinal disturbances • hypersensitivity reactions (usually in the first 6–8 weeks of therapy) • jaundice (usually in the first 6–8 weeks of therapy) • nausea • vomiting
  
  **SIDE-EFFECTS, FURTHER INFORMATION**

  ▶ **Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.
  
  ▶ **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
  
  ▶ **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
  
  ▶ **PATIENT AND CARER ADVICE**

  The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

  **Driving and skilled tasks**

  Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

- **Glibenclamide**

  - **INDICATIONS AND DOSE**

    **Type 2 diabetes mellitus**

    ▶ **BY MOUTH**

    ▶ **Adult** Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

    - **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930

    - **INTERACTIONS** → Appendix 1 (antidiabetics).

    - **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

    - **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

  - **MEDICINAL FORMS**

    There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

    **Tablet**

    ▶ **Glibenclamide (Non-proprietary)**

    **Glibenclamide 2.5 mg** Glibenclamide 2.5mg tablets | 28 tablet (Post) £1.46 DT price = £7.13

    **Glibenclamide 5 mg** Glibenclamide 5mg tablets | 28 tablet (Post) £1.40 DT price = £0.82

- **Gliclazide**

  - **INDICATIONS AND DOSE**

    **Type 2 diabetes mellitus**

    ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

    ▶ **Adult** Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

    ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

    ▶ **Adult** Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

  **DOSE EQUIVALENT AND CONVERSION**

  ▶ Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

    - **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930

    - **INTERACTIONS** → Appendix 1 (antidiabetics).

    - **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

    - **BREAST FEEDING** Avoid— theoretical possibility of hypoglycaemia in the infant.

    - **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.
Glimepiride

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH**
    - Adult: Initially 1 mg daily, adjusted according to response, doses may be increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - Porphyria Sulphonylureas should be avoided where possible in acute porphyrias p. 930 but glimepiride is thought to be safe.
  - **INTERACTIONS** → Appendix 1 (antidiabetics).
  - **SIDE-EFFECTS**
    - Hyponatraemia
  - **PREGNANCY**
    - The use of sulphonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
  - **BREAST FEEDING**
    - Avoid— theoretical possibility of hypoglycaemia in the infant.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Glimepiride (Non-proprietary)
  - Glimepiride 1 mg Glimepiride 1mg tablets | 20 tablet Pom £4.33 DT price = £0.22
  - Glimepiride 2 mg Glimepiride 2mg tablets | 30 tablet Pom £7.13 DT price = £0.24
  - Glimepiride 3 mg Glimepiride 3mg tablets | 30 tablet Pom £10.75 DT price = £0.36
- Amaryl (Zentiva)
  - Glimepiride 3 mg Amaryl 3mg tablets | 30 tablet Pom £10.75 DT price = £0.36

**MONITORING REQUIREMENTS**
Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

**Diabetes mellitus and hypoglycaemia**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Glimepiride (Non-proprietary)
  - Glimepiride 1 mg Glimepiride 1mg tablets | 30 tablet Pom £4.33 DT price = £0.22
  - Glimepiride 2 mg Glimepiride 2mg tablets | 30 tablet Pom £7.13 DT price = £0.24
  - Glimepiride 3 mg Glimepiride 3mg tablets | 30 tablet Pom £10.75 DT price = £0.36
- Amaryl (Zentiva)
  - Glimepiride 3 mg Amaryl 3mg tablets | 30 tablet Pom £10.75 DT price = £0.36

**Glipizide**

- **INDICATIONS AND DOSE**
  - **Type 2 diabetes mellitus**
    - **BY MOUTH**
    - Adult: Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - Porphyra Sulphonylureas should be avoided where possible in acute porphyrias p. 930 but glipizide is thought to be safe.
  - **INTERACTIONS** → Appendix 1 (antidiabetics).
  - **SIDE-EFFECTS**
    - Rare Photosensitivity
    - Frequency not known Dizziness, drowsiness, hyponatraemia
  - **PREGNANCY**
    - The use of sulphonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
  - **BREAST FEEDING** Avoid— theoretical possibility of hypoglycaemia in the infant.
  - **HEPATIC IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.
  - **RENAL IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Glipizide (Non-proprietary)
  - Glipizide 5 mg Glipizide 5mg tablets | 28 tablet Pom £2.48 DT price = £0.22
  - Minodiab (Pfizer Ltd)
    - Glipizide 5 mg Minodiab 5mg tablets | 28 tablet Pom £1.26 DT price = £0.22
### Tolbutamide

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **BY MOUTH**
  - Adult: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 930

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS** Headache; tinnitus

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Tablet**
    - Tolbutamide (Non-proprietary)
      - Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet [PoM] £34.88 DT price = £8.14 | 112 tablet [PoM] £39.44

### Blood Glucose Lowering Drugs

#### Thiazolidinediones

### Pioglitazone

**DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)**

- **BY MOUTH**
  - Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

POIGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

**CONTRA-INDICATIONS** History of heart failure; previous or active bladder cancer; uninvestigated macroscopic haematuria

**CAUTIONS** Avoid in acute porphyrias p. 930; cardiovascular disease or in combination with insulin (risk of heart failure); elderly (increased risk of heart failure, fractures, and bladder cancer); increased risk of bone fractures, particularly in women; risk factors for bladder cancer

**CAUTIONS, FURTHER INFORMATION**

Substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally).

**SIDE-EFFECTS, FURTHER INFORMATION**

- Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice occurs.
- **PREGNANCY** Avoid—tumour in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.
- **PATIENT AND CARER ADVICE**
  - Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to
take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

**Insulins**

**IMPORANT SAFETY INFORMATION**

**NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)**

Insulin should not be extracted from insulin pen devices. The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

**SIDE-EFFECTS**

- **Common or very common** Fat hypertrophy at injection site - local reactions at injection site - transient oedema
- **Rare** Hypersensitivity reactions - rash - urticaria
  - **Overdose**

**BNF 73**
Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:
3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112
GP practices can obtain supplies through their Local Area Team stores.
NHS Trusts can order supplies from www.nhsforms.co.uk/or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

INSULINS INTERMEDIATE-ACTING

Biphasic isophane insulin (Biphasic Isophase Insulin Injection—intermediate acting)

- INDICATIONS AND DOSE
  Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: According to requirements
  - Adult: According to requirements

- INTERACTIONS Appendix 1 (antidiabetics).
- SIDE-EFFECTS Protamine may cause allergic reactions
- PRESCRIBING AND DISPENSING INFORMATION A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species. Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Suspension for injection
  - Humulin M3 (Eli Lilly and Company Ltd)
    Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £19.08 DT price = £19.08
    Humulin M3 cartridges for injection 10ml vials | 1 vial (Pdp) £15.68
  - Humulin M3 KwikPen (Eli Lilly and Company Ltd)
    Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pdp) £21.70 DT price = £21.70
  - Hypurin Porcine 30/70 Mix (Wockhardt UK Ltd)
    Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £37.80
    Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £22.20
  - Insulatard (Novo Nordisk Ltd)
    Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £7.48

- INSUMAN Comb 15 (Sanofi)
  Insulin human (as Insulin soluble human) 15 unit per 1 ml, Insulin human (as Insulin isophane human) 85 unit per 1 ml Insumen Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £17.50

- INSUMAN Comb 25 (Sanofi)
  Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insumen Comb 25 100units/ml suspension for injection 5ml vials | 1 vial (Pdp) £5.61
  Insumen Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £17.50

- INSUMAN Comb 25 SoloStar (Sanofi)
  Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insumen Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (Pdp) £19.80

- INSUMAN Comb 50 (Sanofi)
  Insulin human (as Insulin isophane human) 50 unit per 1 ml, Insulin human (as Insulin soluble human) 50 unit per 1 ml Insumen Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £17.50

Isophane insulin (Insophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

- INDICATIONS AND DOSE
  Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: According to requirements
  - Adult: According to requirements

- INTERACTIONS Appendix 1 (antidiabetics).
- SIDE-EFFECTS Protamine may cause allergic reactions
- PREGNANCY Recommended where longer-acting insulins are needed.
- PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Suspension for injection
  - Humulin I (Eli Lilly and Company Ltd)
    Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £15.68
    Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £19.08 DT price = £19.08
  - Humulin I KwikPen (Eli Lilly and Company Ltd)
    Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pdp) £21.70 DT price = £21.70
  - Hyprurin Bovine Isophane (Wockhardt UK Ltd)
    Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hyprurin Bovine Isophane 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £27.72
    Hyprurin Bovine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £41.58
  - Hyprurin Porcine Isophane (Wockhardt UK Ltd)
    Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hyprurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pdp) £37.80
    Hyprurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £25.20
  - Insulatard (Novo Nordisk Ltd)
    Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial (Pdp) £7.48
Insulatard InnoLet (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (POD) £20.40 DT price = £21.70

Insulatard Penfill (Novo Nordisk Ltd)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100 units/ml suspension for injection 3 ml cartridges | 5 cartridge (POD) £22.90 DT price = £19.08

Insumin Basal (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insumin Basal 100 units/ml suspension for injection 5 ml vials | 1 vial (POD) £5.61
Insumin Basal 100 units/ml suspension for injection 3 ml cartridges | 5 cartridge (POD) £17.50 DT price = £19.08

Insumin Basal SoloStar (Sanofi)
Insulin human (as Insulin isophane human) 100 unit per 1 ml Insumin Basal 100 units/ml suspension for injection 3 ml pre-filled SoloStar pen | 5 pre-filled disposable injection (POD) £19.80 DT price = £21.70

INSULINS › INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

Biphasic insulin aspart (Intermediate-acting insulin)

- INDICATIONS AND DOSE
  Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: Administer up to 10 minutes before or soon after a meal, according to requirements
  - Adult: Administer up to 10 minutes before or soon after a meal, according to requirements

- INTERACTIONS ➔ Appendix 1 (antidiabetics).

- SIDE-EFFECTS
  Protamine may cause allergic reactions

- PRESCRIBING AND DISPENSING INFORMATION
  Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Suspension for injection
  - Humalog Mix52 (Eli Lilly and Company Ltd)
    Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix52 100 units/ml suspension for injection 10 ml vials | 1 vial (POD) £16.61
    Humalog Mix52 100 units/ml suspension for injection 3 ml cartridges | 5 cartridge (POD) £29.46 DT price = £29.46
  - Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)
    Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (POD) £30.98 DT price = £30.98
  - Humalog Mix50 (Eli Lilly and Company Ltd)
    Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 100 unit per 1 ml Humalog Mix50 100 units/ml suspension for injection 3 ml cartridges | 5 cartridge (POD) £29.46
  - Humalog Mix50 KwikPen (Eli Lilly and Company Ltd)
    Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 100 unit per 1 ml Humalog Mix50 KwikPen 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (POD) £30.98 DT price = £30.98

INSULINS › LONG-ACTING

Insulin degludec (Recombinant human insulin analogue—long acting)

- INDICATIONS AND DOSE
  Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child 1-17 years: Dose to be given according to requirements
  - Adult: Dose to be given according to requirements

- INTERACTIONS ➔ Appendix 1 (antidiabetics).

- PREGNANCY
  Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- PRESCRIBING AND DISPENSING INFORMATION
  Insulin degludec (Tresiba®) is available in strengths of 100 units/ml (allows 1-unit dose adjustment) and 200 units/ml (allows 2-unit dose adjustment)—ensure correct strength prescribed.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Tresiba FlexTouch (Novo Nordisk Ltd)
    Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100 units/ml solution for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (POD) £46.60
    Insulin human (as Insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200 units/ml solution for injection 3 ml pre-filled pen | 3 pre-filled disposable injection (POD) £55.92
  - Tresiba Penfill (Novo Nordisk Ltd)
    Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba Penfill 100 units/ml solution for injection 3 ml cartridges | 5 cartridge (POD) £46.60

Biphasic insulin lispro (Intermediate-acting insulin)

- INDICATIONS AND DOSE
  Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: Administer up to 15 minutes before or soon after a meal, according to requirements
  - Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

- CAUTIONS
  Children under 12 years (use only if benefit likely compared to soluble insulin)
  - INTERACTIONS ➔ Appendix 1 (antidiabetics).

- SIDE-EFFECTS
  Protamine may cause allergic reactions

- PRESCRIBING AND DISPENSING INFORMATION
  Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).
Insulin degludec with liraglutide

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec p. 650, liraglutide p. 639.

- **INDICATIONS AND DOSE**
  - As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day
  - When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- **INTERACTIONS**
  - Dose of concomitant sulfonylurea may need to be reduced.

- **PATIENT AND CARER ADVICE**
  - Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (October 2015) that insulin degludec with liraglutide (Xultophy®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Xultophy (Novo Nordisk Ltd)
      - Insulin human (as Insulin degludec) 100 unit per 1 ml, Liraglutide 3.6 mg per 1 ml Xultophy 100units/ml / 3.6mg/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection £95.53

Insulin detemir

*(Recombinant human insulin analogue—long acting)*

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - Child 2-17 years: According to requirements
    - Adult: According to requirements

- **INTERACTIONS**
  - Appendix 1 (antidiabetics).

- **PREGNANCY**
  - Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
  - Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
      - In those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
      - As a once daily insulin therapy for patients who require a carer to administer their insulin
    - It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Levemir FlexPen (Novo Nordisk Ltd)
      - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £42.00
    - Levemir InnoLet (Novo Nordisk Ltd)
      - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £44.85
    - Levemir Penfill (Novo Nordisk Ltd)
      - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge £42.00 DT price = £42.00

- **Diabetes mellitus**
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: According to requirements

- **TOUJEO®**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: According to requirements

- **INTERACTIONS**
  - Appendix 1 (antidiabetics).

- **PREGNANCY**
  - Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

  - **Solution for injection**
    - Abasaglar (Eli Lilly and Company Ltd)
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge £35.28 DT price = £41.50
    - Abasaglar KwikPen (Eli Lilly and Company Ltd)
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £35.28 DT price = £41.50
    - Lantus (Sanofi)
      - Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge £41.50 DT price = £41.50
      - Lantus 100units/ml solution for injection 10ml vials | 1 vial £30.68
Insulin zinc suspension
(Insulin zinc suspension (mixed)—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **Adult:** According to requirements
- **Child:** According to requirements

**INTERACTIONS** 
- Appendix 1 (antidiabetics).

**PREGNANCY**
Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 649 is recommended where longer-acting insulins are needed; insulin detemir p. 651 may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION**
A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Hypurin Bovine Lente** (Wockhardt UK Ltd)
  - Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100 units/ml suspension for injection 10ml vials | 1 vial (GB) £27.72

Protamine zinc insulin
(Protamine zinc insulin injection—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **Adult:** According to requirements
- **Child:** According to requirements

**INTERACTIONS** 
- Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
Protamine may cause allergic reactions

**PREGNANCY**
Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 649 is recommended where longer-acting insulins are needed; insulin detemir p. 651 may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION**
A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**
- **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
  - Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100 units/ml suspension for injection 10ml vials | 1 vial (GB) £27.72

**INSULINS > RAPID-ACTING**

**Insulin**
(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - **Adult:** According to requirements
  - **Diabetic ketoacidosis / Diabetes during surgery**
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** (consult local protocol)

**INTERACTIONS** 
- Appendix 1 (antidiabetics).

**DIRECTIONS FOR ADMINISTRATION**
Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

For **intravenous infusion** give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into ‘dead space’ of injection port of the infusion bag.

**PRESCRIBING AND DISPENSING INFORMATION**
A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol] despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**
- **Insulin (Non-proprietary)**
  - Insulin human 100 unit per 1 ml Humulin R 100 units/ml solution for injection 10ml vials | 1 vial (GB) no price available
Insulin human 500 unit per 1 ml Humulin R 500 units/ml solution for injection 20ml vials | 1 vial (Pom) no price available

- Actrapid (Novo Nordisk Ltd)
- Humulin S 100 units/ml solution for injection 10ml vials | 1 vial (Pom) £15.68
- Humulin S 100 units/ml solution for injection 3ml cartridges | 5 cartridges (Pom) £19.08
- Hypurin Bovine Neutral (Wockhardt UK Ltd)
- Insulin bovine (as Insulin soluble bovine) 100 unit per 1 ml Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial (Pom) £27.72
- Hypurin Bovine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge (Pom) £41.58
- Hypurin Porcine Neutral (Wockhardt UK Ltd)
- Insulin porcine (as Insulin soluble porcine) 100 unit per 1 ml Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial (Pom) £25.20

- Insulin Infusat (Sanofi)
- Insulin human 100 unit per 1 ml Insulin Infusat 100units/ml solution for injection 3ml cartridges | 5 cartridge (Pom) £37.80
- Insulin Rapid (Sanofi)
- Insulin human (as Insulin soluble human) 100 unit per 1 ml Insulin human 100 unit per ml solution for injection 3ml cartridges | 5 cartridge (Pom) £17.50

**Insulin aspart**
*(Recombinant human insulin analogue—short acting)*

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - Child 2-17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
    - Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements
  - **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Child 2-17 years: According to requirements
    - Adult: According to requirements

- **UNLICENSED USE**
  - Not licensed for use in children under 2 years.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY**
  - Not known to be harmful—may be used during pregnancy.
- **BREAST FEEDING**
  - Not known to be harmful—may be used during lactation.
- **DIRECTIONS FOR ADMINISTRATION**
  - Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
  - With intravenous use in adults: For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to 0.05-1 unit/ml with infusion fluid; adsorbed to some extent by plastics of infusion set.
  - With intravenous use in children: For *intravenous infusion*, dilute to a concentration of 0.05–1 unit/ml with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 ml of infusion fluid containing insulin.
- **NATIONAL FUNDING/ACCESS DECISIONS**

      - Adult: According to requirements

- **UNLICENSED USE**
  - Not licensed for children under 6 years.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
**DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- With intravenous use in adults: For intravenous infusion (Apidra®), give continuously in Sodium chloride 0.9%; dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or

- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2008) that Apidra® is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Apidra®** (Sanofi)
  - Insulin lispro 100 unit per 1 ml Apidra 100 units/ml solution for injection 10 ml vials | 1 vial (PSt) £16.00
  - Apidra 100 units/ml solution for injection 3 ml cartridges | 5 cartridge (PSt) £28.30

- **Apidra SoloStar®** (Sanofi)
  - Insulin lispro 100 unit per 1 ml Apidra 100 units/ml solution for injection 3 ml pre-filled SoloStar pen | 5 pre-filled disposable injection (PSt) £28.30 DT price = £28.30

**Insulin lispro**

*(Recombinant human insulin analogue—short acting)*

**INDICATIONS AND DOSE**

- **Diabetes mellitus**
  - **BY SUBCUTANEOUS INJECTION**
    - Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
  - Adult: Administer shortly before meals or when necessary shortly after meals, according to requirements
  - **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Child 2-17 years: According to requirements
    - Adult: According to requirements

**UNLICENSED USE** Not licensed for use in children under 2 years.

**CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING** Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- With intravenous use in adults: For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.

- With intravenous use in children: For intravenous infusion, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or

- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Humalog®** (Eli Lilly and Company Ltd)
  - Insulin lispro 100 unit per 1 ml Humalog 100 units/ml solution for injection 10 ml vials | 1 vial (PSt) £16.61 DT price = £16.61
  - Humalog 100 units/ml solution for injection 3 ml cartridges | 5 cartridge (PSt) £28.31 DT price = £28.31
The oral glucose tolerance test generally involves giving anhydrous glucose by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals. The appropriate amount of glucose should be given with 200–300 mL fluid. Anhydrous glucose may alternatively be given as 113 mL Polycal® with extra fluid to administer a total volume of 200–300 mL, or as Rapilose® OGTT oral solution.

### Needle free Insulin delivery systems

**INSUJET**

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units. Available as starter set (InsuJet® device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), nozzle pack (15 nozzles), cartridge adapter pack (15 adaptors), or vial adaptor pack (15 adaptors).

**InsuJet starter set** (Spirit Healthcare Ltd)

1 pack - NHS indicative price = £90.00 - Drug Tariff (Part Ixa)

### Urinanalysis reagent strips

**PRESCRIBING AND DISPENSING INFORMATION**

Other reagent strips available for urinanalysis

Include: *Combur-3 Test®* (glucose and protein—Roche Diagnostics); *Clinitek Microalbumin®* (albumin and creatinine—Siemens); *Ketodixast®* (glucose and ketones—Bayer Diagnostics); *Medi-Test Combi 2®* (glucose and protein—BHR); *Mical-Test II®*, used to detect microaluminuria but this should be followed by confirmation in the laboratory—false positive results are common (albumin—Roche Diagnostics); *Microalbumin®* (albumin and creatinine—Siemens); *Uristix®* (glucose and protein—Siemens).

These reagent strips are not prescribable under National Health Service (NHS).

**URINE GLUCOSE TESTING STRIPS**

**Diastix testing strips** (Bayer Diagnostics Manufacturing Ltd)

50 strip - NHS indicative price = £2.89 - Drug Tariff (Part Ix)

**Medi-Test Glucose testing strips** (BHR Pharmaceuticals Ltd)

50 strip - NHS indicative price = £2.33 - Drug Tariff (Part Ix)

**Mission Glucose testing strips** (Spirit Healthcare Ltd)

50 strip - NHS indicative price = £2.29 - Drug Tariff (Part Ix)

**URINE PROTEIN TESTING STRIPS**

**Albustix testing strips** (Siemens Medical Solutions Diagnostics Ltd)

50 strip - NHS indicative price = £4.10 - Drug Tariff (Part Ix)

**Medi-Test Protein 2 testing strips** (BHR Pharmaceuticals Ltd)

50 strip - NHS indicative price = £3.27 - Drug Tariff (Part Ix)

**URINE KETONES TESTING STRIPS**

**GlucoRx KetoRx Sticks 2GK testing strips** (GlucoRx Ltd)

50 strip - NHS indicative price = £2.25 - Drug Tariff (Part Ix)

**Ketostix testing strips** (Bayer Diagnostics Manufacturing Ltd)

50 strip - NHS indicative price = £3.06 - Drug Tariff (Part Ix)

**Mission Ketone testing strips** (Spirit Healthcare Ltd)

50 strip - NHS indicative price = £2.50 - Drug Tariff (Part Ix)

### 3.2 Hypoglycaemia

**Hypoglycaemia**

**Treatment of hypoglycaemia**

Initially glucose 10–20 g p. 915 is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, *Ribena®* Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps.
Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, is for saving life in emergency. Glucagon below, a polypeptide hormone increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 20% may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also, emergency management of hypoglycaemia in dental practice for further advice.

**Chronic hypoglycaemia**

Diazoxide below, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

**GLYCOGENOLYTIC HORMONES**

**Glucagon**

- **INDICATIONS AND DOSE**
  - **Insulin-induced hypoglycaemia**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Child 1 month–1 year: 500 micrograms
    - Child 2–7 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
    - Child 2–7 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
    - Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given
  - **Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)**
    - **INITIALLY BY INTRAVENOUS INJECTION**
    - Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

- **Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion)**
  - 50 micrograms/kg/hour

**DIAGNOSTIC AID**

- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: (consult product literature)

**DOSE EQUIVALENCE AND CONVERSION**

- 1 unit of glucagon = 1 mg of glucagon.

**UNLICENSED USE**

Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

**CONTRA-INDICATIONS**

- Phaeochromocytoma

**CAUTIONS**

- Glucagonoma: ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency.
- Insulinoma: when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge) (in children)

**SIDE-EFFECTS**

- Rare: Hypersensitivity reactions
- **Frequency not known**
  - Abdominal pain (in adults)
  - Diarrhoea (in children)
  - Hypokalaemia
  - Hypotension (in adults)
  - Nausea
  - Vomiting

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children: When administered by continuous intravenous infusion, do not add to infusion fluids containing calcium—precipitation may occur.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Glucagon for hypoglycaemia

www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia

**EXCEPTIONS TO LEGAL CATEGORY**

Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Glucagen Hypokit** (Novo Nordisk Ltd)
  - Glucagen hydrochloride 1 mg
  - Glucagen Hypokit 1mg powder and solvent for solution for injection
  - 1 vial £9.52

**SIDE-EFFECTS**

- Taste disturbance
- Headache
- Abdominal pain
- Nausea
- Vomiting

**Hypersensitivity reactions**

- **INJECTION**
  - Glucagon

**DOSE EQUIVALENCE AND CONVERSION**

- 1 unit of glucagon = 1 mg of glucagon.

**3.2a Chronic hypoglycaemia**

**THIAZIDE DERIVATIVES**

**Diazoxide**

- **INDICATIONS AND DOSE**
  - **Chronic intractable hypoglycaemia**
    - **BY MOUTH**
    - Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

**CAUTIONS**

- Aortic coarctation
- Aortic stenosis
- Arteriovenous shunt
- Heart failure
- Hyperuricaemia
- Impaired cardiac circulation
- Impaired cerebral circulation

**INTERACTIONS**

- Appendix 1 (diazoxide).

**SIDE-EFFECTS**

- Taste disturbance
- Abdominal pain
- Anaemia
- Anorexia (prolonged use)
- Bleeding
- Constipation
- Decreased libido
- Dermatitis
- Diarrhoea
- Dizziness
- Dyspnoea
- Eosinophilia
- Extrapyramidal effects
- Galactorrhoea
- Headache
- Heart failure
- Hyperglycaemia
- Hyperosmolar non-ketotic coma
- Hypertrichosis
- Hyperuricaemia (prolonged use)
- Hypotension
- Ileus
Bone metabolism

Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticoids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Also see: calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

Postmenopausal osteoporosis

The bisphosphonates (alendronic acid and risedronate) are effective for preventing postmenopausal osteoporosis.

Hormone replacement therapy (HRT) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a bisphosphonate. The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol p. 953 or strontium ranelate may be considered. Calcitonin (salmon) p. 668 is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin (salmon) [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks. Teriparatide has been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene hydrochloride p. 689 is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis.

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate;
- Calcitriol [unlicensed indication];
- hormone replacement (HRT) in women, testosterone in men [unlicensed indication].

Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. Calcitonin (salmon) (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy.

Calcitonin (salmon) is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin (salmon) is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Teriparatide p. 670 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis.

Cinacalcet p. 918 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.
Bisphosphonates

Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronate p. 663 or risedronate sodium p. 666 are considered the drugs of choice for these conditions.

Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

Strontium ranelate

Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

ANABOLIC STEROIDS

Nandrolone

- **INDICATIONS AND DOSE**
  - Osteoporosis in postmenopausal women (but not recommended)
  - Adult (female): 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyria p. 930 - male breast cancer - prostate cancer

- **CAUTIONS**
  - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)

- **INTERACTIONS** → Appendix 1 (anabolic steroids).

- **SIDE-EFFECTS** Abnormal liver-function tests (with high doses) - acnæ - amenorrhoea - inhibition of spermatogenesis - liver tumours (with prolonged treatment with anabolic steroids) - premature epiphyseal closure - sodium retention with oedema - virilisation (with high doses including voice changes—sometimes irreversible)

- **HEPATIC IMPAIRMENT** Use in severe hepatic impairment only if benefit outweighs risk.

- **RENAL IMPAIRMENT** Use with caution—may cause sodium and water retention.

- **MONITORING REQUIREMENTS** Monitor skeletal maturation in young patients.

- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Excipients: May contain Arachis (peanut) oil, benzyl alcohol
  - Deca-Durabolin (Aspen Pharma Trading Ltd)
  - Nandrolone decanoate 50 mg per 1 ml

BISPHOSPHONATES

**Drug action**

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**Monitoring requirements**

- Renal impairment
- Hepatic impairment

**Contraindications**

- Pregnancy
- Breastfeeding
- Children

**Common side effects**

- Nausea
- Vomiting
- Stomach pain
- Bone pain

**Other side effects**

- Painful muscles
- Headache
- Swelling

**Interactions**

- With other medications
- With alcohol

**Precautions**

- Patients should avoid excessive consumption of alcohol.

**Monitoring**

- Regular monitoring of blood tests
- Regular monitoring of bone density

**Special populations**

- Elderly patients
- Children
- Pregnant or breastfeeding women

**Special considerations**

- Bone density may not improve in some patients
- Long-term use may increase the risk of osteonecrosis of the jaw

**Dental care**

- Patients should inform their doctor and dentist of any planned dental treatment
- Adequate dental hygiene should be maintained

**Other considerations**

- Bisphosphonates are not recommended for the treatment of Paget’s disease

**BNF**

- Bisphosphonates: Dental Clinical Guidance

**MHRA/CHM Advice**

- Bisphosphonates: Osteonecrosis of the Jaw
- Bisphosphonates: Atypical Femoral Fractures

**Further measures to minimise risk**

- Patients should be counselled about the risks and benefits of bisphosphonate treatment
- Patients should be informed about the need for regular dental checks
- Patients should be advised to avoid non-essential dental procedures

**Important safety information**

- Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.
- The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

- Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.
- Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**Additional information**

- Bisphosphonates are used in the treatment of Paget’s disease, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

**References**

- Scottish Dental Clinical Effectiveness Programme, April 2011
- www.sdcep.org.uk

**Important safety information**

- Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.
- The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.
- Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.
- Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**MHRA/CHM Advice**

- The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.
- Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.
- All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.
- Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.
- MHRA/CHM Advice: Bisphosphonates: Osteonecrosis of the External Auditory Canal (December 2015)
- Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).
- The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.
- Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.
- Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.
**INDICATIONS AND DOSE**

**Treatment of postmenopausal osteoporosis**
- **BY MOUTH**
  - Adult (female): 10 mg daily, alternatively 70 mg once weekly.

**Treatment of osteoporosis in men**
- **BY MOUTH**
  - Adult (male): 10 mg daily.

**Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy**
- **BY MOUTH**
  - Adult (female): 10 mg daily.

**CONTRA-INDICATIONS** Abnormalities of oesophagus - hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)

**CAUTIONS** Active gastro-intestinal bleeding - atypical femoral fractures - duodenitis - dysphagia - exclude other causes of osteoporosis - gastritis - history (within 1 year) of ulcers - surgery of the upper gastro-intestinal tract - symptomatic oesophageal disease - ulcers - upper gastro-intestinal disorders

**INTERACTIONS** → Appendix 1 (bisphosphonates).

**SIDE-EFFECTS**
- Common or very common Abdominal distension - abdominal pain - constipation - diarrhea - dyspepsia - flatulence - headache - oesophageal reactions - regurgitation
- Uncommon Episcleritis - erythema - gastritis - nausea - rash - scleritis - uveitis - vomiting
- Rare Atypical femoral fractures with long-term use - hypocalcaemia - oesteonecrosis of the jaw - photosensitivity - severe skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis - upper gastro-intestinal ulcers
- Very rare Osteonecrosis of the external auditory canal
- Frequency not known Musculoskeletal pain

**SIDE-EFFECTS, FURTHER INFORMATION**
Severe oesophageal reactions (oesophagitis, oesophageal strictures and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

**PREGNANCY** Avoid.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

**PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution.

**INTERACTIONS**
Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

**Alendronate** is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:
- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis.

www.nice.org.uk/TA160

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Alendronate** is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women.

www.nice.org.uk/TA161

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (April 2016) that alendronic acid (Binosto®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**
- **Alendronic acid (Non-proprietary)**
  - Alendronic acid (as Alendronate sodium) 10 mg
  - Alendronic acid 10 mg tablets | 28 tablet (PO) £3.25 DT price = £1.76
  - Alendronic acid (as Alendronate sodium) 70 mg
  - Alendronic acid 70 mg tablets | 4 tablet (PO) £22.80 DT price = £5.78
- **Fosamax** (Merck Sharp & Dohme Ltd)
  - Alendronic acid (as Alendronate sodium) 10 mg
  - Fosamax 10 mg tablets | 28 tablet (PO) £23.12 DT price = £1.76
**Alendronic acid with colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 663, colecalciferol p. 953.

### Indications and dose

**Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency**
- **By mouth**
  - Adult (female): 1 tablet once weekly.

### Directions for administration

The directions for administration are contingent on the specific dosing regimen. For example, tablets should be swallowed whole with plenty of water while sitting or standing. For intravenous use, a specific rate is recommended, typically 1 mg per minute. Special considerations, such as renal function, are noted. For oral use, the patient should stand or sit upright for at least 30 minutes after taking the tablet.

### Patient and Carer Advice

Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Fosavance** (Merck Sharp & Dohme Ltd)
  - Alendronic acid (as Alendronate sodium) 70 mg, Colecalciferol 70 microgram
  - Fosavance tablets | 4 tablet [POM] £22.80 DT price = £22.80

### Ibandronic acid

**Indications and dose**

**Reduction of bone damage in bone metastases in breast cancer**
- **Initially by mouth**
  - Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

**Hypercalcaemia of malignancy**
- **By intravenous infusion**
  - Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

**Treatment of postmenopausal osteoporosis**
- **Initially by mouth**
  - Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

### Contra-Indications

**General Contra-Indications**

- Hypocalcaemia

**Specific Contra-Indications**
- With oral use: Abnormalities of the oesophagus - other factors which delay emptying (e.g. stricture or achalasia)
- **Caution**: Atypical femoral fractures - cardiac disease (avoid fluid overload)
- **Interactions**: → Appendix 1 (bisphosphonates).

### Side-effects

**General Side-effects**

- **Common or very common**: Abdominal pain - asthma - bone pain - chills - diarhoea - dyspepsia - fever - gastritis - headache - hypocalcaemia - hypophosphataemia - influenza-like symptoms - muscle pain - nausea - pharyngitis - rash - vomiting
- **Rare**: Anaemia - angioedema - atypical femoral fractures - bronchospasm - hypersensitivity reactions - injection-site reactions - pruritus - urticaria
- **Very rare**: Osteonecrosis of the external auditory canal - osteonecrosis of the jaw.

**Specific SIDE-EFFECTS**

- **Common or very common**: With oral use - Severe oesophageal reactions (discontinue)
- **Pregnancy**: Avoid.
- **Breast Feeding**: Avoid—present in milk in animal studies.

**Renal Impairment**

- With intravenous use: When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
- With oral use: When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

**Monitoring Requirements**

Monitor renal function and serum calcium, phosphate and magnesium.

**Directions for Administration**

Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

**Patient and Carer Advice**

A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw). Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Ibandronic acid (Non-proprietary)**
  - Ibandronic acid (as Ibandronic sodium monohydrate) 50 mg
    - Ibandronic acid 50mg tablets | 28 tablet [POM] £174.51 DT price = £6.27
  - Ibandronic acid (as Ibandronic sodium monohydrate) 150 mg
    - Ibandronic acid 150mg tablets | 1 tablet [POM] £174.48 DT price = £1.10
  - **Bonviva** (Roche Products Ltd)
    - Ibandronic acid (as Ibandronic sodium monohydrate) 50 mg
      - Bonviva 50mg tablets | 28 tablet [POM] £183.69 DT price = £6.27
    - **Bonviva** (Roche Products Ltd)
      - Ibandronic acid (as Ibandronic sodium monohydrate) 150 mg
        - Bonviva 150mg tablets | 1 tablet [POM] £18.40 DT price = £1.10
Pamidronate disodium
(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

**INDICATIONS AND DOSE**

**Hypercalcaemia of malignancy**

- **BY INTRAVENOUS INFUSION**
  - Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

**Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma**

- **BY INTRAVENOUS INFUSION**
  - Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

**Paget’s disease of bone**

- **BY INTRAVENOUS INFUSION**
  - Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

**CAUTIONS** Atypical femoral fractures - cardiac disease (especially in elderly) - ensure adequate hydration - previous thyroid surgery (risk of hypocalcaemia)

**INTERACTIONS** Appendix 1 (bisphosphonates). Avoid concurrent use with other bisphosphonates.

**SIDE-EFFECTS**

- Common or very common Abdominal pain - anaemia - anorexia - arthralgia - bone pain - constipation - diarrhoea - drowsiness - fever - headache - hypertension - hypomagnesaemia - hypophosphataemia - influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushed) - insomnia - lymphocytopenia - myalgia - nausea - paraesthesia - rash - symptomatic hypocalcaemia - tetany - thrombocytopenia - vomiting

- Rare Acute renal failure - agitation - atypical femoral fractures - confusion - conjunctivitis - deterioration of renal disease - dizziness - dyspepsia - haematuria - hallucinations - hyperkalaemia - hypertension - isolated cases of seizures - lethargy - leucopenia - muscle cramps - osteonecrosis of the jaw - other ocular symptoms - pruritus

- Very rare Osteonecrosis of the external auditory canal

- **Frequency not known** Atrial fibrillation - injection-site reactions - reactivation of herpes simplex - reactivation of herpes zoster

**SIDE-EFFECTS, FURTHER INFORMATION**

- Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 ml/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

**MONITORING REQUIREMENTS**

- Monitor serum electrolytes, calcium and phosphate possibility of convulsions due to electrolyte changes.

- Assess renal function before each dose.

**DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (Arelia®; Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium Chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Arelia®, reconstitute initially with water for injections (15 mg in 5 ml, 30 mg or 90 mg in 10 ml), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 ml. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 ml.

**PATIENT AND CARER ADVICE**

A patient reminder card should be provided (risk of osteonecrosis of the jaw).

Driving and skilled tasks

Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Pamidronate disodium 3 mg per 1 ml
- Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial £27.50 (Hospital only) | 5 vial £149.15
- Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial £55.00 (Hospital only) | 1 vial £59.66
- Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial £110.00 (Hospital only) | 1 vial £165.00 (Hospital only)
- Pamidronate disodium 9 mg per 1 ml
- Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial £170.45
- Pamidronate disodium 15 mg per 1 ml
- Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule £119.32
- Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule £119.32
Risedronate sodium

- **INDICATIONS AND DOSE**

  **Paget's disease of bone**
  - **BY MOUTH**
  - Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

  **Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**
  - **BY MOUTH**
  - Adult (female): 5 mg daily, alternatively 35 mg once weekly.

  **Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women**
  - **BY MOUTH**
  - Adult (female): 5 mg daily.

  **Treatment of osteoporosis in men at high risk of fractures**
  - **BY MOUTH**
  - Adult (male): 35 mg once weekly.

- **CONTRA-INDICATIONS**
  - Hypocalcaemia

- **CAUTIONS**
  - Atypical femoral fractures • oesophageal abnormalities • other factors which delay transit or emptying (e.g. stricture or achalasia)

- **INTERACTIONS**
  - Appendix 1 (bisphosphonates).

- **SIDE-EFFECTS**
  - Abdominal pain • constipation • diarrhoea • dyspepsia • headache • musculoskeletal pain • nausia
  - Duodenitis • dysphagia • gastritis • oesophageal ulcer • oesophagitis • uveitis
  - Atypical femoral fractures • glossitis • oesophageal stricture
  - Osteonecrosis of the external auditory canal
  - Frequency not known

  - Cutaneous vasculitis • gastroduodenal ulceration • hair loss • hepatic disorders • osteonecrosis of the jaw • Stevens-Johnson syndrome • toxic epidermal necrolysis

- **PREGNANCY**
  - Avoid

- **BREAST FEEDING**
  - Avoid.

- **RENAI IMPAIRMENT**
  - Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Correct hypocalcaemia before starting.
  - Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  - Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer risedronate sodium tablets.
  - Oesophageal reactions
  - Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160**
      - **Risedronate** is recommended as an alternative for women:
        - in whom alendronate is contra-indicated or not tolerated and
        - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.
        - **www.nice.org.uk/TA160**
    - **Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161**
      - This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.
      - **Risedronate** is recommended as an alternative for women:
        - in whom alendronate is contra-indicated or not tolerated and
        - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance.
        - **www.nice.org.uk/TA161**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - **Risedronate sodium (Non-proprietary)**
    - **Risedronate sodium 5 mg**
      - Risedronate sodium 5mg tablets | 28 tablet (pom) £24.78 DT price = £18.85
    - **Risedronate sodium 30 mg**
      - Risedronate sodium 30mg tablets | 28 tablet (pom) £143.95 DT price = £143.83
    - **Risedronate sodium 35 mg**
      - Risedronate sodium 35mg tablets | 4 tablet (pom) £19.12 DT price = £0.89
  - **Actonel** (Warner Chilcott UK Ltd, Teva UK Ltd)
    - **Risedronate sodium 5 mg**
      - Actonel 5mg tablets | 28 tablet (pom) £17.99 DT price = £18.85
    - **Risedronate sodium 30 mg**
      - Actonel 30mg tablets | 28 tablet (pom) £143.95 DT price = £143.83
    - **Risedronate sodium 35 mg**
      - Actonel Once a Week 35mg tablets | 4 tablet (pom) £19.12 DT price = £0.89

- **Risedronate with calcium carbonate and colecalciferol**
  - The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium above, calcium carbonate p. 919, colecalciferol p. 953.

- **INDICATIONS AND DOSE**
  - **Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**
    - **BY MOUTH**
    - Adult: 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle.
DIRECTIONS FOR ADMINISTRATION  Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

PRESCRIBING AND DISPENSING INFORMATION  Actonel Combi® effervescent granules contain calcium carbonate 2.5g (calcium 1g or Ca²⁺ 25 mmol) and colecaltferol 22 micrograms (880 units)/sachet.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer calcium carbonate with colecaltferol and risedronate tablets and granules.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet/Granules
- Actonel Combi (Teva UK Ltd)
  - Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply  £19.12

Sodium clodronate

INDICATIONS AND DOSE
Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma
- BY MOUTH
  - Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520®
Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma
- BY MOUTH
  - Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

CONTRA-INDICATIONS  Acute gastro-intestinal inflammatory conditions

CAUTIONS  Atypical femoral fractures - maintain adequate fluid intake during treatment

INTERACTIONS  → Appendix 1 (bisphosphonates). Renal dysfunction reported in patients receiving concomitant NSAIDs.

SIDE-EFFECTS
- Common or very common  Bronchospasm • diarrhoea • nausea • skin reactions • vomiting
- Rare  Atypical femoral fractures
- Very rare  Osteonecrosis of the external auditory canal • osteonecrosis of the jaw
- Frequency not known  Renal impairment • uveitis

PREGNANCY  Avoid.

BREAST FEEDING  Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT  Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73m² . Use half normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS  Monitor renal function, serum calcium and serum phosphate before and during treatment.

DIRECTIONS FOR ADMINISTRATION  Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS  10
- Sodium clodronate (Non-proprietary)

Zoledronic acid

INDICATIONS AND DOSE
ACLASTA®
Treatment of Paget’s disease of bone
- BY INTRAVENOUS INFUSION
  - Adult: 5 mg as a single dose, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)
- BY INTRAVENOUS INFUSION
  - Adult: 5 mg once yearly as a single dose, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 5000–125000 units of vitamin D

ZOMETA® INFUSION
Reduction of bone damage in advanced malignancies involving bone
- BY INTRAVENOUS INFUSION
  - Adult: 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy
- BY INTRAVENOUS INFUSION
  - Adult: 4 mg for 1 dose, to be administered over at least 15 minutes

CAUTIONS  Atypical femoral fractures • cardiac disease (avoid fluid overload) • concomitant medicines that affect renal function

INTERACTIONS  → Appendix 1 (bisphosphonates).

SIDE-EFFECTS
- Common or very common  Anaemia • arthralgia • atrial fibrillation • bone pain • conjunctivitis • dizziness • fever •
Endocrine system

Disorders of bone metabolism

668 Disorders of bone metabolism

BNF 73

†Indental disturbances • headache • hypophosphataemia • influenza-like symptoms • myalgia • renal impairment • rigors

> Uncommon Angioedema • anorexia • anxiety • asthenia • blurred vision • chest pain • cough • dry mouth • dyspnoea • haematuria • hypersensitivity reactions • hypertension • hypokalaemia • hypomagnesaemia • hypotension • injection-site reactions • lethargy • leucopenia • muscle cramps • paraesthesia • peripheral oedema • proteinuria • pruritus • rash • sleep disturbance • stomatitis • sweating • taste disturbance • thrombocytopenia • tremor • urinary frequency • weight gain

> Rare Acute renal failure • atypical femoral fractures • bradycardia • confusion • hyperkalaemia • hypernatraemia • osteonecrosis of the jaw • pancytopenia

> Very rare Episcleritis • osteonecrosis of the external auditory canal • uveitis

Side-effects, Further Information

Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

Conception and Contraception

Contra-indicated in women of child-bearing potential.

Pregnancy

Avoid—toxicity in animal studies.

Breast Feeding

Avoid—no information available.

Hepatic Impairment

Caution in severe hepatic impairment—limited information available.

Renal Impairment

In advanced malignancies involving bone, if eGFR 50–60 ml/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 ml/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 ml/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 ml/minute/1.73 m² (or if serum creatinine greater than 265 micromol/litre).

Avoid in Paget’s disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 ml/minute/1.73 m².

Monitoring Requirements

Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.

Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

Directions for Administration

For intravenous infusion (Zometa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

Patient and Carer Advice

A patient reminder card should be provided (risk of osteonecrosis of the jaw).

National Funding/Access Decisions

Zometa® Infusion

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2003) that for the prevention of skeletal related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

Aclasta®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Infusion

Aclasta® (Novartis Pharmaceuticals UK Ltd)

Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 ml Aclasta 5mg/100ml infusion bottles £125.38

Zometa® (Novartis Pharmaceuticals UK Ltd)

Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 ml Zometa 4mg/100ml infusion bottles £174.14

Solution for Infusion

Zometa® (Novartis Pharmaceuticals UK Ltd)

Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 ml Zometa 4mg/5ml solution for infusion vials £174.14

Calcitonin (salmon)

(Salcatonin)

Indications and Dose

Hypercalcaemia of malignancy

By Subcutaneous Injection, or By Intramuscular Injection

Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response

By Intravenous Infusion

Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

Paget’s Disease of Bone

By Subcutaneous Injection, or By Intramuscular Injection

Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

Prevention of Acute Bone Loss Due to Sudden Immobility

By Subcutaneous Injection, or By Intramuscular Injection

Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

Contra-Indications

Hypocalcaemia

Caution

Heart failure • history of allergy (skin test advised) • risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

Side-effects

Common or Very Common

Abdominal pain • diarrhea • dizziness • fatigue • flushing • headache • malignancy (with long-term use) • musculoskeletal pain • nausea • taste disturbances • vomiting

Uncommon

Cough • hypersensitivity reactions • hypertension • injection-site reactions • oedema • polyuria • pruritus • rash • visual disturbances

Frequency Not Known

Tremor

Pregnancy

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

Breast Feeding

Avoid; inhibits lactation in animals.
Strontium ranelate

- **DRUG ACTION** Stimulates bone formation and reduces bone resorption.

- **INDICATIONS AND DOSE**
  Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)

  - **By mouth**
  - Adult: 2 g once daily, dose to be taken in water, preferably at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or prolonged immobilisation · uncontrolled hypertension

- **CAUTIONS** Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment

- **INTERACTIONS** → Appendix 1 (strontium ranelate).

- **SIDE-EFFECTS**
  - Common or very common Dermatitis · diarrhoea · eczema · headache · myocardial infarction · nausea · venous thromboembolism
  - Very rare Angioedema · hypersensitivity reactions · pruritus · rash · urticaria
  - Frequency not known Abdominal pain · alopecia · bone marrow suppression · constipation · dyspepsia · flatulence · gastro-oesophageal reflux · peripheral oedema · stomatitis · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Severe allergic reactions Including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

- **EFFECT ON LABORATORY TESTS** Interferes with colorimetric measurements of calcium in blood and urine.

- **MEDICINAL FORMS**

  **Solution for injection**
  - Calcitonin (salmon) (Non-proprietary) Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon) 50 units/1 ml solution for injection ampoules | 5 ampoule £167.20
  - Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100 units/1 ml solution for injection ampoules | 5 ampoule £220.00
  - Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 200 units/1 ml solution for injection ampules | 1 vial £352.00
  - Miacalcic (Essential Pharma Ltd) Miacalcic (salmon) 50 units/ml solution for injection ampules | 5 ampoule £17.10
  - Miacalcic (salmon) 100 unit per 1 ml Miacalcic 100 units/ml solution for injection ampules | 5 ampoule £34.21
  - Miacalcic (salmon) 200 unit per 1 ml Miacalcic 200 units/ml multidose solution for injection vials | 1 vial £24.60

- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer strontium ranelate granules. Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (TAs)**
  - Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160
  - Strontium ranelate is recommended as an alternative for women:
    - in whom alendronate and risedronate are contra-indicated or not tolerated and
    - who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.
  - www.nice.org.uk/TA160
  - Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

- **Endocrine system**
**Teriparatide**

- **INDICATIONS AND DOSE**
  Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis
  - By subcutaneous injection
  - Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

- **CONTRA-INDICATIONS**
  Bone metastases • hyperparathyroidism • metabolic bone diseases • Paget’s disease • pre-existing hypercalcaemia • previous radiation therapy to the skeleton • skeletal malignancies • unexplained raised alkaline phosphatase

- **SIDE-EFFECTS**
  - Common or very common
    - Anaemia • arthralgia • asthenia • depression • dizziness • dyspnoea • fatigue • gastrointestinal disorders • haemorrhoids • headache • increased sweating • muscle cramps • myalgia • nausea • palpititation • reflux • sciatica • vertigo
  - Uncommon
    - Hypercalcaemia • injection-site reactions • urinary disorders
  - Rare
    - Hypersensitivity reactions

- **PREGNANCY**
  Avoid.

- **BREAST FEEDING**
  Avoid.

- **RENAL IMPAIRMENT**
  Caution in moderate impairment; avoid if severe.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  NICE technology appraisals (TAs)
  - Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161
  This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

  **Teriparatide** is recommended as an alternative for women:
  - In whom alendronate or risedronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate or risedronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) and
  - Who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

  www.nice.org.uk/TA161

  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised (December 2003) that the use of teriparatide (Forsteo®) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

- **MEDICINAL FORMS**
  There is variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Forsteo (Eli Lilly and Company Ltd)
    Teriparatide 250 microgram per 1 ml Forsteo 20 microlitres solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection £71.88

---

**Denosumab**

- **DRUG ACTION**
  Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

- **INDICATIONS AND DOSE**
  **PROLIA®**
  Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures
  - By subcutaneous injection
  - Adult: 60 mg every 6 months, supplement with calcium and vitamin D

  **XGEVA®**
  Prevention of skeletal related events in patients with bone metastases from solid tumours
  - By subcutaneous injection
  - Adult: 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

  **Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescents**
  - By subcutaneous injection
  - Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

---

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)**

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

**Osteonecrosis of the jaw**

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

Denosumab 120 mg (cancer indication)
● A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients

● Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery

Denosumab 60 mg (osteooporosis indication)

● Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

Hypocalcaemia

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

● before the first dose

● within two weeks after the initial dose

● if suspected symptoms of hypocalcaemia occur

● consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

● before each dose

● within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

● if suspected symptoms of hypocalcaemia occur

All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204

Denosumab is recommended as a treatment option for the primary prevention of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

● who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments and

● who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

Denosumab is recommended as a treatment option for the secondary prevention of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments.

www.nice.org.uk/TA204

Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:

● bisphosphonates would otherwise be prescribed, and

● the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is not recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA265
5 Dopamine responsive conditions

DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Overview

Bromocriptine p. 391 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 846) are more effective.

Cabergoline p. 393 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide below has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analogics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Quinagolide

- DRUG ACTION Quinagolide is a non-ergot dopamine D2 agonist.

- INDICATIONS AND DOSE

Hyperprolactinaemia

- BY MOUTH

- Adult: Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Prolixa (Amgen Ltd)
  - Denosumab 60 mg per 1 ml Prolixa 60mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PAM) £183.00
  - Xgeva (Amgen Ltd)
  - Denosumab 70 mg per 1 ml Xgeva 120mg/1.7ml solution for injection vials | 1 vial (PAM) £309.86

- UNLICENSED USE Not licensed for the suppression of lactation.

- CAUTIONS Acute porphyrias p. 930 · history of psychotic illness · history of serious mental disorders

- INTERACTIONS → Appendix 1 (quinagolide). Tolerance may be reduced by alcohol.

- SIDE-EFFECTS

- Common or very common Abdominal pain · anorexia · constipation or diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting

- Very rare Psychosis

SIDE-EFFECTS, FURTHER INFORMATION

- Gastro-intestinal bleeding · Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- ALLERGY AND CROSS-SENSITIVITY Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypotension to ergot alcohol).

- CONCEPTION AND CONTRACEPTION Advise non-hormonal contraception if pregnancy not desired.

- PREGNANCY Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

- BREAST FEEDING Suppresses lactation.

- HEPATIC IMPAIRMENT Avoid—no information available.

- RENAL IMPAIRMENT Avoid—no information available.

- MONITORING REQUIREMENTS Monitor blood pressure for a few days after starting treatment and following dosage increase.

- PATIENT AND CARER ADVICE

Driving and skilled tasks

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 10, 21

- Quinagolide (Non-proprietary)

  | Quinagolide (as Quinagolide hydrochloride) |
  | 25 microgram | Quinagolide 25microgram tablets | 3 tablet (PAM) no price available |
  | 50 microgram | Quinagolide 50microgram tablets | 3 tablet (PAM) no price available |
  | 75 microgram | Quinagolide 75microgram tablets | 30 tablet (PAM) £54.57 DT price = £27.00 |
Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and withdrawal of an oral contraceptive or of hormone replacement therapy to resolve the symptoms. Recurrence of symptoms that persist for longer than 6 months may require analgesics; moderate to severe pain, cyclical pain or pain of hormone replacement therapy may help to resolve the reduction in dietary fat; withdrawal of an oral contraceptive ruled out, most women will respond to reassurance and continued if necessary. Symptoms recur in 50% of women within 2 years of withdrawal of therapy but may be less severe.

6 Gonadotrophin responsive conditions

Gonadotrophins

Drugs affecting gonadotrophins

Danazol p. 678 is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix, below, and ganirelix, below, are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypospermatogenesis with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuporelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 848 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

Cetrorelix

- **INDICATIONS AND DOSE**
  - Adjunct in the treatment of female infertility (initiated under specialist supervision)
    - *by subcutaneous injection*
      - Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

- **SIDE-EFFECTS**
  - Common or very common
    - Headache, injection site reactions, nausea
  - Rare
    - Hypersensitivity reactions

- **PREGNANCY**
  - Avoid in confirmed pregnancy.

- **BREAST FEEDING**
  - Avoid.

- **HEPATIC IMPAIRMENT**
  - Avoid in moderate or severe liver impairment.

- **RENAL IMPAIRMENT**
  - Avoid in moderate or severe renal impairment.

---

Ganirelix

- **INDICATIONS AND DOSE**
  - Adjunct in the treatment of female infertility (initiated under specialist supervision)
    - *by subcutaneous injection*
      - Adult: 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (in administering in afternoon, give last dose in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy).

- **SIDE-EFFECTS**
  - Very rare
    - Facial oedema, hypersensitivity reactions, rash
  - Frequency not known
    - Dyspnoea, headache, injection site reactions, malaise, nausea

- **PREGNANCY**
  - Avoid in confirmed pregnancy—toxicity in animal studies.

- **BREAST FEEDING**
  - Avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Avoid in moderate or severe hepatic impairment.

- **RENAL IMPAIRMENT**
  - Avoid in moderate to severe renal impairment.

Gonadotrophin responsive conditions 673

Endocrine system
**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES**

**Buserelin**

**DRUG ACTION** Administration of gonadotropin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotropin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**Endometriosis**

- **BY INTRanasal ADMINISTRATION**
  - Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**

- **BY SUBcutaneous INJECTION**
  - Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

- **BY INTRanasal ADMINISTRATION**
  - Adult: 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**Advanced prostate cancer**

- **INITIALLY BY SUBcutaneous INJECTION**
  - Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

**CONTRA-INDICATIONS**

- When used for endometriosis Hormone dependent tumours - undiagnosed vaginal bleeding - use longer than 6 months (do not repeat)
- When used for pituitary desensitisation Hormone dependent tumours - undiagnosed vaginal bleeding

**CAUTIONS** Depression - diabetes - hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intranasal use Altered sense of taste and smell - nasal irritation - nose bleeds

**SIDE-EFFECTS, FURTHER INFORMATION**

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

**CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**DIRECTIONS FOR ADMINISTRATION**

- With intranasal use Avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Orgalutran** (Merck Sharp & Dohme Ltd)
  - Ganirelix 500 microgram per 1 ml Orgalutran 250 microgram/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £21.48

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intranasal use Altered sense of taste and smell - nasal irritation - nose bleeds

**SIDE-EFFECTS, FURTHER INFORMATION**

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

**CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY** Avoid.

**Spray**

- **Suprecur (Sanofi)**
  - Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose | £105.16
- **Suprecurfact (Sanofi)**
  - Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprecurfact 100micrograms/dose nasal spray | 336 dose | £122.24
Goserelin

**DRUG ACTION** Administration of goserelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle-stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**ZOLADEX LA**
- Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer
  - BY SUBCUTANEOUS INJECTION
    - Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

**ZOLADEX**
- Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer
  - BY SUBCUTANEOUS INJECTION
    - Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

**Endometriosis**
  - BY SUBCUTANEOUS INJECTION
    - Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

**Endometrial thinning before intra-uterine surgery**
  - BY SUBCUTANEOUS INJECTION
    - Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

**Before surgery in women who have anaemia due to uterine fibroids**
  - BY SUBCUTANEOUS INJECTION
    - Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)**
  - BY SUBCUTANEOUS INJECTION
    - Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

**CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)

**CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men

**SIDE-EFFECTS**
- Rare Hypercalcaemia (in women)
- Frequency not known Anaphylaxis · arthralgia · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dizziness · dyspareunia (when used for gynaecological conditions) · gastro-intestinal disturbances · gynaecomastia · headache · heart failure (when used for prostate or breast cancer) · hot flushes · hypersensitivity reactions · increased sweating · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain (when used for gynaecological conditions) · musculoskeletal weakness (when used for gynaecological conditions) · myalgia · myocardial infarction (when used for prostate or breast cancer) · oedema of the face and extremities (when used for gynaecological conditions) · ovarian cysts (may require withdrawal) · palpitation (when used for gynaecological conditions) · paraesthesia · paraesthesia · pruritus · rash · sexual dysfunction · sleep disorders · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · weight change · withdrawal bleeding

**SIDE-EFFECTS, FURTHER INFORMATION**
- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.
- CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- MONITORING REQUIREMENTS Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy for prostate cancer.
- DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Implant**
- Zoladex (AstraZeneca UK Ltd)
- Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant

Endometriosis

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

**PROSTAP SR DCS**
Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 3.75 mg every month

Endometriosis

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every month for maximum 6 months (course not to be repeated)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Tumour flare** (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

**CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**PREGNANCY** Avoid—teratogenic in animal studies.

**BREAST FEEDING** Avoid.

**MONITORING REQUIREMENTS**

- Monitor liver function.
- Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

**DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- **Prostap 3 DCS** (Takeda UK Ltd)
  - Leuprolrelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled disposable injection \( \text{P} \& \text{S} \) £225.72 DT price = £225.72

- **Prostap SR DCS** (Takeda UK Ltd)
  - Leuprolrelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled disposable injection \( \text{P} \& \text{S} \) £75.24 DT price = £75.24

Nafarelin

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**Endometriosis**

- **BY INTRANASAL ADMINISTRATION**
  - Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).
Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding - use longer than 6 months in the treatment of endometriosis (do not repeat)
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Acne · anaphylaxis · asthma · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dyspareunia · headache · hot flushes · hypersensitivity reactions · hypertension · increased sweating · irritation of the nasal mucosa · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · ovariian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · urticaria · vaginal dryness · visual disturbances · weight changes
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Menopausal-like symptoms: These effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone).
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

**MEDICINAL FORMS**

There can be variation in thelicensing of different medicines containing the same drug.

Spray

- CAUTIONARY AND ADVISORY LABELS 10
  - Synarel (Pfizer Ltd)
    - Nafarelin (as Nafarelin acetate) 200 microgram per 1 dose Synarel 200micrograms/dose nasal spray | 60 dose Pod | £52.43

---

**Triptorelin**

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **DECAPEPTYL® SR 11.25MG**
    - Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
    - BY INTRAMUSCULAR INJECTION
    - Adult: 11.25 mg every 3 months
  - **DECAPEPTYL® SR 22.5MG**
    - Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
    - BY INTRAMUSCULAR INJECTION
    - Adult: 22.5 mg every 6 months
  - **DECAPEPTYL® SR 3MG**
    - Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression
    - BY INTRAMUSCULAR INJECTION
    - Adult: 3 mg every 4 weeks

**Endometriosis**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Reduction in size of uterine fibroids**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**GONAPEPTYL DEPOT®**

**Advanced prostate cancer**

- **BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 3.75 mg every 4 weeks

---

Endocrine system
Endometriosis | Reduction in size of uterine fibroids
▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
▶ Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**SALVACYL®**

Male hypersexuality with severe sexual deviation
▶ BY INTRAMUSCULAR INJECTION
▶ Adult: 11.25 mg every 12 weeks

**CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) - undiagnosed vaginal bleeding

**SALVACYL®** Severe osteoporosis

**CAUTIONS**

**GENERAL CAUTIONS**
Patients with metabolic bone disease (decrease in bone mineral density can occur)

**SPECIFIC CAUTIONS**
▶ When used for prostate cancer Risk factors for osteoporosis - risk of spinal cord compression in men - risk of ureteric obstruction in men

**SALVACYL®** Increased risk of sensitivity to restored testosterone if treatment interrupted - consider administration of an antiandrogen before stopping treatment - transient increase in serum testosterone occurs on initiation - consider administration of an antiandrogen

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
Anaphylaxis - arthralgia - asthenia - asthma - breast tenderness (males and females) - changes in blood pressure - changes in breast size - changes in scalp and body hair - depression - gastrointestinal disturbances - headache - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - visual disturbances - weight changes

**SPECIFIC SIDE-EFFECTS**
▶ When used for endometriosis Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

▶ When used for male hypersexuality with severe sexual deviation Decrease in trabecular bone density - dyspareunia - loss of libido - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation

▶ When used for prostate cancer Dizziness - dry mouth - hair loss - increased dysuria - myalgia - peripheral oedema - sexual dysfunction - sleep disorders

▶ When used for reduction in size of uterine fibroids Bleeding associated with fibroid degeneration - decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

**SIDE-EFFECTS, FURTHER INFORMATION**
▶ Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.

▶ CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

▶ PREGNANCY Avoid.

▶ BREAST FEEDING Avoid.

▶ MONITORING REQUIREMENTS
When used for Prostate cancer Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

▶ DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.

▶ PRESCRIBING AND DISPENSING INFORMATION

**DECAPEPTYL® SR 11.25MG** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

**DECAPEPTYL® SR 22.5MG** Each vial includes an overage to allow accurate administration of a 22.5 mg dose.

**DECAPEPTYL® SR 3MG** Each vial includes an overage to allow accurate administration of 3 mg dose.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**
▶ **Decapeptyl SR** (Ipsen Ltd) Triptorelin (as Triptorelin acetate) 3 mg Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial (Ipsen) £69.00 DT price = £63.00

Triptorelin (as Triptorelin acetate) 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial (Ipsen) £207.00 DT price = £207.00

Triptorelin (as Triptorelin acetate) 22.5 mg Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial (Ipsen) £414.00 DT price = £414.00

▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd) Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection (Ferring) £81.69

▶ **Salvacyl** (Ipsen Ltd) Triptorelin (as Triptorelin acetate) injection vials | 1 vial (Ipsen) £248.00

6.1 Hereditary angioedema

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**
▶ ANTI-GONADOTROPIN-RELEASING HORMONES

**Danazol**

▶ DRUG ACTION Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity.

▶ INDICATIONS AND DOSE

**Endometriosis**
▶ **BY MOUTH**
▶ Adult: 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

**Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment**
▶ **BY MOUTH**
▶ Adult: 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1
**Hypothalamic and anterior pituitary hormone related disorders**

### Hypothalamic and anterior pituitary hormones

#### Anterior pituitary hormones

### Corticotrophins

Tetracosactide p. 680 (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in follitropin), or chorionic gonadotrophin p. 681, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 702, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligosperma. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

### Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 685, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-1 (rIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

### Hypothalamic hormones

Gonadorelin p. 681 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility and in breast and prostate cancer.
7.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide (Tetracosactrin)

- **INDICATIONS AND DOSE**
  
  **Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)**
  - By intravenous injection, or by intramuscular injection
  - Adult: 250 micrograms for 1 dose
  
  **Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)**
  - By intramuscular injection using depot injection
  - Adult: 1 mg for 1 dose
  
  **Alternative to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)**
  - By intramuscular injection using depot injection
  - Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

- **CONTRA-INDICATIONS**
  Acute psychosis • adrenogenital syndrome • allergic disorders • asthma • avoid injections containing benzyl alcohol in neonates • Cushing’s syndrome • infectious diseases • peptic ulcer • primary adrenocortical insufficiency • refractory heart failure

- **CAUTIONS**
  Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) • active systemic diseases (should not be used unless adequate disease-specific therapy is being given) • diabetes mellitus • diverticulitis • history of asthma • history of atopic allergy • history of eczema • history of hayfever • history of hypersensitivity • hypertension • latent amoebiasis (may become activated) • latent tuberculosis (may become activated) • myasthenia gravis • ocular herpes simplex • osteoporosis • predisposition to thromboembolic • psychological disturbances may be triggered • recent intestinal anastomosis • reduced immune response (should not be used unless adequate disease-specific therapy is being given) • ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

- Risk of anaphylaxis. Should only be administered under medical supervision. Consult product literature.
- Hypertension. Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- Diabetes mellitus. Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.

- **SIDE-EFFECTS** → Appendix 1 (corticosteroids).
- **INTERACTIONS**

hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) • hypertension • hypokalaemia • hypokalaemic alkalosis • impaired healing • increased appetite • increased intraocular pressure • infection susceptibility increased • insomnia • irregular menstruation • leukocytosis • malaise • manifestations of latent diabetes mellitus • mood swings • muscle atrophy • muscular weakness • myopathy • nausea • necrotising vasculitis • negative nitrogen balance • osteoporosis • pancreatitis • pathological fracture of long bones • peptic ulcer • personality changes • petechiae • posterior subcapsular cataracts • pruritus • psychotic manifestations • Quincke’s oedema • secondary adrenocortical unresponsiveness • secondary pituitary unresponsiveness • severe depression • skin atrophy • skin hyperpigmentation • skin reactions at injection site • sodium retention • spinal compression fractures • tendon rupture • thromboembolism • ulcerative oesophagitis • urticaria • vertigo • vomiting • weight increase

- **ALLERGY AND CROSS-SENSITIVITY**
  Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.

- **PREGNANCY**
  Avoid (but may be used diagnostically if essential).

- **BREAST FEEDING**
  Avoid (but may be used diagnostically if essential).

- **HEPATIC IMPAIRMENT**
  An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.

- **RENAL IMPAIRMENT**
  Use with caution in patients with renal impairment.

- **EFFECT ON LABORATORY TESTS**
  May suppress skin test reactions.

  Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  - Synacthen (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
    - Tetracosactide acetate 250 microgram per 1 ml Synacthen
      - 250micrograms/1ml solution for injection ampoules | 1 ampoule [Pud] £38.00

  **Suspension for injection**

  **EXCIPIENTS:** May contain Benzyl alcohol

  - Synacthen Depot (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
    - Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [Pud] £346.28
7.2 Assessment of pituitary function

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ➔ GONADOTROPIN-RELEASING HORMONES

**Gonadorelin**
(Gonadotrophin-releasing hormone; GnRH; LH-RH)

- **INDICATIONS AND DOSE**
  - Assessment of pituitary function
    - By subcutaneous injection, or by intravenous injection
  - Adult: 100 micrograms for 1 dose

- **CAUTIONS**
  - Pituitary adenoma
  - Side-effects: Abdominal pain, headache, hypersensitivity reaction on repeated administration of large doses, increased menstrual bleeding, irritation at injection site, nausea

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - Avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder and solvent for solution for injection
    - Excipients: May contain Benzyl alcohol
      - Gonadorelin (Non-proprietary)
      - Gonadorelin (as Gonadorelin hydrochloride)
        - 100 microgram Gonadorelin 100 microgram powder and solvent for solution for injection vials | 1 vial £75.00 (Hospital only)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

**Choriogonadotropin alfa**
(Human chorionic gonadotropin)

- **INDICATIONS AND DOSE**
  - Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene
  - Superoxivan treatment for assisted conception (such as in vitro fertilisation)
  - By subcutaneous injection
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Active thromboembolic disorders
  - Ovarian enlargement or cyst (unless caused by polycystic ovarian disease)
  - Ovarian malignancy
  - Pituitary malignancy
  - Uterine malignancy

- **CAUTIONS**
  - Acute porphyrias p. 930
  - Side-effects: Abdominal pain, breast pain, depression, diarrhoea, ectopic pregnancy, headache, injection-site reactions, irritability, nausea, ovarian hyperstimulation syndrome, ovarian torsion, tiredness, vomiting

**Chorionic gonadotrophin**
(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION**
  - A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

- **INDICATIONS AND DOSE**
  - Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene
  - Superoxivan treatment for assisted conception (such as in vitro fertilisation)
  - By intramuscular injection, or by subcutaneous injection
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Androgen-dependent tumours

- **CAUTIONS**
  - Asthma, cardiac impairment, epilepsy, migraine, prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
  - Gynaecomastia, headache, local reactions, may aggravate ovarian hyperstimulation, mood changes, multiple pregnancy, oedema (particularly in males—reduce dose), tiredness

- **RENAL IMPAIRMENT**
  - Use with caution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder and solvent for solution for injection
    - Choragon (Ferring Pharmaceuticals Ltd)
      - Chorionic gonadotrophin human 5000 unit Choragon 5,000 unit powder and solvent for solution for injection ampoules | 3 ampoules £9.77 (CD4-2)
    - Pregnyl (Merck Sharp & Dohme Ltd)
      - Chorionic gonadotrophin human 5000 unit Pregnyl 5,000 unit powder and solvent for solution for injection ampoules | 1 ampoule £15.00 (CD4-2)

- **Corifollitropin alfa**

- **INDICATIONS AND DOSE**
  - Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist
  - By subcutaneous injection
  - Adult (body-weight up to 60 kg): 100 micrograms
  - Adult (body-weight 60 kg and above): 150 micrograms

- **CONTRA-INDICATIONS**
  - History of ovarian hyperstimulation syndrome, ovarian enlargement or cyst, polycystic ovarian syndrome, tumours of breast, tumours of hypothalamus, tumours of ovaries, tumours of pituitary, tumours of uterus, vaginal bleeding of unknown cause

- **CAUTIONS**
  - Acute porphyrias p. 930—risk factors for thromboembolism, risk of ovarian hyperstimulation syndrome
## Folitropin alfa
*(Recombinant human follicle stimulating hormone)*

### INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- **BY SUBCUTANEOUS INJECTION**
  - Adult (female): Adjusted according to response.

### CONTRA-INDICATIONS

Ovarian cysts (not caused by polycystic ovarian syndrome) | ovarian enlargement (not caused by polycystic ovarian syndrome) | tumours of breast | tumours of hypothalamus | tumours of ovaries | tumours of pituitary | tumours of prostate | tumours of testes | tumours of uterus | vaginal bleeding of unknown cause

### CAUTIONS

Acute porphyrias p. 930 | history of tubal disease

### SIDE-EFFECTS

- **Common or very common** Fever | gastro-intestinal disturbances | headache | hyperstimulation | injection site reactions | joint pain | ovarian hyperstimulation | varicocele
  - **Very rare** Exacerbation or aggravation of asthma | thromboembolism
  - **Frequency not known** Acne | gynaecomastia | increased risk of miscarriage | increased risk of multiple pregnancy | weight gain

### PREGNANCY

Avoid.

### BREAST FEEDING

Avoid.

### PRESCRIBING AND DISPENSING INFORMATION

Folitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

### PATIENT AND CARER ADVICE

Patient advice required around conception and contraception

Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

---

### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Bemfola** *(Finox Biotech UK)*
  - Folitropin alfa 600 unit per 1 ml | Bemfola 225units/0.375ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £70.50
  - Bemfola 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £94.00
  - Bemfola 150units/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £23.50

- **Gonal-f** *(Merck Sharp & Dohme Ltd)*
  - Folitropin alfa 600 unit per 1 ml | Gonal-f 900units/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £282.00
  - Gonal-f 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £94.00
  - Gonal-f 450units/0.75ml solution for injection pre-filled pen | 1 pre-filled disposable injection | £141.00

- **Ovaleap** *(Teva UK Ltd)*
  - Folitropin alfa 600 unit per 1 ml | Ovaleap 450units/0.75ml solution for injection cartridges | 1 cartridge | £112.80
  - Ovaleap 900units/1.5ml solution for injection cartridges | 1 cartridge | £225.60
  - Ovaleap 300units/0.5ml solution for injection cartridges | 1 cartridge | £75.20

#### Powder and solvent for solution for injection

- **Gonal-f** *(Merck Serono Ltd)*
  - Folitropin alfa 75 unit | Gonal-f 75unit powder and solvent for solution for injection vials | 1 vial | £126.10
  - Folitropin alfa 450 unit | Gonal-f 450unit powder and solvent for solution for injection vials | 1 vial | £294.22

---

### Folitropin alfa with lutropin alfa

The properties listed below are those particular to the combination only. For the properties of the components please consider, folitropin alfa above, lutropin alfa p. 683.

#### INDICATIONS AND DOSE

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

- **BY SUBCUTANEOUS INJECTION**
  - Adult (female): Adjusted according to response.

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

**ELECTROLYTES:** May contain Sodium

- **Pergovers** *(Merck Serono Ltd)*
  - Lutropin alfa 75 unit, Folitropin alfa 150 unit | Pergovers 150unit/75unit powder and solvent for solution for injection vials | 1 vial | £60.29 | 10 vial | £602.90
Follitropin beta
(Recombinant human follicle stimulating hormone)

- **INDICATIONS AND DOSE**
  - Infertility in women with proven hypopituitarism or who have not responded to clomifene | Supereovulation treatment for assisted conception (such as in vitro fertilisation)
    - By intramuscular injection, or by subcutaneous injection
  - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Ovarian cysts (not caused by polycystic ovarian syndrome) - ovarian enlargement (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

- **CAUTIONS**
  - Acute porphyrias p. 930 - history of tubal disease

- **SIDE-EFFECTS**
  - Common or very common: Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - injection site reactions - joint pain - ovarian hyperstimulation
  - Very rare: Thromboembolism
  - Frequency not known: Acne - gynaecomastia - increased risk of miscarriage - increased risk of multiple pregnancy - weight gain

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - Avoid.

- **DIRECTIONS FOR ADMINISTRATION**
  - Cartridges and vials are used for subcutaneous administration; vials are used for intramuscular injection.

- **PATIENT AND CARER ADVICE**
  - Patient advice required around conception and contraception
  - Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - EXCIPIENTS: May contain Neomycin, streptomycin
    - Puregon (Merck Sharp & Dohme Ltd)
      - Follitropin beta 100 unit per 1 ml
        - Puregon 50units/0.5ml solution for injection vials | 1 vial £18.03
      - Follitropin beta 200 unit per 1 ml
        - Puregon 100units/0.5ml solution for injection vials | 1 vial £36.06

        - Puregon 900units/1.08ml solution for injection cartridges | 1 cartridge £292.23
        - Puregon 600units/0.72ml solution for injection cartridges | 1 cartridge £194.82
        - Puregon 300units/0.36ml solution for injection cartridges | 1 cartridge £97.41

Lutropin alfa
(Recombinant human luteinising hormone)

- **INDICATIONS AND DOSE**
  - Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Supereovulation treatment for assisted conception (such as in vitro fertilisation)
    - By subcutaneous injection
    - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Mammary carcinoma - ovarian carcinoma - ovarian enlargement or cyst (unless caused by polycystic ovarian disease) - tumours of hypothalamus - tumours of pituitary - undiagnosed vaginal bleeding - uterine carcinoma

- **CAUTIONS**
  - Acute porphyrias p. 930

- **SIDE-EFFECTS**

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**
  - Luveris (Merck Serono Ltd)
    - Lutropin alfa 75 unit
      - Luveris 75unit powder and solvent for solution for injection vials | 1 vial £31.38

Menotrophin

- **INDICATIONS AND DOSE**
  - Infertility in women with proven hypopituitarism or who have not responded to clomifene | Supereovulation treatment for assisted conception (such as in vitro fertilisation)
    - By subcutaneous injection, or by deep intramuscular injection
    - Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS**
  - Ovarian cysts (not caused by polycystic ovarian syndrome) - ovarian enlargement (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

- **CAUTIONS**
  - Acute porphyrias p. 930 - history of tubal disease

- **SIDE-EFFECTS**
  - Very rare: Thromboembolism
  - Frequency not known: Acne - fever - gastro-intestinal disturbances - gynaecomastia - headache - hypersensitivity reactions - increased risk of multiple pregnancy and miscarriage - injection site reactions - joint pain - ovarian hyperstimulation - weight gain

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - Avoid.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1.
684 Hypothalamic and anterior pituitary hormone related disorders

**PATIENT AND CARER ADVICE**

Patient advice required around conception and contraception

Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Menotrophin** (Ferring Pharmaceuticals Ltd)
  - Menotrophin 75 unit Menotrophin 75 unit powder and solvent for solution for injection vials | 1 vial (Pom) £16.38 | 10 vial (Pom) £163.80
  - Menotrophin 150 unit Menotrophin 150 unit powder and solvent for solution for injection vials | 5 vial (Pom) £163.80 | 10 vial (Pom) £327.60
- **Menotrophin 600 unit** Menotrophin 600 unit powder and solvent for solution for injection vials | 1 vial (Pom) £131.04
- **Menotrophin 1200 unit** Menotrophin 1200 unit powder and solvent for solution for injection vials | 1 vial (Pom) £262.08
  - **Merional** (BSA Farmaceutici Italia Srl)
    - **Menotrophin 75 unit** Merional 75 unit powder and solvent for solution for injection vials | 10 vial (Pom) £279.00
    - **Menotrophin 150 unit** Merional 150 unit powder and solvent for solution for injection vials | 10 vial (Pom) £558.00

**Urofollitropin**

**INDICATIONS AND DOSE**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superoovulation treatment for assisted conception (such as in vitro fertilisation)

- **BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Adult (female): Adjusted according to response.

**CONTRA-INDICATIONS**

Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

**CAUTIONS**

Acute porphyrias p. 930

**SIDE-EFFECTS**

- Very rare: Thromboembolism
- Frequency not known: Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - increased risk of miscarriage - increased risk of multiple pregnancy - injection site reactions - joint pain - ovarian hyperstimulation

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Avoid.

**PRESCRIBING AND DISPENSING INFORMATION**

Urofollitropin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH).

**PATIENT AND CARER ADVICE**

Patient advice required around conception and contraception

Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Bravelle** (Ferring Pharmaceuticals Ltd)
  - **Follicle stimulating hormone human (as Urofollitropin)**
    - **75 unit** Bravelle 75 unit powder and solvent for solution for injection vials | 10 vial (Pom) £270.00
  - **Fostimon** (BSA Farmaceutici Italia Srl)
    - **Follicle stimulating hormone human (as Urofollitropin)**
      - **75 unit** Fostimon 75 unit powder and solvent for solution for injection vials | 10 vial (Pom) £279.00

**7.4 Growth hormone disorders**

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GROWTH HORMONE RECEPTOR ANTAGONISTS**

**Pegvisomant**

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

**INDICATIONS AND DOSE**

Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

**CAUTIONS**

Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - liver disease

**SIDE-EFFECTS**

- Uncommon: Bleeding tendency - leucocytosis - leucopenia - thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

Injection-site reactions: Rotate injection sites to avoid lipohypertrophy.

**CONCEPTION AND CONTRACEPTION**

Possible increase in female fertility.

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Avoid.

**MONITORING REQUIREMENTS**

Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Somavert** (Pfizer Ltd)
  - **Pegvisomant 10 mg** Somavert 10mg powder and solvent for solution for injection vials | 30 vial (Pom) £1,500.00 (Hospital only)
  - **Pegvisomant 15 mg** Somavert 15mg powder and solvent for solution for injection vials | 30 vial (Pom) £2,250.00 (Hospital only)
  - **Pegvisomant 20 mg** Somavert 20mg powder and solvent for solution for injection vials | 1 vial (Pom) £100.00 (Hospital only) | 30 vial (Pom) £3,000.00 (Hospital only)
  - **Pegvisomant 25 mg** Somavert 25mg powder and solvent for solution for injection vials | 30 vial (Pom) £3,750.00 (Hospital only)
  - **Pegvisomant 30 mg** Somavert 30mg powder and solvent for solution for injection vials | 30 vial (Pom) £4,500.00 (Hospital only)
PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin
(Recombinant Human Growth Hormone)

- INDICATIONS AND DOSE
  Gonadal dysgenesis (Turner syndrome)
  > BY SUBCUTANEOUS INJECTION
  > Adult: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily

- Deficiency of growth hormone
  > BY SUBCUTANEOUS INJECTION
  > Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

- DOSE EQUIVALENCE AND CONVERSION
  > Dose formerly expressed in units; somatropin 1 mg = 3 units.

- CONTRA-INDICATIONS
  Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) - not to be used after renal transplantation - severe obesity in Prader-Willi syndrome - severe respiratory impairment in Prader-Willi syndrome

- CAUTIONS
  Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - disorders of the epiphysis of the hip (monitor for limping) - history of malignant disease - hypothyroidism - manufacturers recommend periodic thyroid function tests but limited evidence of clinical value - initiation of treatment close to puberty not recommended in child born small for corrected gestational age - papilloedema - relative deficiencies of other pituitary hormones - resolved intracranial hypertension (monitor closely) - Silver-Russell syndrome

- INTERACTIONS
  > Appendix 1 (somatropin).

- SIDE-EFFECTS
  Antibody formation - arthralgia - benign intracranial hypertension - carpal tunnel syndrome - fluid retention (peripheral oedema) - headache - hyperglycaemia - hypoglycaemia - hypothyroidism - insulin resistance - leukaemia in children with growth hormone deficiency - myalgia - nausea - papilloedema - paraesthesia - reactions at injection site - visual problems - vomiting

- SIDE-EFFECTS, FURTHER INFORMATION
  Papilloedema - Fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur - if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- PREGNANCY
  Discontinue if pregnancy occurs - no information available.

- BREAST FEEDING
  No information available. Absorption from milk unlikely.

- DIRECTIONS FOR ADMINISTRATION
  Rotate subcutaneous injection sites to prevent lipoatrophy.

- SAIZEN® SOLUTION FOR INJECTION
  For use by subcutaneous injection.

- NUTROPINAQ®
  For use by subcutaneous injection.

- OMNITROPE®
  For use by subcutaneous injection.

- NORDITROPIN® PREPARATIONS
  For use by subcutaneous injection.

- ZOMACTON®
  For use by subcutaneous injection.

- GENOTROPIN® PREPARATIONS
  For use by subcutaneous injection.

- SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION
  For use by subcutaneous injection.

- HUMATROPE®
  Cartridges for use by subcutaneous injection.

- PRESCRIBING AND DISPENSING INFORMATION
  Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

- SAIZEN® SOLUTION FOR INJECTION
  For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

- NUTROPINAQ®
  For use with NutropinAg® Pen device (non-NHS but available free of charge from clinics).

- OMNITROPE®
  For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).

- NORDITROPIN® PREPARATIONS
  Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics).

- ZOMACTON®
  4 mg vial for use with ZomaJet 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

- GENOTROPIN® PREPARATIONS
  Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

- SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION
  For use with one. click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

- NATIONAL FUNDING/ACCESS DECISIONS

- NICE technology appraisals (TAs)

  Somatropin for the treatment of growth failure in children
  (May 2010) NICE TA188
  Somatropin is recommended for children with growth failure who:
  - have growth-hormone deficiency
  - have Turner syndrome
  - have Prader-Willi syndrome
  - have chronic renal insufficiency
  - are born small for gestational age with subsequent growth failure at 4 years of age or later
  - have short stature homeobox-containing gene (SHOX) deficiency.
  Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.
  www.nice.org.uk/TA188

  Somatropin for adults with growth hormone deficiency
  (August 2003) NICE TA64
  Somatropin is recommended in adults only if the following 3 criteria are fulfilled:
  - Severe growth hormone deficiency, established by an appropriate method,
  - Impaired quality of life, measured by means of a specific questionnaire,
  - Already receiving treatment for another pituitary hormone deficiency.
  Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.
  Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved.
  Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.
  Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone
Sex hormone responsive conditions

**Sex hormones**

**Oestrogens and HRT**

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia. 

In terms of oestrogenic activity, natural oestrogens (estradiol p. 690 (oestradiol), estrone (oestrone), and estriol p. 761 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 694 (ethinylestrodiol) and mestranol). Tibolone p. 695 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a prostegestone should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

**Hormone replacement therapy**

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal

**Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.**

In terms of oestrogenic activity, natural oestrogens (estradiol p. 690 (oestradiol), estrone (oestrone), and estriol p. 761 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 694 (ethinylestrodiol) and mestranol). Tibolone p. 695 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism. **Hormone replacement therapy**

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal
vaginal oestrogen preparation used for a few weeks and osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogen activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 136 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer
It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer
The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary

</table>

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (Drug Safety 2007; 1 (2): 2–6) available at www.gov.uk/drug-safety-update

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Tibolone increases the risk of breast cancer within 2 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
5. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
6. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
7. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.
Endocrine system

involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

Risk of coronary heart disease
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice
The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances. An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Surgery
Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT
Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

Ethinylestradiol
Ethinylestradiol p. 694 (ethinyleoestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene
Raloxifene hydrochloride p. 689 is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Progestogens and progesterone receptor modulators
There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 741) and testosterone analogues (norethisterone p. 699 and norgestrel). The newer progestogens (desogestrel p. 737, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 737 is the active isomer of norgestrel and has twice its potency. Progesterone p. 701 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 678 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 104 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1004; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 114 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy
In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception
Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.
Cancer
Progestogens also have a role in neoplastic disease.

**Progestrone receptor modulators**
Ulipristal acetate p. 736 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

8.1 Female sex hormone responsive conditions

**CALCIUM REGULATING DRUGS** > BONE RESORPTION INHIBITORS

**Raloxifene hydrochloride**

- **INDICATIONS AND DOSE**
  - Treatment and prevention of postmenopausal osteoporosis
  - **BY MOUTH**
  - Adult: 60 mg once daily

- **CONTRA-INDICATIONS**
  - Cholestatic • endometrial cancer • history of venous thromboembolism • undiagnosed uterine bleeding

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930 • breast cancer (manufacturer advises avoid during treatment for breast cancer) • history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) • risk factors for stroke • risk factors for venous thromboembolism (discontinue if prolonged immobilisation)

- **INTERACTIONS**
  - Common or very common Hot flushes • influenza-like symptoms • leg cramps • peripheral oedema
  - Uncommon Thrombophlebitis • venous thromboembolism
  - Rare Arterial thromboembolism • breast discomfort • gastro-intestinal disturbances • headache • hypertension • migraine • rashes • thrombocytopenia

- **HEPATIC IMPAIRMENT**
  - Avoid.

- **RENAL IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160
    - Raloxifene is not recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.
    - www.nice.org.uk/TA160
  - Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fracture fragility fractures in postmenopausal women (October 2008) NICE TA161
    - This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.
    - **Raloxifene** is recommended as an alternative treatment option for women:
      - in whom alendronate and risedronate are contra¬indicated or not tolerated and

**OESTROGENS**

**Conjugated oestrogens (equine)**

- **INDICATIONS AND DOSE**
  - **PREMARIN ® TABLETS**
    - Menopausal symptoms
      - **BY MOUTH**
      - Adult: 0.3—1.25 mg daily continuously; with cyclical progesterone for 12—14 days of each cycle in women with a uterus
    - Osteoporosis prophylaxis
      - **BY MOUTH**
      - Adult: 0.625—1.25 mg daily continuously; with cyclical progesterone for 12—14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS**
  - Active arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin-Johnson syndromes (or monitor closely) • history of breast cancer • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Rotor syndromes (or monitor closely) • thrombophilic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

- **CAUTIONS**
  - Acute porphyrias p. 930 • diabetes (increased risk of heart disease) • factors predisposing to thromboembolism • history of breast nodules (closely monitor breast status—risk of breast cancer) • history of endometrial hyperplasia • history of fibrocystic disease (closely monitor breast status—risk of breast cancer) • hypophyseal tumours • increased risk of gall-bladder disease reported • migraine • migraine-like headaches • presence of antiphospholipid antibodies (increased risk of thrombotic events) • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

- Risk of breast cancer It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1—2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at
which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

  - In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen–only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- **Risk of venous thromboembolism** Women using combined or oestrogen–only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

  - In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

  - **Travel** involving prolonged immobility further increases the risk of deep vein thrombosis.

- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen–only HRT slightly increases the risk of stroke.

- **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (oestrogens).

- **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · migraine · mood changes · nausea · premenstrual-like syndrome · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · sodium retention · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · vaginal candidiasis · vomiting · weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

- Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin–Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Premarin** (Pfizer Ltd)

**Estradiol**

- **INDICATIONS AND DOSE**
  - **BEDOL**
    - **Menopausal symptoms | Osteoporosis prophylaxis**
      - **BY MOUTH**
        - Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus
      - **CLIMAVAL**
        - **Menopausal symptoms (if patient has had a hysterectomy)**
          - **BY MOUTH**
            - Adult: 1–2 mg daily
          - **ELLESTE SOLO** ®
            - **MX**
        - Menopausal symptoms
          - **BY TRANSDERMAL APPLICATION**
            - Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40, subsequently adjust according to response
Menopausal symptoms

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 80, subsequently adjust according to response

ELLESTE-SOLO® 1-MG

Menopausal symptoms

BY MOUTH

Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progesterone for 12–14 days of each cycle in women with a uterus

ELLESTE-SOLO® 2-MG

Menopausal symptoms not controlled with lower strength

BY MOUTH

Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progesterone for 12–14 days of each cycle in women with a uterus

ESTRADERM MX®

Menopausal symptoms

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progesterone for at least 12 days of each cycle in women with a uterus, initiate therapy with MX25 for first 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progesterone for at least 12 days of each cycle in women with a uterus, initiate therapy with MX50; subsequently adjust according to response

ESTRADOT®

Menopausal symptoms

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

EVOREL®

Menopausal symptoms | Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, therapy should be initiated with Evorel 50 patch; subsequently adjust according to response; dose may be reduced to Evorel 25 patch after first month if necessary for menopausal symptoms only

FEMSEVEN®

Menopausal symptoms | Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch once weekly continuously, to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

OSTREGEL®

Menopausal symptoms

TO THE SKIN

Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progesterone for at least 12 days of each cycle in women with a uterus

Osteoporosis prophylaxis

TO THE SKIN

Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progesterone for at least 12 days of each cycle in women with a uterus

DOSE EQUIVALENCE AND CONVERSION

For Oestrogel®: 2 measures is equivalent to estradiol 1.5 mg.

PROGYNOVA®

Menopausal symptoms

BY MOUTH

Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progesterone for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

BY MOUTH

Adult: 2 mg daily continuously, to be taken with cyclical progesterone for 12–14 days of each cycle in women with a uterus

PROGYNOVA® TS

Menopausal symptoms | Osteoporosis prophylaxis

BY TRANSDERMAL APPLICATION

Adult: Apply 1 patch once weekly continuously, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progesterone for 12–14 days of each cycle in women with a uterus, initiate therapy with Progynova TS 50, subsequently adjust according to response, women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

SANDRENA®

Menopausal symptoms | Osteoporosis prophylaxis

BY MOUTH

Adult: 50 µg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progesterone for 12–14 days of each cycle in women with a uterus, therapy should be initiated with Sandrena 50 patch; subsequently adjust according to response; dose may be reduced to Sandrena 10 patch after first month if necessary for menopausal symptoms only

ZUMENON®

Menopausal symptoms

BY MOUTH

Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if continued →
necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

▶ BY MOUTH

Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

- CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin-Johnson syndrome (or monitor closely) • history of breast cancer • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • oestrogen-dependent cancer • recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Rotor syndrome (or monitor closely) • thrombophilic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

- CAUTIONS Acute porphyrrias p. 930 • diabetes (increased risk of heart disease) • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia; factors predisposing to thromboembolism • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • hypophyseal tumours • increased risk of gall-bladder disease • migraine (or migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size

CAUTIONS, FURTHER INFORMATION

- Risk of breast cancer It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

- Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

- Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.

Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- INTERACTIONS → Appendix 1 (oestrogens).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal bloating • abdominal cramps • altered blood lipids (may lead to pancreatitis, rashes and chloasma) • breast enlargement • breast tenderness • changes in libido • cholestatic jaundice • contact lenses may irritate • depression • dizziness • fluid retention • glucose intolerance • headache • headache (on vigorous exercise) • leg cramps (rule out venous thrombosis) • migraine • mood changes • nausea • premenstrual-like syndrome • sodium retention • vaginal candidiasis • vomiting • weight changes

SPECIFIC SIDE-EFFECTS

- With transdermal use Cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure)

SIDE-EFFECTS, FURTHER INFORMATION

- Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

- PREGNANCY Not known to be harmful.

- BREAST FEEDING Avoid; adverse effects on lactation.

- HEPATIC IMPAIRMENT Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
MONITORING REQUIREMENTS

- History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

DIRECTIONS FOR ADMINISTRATION

- With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

PATIENT AND CARER ADVICE

- With transdermal use Patient counselling is advised for estradiol patches (administration).
- With topical use Patient counselling is advised for estradiol gels (administration).

OESTROGEL® Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

SANDRENA® Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

**INDICATIONS AND DOSE**

**Short-term treatment of symptoms of oestrogen deficiency**/Osteoporosis prophylaxis if other drugs cannot be used
- **BY MOUTH**
  - Adult (female): 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progesterogen for 12–14 days per cycle in women with intact uterus.

**Female hypogonadism**
- **BY MOUTH**
  - Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progesterogen therapy.

**Menstrual disorders**
- **BY MOUTH**
  - Adult (female): 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progesterogen, added either throughout the cycle or from day 15 to 25.

**Palliative treatment of prostate cancer**
- **BY MOUTH**
  - Adult (male): 0.15–1.5 mg daily.

**CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) / active thrombophlebitis / acute porphyrias p. 930 / Dubin-Johnson and Rotor syndromes (or monitor closely) / gallstones / heart disease associated with pulmonary hypertension / heart disease associated with risk of embolus / history during pregnancy of cholestatic jaundice / history during pregnancy of convulsions / history during pregnancy of pemphigoid gestationis / history during pregnancy of pruritus / history of breast cancer / history of haemolytic uraemic syndrome / liver disease (where liver function tests have failed to return to normal) / migraine with aura / oestrogen-dependent cancer / thrombophlebitis / thromboembolic disease / systemic lupus erythematosus with (or unknown) antiphospholipid antibodies / thrombophilic disorder / transient cerebral ischaemic attacks without headaches / undiagnosed vaginal bleeding / untreated endometrial hyperplasia / venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

**CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice / cardiovascular disease (sodium retention with oedema, thromboembolism) / Crohn’s disease / diabetes (increased risk of heart disease) / gene mutations associated with breast cancer (e.g. BRCA 1) / heart disease associated with risk of embolus / history during pregnancy of cholestatic jaundice / heart disease associated with risk of embolus / history during pregnancy of cholestatic jaundice / renal disease (where liver function tests have failed to return to normal) / migraine with aura / oestrogen-dependent cancer / thrombophlebitis / thromboembolic disease / systemic lupus erythematosus with (or unknown) antiphospholipid antibodies / thrombophilic disorder / transient cerebral ischaemic attacks without headaches / undiagnosed vaginal bleeding / untreated endometrial hyperplasia / venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

**SIDE-EFFECTS**

- Other conditions: The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, osteosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **Risk of venous thromboembolism** Use with caution if any of the following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity—body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

- Risk factors for arterial disease Use with caution if any one of the following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if other genetic lipid profile);
  - diabetes mellitus (avoid if diabetes complications present);
  - hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, avoid if blood pressure very high);
  - smoking (avoid if smoking 40 or more cigarettes daily);
  - age over 35 years (avoid if over 50 years);
  - obesity (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

- Migraine: Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

**INTERACTIONS** → Appendix 1 (oestrogens).

- Rare: Gallstones / systemic lupus erythematosus
- **Frequency not known** Abdominal bloating / abdominal cramps / absence of withdrawal bleeding / altered blood lipids (may lead to pancreatitis) / amenorrhoea after discontinuation / breast enlargement / breast secretion / breast tenderness / cervical erosion / changes in libido / changes in lipid metabolism / changes in vaginal discharge / chloasma / cholestatic jaundice / chorea / contact lenses may irritate / depression / dizziness / feminising effects / fluid retention / glucose intolerance / headache / hepatic tumours / hypertension / irritability / leg cramps (rule out venous thrombosis) / liver impairment / migraine / mood changes / nausea / nervousness / photosensitivity / premenstrual-like syndrome / rashes / reduced menstrual
loss • skin reactions • sodium retention • symptoms of endometriosis may be exacerbated • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • uterine fibroids may increase in size • vaginal candidiasis • visual disturbances • vomiting • weight changes • ‘spotting’ in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding  Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

PREGNANCY  Not known to be harmful.

BREAST FEEDING  Avoid until weaning or for 6 months after birth (adverse effects on lactation).

HEPATIC IMPAIRMENT  Avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Tablet**

- Ethinylestradiol (Non-proprietary)
  - Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet £200.00 DT price = £200.00
  - Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet £200.00 DT price = £200.00
  - Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet £200.00 DT price = £200.00

**Tibolone**

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) • Osteoporosis prophylaxis in women at high risk of fractures when other prophyaxis contra-indicated or not tolerated

BY MOUTH

- Adult: 2.5 mg daily

CONTRA-INDICATIONS  Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Acute porphyrias p. 930 • Dubin–Johnson andRotor syndrome (or monitor closely) • history of breast cancer • history of cardiovascular disease • history of cerebrovascular disease • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • history of thromboembolism • history of thrombophlebitis • hormone-dependent tumours • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • thrombohaemolytic disorder • uninvestigated or undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

CAUTIONS  Acute porphyrias p. 930 • diabetes (increased risk of heart disease) • epilepsy • factors predisposing to thromboembolism • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of liver disease • hypertriglyceridaemia • hypophyseal tumours • migraine (or migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk of stroke

CAUTIONS, FURTHER INFORMATION

Other conditions  The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, atherosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

INTERACTIONS  Appendix 1 (tibolone).

SIDE-EFFECTS

- Common or very common  Abdominal pain • facial hair • leucorrhoea • vaginal bleeding • weight changes

- Rare  Amnesia

- Frequency not known  Arthralgia • breast cancer • depression • dizziness • gastro-intestinal disturbances • headache • increased risk of gall-bladder disease • migraine • myalgia • oedema • pruritus • rash • seborrhoeic dermatitis • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Vaginal bleeding  Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment  Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

PREGNANCY  Avoid; toxicity in animal studies.

BREAST FEEDING  Avoid.

HEPATIC IMPAIRMENT  Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.

RENAL IMPAIRMENT  Patients with renal impairment should be closely monitored (risk of fluid retention).

PRESCRIBING AND DISPENSING INFORMATION  Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous–combined HRT, start at any time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- T__ibolone (Non-proprietary)
  - T__ibolone 2.5 mg Tibolone 2.5mg tablets | 28 tablet £10.36–£10.95 DT price = £10.36 | 84 tablet £31.08–£32.63
  - L__ivial (Merck Sharp & Dohme Ltd)
    - T__ibolone 2.5 mg Livial 2.5mg tablets | 28 tablet £10.36 DT price = £10.36 | 84 tablet £31.08

OESTROGENS COMBINED WITH PROGESTOGENS

Conjugated oestrogens with medroxyprogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 689, medroxyprogesterone acetate p. 741.

- **INDICATIONS AND DOSE**
  - PREMIQUE®
    - Menopausal symptoms in women with a uterus
    - Osteoporosis prophylaxis in women with a uterus
      - **BY MOUTH**
      - Adult: 1 tablet daily continuously
  - PREMIQUE® LOW DOSE TABLETS
    - Menopausal symptoms in women with a uterus
      - **BY MOUTH**
      - Adult: 1 tablet daily continuously

- **INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Premique (Pfizer Ltd)
      - Conjugated oestrogens 625 microgram, Medroxyprogesterone acetate 5 mg Premique 0.625mg/5mg tablets | 84 tablet [POM] £10.61 DT price = £10.61
    - Modified-release tablet
      - Premique (Pfizer Ltd)
        - Conjugated oestrogens 300 microgram, Medroxyprogesterone acetate 1.5 mg Premique Low Dose 0.3mg/1.5mg modified-release tablets | 84 tablet [POM] £6.52 DT price = £6.52

Conjugated oestrogens with norgestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 689.

- **INDICATIONS AND DOSE**
  - PREMPAK C® 0.625
    - Menopausal symptoms in women with a uterus
    - Osteoporosis prophylaxis in women with a uterus
      - **BY MOUTH**
      - Adult: 1 tablet daily continuously, maroon tablet to taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) and 1 tablet daily, brown tablet to be taken and started on days 17–28 of each 28-day treatment cycle, subsequent courses are repeated without interval
  - PREMPAK C® 1.25
    - Menopausal symptoms in women with a uterus (if symptoms not fully controlled with lower strength pack)
    - Osteoporosis prophylaxis in women with a uterus (if symptoms not fully controlled with lower strength pack)
      - **BY MOUTH**
      - Adult: 1 tablet daily continuously, (yellow tablet) to taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) and 1 tablet daily, (brown tablet) to be taken and started on days 17–28 of each 28-day treatment cycle, subsequent courses are repeated without interval

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablets**
    - PREmpak-C (Pfizer Ltd)
      - PREmpak-C 1.25mg/0.15mg tablets | 120 tablet [POM] £7.40 DT price = £7.40
      - PREmpak-C 0.625mg/0.15mg tablets | 120 tablet [POM] £6.25 DT price = £6.25

Estradiol with drospirenone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 690.

- **INDICATIONS AND DOSE**
  - Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously
  - Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously
      - **BY MOUTH**
      - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

- **CAUTIONS**
  - Use with care if an increased concentration of potassium might be hazardous
  - **RENNAL IMPAIRMENT**
    - Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Angeliq (Bayer Plc)
      - Estradiol (as Estradiol hemihydrate) 1 mg, Drospirenone 2 mg Angeliq tablets | 84 tablet [POM] £29.00 DT price = £29.00

Estradiol with dydrogesterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 690.

- **INDICATIONS AND DOSE**
  - Menopausal symptoms in women with a uterus
      - **BY MOUTH**
      - Adult: 1 tablet daily for 14 days, white tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, grey tablet to be taken, subsequent courses repeated without interval, Femoston® 1 mg/10 mg given initially and Femoston® 2 mg/10 mg substituted if symptoms not controlled

  - Osteoporosis prophylaxis in women with a uterus
      - **BY MOUTH**
      - Adult: 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or...
any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval, Femoston® 1 mg/10 mg given initially and Femoston® 2 mg/10 mg substituted if symptoms not controlled

**Osteoporosis prophylaxis in women with a uterus**
- **BY MOUTH**
  - Adult: 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval

**FEMOSTON® CONTI 0.5 MG/2.5MG**
Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously
- **BY MOUTH**
  - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progesterone phase

**FEMOSTON® CONTI 1 MG/5MG**
Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously
- **BY MOUTH**
  - Adult: 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progesterone phase

**CONTRA-INDICATIONS**
- Acute porphyrias p. 930 | genital or breast cancer | history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis | history of liver tumours | severe arterial disease | undiagnosed vaginal bleeding

**CAUTIONS**
- Conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction | diabetes (progestogens can decrease glucose tolerance) | history of depression | in those susceptible to thromboembolism (particular caution with high dose)

**INTERACTIONS**
- Appendix 1 (progestogens).

**SIDE-EFFECTS**
- Acne | alopecia | anaphylactoid reactions | bloating | breast tenderness | change in libido | depression | dizziness | drowsiness | fluid retention | headache | hirsutism | insomnia | jaundice | menstrual disturbances | nausea | premenstrual-like syndrome | pruritus | rash | skin reactions | urticaria | weight change

**HEPATIC IMPAIRMENT**
- Avoid.

**RENAL IMPAIRMENT**
- Use with caution.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Transdermal patch**
- FemSeven Conti (Teva UK Ltd)
  - Levonorgestrel 7 microgram per 24 hour, Estradiol 50 microgram per 24 hour
  - FemSeven Conti patches | 4 patch | £15.48 | 12 patch | £44.12
- FemSeven Sequi (Teva UK Ltd)
  - FemSeven Sequi patches | 4 patch | £13.18 | 12 patch | £37.54

**Estradiol with levonorgestrel**
The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 690, levonorgestrel p. 737.

**INDICATIONS AND DOSE**

**FEMSEVEN CONTI®**
- Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch once weekly continuously

**FEMSEVEN SEQUI®**
- Menopausal symptoms in women with a uterus
- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch once weekly for 2 weeks, phase 1 patches to be applied, then apply 1 patch once weekly for 2 weeks, phase 2 patches to be applied, subsequent courses are repeated without interval

**PATIENT AND CARER ADVICE**
- Patient counselling is advised for estradiol with levonorgestrel patches (application).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**INDIVINA® TABLETS**
- Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 3 years previously
- **BY MOUTH**
  - Adult: Initially 1/2.5 mg daily taken continuously, adjust according to response, to be started at end of scheduled bleed if changing from cyclical HRT

**TRIDESTRA®**
- Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus
- **BY MOUTH**
  - Adult: 1 tablet daily for 70 days, white tablet to be taken, then 1 tablet daily for 14 days, blue tablet to be taken, then 1 tablet daily for 7 days, yellow tablet to be taken, subsequent courses are repeated without interval

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Indivina (Orion Pharma (UK) Ltd)
  - Estradiol valerate 1 mg, Medroxyprogesterone acetate
  - 2.5 mg Indivina 1mg/2.5mg tablets | 84 tablet | £20.58 DT price = £20.58
Estradiol with notherhisterone

The properties listed below are those particular to the combination only. For the properties of the components please see, estradiol p. 690, notherhisterone p. 699.

**INDICATIONS AND DOSE**

CLIMAGEST® 1-MG

Menopausal symptoms

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, grey tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval

CLIMAGEST® 2-MG

Menopausal symptoms (if symptoms not controlled with lower strength)

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, blue tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, white tablet to be taken, subsequent courses are repeated without interval

CLIMESSE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously

CLINORETTE®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, white tablets to be taken, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, pink tablets to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® 1-MG

Menopausal symptoms

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, white tablet to be taken and started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, green tablets to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® 2-MG

Menopausal symptoms | Osteoporosis prophylaxis

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, orange tablet to be taken, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 12 days, grey tablet to be taken, subsequent courses are repeated without interval

ELLESTE-DUET® CONTI

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuous basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed

EVOREL® CONTI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch twice weekly continuously

EVOREL® SEQUI

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY TRANSDERMAL APPLICATION**
  - Adult: Apply 1 patch twice weekly for 2 weeks, Evorel® 50 patch to be applied and started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), then apply 1 patch twice weekly, Evorel® Conti patch to be applied, subsequent courses are repeated without interval.

KLIOfem®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

KLOVANCE®

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, to be started at end of scheduled bleed if changing from cyclical HRT

NOVOFEM®

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
  - Adult: 1 tablet daily for 16 days, red tablets to be taken, then 1 tablet daily for 12 days, white tablets to be taken, subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

NUVELLE® CONTINUOUS

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously

- **BY MOUTH**
  - Adult: 1 tablet daily continuously, if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Estradiol with norgestrel**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 690.

### INDICATIONS AND DOSE

**Cyclo-Progynova 2mg Tablets**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
- **Adult:** 1 tablet daily for 11 days, white tablet to be taken; start on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 10 days, brown tablet to be taken, followed by a 7-day tablet free interval

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestations (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

**SPECIFIC CONTRA-INDICATIONS**

- With oral use | Acute porphyrias p. 930 · severe arterial disease · undiagnosed vaginal bleeding

---

**TRISEQUENS**

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

- **BY MOUTH**
- **Adult:** 1 tablet daily for 12 days, blue tablets to be taken, followed by 1 tablet daily for 10 days, white tablet to be taken, then 1 tablet daily for 6 days, red tablet to be taken, subsequent courses are repeated without interval

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)**

- **BY MOUTH**
- **Adult:** 5 mg 3 times a day for 10 days

**Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)**

- **BY MOUTH**
- **Adult:** 5 mg twice daily, to be taken from day 19 to day 26 of cycle

**Dysmenorrhoea**

- **BY MOUTH**
- **Adult:** 5 mg 3 times a day for 3–4 days to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Premenstrual syndrome (not recommended)**

- **BY MOUTH**
- **Adult:** 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

**Postponement of menstruation**

- **BY MOUTH**
- **Females of childbearing potential:** 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Breast cancer**

- **BY MOUTH**
- **Adult:** 40 mg daily, increased if necessary to 60 mg daily

**Short-term contraception**

- **BY DEEP INTRAMUSCULAR INJECTION**
- **Females of childbearing potential:** 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

**Contraception**

- **BY MOUTH**
- **Females of childbearing potential:** 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’
CAUTIONS

GENERAL CAUTIONS
Asthma • cardiac dysfunction • conditions that may worsen with fluid retention • diabetes (progestogens can decrease glucose tolerance—monitor patient closely) • epilepsy • history of depression • hypertension • migraine • susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

• When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gondotrophin concentration)—seek specialist advice • arterial disease • functional ovarian cysts • history of jaundice in pregnancy • malabsorption syndromes • past ectopic pregnancy • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies

• With intramuscular use for contraception Disturbances of lipid metabolism • history during pregnancy of deterioration of otoosclerosis • history during pregnancy of pruritus • possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

• Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

• Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

INTERACTIONS

• With intramuscular use Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
Acne • alopecia • anaphylactoid reactions • breast tenderness • change in libido • depression • disturbance of appetite • dizziness • fluid retention • headache • hirsutism • insomnia (non-contraceptive indications) • jaundice • menstrual disturbances • nausea • premenstrual-like syndrome • pruritus • rash • skin reactions • urticaria • vomiting • weight change

SPECIFIC SIDE-EFFECTS

• With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

• Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

PREGNANCY

• With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

BREAST FEEDING

Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

• With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

HEPATIC IMPAIRMENT

When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

RENAL IMPAIRMENT

Use with caution in non-contraceptive indications.

PATIENT AND CARER ADVICE

Missed oral contraceptive pill The following advice is recommended: ’If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than three hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Contraceptives by injection Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

• Norethisterone (Non-proprietary)
  Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet £2.48 DT price = £2.09

• Micronor (Janssen-Cilag Ltd)
  Micronor 350 microgram Micronor 350 microgram tablets | 84 tablet £1.80 DT price = £1.80
**Progestosterone**

**INDICATIONS AND DOSE**

**CRINONE® VAGINAL GEL**

Infertility due to inadequate luteal phase

- **BY VAGINA**
  - Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**CYCLOGEST® PESSARIES**

Premenstrual syndrome / Post-natal depression

- **BY VAGINA, OR BY RECTUM**
  - Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**GESTONE® SOLUTION FOR INJECTION**

Dysfunctional uterine bleeding

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

Recurrence miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

**LUBION®**

Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

**UTROGESTAN® CAPSULES**

Progestogen opposition of oestrogen HRT

- **BY MOUTH**
  - Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

**UTROGESTAN® VAGINAL CAPSULES**

Supplementation of luteal phase during assisted reproductive technology (ART) cycles

- **BY VAGINA**
  - Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

**CONTRA-INDICATIONS**

Acute porphyrias p. 930 - avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of pemphigoid gestations - history during pregnancy of severe pruritus - incomplete miscarriage - missed miscarriage - severe arterial disease - undiagnosed vaginal bleeding

**CAUTIONS**

- Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

**INTERACTIONS**

- Appendix 1 (progestogens).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use or subcutaneous use - Injection-site reactions
  - With rectal use - Diarrhoea - flatulence - pain
  - With vaginal use - Local irritation

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Avoid — present in milk.

**HEPATIC IMPAIRMENT**

Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

**RENAL IMPAIRMENT**

Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use - Capsules should be taken at bedtime on an empty stomach.

**PATIENT AND CARER ADVICE**

- With oral use - Patient counselling is advised for progestosterone capsules (administration).

**LESS SUITABLE FOR PRESCRIBING**

- With vaginal use - Progestosterone pessaries are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **EXCIPIENTS:** May contain Arachis (peanut) oil
  - **Utrogestan** (Besins Healthcare (UK) Ltd)
    - Progesterone 100 mg Utrogestan 100mg capsules | 30 capsule | £5.13
    - Progesterone 200 mg Utrogestan 200mg capsules with applicators | 21 capsule | £21.00

**Solution for injection**

- **Gestone** (Nordic Pharma Ltd)
  - Gestone 50 mg per 1 ml Gestone 50mg/1ml solution for injection ampoules | 10 ampoule | £45.00
  - Gestone 100mg/2ml solution for injection ampoules | 10 ampoule | £45.00
8.1a Anti-oestrogens

OVULATION STIMULANTS

Clomifene citrate

(Clomiphene citrate)

- **DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

- **INDICATIONS AND DOSE**
  
  Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)
  
  - **BY MOUTH**
  - Adult (female): 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progesterogen-induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

- **IMPORTANT SAFETY INFORMATION**

  The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).

- **CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause • hormone-dependent tumours • ovarian cysts

- **CAUTIONS** Ectopic pregnancy • incidence of multiple births increased (consider ultrasound monitoring) • ovarian hyperstimulation syndrome • polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) • uterine fibroids

- **SIDE-EFFECTS** Abdominal discomfort • breast tenderness • convulsions • depression • dizziness • endometriosis • hair loss • headache • hot flushes • insomnia • intermenstrual spotting • menorrhagia • nausea • ovarian hyperstimulation (withdraw) • rashes • visual disturbances (withdraw and initiate ophthalmological examination) • vomiting • weight gain

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.

- **PREGNANCY** Possible effects on fetal development.

- **BREAST FEEDING** May inhibit lactation.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

- **PATIENT AND CARER ADVICE**

  Patient advice required around conception and contraception

  Patients planning to conceive should be warned that there is a risk of multiple pregnancy (rarely more than twins).

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - Clomifene citrate (Non-proprietary)
    - Clomifene citrate 50 mg Clomifene 50 mg tablets | 30 tablet
    - £21.74 DT price = £10.15
  - Clomid (Sanofi)
    - Clomifene citrate 50 mg Clomid 50 mg tablets | 30 tablet
    - £10.15 DT price = £10.15

8.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

**Androgens**

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

**Anti-androgens**

Cyproterone acetate

Cyproterone acetate p. 704 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 720 and finasteride p. 720 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 716 in the management of benign prostatic hyperplasia.
A low strength of finasteride is licensed for treating male-pattern baldness in men.

**Anabolic steroids**

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

**ANDROGENS**

**Androgens**

- **CONTRA-INDICATIONS** Breast cancer in males; history of liver tumours; hypercalcaemia; prostate cancer
- **CAUTIONS** Cardiac impairment; diabetes mellitus; elderly; epilepsy; hypertension; ischaemic heart disease; migraine; pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—satural growth and sexual development should be monitored; skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored); sleep apnoea; stop treatment or reduce dose if severe polycythaemia occurs—tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **INTERACTIONS** → Appendix 1 (testosterone).
- **SIDE-EFFECTS**
  - **Common or very common** Acne; androgenic effects (to be assessed regularly in women); anxiety; arthralgia; asthenia; changes in libido; cholestatic jaundice; depression; electrolyte disturbances; excessive duration of penile erection; excessive frequency of penile erection; gastro-intestinal bleeding; gynaecomastia; headache; hirsutism; hypercalcaemia; hypertension; increased bone growth; irritability; male-pattern baldness; muscle cramps; nausea; nervousness; oedema; paraesthesia; polycythaemia—precocious sexual development in pre-pubertal males; premature closure of epiphyses in pre-pubertal males; prostate abnormalities; prostate cancer; pruritus; seborrhoea; sodium retention—suppression of virilism in women; vomiting—weight gain
  - **Rare** Liver tumours
  - **Frequency not known** Sleep apnoea
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Polycythaemia—Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS**
  - Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
  - Monitor prostate and PSA in men over 45 years.
- **PATIENT AND CARER ADVICE**
  - Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

---

**Mesterolone**

- **INDICATIONS AND DOSE**
  - **Androgen deficiency | Male infertility associated with hypogonadism**
    - **BY MOUTH**
    - Adult: 25 mg 3–4 times a day for several months, then maintenance 50–75 mg daily in divided doses
  - **MEDICINAL FORMS**
    - **Tablet**
      - [Pro-Viron](Bayer Plc) Mesterolone 25 mg
      - Pro-Viron 25mg tablets | 30 tablet [P4M]
      - £4.19

---

**Testosterone**

- **INDICATIONS AND DOSE**
  - **TESTIM®**
    - **Hypogonadism due to testosterone deficiency in men**
      - **BY TRANSDERMAL APPLICATION**
      - Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day
      - **DOSE EQUIVALENCE AND CONVERSION**
        - One tube of 5 g contains 50 mg testosterone.
  - **TESTOGEL®**
    - **Hypogonadism due to androgen deficiency in men**
      - **BY TRANSDERMAL APPLICATION**
      - Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day
      - **DOSE EQUIVALENCE AND CONVERSION**
        - One sachet of 5 g contains 50 mg testosterone.
  - **TOSTRAN®**
    - **Hypogonadism due to testosterone deficiency in men**
      - **BY TRANSDERMAL APPLICATION**
      - Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day
      - **DOSE EQUIVALENCE AND CONVERSION**
        - 1 g of gel contains 20 mg testosterone.
  - **SIDE-EFFECTS** Allergic reactions—local irritation—suppression of spermatogenesis
  - **DIRECTIONS FOR ADMINISTRATION** Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.
  - **TESTOGEL®** Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.
  - **TESTIM®** Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.
Testosterone propionate

**INDICATIONS AND DOSE**

**Androgen deficiency**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg 2–3 times a week

**Delayed puberty in males**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg once weekly

**Breast cancer in women**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 100 mg 2–3 times a week

**SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

Testosterone undecanoate

**INDICATIONS AND DOSE**

**Androgen deficiency**

- **BY MOUTH**
  - Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**Hypogonadism**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult (male): 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

**SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 21, 25

- **Restandol** (Merck Sharp & Dohme Ltd)

**Solution for injection**

- **Nebido** (Bayer Plc)

**Cyproterone acetate**

**INDICATIONS AND DOSE**

**Hyper-sexuality in males | Sexual deviation in males**

- **BY MOUTH**
  - Adult: 50 mg twice daily, to be taken after food

**Prevention of tumour flare with initial gonadorelin analogue therapy**

- **BY MOUTH**
  - Adult (male): 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for...
CONTRA-INDICATIONS In hypersexuality, Dubin-Johnson syndrome - in hypersexuality, history of thromboembolic disorders - in hypersexuality, liver-disease - in hypersexuality, malignant diseases - in hypersexuality, previous or existing liver tumours - in hypersexuality, Rotor syndrome - in hypersexuality, severe depression - in hypersexuality, severe diabetes (with vascular changes) - in hypersexuality, sickle-cell anaemia - in hypersexuality, wasting diseases - meningioma or history of meningioma

SIDE-EFFECTS Diabetes mellitus - in prostate cancer, severe depression - in prostate cancer, sickle-cell anaemia - ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

HEPATIC IMPAIRMENT Avoid (unless used for prostate cancer)—dose-related toxicity.

MONITORING REQUIREMENTS

Monitor blood counts initially and throughout treatment.

Monitor adrenocortical function regularly.

Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

Hyperthyroidism

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term...
management. In the UK carbimazole below is the most commonly used drug. Propylthiouracil p. 707 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium p. 708 daily, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroideectomy.

Propranolol hydrochloride p. 142 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism.

Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 141 is also used. Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 620 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy
Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Other drugs used for Hyperthyroidism Metoprolol tartrate, p. 145

### ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

#### Carbimazole

- **INDICATIONS AND DOSE**
  - **Hyperthyroidism**
    - **BY MOUTH**
      - Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months
    - **Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine**
      - **BY MOUTH**
        - Adult: 40–60 mg daily, therapy usually given for 18 months
  - **DOSE EQUIVALENCE AND CONVERSION**
    - When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

#### IMPORTANT SAFETY INFORMATION

**NEUTROPENIA AND AGRANULOCYTOSIS**

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

**SIDE-EFFECTS**

- **Common or very common** Arthralgia · fever · headache · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · bone marrow suppression · jaundice · myopathy · pancytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

**PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

**BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

**PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.
Antithyroid drugs

Propylthiouracil

Indications and dose

Hyperthyroidism

- **By mouth**
  - Adults: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose.

Dose equivalence and conversion

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Side-effects

- Common or very common: Arthralgia, fever, headache, jaundice, leucopenia, malaise, mild gastro-intestinal disturbances, nausea, pruritus, rash, taste disturbance.
- Rare: Agranulocytosis, alopecia, aplastic anaemia, bone marrow suppression, cutaneous vasculitis, encephalopathy, hepatic disorders, hepatic failure, hepatic necrosis, hepatitis, hypoprothrombinaemia, jaundice, lupus erythematosus-like syndromes, myopathy, nephritis, pancytopenia, thrombocytopenia.

Further information

- Hepatotoxicity: Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

Pregnancy

Propylthiouracil can be given but the blocking-replacement regimen is not suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Breast feeding

Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.

Monitor infant’s thyroid status.

Hepatic impairment

Reduce dose.

Renal impairment

Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m². Use half normal dose if eGFR less than 10 mL/minute/1.73 m².

Monitoring requirements

Monitor for hepatotoxicity.

Patient and carer advice

Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

Vitamins and trace elements

Iodide with iodine

Indications and dose

Thyrotoxicosis (pre-operative)

- **By mouth using oral solution**
  - Adult: 0.1–0.3 mL 3 times a day.

Caution

Side-effects

- Bronchitis, conjunctivitis, coryza-like symptoms, depression (on prolonged treatment), goitre in infants of mothers taking iodides, headache, hypersensitivity reactions, impotence (on prolonged treatment), insomnia (on prolonged treatment), lacrimation, laryngitis, pain in salivary glands, rashes.

Pregnancy

Neonatal goitre and hypothyroidism.

Breast feeding

Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

Directions for administration

For oral solution, dilute well with milk or water.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

- Iodide with iodine (Non-proprietary)
  - Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL, iodine aqueous oral solution | 500 mL P £9.58

9.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto’s thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium p. 708 (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 708 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 620, and treatment of infection; assisted ventilation is often required.
THYROID HORMONES

Levothyroxine sodium
(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism
▶ BY MOUTH
  ▶ Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
  ▶ Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism
▶ BY MOUTH
  ▶ Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole
▶ BY MOUTH
  ▶ Adult: 50–150 micrograms daily therapy usually given for 18 months

● CONTRA-INDICATIONS
Thyrotoxicosis

● CAUTIONS
Cardiovascular disorders • diabetes insipidus • diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) • elderly • hypertension • long-standing hypothyroidism • myocardial infarction • myocardial insufficiency • panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) • predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

CAUTIONS, FURTHER INFORMATION
Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

● INTERACTIONS → Appendix 1 (thryroid hormones).

● SIDE-EFFECTS
Anginal pain (usually at excessive dosage) • arrhythmias (usually at excessive dosage) • diarrhoea (usually at excessive dosage) • excitability (usually at excessive dosage) • fever • flushing • headache • heat intolerance • hypersensitivity reactions • insomnia (usually at excessive dosage) • muscle cramp • muscular weakness • oedema • palpitation (usually at excessive dosage) • pruritus • rash • restlessness (usually at excessive dosage) • sweating • tachycardia (usually at excessive dosage) • transient hair loss in children • tremor (usually at excessive dosage) • vomiting (usually at excessive dosage) • weight loss

SIDE-EFFECTS, FURTHER INFORMATION
Initial dosage in patients with cardiovascular disorders. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

● PREGNANCY
Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

● BREAST FEEDING
Amount too small to affect tests for neonatal hypothyroidism.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet
▶ Levothyroxine sodium (Non-proprietary)
Levothyroxine sodium anhydrous 12.5 microgram | 28 tablet P<sub>om</sub> £15.00
Levothyroxine sodium anhydrous 25 microgram | 28 tablet P<sub>om</sub> £16.65
Levothyroxine sodium anhydrous 50 microgram | 100 tablet P<sub>om</sub> no price available
Levothyroxine sodium anhydrous 100 microgram | 100 tablet P<sub>om</sub> no price available
Levothyroxine sodium anhydrous 100 microgram lactose free | 100 tablet P<sub>om</sub> £48.95
Levothyroxine sodium anhydrous 100 microgram tablets lactose free | 100 tablet P<sub>om</sub> £56.21
Levothyroxine sodium anhydrous 75 microgram | 28 tablet P<sub>om</sub> £10.77 DT price = £1.65
Levothyroxine sodium anhydrous 50 microgram | 100 tablet P<sub>om</sub> £22.12
Levothyroxine sodium anhydrous 25 microgram | 100 tablet P<sub>om</sub> £46.39
Levothyroxine sodium anhydrous 12.5 microgram | 100 tablet P<sub>om</sub> £67.86

▶ Eltroxin (AMCo)
Eltroxin 25microgram tablets | 28 tablet P<sub>om</sub> £2.54 DT price = £2.85
Eltroxin 50microgram tablets | 28 tablet P<sub>om</sub> £4.77 DT price = £1.65
Eltroxin 75microgram tablets | 28 tablet P<sub>om</sub> £5.48

▶ Tirosint
Levothyroxine sodium anhydrous 5 microgram | 100 capsule P<sub>om</sub> £26.95
Levothyroxine sodium anhydrous 10 microgram | 100 capsule P<sub>om</sub> £45.00
Levothyroxine sodium anhydrous 20 microgram | 100 capsule P<sub>om</sub> £65.45

Levothyroxine sodium anhydrous 25 microgram | 100 capsule P<sub>om</sub> £85.74

DT price = £1.65

Levothyroxine sodium anhydrous 50 microgram | 100 capsule P<sub>om</sub> £19.52
Levothyroxine sodium anhydrous 75 microgram | 100 capsule P<sub>om</sub> £28.62
Levothyroxine sodium anhydrous 100 microgram | 100 capsule P<sub>om</sub> £42.02

Capsule
▶ Levothyroxine sodium (Non-proprietary)
Levothyroxine sodium anhydrous 25 microgram Tirosint 25microgram capsules | 28 capsule P<sub>om</sub> no price available
Levothyroxine sodium anhydrous 50 microgram Tirosint 50microgram capsules | 28 capsule P<sub>om</sub> no price available
Levothyroxine sodium anhydrous 100 microgram Tirosint 100microgram capsules | 28 capsule P<sub>om</sub> no price available

Oral solution
▶ Levothyroxine sodium (Non-proprietary)
Levothyroxine sodium anhydrous 5 microgram per 1 ml Levothyroxine sodium 5micrograms/5ml oral solution sugar free sugar-free | 100 ml P<sub>om</sub> £95.00 DT price = £94.26
Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 10micrograms/5ml oral solution sugar free sugar-free | 100 ml P<sub>om</sub> £97.52 DT price = £95.81
Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 20micrograms/5ml oral solution sugar free sugar-free | 100 ml P<sub>om</sub> £165.00 DT price = £162.45

Liothyronine sodium
(L-Tri-iodothyronine sodium)

● INDICATIONS AND DOSE

Hypothyroidism
▶ BY MOUTH
  ▶ Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should
be increased gradually, smaller initial doses given for the elderly

**Hypothyroid coma**
- **BY SLOW INTRAVENOUS INJECTION**
- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**DOSE EQUIVALENC E AND CONVERSION**
- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CONTRA-INDICATIONS** Thyrotoxicosis

**CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of anti-diabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

**CAUTIONS, FURTHER INFORMATION**
- Cardiovascular disorders  Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

**INTERACTIONS**  → Appendix 1 (thyroid hormones).

**SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

**SIDE-EFFECTS, FURTHER INFORMATION**
- Initial dosage in patients with cardiovascular disorders  If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

**PREGNANCY**  Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
- Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**BREAST FEEDING**  Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**
- Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent.
- Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 5 microgram  Cytomel 5microgram tablets | 100 tablet (POM) no price available
  - Liothyronine sodium 20 microgram  Liothyronine 20microgram tablets | 28 tablet (POM) £258.20 DT price = £258.20
  - Liothyronine sodium 25 microgram  Cytomel 25microgram tablets | 100 tablet (POM) no price available

**Powder for solution for injection**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram  Liothyronine 20microgram powder for solution for injection vials | 5 vial (POM) £1,425.00

  6.2 Vaginal atrophy 760

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 345 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 712 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 714 are comparable to those of modified-release oxybutynin hydrochloride.

Flavoxate hydrochloride p. 712 has less marked side-effects but it is also less effective. Darifenacin p. 711, fesoterodine fumarate p. 711, propiverine hydrochloride p. 714, solifenacin succinate p. 713, and trosiptium chloride p. 713 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 81 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 353 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 715, a selective beta3 agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An enuresis alarm should be first line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin p. 611, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the
Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - prostatic enlargement (in adults) - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- **CAUTIONS** Acute myocardial infarction (in adults) - arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - children (increased risk of side-effects) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diaphoresis - elderly (especially if frail) - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hyperthyroidism (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - prostatic hyperplasia (in adults) - pyrexia - ulcerative colitis

- **INTERACTIONS**

  Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

- **SIDE-EFFECTS**

  - **Common or very common** Constipation - dilation of pupils with loss of accommodation - dry mouth - photophobia - reduced bronchial secretions - skin dryness - skin flushing - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency

  - **Uncommon** Confusion (particularly in the elderly) - dizziness - dryness - euphoria - fatigue - flatulence - hallucinations - headache - impaired memory - palpitation - photosensitivity - rash - reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) - restlessness - taste disturbances

  - **Very rare** Angle-closure glaucoma

- **SIDE-EFFECTS**

  - **Common or very common** Insomnia

  - **Uncommon** Cough - nasal dryness - pharyngolaryngeal pain - vertigo

- **PREGNANCY** Manufacturer advises avoid — toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid — no information available.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

**ANTIMUSCARINICS > URINARY**

### Darifenacin

- **INDICATIONS AND DOSE**

  **Urinary frequency / Urinary urgency / Incontinence**

  - **BY MOUTH**

    - **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

  - **SIDE-EFFECTS**

    - **Uncommon**

      - Cough - dyspnoea - hypertension - impotence - insomnia - oedema - rhinitis - ulcerative stomatitis - vaginitis - weakness

  - **PREGNANCY** Manufacturer advises avoid — toxicity in animal studies.

### Fesoterodine fumarate

- **INDICATIONS AND DOSE**

  **Urinary frequency / Urinary urgency / Urge incontinence**

  - **BY MOUTH**

    - **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

    Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, or telithromycin.

    In patients with hepatic or renal impairment, consult product literature before concomitant use with amnprevir, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice.

  - **SIDE-EFFECTS**

    - **Common or very common**

      - Insomnia

    - **Uncommon**

      - Cough - nasal dryness - pharyngolaryngeal pain - vertigo
Oxybutynin hydrochloride

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

- Neurogenic bladder instability
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
    - Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
    - Adult: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
    - Elderly: Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response
  - **BY MOUTH USING MODIFIED-RELEASE TABLETS**
    - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
    - Adult: Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

Urinary frequency | Urinary urgency | Urinary incontinence

- **BY TRANSDERMAL APPLICATION USING PATCHES**
  - Adult: Apply 1 patch twice weekly, patch is to be applied to clean, dry, unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

Nocturnal enuresis associated with overactive bladder

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
  - **BY MOUTH USING MODIFIED-RELEASE TABLETS**
    - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

- Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel® XL

**UNLICENSED USE** Not licensed for use in children under 5 years.

**CAUTIONS** Acute porphyrias p. 930

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Uncommon Anorexia · Facial flushing
- Rare Night terrors
- Frequency not known Cognitive impairment (in adults)

**SPECIFIC SIDE-EFFECTS**

- Rare
  - With transdermal use Application site reactions with patches
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION**

- With transdermal use Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Max. 5 mg daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, omeprazole, or ritonavir).

CONTRA-INDICATIONS
- Narrow-angle glaucoma

CAUTIONS
- Neurogenic bladder disorder – susceptibility to QT-interval prolongation

SIDE-EFFECTS
- Uncommon Gastro-oesophageal reflux – oedema
- Frequency not known Dysphonia – hepatic impairment – hyperkalaemia – muscle weakness – reduced appetite – tachycardia

PREGNANCY
Manufacturer advises caution—no information available.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Max. 5 mg daily in moderate impairment. Avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole or ritonavir).

RENAI IMPAIRMENT
Max. 5 mg daily if eGFR less than 30 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m² in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole or ritonavir).

PRESCRIBING AND DISPENSING INFORMATION
The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solifenacin succinate

INDICATIONS AND DOSE
Urinary frequency | Urinary urgency | Urinary incontinence
- BY MOUTH
  - Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Trosprim chloride

INDICATIONS AND DOSE
Urinary frequency | Urinary urgency | Urinary incontinence
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Adult: 20 mg twice daily, to be taken before food
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Adult: 60 mg once daily

SIDE-EFFECTS
- Rare Asthenia - chest pain - dyspnoea
- Very rare Arthralgia - myalgia

PREGNANCY
Manufacturer advises caution.

BREAST FEEDING
Manufacturer advises caution.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

RENAI IMPAIRMENT
Reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73m². Use with caution. Avoid Regurin® XL.

PRESCRIBING AND DISPENSING INFORMATION
The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 3
- Solifenacin succinate 5 mg Vesicare 5mg tablets | 30 tablet (£27.62 DT price = £27.62
- Solifenacin succinate 10 mg Vesicare 10mg tablets | 30 tablet (£55.91 DT price = £55.91

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2005) that Kentera® should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects.

CAUTIONARY AND ADVISORY LABELS
- Very rare
- Rare

RENAL IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

BREAST FEEDING
Manufacturer advises caution—present in milk in animal studies.
Propiverine hydrochloride

**INDICATIONS AND DOSE**

Urinary frequency, urgency and incontinence associated with overactive bladder

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 15 mg 1–2 times a day, increased if necessary up to 15 mg 3 times a day
  - **BY MOUTH USING MODIFIED-RELEASE CAPSULES**
  - Adult: 30 mg once daily

Urinary frequency, urgency and incontinence associated with neurogenic bladder instability

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 15 mg 3 times a day

**PREGNANCY**
Manufacturer advises avoid (restriction of skeletal development in animals).

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Avoid in moderate to severe impairment.

**RENAL IMPAIRMENT**
Max. daily dose 30 mg if eGFR less than 30 mL/minute/1.73m². Manufacturer advises caution in mild or moderate impairment.

**PRESCRIBING AND DISPENSING INFORMATION**
The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Detrusitol**
  - **AMCo**
  - **Propiverine hydrochloride 15 mg** Detrusitnorm 15mg tablets | 56 tablet £18.00 DT price = £18.00

**Modified-release capsule**

- **AMCo**
  - **Propiverine hydrochloride 30 mg** Detrusitnorm XL 30mg capsules | 28 capsule £24.45 DT price = £24.45
  - **Propiverine hydrochloride 45 mg** Detrusitnorm XL 45mg capsules | 28 capsule £27.00 DT price = £27.00

**Tolterodine tartrate**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 2 mg twice daily, reduced if not tolerated to 1 mg twice daily
  - **BY MOUTH USING MODIFIED-RELEASE CAPSULES**
  - Adult: 4 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**
Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to modified-release tolterodine tartrate 4 mg once daily.

**CAUTIONS**
History of QT-interval prolongation

**INTERACTIONS**
Caution with concomitant use with other drugs known to prolong QT interval.

**SIDE-EFFECTS**
- Common or very common: Bronchitis, chest pain, fatigue, paraesthesia, peripheral oedema, sinusitis, vertigo, weight gain
- Uncommon: Memory impairment
- Frequency not known: Flushing

**PREGNANCY**
Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**
Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
Reduce dose to 1 mg twice daily. Avoid modified-release preparations.

**RENAL IMPAIRMENT**
Reduce dose to 1 mg twice daily if eGFR less than 30 mL/minute/1.73m². Avoid modified-release preparations if eGFR less than 30 mL/minute/1.73m².

**PRESCRIBING AND DISPENSING INFORMATION**
The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Tolterodine tartrate (Non-proprietary)**
  - **Tolterodine tartrate 1 mg** Tolterodine 1mg tablets | 56 tablet £25.03 DT price = £1.91

  - **Inconex XL (Sandor Ltd)**
BETA3-ADRENOCEPTOR AGONISTS

Mirabegron

INDICATIONS AND DOSE
Urinary frequency, urgency, and urge incontinence

- Adult: 50 mg once daily

CONTRA-INDICATIONS
Severe uncontrolled hypertension (systolic blood pressure ≥180 mmHg or diastolic blood pressure ≥110 mmHg)

CAUTIONS
History of QT-interval prolongation - stage 2 hypertension

INTERACTIONS
Appendix 1 (mirabegron). Caution with concomitant use with drugs that prolong the QT interval.

Hepatic impairment
With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketocazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily in mild impairment, and avoid in moderate impairment.

Renal impairment
With concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ketocazole, ritonavir, or clarithromycin reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m², and avoid if eGFR less than 30 mL/minute/1.73 m².

SIDE-EFFECTS
- Common or very common Tachycardia - urinary-tract infection
- Uncommon Atrial fibrillation - dyspepsia - gastritis - hypertension - joint swelling - palpitation - pruritus - rash - vulvovaginal infection - vulvovaginal pruritus

CONCEPTION AND CONTRACEPTION
Contraception advised in women of child-bearing potential.

PREGNANCY
Avoid - toxicity in animal studies.

BREAST FEEDING
Avoid - present in milk in animal studies.

HEPATIC IMPAIRMENT
Reduce dose to 25 mg once daily in moderate impairment. Avoid in severe impairment - no information available.

RENAL IMPAIRMENT
Reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m²—no information available.

MONITORING REQUIREMENTS
Blood pressure should be monitored before starting treatment and regularly during treatment, especially in patients with pre-existing hypertension.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (Tes)

- Mirabegron for treating symptoms of overactive bladder (June 2013) NICE TA290

Mirabegron is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS

- Mirabegron 25 mg Betmiga (Astellas Pharma Ltd)

- Mirabegron 50 mg Betmiga 50mg modified-release tablets | 30 tablet (POM) £29.00 DT price = £29.00

1.2 Urinary retention

Drugs for urinary retention

Overview
Acute retention is painful and is treated by catheterisation. Chronic retention is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

Benign prostatic hyperplasia is treated either surgically or medically with alpha-blockers. Dutasteride p. 720 and finasteride p. 720 are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil p. 746, a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

Alpha-blockers

Parasympathomimetics
The parasympathomimetic bethanechol chloride p. 720 increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

ALPHA-ADRENOCEPTOR BLOCKERS

Alfuzosin hydrochloride

INDICATIONS AND DOSE

Benign prostatic hyperplasia

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 2.5 mg 3 times a day; maximum 10 mg per day

- Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

- BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 10 mg once daily

Acute urinary retention associated with benign prostatic hyperplasia

- BY MOUTH USING MODIFIED-RELEASE TABLETS

- Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days
### Doxazosin

#### INDICATIONS AND DOSE

**Hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

**Benign prostatic hyperplasia**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**DOSE EQUIVALENCE AND CONVERSION**
- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

#### CONTRA-INDICATIONS
- History of micturition syncope (in patients with benign prostatic hypertrophy)• history of postural hypotension • monotherapy in patients with overflow bladder or anuria

#### CAUTIONS
- Care with initial dose (postural hypotension) • cataract surgery (risk of intra-operative floppy iris syndrome) • elderly • heart failure • pulmonary oedema due to aortic or mitral stenosis

#### INTERACTIONS
- **Appendix 1 (alpha-blockers).**

#### SIDE-EFFECTS
- **Very rare**
  - Angioedema • ashenha • blurred vision • depression • dizziness • drowsiness • dry mouth • erectile disorders • gastro-intestinal disturbances • headache • hypersensitivity • hypotension • intra-operative floppy iris syndrome • liver damage • oedema • palpitations • pruritus • rash • rhinitis • syncope • tachycardia

### Medicinal forms

#### There may be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**
- Alfuzosin hydrochloride (Non-proprietary)
- Alfuzosin hydrochloride 2.5 mg Alfuzosin 2.5 mg tablets | 60 tablet | £21.20 DT price = £2.40
- Xatral (Sanofi)
- Alfuzosin hydrochloride 2.5 mg Xatral 2.5 mg tablets | 60 tablet | £20.37 DT price = £2.40

**Modified-release tablet**

#### CAUTIONARY AND ADVISORY LABELS 21, 25
- Alfuzosin hydrochloride (Non-proprietary)
- Alfuzosin hydrochloride 10 mg Alfuzosin 10 mg modified-release tablets | 30 tablet | no price available DT price = £12.51
- Besavar XL (Zentiva)
- Alfuzosin hydrochloride 10 mg Besavar XL 10 mg tablets | 30 tablet | £12.51 DT price = £12.51
- Fuzatal XL (Teva UK Ltd)
- Alfuzosin hydrochloride 10 mg Fuzatal XL 10 mg tablets | 30 tablet | £12.76 DT price = £12.51
- Vasran XL (Ranbaxy (UK) Ltd)
- Alfuzosin hydrochloride 10 mg Vasran XL 10 mg tablets | 30 tablet | £11.48 DT price = £12.51
- Xatral XL (Sanofi)
- Alfuzosin hydrochloride 10 mg Xatral XL 10 mg tablets | 10 tablet | £14.17 | 30 tablet | £12.51 DT price = £12.51

**Driving and skilled tasks**
- May affect performance of skilled tasks e.g. driving.

**Hisoria of micturition syncope in patients of benign prostatic hypertrophy • history of postural hypotension • monotherapy in patients of overflow bladder or anuria

#### CAUTIONS
- Care with initial dose (postural hypotension) • cataract surgery (risk of intra-operative floppy iris syndrome) • elderly • heart failure • pulmonary oedema due to aortic or mitral stenosis

#### INTERACTIONS
- **Appendix 1 (alpha-blockers).**

#### SIDE-EFFECTS
- **Very rare**
  - Angioedema • ashenha • blurred vision • depression • dizziness • drowsiness • dry mouth • erectile disorders • gastro-intestinal disturbances • headache • hypersensitivity • hypotension • intra-operative floppy iris syndrome • liver damage • oedema • palpitations • pruritus • rash • rhinitis • syncope • tachycardia

#### Frequency not known
- Angioedema • ashenha • blurred vision • depression • dizziness • drowsiness • dry mouth • erectile disorders • gastro-intestinal disturbances • headache • hypersensitivity • hypotension • intra-operative floppy iris syndrome • liver damage • oedema • palpitations • pruritus • rash • rhinitis • syncope • tachycardia

#### Pregnancy
- No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

#### Breast feeding
- Accumulates in milk in *animal* studies—manufacturer advises avoid.

#### Hepatic impairment
- Use with caution. Manufacturer advises avoid in severe impairment—no information available.

**Patient and carer advice**
- Patient counselling is advised for doxazosin tablets (initial dose).

**Driving and skilled tasks**
- May affect performance of skilled tasks e.g. driving.
MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

Tablet
- **Doxazosin (Non-proprietary)**
  - Doxazosin (as Doxazosin mesilate) 1 mg: Doxazosin 1mg tablets | 28 tablet (P) £0.56 DT price = £0.72
  - Doxazosin (as Doxazosin mesilate) 2 mg: Doxazosin 2mg tablets | 28 tablet (P) £1.08 DT price = £0.74
  - Doxazosin (as Doxazosin mesilate) 4 mg: Doxazosin 4mg tablets | 28 tablet (P) £1.08 DT price = £0.83
- **Cardura**
  - Doxazosin (as Doxazosin mesilate) 1 mg: Cardura 1mg tablets | 28 tablet (P) £0.56 DT price = £0.72
  - Doxazosin (as Doxazosin mesilate) 2 mg: Cardura 2mg tablets | 28 tablet (P) £1.08 DT price = £0.74
  - **Doxadura (Discovery Pharmaceuticals)**
    - Doxazosin (as Doxazosin mesilate) 1 mg: Doxadura 1mg tablets | 28 tablet (P) £0.64 DT price = £0.72
    - Doxazosin (as Doxazosin mesilate) 2 mg: Doxadura 2mg tablets | 28 tablet (P) £0.66 DT price = £0.74
    - Doxazosin (as Doxazosin mesilate) 4 mg: Doxadura 4mg tablets | 28 tablet (P) £0.73 DT price = £0.83

Modified-release tablet
**CAUTIONARY AND ADVISORY LABELS 25**
- **Cardoxin XL** (Almus Pharmaceuticals Ltd)

- **Raporsin XL** (Actavis UK Ltd)
  - Doxazosin (as Doxazosin mesilate) 4 mg: Raporsin XL 4mg tablets | 28 tablet (P) £5.70 DT price = £5.00
- **Slocinx XL** (Zentiva)
  - Doxazosin (as Doxazosin mesilate) 4 mg: Slocinx XL 4mg tablets | 28 tablet (P) £5.56 DT price = £5.00

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

**Benign prostatic hyperplasia**
- **BY MOUTH**
  - Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
  - Elderly: 20 mg daily may be adequate, dose to be taken at night

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

**CONTRA-INDICATIONS**
- Established heart failure · history micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)

**CAUTIONS**
- Cataract surgery (risk of intra-operative floppy iris syndrome) · control incipient heart failure before initiating indoramin · elderly · epilepsy (convulsions in

animal studies) · history of depression · Parkinson’s disease (extrapyramidal disorders reported)

**INTERACTIONS** → Appendix 1 (alpha-blockers).
Avoid alcohol (enhances rate and extent of absorption).

**SIDE-EFFECTS**
- **Common or very common** Sedation
- **Uncommon** Failure of ejaculation · fatigue · weight gain
- **Frequency not known** Angioedema · asthenia · blurred vision · depression · dizziness · drowsiness · dry mouth · erectile disorders · extrapyramidal disorders · gastrointestinal disturbances · headache · hypersensitivity reactions · hypotension · incontinence · intra-operative floppy iris syndrome · oedema · palpitations · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia · urinary frequency

**PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAI IMPAIRMENT** Manufacturer advises caution.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Tablet
**CAUTIONARY AND ADVISORY LABELS 2**
- **Indoramin (Non-proprietary)**
  - **Indoramin hydrochloride 20 mg** Indoramin 20mg tablets | 60 tablet (P) £13.30 DT price = £10.15
  - **Indoramin (as indoramin hydrochloride) 25 mg** Indoramin 25mg tablets | 84 tablet (P) £60.26 DT price = £60.26
- **Doralene Tiltab** (Chemidex Pharma Ltd)
  - **Indoramin hydrochloride 20 mg** Doralene Tiltab 20mg tablets | 60 tablet (P) £11.44 DT price = £10.15

**Prazosin**

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

**Congestive heart failure (rarely used)**
- **BY MOUTH**
  - Adult: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

**Raynaud’s syndrome (but efficacy not established)**
- **BY MOUTH**
  - Adult: 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

**Benign prostatic hyperplasia**
- **BY MOUTH**
  - Adult: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients continued →
DOSE ADJUSTMENTS DUE TO INTERACTIONS
Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- CONTRA-INDICATIONS History of micturition syncope, history of postural hypotension not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)
- CAUTIONS Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose hypotension
- INTERACTIONS Appendix 1 (alpha-blockers).
- SIDE-EFFECTS Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, gastro-intestinal disturbances, headache, hypersensitivity reactions, hypotension (notably postural hypotension), intra-operative floppy iris syndrome, oedema, palpitations, priapism, pruritus, rash, rhinitis, syncope, tachycardia
- HEPATIC IMPAIRMENT Avoid in severe impairment.
- RENAL IMPAIRMENT Use with caution if eGFR less than 10 mL/minute/1.73 m².
- PATIENT AND CARER ADVICE Driving and skilled tasks May affect performance of skilled tasks e.g. driving.
- EXCEPTIONS TO LEGAL CATEGORY Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Tamsulosin hydrochloride

- INDICATIONS AND DOSE
  Benign prostatic hyperplasia
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
    - Adult: 400 micrograms once daily
- CONTRA-INDICATIONS History of micturition syncope, history of postural hypotension

- SIDE-EFFECTS
  - Frequency not known
    - Rare
      - Alopecia, bradycardia, flushing, gynaecomastia, hallucinations, pancreatitis, priapism, urinary incontinence, vasculitis, worsening of narcolepsy
    - Frequency not known
      - Angioedema, asthma, erectile disorders, hypersensitivity reactions, hypotension, intra-operative floppy iris syndrome, postural hypotension, rhinitis
  - PREGNANCY
    - No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
  - BREAST FEEDING
    - Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.
  - HEPATIC IMPAIRMENT
    - Initially 500 micrograms daily; increased with caution.
  - RENAL IMPAIRMENT
    - Initially 500 micrograms daily in moderate to severe impairment; increased with caution.
  - PATIENT AND CARER ADVICE
    - Driving and skilled tasks
      - May affect performance of skilled tasks e.g. driving.
      - First dose effect
        - First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  
  **Tablet**
  - Prazosin (Non-proprietary)

    - **CAUTIONARY AND ADVISORY LABELS** 25
    - **Combodart** (GlaxoSmithKline Ltd)
      - **Tamsulosin hydrochloride 400 microgram, Dutasteride 500 microgram** Combidart 0.5mg/0.4mg capsules | 30 capsule (Pom) £23.76 DT price = £23.76

Tamsulosin with solifenacin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 718, solifenacin succinate p. 713.

- **INDICATIONS AND DOSE**
  - Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective
    - BY MOUTH
    - Adult (male): 1 tablet daily.
  - **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
    - Max. 1 Vesomni® tablet daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir).

- **HEPATIC IMPAIRMENT**
  - Max. 1 Vesomni® tablet daily in moderate impairment.

- **RENAL IMPAIRMENT**
  - Max. 1 Vesomni® tablet daily if eGFR less than 30 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 3, 25
    - **Vesomni** (Astellas Pharma Ltd)
      - **Solifenacin succinate 6 mg, Tamsulosin hydrochloride 400 microgram** Vesomni 6mg/0.4mg modified-release tablets | 30 tablet (Pom) £27.62 DT price = £27.62

Terazosin

- **INDICATIONS AND DOSE**
  - Mild to moderate hypertension
    - BY MOUTH
    - Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy
  - Benign prostatic hyperplasia
    - BY MOUTH
    - Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

- **CONTRA-INDICATIONS**
  - History of micturition syncope (in benign prostatic hyperplasia); history of postural hypotension (in benign prostatic hyperplasia)
  - **CAUTIONS**
    - Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose
    - **CAUTIONS, FURTHER INFORMATION**
      - First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.
  - **INTERACTIONS**
    - Appendix 1 (alpha-blockers).
  - **SIDE-EFFECTS**
  - **PREGNANCY**
    - No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
  - **BREAST FEEDING**
    - No information available.
  - **PATIENT AND CARER ADVICE**
    - Patient counselling is advised for terazosin tablets (initial dose).
    - First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.
    - **Driving and skilled tasks**
    - May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **Terazosin (Non-proprietary)**
      - **Terazosin (as Terazosin hydrochloride) 2 mg** Benph 2mg tablets | 28 tablet (Pom) £2.20 DT price = £2.15
      - **Terazosin 2mg tablets** | 28 tablet (Pom) £2.70 DT price = £2.15
      - **Terazosin (as Terazosin hydrochloride) 5 mg** Terazosin 5mg tablets | 28 tablet (Pom) £3.24 DT price = £2.31
      - **Terazosin (as Terazosin hydrochloride) 10 mg** Terazosin 10mg tablets | 28 tablet (Pom) £8.11 DT price = £7.87
Genito-urinary system

CHOLINE ESTERS

Bethanechol chloride

- **INDICATIONS AND DOSE**
  - **Urinary retention**
    - Adult: 10–25 mg 3–4 times a day, to be taken 30 minutes before food

- **CONTRA-INDICATIONS** Bradycardia, cardiovascular disorders, conditions where increased motility of the gastro-intestinal tract could be harmful, conditions where increased motility of the urinary tract could be harmful, epilepsy, heart block, hyperthyroidism, hypotension, intestinal obstruction, obstructive airways disease, parkinsonism, peptic ulcer, recent myocardial infarction, urinary obstruction

- **CAUTIONS** Autonomic neuropathy (use lower initial dose)

- **INTERACTIONS** → Appendix 1 (parasympathomimetics).

- **SIDE-EFFECTS** Abdominal pain, bradycardia, bronchoconstriction, diarrhoea, eructation, flushing, headache, hypotension, increased lacrimation, increased salivation, increased sweating, nausea, rhinorrhea, vomiting

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid; gastrointestinal disturbances in infant reported.

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25
  - **Avodart** (GlaxoSmithKline UK Ltd)
    - **Dutasteride 500 microgram** Avodart 500microgram capsules | 30 capsule (Pom) £14.60 DT price = £14.60
    - **Combinations available:** Hytrin with dutasteride, p. 719

5α-REDUCTASE INHIBITORS

Dutasteride

- **DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

- **INDICATIONS AND DOSE**
  - **Benign prostatic hyperplasia**
    - Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **INTERACTIONS** → Appendix 1 (dutasteride).

- **SIDE-EFFECTS** Breast enlargement, breast tenderness, decreased libido, ejaculation disorders, impotence

- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.

- **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.

- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25
  - **Avodart** (GlaxoSmithKline UK Ltd)
    - **Dutasteride 500 microgram** Avodart 500microgram capsules | 30 capsule (Pom) £14.60 DT price = £14.60
    - **Combinations available:** Tamsulosin with dutasteride, p. 719

Finasteride

- **DRUG ACTION** A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

- **INDICATIONS AND DOSE**
  - **Benign prostatic hyperplasia**
    - Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **SIDE-EFFECTS** Breast enlargement, breast tenderness, decreased libido, ejaculation disorders, face swelling, hypersensitivity reactions, impotence, lip swelling, male breast cancer, pruritus, rash, testicular pain

- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

- **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.

- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25
  - **Avodart** (GlaxoSmithKline UK Ltd)
    - **Dutasteride 500 microgram** Avodart 500microgram capsules | 30 capsule (Pom) £14.60 DT price = £14.60
    - **Combinations available:** Tamsulosin with dutasteride, p. 719

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NHS restrictions** Finasteride is not prescribable under the NHS for the treatment of androgenetic alopecia in men.

- **CONTRA-INDICATIONS** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **CAUTIONS** Obstructive uropathy

- **SIDE-EFFECTS** Breast enlargement, breast tenderness, decreased libido, ejaculation disorders, face swelling, hypersensitivity reactions, impotence, lip swelling, male breast cancer, pruritus, rash, testicular pain

- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

- **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.

- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 25
  - **Avodart** (GlaxoSmithKline UK Ltd)
    - **Dutasteride 500 microgram** Avodart 500microgram capsules | 30 capsule (Pom) £14.60 DT price = £14.60
    - **Combinations available:** Tamsulosin with dutasteride, p. 719

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NHS restrictions** Finasteride is not prescribable under the NHS for the treatment of androgenetic alopecia in men.
### 1.3 Urological pain

#### Urological pain

**Treatment**

The acute pain of *ureteric colic* may be relieved with pethidine hydrochloride p. 434. *Diclofenac* by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

*Lidocaine hydrochloride* gel p. 1197 is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

**Alkalisation of urine**

*Alkalisation* of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. *Sodium bicarbonate* p. 910 is used as a urinary alkalinising agent in some metabolic and renal disorders.

### ALKALISING DRUGS

#### Citric acid with potassium citrate

**INDICATIONS AND DOSE**

**Relief of discomfort in mild urinary-tract infections**

**Alkalisation of urine**

- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 10 mL 3 times a day, diluted well with water

**CAUTIONS** Cardiac disease · elderly

**INTERACTIONS** Appendix 1 (potassium salts).

**SIDE-EFFECTS** Hyperkalaemia on prolonged high dosage · mild diuresis

**RENAAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states *Potassium Citrate Mixture* BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.

**EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

*Cautionary and Advisory Labels 27*

- **Citic acid with potassium citrate (Non-proprietary)**
  - Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL

**Price**

- 200 mL £1.33
- 400 mL £1.33

**Sodium citrate**

**INDICATIONS AND DOSE**

**Bladder washouts**

- Adult: (consult product literature)

**Relief of discomfort in mild urinary-tract infections**

- **BY MOUTH**
  - Adult: (consult product literature)

**MICOLETTE®**

**Constipation**

- **BY RECTUM**
  - Child 3-17 years: 5–10 mL for 1 dose
  - Adult: 5–10 mL for 1 dose

**MICRALAX®**

**Constipation**

- **BY RECTUM**
  - Child 3-17 years: 5 mL for 1 dose
  - Adult: 5 mL for 1 dose

**RELAXIT®**

**Constipation**

- **BY RECTUM**
  - Child 1 month-2 years: 5 mL for 1 dose, insert only half the nozzle length
  - Child 3-17 years: 5 mL for 1 dose
  - Adult: 5 mL for 1 dose

**CONTRA-INDICATIONS**

- With rectal use Acute gastro-intestinal conditions

**CAUTIONS**

- With oral use Cardiac disease · elderly · hypertension · patients on a sodium-restricted diet
- With rectal use Debilitated patients (in adults) · sodium and water retention in susceptible individuals

**INTERACTIONS**

- With oral use Appendix 1 (sodium citrate).

**SIDE-EFFECTS**

- With oral use Mild diuresis

**PREGNANCY**

- With oral use Use with caution.

**RENAAL IMPAIRMENT**

- With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

**PRESCRIBING AND DISPENSING INFORMATION** Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.
722 Bladder instillations and urological surgery

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Granules**

- Sodium citrate (Non-proprietary)
- Sodium citrate 4 gram Cystitis Relief 4g oral granules sachets | 6 sachet [SSL] £2.33
- Brands may include Cymalon (sodium citrate), Cystocalm

**Oral solution**

- Sodium citrate (Non-proprietary)
- Sodium citrate 88.23 mg per 1 ml Sodium citrate 0.3% oral solution | 30 ml [PBP] £4.50
- Sodium citrate 441.17mg/5ml oral solution | 30 ml [P] no price available

**Enema**

- Micolette Micro-enema (Pinewood Healthcare)
- Sodium citrate 90 mg per 1 ml Micolette Micro-enema 5ml | 12 enema [P] £3.40
- Micralax Micro-enema (Focus Pharmaceuticals Ltd)
- Sodium citrate 90 mg per 1 ml Micralax Micro-enema 5ml | 12 enema [P] £4.87
- Relaxit (Supra Enterprises Ltd)
- Sodium citrate 90 mg per 1 ml Relaxit Micro-enema 5ml | 12 enema £5.21

**Irrigation solution**

- Sodium citrate (Non-proprietary)
- Sodium citrate 3% irrigation solution 1 litre bags | 1 bag no price available

**Powder**

- Sodium citrate (Non-proprietary)
- Sodium citrate 1 mg per 1 mg Sodium citrate powder | 500 gram [SSL] £5.28 DT price = £5.28

**TERPENES**

**Anethol with borneol, camphene, cineole, fenchone and pinene**

**INDICATIONS AND DOSE**

**Urolithiasis for the expulsion of calculi**

- **BY MOUTH**
  - Adult: 1–2 capsules 3–4 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING** Preparation is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- CAUTIONARY AND ADVISORY LABELS 25
- Rowatinex (Meadow Laboratories Ltd)
  - Cineole 3 mg, Anethol 4 mg, Fenchone 4 mg, Borneol 10 mg, Camphene 15 mg, Pinene 31 mg Rowatinex capsules | 50 capsule [PBP] £7.35

2 Bladder instillations and urological surgery

**Bladder instillations and urological surgery**

**Bladder infection**

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 1064 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp*. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 914 (physiological saline) is usually adequate and is preferred as a mechanical irritant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL p. 547 may be of value in mycotic infections in adults.

**Dissolution of blood clots**

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution p. 721 for bladder irrigation 3% may also be helpful.

**Bladder cancer**

Bladder instillations of doxorubicin hydrochloride p. 807 and mitomycin p. 822 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 808 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin p. 852), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

**Urological surgery**

Glycine irrigation solution 1.5% p. 723 is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

**Maintenance of indwelling urinary catheters**

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

**ANTISEPTICS AND DISINFECTANTS**

**Chlorhexidine with lidocaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1064, lidocaine hydrochloride p. 1197.

**INDICATIONS AND DOSE**

**Urethral sounding and catheterisation**

- **BY URETHRAL APPLICATION**
  - Adult: 6–11 mL

**Cystoscopy**

- **BY URETHRAL APPLICATION**
  - Adult: 11 mL, then 6–11 mL if required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

- **EXCIPIENTS:** May contain Hydroxybenzoates (parabens)
- **Instillagel (CliniMed Ltd)**
  - Chlorhexidine gluconate 500 microgram per 1 mL, Lidocaine hydrochloride 20 mg per 1 mL Instillagel gel | 60 ml [P] £14.05 DT price = £14.05 | 110 ml [P] £15.76 DT price = £15.76
IRRIGATING SOLUTIONS

Glycine

- INDICATIONS AND DOSE
  Bladder irrigation during urological surgery / Irrigation for transurethral resection of the prostate gland and bladder tumours
    - Adult: (consult product literature)

- CAUTIONS
  Urological surgery. There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

- SIDE-EFFECTS
  Haemolysis - hypervolaemia - renal failure

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Irrigation solution
    - Glycine (Non-proprietary)
      Glycine 1.5% irritation solution 3 litre Easyflow bags | 1 bag no price available
      Glycine 1.5% irritation solution 1 litre Flowfusor bottles | 1 bottle no price available
      Glycine 1.5% irritation solution 1 litre Easyflow bags | 1 bag no price available
      Glycine 1.5% irritation solution 2 litre Flowfusor bottles | 1 bottle no price available

UROLOGICAL ANTI-INFLAMMATORY DRUGS

Dimethyl sulfoxide

- INDICATIONS AND DOSE
  Symptomatic relief in interstitial cystitis (Hunner’s ulcer)
    - BY INTRAVESICAL INSTILLATION
    - Adult: 50 mL every 2 weeks retained for 15 minutes then voided by the patient; 50% solution is used and instilled into the bladder

- INTERACTIONS
  → Appendix 1 (dimethyl sulfoxide).

- SIDE-EFFECTS
  Bladder spasm - hypersensitivity

- MONITORING REQUIREMENTS
  Ophthalmic, renal and hepatic assessments at intervals of 6 months are required in long-term treatment.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Liquid
    - RIMSO-50 (Thornton & Ross Ltd)
      Dimethyl sulfoxide 500 mg per 1 ml | Rimso-50 solution for instillation | 50 ml | £324.00

Catheter maintenance solutions

CATHETER MAINTENANCE SOLUTIONS

OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd) 50 mL | NHS indicative price = £3.56 | Drug Tariff (Part IXa) 100 mL | NHS indicative price = £3.56 | Drug Tariff (Part IXa)

Uro-Tainer Twin Solution R citric acid 6% catheter maintenance solution (B.Braun Medical Ltd) 60 mL | NHS indicative price = £4.81 | Drug Tariff (Part IXa)

OptiFlo S saline 0.9% catheter maintenance solution (Bard Ltd) Sodium chloride 9 mg per 1 ml 50 mL | NHS indicative price = £3.36 | Drug Tariff (Part IXa) 100 mL | NHS indicative price = £3.36 | Drug Tariff (Part IXa)

Uro-Tainer M sodium chloride 0.9% catheter maintenance solution (B.Braun Medical Ltd) Sodium chloride 9 mg per 1 mL 50 mL | No NHS indicative price available | Drug Tariff (Part IXa) 100 mL | No NHS indicative price available | Drug Tariff (Part IXa)

Uro-Tainer sodium chloride 0.9% catheter maintenance solution (B.Braun Medical Ltd) Sodium chloride 9 mg per 1 ml 50 mL | NHS indicative price = £3.51 | Drug Tariff (Part IXa) 100 mL | NHS indicative price = £3.51 | Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004)): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16 should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but may have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide.

Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

### Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 694 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.
• **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

• **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phase preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 730, ethinylestradiol with drospirenone p. 736, and ethinylestradiol with gestodene p. 731 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 729 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evo intrigue®*). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing®*).

**Surgery**

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately**

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

**Progestogen-only contraceptives**

**Oral progestogen-only contraceptives**

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

**Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate (*Depo-Provera*, SAYANA PRESS®) p. 741 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (*Noristerat®*) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (*Nexplanon®*) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

**Intra-uterine progestogen-only device**

The progestogen-only intra-uterine systems *Mirena®, Jaydess®* and *Levovist®, release levonorgestrel p. 737 directly into the uterine cavity. *Mirena®* is licensed for use as a contraceptive, for the treatment of primary menorrhagia and
for the prevention of endometrial hyperplasia during oestrogen replacement therapy. Jaydess® and Levosert® are licensed for contraception, and Levosert® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery
All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods
Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 736; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device
Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 495). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Combined hormonal contraceptives interactions
The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 291, eslicarbazepine acetate p. 293, nevirapine p. 594, oxcarbazepine p. 300, phenyoitn p. 302, phenobarbital p. 313, primidone p. 313, ritonavir p. 604, St John’s Wort, topiramate p. 309 and, above all, rifabutin p. 530 and rifampicin p. 535). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylessradiol 30 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses.

- For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

- If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

- Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes
Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 507, doxycycline p. 521) reduce the efficacy of
combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

**Oral progestogen-only contraceptives interactions**

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

**Parenteral progestogen-only contraceptives interactions**

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection p. 699 and medroxyprogesterone acetate intramuscular and subcutaneous injections p. 741 is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant p. 740 may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

**Hormonal emergency contraception interactions**

The effectiveness of levonorgestrel p. 737, and possibly ulipristal acetate p. 736, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose (unlicensed dose—advise women accordingly). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

**Contraceptives, non-hormonal**

**Spermicidal contraceptives**

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol ‘9’ p. 743 has been associated with genital lesions, which may increase the risk of acquiring these infections.

**Contraceptive devices**

**Intra-uterine devices**

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (Gyne Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

**Caution with oil-based lubricants**

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

### 3.1 Contraception, combined

**OESTROGENS COMBINED WITH PROGESTOGENS**

**Combined hormonal contraceptives**

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 - gallstones - heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of phephoid gestationis - history during pregnancy of pruritus - history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) - history of haemolytic uraemic syndrome - migraine with aura - personal history of venous or arterial thrombosis - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - Crohn’s disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia (seek specialist advice) - inflammatory bowel disease - migraine - personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) - risk factors for arterial disease - risk factors for venous thromboembolism - sickle-cell disease - undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

- Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined...
hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100,000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- **Risk factors for venous thromboembolism** Use with caution if any of following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relatives aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity; body mass index $\geq 30$ kg/m$^2$ (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

Combined with ethinylestradiol Combined with estradiol

- **Risk factors for arterial disease** Use with caution if any one of following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - diabetes mellitus (avoid if diabetes complications present);
  - hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
  - smoking (avoid if smoking 40 or more cigarettes daily);
  - age over 35 years (avoid if over 50 years);
  - obesity (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** Appendix 1 (oestrogens, progestogens).
- **SIDE-EFFECTS**
  - Rare Gallstones · systemic lupus erythematosus · Frequency not known Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chloasma · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual disturbances · vomiting · ‘spotting’ in early cycles
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.
    - Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection...
may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain a woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain a woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira®).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira®).

After abortion or miscarriage Start same day.

### PATIENT AND CARER ADVICE

#### Missed pill

The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

### Dienogest with estradiol valerate

#### INDICATIONS AND DOSE

Contraception with 28-day combined preparations

Menstrual symptoms with 28-day combined preparations

- BY MOUTH
- Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of inactive tablets, tablets should be taken at approximately the same time each day

#### DIRECTIONS FOR ADMINISTRATION

Changing to Qlaira®: start the first active Qlaira® tablet on the day after taking the last active tablet of the previous brand

#### PATIENT AND CARER ADVICE

Missed dose A missed pill for a patient taking Qlaira® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Qlaira®, refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Qlaira®, refer to product literature.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Dienogest with estradiol valerate (Non-proprietary)
  - Dienogest 2 mg, Estradiol valerate 2 mg
  - Dienogest 2 mg tablets | 15 tablet [POM] no price available
  - Estradiol valerate 2 mg, Dienogest 3 mg
  - Estradiol valerate 2 mg | Dienogest 3 mg tablets | 51 tablet [POM] no price available
  - Qlaira (Bayer Plc)
  - Qlaira tablets | 84 tablet [POM] £25.18

### Estradiol with nomegestrol

#### INDICATIONS AND DOSE

Contraception

- BY MOUTH
- Females of childbearing potential: 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval

#### PREGNANCY

Toxicity in animal studies.

#### DIRECTIONS FOR ADMINISTRATION

Changing to Zoely®, start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand.

#### PATIENT AND CARER ADVICE

Missed doses A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Zoely®, refer to product literature.
Ethinylestradiol with desogestrel

### INDICATIONS AND DOSE

Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations

- **BY MOUTH**
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Ethinylestradiol with desogestrel (Non-proprietary)**
  - Ethinylestradiol 20 microgram, Desogestrel
    - 150 microgram Ethinylestradiol 20microgram / Desogestrel 150microgram tablets | 63 tablet £6.13
    - Ethinylestradiol 30 microgram, Desogestrel

    - Drospirenone 3 mg, Ethinylestradiol 30 microgram Dretine 0.02mg/3mg tablets | 63 tablet £8.30 DT price = £14.70
  - Eloine (Bayer Plc)
    - Drospirenone 3 mg, Ethinylestradiol 20 microgram Eloine 0.02mg/3mg tablets | 84 tablet £14.70 DT price = £14.70
  - Lucette (Consilient Health Ltd)
    - Drospirenone 3 mg, Ethinylestradiol 30 microgram Lucette 0.03mg/3mg tablets | 63 tablet £9.35 DT price = £14.70
  - Yacella (Morningside Healthcare Ltd)
    - Drospirenone 3 mg, Ethinylestradiol 30 microgram Yacella 0.03mg/3mg tablets | 63 tablet £8.30 DT price = £14.70

### Ethinylestradiol with etonogestrel

### INDICATIONS AND DOSE

Contraception | Menstrual symptoms

- **BY VAGINA**
  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

### DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring
Changing from combined hormonal contraception
Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used
correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.
Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer vaginal ring.
  Counselling: The presence of the ring should be checked regularly.
  **Missed doses**
  Expulsion, delayed insertion or removal, or broken vaginal ring: If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.
  If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
  - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Vaginal delivery system**
  - Ethinylestradiol with etonogestrel (Non-proprietary)
    Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg  
    Ethinylestradiol 2.7 mg / Etonogestrel 11.7 mg vaginal delivery system | 3 system [POM] no price available
  - NuvaRing (Merck Sharp & Dohme Ltd)
    Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg  
    NuvaRing 0.12 mg/0.015 mg per day vaginal delivery system | 3 system [POM] £28.70

- **INDICATIONS AND DOSE**
  Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations
  - **BY MOUTH**
    - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.
  Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations
  - **BY MOUTH**
    - Females of childbearing potential: 1 active tablet once daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval, withdrawal bleeding occurs during the 7-day interval of inactive tablets being taken, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.
Genito-urinary system

Ethinylestradiol with levonorgestrel

- **INDICATIONS AND DOSE**
  - **Contraception with 21-day combined preparations**
    - **Menstrual symptoms with 21-day combined preparations**
      - **BY MOUTH**
        - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

    - 150 microgram: Rigevidon tablets | 63 tablet (POM) £1.89 DT price = £2.82

Ethinylestradiol with norelgestromin

- **INDICATIONS AND DOSE**
  - **Contraception**
    - **Menstrual symptoms**
      - **BY TRANSDERMAL APPLICATION**
        - Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **DIRECTIONS FOR ADMINISTRATION**
  - Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.
  - Changing to a transdermal combined hormonal contraceptive Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.
  - Changing from progestogen-only method
    - from an implant, apply first patch on the day implant removed
    - from an injection, apply first patch when next injection due
    - from oral progestogen, first patch may be applied on any day after stopping pill
  - For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding)

- Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage

- Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

**PATIENT AND CARER ADVICE**

- Patients and carers should be given advice on how to administer patches.

Missed doses

- Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional
contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

Travel
Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

### NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Transdermal patch**
- **Evra** (Janssen-Cilag Ltd)
  - Ethinylestradiol 3.9 microgram per 24 hour, Norelgestromin 203 microgram per 24 hour Evra transdermal patches | 9 patches
  - DT price = £19.51

### Ethinylestradiol with norethisterone

**INDICATIONS AND DOSE**

Contraception with 21-day combined preparations

Menstrual symptoms with 21-day combined preparations

- **BY MOUTH**
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

Norethisterone with mestranol

**INDICATIONS AND Dose**

**Contraception | Menstrual symptoms**

- **By mouth**
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval; withdrawal bleeding can occur during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at the same time each day.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Norinyl-1 (Pfizer Ltd)
  - Mestranol 50 microgram, Norethisterone 1 mg Norinyl-1 tablets | 63 tablet | £2.19 DT price = £2.19

3.2 Contraception, devices

Contraception devices not listed below Levonorgestrel, p. 737

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

**INDICATIONS AND Dose**

**Contraception**

- **By intra-uterine administration**
- Females of childbearing potential: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

**CONTRA-INDICATIONS**

Active trophoblastic disease (until return to normal of urine and plasma·gonadotrophin concentration) - distorted uterine cavity - established or marked immunosuppression - genital malignancy - medical diathesis - pelvic inflammatory disease - recent sexually transmitted infection (if not fully investigated and treated) - severe anaemia - small uterine cavity - unexplained uterine bleeding - Wilson’s disease.

**CAUTIONS**

Anaemia - anticoagulant therapy (avoid if possible) - diabetes - disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - endometriosis - epilepsy (risk of seizure at time of insertion) - fertility problems - history of pelvic inflammatory disease - increased risk of expulsion if inserted before uterine involution - menorrhagia (progestogen intra-uterine system might be preferable) - nulliparity - severe cervical stenosis - severe primary dysmenorrhea - severely scarred uterus (including after endometrial resection) - young age

**CAUTIONS, FURTHER INFORMATION**

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **Risk of infection** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  - they are under 25 years old or
  - they are over 25 years old and have a new partner or have had more than one partner in the past year or their regular partner has other partners.

  In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS**

  Allergy - bleeding (on insertion) - cervical perforation - displacement - dysmenorrhea - expulsion - menorrhagia - occasionally epileptic seizure (on insertion) - pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) - pelvic infection may be exacerbated - uterine perforation - vasovagal attack (on insertion)

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Presence of significant symptoms (especially pain). Advise the patient to seek medical attention promptly in case of significant symptoms.

  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
  - **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
  - **BREAST FEEDING** Not known to be harmful.
  - **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
  - **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

### Other drugs used for Contraception, emergency

Intra-uterine contraceptive devices (copper), p. 734 Levonorgestrel, p. 737
**Ulipristal acetate**

**DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

**INDICATIONS AND DOSE**

**Pre-operative and intermitent treatment of moderate to severe symptoms of uterine fibroids**
- **BY MOUTH**
- Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation, courses may be repeated if necessary, re-treatment should start no sooner than during the first week of the second menstruation following completion of the first course; max. 4 courses

**Emergency contraception**
- **BY MOUTH**
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
Repeated use as an emergency contraceptive within a menstrual cycle

**SPECIFIC CONTRA-INDICATIONS**
- When used for uterine fibroids: Breast cancer | cervical cancer | ovarian cancer | undiagnosed vaginal bleeding | uterine cancer | vaginal bleeding not caused by uterine fibroids

**CAUTIONS** Uncontrolled severe asthma

**INTERACTIONS** → Appendix 1 (ulipristal).

The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

**SIDE-EFFECTS**

- **Common or very common**
  - When used for emergency contraception: Abdominal pain | back pain | diarrhoea | dizziness | fatigue | gastrointestinal disturbances | headache | menstrual irregularities | muscle spasms | nausea | vomiting
  - When used for uterine fibroids: Abdominal pain | acne | breast pain | dizziness | endometrial thickening | headache | hot flushes | hyperhidrosis | malaise | menstrual disturbances | myalgia | nausea | oedema | ovarian cyst (including rupture) | pelvic pain | uterine haemorrhage

- **Uncommon**
  - When used for emergency contraception: Blurred vision | breast tenderness | dry mouth | hot flushes | pruritus | rash | tremor | uterine spasm
  - When used for uterine fibroids: Anxiety | constipation | dry mouth | dyspepsia | epistaxis | flatulence | urinary incontinence

**CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for Quaira®) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

**PREGNANCY** Limited information available when used as an emergency contraceptive. Manufacturer advises avoid for uterine fibroids—no information available.

**BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk. When used for uterine fibroids, manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- When used for Emergency contraception: Manufacturer advises avoid in severe impairment—no information available.
- When used for Uterine fibroids: Manufacturer advises avoid in moderate to severe impairment unless patient is closely monitored—no information available.

**RENAL IMPAIRMENT**
- When used for Uterine fibroids: Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.

**MONITORING REQUIREMENTS**
- When used for Uterine fibroids: Periodic monitoring of the endometrium is recommended following repeated intermittent treatment.

**PATIENT AND CARER ADVICE**

**Missed doses**
- When used for Uterine fibroids: If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Treatment free intervals
- When used for Uterine fibroids: The prescriber should explain the requirement for treatment free intervals.
- When used for Emergency contraception: If vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **EllaOne** (HRA Pharma UK Ltd) Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet | £14.05
- **Esmya** (Gedeon Richter (UK) Ltd) Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet | £114.13

### 3.4 Contraception, oral progestogen-only

Other drugs used for Contraception, oral progestogen-only Nor ethisterone, p. 699
Desogestrel

- **INDICATIONS AND DOSE**
  - **Contraception**
    - **BY MOUTH**
    - Females of childbearing potential: 75 micrograms daily, dose to be taken at the same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a ‘missed pill’

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 930 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

- **CAUTIONS**
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- **SIDE-EFFECTS**
  - Breast cancer · There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **PREGNANCY**
  - Not known to be harmful.

- **BREAST FEEDING**
  - Progestogen-only contraceptives do not affect lactation.

- **HEPATIC IMPAIRMENT**
  - Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

- **PATIENT AND CARER ADVICE**
  - **Missed pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

  The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

  Surgery · All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

  Starting routine · One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

  Changing from a combined oral contraceptive · Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

  After childbirth · Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

  Diarrhoea and vomiting · Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contraindicated.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Desogestrel (Non-proprietary)
    - Desogestrel 75 microgram tablets 84 [POM] £9.55 DTP price = £1.93
    - Aizea (Besins Healthcare (UK) Ltd) Desogestrel 75 microgram tablets 84 [POM] £5.21 DTP price = £1.93
    - Cerazette (Merck Sharp & Dohme Ltd) Desogestrel 75 microgram tablets 84 [POM] £9.55 DTP price = £1.93
    - Cerelle (Consilient Health Ltd) Desogestrel 75 microgram tablets 84 [POM] £3.50 DTP price = £1.93
    - Desomono (Smedix Developments Ltd) Desogestrel 75 microgram tablets 84 [POM] £7.49 DTP price = £1.93
    - Desorex (Somex Pharma) Desogestrel 75 microgram tablets 84 [POM] £6.70 DTP price = £1.93
    - Desorex (Smedix Developments Ltd) Desogestrel 75 microgram tablets 84 [POM] £3.49 DTP price = £1.93
    - Nacrez (Teva UK Ltd) Desogestrel 75 microgram tablets 84 [POM] £3.50 DTP price = £1.93
    - Zelleta (Morningside Healthcare Ltd) Desogestrel 75 microgram tablets 84 [POM] £3.35 DTP price = £1.93
Contraception

- **BY MOUTH**
- Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

**JAYDESS®, 13.5MG INTRA-UTERINE DEVICE**

Contraception

- **BY VAGINA**
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

**LEVOSERT®, 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**

Contraception | Menorrhagia

- **BY INTRA-UTERINE ADMINISTRATION**
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

**MIRENA®, 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**

Contraception | Menorrhagia

- **BY INTRA-UTERINE ADMINISTRATION**
- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

**Prevention of endometrial hyperplasia during oestrogen replacement therapy**

- **BY INTRA-UTERINE ADMINISTRATION**
- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding at any time if amenorrhoeic; effective for 4 years

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

With the progestogen—only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen—only intra-uterine system and additional contraceptive precautions are not required.

**UNLICENSED USE**

- With oral use in children: Consult product literature for licensing status of individual preparations.
- With vaginal use in children: Not licensed for use in women under 18 years.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

**CONTRA-INDICATIONS**

- With intra-uterine use: Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration — acute cervicitis — acute vaginitis — distorted uterine cavity — established immunosuppression — genital malignancy — history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception — infected abortion during the previous three months — marked immunosuppression — not suitable for emergency contraception — pelvic inflammatory disease — postpartum endometritis — recent sexually transmitted infection (if not fully investigated and treated) — severe anaemia — small uterine cavity — unexplained uterine bleeding
- With oral use: Acute porphyrias p. 930
- With oral use for contraception: History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable — severe arterial disease — undiagnosed vaginal bleeding

**CAUTIONS**

- With intra-uterine use: Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) — anaemia — anticoagulant therapy (avoid if possible) — diabetes — drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) — endometriosis — epilepsy (risk of seizure at time of insertion) — fertility problems — history of pelvic inflammatory disease — increased risk of expulsion if inserted before uterine involution — menorrhagia (progestogen intra-uterine system might be preferable) — nulliparity — severe cervical stenosis — severe primary dysmenorrhoea — severely scarred uterus (including after endometrial resection) — young age
- With oral use for contraception: Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice — arterial disease — functional ovarian cysts — history of jaundice in pregnancy — malabsorption syndromes — past ectopic pregnancy — sex-steroid dependent cancer —
systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- With oral use for emergency contraception. Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - past ectopic pregnancy - severe malabsorption syndromes

**CAUTIONS, FURTHER INFORMATION**

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- Risk of infection with intra-uterine devices. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
  - they are under 25 years old
  - they are over 25 years old and
  - have a new partner or
  - have had more than one partner in the past year or
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- Use as a contraceptive in co-morbidities
- With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE** Advanced uterine atrophy

**INTERACTIONS** → Appendix 1 (progestogens).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Depresssion (sometimes severe) - headache - nausea
- Frequency not known Vomiting

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - With intra-uterine use Changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) - abdominal pain - acne - alopecia - back pain - breast pain - expulsion - hirsutism - migraine - nervousness - pelvic pain - peripheral oedema - salpingitis

- Uncommon
  - With intra-uterine use Abdominal distension - cervicitis - eczema - pelvic inflammatory disease - pruritus - skin hyperpigmentation
- Rare
  - With intra-uterine use Rash - uterine perforation
- Frequency not known
  - With intra-uterine use Functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) - allergy - bleeding (on insertion) - cervical perforation - displacement - dysmenorrhoea - epileptic seizures (on insertion) - menorrhagia - pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) - pelvic infection may be exacerbated - vasovagal attack (on insertion)
  - With oral use Breast discomfort - breast tenderness - changes in libido - disturbances of appetite - dizziness - fatigue - menstrual irregularities - skin disorders

**SIDE-EFFECTS, FURTHER INFORMATION**

- Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

**PREGNANCY**

- With oral use Not known to be harmful.

- With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

**BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

**HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**MONITORING REQUIREMENTS**

- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**JAYDESS® 13.5MG INTRA-UTERINE DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

**LEVONELLE® ONE STEP** Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

**PATIENT AND CARER ADVICE**

**Missed doses**

When used as an oral contraceptive, the following advice is recommended ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also
use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with use as an oral contraceptive

Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

▶ With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

▶ With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.

After childbirth

Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

▶ With oral use for Emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

● that their next period may be early or late;

● that a barrier method of contraception needs to be used until the next period;

● to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;

● to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

EXCEPTIONS TO LEGAL CATEGORYLEVONELLE® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ LEVONORGESTREL (NON-proprietary) Levonorgestrel 1.5mg tablets | 1 tablet P £13.83 DT price = £5.20 | 1 tablet POM £3.74–£5.20 DT price = £5.20

3.5 Contraception, parenteral progestogen-only

PROGESTOGENS

ETONOGESTREL 27-Sep-2016

INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

▶ BY SUBDERMAL IMPLANTATION

Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

▶ BY SUBDERMAL IMPLANTATION

Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery, 1 implant to be inserted after 28 days postpartum in breast-feeding mothers, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

▶ BY SUBDERMAL IMPLANTATION

Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester

▶ BY SUBDERMAL IMPLANTATION

Females of childbearing potential: 1 implant to be inserted within 5 days, implant should be removed within 3 years of insertion

Other drugs used for Contraception, parenteral progestogen-only Norethisterone, p. 699
Medroxyprogesterone acetate

### INDICATIONS AND DOSE

**Dysfunctional uterine bleeding**

- **By mouth**
  - Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

**Secondary amenorrhoea**

- **By mouth**
  - Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

**Mild to moderate endometriosis**

- **By mouth**
  - Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Progestogenic opposition of oestrogen HRT**

- **By mouth**
  - Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Endometrial cancer | Renal cell cancer**

- **By mouth**
  - Adult: 200–600 mg daily

**Breast cancer**

- **By mouth**
  - Adult: 0.4–1.5 g daily

**Contraception**

- **By deep intramuscular injection**
  - Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
  - **By subcutaneous injection**
  - Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

**Long-term contraception**

- **By deep intramuscular injection**
  - Females of childbearing potential: 150 mg every 12 weeks, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
  - **By subcutaneous injection**
  - Females of childbearing potential: 104 mg every 13 weeks, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected

• **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.

• **CONTRA-INDICATIONS** Acute porphyria p. 930 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

• **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

• **INTERACTIONS** Appendix 1 (progestogens). Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. Effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

• **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · injection-site reactions · menstrual irregularities · nausea · vomiting

• **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.
  - **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

• **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

• **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

• **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.
CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
- Acute porphyrias p. 930.
- Severe arterial disease.
- Undiagnosed vaginal bleeding.

SPECIFIC CONTRA-INDICATIONS
- With intramuscular use or subcutaneous use.
  - History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable.
- With oral use.
  - Breast cancer (unless progestogens are being used in the management of this condition).
  - Genital cancer (unless progestogens are being used in the management of this condition).
  - History of liver tumours.

CAUTIONS

GENERAL CAUTIONS
- Possible risk of breast cancer.

SPECIFIC CAUTIONS
- With intramuscular use or subcutaneous use.
  - History during pregnancy in disturbances of lipid metabolism.
  - History during pregnancy of deterioration of otsosclerosis.
  - History during pregnancy of pruritus.
- With oral use.
  - Asthma.
  - Cardiac dysfunction.
  - Conditions that may worsen with fluid retention (diabetes [progestogens can decrease glucose tolerance—monitor patient closely]).
  - Epilepsy.
  - History of depression.
  - Hypertension.
  - Migraine.
  - Susceptibility to thromboembolism (particular caution with high dose).

INTERACTIONS → Appendix 1 (progestogens).
- With intramuscular use or subcutaneous use.
  - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes.
  - The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Breast discomfort.
- Changes in libido.
- Depression.
- Dizziness.
- Headache.
- Indigestion.
- (Discontinue treatment if papilloedema or retinal vascular lesions). 
- Menstrual irregularities.
- Nausea.
- Pruritus.
- Vomiting.
- Weight gain.

SPECIFIC SIDE-EFFECTS
- Rare
  - With intramuscular use or subcutaneous use.
    - Osteoporosis.
    - Osteoporotic fractures.
- Frequency not known
  - With intramuscular use or subcutaneous use.
    - Disturbance of appetite.
    - Injection site-reactions.
    - Reduced bone mineral density.
    - Skin disorders.
  - With oral use:
    - Acne.
    - Adrenergic-like effects (when used for malignant disease).
    - Alopecia.
    - Anaphylactoid reactions.
    - Bloating.
    - Breast tenderness.
    - Cervical erosions (when used for malignant disease).
    - Confusion (when used for malignant disease).
    - Congestive heart failure (when used for malignant disease).
    - Constipation (when used for malignant disease).
    - Diarrhoea (when used for malignant disease).
    - Drowsiness.
    - Dry mouth (when used for malignant disease).
    - Euphoria (when used for malignant disease).
    - Fluid retention.
    - Galactorrhoea (when used for malignant disease).
    - Glucocorticoid effects may lead to a cushingoid syndrome (with high doses for malignant disease).
  - Hyperparathyroidism.
  - Hypercalcaemia.
  - Hyperpyrexia.
  - Hypertension.
  - Insomnia.
  - Jaundice.
  - Loss of concentration (when used for malignant disease).
  - Nervousness (when used for malignant disease).
  - Palpitation (when used for malignant disease).
  - Premenstrual-like syndrome.
  - Raised platelet count (when used for malignant disease).
  - Raised white blood cell count (when used for malignant disease).
  - Rash.
  - Retinal thrombosis (when used for malignant disease).
  - Skin reactions.
  - Tachycardia (when used for malignant disease).
  - Urticaria.
  - Vision disorders (when used for malignant disease).

SIDE-EFFECTS, FURTHER INFORMATION
- With intramuscular use or subcutaneous use.
  - Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives.

CONCEPTION AND CONTRACEPTION
- With intramuscular use.
  - If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- With subcutaneous use.
  - If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

PREGNANCY
- With oral use.
  - Avoid—genital malformations and cardiac defects reported.
- With intramuscular use or subcutaneous use.
  - Not known to be harmful.

BREAST FEEDING
- Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.
- With intramuscular use or subcutaneous use.
  - The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

HEPATIC IMPAIRMENT
- Avoid in liver tumour.
- With oral use.
  - Avoid in hepatic impairment.
- With intramuscular use or subcutaneous use.
  - Caution in severe liver disease and recurrent cholestatic jaundice.

RENAL IMPAIRMENT
- When used for mild to moderate endometriosis or Progestogenic opposition of oestrogen HRT or Dysfunctional uterine bleeding or Secondary amenorrhea.
  - Use with caution.

PATIENT AND CARER ADVICE
- With intramuscular use or subcutaneous use.
  - Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.
3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

- INDICATIONS AND DOSE
  Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps
  - BY VAGINA
  - Females of childbearing potential: consult product literature

- SIDE-EFFECTS
  Genital lesions

SIDE-EFFECTS, FURTHER INFORMATION
High frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

- CONCEPTION AND CONTRACEPTION
  No evidence of harm to latex condoms and diaphragms.

- PREGNANCY
  Toxicity in animal studies.

- BREAST FEEDING
  Present in milk in animal studies.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Gel
  EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid
  - Gygel (Marlborough Pharmaceuticals Ltd)
  Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly: 30 gram £4.25; 81 gram £11.00

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

Overview
Reasons for failure to produce a satisfactory erection include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced.

Intracavernosal, urethral or topical application of vasoactive drugs under careful medical supervision are used for the management of erectile dysfunction. Intracavernosal or intraurethral preparations can also be used in the diagnosis of erectile dysfunction.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernous fibrosis, and Peyronie's disease).

Priapism

If priapism occurs with alprostadil p. 748, treatment should not be delayed more than 6 hours and is as follows:

- Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side.
- If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.
- If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) can be given.
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.
- If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS
Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIIIIB of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm

Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Alprostadil

Alprostadil, (prostaglandin E1) is given by intracavernosal injection, intraurethral application, or topical application for the management of erectile dysfunction (after exclusion of treatable medical causes). Intracavernosal or intraurethral preparations can also be used in the diagnosis of erectile dysfunction.

Phosphodiesterase type-5 inhibitors

Avanafil p. 744, sildenafil p. 744, tadalafil p. 746 and vardenafil p. 747 are phosphodiesterase type-5
inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalaflı or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Papaverine and phentolamine
Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine mesilate p. 173 is added if the response is inadequate [unlicensed indication]. Persistence of the erection for longer than 4 hours is an emergency.

PHOSPHODIESTERASE TYPE-5 INHIBITORS

Avanafil

- **INDICATIONS AND DOSE**
  - **Erectile dysfunction**
    - **BY MOUTH**
    - Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day
  - **Erectile dysfunction in patients on alpha-blocker therapy**
    - **BY MOUTH**
    - Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil. Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

- **CONTRA-INDICATIONS**
  Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure > 170/100 mmHg · hereditary degenerative retinal disorders · history of non-articteric anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilatation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina

- **CAUTIONS**
  Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- **INTERACTIONS**
  ➔ Appendix I (avanafil).

- **SIDE-EFFECTS**
  ➔ Common or very common Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting

- **Uncommon**
  Drowsiness · epistaxis · hypertension · hypotension · malaise · painful red eyes · palpitation · tachycardia

- **Rare**
  Abdominal pain · diarrhoea · dry mouth · facial oedema · gastritis · genital irritation · gout · haematuria · hyperactivity · hyperbilirubinaemia · hypersensitivity reactions · increased serum creatinine · insomnia · muscle spasms · peripheral oedema · pollakiuria · priapism · rash · Stevens-Johnson syndrome · syncope · weight gain

- **Frequency not known**
  Arrhythmia · myocardial infarction · non-articteric anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina

- **HEPATIC IMPAIRMENT**
  Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT**
  Avoid if eGFR less than 30 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  Onset of effect may be delayed if taken with food.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  NHS restrictions Spedra™ is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’.

- **MEDITIC FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Spedra (A. Menarini Farmaceutica Internazionale SRL) ➔ Avanafil 50 mg Spedra 50mg tablets | 4 tablet [DT] £10.94 DT price + £10.94 8 tablet [DT] £19.70 DT price + £19.70
  - Avanafil 100 mg Spedra 100mg tablets | 4 tablet [DT] £14.08 DT price + £14.08 8 tablet [DT] £26.26 DT price + £26.26

Sildenafil

- **INDICATIONS AND DOSE**
  - **Pulmonary arterial hypertension (initiated under specialist supervision)**
    - **BY MOUTH**
    - Adult: 20 mg 3 times a day
    - **BY INTRAVENOUS INJECTION**
    - Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

  - **Erectile dysfunction**
    - **BY MOUTH**
    - Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Hereditary degenerative retinal disorders · history of non-articteric anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke
SPECIFIC CONTRA-INDICATIONS

- When used for erectile dysfunction: Avoid if systolic blood pressure below 90 mmHg (no information available). Patients in whom vasodilation or sexual activity are inadvisable. Recent unstable angina is a contraindication.
- When used for pulmonary arterial hypertension: Sickle-cell anaemia.

CAUTIONS

GENERAL CAUTIONS
Active peptic ulceration - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction.

SPECIFIC CAUTIONS

- When used for erectile dysfunction: Anatomical deformation of the penis (e.g., angulation, cavernosal fibrosis, Peyronie's disease) - predisposition to priapism (e.g., in sickle-cell disease, multiple myeloma, or leukaemia).
- When used for pulmonary arterial hypertension: Anatomical deformation of the penis - autonomic dysfunction - hypotension (avoid if systolic blood pressure below 90 mmHg) - intravascular volume depletion - predisposition to priapism - pulmonary veno-occlusive disease.

INTERACTIONS → Appendix 1 (sildenafil).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common: Back pain - dyspepsia - flushing - migraine - myalgia - nasal congestion - visual disturbances.
- Frequency not known: Non-articulating anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) - sudden hearing loss (advise patient to seek medical help).

SPECIFIC SIDE-EFFECTS

- Common or very common: Nausea - dizziness - vomiting.
- When used for pulmonary arterial hypertension: Gynaecomastia - haematuria - penile haemorrhage - priapism.
- Rare: When used for erectile dysfunction: Atrial fibrillation - cerebrovascular accident - facial oedema - hypersensitivity reactions - priapism - rash - Stevens-Johnson syndrome - syncope.
- Frequency not known: When used for erectile dysfunction: Arrhythmia - myocardial infarction - seizures - unstable angina.
- When used for pulmonary arterial hypertension: Rash - retinal vascular occlusion.

PREGNANCY
Use only if potential benefit outweighs risk — no evidence of harm in animal studies.

BREAST FEEDING
Manufacturer advises avoid — no information available.

HEPATIC IMPAIRMENT
In pulmonary arterial hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.

RENAL IMPAIRMENT
Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m².

In pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily.

TREATMENT CESSATION

- When used for Pulmonary arterial hypertension: Consider gradual withdrawal.

PATIENT AND CARER ADVICE

- When used for Erectile dysfunction: Onset of effect may be delayed if taken with food.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2010 and February 2011) that sildenafil tablets (Revatio®) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (Revatio®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions
Viagra® is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII B of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug.

Tadalafil

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension (initiated under specialist supervision)**

- **BY MOUTH**
  - Adult: 40 mg once daily

**Erectile dysfunction**

- **BY MOUTH**
  - Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20 mg not recommended; maximum 1 dose per day

**Erectile dysfunction; for patients who anticipate sexual activity at least twice a week**

- **BY MOUTH**
  - Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours

**Benign prostatic hyperplasia**

- **BY MOUTH**
  - Adult: 5 mg once daily

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

History of non-articrterial anterior ischaemic optic neuropathy

**SPECIFIC CONTRA-INDICATIONS**

- When used for benign prostatic hyperplasia or erectile dysfunction Hypotension (avoid if systolic blood pressure below 90 mmHg) · mild to severe heart failure · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · recent stroke · uncontrolled arrhythmias · uncontrolled hypertension · unstable angina

- When used for pulmonary arterial hypertension Acute myocardial infarction in past 90 days

**CAUTIONS**
