- When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernous fibrosis, Peyronie’s disease) · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

- When used for pulmonary arterial hypertension Anatomical deformation of the penis · aortic and mitral valve disease · congestive cardiomyopathy · coronary artery disease · hereditary degenerative retinal disorders · hypotension (avoid if systolic blood pressure below 90 mmHg) · left ventricular dysfunction · life-threatening arrhythmias · pericardial constriction · predisposition to priapism · pulmonary veno-occlusive disease · uncontrolled hypertension

**INTERACTIONS**

- Appendix 1 (tadalafil).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Back pain · dyspepsia · flushing · headache · myalgia · nausea · vomiting

- **Uncommon** Hypertension · tachycardia

- **Frequency not known** Arrhythmia · myocardial infarction · non-artericterial anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - When used for benign prostatic hyperplasia or erectile dysfunction Dizziness · migraine · nasal congestion · visual disturbances

- When used for pulmonary arterial hypertension Blurred vision · chest pain · epistaxis · facial oedema · gastro-oesophageal reflux · hypotension · increased uterine bleeding · limb pain · nasopharyngitis · palpitation · rash

- **Uncommon**
  - When used for benign prostatic hyperplasia or erectile dysfunction Epistaxis · hypotension · painful red eyes · palpitation

- When used for pulmonary arterial hypertension Amnesia · hyperhidrosis · priapism · seizures

- **Rare**
  - When used for benign prostatic hyperplasia or erectile dysfunction Facial oedema · hypersensitivity reactions · priapism · rash · Stevens-Johnson syndrome · syncope

- **Frequency not known**
  - When used for benign prostatic hyperplasia or erectile dysfunction Abdominal pain · increased sweating · seizures · serious cardiovascular events · transient annemia

- When used for pulmonary arterial hypertension Stevens-Johnson syndrome · stroke · visual field defect

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

For pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. When used for pulmonary arterial hypertension, avoid in severe impairment. Manufacturer advises caution in severe impairment and for regular once-daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.

**RENAL IMPAIRMENT**

In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing). In pulmonary arterial hypertension, avoid in severe impairment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2012) that tadalafil (Adcirca®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

**NHS restrictions**

Cialis® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.
Vardenafil

**INDICATIONS AND DOSE**

**Erectile dysfunction**

- **BY MOUTH USING TABLETS**
  - Adult: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

- **BY MOUTH USING ORODISPERSE TABLET**
  - Adult: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

**Erectile dysfunction (patients on alpha-blocker therapy)**

- **BY MOUTH USING TABLETS**
  - Adult: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Concomitant treatment with phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

**DOSE EQUIVALENT AND CONVERSION**

- Levitra® 10 mg orodispersible tablets and Levitra® 10 mg film coated tablets are not bioequivalent.

**CONTRA-INDICATIONS**

Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina

**CAUTIONS**

Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukemia) · susceptibility to prolongation of QT interval

**INTERACTIONS**

Appendix 1 (vardenafil)

Caution with concomitant use of drugs which prolong QT interval. Avoid concomitant use of nitrates.

**SIDE-EFFECTS**

- Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting

- Drowsiness · dyspnoea · epistaxis · hypertension · hypotension · increased lacrimation · painful red eyes · palpitation · photosensitivity · tachycardia

**RARE**

Anxiety · facial oedema · hypersensitivity reactions · hypertension · priapism · raised intra-ocular pressure · rash · Stevens-Johnson syndrome · syncope · transient amnesia

**FREQUENCY NOT KNOWN**

Arrhythmia · myocardial infarction · non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina

**HEPATIC IMPAIRMENT**

Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment). Manufacturer advises avoid in severe impairment. Orodispersible tablets not suitable for patients with moderate hepatic impairment.

**RENAL IMPAIRMENT**

Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m². Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

**NHS restrictions**

Levitra® is not prescribable under the NHS for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use the BNF.

**LEVITRA® ORODISPERSIBLE TABLETS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Levitra® (Bayer Plc)
  - Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg Levitra 5mg tablets | 4 tablet POM £7.56 DT price = £7.56 | 8 tablet POM £15.12

**Prostaglandin Analogues and Prostamides**

Prostaglandins, erectile dysfunction

---

**Alprostadil**

- **Indications and Dose**
  - Erectile dysfunction (initiated under specialist supervision)
    - By urethral application
      - Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week
  - Aid to diagnosis of erectile dysfunction
    - By urethral application
      - Adult: 500 micrograms for 1 dose
  - Erectile dysfunction
    - To the skin
      - Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**Caverject**

- Erectile dysfunction
  - By intracavernosal injection
    - Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Erectile dysfunction associated with neurological dysfunction**

- By intracavernosal injection
  - Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Aid to diagnosis**

- By intracavernosal injection
  - Adult: 10–20 micrograms for 1 dose (consult product literature)

**Aid to diagnosis where evidence of neurological dysfunction**

- By intracavernosal injection
  - Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

**Viridal® DUO Continuation Pack**

- Erectile dysfunction
  - By intracavernosal injection
    - Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Neurogenic erectile dysfunction**

- By intracavernosal injection
  - Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Viridal® DUO Starter Pack**

- Erectile dysfunction
  - By intracavernosal injection
    - Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours
producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

● CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) - not for use with other agents for erectile dysfunction - predisposition to prolonged erection (as in thrombocythemia, polycythemia, sickle cell anaemia, multiple myeloma or leukaemia) - urethral application contra-indicated in balanitis - urethral application contra-indicated in severe curvature - urethral application contra-indicated in severe hypospadia - urethral application contra-indicated in urethral stricture - urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS
> With topical use Balanitis - severe curvature - severe hypospadia - urethral stricture - urethritis

● CAUTIONS
Anatomical deformations of penis (painful erection more likely) - follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop) - priapism (patients should be instructed to report any erection lasting 4 hours or longer)

● INTERACTIONS  ➔ Appendix 1 (alprostadil).

● SIDE-EFFECTS
> Common or very common Dizziness - haematoma - haemosiderin deposits - headache - hypertension - hypotension - influenza-like syndrome - injection site reactions - other localised pain (buttocks, leg, testicular, abdominal) - penile fibrosis - penile oedema - penile pain - penile rash - urethral bleeding - urethral burning

> Rare Anaphylaxis - erythema - hypersensitivity reactions - rash - urinary-tract infection - urticaria - vertigo

● CONCEPTION AND CONTRACEPTION
> With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.

> With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

● DIRECTIONS FOR ADMINISTRATION
> With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.

> With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

● PATIENT AND CARER ADVICE
Patients should be instructed to report any erection lasting 4 hours or longer.

With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

● NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Caverject®, Viridil® Duo, Vitaros® and MUSE® are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIIB of the Drug Tariff (Part XIIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF Publications.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
> Caverject (Pfizer Ltd) Alprostadil 250 microgram Caverject 5microgram powder and solvent for solution for injection vials | 1 vial (Pom) £7.73 DT price = £7.73 Alprostadil 10 microgram Caverject 10microgram powder and solvent for solution for injection vials | 1 vial (Pom) £9.24 DT price = £9.24 Alprostadil 20 microgram Caverject 20microgram powder and solvent for solution for injection vials | 1 vial (Pom) £11.94 DT price = £11.94 Alprostadil 40 microgram Caverject 40microgram powder and solvent for solution for injection vials | 1 vial (Pom) £21.58 DT price = £21.58

**SYMPATHOMIMETICS \ VASOCONSTRICTOR**

### Adrenaline/epinephrine

**DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta₂ effects); it can cause peripheral vasodilatation (a beta₁ effect) or vasoconstriction (an alpha effect).

### INDICATIONS AND DOSE

**Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)**

- **BY INTRACAVERNOSAL INJECTION**

  - **Adult:** 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution. **Important:** If suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

### UNLICENSED USE

The use of adrenaline for the treatment of priapism is an unlicensed indication.

### CAUTIONS

- Arteriosclerosis
- arrhythmias
- cerebrovascular disease
- cor pulmonale
- diabetes mellitus
- elderly
- hypercalcaemia
- hyperreflexia
- hypertension
- hyperthyroidism
- hypokalaemia
- ischaemic heart disease
- obstructive cardiomyopathy
- oculuseive vascular disease
- organic brain damage
- phaeochromocytoma
- prostate disorders
- psychoneurosis
- severe angina
- susceptibility to angle-closure glaucoma

### INTERACTIONS

→ Appendix 1 (sympathomimetics)

### SIDE-EFFECTS

- Angina
- angle-closure glaucoma
- anorexia
- anxiety
- arrhythmias
- cold extremities
- confusion
- difficulty in micturition
- dizziness
- dry mouth
- dyspnoea
- headache
- hyperglycaemia
- hypersalivation
- hypertension (risk of cerebral haemorrhage)
- hypokalaemia
- insulinoma
- metabolic acidosis
- mydriasis
- myocardial infarction
- nausea
- pallor
- palpitation
- psychosis
- pulmonary oedema (on excessive dosage or extreme sensitivity)
- restlessness
- sweating
- tachycardia
- tissue necrosis at injection site
- tissue necrosis of bowel
- tissue necrosis of extremities
- tissue necrosis of kidneys
- tissue necrosis of liver
- tremor
- urinary retention
- vomiting
- weakness

### RENAL IMPAIRMENT

Manufacturers advise use with caution in severe impairment.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

**EXCIPIENTS:** May contain Sulfites

- **Adrenaline/epinephrine (Non-proprietary)**
  - Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml Adrenaline (base) 5mg/5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [POD] £73.66
  - Adrenaline (base) 500micrograms/0.5ml (1 in 1,000) solution for injection ampoules | 10 ampoule [POD] £58.40–£58.41 DT price = £58.41
  - Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection ampoules | 10 ampoule [POD] £6.03 DT price = £6.01

### Metaraminol

**INDICATIONS AND DOSE**

**Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)**

- **BY INTRACAVERNOSAL INJECTION**

  - **Adult:** 1 mg every 15 minutes

### UNLICENSED USE

Use for priapism is an unlicensed indication.

### CONTRA-INDICATIONS

Hypertension

### CAUTIONS

- Associated with fatal hypertensive crises
- cirrhosis
- coronary vascular thrombosis
- diabetes mellitus
- elderly
- extravasation at injection site may cause necrosis
- following myocardial infarction
- hypercapnia
- hyperthyroidism
- hypoxia
- mesenteric vascular thrombosis
- peripheral vascular thrombosis
- Prinzmetal’s variant angina
- uncorrected hypovolaemia

### INTERACTIONS

→ Appendix 1 (sympathomimetics)

### SIDE-EFFECTS

- Angle-closure glaucoma
- anorexia
- anxiety
- arrhythmias
- bradycardia
- confusion
- dyspnoea
- fatal ventricular arrhythmia reported in Laennec’s cirrhosis
- headache
- hypertension
- hypoxia
- insomnia
- nausea
- palpitation
- peripheral ischaemia
- psychosis
- tachycardia
- tremor
- urinary retention
- vomiting
- weakness

### MONITORING REQUIREMENTS

Monitor blood pressure and rate of flow frequently.

### DIRECTIONS FOR ADMINISTRATION

For intracavernosal injection, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Metaraminol (Non-proprietary)**
  - Metaraminol (as Metaraminol tartrate) 10 mg per 1 ml Metaraminol 10mg/1ml solution for injection ampoules | 10 ampoule [POD] £31.97

### Phenylephrine hydrochloride

**INDICATIONS AND DOSE**

**Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)**

- **BY INTRACAVERNOSAL INJECTION**

  - **Adult:** 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

### UNLICENSED USE

Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.

### CONTRA-INDICATIONS

Hypertension

### INTERACTIONS

→ Appendix 1 (sympathomimetics)

Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.

### SIDE-EFFECTS

- Arrhythmias
- hypertension
- palpitation
- tachycardia

### DIRECTIONS FOR ADMINISTRATION

For intracavernosal injection, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Phenylephrine hydrochloride (Non-proprietary)**
  - Phenylephrine hydrochloride 10 mg per 1 ml Phenylephrine 10mg/1ml solution for injection ampoules | 10 ampoule [POD] £99.12
4.2 Premature ejaculation

**SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS**

**Dapoxetine**

- **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

- **INDICATIONS AND DOSE**
  
  Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes
  
  - **BY MOUTH**
  
    - **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

  Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes (with concomitant apreptin, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil)
  
  - **BY MOUTH**
  
    - **Adult:** Up to 30 mg, to be taken approximately 1–3 hours before sexual activity; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  
  Max. single dose 30 mg with concomitant apreptin, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil.

  Use 60–mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4.

- **CONTRA-INDICATIONS** History of bipolar disorder • history of mania • history of severe depression • history of syncope • significant cardiac disease • uncontrolled epilepsy

- **CAUTIONS** Bleeding disorders • epilepsy (discontinue if convulsions develop) • susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (dapoxetine).

  Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS**
  
  - **Common or very common** Abdominal distension • abdominal pain • abnormal dreams • agitation • anxiety • constipation • diarrhea • dizziness • drowsiness • dry mouth • dyspepsia • flushing • headache • hypertension • impaired attention • irritability • malaise • nausea • paraesthesia • sexual dysfunction • sleep disturbances • sweating • tinnitus • tremor • visual disturbances • vomiting

  - **Uncommon** Abnormal thoughts • bradycardia • bruxism • confusion • depression • eye pain • hypotension • mood disturbances • mydriasis • postural hypotension • pruritus • restlessness • sinus arrest • syncope • tachycardia • taste disturbances • vertigo

  - **Rare** Defaecation urgency • sudden onset of sleep

**SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue if psychiatric disorder develops.

Avoid if postural hypotension occurs during test dose.

- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

- **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.

- **PATIENT AND CARER ADVICE**

  Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  **CAUTIONARY AND ADVISORY LABELS 2, 25**

  - **Dapoxetine (Non-proprietary)**
    
    Dapoxetine 30 mg Dapoxetine 30mg tablets | 6 tablet £42.68

    Priligy (A. Menarini Farmaceutica Internazionale SRL)

    Dapoxetine 30 mg Priligy 30mg tablets | 3 tablet £14.71 | 6 tablet £26.48

    Dapoxetine 60 mg Priligy 60mg tablets | 3 tablet £19.12 | 6 tablet £34.42

5 **Obstetrics**

**Obstetrics**

**Prostaglandins and oxytocics**

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 753, carbetocin p. 754, ergometrine maleate p. 754, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

**Induction of abortion**

Gemeprost p. 756, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol p. 756 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication].

Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone p. 755 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

**Induction and augmentation of labour**

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally or vaginally for the induction of
labour [unlicensed indication].

Prevention and treatment of haemorrhage
Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (Syntometrine®) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (Syntometrine®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
- ergometrine by slow intravenous injection (use with caution—risk of hypertension) or
- ergometrine with oxytocin (Syntometrine®) by intramuscular injection

Carboprost p. 754 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Mifepristone
For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

Myometrial relaxants
Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 755, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta, agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 153 also has fewer side-effects than a beta, agonist.

The beta, agonists salbutamol p. 239 and terbutaline sulfate p. 241 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta, agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 1001, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta, agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

5.1 Induction of labour

PROSTAGLANDINS AND OXYTOCICS

Dinoprostone

- INDICATIONS AND DOSE

PROPESS®

Cervical ripening and induction of labour at term
- BY VAGINA
  - Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

PROSTIN E2® VAGINAL GEL

Induction of labour
- BY VAGINA
  - Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

Induction of labour (unfavourable primigravida)
- BY VAGINA
  - Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

PROSTIN E2® VAGINAL TABLETS

Induction of labour
- BY VAGINA
  - Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

DOSE EQUIVALENCE AND CONVERSION
- Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.

- CONTRA-INDICATIONS

Active cardiac disease • active pulmonary disease • avoid extra-amniotic route in cervicitis or vaginitis • fetal distress • fetal malpresentation • grand multiparas • history of caesarean section • history of difficult or traumatic delivery • history of major uterine surgery • major cephalopelvic disproportion • multiple pregnancy • placenta praevia or unexplained vaginal bleeding during pregnancy • ruptured membranes • untreated pelvic infection

- CAUTIONS

Effect of oxytocin enhanced • history of asthma • history of epilepsy • history of glaucoma and raised intraocular pressure • hypertension • risk factors for disseminated intravascular coagulation • uterine rupture • uterine scarring

- INTERACTIONS

- Appendix 1 (prostaglandins).

- SIDE-EFFECTS

Abruptio placenta • amniotic fluid embolism • backache • bronchospasm • cardiac arrest • diarrhoea • disseminated intravascular coagulation • fetal distress • fever • low Apgar scores • maternal hypertension • nausea • pulmonary embolism • rapid cervical dilation • severe
Oxytocin

**INDICATIONS AND DOSE**

**Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia**

- **BY INTRAVENOUS INFUSION**
- **Adult:** Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

**Caesarean section**

- **BY SLOW INTRAVENOUS INJECTION**
- **Adult:** 5 units immediately after delivery

**Prevention of postpartum haemorrhage after delivery of placenta**

- **BY SLOW INTRAVENOUS INJECTION**
- **Adult:** 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

**BY INTRAMUSCULAR INJECTION**

- **Adult:** 10 units, can be used instead of oxytocin with ergometrine (Syntometrine®).

**Treatment of postpartum haemorrhage**

- **BY SLOW INTRAVENOUS INJECTION**
- **Adult:** 5 units, repeated if necessary

---

**Treatment of severe cases of postpartum haemorrhage (following intravenous injection)**

- **BY INTRAVENOUS INFUSION**
- **Adult:** 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

**Incomplete, inevitable, or missed miscarriage**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- **Adult:** 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

**UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by Intramuscular injection is an unlicensed use.

**IMPORTANT SAFETY INFORMATION**

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

**CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable • any condition where vaginal delivery inadvisable • avoid intravenous injection during labour • avoid prolonged administration in oxytocin–resistant uterine inertia • avoid rapid intravenous injection (may transiently reduce blood pressure) • fetal distress (discontinue immediately if this occurs) • hypertonic uterine contractions (discontinue immediately if this occurs) • severe cardiovascular disease • severe pre-eclamptic toxaemia

**CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) • enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • history of lower-uterine segment caesarean section • induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • mild pregnancy-induced cardiac disease • mild pregnancy-induced hypertension • moderate pregnancy-induced cardiac disease • moderate pregnancy-induced hypertension • risk factors for disseminated intravascular coagulation • secondary uterine inertia • women over 35 years

**INTERACTIONS** • Appendix 1 (oxytocin). Effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity). Caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors).

**SIDE-EFFECTS**

- **Common or very common** Arrhythmia • headache • nausea • vomiting
- **Rare** Anaphylactoid reactions (with dyspnoea, hypotension, or shock) • disseminated intravascular coagulation • hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid • rash • uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) • uterine spasm (may occur at low doses) • water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

**SIDE-EFFECTS, FURTHER INFORMATION**

Avoid rapid intravenous injection (may transiently reduce blood pressure).

**Overdose**

Placental abruption and amniotic fluid embolism reported on overdose.
5.2 Postpartum haemorrhage

Other drugs used for Postpartum haemorrhage Oxytocin, p. 753

PROSTAGLANDINS AND OXYTOCICS

Carbetocin

- INDICATIONS AND DOSE
  - Prevention of uterine atony after caesarean section
    - By slow intravenous injection
      - Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- CONTRA-INDICATIONS
  - Eclampsia, epilepsy, pre-eclampsia

- CAUTIONS
  - Asthma, cardiovascular disease (avoid if severe), hypotenraemia, migraine

- SIDE-EFFECTS
  - Abdominal pain, anaemia, back pain, chest pain, chills, dizziness, dyspnoea, feeling of warmth, flushing, headache, hypotension, metallic taste, nausea, pruritus, sweating, tachycardia, tremor, vomiting

- HEPATIC IMPAIRMENT
  - Manufacturer advises avoid.

- RENAL IMPAIRMENT
  - Manufacturer advises avoid.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Pabal (Ferring Pharmaceuticals Ltd)
      - Carbetocin 100 microgram per 1 ml Pabal 100micrograms/1ml solution for injection ampoules | 5 ampoule £88.20 (Hospital only)

Carboprost

- INDICATIONS AND DOSE
  - Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin
    - By deep intramuscular injection
      - Adult: 250 micrograms at least every 15 minutes, repeated if necessary, total dose should not exceed 2 mg (8 doses)

- CONTRA-INDICATIONS
  - Cardiac disease, pulmonary disease, untreated pelvic infection

- CAUTIONS
  - Excessive dosage may cause uterine rupture, history of anaemia, history of asthma, history of diabetes, history of epilepsy, history of glaucoma, history of hypertension, history of hypotension, history of jaundice, history of raised intraocular pressure, uterine scars

- INTERACTIONS
  - Appendix 1 (prostaglandins)

- SIDE-EFFECTS
  - Bronchospasm, cardiovascular collapse, chills, diaphoresis, diarrhoea, dizziness, dyspnoea, erythema at injection site, flushing, headache, hyperthermia, nausea, pain at injection site, pulmonary oedema, raised blood pressure, vomiting

- HEPATIC IMPAIRMENT
  - Manufacturer advises avoid.

- RENAL IMPAIRMENT
  - Manufacturer advises avoid.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Hemabate (Pfizer Ltd)
      - Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Hemabate 250micrograms/1ml solution for injection ampoules | 1 ampoule £182.01 (Hospital only)

Ergometrine maleate

- INDICATIONS AND DOSE
  - Postpartum haemorrhage caused by uterine atony
    - By intramuscular injection, or by slow intravenous injection
      - Adult: 250–500 micrograms

- CONTRA-INDICATIONS
  - Eclampsia, first stage of labour, induction of labour, second stage of labour, septis, severe cardiac disease, severe hypertension, vascular disease

- CAUTIONS
  - Acute porphyrias, p. 930, cardiac disease, hypertension, multiple pregnancy, risk of hypertension associated with intravenous administration

- INTERACTIONS
  - Appendix 1 (ergot alkaloids)

- SIDE-EFFECTS
  - Common or very common
    - Abdominal pain, arrhythmias, bradycardia, chest pain, dizziness, dyspnoea, headache, hypertension, nausea, palpitation, pulmonary oedema, rash, tinnitus, vasoconstriction, vomiting

  - Very rare
    - Myocardial infarction

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- RENAL IMPAIRMENT
  - Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Ergometrine maleate (Non-proprietary)
      - Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/1ml solution for injection ampoules | 10 ampoule £12.00–£15.00
Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 754, oxytocin p. 753.

**INDICATIONS AND DOSE**

Active management of the third stage of labour

Postpartum haemorrhage caused by uterine atony

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 1 mL for one dose
  - Adult: No longer recommended

Bleeding due to incomplete miscarriage or abortion

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Adjusted according to response to, the patient’s condition and blood loss

**SIDE-EFFECTS**

- nausea.
- vomiting.
- rash.
- For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%.

**CONTRA-INDICATIONS**

Abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · intra-uterine growth restriction with abnormal fetal heart rate · placenta praevia · premature rupture of membranes after 30 weeks’ gestation · severe pre-eclampsia

**CAUTIONS**

Abnormal placental site · intra-uterine growth restriction

**SIDE-EFFECTS**

- Common or very common Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting
- Uncommon Fever · insomnia · pruritus · rash

**HEPATIC IMPAIRMENT**

No information available.

**RENAL IMPAIRMENT**

No information available.

**MONITORING REQUIREMENTS**

Monitor blood loss after delivery.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%.

Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Atosiban (Non-proprietary)**
  - Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban
    - Adult: 6.75mg/0.9ml solution for injection vials | 1 vial (Hospital only)
  - **Tractocile** (Ferring Pharmaceuticals Ltd)
    - Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile
      - Adult: 6.75mg/0.9ml solution for injection vials | 1 vial (Hospital only)

**Solution for infusion**

- **Atosiban (Non-proprietary)**
  - Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban
    - Adult: 37.5mg/5ml concentrate for solution for infusion vials | 1 vial (Hospital only)
    - Adult: 37.5mg/5ml concentrate for solution for infusion vials | 1 vial (Hospital only)
  - **Tractocile** (Ferring Pharmaceuticals Ltd)
    - Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile
      - Adult: 37.5mg/5ml solution for infusion vials | 1 vial (Hospital only)

5.3 Premature labour

Other drugs used for Premature labour

- Nifedipine, p. 153
- Salbutamol, p. 239
- Terbutaline sulfate, p. 241

**OXYTOCIN RECEPTOR ANTAGONISTS**

**Atosiban**

**INDICATIONS AND DOSE**

Uncomplicated premature labour between 24 and 33 weeks of gestation

- Initially by intravenous injection
- Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

**CONTRA-INDICATIONS**

Abruptio placenta · antepartum haemorrhage (requiring immediate delivery) · eclampsia · intra-uterine fetal death · intra-uterine infection · intra-uterine growth restriction with abnormal fetal heart rate · placenta praevia · premature rupture of membranes after 30 weeks’ gestation · severe pre-eclampsia

**CAUTIONS**

Abnormal placental site · intra-uterine growth restriction

**SIDE-EFFECTS**

- Common or very common Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting
- Uncommon Fever · insomnia · pruritus · rash

**HEPATIC IMPAIRMENT**

No information available.

**RENAL IMPAIRMENT**

No information available.

**MONITORING REQUIREMENTS**

Monitor blood loss after delivery.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%.

Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

**5.4 Termination of pregnancy**

PROGESTERONE RECEPTOR MODULATORS

**Mifepristone**

**INDICATIONS AND DOSE**

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
**Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)**

- **BY MOUTH**
  - Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended.

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma

- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease

- **INTERACTIONS** → Appendix 1 (mifepristone).

- **SIDE-EFFECTS**
  - Common or very common Gastro-intestinal cramps · uterine contractions · vaginal bleeding (sometimes severe) may occur between administration of misoprostol and surgery (and rarely abortion may occur before surgery)
  - Uncommon Hypersensitivity reactions · rash · urticaria
  - Rare Chills · dizziness · fever · headache · hot flushes · hypotension · malaise
  - Frequency not known Infections · toxic shock syndrome

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).

- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.

- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 10
  - **Mifepristone (Non-proprietary)** Mifepristone 200 mg Mifepristone 200mg tablets | 1 tablet [POM] no price available (Hospital only)
  - **Mifegyne (Nordic Pharma Ltd)** Mifepristone 200 mg Mifegyne 200mg tablets | 3 tablet [POM] £52.66 (Hospital only)

**PROSTAGLANDINS AND OXYTOCICS**

**Gemeprost**

- **INDICATIONS AND DOSE**
  - **Cervical ripening prior to first trimester surgical abortion**
    - **BY VAGINA**
    - Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery
  - **Second trimester abortion**
    - **BY VAGINA**
    - Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring

- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis

- **INTERACTIONS** → Appendix 1 (prostaglandins).

- **SIDE-EFFECTS** Backache · chest pain · chills · coronary artery spasm · diarrhoea · dizziness · dyspnoea · flushing · headache · mild pyrexia · muscle weakness · myocardial infarction · nausea · palpitation · severe hypotension · uterine pain · uterine rupture (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics) · vaginal bleeding · vomiting

- **MONITORING REQUIREMENTS**
  - If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Pessary**
    - **Gemeprost (Non-proprietary)**
    - Gemeprost 1 mg Gemeprost 1mg pessaries | 5 pessary [POM] no price available

**Misoprostol**

- **DRUG ACTION** Misoprostol acts as a potent uterine stimulant.

- **INDICATIONS AND DOSE**
  - **Termination of pregnancy following mifepristone (gestation up to 49 days)**
    - **BY MOUTH**
    - Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone
Termination of pregnancy following mifepristone (gestation 50 to 63 days)

- **INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION**
- Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)

- **INITIALLY BY VAGINA**
- Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)

- **INITIALLY BY VAGINA**
- Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

- **UNLICENSED USE** Use of misoprostol for termination of pregnancy is an unlicensed use.
- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - inflammatory bowel disease
- **INTERACTIONS** → Appendix 1 (misoprostol)
- **SIDE-EFFECTS**
  - Common or very common Diarrhoea
  - Frequency not known Abdominal pain - abnormal vaginal bleeding - dizziness - dyspesia - flatulence - intermenstrual bleeding - menorrhagia - nausea - postmenopausal bleeding - rashes - vomiting
- **BREAST FEEDING** Present in milk, but amount probably too small to be harmful.

### Vaginal and vulval conditions

#### Vaginal and vulval conditions

##### Management

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure. *Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

**Topical anaesthetic agents** give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

**Systemic drugs** are required in the treatment of infections such as gonorrhoea and syphilis.

#### Preparations for vaginal and vulval changes

**Topical HRT for vaginal atrophy**

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is important to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when systemic oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

**Non-hormonal preparations for vaginal atrophy**

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

#### Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

**Fungal infections**

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs (clotrimazole p. 758, econazole nitrate p. 759, fenticonazole nitrate p. 759, and miconazole p. 760) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with *fluconazole* p. 548 or *itraconazole* p. 550 is also effective.

**Vulvovaginal candidiasis in pregnancy**

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis**

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner
may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections
Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 499 or tinidazole p. 501. Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery. Clindamycin, cream below and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir, famciclovir and valaciclovir p. 587, and famciclovir p. 587, and valaciclovir p. 587 can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

6.1 Vaginal and vulval infections

6.1a Vaginal and vulval bacterial infections

Other drugs used for Vaginal and vulval bacterial infections Metronidazole, p. 499

Other drugs used for Vaginal and vulval fungal infections Fluconazole, p. 548 · Itraconazole, p. 550

CARBOXYLIC ACIDS

Lactic acid

- INDICATIONS AND DOSE
  - BALANCE ACTIV RX® GEL
    - Prevention of bacterial vaginosis
      - BY VAGINA
        - Adult: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)
    - RELACTAGEL® GEL
      - Prevention of bacterial vaginosis
        - BY VAGINA
        - Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

- SIDE-EFFECTS
  - RELACTAGEL® GEL Mild irritation
  - CONCEPTION AND CONCEPTION
    - RELACTAGEL® GEL Not recommended if trying to conceive.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Gel EXCIPIENTS: May contain Propylene glycol
    - Balance Activ (BBI Healthcare Ltd)
      - Balance Activa BV vaginal pH correction gel | 7 device £5.25
    - Relactagel (KoRa Healthcare)
      - Relactagel vaginal pH correction gel | 7 device £5.25

- ANTIFUNGALS ➤ IMIDAZOLE ANTIFUNGALS

Clotrimazole

- INDICATIONS AND DOSE
  - Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)
    - BY VAGINA USING CREAM
      - Adult: Apply 2–3 times a day, to be applied to anogenital area
  - Vaginal candidiasis (dose for 10% intravaginal cream)
    - BY VAGINA USING VAGINAL CREAM
      - Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary
  - Vaginal candidiasis
    - BY VAGINA USING PESSARIES
      - Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary
  - Recurrent vulvovaginal candidiasis
    - BY VAGINA USING PESSARIES
      - Adult: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- SIDE-EFFECTS Local irritation
- CONCEPTION AND CONCEPTION
  - Cream and pessaries may damage latex condoms and diaphragms.
Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Brands for sale to the public include Canesten® Internal Cream.

There can be variation in the licensing of different medicines containing the same drug.

**Pessary**

- Canesten (Janssen-Cilag Ltd)
  - Econazole nitrate 150 mg | 1 pessary £3.69
  - Canesten 150mg vaginal pessaries | 3 pessary £4.17

**Cream**

- Canesten (Janssen-Cilag Ltd)
  - Econazole nitrate 10 mg per 1 gram | 15 gram £2.11 | 30 gram £3.78

**Fenticonazole nitrate**

**INDICATIONS AND DOSE**

**Vaginal and vulva candidiasis**

- Adult: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
- BY VAGINA USING CREAM
  - Adult: 1 applicatorful twice daily for 3 days

**DOSE EQUIVALENT AND CONVERSION**

- With topical use: 1 applicatorful delivers a 5 g dose of fenticonazole 2 %.

**SIDE-EFFECTS** Local irritation

**CONCEPTION AND CONTRACEPTION** Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Gynoxin (Recordati Pharmaceuticals Ltd)
  - Fenticonazole nitrate 200 mg | 3 capsule £2.42

**Cream**

- Gynoxin (Recordati Pharmaceuticals Ltd)
  - Fenticonazole nitrate 20 mg per 1 gram | 1 capsule £3.74

**Ketoconazole**

**INDICATIONS AND DOSE**

**Vaginal and vulva candidiasis**

- Adult: Apply 1–2 times a day, to be applied to the anogenital area

**SIDE-EFFECTS** Occasional local irritation

**CONCEPTION AND CONTRACEPTION** Effects on latex condoms and diaphragms not yet known.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- Nizoral (Janssen-Cilag Ltd)
  - Ketoconazole 20 mg per 1 gram | 30 gram £4.24 DT price = £4.24
Miconazole

**INDICATIONS AND DOSE**

**Vaginal and vulval candidiasis**
- By vagina using cream or capsule
- Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
- Adult: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
- By vagina using cream
  - Adult: Apply 1 applicatorful daily for 10 to 14 days, alternatively apply 1 applicatorful twice daily for 7 days, course can be repeated once if necessary

Superficial sites of infection in vaginal and vulval candidiasis | Vulvitis
- By vagina using cream
- Adult: Apply twice daily, apply to the anogenital area

**INTERACTIONS**
- Common or very common: Nausea, rash, vomiting
- Frequency not known: Occasional local irritation
- CONCEPTION AND CONTRACEPTION: Gyno-Daktarin® damages latex condoms and diaphragms.
- Pregnancy: Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- Breast feeding: Manufacturer advises caution—no information available.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- Capsule: **EXCIPIENTS:** May contain hydroxybenzoates (parabens)
  - Gyno-Daktarin (Janssen-Cilag Ltd)
  - Miconazole nitrate 1.2 gram Gyno-Daktarin 1200 mg vaginal capsules 1 capsule (Pom) £2.94 OT price £2.94
- Cream: **EXCIPIENTS:** May contain butylated hydroxyanisole
  - Gyno-Daktarin (Janssen-Cilag Ltd)
  - Miconazole nitrate 20 mg per 1 gram Gyno-Daktarin 2% vaginal cream 1 tube (Pom) £4.33

6.2 Vaginal atrophy

**OESTROGENS**

**Estradiol**

**INDICATIONS AND DOSE**

**ESTRING®**
- Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)
- By vagina
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

**VAGIFEM®**
- Improve the vaginal epithelium in menopausal atrophic vaginitis
  - By vagina
  - Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

**CONTRA-INDICATIONS**
- Active arterial thromboembolic disease (e.g. angina or myocardial infarction)

thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophiolic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

**CAUTIONS**
- Avoid in acute porphyrias p. 930 · avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **SIDE-EFFECTS**
  - Common or very common: Nausea, rash, vomiting
  - Frequency not known: Occasional local irritation

• Risk of breast cancer: It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult by mammographic density increase with HRT use.

• Risk of endometrial cancer: The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

• Risk of ovarian cancer: Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

• Risk of venous thromboembolism: Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

• Risk of stroke: Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

• Risk of coronary heart disease: HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause,
studies suggest a lower relative risk compared with older women.

- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1 (oestrogens).

- **SIDE-EFFECTS** Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - chloasma - glucose intolerance - headache - headache (on vigorous exercise) - leg cramps (rule out venous thrombosis) - local irritation - migraine - mood changes - nausea - premenstrual-like syndrome - sodium retention - vaginal candidiasis - vomiting - weight changes

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly if not repeated under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**VAGIFEM®** No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid; adverse effects on lactation.

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

- **MONITORING REQUIREMENTS**

  - History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Pessary**

- **Vagifem** (Novo Nordisk Ltd)
  - Estradiol 10 microgram vaginal tablets | 24 pessary £16.72 0T price = £16.72

**Vaginal delivery system**

**CAUTIONARY AND ADVISORY LABELS 10**

- **Estring** (Pfizer Ltd)
  - Estradiol (as Estradiol hemihydrate) 7.5 microgram per 24 hour
    - Estring 7.5micrograms/24hours vaginal delivery system | 1 device £31.42

**Estriol**

- **INDICATIONS AND DOSE**

  **OVESTIN®**

  - **Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)**

    - **FOR VAGINA**
      - Adult: Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, discontinue every 2–3 months for 4 weeks to assess need for further treatment

  **Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)**

    - **FOR VAGINA**
      - Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 930 - diabetes (increased risk of heart disease) - factors predisposing to thromboembolism - history of breast nodules—closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia - history of fibrocystic disease—closely monitor breast status (risk of breast cancer) - hypophyseal tumours - increased risk of gall-bladder disease - interrupt treatment periodically to assess need for continued treatment - migraine (or migraine-like headaches) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

**CAUTIONS, FURTHER INFORMATION**

- **Risk of breast cancer** It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.
  - Radioiodination of breast cancer can be made more difficult as mammographic density can increase with HRT use.
  - **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.
In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- Risk of ovarian cancer: Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- Risk of venous thromboembolism: Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- Risk of stroke: Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

- Risk of coronary heart disease: HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions: The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- INTERACTIONS: Appendix 1 (oestrogens).
- SIDE-EFFECTS: Abdominal bloating, abdominal cramps, altered blood lipids (may lead to pancreatitis, rashes and chloasma), breast enlargement, breast tenderness, changes in libido, cholestatic jaundice, contact lenses may irritate, depression, dizziness, fluid retention, glucose intolerance, headache, leg cramps, local irritation, migraine, mood changes, nausea, premenstrual-like syndrome, sodium retention, vaginal candidiasis, vomiting, weight changes

SIDE-EFFECTS, FURTHER INFORMATION
- Leg Cramps: Venous thrombosis should be ruled out.
- Withdrawal Bleeding: Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- CONCEPTION AND CONTRACEPTION: Effect on latex condoms and diaphragms not yet known.
- PREGNANCY: Not known to be harmful.
- BREAST FEEDING: Avoid; adverse effects on lactation.

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 765, ciclosporin p. 766, mercaptopurine p. 816, and methotrexate p. 817 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 898 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 773), calcineurin inhibitors (ciclosporin or tacrolimus p. 769), corticosteroids, or sirolimus p. 768. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised — important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 980 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 802 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 622 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non–Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non–myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart–lung transplantation, and for prophylaxis and treatment of graft–versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non–calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 772 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 774 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein–Barr virus. It is used with interleukin-2 receptor antagonist.
induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

NICE technology appraisals (TAs)
For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:
- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA85

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen only if:
- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

IMMUNE SERA AND IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

- **INDICATIONS AND DOSE**
  - Prophylaxis of organ rejection in heart allograft recipients
    - BY INTRAVENOUS INFUSION
      - Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours
  - Prophylaxis of organ rejection in renal allograft recipients
    - BY INTRAVENOUS INFUSION
      - Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours
  - Treatment of corticosteroid-resistant allograft rejection in renal transplantation
    - BY INTRAVENOUS INFUSION
      - Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

- **CONTRA-INDICATIONS**
  - Infection

- **SIDE-EFFECTS**
  - Anaphylaxis · cytokine release syndrome · diarrhoea · dysphagia · fever · hypotension · increased susceptibility to infection · increased susceptibility to malignancy · infusion-related reactions · lymphopoenia · myalgia · nausea · neutropenia · pruritus · rash · serum sickness · shivering · thrombocytopenia · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION**
  - For continuous intravenous infusion (Thymoglobulin®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for infusions to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**
    - Antithymocyte immunoglobulin (rabbit) 20 mg per 1 mL Grafalon 100mg/5mL concentrate for solution for infusion vials | 1 vial no price available

  **Powder and solvent for solution for infusion**
  - **Thymoglobulin** (Sanofi)
    - Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobulin 25mg powder and solvent for solution for infusion vials | 1 vial £158.77 (Hospital only)
Azathioprine

**DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

### INDICATIONS AND DOSE

**Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis**

- **Adult:** 2–2.5 mg/kg daily, some patients may respond to lower doses

**Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders**

- **Adult:** Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

**Autoimmune conditions**

- **Adult:** 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Suppression of transplant rejection**

- **Adult:** 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Severe refractory eczema, normal or high TPMT activity**

- **Adult:** 1–3 mg/kg daily

**Severe refractory eczema, intermediate TPMT activity**

- **Adult:** 0.5–1.5 mg/kg daily

**Generalised myasthenia gravis**

- **Adult:** Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

### UNLICENSED USE

Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

### CONTRA-INDICATIONS

- When used for severe refractory eczema Absent thiopurine methyltransferase (TPMT) activity • very low thiopurine methyltransferase (TPMT) activity

### CAUTIONS

- Reduce dose in elderly - reduced thiopurine methyltransferase activity

### INTERACTIONS

- Appendix 1 (azathioprine).

### SIDE-EFFECTS

- Rare Hepatic veno-occlusive disease • lymphoma • pancreatitis • pneumonitis • red cell aplasia

- Frequency not known Arthralgia • cholestatic jaundice • colitis in patients also receiving corticosteroids • diarrhoea • dizziness • dose-related bone marrow suppression • fever • hair loss • herpes zoster infection • hypersensitivity reactions • hypotension • increased susceptibility to infections in patients also receiving corticosteroids • interstitial nephritis • liver impairment • malaise • myalgia • neutropenia • rash • rigors • thrombocytopenia • vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- Red cell aplasia Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.

- Neutropenia and thrombocytopenia Usually resolved by reducing the dose.

- Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

- Nausea, vomiting and diarrhoea Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in hypersensitivity to mercaptopurine.

### PREGNANCY

Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth–weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

### BREAST FEEDING

Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

### HEPATIC IMPAIRMENT

Reduce dose. Monitor liver function.

### RENAL IMPAIRMENT

Reduce dose.

### PRE-TREATMENT SCREENING

Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

### MONITORING REQUIREMENTS

- Monitor for toxicity throughout treatment.

- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

### DIRECTIONS FOR ADMINISTRATION

For intravenous injection, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For intravenous
Immune system and malignant disease

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin

01-Sep-2016

Drug action
Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

Indications and dose
Severe acute ulcerative colitis refractory to corticosteroid treatment

- By continuous intravenous infusion
- Adult: 5 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

Severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective (administered on expert advice)

- By mouth
- Adult: Initially 2.5 mg/kg daily in 2 divided doses, increased if necessary up to 4 mg/kg daily after 6 weeks, if dose increases are necessary they should be made gradually, discontinue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- By mouth
- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Contra-indications
Abnormal baseline renal function (in non-transplant indications) - malignancy (in non-transplant indications) - uncontrolled hypertension (in non-transplant indications) - uncontrolled infections (in non-transplant indications)

Caution
Patients with active infections are not suitable for ciclosporin therapy

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- By mouth
- Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

- By mouth
- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Bone marrow transplantation | Prevention and treatment of graft-versus-host disease

- Initially by intravenous infusion
- Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

- By mouth
- Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

Unlicensed use
Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

Important safety information
MHRA/CHM advice: Ciclosporin must be prescribed and dispensed by brand name (December 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.
psoriasis, treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) - in uveitis, Behcet’s syndrome (monitor neurological status) - lymphoproliferative disorders (discontinue treatment) - malignancy

CAUTIONS, FURTHER INFORMATION

- **Malignancy**
  - In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

- **INTERACTIONS**
  - Appendix 1 (ciclosporin).
  - For patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer).

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain
    - acne
    - anorexia
    - convulsion
    - diarrhoea
    - fatigue
    - flushing
    - gingival hyperplasia
    - headache
    - hepatic dysfunction
    - hirsutism
    - hyperglycaemia
    - hyperkalaemia
    - hyperlipidaemia
    - hypertension
    - hypertrichosis
    - hyperuricaemia
    - hypomagnesaemia
    - leucopenia
    - muscle cramps
    - myalgia
    - nausea
    - paraesthesia
    - peptic ulcer
    - pyrexia
    - renal dysfunction
    - tremor
    - vomiting
  - **Uncommon**
    - Anaemia
    - oedema
    - signs of encephalopathy
    - thrombocytopenia
    - weight gain
  - **Rare**
    - Gynaecomastia
    - haemolytic uraemic syndrome
    - menstrual disturbances
    - micro-angiopathic haemolytic anaemia
    - motor polyneuropathy
    - muscle weakness
    - myopathy
    - pancreatitis
  - **Very rare**
    - Visual disturbances secondary to benign intracranial hypertension
  - **Frequency not known**
    - With intravenous use
      - Anaphylaxis
    - With systemic use
      - Migraine
      - pain in lower extremities
  - **PREGNANCY**
    - Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
  - **BREAST FEEDING**
    - Manufacturer advises avoid—present in milk.
  - **HEPATIC IMPAIRMENT**
    - Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.
  - **RENAL IMPAIRMENT**
    - In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid.
    - In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment.
    - During treatment for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
  - **MONITORING REQUIREMENTS**
    - Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
    - Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
    - Monitor liver function.
    - Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia).
    - Monitor serum magnesium.
    - Measure blood lipids before treatment and after the first month of treatment.
    - In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
    - Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
    - Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
    - Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
    - In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
    - In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).
    - Monitor hepatic function if concomitant NSAIDs given.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use
    - Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
  - With intravenous use
    - For intravenous infusion (Sandimmun®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Brand name prescribing
  - Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications). Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

- **PATIENT AND CARER ADVICE**
  - Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UBV or PUVA.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**EXCIPIENTS:**
- Ethanol, ethyl lactate, propylene glycol

- **Ciclosporin (Non-proprietary)**
  - **Ciclosporin 25 mg**
  - Ciclosporin 25mg capsules | 30 capsule

- **Ciclosporin 50 mg**
  - Ciclosporin 50mg capsules | 30 capsule

- **Ciclosporin 100 mg**

Sandimmun 50mg/1ml concentrate for solution for infusion ampoules | 10 ampoule | £23.23

Sirolimus

**INDICATIONS AND DOSE**

**Prophylaxis of organ rejection in kidney allograft recipients**

- **BY MOUTH**
  - Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

**DOSE EQUIVALENCE AND CONVERSION**

- The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

**CAUTIONS**

- Hyperlipidaemia - increased susceptibility to infection (especially urinary-tract infection) - increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

**INTERACTIONS** → Appendix 1 (sirolimus).

**SIDE-EFFECTS**

**Uncommon** Nephrotic syndrome - pancreatitis - pancytopenia - pericardial effusion - pulmonary embolism - pulmonary haemorrhage

- Rare Alveolar proteinosis - anaphylactic reactions - angioedema - exfoliative dermatitis - hepatic necrosis - hypersensitivity reactions - hypersensitivity vasculitis - interstitial lung disease - lymphoedema

**Frequency not known** Focal segmental glomerulosclerosis - reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
- Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
- When changing between oral solution and tablets, measurement of whole blood ’trough’ sirolimus concentration after 1–2 weeks is recommended.
- Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

**DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least
120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Rapamune (Pfizer Ltd)**
  - Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet [PO] £86.49 DT price = £86.49
  - Sirolimus 500 microgram Rapamune 0.5mg tablets | 30 tablet [PO] £69.00 DT price = £69.00
  - Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PO] £172.98 DT price = £172.98

**Oral solution**
EXCIPIENTS: May contain Ethanol
- Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free
  - 60 ml [PO] £162.41

---

**Tacrolimus**

**INDICATIONS AND DOSE**

**ADOPORT®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- **BY MOUTH**
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
- **BY MOUTH**
  - Adult: Seek specialist advice

**ENVARSUS® MODIFIED-RELEASE TABLETS**

Prophylaxis of graft rejection following liver transplantation, starting within 24 hours of transplantation
- **BY MOUTH**
  - Adult: Initially 110–130 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following renal transplantation, starting within 24 hours of transplantation
- **BY MOUTH**
  - Adult: Initially 170 micrograms/kg once daily, to be taken in the morning

Rejection therapy
- **BY MOUTH**
  - Adult: Seek specialist advice

**MODIGRAF®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- **BY MOUTH**
  - Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- **BY MOUTH**
  - Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- **BY MOUTH**
  - Adult: Initially 75 micrograms/kg daily in 2 divided doses

Immune system disorders and transplantation

770

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Rejection therapy
- Adult: Seek specialist advice

**PROGRAF® CAPSULES**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate**
- Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate**
- Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Allograft rejection resistant to conventional immunosuppressive therapy**
- Adult: Seek specialist advice (consult local protocol)

**TACNI®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
- Adult: Seek specialist advice

**VIVADEX®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
- Adult: Seek specialist advice

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)**

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection.
rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- **Adoport®, Prograf®, Capexion®, Tacn®, and Vivadex®** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf® granules** are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf®** is a prolonged-release capsule that is taken once daily in the morning.

Switcthing between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist. Important: **Envarsus®** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections - lymphoproliferative disorders - malignancies - neurotoxicity - QT-interval prolongation - UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1 (tacrolimus).

Contra-indication—avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).

- **SIDE-EFFECTS**

  - **Rare** Blindness - dehydration - hirsutism - pericardial effusion - posterior reversible encephalopathy syndrome - respiratory distress syndrome - thrombotic thrombocytopenic purpura - toxic epidermal necrolysis

  - **Very rare** Haemorrhagic cystitis - myasthenia - Stevens-Johnson syndrome

  - **Frequency not known** Agranulocytosis - haemolytic anaemia - pure red cell aplasia

**SIDE-EFFECTS, FURTHER INFORMATION**

Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

**CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.

**PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.

**BREAST FEEDING** Avoid—present in breast milk (following systemic administration).

**HEPATIC IMPAIRMENT** Dose reduction may be necessary in severe impairment.

**MONITORING REQUIREMENTS**

- After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.

- Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Prograf®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

**PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2010) that tacrolimus granules for oral suspension (Modigraf®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- **Envarsus® (Chiesi Ltd)**
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg Envarsus 1mg modified-release tablets | 30 tablet DT price = £59.10
  - Tacrolimus (as Tacrolimus monohydrate) 4 mg Envarsus 4mg modified-release tablets | 30 tablet DT price = £236.40

- **Tacrolimus (as Tacrolimus monohydrate)**
  - 750 microgram Envarsus 750microgram modified-release tablets | 30 tablet DT price = £44.33

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 23

- **Adoport® (Sandoz Ltd)**
  - Tacrolimus 500 microgram Adoport 0.5mg capsules | 50 capsule DT price = £61.88
  - Tacrolimus 750 microgram Adoport 0.75mg capsules | 50 capsule DT price = £51.75

- **Tacrolimus 1 mg** Adoport 1mg capsules | 50 capsule DT price = £55.69 | 100 capsule DT price = £111.36

- **Tacrolimus 2 mg** Adoport 2mg capsules | 50 capsule DT price = £111.00 | 100 capsule DT price = £205.74

- **Tacrolimus 5 mg** Adoport 5mg capsules | 50 capsule DT price = £296.55

- **Capexion® (Mylan Ltd)**
  - Tacrolimus 500 microgram Capexion 0.5mg capsules | 50 capsule DT price = £52.50 | 100 capsule DT price = £105.00

- **Prograf® (Astellas Pharma Ltd)**
  - Tacrolimus 500 microgram Prograf 0.5mg capsules | 50 capsule DT price = £61.88
  - Tacrolimus 1 mg Prograf 1mg capsules | 50 capsule DT price = £80.28 | 100 capsule DT price = £160.54

- **Tacrolimus 5 mg** Prograf 5mg capsules | 50 capsule DT price = £296.58
Modified-release capsule

**CAUTIONARY AND ADVISORY LABELS 23, 25**

- Advagraf (Astellas Pharma Ltd)
  - Tacrolimus (as Tacrolimus monohydrate) 500 microgram/5 ml modified-release capsules 50 capsule (£52.15)
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg/1 ml modified-release capsules 50 capsule (£61.59)
  - Tacrolimus (as Tacrolimus monohydrate) 3 mg/3 ml modified-release capsules 50 capsule (£134.76)
  - Tacrolimus (as Tacrolimus monohydrate) 5 mg/5 ml modified-release capsules 50 capsule (£266.92)

**Granules**

**CAUTIONARY AND ADVISORY LABELS 13, 23**

- Modigraft (Astellas Pharma Ltd)
  - Tacrolimus (as Tacrolimus monohydrate) 200 microgram/2 ml granules sachets sugar-free 50 sachet (£131.30)
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg/1 ml granules sachets sugar-free 50 sachet (£356.65)

**Solution for infusion**

**EXCIPIENTS** May contain Polyoxyly castor oils

- Prograf (Astellas Pharma Ltd)
  - Tacrolimus 5 mg per 1 ml Prograf 5mg/1ml solution for infusion ampoules 10 ampoule (£84.51)

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES**

### Canakinumab

**DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**INDICATIONS AND DOSE**

Acute gout in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated.

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Active infection • leucopenia • neutropenia

**CAUTIONS** History of recurrent infection • latent and active tuberculosis • predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

- Vaccinations: Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

**INTERACTIONS** → Appendix 1 (canakinumab).

- Contra-indicated with concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections).

**SIDE-EFFECTS**

- Back pain • increased susceptibility to infection (including serious infection) • injection-site reactions • malaise • neutropenia • vertigo

- Common Gastro-oesophageal reflux

- Frequency not known Malignancy • vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.

**HEPATIC IMPAIRMENT** No information available.

**RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.

**PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.

**MONITORING REQUIREMENTS**

- Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.

- Monitor for signs and symptoms of tuberculosis during and after treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Ilaris (Novartis Pharmaceuticals UK Ltd) Canakinumab 150 mg Ilaris 150mg powder for solution for injection vials 1 vial (£50.00)

- Canakinumab 150 mg Ilaris 150mg powder for solution for injection vials 1 vial (£927.80)

**IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE**

### Basiliximab

**DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

**INDICATIONS AND DOSE**

Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

**CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects

**INTERACTIONS** → Appendix 1 (basiliximab).

**SIDE-EFFECTS** Atrial flutter • cardiac arrest • cytokine release syndrome • palpitations • severe hypersensitivity reactions

**CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Simulect®) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.
BREAST FEEDING
Frequency not known

SIDE-EFFECTS

CAUTIONS
Do not initiate until active infections controlled; history or development of malignancy; predisposition to infection

INTERACTIONS ▶ Appendix 1 (belimumab).

SIDE-EFFECTS ▶ Common or very common Infusion-related reactions ▶ Frequency not known Depression; diarrhoea; hypersensitivity reactions; infections; insomnia; leucopenia; migraine; nausea; pain in extremities; pyrexia; vomiting
SIDE-EFFECTS, FURTHER INFORMATION Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an anti-pyretic may be considered.

CONCESSION AND CONTRACEPTION
Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.

PREGNANCY Avoid unless essential.

BREAST FEEDING Avoid—present in milk in animal studies.

RENAL IMPAIRMENT Caution in severe impairment—no information available.

MONITORING REQUIREMENTS Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Benlysta®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

NATIONAL FUNDING/ACCESS DECISIONS NICE technology appraisals (TAs) ▶ Belimumab for treating active autoantibody-positive systemic lupus erythematosus (June 2016) NICE TA397 Belimumab is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria apply:
- there is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment – Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy; treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
- the manufacturer provides belimumab with the discount agreed in the patient access scheme; and
- under the conditions specified in the NICE managed access agreement documentation. Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

IMMUNOSUPPRESSANTS ▶ PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

INDICATIONS AND DOSE Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision) ▶ BY MOUTH ▶ Adult: 1 g twice daily, to be started within 72 hours of transplantation ▶ BY INTRAVENOUS INFUSION ▶ Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision) ▶ BY MOUTH ▶ Adult: 1.5 g twice daily, to be started within 5 days of transplantation Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision) ▶ INITIALLY BY INTRAVENOUS INFUSION ▶ Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

MYFORTIC® Renal transplantation ▶ BY MOUTH ▶ Adult: 720 mg twice daily, to be started within 72 hours of transplantation

DOSE EQUIVALENCE AND CONVERSION ▶ For Myfortic®, Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

CAUTIONS Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · delayed graft function · elderly (increased risk of infection, gastrointestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants
Immune system disorders and transplantation

CAUTIONS, FURTHER INFORMATION
- Hypogammaglobulinaemia or bronchiectasis: Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- INTERACTIONS: Appendix 1 (mycophenolate).
- Live vaccines: Specialist advice should be sought for those being treated with immunosuppressive drugs.

SIDE-EFFECTS
- Common or very common: Abdominal pain, acne, agitation, alopecia, anaemia, anorexia, anxiety, arthralgia, blood disorders, confusion, constipation, convulsions, cough, depression, disturbances of blood lipids, disturbances of electrolytes and blood lipids, dizziness, dysphonia, flatulence, gastro-intestinal bleeding, gastro-intestinal inflammation, gastro-intestinal ulceration, gingival hyperplasia, headache, hepatitis, hyperglycaemia, hypertension, hypotension, infections, influenza-like syndrome, insomnia, jaundice, leucopenia, malignancy (particularly of the skin), myasthenic syndrome, nausea, oedema, pancreatitis, pancytopenia, paraesthesia, rash, red cell aplasia, renal impairment, skin hypertrophy, stomatitis, tachycardia, taste disturbance, thrombocytopenia, tremor, vasodilatation, vomiting, weight loss.
- Frequency not known: Interstitial lung disease, intestinal villous atrophy, progressive multifocal leucoencephalopathy, pulmonary fibrosis.

SIDE-EFFECTS, FURTHER INFORMATION
Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

CONCEPTION AND CONTRACEPTION: In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

MYFORTIC®: Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.

PREGNANCY: Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.

RENAL IMPAIRMENT: No data available in cardiac or hepatic transplant patients with renal impairment.

MONITORING REQUIREMENTS: Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

DIRECTIONS FOR ADMINISTRATION: For intravenous infusion (CellCept®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.

PATIENT AND CARER ADVICE
Bone marrow suppression: Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

MEDITICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

Tablet
- Mycophenolate mofetil (Non-proprietary): Mycophenolate mofetil 500 mg tablets 50 tablet (Roche Products Ltd) £42.50 DT price = £6.64
- CellCept (Roche Products Ltd): Mycophenolate mofetil 500 mg tablets 50 tablet (Roche Products Ltd) £82.26 DT price = £6.64
- Myfenax (Teva UK Ltd): Mycophenolate mofetil 500 mg tablets 50 tablet (Teva) £78.15 DT price = £6.64

Gastro-resistant tablet
CAUTIONARY AND ADVISORY LABELS: 25
- Myfortic (Novartis Pharmaceuticals UK Ltd): Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180 mg gastro-resistant tablets 120 tablet (Roche) £96.72
- Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360 mg gastro-resistant tablets 120 tablet (Roche) £193.43

Capsule
- Mycophenolate mofetil (Non-proprietary): Mycophenolate mofetil 250 mg capsules 100 capsule (Myfortic) £82.26 DT price = £82.26

- CellCept (Roche Products Ltd): Mycophenolate mofetil 250 mg capsules 100 capsule (Roche) £82.26 DT price = £82.26

- Myfenax (Teva UK Ltd): Mycophenolate mofetil 250 mg capsules 100 capsule (Teva) £78.15 DT price = £82.26

Oral suspension
EXCipients: May contain Aspartame
- CellCept (Roche Products Ltd): Mycophenolate mofetil 200 mg per 1 ml CellCept 1g/5ml oral suspension sugar-free 175 ml (Roche) £115.16 DT price = £115.16

Powder for solution for infusion
- Mycophenolate mofetil (Non-proprietary): Mycophenolate mofetil (as Mycophenolate mofetil hydrochloride) 500 mg Mycophenolate mofetil 500 mg powder for concentrate for solution for infusion vials 4 vial (Roche) £26.64

IMMUNOSUPPRESSANTS: T-CELL ACTIVATION INHIBITORS

Belatacept

- INDICATIONS AND DOSE: Prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus
  - By intravenous infusion

- Adult: (consult product literature)

- CAUTIONS: Increased risk of acute graft rejection—with tapering of corticosteroid, particularly in patients with high immunologic risk—increased risk of infection—latent and active tuberculosis—risk factors for post-transplant lymphoproliferative disorder

- SIDE-EFFECTS
  - Common or very common: Anaemia, constipation, cough, dehydration, diarrhoea, headache, hypotension, hypophosphataemia, infection, leucopenia, malignancy, nausea, peripheral oedema, pyrexia, vomiting
  - Uncommon: Infusion related reactions, progressive multifocal leucoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION
Side effects are reported when used in combination with basiliximab, mycophenolate mofetil and corticosteroids.
1.1 Multiple sclerosis

CHOLINERGIC RECEPTOR STIMULATING DRUGS

Fampridine

- **INDICATIONS AND DOSE**
  - Improvement of walking disability in multiple sclerosis (specialist use only)
    - **BY MOUTH**
    - Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS**
  - History of seizures (discontinue treatment if seizures occur)

- **CAUTIONS**
  - Atrophic cerebral conduction disorders - predisposition to seizures - sinoartrial conduction disorders - symptomatic cardiac rhythm disorders

- **INTERACTIONS**
  - Appendix 1 (fampridine).
  - Caution in concomitant use of drugs that lower seizure threshold.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Anxiety
    - Back pain
    - Constipation
    - Dizziness
    - Dyspepsia
    - Dysphagia
    - Headache
    - Insomnia
    - Malaise
    - Nausea
    - Paraesthesia
    - Pharyngolaryngeal pain
    - Tremor
    - Urinary tract infection
    - Vomiting
  - **Uncommon**
    - Seizures

- **PREGNANCY**
  - Avoid - toxicity in animal studies.

- **BREAST FEEDING**
  - Avoid - no information available.

- **RENAI IMPAIRMENT**
  - Avoid if eGFR less than 80 ml/minute/1.73 m².

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Modified-release tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 23, 25
    - **Fampyra** (Biogen Idec Ltd)
      - Fampyra 10 mg modified-release tablets | £181.00
      - 28 tablet pack
    - **Nulojix** (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Nulojix powder for solution for infusion vials | £709.04

- **INTERACTIONS**
  - Avoid excessive exposure to UV light including sunlight.
  - Avoid in concomitant use of drugs that lower seizure threshold.

- **CONCEPTION AND CONTRACEPTION**
  - Adequate contraception must be used during treatment and for up to 8 weeks after last dose.

- **PREGNANCY**
  - Use only if essential.

- **BREAST FEEDING**
  - Avoid - no information available.

- **PRE-TREATMENT SCREENING**
  - Patients should be evaluated for latent and active tuberculosis before starting treatment.

- **MONITORING REQUIREMENTS**
  - Patients should be monitored for signs and symptoms of tuberculosis during and after treatment.

- **PATIENT AND CARER ADVICE**
  - Patients should be advised to avoid excessive exposure to UV light including sunlight.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - **Nulojix** (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Belatacept 250 mg Nulojix 250 mg powder for concentrate for solution for infusion vials | £354.52
      - 2 vial pack | £709.04

- **IMMUNOSTIMULANTS**
  - **INTERFERONS**
    - **Fampyra**
      - For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided
      - For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)
      - **BY INTRAVENOUS INJECTION**
      - Adult: (consult product literature)

    - **AVONEX® VIAL**
      - For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided
      - For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)
      - **BY INTRAMUSCULAR INJECTION**
      - Adult: (consult product literature)

    - **BETAFERON® INJECTION**
      - For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided
      - For secondary progressive multiple sclerosis with active disease
      - For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)
      - **BY SUBCUTANEOUS INJECTION**
      - Adult: (consult product literature)

    - **EXTAVIA®**
      - For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided
      - For secondary progressive multiple sclerosis with active disease
      - For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)
      - **BY INTRAMUSCULAR INJECTION**
      - Adult: (consult product literature)

    - **REBIF® CARTRIDGE**
      - For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided
      - For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)
      - **BY SUBCUTANEOUS INJECTION**
      - Adult: (consult product literature)
PRESCRIBING AND DISPENSING INFORMATION

Monitor for signs of hepatic injury

HEPATIC IMPAIRMENT

PREGNANCY

CONCEPTION AND CONTRACEPTION

SIDE-EFFECTS

CAUTIONS

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Consult product literature for further information on contra-indications.

CAUTIONS

History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION

Consult product literature for further information on cautions.

SIDE-EFFECTS

Alopecia · anaphylaxis · blood disorders · chills · confusion · convulsions · fever · hepatitis · hypersensitivity reactions · influenza-like symptoms (decreasing over time) · irritation at injection site (including inflammation, hypersensitivity, necrosis) · malaise · menstrual disorders · mood and personality changes · myalgia · nausea · nephrotic syndrome · suicide attempts · thrombotic microangiopathy · thyroid dysfunction · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Also consult product literature for all side effects.

CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment—consult product literature.

PREGNANCY

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING

Avoid—no information available.

HEPATIC IMPAIRMENT

Caution in severe hepatic impairment.

RENAL IMPAIRMENT

Caution in severe renal impairment.

MONITORING REQUIREMENTS

Monitor for signs of hepatic injury—hepatic failure has been reported rarely.

Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).

Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

PRESCRIBING AND DISPENSING INFORMATION

REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

BY SUBCUTANEOUS INJECTION

Adult: (consult product literature)

CONTRA-INDICATIONS

Decompensated liver disease · severe depressive illness

REBIF® CARTRIDGE

Cartridges for use with RebiSmart® auto-injector device.

BETAFERON® INJECTION

An auto-injector device (Betaject® Light) is available from Bayer Schering.

EXTAVIA®

An auto-injector device (ExtaviPro® 30G) is supplied as part of the ExtaviPro® 30G kit.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Interferon beta and glatiramer for multiple sclerosis (January 2002) NICE TA32

Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

www.nice.org.uk/TA32

NHS restrictions

 Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

Avonex (Biogen Idec Ltd)

Interferon beta-1a 12 mega u per 1 ml Avonex 30micrograms/0.5ml (6m units) solution for injection pre-filled syringes | 4 pre-filled disposable injection | £654.00 | 12 pre-filled disposable injection | £1,962.00

Aronex 30micrograms/0.5ml (6m units) solution for injection pre-filled pen | 4 pre-filled disposable injection | £654.00 | 12 pre-filled disposable injection | £1,962.00

Rebif (Merck Serono Ltd)

Interferon beta-1a 12 mega u per 1 ml Rebif 2micrograms/0.5ml (6m units) solution for injection 1.5ml cartridges | 4 cartridge | £613.52

Rebif 8.8micrograms/0.2ml (2.4ml units) solution for injection pre-filled syringes | 6 pre-filled disposable injection | no price available

Rebif 8.8micrograms/0.2ml (2.4ml units) solution for injection pre-filled pen | 6 pre-filled disposable injection | no price available

Rebif 2micrograms/0.5ml (6m units) solution for injection pre-filled pen | 6 pre-filled disposable injection | £613.52

Rebif 2micrograms/0.5ml (6m units) solution for injection pre-filled syringes | 6 pre-filled disposable injection | no price available

Rebif 2micrograms/0.5ml (6m units) solution for injection pre-filled syringes | 12 pre-filled disposable injection | £613.52

Rebif 4micrograms/0.5ml (12ml units) solution for injection pre-filled pen | 12 pre-filled disposable injection | £813.21

Rebif 4micrograms/0.5ml (12ml units) solution for injection pre-filled syringes | 12 pre-filled disposable injection | £813.21

Powder and solvent for solution for injection

Beterafor (Bayer Plc)

Interferon beta-1b 300 microgram Beterafor 300microgram powder and solvent for solution for injection vials | 15 vial | £596.63 (Hospital only)

Extavia (Novartis Pharmaceuticals UK Ltd)

Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial | £596.63
Peginterferon beta-1a

- **DRUG ACTION** Peginterferon beta-1a is a polyethylene glycol-conjugated (‘pegylated’) derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

- **INDICATIONS AND DOSE**
  - Treatment of relapsing, remitting multiple sclerosis
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severe depression - suicidal ideation

- **CAUTIONS** History of cardiac disorders - history of depressive disorders (avoid in severe depression or in those with suicidal ideation), history of seizures - history of severe myelosupression

- **MONITORING REQUIREMENTS**
  - Patients should also be monitored for:
    - Thrombotic microangiopathy: Patients should be monitored for signs of hepatic injury
    - Renal impairment: Caution in severe renal impairment.
  - **RENAL IMPAIRMENT**
    - Caution in severe renal impairment.
  - **SIDE-EFFECTS**
    - Consult product literature for information about side effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment — consult product literature.

- **PREGNANCY**
  - Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**
  - Avoid — no information available.

- **HEPATIC IMPAIRMENT**
  - Caution in severe hepatic impairment.

- **RENAI IMPAIRMENT**
  - Caution in severe renal impairment.

- **INDICATIONS AND DOSE**
  - Treatment of relapsing, remitting multiple sclerosis
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: 20 mg daily

**Glatiramer acetate**

- **DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

- **INDICATIONS AND DOSE**
  - Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision)
  - Reducing frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision)
    - **BY SUBCUTANEOUS INJECTION**
    - Adult: 20 mg daily

- **CONTRA-INDICATIONS** Severe depression

- **CAUTIONS**
  - Cardiac disorders
  - **SIDE-EFFECTS**
    - Common or very common: Anxiety - arthralgia - asthenia - back pain - chest pain - constipation - depression - dyspepsia - dyspnoea (may occur within minutes of injection) - flushing - headache - hypersensitivity reactions - hypertonia - influenza-like symptoms - injection-site reactions - lymphadenopathy - nausea - oedema - palpitation - rash - sweating - syncope - tachycardia - tremor
    - Rare: Seizures

- **PREGNANCY**
  - Manufacturer advises avoid — no information available.

- **BREAST FEEDING**
  - Manufacturer advises caution — no information available.

- **RENAL IMPAIRMENT**
  - No information available — manufacturer advises caution.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Interferon beta and glatiramer for multiple sclerosis (January 2002) NICE TA32**
  - Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales.
  - Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.
  - [www.nice.org.uk/TA32](http://www.nice.org.uk/TA32)

**NHS restrictions**

- **Provision of disease-modifying therapies for multiple sclerosis**
  - The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website ([www.dh.gov.uk](http://www.dh.gov.uk)).

**MEDICINAL FORMS**

**Solution for injection**

- **Peginterferon beta-1a 126 microgram per 1 ml** Plegridy
  - 63 micrograms/0.5 ml solution for injection pre-filled pen £1,262.00
  - 94 micrograms/0.5 ml solution for injection pre-filled pen £1,262.00

- **Peginterferon beta-1a 188 microgram per 1 ml** Plegridy
  - 188 micrograms/0.5 ml solution for injection pre-filled pen £1,262.00

- **Peginterferon beta-1a 250 microgram per 1 ml** Plegridy
  - 250 micrograms/0.5 ml solution for injection pre-filled pen £1,262.00

**Glatiramer acetate**

- **Solution for injection**
  - **Copaxone** (Teva UK Ltd)
    - Glatiramer acetate 20 mg per 1 ml Copaxone 20 mg/1 ml solution for injection pre-filled syringes £513.95
    - Glatiramer acetate 40 mg per 1 ml Copaxone 40 mg/1 ml solution for injection pre-filled syringes £513.95
Dimethyl fumarate

**Indications and Dose**

Treatment of adults with relapsing-remitting multiple sclerosis (initiated by a specialist)

- **BY MOUTH**
  - Adult: 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature

- **Conception and Contraception**
  - Contraception required in women of child-bearing potential (consider non-hormonal methods).

- **Pregnancy**
  - Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies.

- **Breast Feeding**
  - Manufacturer advises avoid.

- **Renal Impairment**
  - Manufacturer advises caution in severe impairment.

- **Hepatic Impairment**
  - Manufacturer advises caution in severe impairment.

- **Drug Action**
  - Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

- **Monitoring Requirements**
  - Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
  - Monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
  - Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.

- **Patient and Carer Advice**
  - Patient information leaflet should be provided.
  - Counselling is advised on progressive multifocal leukoencephalopathy.

- **NICE Technology Appraisals (TAs)**
  - Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
  - Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
    - the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
    - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
  - Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA320

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Gastro-resistant Capsule**
    - Tecfidera (Biogen Idec Ltd)
    - Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule £343.00
    - Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 56 capsule £1,373.00

**Fingolimod**

**Indications and Dose**

Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 500 micrograms once daily

- **Monitoring Requirements**
  - Monitor heart rate and blood pressure measurement every hour

- **Drug Action**
  - Fingolimod is an immunomodulating drug.

**Important Safety Information**

- **MHRA/CHM Advice: Fingolimod—Not recommended for patients at known risk of cardiovascular events. Advice for extended monitoring for those with significant bradycardia or heart block after the first dose and following treatment interruption (January 2013)**
  - Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:
    - Patients with the following medical conditions:
      - 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
      - significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
      - history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.

  - Patients receiving the following antiarrhythmic or heart-rate lowering drugs:
    - class Ia or class III antiarrhythmics
    - beta blockers
    - heart rate-lowering calcium channel blockers
    - other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).
  - All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:
    - Pre-treatment:
      - a 12-lead ECG and blood pressure measurement before starting
    - During the first 6 hours of treatment:
      - continuous ECG monitoring for 6 hours
      - blood pressure and heart rate measurement every hour
After 6 hours of treatment
- a further 12-lead ECG and blood pressure measurement
If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradycardia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

Note
First dose monitoring as above should be repeated in all patients whose treatment is interrupted for:
- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment
If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

● CONTRA-INDICATIONS  Active malignancies · immunosuppression · severe active infection

● CAUTIONS  Check varicella zoster virus status—consult product literature for further information · chronic obstructive pulmonary disease · pulmonary fibrosis · risk of macular oedema · severe respiratory disease · susceptibility to QT-interval prolongation (including electrolyte disturbances)

CAUTIONS, FURTHER INFORMATION
- Washout period  A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.

● INTERACTIONS  Appendix 1 (fingolimod).
Caution with concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS
- Common or very common  Alopecia · AV block · back pain · basal cell carcinoma · blurred vision · bradycardia · bronchitis · cough · depression · diarrhoea · dizziness · dyspnœa · eczema · gastroenteritis · headache · herpes · hypertension · influenza · leucopenia · lymphopenia · malaise · migraine · pruritus · sinusitis · tinea versicolor · tinea versicolor
- Uncommon  Macular oedema · neutropenia · pneumonia
- Rare  Lymphoma
- Frequency not known  Haemophagocytic syndrome · lymphoma · posterior reversible encephalopathy syndrome · progressive multifocal leukoencephalopathy

SIDE-EFFECTS, FURTHER INFORMATION
- Basal cell carcinoma  Patients should be advised to seek medical advice if they have any signs of basal cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.
- Progressive multifocal leukoencephalopathy (PML) and other opportunistic infections  Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.

● CONCEPTION AND CONTRACEPTION  Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

● PREGNANCY  Avoid (toxicity in animal studies).

● BREAST FEEDING  Avoid.

● HEPATIC IMPAIRMENT  Use with caution in mild to moderate impairment. Avoid in severe impairment.

● MONITORING REQUIREMENTS
- Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis). Manufacturer also advises skin examination for signs of basal-cell carcinoma before starting treatment and then at least yearly thereafter.
- Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
- Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.
- Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytology, hyponatraemia)—initiate treatment immediately.
- Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254
Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:
- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and
- the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme.
Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA254

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

MEdICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Gilenya (Novartis Pharmaceuticals UK Ltd) ▼
Fingolimod (as Fingolimod hydrochloride)
500 microgram  Gilenya 0.5mg capsules  7 capsule fas £367.50
| 28 capsule fas £1,470.00
Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**IMPORTANT SAFETY INFORMATION**
All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

- **SIDE-EFFECTS**
  - **Common or very common** Allergic reactions - angioedema - bronchospasm - chills - cytokine release syndrome - dyspnoea - fever - flushing - nausea - pruritus - rash - tumour pain - vomiting
  - **Frequency not known** Cardiac events

**SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens.

The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

- **Cytokine release syndrome** Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

Alemtuzumab

- **INDICATIONS AND DOSE**
  - Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features
    - **BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

**UNLICENSED USE**
Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

**IMPORTANT SAFETY INFORMATION**
Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

- **CONTRA-INDICATIONS** Human immunodeficiency virus

**CAUTIONS**
Hepatitis B carriers - hepatitis C carriers - in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled - not recommended for inactive disease - not recommended for stable disease - patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course - patients with previous autoimmune conditions other than multiple sclerosis - pretreatment before administration is required (consult product literature)

**CONCEPTION AND CONTRACEPTION**
Women of childbearing potential should use effective contraception during and for 4 months after treatment.

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk - toxicity in animal studies.

**BREAST FEEDING**
Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.

**PRE-TREATMENT SCREENING**
Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.

**MONITORING REQUIREMENTS**
HPV screening should be carried out annually in female patients.

**PRESCRIBING AND DISPENSING INFORMATION**
All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.

**PATIENT AND CARER ADVICE**
Patients should be provided with a patient alert card and patient guide.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312
    - Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.

  [www.nice.org.uk/TA312](http://www.nice.org.uk/TA312)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Lemtrada** (Genzyme Therapeutics Ltd)
  - Alemtuzumab 10 mg per 1 ml
  - Lemtrada 12mg/1.2ml concentrate for solution for infusion 1 vial £7,045.00 (Hospital only)
Natalizumab

- **DRUG ACTION** Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

- **INDICATIONS AND DOSE** Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)
  - **BY INTRAVENOUS INFUSION**
    - Adult 18-65 years: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months.

- **CONTRA-INDICATIONS** Active infection, active malignancies (except cutaneous basal cell carcinoma), immunosuppression, progressive multifocal leucoencephalopathy.

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - For information on cautions consult product literature.
  - Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

- **INTERACTIONS**
  - **Appendix 1 (natalizumab),** Concurrent use of interferon beta or glatiramer acetate contra-indicated.

- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia, rash (during infusion), autoantibodies, dizziness (during infusion), fatigue (during infusion), headache (during infusion), nasopharyngitis, nausea (during infusion), pyrexia (during infusion), rigors (during infusion), urinary-tract infection, urticaria (during infusion), vomiting (during infusion).
  - **Uncommon** Hypersensitivity reactions (discontinue permanently), Progressive Multifocal Leucoencephalopathy (PML).
  - **Frequency not known** Flushing (during infusion), increased risk of opportunistic infection, liver toxicity.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Progressive Multifocal Leucoencephalopathy If Progressive Multifocal Leucoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.
  - Liver toxicity Discontinue treatment if significant liver injury occurs.

- **PREGNANCY** Avoid unless essential — toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—avoid.

- **PRE-TREATMENT SCREENING**
  - Progressive Multifocal Leucoencephalopathy: A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.
  - Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

- **MONITORING REQUIREMENTS**
  - Liver function.
  - Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.
  - Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Tysabri®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

- **PATIENT AND CARER ADVICE** A patient alert card should be provided.
  - Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).
  - Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.
  - Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)
      - NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. www.nice.org.uk/TA127

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - ELECTROLYTES: May contain Sodium
      - **Tysabri** (Biogen Idec Ltd)

Natalizumab 20 mg per 1 ml Tysabri 300mg/15ml concentrate for solution for infusion vials | 1 vial (HEP) £1,130.00 (Hospital only)
Teriflunomide

**DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

**INDICATIONS AND DOSE** Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 14 mg once daily

**CONTRA-INDICATIONS** Anaemia - leucopenia - neutropenia - serious infection - severe hypoproteinaemia - severe immunodeficiency - significantly impaired bone-marrow function - thrombocytopenia

**CAUTIONS** Adult over 65 years - anaemia - dyspnoea—assess for interstitial lung disease and consider suspending treatment - hypoproteinaemia (avoid if severe) - impaired bone-marrow function (avoid if severe) - latent tuberculosis - leucopenia - persistent cough—assess for interstitial lung disease and consider suspending treatment - severe infection—delay or suspend treatment until resolved - significant alcohol consumption - signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment - switching between other immunomodulating drugs - thrombocytopenia

**INTERACTIONS** → Appendix 1 (teriflunomide).

**SIDE-EFFECTS**

- **Common or very common** Acne - alopecia - anxiety - carpal tunnel syndrome - cystitis - diarrhoea - elevated liver enzymes - gastroenteritis - hyperaesthesia - hypertension - laryngitis - leucopenia - menorrhagia - musculoskeletal pain - myalgia - nausea - neuralgia - neutropenia - oral infection - paraesthesia - peripheral neuropathy - pollakiuria - rash - respiratory tract infection - sciatica - tinea pedis - urinary tract infection - vomiting - weight loss

- **Uncommon** Anaemia - thrombocytopenia

- **Very rare** Interstitial lung disease - pancreatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Accelerated elimination procedure **Important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).
- Hepatic injury Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
- Monitor blood pressure before treatment and periodically thereafter.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hepatic monitoring** Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

**TREATMENT CESSATION** Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give either colestyramine p. 186 or charcoal, activated p. 1211. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014) NICE TA303 Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
  - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
  - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme www.nice.org.uk/TA303

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (February 2014) that the use of teriflunomide (Aubagio® in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

ANTINEOPLASTIC DRUGS › MONOCLONAL ANTIBODIES

Bevacizumab

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

- **INDICATIONS AND DOSE**
  
  Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy | First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | First-line treatment of metastatic breast cancer in combination with capetitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capetitabine) | Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a | First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) | First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) | First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

  - **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) | history of arterial thromboembolism | history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) | history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) | increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) | increased risk of haemorrhage | increased risk of tumour-associated haemorrhage | intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) | uncontrolled hypertension | untreated CNS metastases

- **INTERACTIONS** 
  
  → Appendix 1 (bevacizumab).

- **SIDE-EFFECTS** Abdominal pain | alopaeia | anaemia | anorexia | arterial thromboembolism | asthenia | bone marrow suppression | chest pain | congestive heart failure | constipation | dehydration | diarrhoea | drowsiness | dry skin | dysarthria | dysphoea | exfoliative dermatitis | extravasation | eye disorders | fistulas | flushing | gall bladder perforation | gastro-intestinal perforation | haemorrhage | hand-foot syndrome | headache | hypersensitivity reactions | hypertension | hyperuricaemia | hypotension | hypoxia | impaired wound healing | infection | intestinal obstruction | lethargy | mucocutaneous bleeding | nausea | necrotising fasciitis (discontinue and initiate treatment promptly) | neutropenia | oral mucositis | osteonecrosis of the jaw | peripheral neuropathy | posterior reversible encephalopathy syndrome | proteinuria | pulmonary hypertension | pyrexia | rash | rhinitis | rinos | skin discoloration | supraventricular tachycardia | syncope | taste disturbances | thrombocytopenia | thromboembolism | tumour lysis syndrome | vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women.

- **PREGNANCY** Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.

- **MONITORING REQUIREMENTS**
  
  ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
  
  ▶ Monitor blood pressure.
  
  ▶ Monitor for congestive heart failure.
  
  ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
  
  ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  
  NICE technology appraisals (Tas)
  
  ▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

The Scottish Medicines Consortium has advised (August 2015) that bevacizumab (Avastin®) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of adult patients with platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who received no more than two prior chemotherapy regimens and who have not received prior therapy with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

The Scottish Medicines Consortium has advised (October 2015) that bevacizumab (Avastin®) is accepted for restricted use within NHS Scotland in combination with carboplatin and paclitaxel for the first-line treatment of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

Avastin (Roche Products Ltd)

Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial £924.40 (Hospital only)

Avastin 100mg/4ml solution for infusion vials | 1 vial £242.66 (Hospital only)

Brentuximab vedotin

INDICATIONS AND DOSE

Treatment of relapsed or refractory CD-30 positive Hodgkin’s disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option | Relapsed or refractory systemic anaplastic large cell lymphoma

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CAUTIONS

Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome

INTERACTIONS

Appendix 1 (brentuximab vedotin).

SIDE-EFFECTS

Common or very common

Anaphylaxis · arthralgia · back pain · constipation · cough · demyelinating polyneuropathy · diarrhoea · dizziness · dysphoenia · fatigue · hyperglycaemia · infusion-related reactions · myalgia · peripheral neuropathy · pruritus · rash

Uncommon

Stevens-Johnson syndrome

Frequency not known

Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · progressive multifocal leuкоencephalopathy · thromboembolism · tumour lysis syndrome · vomiting

CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment and for 6 months after treatment in men and women.

PREGNANCY

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING

Avoid—no information available.

MONITORING REQUIREMENTS

Monitor for infusion-related (including anaphylactic) reactions.

Monitor for symptoms of progressive multifocal leuкоencephalopathy—consult product literature for treatment adjustment.

Routinely monitor hepatic function.

Monitor for pulmonary toxicity—treat symptoms promptly.

Monitor for thromboembolism.

Monitor for infusion-related (including anaphylactic) reactions.

Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.
**Catumaxomab**

**INDICATIONS AND DOSE**
Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible

- BY INTRAPERITONEAL INFUSION
- Adults: consult product literature

**SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related side-effects
- Infusion-related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**
Avoid—limited information available.

**BREAST FEEDING**
Avoid—limited information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **Removab** (Neovii Biotech GmbH)
  - Catumaxomab 100 microgram per 1 ml
  - 50 micrograms/0.5 ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection POM £2,550.00 (Hospital only)
  - 10 micrograms/0.1 ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection POM £510.00 (Hospital only)

**INTERACTIONS**
Appendix 1 (catumaxomab).

**CAUTIONS**
- Haemodynamic insufficiency
- Hypoproteinaemia
- Oedema

  - Urticaria
  - Vomiting

- **Very rare**
  - Stevens-Johnson syndrome
  - Toxic epidermal necrolysis

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**
Use only if potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Avoid breast-feeding during and for 2 months after treatment—no information available.

**PRE-TREATMENT SCREENING**
Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and
Immune system and malignant disease

Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer that has progressed after first-line chemotherapy. (August 2009) NICE TA176

Cetuximab in combination with bevacizumab is not recommended for the treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is unresectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid, and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

Iplimumab

DRUG ACTION

Iplimumab causes T-cell activation.

INDICATIONS AND DOSE

Treatment of unresectable or metastatic advanced melanoma

BY INTRAVENOUS INFUSION

Adult: (consult product literature)

CAUTIONS

CONCESSION AND CONTRACEPTION

Use effective contraception.

PREGNANCY

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING

Discontinue breast-feeding—no information available.

HEPATIC IMPAIRMENT

Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

MONITORING REQUIREMENTS

For information on monitoring of side effects, consult product literature.

PRESCRIBING AND DISPENSING INFORMATION

Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

NATIONAL FUNDING/ACCESS DECISIONS

Iplimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319

Iplimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides iplimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA319

Iplimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268

Iplimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides iplimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA268

Nivolumab in combination with iplimumab for treating advanced melanoma (July 2016) NICE TA400

Nivolumab in combination with iplimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma.
metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. 
www.nice.org.uk/TA400

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2013) that ipilimumab (Yervoy<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

- **Solution for Infusion**
  ELECTROLYTES: May contain Sodium
  - Yervoy (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼
    - Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial (£3,750.00 (Hospital only)
    - Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial (£50 | £15,000.00 (Hospital only)

Nivolumab
19-Oct-2016

- **DRUG ACTION**
  Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

- **INDICATIONS AND DOSE**
  Treatment of unresectable or metastatic advanced melanoma in combination with ipilimumab
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

  Treatment of unresectable or metastatic advanced melanoma (as monotherapy) | Treatment of locally advanced or metastatic non-small cell lung cancer after prior chemotherapy | Treatment of advanced renal cell carcinoma after prior therapy (as monotherapy)
  - BY INTRAVENOUS INFUSION
  - Adult: 3 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

- **CAUTIONS**
  Patients may need pre-medications to minimise the development of infusion-related reactions

- **INTERACTIONS**
  → Appendix 1 (nivolumab).

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain • alopecia • arthralgia • blurred vision • colitis • constipation • cough • decreased appetite • diarrhoea • dizziness • dry eyes • dry mouth • dry skin • dyspnoea • erythema • headache • hyperglycaemia • hypertension • infusion-related reactions • malaise • musculoskeletal pain • nausea • oedema • peripheral neuropathy • pneumonitis • pruritus • pyrexia • rash • stomatitis • thyroid disorders • upper respiratory tract infection • vitiligo • vomiting
  - **Uncommon**
    - Adrenal insufficiency • anaphylactic reaction • arthritis • chest pain • dehydration • diabetic ketoacidosis • eosinophilia • erythema multiforme • hepatitis • hyperbilirubinaemia • hypophosphitism • hypopituitarism • metabolic acidosis • pancreatitis • pleural effusion • polymyalgia rheumatica • polynuropathy • psoriasis • renal failure • rosacea • tachycardia • tubulointerstitial nephritis • urticaria • uveitis • vasculitis
  - **Rare**
    - Arrhythmias • autoimmune neuropathy • cholestasis • demyelination • diabetes mellitus • duodenal ulcer • gastritis • Guillain–Barré syndrome • histocytic necrotising lymphadenitis (Kikuchi lymphadenitis) • lung infiltration • myasthenic syndrome • myopathy • toxic epidermal necrolysis
  - **Frequency not known**
    - Cardiac adverse events
    - SIDE-EFFECTS, FURTHER INFORMATION
      Side effects listed are reported when nivolumab is used as monotherapy; if combination therapy used, consult product literature for further information.

  - **Immune-related reactions**
    - Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

  - **Infusion-related reactions**
    - Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of pre-medication according to local guidelines; discontinue treatment if severe infusion reactions occur.

  - **CONCEPTION AND CONTRACEPTION**
    - Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.

  - **PREGNANCY**
    - Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

  - **BREAST FEEDING**
    - Manufacturer advises avoid—no information available.

  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises use with caution in moderate to severe impairment—limited information available.

  - **MONITORING REQUIREMENTS**
    - Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.

  - **DIRECTIONS FOR ADMINISTRATION**
    - Manufacturer advises for intermittent intravenous infusion, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through an in-line filter (pore size 0.2–1.2 micron).

  - **HANDLING AND STORAGE**
    - Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for storage conditions after preparation of the infusion.

  - **PATIENT AND CARER ADVICE**
    - Patients should be provided with a patient alert card with each prescription.

  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - NICE technology appraisals (TAs)
      - Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE TA384
        - Nivolumab as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.
        - www.nice.org.uk/TA384
      - Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400
        - Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.
        - www.nice.org.uk/TA400

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2016) that nivolumab (Opdivo<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults; it has also advised (August 2016) that nivolumab (Opdivo<sup>®</sup>) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab, and (October 2016)
for restricted use for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a 2-year clinical stopping rule.

This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**CAUTIONARY AND ADVISORY LABELS**
- **3 ELECTROLYTES:** May contain Sodium
- **Opdivo** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Nivolumab 10 mg per 1 ml
  - Opdivo 40mg/4ml concentrate for solution for infusion vials | 1 vial (PSt) £439.00 (Hospital only)
  - Opdivo 100mg/10ml concentrate for solution for infusion vials | 1 vial (PSt) £1,097.00 (Hospital only)

**Obinutuzumab**

**INDICATIONS AND DOSE**

**Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities**

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature or local protocols)

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**
For obinutuzumab contra-indications, consult product literature.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**
For full details on the cautions of obinutuzumab, consult product literature.

**Hepatitis B infection and reactivation**
Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

**INTERACTIONS** → Appendix 1 (obinutuzumab).

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
For full side effect details for obinutuzumab (including monitoring and management), consult product literature.

**CONCEPTION AND CONTRACEPTION**
Use effective contraception during and for 18 months after treatment.

**PREGNANCY**
Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.

**BREAST FEEDING**
Avoid breast-feeding during and for 18 months after treatment—present in milk in animal studies.

**MONITORING REQUIREMENTS**
Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

**PRESCRIBING AND DISPENSING INFORMATION**
Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.

**Ofatumumab**

**INDICATIONS AND DOSE**

**Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab**

**TREATMENT OF CLL IN patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)**

- **BY INTRAVENOUS INFUSION**
- **Adult:** Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**
For full details on the contra-indications for ofatumumab, consult product literature.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**
History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

**INTERACTIONS**
For full details about the cautions for ofatumumab, consult product literature.

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature.

For full details (including monitoring and management of side-effects) consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)**
  - **NICE TA343**
  - Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
    - bendamustine-based therapy is not suitable and the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
  - Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - [www.nice.org.uk/TA343](http://www.nice.org.uk/TA343)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Opdivo** (Roche Products Ltd)
  - Obinutuzumab 25 mg per 1 ml
  - Obinutuzumab 1000mg/40ml concentrate for solution for infusion vials | 1 vial (PSt) £3,312.00 (Hospital only)
  - Gazyvaro (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Nivolumab 10 mg per 1 ml
  - Nivolumab 40mg/4ml concentrate for solution for infusion vials | 1 vial £439.00 (Hospital only)
  - Nivolumab 100mg/10ml concentrate for solution for infusion vials | 1 vial £1,097.00 (Hospital only)
Panitumumab

- **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

- **INDICATIONS AND DOSE**
  - Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy)
  - Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)
  - BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SEVERE SKIN REACTIONS**

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

**MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** Interstitial pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown.

- **CAUTIONS** History of keratitis - history of severe dry eye - history of ulcerative keratitis - pulmonary disease—discontinue if interstitial lung disease develops - risk factors for keratitis - risk factors for severe dry eye - risk factors for ulcerative keratitis (including contact lens use)

- **INTERACTIONS** → Appendix 1 (panitumumab).

- **SIDE-EFFECTS**
  - Uncommon Bronchospasm - cyanosis - hirsutism - infusion-related reactions - nasal dryness
  - Rare Keratitis - skin necrosis - Stevens-Johnson syndrome - toxic epidermal necrolysis

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
  - Monitor for hypomagnesaemia.
  - Monitor for hypocalcaemia.
- **MEDICINAL FORMS**
- **PRE-TREATMENT SCREENING**
  - Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
  - Monitor for hypomagnesaemia.
  - Monitor for hypocalcaemia.
  - Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242
    - Panitumimab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.
    - www.nice.org.uk/TA242

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - **ELECTROLYTES**: May contain Sodium
      - **Vectibix** (Amgen Ltd)
        - Panitumumab 20 mg per 1 ml Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial (Pharmaceutical only) Vectibix 100mg/5ml concentrate for solution for infusion vials | 1 vial (Pharm) £379.29 (Hospital only)

**Pembrolizumab**

**DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

**INDICATIONS AND DOSE**
**Treatment of unresectable or metastatic advanced melanoma**
- **BY INTRAVENOUS INFUSION**
  - Adult: 2 mg/kg every 3 weeks

**CAUTIONS** Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)

**INTERACTIONS**

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - alopecia - arthritis - blood dyscrasia - changes in hair colour - chills - colitis - constipation - cough - decreased appetite - depigmentation - diarrhoea - dizziness - dry eye - dry mouth - dry skin - eczema - erythema - headache - hepatitis - influenza-like symptoms - infusion-related reactions - insomnia - malaise - musculoskeletal pain - myositis - nausea - oedema - peripheral neuropathy - pneumonitis - pruritus - pyrexia - rash - shortness of breath - taste disturbances - thyroid dysfunction - vomiting
- **Rare** Guillain-Barré syndrome - myasthenic syndrome - small intestinal perforation

**SIDE-EFFECTS, FURTHER INFORMATION**
- Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.
- Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **DIRECTIONS FOR ADMINISTRATION**
  - **For intravenous infusion (Keytruda®)**, give intermittently in Sodium chloride 0.9% or Glucose 5%. Reconstitute each 50 mg vial with 2.3 mL water for injection, to produce a 25 mg/mL solution. Gently swirl without shaking to dissolve, and allow up to 5 minutes for the bubbles to clear. Withdraw the required volume and transfer into an intravenous bag containing infusion fluid to prepare a final concentration ranging from 1–10 mg/mL; give over 30 minutes.
  - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
  - **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (October 2015)** NICE TA357
  - Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma only if:
    - the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor and
    - the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.
    - www.nice.org.uk/guidance/TA357

- **Pembrolizumab for advanced melanoma not previously treated with ipilimumab (November 2015)** NICE TA366
  - Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, only if the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.
    - www.nice.org.uk/guidance/TA366
Pertuzumab

**DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

**INDICATIONS AND DOSE**

Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature

**SIDE-EFFECTS**

- **Common or very common**
  - Anaemia
  - Arthralgia
  - Chills
  - Constipation
  - Cough
  - Decreased appetite
  - Diarrhoea
  - Dizziness
  - Dry skin
  - Dyspepsia
  - Dysphonia
  - Febrile neutropenia
  - Headache
  - Increased lacrimation
  - Infusion-related reactions
  - Insomnia
  - Left ventricular dysfunction
  - Leucopenia
  - Malaise
  - Myalgia
  - Nail disorder
  - Nasopharyngitis
  - Neutropenia
  - Oedema
  - Pain
  - Paronychia
  - Peripheral neuropathy
  - Pleural effusion
  - Pruritus
  - Pyrexia
  - Rash
  - Severe hypersensitivity reactions
  - Taste disturbance
  - Upper respiratory-tract infection

- **Uncommon**
  - Intestinal ulcer disease

- **Frequency not known**
  - Alopecia
  - Bone-marrow suppression
  - Extravasation
  - Hyperuricaemia
  - Hypertension
  - Impaired left ventricular function
  - Impaired wound healing
  - Mucosal ulceration
  - Nausea
  - Oral mucositis
  - Pruritus
  - Rash
  - Severe hypersensitivity reactions
  - Tissue oedema
  - Upper respiratory tract infection
  - Upper respiratory tract infection
  - Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.

**CONCESSION AND CONTRACEPTION**

Ensure effective contraception during and for six months after treatment in women of childbearing potential.

**PREGNANCY**

Avoid (toxicity in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

**BREAST FEEDING**

Avoid—no information available.

**HEPATIC IMPAIRMENT**

Caution—no information available.

**RENAL IMPAIRMENT**

Caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
- Monitor for febrile neutropenia.

**CAUTIONS**

- Conditions that could impair left ventricular function.
- History of congestive heart failure.
- Impaired left ventricular function.
- Prior anthracycline exposure.
- Radiotherapy to the chest area.
- Recent myocardial infarction.
- Serious cardiac arrhythmia.
- Uncontrolled hypertension.

**INTERACTIONS**

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature

**DIRECTIONS FOR ADMINISTRATION**

Resuscitation facilities should be available.

**CAUTIONS**

Elective surgery—discontinue treatment for at least 4 weeks prior to surgery. Hypertension—must be controlled before initiation. Impaired wound healing—discontinue treatment until wound fully healed. Pretreatment is recommended to minimise the development of adverse reactions (consult product literature) risk of bleeding.

**INTERACTIONS**

- **Appendix 1 (pertuzumab).**

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain
  - Diarrhoea
  - Epistaxis
  - Gastro-intestinal haemorrhage
  - Headache
  - Hypertension
  - Hypoalbuninaemia
  - Hypokalaemia
  - Hyponatraemia
  - Leucopenia
  - Malaise
  - Mucosal

Ramucirumab

**DRUG ACTION**

Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF-induced angiogenesis.

**INDICATIONS AND DOSE**

Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature for dose adjustments due to side-effects and infusion-related reactions

**TREATMENT OF ADVANCED Gastric CANCER OR Gaстро-OESOPHAGEAL JUNCTION ADENOCARCINOMA, AS MONOTHERAPY, IN PATIENTS WITH DISEASE PROGRESSION AFTER PRIOR PLATINUM AND FLUOROPYRIMIDINE CHEMOTHERAPY**

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature for dose adjustments due to side-effects and infusion-related reactions

**TREATMENT OF ADVANCED Gastric CANCER OR Gastro-Oesophageal JUNCTION ADENOCARCINOMA, AS MONOTHERAPY, IN PATIENTS WITH DISEASE PROGRESSION AFTER PRIOR PLATINUM OR FLUOROPYRIMIDINE CHEMOTHERAPY, AND FOR WHOM TREATMENT IN COMBINATION WITH PACITAXEL IS NOT APPROPRIATE**

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature for dose adjustments due to side-effects and infusion-related reactions

**TREATMENT OF METASTATIC COLORECTAL CANCER, IN COMBINATION WITH FOLFIRI (IRINOTECAN, FLUOROURACIL AND FOLinic ACID), IN PATIENTS WITH DISEASE PROGRESSION ON, OR AFTER, PRIOR THERAPY WITH BEVACIZUMAB, OXAPlATIN AND A FLUOROPYRIMIDINE**

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature for dose adjustments due to side-effects and infusion-related reactions

**TREATMENT OF LOCALLY ADVANCED OR METASTATIC NON-SMALL CELL LUNG CANCER, IN COMBINATION WITH DOCETAXEL, IN PATIENTS WITH DISEASE PROGRESSION AFTER PLATINUM-BASED CHEMOTHERAPY**

- **BY INTRAVENOUS INFUSION**
- Adult: consult product literature for dose adjustments due to side-effects and infusion-related reactions

**CAUTIONS**

- Conditions that could impair left ventricular function.
- History of congestive heart failure.
- Impaired left ventricular function.
- Prior anthracycline exposure.
- Radiotherapy to the chest area.
- Recent myocardial infarction.
- Serious cardiac arrhythmia.
- Uncontrolled hypertension.

**INTERACTIONS**

- **Appendix 1 (ramucirumab).**

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain
  - Diarrhoea
  - Epistaxis
  - Gastro-intestinal haemorrhage
  - Headache
  - Hypertension
  - Hypoalbuninaemia
  - Hypokalaemia
  - Hyponatraemia
  - Leucopenia
  - Malaise
  - Mucosal
  - Rash
  - Tissue oedema
  - Upper respiratory tract infection

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Perjeta (Roche Products Ltd)
- Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials 1 vial (Product) £1,315.00 (hospital only)

**DIRECTIONS FOR ADMINISTRATION**

Resuscitation facilities should be available.
Immune system and malignant disease

Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA403

SIDES-EFFECTS, FURTHER INFORMATION

Infusion-related reactions

Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.

CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

BREAST FEEDING

Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome—use only if potential benefit outweighs risk of progressive hepatic failure.

MONITORING REQUIREMENTS

Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Cyramza®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.

PRESCRIBING AND DISPENSING INFORMATION

For Cyramza®, each 10 mL vial contains sodium 17 mg (equivalent to Na+ 0.74 mmol).

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378

Ramucirumab alone or in combination with paclitaxel is not recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.

Patients whose treatment was started before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA378

Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016) NICE TA403

Ramucirumab, in combination with docetaxel, is not recommended for treating locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.

Rituximab

INDICATIONS AND DOSE

Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)

BY INTRAVENOUS INFUSION

Adult: 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)

Treatment of previously untreated stage III–IV follicular lymphoma (in combination with other chemotherapy) Maintenance therapy in patients with follicular non-Hodgkin’s lymphoma that has responded to induction therapy (in combination with other chemotherapy)

Treatment of diffuse large B-cell non-Hodgkin’s lymphoma (in combination with other chemotherapy)

Treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia

Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (in combination with glucocorticoids)

BY INTRAVENOUS INFUSION

Adult: Patients should receive premedication before each dose (consult product literature for details)

CONTRA-INDICATIONS

Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) • severe infection • severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS

History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported - patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported - transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)
SPECIFIC CAUTIONS

- When used for rheumatoid arthritis: Predisposition to infection.

CAUTIONS, FURTHER INFORMATION

- Hepatitis B infection and reactivation: Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- INTERACTIONS: Appendix 1 (rituximab).

- SIDE-EFFECTS: Abdominal pain, anaemia, antibody formation, aplastic anaemia, arthralgia, asthenia, blood disorders, depression, dyspepsia, headache, hypertension, hypotension, injection-site reactions, leucopenia, lupus erythematosus-like syndrome, migraine, muscle spasm, pancytopenia, paraesthesia, progressive multifocal leucoencephalopathy, pruritus, rhinitis, severe fatal skin reactions, severe skin reactions (permanently discontinue treatment if occurs), sore throat, Stevens-Johnson syndrome (permanently discontinue treatment if occurs), thrombocytopenia, toxic epidermal necrolysis (permanently discontinue treatment if occurs), urticaria, worsening heart failure.

SIDE-EFFECTS, FURTHER INFORMATION

- Associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation.

- Progressive multifocal leucoencephalopathy: Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

For full details, including management of side-effects, consult product literature.

- CONCEPTION AND CONTRACEPTION: Effective contraception (in both sexes) required during and for 12 months after treatment.

- PREGNANCY: Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

- BREAST FEEDING: Avoid breast-feeding during and for 12 months after treatment.

- MONITORING REQUIREMENTS: For full details on monitoring requirements consult product literature.

- DIRECTIONS FOR ADMINISTRATION: For intravenous infusion (MabThera®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1-4 mg/mL and gently invert bag to avoid foaming.

- PATIENT AND CARER ADVICE: Alert card. Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014) NICE TA308

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:

- Further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, or
- Cyclophosphamide is contra-indicated or not tolerated, or
- The patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
- The disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months or
- The patient has had uroepithelial malignancy.

www.nice.org.uk/TA308

- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

www.nice.org.uk/TA195

- Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:

- Cyclophosphamide, vincristine and prednisolone (CVP);
- Cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- Mitoxantrone, chlorambucil and prednisolone (MCP);
- Cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); or
- Chlorambucil is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

www.nice.org.uk/TA243

- Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma (February 2008) NICE TA137

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin’s lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin’s lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

www.nice.org.uk/TA137

- Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:

- Is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
- Has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the
dose currently licensed for chronic lymphocytic leukemia or with chemotherapy other than fludarabine and cyclophosphamide. Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukemia that has previously been treated with rituximab, unless rituximab has been given as specified above. www.nice.org.uk/TA193

- **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011) NICE TA226**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy. www.nice.org.uk/TA226

- **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009) NICE TA174**
  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA174

- **Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359**
  Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:
  - who have untreated chronic lymphocytic leukaemia or
  - who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and
  - if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement. Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop. www.nice.org.uk/guidance/TA359

  This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.
  The use of rituximab for localised (stage I) disease should be limited to clinical trials. www.nice.org.uk/TA65

**Scottish Medicines Consortium (SMC) Decisions**
*The Scottish Medicines Consortium* has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

The *Scottish Medicines Consortium* has advised (June 2014) that subcutaneous rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

**Siltuximab**

- **DRUG ACTION**  Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

- **INDICATIONS AND DOSE**
  **Treatment of multicentric Castleman’s disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative**
  - **BY INTRAVENOUS INFUSION**
    - Adult: 11 mg/kg every 3 weeks

- **CAUTIONS**
  Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation—severe infection—withhold treatment until resolved • treat infection prior to treatment

**CAUTIONS, FURTHER INFORMATION**

- Hypersensitivity reactions • Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.
- Consult product literature for further information about siltuximab cautions.

- **INTERACTIONS**  → Appendix 1 (siltuximab).
  Live vaccines should not be given concurrently or within 4 weeks before starting siltuximab treatment.

- **SIDE-EFFECTS**
  - **Common or very common**  Infusion related side effects
  - **Frequency not known**  Abdominal pain • anaphylaxis • hepatitis B reactivation • hypersensitivity reactions • hypertension • hypertriglyceridaemia • hypoglobulinaemia • increased haemoglobin levels • infections • localised oedema • maculopapular rash • nasopharyngitis • neutropenia • pruritus • renal impairment • thrombocytopenia • upper respiratory tract infection • weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

- Infusion-related side effects  Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

- **CONCEPTION AND CONTRACEPTION**  Women of childbearing potential should use effective contraception during and for 3 months after treatment.

- **PREGNANCY**  Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**  Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**  Use with caution in hepatic impairment.

- **MONITORING REQUIREMENTS**
  - Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the
first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.

- **Monitor for infection during treatment.**

### DIRECTIONS FOR ADMINISTRATION

**For intravenous infusion** (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  
  - Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial £415.00 (Hospital only)
  
  - Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial £1,661.00 (Hospital only)

### Trastuzumab

**INDICATIONS AND DOSE**

Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist) | Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist) | Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist) | **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**

- **Adults:** (consult product literature or local protocols)

  - **Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)**

  - **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**

  - **Adults:** Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

  - **Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)**

  - **BY INTRAVENOUS INFUSION**

  - **Adults:** (consult product literature or local protocols)

- **CONTRA-INDICATIONS**
  
  Severe dyspnoea at rest

- **CAUTIONS**
  
  Coronary artery disease • history of hypertension • symptomatic heart failure • uncontrolled arrhythmias

- **INTERACTIONS**

  - Use with anthracyclines Cardiac function should be monitored closely on the concomitant use of trastuzumab with anthracyclines.

  - **SIDE-EFFECTS**

    - Acne • alopecia • anaphylaxis • angioedema • anxiety • arthralgia • arthritis • asthenia • bone pain • bone marrow suppression • cardiotoxicity • chest pain • chills • depression • diziness • drowsiness • dry eye • dry skin • ecchymosis • extravasation • fever • gastro-intestinal symptoms • headache • hepatitis • hypersensitivity reactions • hypertension • hypothyroidia • hyperuricaemia • hypotension • increased lacrimation • infection • infusion-related side-effects (possibly delayed onset) • insomnia • leg cramps • malaise • mastitis • myalgia • nail disorders • nausea • oedema • oral mucositis • paraesthesia • paresis • peripheral neuropathy • pruritus • pulmonary symptoms (possibly delayed onset) • rash • sweating • taste disturbance • thromboembolism • tremor • tumour lysis syndrome • urticaria • vomiting • weight loss

- **CONCEPTION AND CONTRACEPTION**

  Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **PREGNANCY**

  Manufacturer advises avoid—oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING**

  Avoid breast-feeding during treatment and for 7 months afterwards.

- **MONITORING REQUIREMENTS**

  - Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.

- **DIRECTIONS FOR ADMINISTRATION**

  Resuscitation facilities should be available during administration of trastuzumab.

- **PRESCRIBING AND DISPENSING INFORMATION**

  When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is not interchangeable with trastuzumab emtansine.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**

  - Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

    - Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

    - Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

    - [www.nice.org.uk/TA257](http://www.nice.org.uk/TA257)

  - Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34

    - Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

    - Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen–receptor-positive patients.

    - [www.nice.org.uk/TA34](http://www.nice.org.uk/TA34)
Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107
Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).
www.nice.org.uk/TA107

Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208
Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:
- have not received treatment for metastatic disease and
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.
www.nice.org.uk/TA208
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2-positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

The Scottish Medicines Consortium has advised (September 2015) that trastuzumab solution for infusion (Herceptin®) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anti-cancer treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.
Solution for injection
- Herceptin (Roche Products Ltd)
  Trastuzumab 120 mg per 1 ml Herceptin 600mg/5ml solution for injection vials | 1 vial £222.20 (Hospital only)
Powder for solution for infusion
- Herceptin (Roche Products Ltd)
  Trastuzumab 150 mg Herceptin 150mg powder for solution for infusion vials | 1 vial £407.40

Trastuzumab emtansine
15-Apr-2016
DRUG ACTION
Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

INDICATIONS AND DOSE
Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) | Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)

BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

CAUTIONS
- Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias

INTERACTIONS
- Appendix 1 (trastuzumab). Caution with concomitant antiagulant medication—increased risk of thrombocytopenia with haemorrhagic events.

SIDE-EFFECTS
- Common or very common Abdominal pain · arthralgia · blurred vision · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysgeusia · dyspepsia · dyspnoea · epistaxis · gingival bleeding · haemorrhage · hand-foot syndrome · headache · hypertension · hypokalaemia · increased lacrimation · infusion-related reactions · insomnia · left ventricular dysfunction · malaise · memory impairment · myalgia · nail disorder · peripheral neuropathy · peripheral oedema · pruritus · pyrexia · rash · thrombocytopenia · urinary tract infection · urticaria
- Uncommon Hepatic failure · hepatic toxicity · interstitial lung disease · nodular regenerative hyperplasia · pneumonitis · portal hypertension
- Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

CONCEPTION AND CONTRACEPTION
Effective contraception must be used during and for 6 months after stopping treatment in women and men.

PREGNANCY
Manufacturer advises avoid—oligohydranmios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

BREAST FEEDING
Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

HEPATIC IMPAIRMENT
Consult product literature for dose modification in cases of abnormal liver function tests. Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

RENAL IMPAIRMENT
No information available—manufacturer advises caution in severe impairment.

MONITORING REQUIREMENTS
- Monitor hepatic function before each dose.
- Monitor for signs and symptoms of neurotoxicity.
- Monitor closely for infusion-related and hypersensitivity reactions.
Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).

Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.

Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

**DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab emtansine.

**PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

Trastuzumab emtansine for treating HER2-positive, unresectable locally advanced or metastatic breast cancer after treatment with trastuzumab and a taxane (December 2015) NICE TA371

Trastuzumab emtansine is not recommended for treating adults with human epidermal growth factor 2 (HER2) positive, unresectable locally advanced or metastatic breast cancer previously treated with trastuzumab and a taxane.

[www.nice.org.uk/TA371](http://www.nice.org.uk/TA371)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (September 2014) trastuzumab emtansine (Kadcyla®) is not recommended for use within NHS Scotland as monotherapy for the treatment of adult patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Kadcyla® (Roche Products Ltd) Trastuzumab emtansine 100 mg Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial POM £1,641.01
- Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial POM £2,625.62

## 2 Cytotoxic responsive malignancy

### Cytotoxic drugs

#### Overview

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neo-adjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

### Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

#### Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from:

**Department of Health**

PO Box 777
London
SE1 6XH
Fax: 01623 724524
It is also available from the Department of Health website ([www.dh.gov.uk](http://www.dh.gov.uk)).

### Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

**IMPORTANT SAFETY INFORMATION**

**RISK OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.
Doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 815, methotrexate p. 817, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil p. 815, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 980 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 816 or azathioprine p. 765 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 981 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 839, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-urate concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 830 and bleomycin p. 821 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 801, lomustine p. 804, and melphalan p. 805. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.06 × 10^7/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.
Thromboembolism
Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Pregnancy and reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug. Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual’s susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 824, methotrexate p. 817 (less than 100 mg/m², low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride p. 807, intermediate and low doses of cyclophosphamide p. 802, mitoxantrone p. 809, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin p. 823, dacarbazine p. 803, and high doses of cyclophosphamide.

Prevention of acute symptoms
For patients at low risk of emesis, pretreatment with dexamethasone p. 618 or lorazepam p. 317 may be used.

For patients at high risk of emesis, a SHT3-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 404 is effective.

Prevention of delayed symptoms
For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and SHT3-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 403 is also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms
Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Treatment for cytotoxic-induced side effects
Anthracycline side-effects
Anthracycline-induced cardiotoxicity
The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Anthracycline extravasation
Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression
Folinic acid p. 838 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 817 and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’). Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 529.

When folinic acid and fluorouracil p. 815 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 839, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Urothelial toxicity
Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 802 and ifosfamide p. 804; it is caused by the metabolite acrolein. Mesna p. 838 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

Anthracyclines and other cytotoxic antibiotics
Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity. Daunorubicin p. 807, doxorubicin hydrochloride p. 807, epirubicin hydrochloride p. 808 andidarubicin hydrochloride p. 809 are anthracycline antibiotics. Mitoxantrone p. 809 is an anthracycline derivative. Doxorubicin hydrochloride is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer.
Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 810 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 821 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin’s lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 822 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

**Antimetabolites**

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

**Alkylating drugs**

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours (e.g. breast and lung cancer).

Vinorelbine p. 831 is a semi-synthetic vinca alkaldoid. See also, role of vinorelbine in the treatment of breast cancer.

**Contraindications**

Jaundice - low leucocyte count - low platelet count - major surgery less than 30 days before start of treatment - severe bone marrow suppression

**Cautions** Avoid in acute porphyrias p. 930 - cardiac disorders—monitor serum potassium and ECG

**Interactions** Appendix 1 (bendamustine).

**Side-effects**

Acute circulatory failure - drowsiness - sweating - voice changes

**Very rare** Anticholinergic syndrome - ataxia - cardiac failure - encephalitis - haemorrhage - hypertension - hypokalaemia - hypotension - infection - insomnia - malaise - pain - palpitation - pyrexia - respiratory dysfunction

**Uncommon** Pericardial effusion

**Rare** Acute circulatory failure - drowsiness - sweating - voice changes

**Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

**Side-effects, further information**

Secondary malignancy - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Conception and contraception** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Pregnancy** Avoid (teratogenic and mutagenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Breast feeding** Discontinue breast-feeding.

**Hepatic impairment** Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

**Renal impairment** No information available on use in patients with creatinine clearance less than 10 mL/minute.

**National funding/access decisions**

NICE technology appraisals (TAs)

**Bendamustine hydrochloride**

**Indications and dose**

Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin’s lymphoma | Treatment of multiple myeloma

**By intravenous infusion**

**Adult:** (consult local protocol)

**Contra-indications**

**Caution** Avoid in acute porphyrias p. 930 - cardiac disorders—monitor serum potassium and ECG

**Interactions** Appendix 1 (bendamustine).

**Side-effects**

Acute circulatory failure - drowsiness - sweating - voice changes

**Very rare** Anticholinergic syndrome - ataxia - cardiac failure - encephalitis - haemorrhage - hypertension - hypokalaemia - hypotension - infection - insomnia - malaise - pain - palpitation - pyrexia - respiratory dysfunction

**Uncommon** Pericardial effusion

**Rare** Acute circulatory failure - drowsiness - sweating - voice changes

**Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

**Side-effects, further information**

Secondary malignancy - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**Conception and contraception** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Pregnancy** Avoid (teratogenic and mutagenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Breast feeding** Discontinue breast-feeding.

**Hepatic impairment** Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

**Renal impairment** No information available on use in patients with creatinine clearance less than 10 mL/minute.

**National funding/access decisions**

NICE technology appraisals (TAs)

**Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)** NICE TA216

Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

www.nice.org.uk/TA216
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2011) that bendamustine (Levact™) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - **Bendamustine hydrochloride (Non-proprietary)**
    - **Bendamustine hydrochloride 25 mg** Bendamustine 25mg powder for concentrate for solution for infusion vials 1 vial (POM) £6.85–£65.98 | 5 vial (POM) £312.53–£347.26 (Hospital only) | 20 vial (POM) £1,241.14 (Hospital only)
    - **Bendamustine hydrochloride 100 mg** Bendamustine 100mg powder for concentrate for solution for infusion vials 1 vial (POM) £27.77–£262.02 | 5 vial (POM) £1,241.14–£1,379.04 (Hospital only)
    - **Levact** (Napp Pharmaceuticals Ltd.)
    - **Bendamustine hydrochloride 25 mg** Levact 25mg powder for concentrate for solution for infusion vials 1 vial (POM) £347.26 (Hospital only)
    - **Bendamustine hydrochloride 100 mg** Levact 100mg powder for concentrate for solution for infusion vials 1 vial (POM) £1,379.04 (Hospital only)

**Busulfan**
(Busulphan)

- **INDICATIONS AND DOSE**
  Chronic myeloid leukaemia, induction of remission
  > **BY MOUTH**
  > Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

  Conditioning treatment before haematopoietic progenitor cell transplantation
  > **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  > Adult: (consult local protocol)

  Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen
  > **BY INTRAVENOUS INFUSION**
  > Adult: (consult local protocol)

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

- **IMPORTANT SAFETY INFORMATION**
  **RISKS OF INCOMPLETE DOSING OF ORAL ANTI-CANCER MEDICINES**
  See Cytotoxic drugs p. 797.

- **CAUTIONS**
  Avoid in acute porphyrias p. 930 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS**
  > Appendix 1 (busulfan).

- **SIDE-EFFECTS**
  **COMMON SIDE-EFFECTS**
  Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
  **RARE**
  Aplastic anaemia · seizures · visual disturbances
  **VERY RARE**
  Gynaecomastia · myasthenia gravis

- **FREQUENCY NOT KNOWN**
  Alopecia · bone-marrow suppression · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**Carmustine**

- **INDICATIONS AND DOSE**
  Multiple myeloma · Non-Hodgkin’s lymphomas · Brain tumours
  > **BY INTRAVENOUS INFUSION**
  > Adult: (consult product literature)

  Recurrent glioblastoma multiforme as an adjunct to surgery · High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy
  > **BY INTRALESIONAL INJECTION**
  > Adult: (consult product literature)

- **CAUTIONS**
  Avoid in acute porphyrias p. 930

- **INTERACTIONS**
  > Appendix 1 (carmustine).

- **SIDE-EFFECTS**
  **GENERAL SIDE-EFFECTS**
  Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · irritant to tissues · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

  **SPECIFIC SIDE-EFFECTS**
  > With intravenous use: Pulmonary fibrosis (delayed) · renal damage (cumulative)
Immune system and malignant disease

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION**: Manufacturer advises effective contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

- **PREGNANCY**: Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

- **BREAST FEEDING**: Discontinue breast-feeding.

- **SIDE-EFFECTS**

- **CAUTIONS**: Avoid in acute porphyrias p. 930; history of epilepsy (increased seizure risk)

- **SIDE-EFFECTS**

- Uncommon: Skin rash

- Very rare: Male sterility (in prepubertal and pubertal males)

- Frequency not known: Alopecia; bone-marrow suppression; hyperuricaemia; nausea; oral mucositis; premature menopause; secondary malignancy; Stevens-Johnson syndrome; thromboembolism; toxic epidermal necrolysis; tumour lysis syndrome; vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- Skin reactions: If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

- **CONCEPTION AND CONTRACEPTION**: Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

- **PREGNANCY**: Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

- **BREAST FEEDING**: Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**: Manufacturer advises consider dose reduction in severe impairment—limited information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
  - Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA212
  - Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres. www.nice.org.uk/TA212

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Implant**

  - Glialdel (Eisai Ltd)

    - Carmustine 7.7 mg: Glialdel 7.7mg implant | 8 device £5,203.00 (Hospital only)

---

**Chlorambucil**

- **INDICATIONS AND DOSE**

  - Some lymphomas and chronic leukaemias (used either alone or in combination therapy)

  - **BY MOUTH**

  - Adult: (consult local protocol)

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**

    - Chlorambucil (Non-proprietary)

      - Chlorambucil 2 mg: Chlorambucil 2mg tablets | 25 tablet £42.87 DT price = £42.87

---

**Cyclophosphamide**

- **INDICATIONS AND DOSE**

  - **Rheumatoid arthritis with severe systemic manifestations**

    - **BY MOUTH**

    - Adult: 1–1.5 mg/kg daily

  - **Severe systemic rheumatoid arthritis** / **Other connective tissue diseases (especially with active vasculitis)**

    - **BY INTRAVENOUS INJECTION**

    - Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

- **UNLICENSED USE**: Not licensed for rheumatoid arthritis with severe systemic manifestations.

---

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.
**CONTRA-INDICATIONS** Haemorrhagic cystitis

**CAUTIONS** Avoid in acute porphyrias p. 930 - diabetes mellitus - previous or concurrent mediastinal irradiation — risk of cardiotoxicity

**INTERACTIONS** → Appendix 1 (cyclophosphamide).

**SIDE-EFFECTS**

GENERAL SIDE-EFFECTS
* Common or very common  Anorexia - cardiotoxicity at high doses - disturbances of carbohydrate metabolism - inappropriate secretion of anti-diuretic hormone - interstitial pulmonary fibrosis - pancreatitis - pigmentation of nails - pigmentation of soles - urothelial toxicity

* Rare  Hepatotoxicity - renal dysfunction

* Frequency not known  Alopecia - bone-marrow suppression - haemorrhagic cystitis - hyperuricaemia - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**SPECIFIC SIDE-EFFECTS**

* With intravenous use  Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

Haemorrhagic cystitis  A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially intravenously then by mouth) can also help prevent cystitis.

Secondary malignancy  Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION**  Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**  Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**  Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**  Reduce dose—consult local treatment protocol for details.

**RENAI IMPAIRMENT**  Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

**DIRECTIONS FOR ADMINISTRATION**  For intravenous infusion (cyclophosphamide injection; Baxter) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Cyclophosphamide (Non-proprietary)**
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 50 mg  $\text{DT price } = \text{£}139.00$
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 100 mg  $\text{DT price } = \text{£}180.00$
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 200 mg  $\text{DT price } = \text{£}220.00$

- **Cyclophosphamide (as Cyclophosphamide monohydrate) 500 mg**  $\text{DT price } = \text{£}375.00$

- **Cyclophosphamide (as Cyclophosphamide monohydrate) 1 gram**  $\text{DT price } = \text{£}700.00$

**Dacarbazine**

**INDICATIONS AND DOSE**

Metastatic melanoma | Soft-tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: (consult local protocol)

**CAUTIONS**  Caution in handling—irritant to tissues

**INTERACTIONS** → Appendix 1 (dacarbazine).

**SIDE-EFFECTS**

* Rare  Irritant to skin - irritant to tissues - liver necrosis due to hepatic vein thrombosis

* Frequency not known  Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression - oral mucositis - severe nausea - severe vomiting - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION**  Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**  Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**  Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**  Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

**RENAI IMPAIRMENT**  Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**  Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Dacarbazine (Non-proprietary)**
  - Dacarbazine (as Dacarbazine citrate) 100 mg  $\text{DT price } = \text{£}160.00$
  - Dacarbazine (as Dacarbazine citrate) 200 mg  $\text{DT price } = \text{£}180.00$
  - Dacarbazine (as Dacarbazine citrate) 500 mg  $\text{DT price } = \text{£}375.00$
  - Dacarbazine (as Dacarbazine citrate) 1 gram  $\text{DT price } = \text{£}700.00$
Estramustine phosphate

- **INDICATIONS AND DOSE**
  - Prostate cancer
  - **BY MOUTH**
  - Adult: Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 797.

- **CONTRA-INDICATIONS**
  - Peptic ulceration
  - Severe cardiovascular disease
  - Thromboembolic disorders

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930
  - Cardiac failure
  - Gynaecomastia

- **INTERACTIONS** → Appendix 1 (estramustine).
- **SIDE-EFFECTS**
  - Rare Angioedema
  - Frequency not known Alopecia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy
  - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- CONCEPTION AND CONTRACEPTION
  - Men should use contraceptive methods during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution. Avoid in severe impairment. In hepatic impairment, manufacturer advises regular liver function tests.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION**
  - Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.

- **PATIENT AND CARER ADVICE**
  - Patients should be given advice on how to administer estramustine capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 5, 23
  - **Estracyt** (Pfizer Ltd)
    - Estramustine phosphate (as Estramustine sodium phosphate)
    - 140 mg
  - Estracyt 140mg capsules | 100 capsule [Pack] £171.28

Ifosfamide

- **INDICATIONS AND DOSE**
  - Malignant disease
  - **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

**CONTRA-INDICATIONS**

- Acute infection
- Urinary-tract infection
- Urinary-tract obstruction
- Urothelial damage

**CAUTIONS**

- Avoid in acute porphyrias p. 930

**SIDE-EFFECTS**

- Acute porphyrias
- Pregnancy and reproductive function
  - Men should use oral contraceptive methods during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy
  - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION**

- Men should use contraceptive methods during treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

Lomustine

- **DRUG ACTION**
  - Lomustine is a lipid-soluble nitrosourea.

- **INDICATIONS AND DOSE**
  - Hodgkin's disease resistant to conventional therapy
  - Hodgkin's disease resistant to conventional therapy
  - **BY MOUTH**
  - Adult: 120–130 mg/m² every 6–8 weeks, dose is for when lomustine is used alone

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 797.

- **CONTRA-INDICATIONS**
  - Coeliac disease

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930

- **INTERACTIONS** → Appendix 1 (lomustine).

- **SIDE-EFFECTS**
  - Alopecia
  - Bone-marrow suppression
  - Cardiac failure
  - Gynaecomastia
mucositis - permanent bone marrow damage (with prolonged use) - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Secondary malignancy**: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION**: Manufacturer advises adequate contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **PREGNANCY**: Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING**: Discontinue breast-feeding.
- **RENAL IMPAIRMENT**: Reduce dose initially (consult product literature).
- **MONITORING REQUIREMENTS**: Monitor full blood count before and throughout treatment.
- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

**Melphalan**

- **INDICATIONS AND DOSE**
  - **Multiple myeloma**
    - Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)
  - **Polycythaemia vera**
    - **BY MOUTH**
      - Adult: Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly
  - **Localised malignant melanoma of the extremities**
    - **BY REGIONAL ARTERIAL PERFUSION**
      - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

- **CAUTIONS**: Avoid in acute porphyrias p. 930
- **INTERACTIONS**: Appendix 1 (melphalan).
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Rare**: Intestinal pneumonitis - life threatening pulmonary fibrosis
    - **Frequency not known**: Alopecia - bone-marrow suppression (delayed) - hyperuricaemia - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use: Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Secondary malignancy**: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION**: Manufacturer advises adequate contraception during treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **PREGNANCY**: Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING**: Discontinue breast-feeding.
- **RENAL IMPAIRMENT**: Reduce dose initially (consult product literature).
- **MONITORING REQUIREMENTS**: Monitor full blood count before and throughout treatment.
- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

**Temozolomide**

- **INDICATIONS AND DOSE**
  - **Newly diagnosed glioblastoma multiforme in adults** (in combination with radiotherapy) and subsequently as monotherapy / Second-line treatment of malignant glioma in adults
    - **BY MOUTH**
      - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

- **CAUTIONS**: Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS**: Appendix 1 (temozolomide).
- **SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting
  - **SIDE-EFFECTS, FURTHER INFORMATION**: For further information on side-effects consult product literature.
- **CONCEPTION AND CONTRACEPTION**: Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **PREGNANCY**: Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING**: Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**: Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT**: Manufacturer advises caution—no information available.
METHOTREXATE

- **INDICATIONS AND DOSE**
  - Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy
  - **BY INTRAVENOUS INJECTION**
  - Adult: (consult local protocol)

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930

- **INTERACTIONS**
  - Appendix 1 (thiotepa).

- **SIDE-EFFECTS**
  - Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Secondary malignancy · Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **PREGNANCY**
  - Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - British National Formulary 73 (BNF 73)
  - Scottish Medicines Consortium (SMC) Decisions

  - The Scottish Medicines Consortium has advised (June 2012) that thiotepa (Tepadina®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 23, 25

    - Thiotepa 15 mg Thiotepa 15mg powder for concentrate for solution for infusion vials | 1 vial (POM) no price available
    - Thiotepa 100 mg Thiotepa 100mg powder for concentrate for solution for infusion vials | 1 vial (POM) no price available

- **Tresosulfan**

- **INDICATIONS AND DOSE**
  - Ovarian cancer
  - **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAPERITONEAL INSTILLATION**
  - Adult: (consult product literature)

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930

- **SIDE-EFFECTS**
  - Common or very common Skin pigmentation
  - Rare Allergic alveolitis · haemorrhagic cystitis · pulmonary fibrosis
  - Frequency not known Alopecia · bone-marrow suppression · extravasation of intravenous drugs · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Secondary malignancy · Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.
malignancy • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- PREGNANCY Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- BREAST FEEDING Discontinue breast-feeding.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Capsule
- CAUTIONARY AND ADVISORY LABELS 25
  - Tresulfan (Non-proprietary)
    - Tresulfan 250 mg Tresulfan 250mg capsules | 100 capsule [POM] £622.10–£653.20
- Powder for solution for injection
  - Tresulfan (Non-proprietary)
    - Tresulfan 1 gram Tresulfan 1g powder for solution for injection vials | 5 vial [POM] £269.17
    - Tresulfan 5 gram Tresulfan 5g powder for solution for injection vials | 5 vial [POM] £1,040.17

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Doxorubicin hydrochloride 10-Jun-2016

Indications and Dose
- Acute leukaemias | Hodgkin’s lymphoma | Non-Hodgkin’s lymphoma | Some solid tumours including breast cancer
  - By intravenous injection
    - Adult: (consult product literature)
- Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)
  - By intravesical instillation
    - Adult: (consult product literature)
- CAELYX®
  - For AIDS-related Kaposi’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk
  - By intravenous injection
    - Adult: (consult product literature)
- MYOCET®
  - For use with cyclophosphamide for metastatic breast cancer
    - Adult: (consult product literature)

Contra-indications
- Myocardial insufficiency • previous treatment with maximum cumulative doses of daunorubicin or other anthracycline • recent myocardial infarction • severe arrhythmia
- CAUTIONS Caution in handling—irritant to tissues
- Interactions > Appendix 1 (daunorubicin).
  - Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
- Side-effects Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting
- Side-effects, Further information
  - Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible
- Conception and Contraception Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- Pregnancy Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- Breast feeding Discontinue breast-feeding.
  - HEPATIC IMPAIRMENT Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.
  - RENAL IMPAIRMENT Reduce dose by 25% if serum creatinine 105–265 micromol/litre. Reduce dose by 50% if serum creatinine greater than 265 micromol/litre. Avoid in severe impairment.
- Monitoring requirements Cardiac monitoring essential.

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug.
- Powder for solution for infusion
  - Daunorubicin (Non-proprietary)
    - Daunorubicin (as Daunorubicin hydrochloride) 20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [POM] £550.00 (Hospital only)
  - Emulsion for infusion
    - DaunoXome (Galen Ltd) Daunorubicin (as Daunorubicin hydrochloride citrate) 50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial [POM] £250.00

Pregnancy and reproductive function
- Prolonged use of alkylating drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
Cytotoxic responsive malignancy

808

BNF 73

Immune system and malignant disease

product literature • extravasation • heart failure (potentially fatal) • hyperuricaemia • nausea • oral mucositis • renal damage • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

• Extravasation Extravasation can cause severe tissue necrosis.

• Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose.

• Cardiotoxic Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

• Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

• Elevated bilirubin concentration Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration can be an indication for reducing the dose.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

RENAL IMPAIRMENT Consult product literature in severe impairment.

MONITORING REQUIREMENTS Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

DIRECTIONS FOR ADMINISTRATION Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

PRESCRIBING AND DISPENSING INFORMATION Doxorubicin is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

NATIONAL FUNDING/ACCESS DECISIONS NICE technology appraisals (TAs)

• Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.

PLDH, in combination with trabectedin, is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA389

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

• Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 10mg/5ml solution for injection vials 1 vial £18.54 (Hospital only)

Doxorubicin 50mg/25ml solution for injection CytoSaves vials 1 vial £103.00

Doxorubicin 50mg/25ml solution for infusion vials 1 vial £103.00 (Hospital only)

Doxorubicin 10mg/5ml solution for injection CytoSaves vials 1 vial £20.60

Doxorubicin 10mg/5ml solution for infusion vials 1 vial no price available

Doxorubicin 10mg/5ml solution for infusion vials 1 vial £20.60 (Hospital only)

Doxorubicin 50mg/25ml solution for injection CytoSaves vials 1 vial £92.70 (Hospital only)

Doxorubicin 50mg/25ml concentrate for solution for infusion vials 1 vial no price available

Powder for solution for injection

• Doxorubicin (medac UK)

Doxorubicin hydrochloride 10 mg Doxorubicin 10mg powder for solution for injection vials 10 vial £182.80

Doxorubicin hydrochloride 50 mg Doxorubicin 50mg powder for solution for injection vials 10 vial £914.00

Solution for infusion

• Doxorubicin hydrochloride (Non-proprietary)

Doxorubicin hydrochloride 2 mg per 1 ml Doxorubicin 200mg/100ml solution for injection CytoSaves vials 1 vial £412.00

Doxorubicin 200mg/100ml solution for injection CytoSaves vials 1 vial £370.80–£412.00 (Hospital only)

Doxorubicin 200mg/100ml concentrate for solution for infusion vials 1 vial no price available

Caelyx (Janssen-Cilag Ltd)

Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml

Doxorubicin 50mg/25mg concentrate for solution for infusion vials 1 vial £112.49

Caelyx 20mg/100ml concentrate for solution for infusion vials 1 vial £360.23

Powder and solvent for suspension for infusion ELECTROLYTES: May contain Sodium

• Myocet (Teva UK Ltd)

Doxorubicin hydrochloride 50 mg Myocet 50mg powder and solvent for suspension for infusion vials 2 vial £912.26 (Hospital only)

Epirubicin hydrochloride

INDICATIONS AND DOSE

Treatment of breast cancer • Treatment and prophylaxis of certain forms of superficial bladder cancer

BY INTRAVENOUS INFUSION, OR BY INTRAVESICAL INSTILLATION

Adult: (consult product literature or local protocols)

CONTRA-INDICATIONS Bladder inflammation or contraction (when used as a bladder instillation) • catheterisation difficulties (when used as a bladder instillation) • haematuria (when used as a bladder instillation) • invasive tumours penetrating the bladder (when used as a bladder instillation) • myocardopathy • previous treatment with maximum cumulative doses of epirubicin or other anthracycline • recent myocardial infarction • severe arhythmia • severe myocardial insufficiency • unstable angina • urinary tract infections (when used as a bladder instillation)

CAUTIONS Caution in handling—irritant to tissues

INTERACTIONS Appendix 1 (epirubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
IDARUBICIN HYDROCHLORIDE

INDICATIONS AND DOSE

Acute non-lymphocytic leukaemias monotherapy
- **BY MOUTH**
  - Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Acute non-lymphocytic leukaemia in combination therapy
- **BY MOUTH**
  - Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)—monotherapy
- **BY MOUTH**
  - Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

MITOXANTRONE

(Mitozantrone)

INDICATIONS AND DOSE

Metastatic breast cancer | Non-Hodgkin’s lymphoma
- **BY INTRAVENOUS INFUSION**
  - Adult: (consult local protocol)

CAUTIONS

Intrathecal administration not recommended

Acute leukaemias | Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)
- **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 797.

CONTRA-INDICATIONS

Previous treatment with maximum cumulative dose of idarubicin or other anthracycline • recent myocardial infarction • severe arrhythmias • severe myocardial insufficiency

CAUTIONS

Caution in handling—irritant to tissues

INTERACTIONS
  - Appendix I (idarubicin).
  - Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common Abdominal pain • cardiac disorders • diarrhoea • haemorrhage • rash • red pigmentation of the urine
- Uncommon Nail hyperpigmentation • skin hyperpigmentation
- Frequency not known Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

SPECIFIC SIDE-EFFECTS
- With intravenous use Extravasation

CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see *Pregnancy and reproductive function in Cytotoxic drugs* p. 797.

PREGNANCY

Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function in Cytotoxic drugs* p. 797.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

RENAL IMPAIRMENT

Dose reduction may be necessary in severe impairment.
Pixuvri

**INDICATIONS AND DOSE**
Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature)

**CONTRA-INDICATIONS** Active severe infection - risk factors for severe infection

**CAUTIONS** Active cardiovascular disease - cardiac risk factors - caution in handling - irritant to tissues - concurrent radiotherapy to the mediastinal area - history of cardiovascular disease - previous radiotherapy to the mediastinal area - previous therapy with anthracyclines - previous therapy with anthracyclines

**INTERACTIONS** → Appendix 1 (pixantrone).
Caution with concurrent use of cardiotoxic drugs - increased risk of cardiotoxicity. Contra-indicated with concurrent immunisation with live virus vaccines.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - abnormal liver function tests - biochemical disturbances - bone pain - cardiac disorders - cardiac toxicity (during or following treatment) - chromaturia - conjunctivitis - constipation - cough - diarrhoea - drowsiness - dry mouth - dyspepsia - dyspnoea - electrolyte disturbances - haematuria - headache - hypotension - infection - loss of appetite - malaise - nail disorder - oedema - pallor - paraesthesia - proteinuria - pruritus - pyrexia - severe myelosuppression - skin discolouration - tachycardia - taste disturbances - vein discolouration - weight loss
- **Uncommon** Anxiety - arrhythmia - arthralgia - arthritis - dizziness - dry eye - keratitis - musculoskeletal pain - musculoskeletal weakness - night sweats - oesophagitis - oliguria - petechiae - pleural effusion - pneumonia - rash - rectal haemorrhage - rhinorrhea - skin ulcer - sleep disorder - spontaneous erection - tumour progression - vein disorder - vertigo
- **Frequency not known** Alpoeia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - photosensitivity - thromboembolism - transient blue-green discolouration of urine - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Cardiotoxicity Cardiac examinations are recommended after a cumulative dose of 160 mg/m².

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- **Mitoxantrone (Non-proprietary)**
  Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial £121.85
- **Onkotrone (Baxter Healthcare Ltd)**
  Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml concentrate for infusion vials | 1 vial no price available
  Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial no price available

**Monograph**
**Pixuvri** (CTI Life Sciences Ltd)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
**ELECTROLYTES:** May contain Sodium
- **Pixuvri**

Pixuvri (as Pixuvri dimaleate) 29 mg Pixuvri 29mg powder for concentrate for solution for infusion vials | 1 vial no price available
Azacitidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts (July 2016) NICE TA399

Azacitidine is not recommended, within its marketing authorisation, for treating acute myeloid leukaemia with greater than 30% bone marrow blasts in patients aged 65 years or above who are not eligible for haematopoietic stem cell transplant.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA399
Capecitabine for the treatment of advanced gastric cancer

Bevacizumab in combination with capecitabine for the first-line treatment of metastatic colorectal cancer (August 2012) NICE TA263

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212

Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191

Cladribine

INDICATIONS AND DOSE

LEUSTAT®

B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent | Hairy cell leukaemia

BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

LITAK®

Hairy cell leukaemia

BY SUBCUTANEOUS INJECTION

Adult: (consult product literature or local protocols)

CAUTIONS

Use irradiated blood only

CAUTIONS, FURTHER INFORMATION

Immunosuppressive effect of cladribine | Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

INTERACTIONS

Appendix 1 (cladribine).

SIDE-EFFECTS

Abdominal pain | acute renal failure (with high doses) | alopecia | anxiety | arthralgia | arthrosis | bone-marrow suppression | chills | constipation | cough | diarrohoea | dizziness | dyspnoea | extravasation | flatulence | haemolytic anaemia | headache | hyperuricaemia | insomnia | malaise | myalgia | nausea | oedema | oral mucositis | pruritus | purpura | rash | severe myelosupression (with neutropenia, anaemia and thrombocytopenia) | severe neurotoxicity (with high doses) | sweating | tachycardia | thromboembolism | tumour lysis syndrome | vomiting
**Cytarabine**

**DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

**INDICATIONS AND DOSE**

- Induction of remission of acute myeloblastic leukaemia
  - By intravenous infusion, or by intravenous injection, or by subcutaneous injection
  - Adult: (consult local protocol)

- Lymphomatous meningitis
  - By intrathecal injection
  - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

**INTERACTIONS** → Appendix 1 (cytarabine).

**SIDE-EFFECTS**

- Alopecia
- Bone-marrow suppression
- Cough
- Dizziness
- Extravasation
- Hyperuricaemia
- Hyperthermia
- Lassitude
- Leucopenia
- Pruritus
- Rash
- Restlessness
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose—consult product literature.

**MONITORING REQUIREMENTS**

- Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

**NATIONAL FUNDING/ACCESS DECISIONS**

**DEPOCYTE®**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - Cytarabine (Non-proprietary)
    - Cytarabine 20 mg per 1 ml Cytarabine 500 mg/25 ml solution for injection vials | 1 vial £9.50
    - Cytarabine 1000 mg/50 ml solution for injection vials | 5 vial £20.99–£30.00
    - Cytarabine 2500 mg/100 ml solution for injection vials | 10 vial £40.00

**Suspension for injection**

- DepoCyte (Napp Pharmaceuticals Ltd)
  - Cytarabine 10 mg per 1 ml DepoCyte 50 mg/5 ml suspension for injection vials | 1 vial £1,223.75 (Hospital only)

**Clofarabine**

**INDICATIONS AND DOSE**

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- By intravenous infusion
- Adult 18–20 years: (consult local protocol)

**CAUTIONS** Cardiac disease

**SIDE-EFFECTS**

- Abdominal pain
- Agitation
- Alopecia
- Anxiety
- Arthralgia
- Bone-marrow suppression
- Cough
- Diarrhoea
- Dizziness
- Drowsiness
- Dyspnoea
- Extravasation
- flushing
- Haematoma
- Haematuria
- Headache
- Hyperuricaemia
- Hypotension
- Jaundice
- Myalgia
- Nausea
- Oedema
- Oral mucositis
- Pancreatitis
- Paraesthesia
- Pericardial effusion
- Peripheral neuropathy
- Pruritus
- Rash
- Restlessness
- Sweating
- Tachycardia
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Clofarabine 1 mg per 1 ml  Evoltra 20 mg/20 ml concentrate for solution for infusion vials | 4 vial £5,304.72 (Hospital only)

Fludarabine phosphate

- **INDICATIONS AND DOSE**
  - Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves
    - **BY MOUTH**
    - Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

  - **RENEWAL IMPAIRMENT**
    - Manufacturer advises caution if creatinine clearance less than 30 mL/minute — no information available.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Diarrhoea
    - Epistaxis
    - Headache
  - **Uncommon**
    - Acute myeloid leukaemia
    - Anorexia
    - Chills
    - Cough
    - Diarrhoea
    - Fever
    - Immunosuppression
    - Malaise
    - Myelodysplastic syndrome
    - Myelosuppression (may be cumulative)
    - Oedema
    - Peripheral neuropathy
    - Pneumonitis
    - Pulmonary toxicity
    - Thrombocytopenia
  - **Frequency not known**
    - Alopecia
    - Bone-marrow suppression
    - Extravasation
    - Haemorrhagic cystitis
    - Hyperuricaemia
    - Nausea
    - Oral mucositis
    - Thromboembolism
    - Tumour lysis syndrome
    - Vomiting
  - **SIDE-EFFECTS**
    - **Very rare**
    - Alopecia
    - Bone-marrow suppression
    - Extravasation
    - Haemorrhagic cystitis
    - Hyperuricaemia
    - Nausea
    - Oral mucositis
    - Thromboembolism
    - Tumour lysis syndrome
    - Vomiting

- **RENEWAL IMPAIRMENT**
  - Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**
  - Monitor for signs of haemolysis.
  - Monitor for neurological toxicity.
  - Assess creatinine clearance in patients over 65 years before treatment initiation.

- **DIRECTIONS FOR ADMINISTRATION**
  - Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119
    - Fludarabine monotherapy is not recommended for the first-line treatment of chronic lymphocytic leukaemia.
      - [www.nice.org.uk/TA119](http://www.nice.org.uk/TA119)

    - Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29
      - Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
        - Cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
        - Cyclophosphamide, doxorubicin and prednisolone (CAP)
      - Intravenous fludarabine should only be used when oral fludarabine is contra-indicated.
      - [www.nice.org.uk/TA29](http://www.nice.org.uk/TA29)

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.
## MEDICINAL FORMS

### Tablet

- **Fludara** (Sanofi)
  - Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet (Pom) £302.48 (Hospital only) | 20 tablet (Pom) £403.31 (Hospital only)

### Solution for injection

- **Fludarabine phosphate (Non-proprietary)**
  - Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial (Pom) £156.00 (Hospital only) | 1 vial (Pom) £155.00 (Hospital only)

- **Fludara** (Sanofi)
  - Fludara 50mg powder for solution for injection vials | 5 vial (Pom) £735.34 (Hospital only)

### Powder for solution for injection

- **Fludarabine phosphate (Non-proprietary)**
  - Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial (Pom) £155.00 (Hospital only)

## Fluorouracil

### INDICATIONS AND DOSE

Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION**
- **Adult:** (consult product literature)

### INTERACTIONS

- **Appendix 1** (fluorouracil).

### SIDE-EFFECTS

- **Rare** Cerebellar syndrome
- **Frequency not known** Alopecia, bone-marrow suppression, desquamative hand-foot syndrome (on prolonged infusion), extravasation, hyperuricaemia, mucositis, myelosuppression, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

### CONCEPTION AND CONTRACEPTION

- Contra-advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

### PREGNANCY

- Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

### BREAST FEEDING

- Discontinue breast-feeding.

### HEPATIC IMPAIRMENT

- Manufacturer advises caution.

### HANDLING AND STORAGE

- Caution in handling—irritant to tissues.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

- **Fluorouracil (as Fluorouracil sodium)** 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial (Pom) £64.00

### Solution for infusion

- **Fluorouracil (as Fluorouracil sodium)** 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial (Pom) £32.00

## Gemcitabine

### INDICATIONS AND DOSE

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel) | **BY INTRAVENOUS INFUSION**

### INTERACTIONS

- **Appendix 1** (gemcitabine).

### SIDE-EFFECTS

- **Rare** Haemolytic uraemic syndrome

### CONTRA-INDICATIONS

- **Frequency not known** Alopecia, bone-marrow suppression, mild gastro-intestinal side-effects, musculoskeletal pain, nausea, oral mucositis, microangiopathic haemolytic anaemia, myelosuppression, oral mucositis, renal impairment, thromboembolism, tumour lysis syndrome, vomiting

### CONCEPTION AND CONTRACEPTION

- Contra-advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

### PREGNANCY

- Avoid (teratogenic in animal studies). See Pregnancy and reproductive function in Cytotoxic drugs p. 797.

### BREAST FEEDING

- Discontinue breast-feeding.

### HEPATIC IMPAIRMENT

- Manufacturer advises caution.

### RENAL IMPAIRMENT

- Manufacturer advises caution.

### NATIONAL FUNDING/ACCESS DECISIONS

- **NICE technology appraisals (TAs)**
  - Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnovsky score of at least 50 [Karnovsky score is a measure of the ability to perform ordinary tasks].
  - Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.
  - www.nice.org.uk/TA25

  - Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capcetabine are also considered appropriate.
  - www.nice.org.uk/TA116

- Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285
  - Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first
recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor–targeted agents.

www.nice.org.uk/TA285

- Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015) NICE TA360

Gemcitabine in combination with albumin-bound paclitaxel (nab-paclitaxel, Abraxane®) is not recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA360

- Topotecan, pegylated liposomal doxorubicin hydrochloride, anthracycline (unless contra-indicated).

relapsed following previous chemotherapy including an the treatment of metastatic breast cancer, which has recommended for treating the

Gemcitabine (Non-proprietary)

Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine 2g powder for solution for infusion vials | 1 vial £324.00

Gemcitabine (as Gemcitabine hydrochloride) 200 mg Gemcitabine 200mg powder for solution for infusion vials | 1 vial £110.00

Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemzar 1g powder for solution for infusion vials | 1 vial £162.76

Gemcitabine (as Gemcitabine hydrochloride) 200 mg Gemzar 200mg powder for solution for infusion vials | 1 vial £32.55

Mercaptopurine

(6-Mercaptopurine)

- INDICATIONS AND DOSE

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis

by mouth

Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses

Acute leukaemias | Chronic myeloid leukaemia

by mouth using tablets

Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response

by mouth using oral suspension

Adult: Initially 25–75 mg/m² daily, adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

Mercaptopurine tablets and Xalquip® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

- UNLICENSED USE

Not licensed for use in severe ulcerative colitis and Crohn's disease.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOsing OF ORAL ANTI-CANCeR MEDICINES

See Cytotoxic drugs p. 797.

- CONTRA-INDICATIONS

Absent thiopurine methyltransferase activity

- CAUTIONS

Reduced thiopurine methyltransferase activity

CAUTIONS, FURTHER INFORMATION

- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- INTERACTIONS

a Appendix 1 ( mercaptopurine).

- SIDE-EFFECTS

Rare Pancreatitis - transient oligospermia

Very rare Intestinal ulceration - lymphoma

Frequency not known Alopecia - anorexia - bone-marrow suppression - hepatotoxicity - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

CONCEPTION AND CONCEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.
Methotrexate

**DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

**INDICATIONS AND DOSE**

**Severe Crohn’s disease**

- **By intramuscular injection**
  - Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

**Maintenance of remission of severe Crohn’s disease**

- **By mouth**
  - Adult: 10–25 mg once weekly

**Moderate to severe active rheumatoid arthritis**

- **By mouth**
  - Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

**Severe active rheumatoid arthritis**

- **By intravenous injection, or by intramuscular injection, or by subcutaneous injection**
  - Adult: Initially 7.5 mg once weekly; then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

**Neoplastic diseases**

- **By intravenous injection, or by intrathecal injection, or by intra-arterial infusion, or by intramuscular injection, or by intravenous infusion, or by mouth**
  - Adult: (consult product literature)

**Severe psoriasis unresponsive to conventional therapy (specialist use only)**

- **By mouth, or by intramuscular injection, or by intravenous injection, or by subcutaneous injection**
  - Adult: Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

**PRESCRIBING AND DISPENSING INFORMATION**

**Flavours of oral liquid formulations may include raspberry.**

**PRE-TREATMENT SCREENING**

**Hepatic impairment**

- Monitor liver function.
- Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- May need dose reduction.
- May need dose adjustment in Cytotoxic drugs p. 930.
- Bone marrow suppression can occur abruptly; treatment may be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops.
- Factors likely to increase toxicity include advanced age, impaired renal function, and concomitant use with other antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.

**CONTRA-INDICATIONS**

- Active infection (in non-malignant conditions) - ascites - immunodeficiency syndromes (in non-malignant conditions) - significant pleural effusion
- Acute porphyrias p. 930 - photosensitivity — psoriasis lesions aggravated by UV radiation (skin ulceration reported) - diarrhoea - extreme caution in blood disorders (avoid if severe) - peptic ulceration - risk of accumulation in pleural effusion or ascites — drain before treatment - ulcerative colitis - ulcerative stomatitis

**SIDE-EFFECTS**

**IMPORTANT SAFETY INFORMATION**

- Note that the dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:
  - the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
  - only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
  - the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
  - the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

**CONTRA-INDICATIONS**

**Active infection (in non-malignant conditions) - ascites - immunodeficiency syndromes (in non-malignant conditions) - significant pleural effusion**

**CAUTIONS**

- Blood count - Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- **Gastro-intestinal toxicity** - Withdrawal treatment if stomatitis develops — may be first sign of gastro-intestinal toxicity.
- **Liver toxicity** - Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
- **Pulmonary toxicity** - Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit — discontinue if pneumonitis suspected.

**INTERACTIONS**

- Appendix 1 (methotrexate).

If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored.

**SIDE-EFFECTS**

- Rare - Pneumonitis

**UNLICENSED USE** Not licensed for use in severe Crohn’s disease.

**METHICILLIN RESISTANT STAPHYLOCOCCUS AUREUS (MRSA)**

- Resistance to methicillin developed as a result of mutation. The prevalence of MRSA in the community may exceed 5% and is rising. Methicillin is active against S. aureus and S. epidermidis, though resistance is increasing.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Tablet**

  - Mercaptopurine (Non-proprietary)
  - Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet | £49.15 DT price = £49.15

**Oral suspension**

EXCIPIENTS: May contain Aspartame

- Xaluprine (Nova Laboratories Ltd)
  - Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml | £170.00

**SIDE-EFFECTS**

Cytotoxic responsive malignancy

Immune system and malignant disease

In view of reports of blood dyscrasias (including fatalities) in patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

 Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

 Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

**Monitoring Requirements**

- **Conception and Contraception** Effective contraception required during and for at least 3 months after treatment in men or women.
- **Pregnancy** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **Breastfeeding** Discontinue breast-feeding—present in milk.
- **Hepatic Impairment** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **Pre-treatment Screening** Exclude pregnancy before treatment.

 Patients should have full blood count and renal and liver function tests before starting treatment.

 **Prescribing and Dispensing Information**

- In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
  - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
  - be advised to report all symptoms and signs suggestive of infection, especially sore throat.
- Local protocols for frequency of monitoring may vary.
- Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

- Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.

- **Patient and Carer Advice**

 Methotrexate treatment booklets

 Methotrexate treatment booklets should be issued where appropriate.

 In England, Wales, and Northern Ireland, they are available for purchase from: Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112 GP practices can obtain supplies through their Local Area Team stores.

 NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mnm.com.

 In Scotland, treatment booklets can be obtained by emailing stockorders.dpas@theapsgroup.com or by fax on 0131 629 9967.

 These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

 Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

 Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

 Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

 **Medicinal Forms**

 There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.
**Pemetrexed**

**DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

**INDICATIONS AND DOSE**

Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin).

First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin).

Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy).

Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy).

**CAUTIONS**

Diabetes - history of cardiovascular disease - prophylactic folic acid supplementation required (consult product literature) - prophylactic vitamin B12 supplementation required (consult product literature).

**INTERACTIONS**

Appendix 1 (pemetrexed). Caution with concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature).

**SIDE-EFFECTS**

- Common or very common
  - Neurotoxicity (discontinue)
  - Concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature).

- Uncommon
  - Arrhythmias
  - Arthralgia
  - Gastro-intestinal disturbances
  - Nephrotoxicity
  - Peripheral neurological disorders
  - Pleural effusion
  - Pyrexia
  - Seizures
  - Taste disturbance
  - Thromboembolism
  - Tremor
  - Tumour lysis syndrome
  - Vomiting
  - Wheezing

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

**PREGNANCY**

Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

Discontinue breast-feeding.

**MONITORING REQUIREMENTS**

- Neurotoxicity: Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2008) that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Atriance** (Novartis Pharmaceuticals UK Ltd) 
  - Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial £1,332.00

---

**Zlatal**

- 22.5mg/0.9ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £16.61
- 15mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £14.92

**Solution for infusion**

- **Methotrexate (Non-proprietary)**
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial | £200.57
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial | £400.00
non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

www.nice.org.uk/TA181

▶ Pemetrexed maintenance treatment for non-squamous non-small-cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402

Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer when a patient’s disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy; their Eastern Cooperative Oncology Group (ECOG) performance status is 0 or 1 at the start of maintenance treatment; the company provides the drug according to the terms of the commercial access agreement as agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA402

▶ Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135

Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

www.nice.org.uk/TA135

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The Scottish Medicines Consortium has advised (January 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Pemetrexed (Non-proprietary)

Pemetrexed (as Pemetrexed ditomotamol) 25 mg per 1 ml Pemetrexed 100mg/4ml concentrate for solution for infusion vials | 1 vial £140.00

Pemetrexed 500mg/20ml concentrate for solution for infusion vials | 1 vial £700.00

Pemetrexed (as Pemetrexed disodium) 100 mg Pemetrexed 100mg powder for concentrate for solution for infusion vials | 1 vial £144.00 (Hospital only)

Pemetrexed (as Pemetrexed disodium) 500 mg Pemetrexed 500mg powder for concentrate for solution for infusion vials | 1 vial £720.00 (Hospital only)

Alimta (Eli Lilly and Company Ltd)

Pemetrexed (as Pemetrexed disodium) 100 mg Alimta 100mg powder for concentrate for solution for infusion vials | 1 vial £160.00 (Hospital only)

Pemetrexed (as Pemetrexed disodium) 500 mg Alimta 500mg powder for concentrate for solution for infusion vials | 1 vial £800.00 (Hospital only)

Tegafur with gimeracil and oteracil

▶ DRUG ACTION

Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

▶ INDICATIONS AND DOSE

Treatment of advanced gastric cancer when used in combination with cisplatin

▶ BY MOUTH

Adult: (consult local protocol)

IMPORTANT SAFETY INFORMATION

Risks of incorrect dosing of oral anti-cancer medicines

See Cytotoxic drugs p. 797.

▶ CONTRA-INDICATIONS

Dihydropyrimidine dehydrogenase deficiency

▶ INTERACTIONS

→ Appendix 1 (tegafur).

▶ SIDE-EFFECTS

Alopecia • bone-marrow suppression • hyperuricaemia • nausea • neuropathy • ocular toxicity • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

▶ CONCEPTION AND CONTRACEPTION

Manufacturer advises effective contraception during and for up to 6 months after treatment.

▶ PREGNANCY

Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

▶ BREAST FEEDING

Discontinue breast-feeding.

▶ RENAL IMPAIRMENT

Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

▶ NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2012) that tegafur with gimeracil and oteracil (Teysuno®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

Tioguanine
(Thioguanine)

**INDICATIONS AND DOSE**

**Acute leukaemia** | **Chronic myeloid leukaemia**

- **BY MOUTH**
- **Adult:** 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CONTRA-INDICATIONS**

- Absent thiopurine methyltransferase activity

**CAUTIONS**

- Thiopurine methyltransferase status

**CAUTIONS, FURTHER INFORMATION**

- Thiopurine methyltransferase  The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- Long-term therapy  Long-term therapy is no longer recommended because of the high risk of liver toxicity.

**INTERACTIONS**

- **Appendix 1** (tioguanine).

**SIDE-EFFECTS**

- **Rare**  Intestinal necrosis  - intestinal perforation

- **Frequency not known**  Alopecia  - bone-marrow suppression  - hepatotoxicity (discontinue)  - hyperuricaemia  - nausea  - oral mucositis  - stomatitis  - thromboembolism  - tumour lysis syndrome  - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal side-effects  Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

**CONCEPTION AND CONTRACEPTION**

- Ensure effective contraception during treatment in men or women.

**PREGNANCY**

- Avoid (teratogenicity reported when men receiving tioguanine therapy.

**PREGNANCY AND REPRODUCTIVE FUNCTION**

- See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- Reduce dose.

**RENAL IMPAIRMENT**

- Reduce dose.

**PRE-TREATMENT SCREENING**

- Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

**MONITORING REQUIREMENTS**

- Monitor liver function weekly—discontinue if liver toxicity develops.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Tablet**

- **Tioguanine (Non-proprietary)**
- Tioguanine 40 mg  Tioguanine 40mg tablets  | 25 tablet  £109.57

**ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES**

**Bleomycin**

**INDICATIONS AND DOSE**

- **Squamous cell carcinoma**  |  **Metastatic germ cell cancer**  |  **Non-Hodgkin's lymphoma**

- **BY INTRAVENOUS INJECTION, OR BY LOCAL INFILTRATION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**

- **Adult:** (consult product literature or local protocols)

**CAUTIONS**

- Caution in handling—irritant to tissues

**INTERACTIONS**

- **Appendix 1** (bleomycin).

**SIDE-EFFECTS**

- **Common or very common**  Dermatological toxicity  - mucositis

- **Frequency not known**  Alopecia  - chills (after drug administration)  - extrava satisive-fever (after drug administration)  - hypersensitivity reactions  - hyperuricaemia  - increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques  - less bone marrow suppression  - nausea  - oral mucositis  - progressive pulmonary fibrosis (dose-related)  - pulmonary toxicity  - Raynaud’s phenomenon  - thromboembolism  - tumour lysis syndrome  - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypersensitivity reactions  Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously.

- Progressive pulmonary fibrosis  This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug.

- Respiratory failure  Patients who have received extensive therapy with bleomycin (e.g. cumulative dose more than 100 000 units) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

**CONCEPTION AND CONTRACEPTION**

- Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**

- Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797

**BREAST FEEDING**

- Discontinue breast feeding.

**RENAL IMPAIRMENT**

- Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.

**PRESCRIBING AND DISPENSING INFORMATION**

- To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Bleo-Kyowa** (Kyowa Kirin Ltd)
- Bleomycin (as Bleomycin sulfate) 15000 unit  Bleo-Kyowa 15,000unit powder for solution for injection vials  | 10 vial  £190.60
Mitomycin

**INDICATIONS AND DOSE**

Recurrent superficial bladder tumours (bladder instillation)

- **BY INTRAVESICAL INSTILLATION**
  - Adult: (consult product literature or local protocols)

Upper gastro-intestinal cancers | Breast cancers

- **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature or local protocols)

**SIDE-EFFECTS**

GENERAL SIDE-EFFECTS
Alopecia, bone marrow damage, bone-marrow suppression, hyperuricaemia, lung fibrosis, nausea, oral mucositis, renal damage, thromboembolism, tumour lysis syndrome, vomiting

- With intravenous use Extravasation

SIDE-EFFECTS, FURTHER INFORMATION
Bone-marrow toxicity. Prolonged use may result in a permanent effect.

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY**
Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Mitomycin-C** (Kyowa Kirin Ltd)
  - Mitomycin 2 mg
  - Mitomycin 10 mg
  - Mitomycin 20 mg
  - Mitomycin 40 mg

**INDICATIONS AND DOSE**

Hairy cell leukaemia (initiated in specialist centres)

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION**
  - Adult: To be given on alternate weeks (consult product literature)

**SIDE-EFFECTS**
Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, immunosuppression, myelosuppression, nausea, neurotoxicity (withhold or discontinue), oral mucositis, severe rash (withhold treatment), thromboembolism, tumour lysis syndrome, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises that men should not father children during and for 6 months after treatment.

**PREGNANCY**
Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution—limited information available.

**RENAAL IMPAIRMENT**
Avoid if creatinine clearance less than 60 mL/minute.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Pentostatin 10 mg** Nipent 10mg powder for solution for injection vials | 1 vial | £734.21 (Hospital only)

**ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS**

Trabectedin

**INDICATIONS AND DOSE**

Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated. Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)

- **BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature or local protocols)

**CONTRA-INDICATIONS**
Elevated creatine phosphokinase (consult product literature)

**SIDE-EFFECTS**
Caution in concomitant use with hepatotoxic drugs (avoid alcohol).

**INTERACTIONS**

- **Frequency not known**
  - Abdominal pain, alopecia, anorexia, arthralgia, asthenia, back pain, bone-marrow suppression, constipation, cough, dehydration, diarrhoea, dizziness, dyspepsia, dysphonia, extravasation, fatigue, flushing, headache, hepatobiliary disorders, hyperuricaemia, hypokalaemia, hypotension, increased blood creatine kinase, insomnia, myalgia, nausea, oedema, oral mucositis, paraesthesia, peripheral neuropathy, pyrexia, taste disturbance, thromboembolism, tumour lysis syndrome, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its anti-emetic and hepatoprotective effects (consult product literature).

**CONCEPTION AND CONTRACEPTION**
Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.

**PREGNANCY**
See Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Manufacturer advises avoid breast-feeding during and for 3 months after treatment.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in impairment—consider dose reduction. Avoid in patients with raised bilirubin. Monitor hepatic function closely in patients with hepatic impairment.

**RENAAL IMPAIRMENT**
Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.
Cytotoxic responsive malignancy

- **MONITORING REQUIREMENTS**
  - Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
  - Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185
      - Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer. www.nice.org.uk/TA185
    - Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
      - Trabectedin in combination with pegyalted liposomal doxorubicin hydrochloride (PLDH) is not recommended for treating the first recurrence of platinum-sensitive ovarian cancer.
      - Patients currently receiving trabectedin in combination with PLDH should have the option to continue their treatment until they or their clinician consider it appropriate to stop. www.nice.org.uk/TA389

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Yondelis (Pharma Mar, S.A.)**
    - **Trabectedin 250 microgram** Yondelis 0.25mg powder for concentration for solution for infusion vials | 1 vial **[POM]** no price available (Hospital only)
    - **Trabectedin 1 mg** Yondelis 1mg powder for concentration for solution for infusion vials | 1 vial **[POM]** no price available (Hospital only)

- **ANTINEOPLASTIC DRUGS ➤ PLATINUM COMPOUNDS**

### Carboplatin

- **INDICATIONS AND DOSE**
  - Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)
    - **BY INTRAVENOUS INFUSION**
    - Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

- **INTERACTIONS** ➤ Appendix 1 (platinum compounds).

- **SIDE-EFFECTS**
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

### Cisplatin

- **INDICATIONS AND DOSE**
  - Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)
    - **BY INTRAVENOUS INFUSION**
    - Adult: (consult product literature)

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
Cytotoxic responsive malignancy

Oxaliplatin

**INDICATIONS AND DOSE**
Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid).

**CONTRA-INDICATIONS**
Peripheral neuropathy with functional impairment

**INTERACTIONS** → Appendix 1 (platinum compounds).

**SIDE-EFFECTS**
Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, hypomagnesaemia, myelosuppression, nephrotoxicity, oral mucositis, ototoxicity, peripheral neuropathy, severe nausea, severe vomiting, thromboembolism, tumour lysis syndrome

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**
Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**RENAL IMPAIRMENT**
Avoid if possible—nephrotoxic.

**MONITORING REQUIREMENTS**
▶ Monitor full blood count.
▶ Monitor audiometry.
▶ Monitor plasma electrolytes.
▶ Nephrotoxic—Monitoring of renal function is essential.

**DIRECTIONS FOR ADMINISTRATION**
Cisplatin is increasingly given in a day care setting.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Cisplatin (Non-proprietary)**
  - Cisplatin 1 mg per 1 ml
    - Cisplatin 50mg/50ml concentrate for solution for infusion vials: 1 vial (Pom) £50.22 (Hospital only) 1 vial (Pom) £50.22-£55.64
    - Cisplatin 10mg/10ml solution for infusion vials: 1 vial (Pom) £5.90 (Hospital only) 1 vial (Pom) £5.90
    - Cisplatin 50mg/50ml solution for infusion vials: 1 vial (Pom) £25.37 (Hospital only) 1 vial (Pom) £25.36-£28.11
    - Cisplatin 10mg/10ml concentrate for solution for infusion vials: 1 vial (Pom) no price available
    - Cisplatin 100mg/100ml concentrate for solution for infusion vials: 1 vial (Pom) £50.22 (Hospital only) 1 vial (Pom) no price available

**ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES**

**Etoposide**

**INDICATIONS AND DOSE**
Small cell carcinoma of the bronchus, the lymphomas and testicular cancer.

**CONTRA-INDICATIONS**
Peripheral neuropathy with functional impairment

**INTERACTIONS** → Appendix 1 (etoposide).

**SIDE-EFFECTS**
Alopecia, bone-marrow suppression, hyperuricaemia, irritant to tissues, nausea, oral mucositis (more common if given with doxorubicin), thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.
**PREN**

**PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAL IMPAIRMENT** Consider dose reduction — consult local treatment protocol for details.

**DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 23

- **Vepesid** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Etoposide 50 mg Vepesid 50 mg capsules | 20 capsule [POM] £95.82 (Hospital only)
  - Etoposide 100 mg Vepesid 100 mg capsules | 10 capsule [POM] £87.23 (Hospital only)

**Powder for solution for injection**

- **Etopophos** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Etoposide (as Etoposide phosphate) 100 mg Etopophos 100 mg powder for solution for injection vials | 10 vial [PSM] £261.68 (Hospital only)

**Solution for infusion**

- **Etoposide (Non-proprietary)**
  - Etoposide 20 mg per 1 ml Etoposide 100 mg/5 ml concentrate for solution for infusion vials | 1 vial [POM] no price available (Hospital only) | 1 vial [POM] £11.50 | 10 vial [POM] £115.00
  - Etoposide 500 mg/25 ml concentrate for solution for infusion vials | 1 vial [POM] £50.75 (Hospital only)
  - **Eposin** (medac UK)
    - Etoposide 20 mg per 1 ml Eposin 500 mg/25 ml concentrate for solution for infusion vials | 1 vial [POM] £67.50 (Hospital only)
    - Eposin 100 mg/5 ml concentrate for solution for infusion vials | 1 vial [POM] £13.50 (Hospital only)

**ANTINEOPLASTIC DRUGS**

**TAXANES**

**Cabazitaxel**

*03-Oct-2016*

**INDICATIONS AND DOSE**

Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult product literature or local protocols)

**CAUTIONS** Avoid in acute porphyrias p. 930

**INTERACTIONS** → Appendix 1 (cabazitaxel).

**SIDE-EFFECTS**

- Common or very common Hypersensitivity reactions

- Frequency not known Abdominal pain · alopecia · anxiety · arthralgia · atrial fibrillation · bone marrow suppression · chest pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dry mouth · dry skin · dyspepsia · dyspnoea · electrolyte disturbances · erythema · extravasation · flushing · gastroesophageal reflux · haemorrhoids · headache · hyperglycaemia · hypertension · hyperuricaemia · hypothermia · hypotension · increased lacrimation · malaise · muscle spasm · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neuropathy · rectal haemorrhage · renal disorders (fatal cases of renal failure reported) · sciatica · tachycardia · taste disturbance · thromboembolism · tinnitus ·

tumour lysis syndrome · urinary incontinence · urinary retention · vertigo · vomiting · weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hypersensitivity reactions** Routine premedication with a corticosteroid, an antihistamine, and a histamine H₁-receptor antagonist is recommended to prevent severe hypersensitivity reactions.
  - For further information on side-effects, consult product literature.

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).

**PREGNANCY** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.

**MONITORING REQUIREMENTS** Monitor electrolytes— correct dehydration.

**DIRECTIONS FOR ADMINISTRATION** Intravenous infusion incompatible with PVC.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391**
  - Cabazitaxel in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:
    - the patient has an eastern cooperative oncology group (ECOG) performance status of 0 or 1
    - the patient has had 225 mg/m² or more of docetaxel
    - treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
    - the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
    - NHS trusts purchase cabazitaxel in accordance with the commercial access agreement, either in vials (at a reduced price to reflect the average cost of waste per patient), or in pre-prepared intravenous infusion bags. Patients currently receiving cabazitaxel that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

**www.nice.org.uk/TA391**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Ethanol

- **Jevtana** (Sanofi)
  - Cabazitaxel 40 mg per 1 ml JEVTA V 60 mg/1.5 ml concentrate and solvent for solution for infusion vials | 1 vial [POM] £3,696.00 (Hospital only)
Docetaxel

- **INDICATIONS AND DOSE**
  Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresetable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)

  - **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult product literature or local protocols)

- **CAUTIONS** Avoid in acute porphyrias p. 930 | consult product literature
- **INTERACTIONS** → Appendix 1 (docetaxel).
- **SIDE-EFFECTS** Alopecia | bone-marrow suppression | cystoid macular oedema | extravasation | fat influence | heart failure | hypersensitivity reactions | hyperuricaemia | nausea | oral mucositis | peripheral neurotoxicity | persistent fluid retention (commonly as leg oedema that worsens during treatment) | can be resistant to treatment | severe skin reactions | thrombocytopenia | tumour lysis syndrome | vomiting

  **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersensitivity reactions and fluid retention | Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions (consult product literature).
  - Consult product literature for monitoring and management of side effects.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men
- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment. Monitor liver function in hepatic impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (TAs)**
  - **Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101**
    Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% | Karnofsky score is a measure of the ability to perform ordinary tasks.
    www.nice.org.uk/TA101
  - **Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109**
    Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.
    www.nice.org.uk/TA109
  - **Scottish Medicines Consortium (SMC) Decisions**
    The Scottish Medicines Consortium has advised that docetaxel (Taxotere®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**
  **EXCIPIENTS:** May contain ethanol
  - **Docetaxel (Non-proprietary)**
    Docetaxel 10 mg per 1 ml Docetaxel 80mg/8ml concentrate for solution for infusion vials | 1 vial (POM) £53.75 (Hospital only) | Docetaxel 160mg/16ml concentrate for solution for infusion vials | 1 vial (POM) £109.50 (Hospital only) | Docetaxel 20mg/2ml concentrate for solution for infusion vials | 1 vial (POM) £162.75 (Hospital only) | Docetaxel 20 mg per 1 ml Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial (POM) £53.00 | Docetaxel 160mg/8ml concentrate for solution for infusion vials | 1 vial (POM) no price available | Docetaxel 140mg/7ml concentrate for solution for infusion vials | 1 vial (POM) £90.00 | Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial (POM) £160.00 | Taxotere (Sanofi)
    Taxotere docetaxel 20 mg per 1 ml Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial (POM) £50.81 | Taxotere 140mg/7ml concentrate for solution for infusion vials | 1 vial (POM) £72.10 | Taxotere 20mg/1ml concentrate for solution for infusion vials | 1 vial (POM) £154.61 | Taxotere (Sanofi)
    Taxotere docetaxel 20 mg per 1 ml Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial (POM) £53.47 (Hospital only) | Taxotere 160mg/8ml concentrate for solution for infusion vials | 1 vial (POM) £1,008.54 (Hospital only) | Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial (POM) £504.27 (Hospital only)
Paclitaxel

**DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

**INDICATIONS AND DOSE**

- Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only)
- Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only)
- Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only)
- Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only)
- Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only)
- Treatment of advanced AIDS-related Kaposis's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only)
- First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only)
- Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only)
- In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

**SIDE-EFFECTS**

- Common or very common: Arrhythmia, arthralgia, febrile neutropenia, gastro-intestinal disorders, myalgia, peripheral neuropathy, sensory neuropathy, tachycardia
- Rare: Bradycardia, cardiac arrest, congestive heart failure, left ventricular dysfunction
- Frequency not known: Alopecia, arhythmias (nearly always asymptomatic), asymptomatic hypotension, bone-marrow suppression, bradycardia, cardiac conduction defects, extravasation, hypersensitivity reactions, hyperuricaemia, muscle pain, myelosuppression, nausea, neutropenia, oral mucositis, pneumonia, Stevens-Johnson syndrome, thromboembolism, toxic epidermal necrolysis, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypersensitivity reactions: Routine premedication with a corticosteroid, an antihistamine and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

**CONCEPTION AND CONTRACEPTION**

Ensure effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**

Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.

**CAUTIONS**

Avoid in acute porphyrias p. 930; consult product literature; patients aged over 75 years with metastatic adenocarcinoma of the pancreas.

**INTERACTIONS** ➔ Appendix 1 (paclitaxel).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Paclitaxel for ovarian cancer (January 2003) NICE TA55
  Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).
  [www.nice.org.uk/TA55](http://www.nice.org.uk/TA55)
- Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108
  Paclitaxel, within its licensed indication, is not recommended for the adjuvant treatment of women with early node-positive breast cancer.
  [www.nice.org.uk/TA108](http://www.nice.org.uk/TA108)
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
  Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).
  [www.nice.org.uk/TA284](http://www.nice.org.uk/TA284)
- Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015) NICE TA360
  Albumin-bound paclitaxel (nab-paclitaxel, Abraxane®) with gemcitabine, within its licensed indication, is not recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.
  Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.
  [www.nice.org.uk/TA360](http://www.nice.org.uk/TA360)
- Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389
  Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer.
  [www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Polyoxyl castor oils

- Paclitaxel (Non-proprietary)
  Paclitaxel 6 mg per 1 ml
  Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial (POD) £504.90–£561.00 (Hospital only) | 1 vial (POD) £300.52
  Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial (POD) £112.31–£116.05 (Hospital only) | 1 vial (POD) £105.84
  Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial (POD) £1,009.80–£1,122.00 (Hospital only) | 1 vial (POD) £951.63
  Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials | 1 vial (POD) £336.60–£374.00 (Hospital only) | 1 vial (POD) £317.21

**Powder for suspension for infusion**

**ELECTROLYTES**: May contain Sodium

- Abraxane (Celgene Ltd)
  Abraxane 100 mg
  Abraxane 100mg powder for suspension for infusion vials | 1 vial (POD) £246.00 (Hospital only)
ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

- **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

- **INDICATIONS AND DOSE** Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab). First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid, and bevacizumab). First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab).

- **CONTRA-INDICATIONS** Bowel obstruction. Chronic inflammatory bowel disease.

- **CAUTIONS** Raised plasma-bilirubin concentration.

- **INTERACTIONS** → Appendix 1 (irinotecan).

- **SIDE-EFFECTS**
  - Uncommon: Interstitial pulmonary disease.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 1 month after treatment in women and up to 3 months after treatment in men.

- **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range. Monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature).

- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor respiratory function.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)** Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93

    A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. [www.nice.org.uk/TA93](http://www.nice.org.uk/TA93)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**

    Irinotecan hydrochloride (Non-proprietary)

    Irinotecan hydrochloride trihydrate 20 mg per 1 ml:

    - Irinotecan 500 mg/25 ml concentrate for solution for infusion vials: £60.15–£65.00 (Hospital only)
    - Irinotecan 40 mg/2 ml concentrate for solution for infusion vials: £49.03–£53.00 (Hospital only)
    - Irinotecan 300 mg/15 ml concentrate for solution for infusion vials: £39.00 (Hospital only)
    - Irinotecan 100 mg/5 ml concentrate for solution for infusion vials: £120.25–£130.00 (Hospital only)
    - Irinotecan £100.62–£123.50

    Campto (Pfizer Ltd)

    Irinotecan hydrochloride trihydrate 20 mg per 1 ml:

    - Campto 100 mg/5 ml concentrate for solution for infusion vials: £130.00 (Hospital only)
    - Campto 40 mg/2 ml concentrate for solution for infusion vials: £53.00 (Hospital only)
    - Campto 300 mg/15 ml concentrate for solution for infusion vials: £390.00 (Hospital only)

- **Topotecan**

  - **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

  - **INDICATIONS AND DOSE** Metastatic ovarian cancer when first-line or subsequent treatment has failed. Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin).

    - **BY INTRAVENOUS INFUSION**

      Adult: (consult product literature or local protocols)

    - **Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate**

      - **BY INTRAVENOUS INFUSION, OR BY MOUTH**

      Adult: (consult product literature or local protocols)

- **IMPORTANT SAFETY INFORMATION**

  - **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 797.

  - **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

  - **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

  - **BREAST FEEDING** Discontinue breast-feeding.

  - **HEPATIC IMPAIRMENT** Avoid in severe impairment.

  - **RENAL IMPAIRMENT** Reduce dose. Avoid infusion if creatinine clearance less than 30 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

    - **NICE technology appraisals (TAs)**

      Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183

      Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin. [www.nice.org.uk/TA183](http://www.nice.org.uk/TA183)
Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184

Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if retreatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated.

Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.

www.nice.org.uk/TA184

Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Topotecan is not recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.

Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

www.nice.org.uk/TA389

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2007) that topotecan (Hycamtin®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- Hycamtin (Novartis Pharmaceuticals UK Ltd)
  - Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg capsules | 10 capsule £360.00
  - Topotecan (as Topotecan hydrochloride) 250 microgram Hycamtin 0.25mg capsules | 10 capsule £75.00

Solution for infusion

- Topotecan (Non-proprietary)
  - Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml Topotecan 4mg/4ml concentrate for solution for infusion vials | 1 vial £261.55 (Hospital only) | 1 vial no price available | 5 vial £1,453.10 (Hospital only)
  - Topotecan 1mg/1ml concentrate for solution for infusion vials | 1 vial £87.88 (Hospital only) | 1 vial no price available | 5 vial £488.25 (Hospital only)

Powder for solution for infusion

- Hycamtin (Novartis Pharmaceuticals UK Ltd)
  - Topotecan (as Topotecan hydrochloride) 1 mg Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial £97.65
  - Topotecan (as Topotecan hydrochloride) 4 mg Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial £348.76

- Potactasol (Actavis UK Ltd)
  - Topotecan (as Topotecan hydrochloride) 1 mg Potactasol 1mg powder for concentrate for solution for infusion vials | 1 vial £97.00 (Hospital only)
  - Topotecan (as Topotecan hydrochloride) 4 mg Potactasol 4mg powder for concentrate for solution for infusion vials | 1 vial £290.00 (Hospital only)

Vinblastine sulfate

INDICATIONS AND DOSE

- Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
  - Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION

Vinblastine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 ml minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

CAUTIONS

Caution in handling—irritant to tissues

INTERACTIONS

Appendix 1 (vinblastine).

SIDE-EFFECTS

Abdominal pain, alopecia, autonomic neuropathy, constipation, hyperuricaemia, loss of deep tendon reflexes, motor weakness, myelosuppression (dose-limiting), nausea, neurotoxicity, oral mucositis, ototoxicity, peripheral neuropathy, peripheral paraesthesia, severe bronchospasm following administration (more commonly when used in combination with mitomycin-C), severe local irritation (care must be taken to avoid extravasation), thromboembolism, tumour lysis syndrome, vomiting

FURTHER INFORMATION

Neurotoxicity

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine.

Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797

PREGNANCY

Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Dose reduction may be necessary—consult local treatment protocol for details.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Vinblastine sulfate (Non-proprietary)
  - Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial £85.00
Vincristine sulfate

- **INDICATIONS AND DOSE**
  - Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
  - Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**
Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS**
  - CONTRA-INDICATIONS. FURTHER INFORMATION
  - Intrathecal injection **contra-indicated**.
- **CAUTIONS**
  - Caution in handling—irritant to tissues • neuromuscular disease
- **INTERACTIONS**
  - **Rare** Diarrhoea • inappropriate secretion of antidiuretic hormone • intestinal necrosis • paralytic ileus • seizures • urinary retention
  - **Frequency not known** Abdominal pain • alopecia • autonomic neuropathy • constipation • extravasation • eye disorders • hyperuricaemia • loss of deep tendon reflexes • motor weakness • muscle wasting • myelosuppression (negligible) • nausea • neurotoxicity • oral mucositis • otoxicity • peripheral neuropathy • peripheral paraesthesia • severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) • severe local irritation (care must be taken to avoid extravasation) • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.
  - Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **PREGNANCY**
  - Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Dose reduction may be necessary—consult local treatment protocol for details.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Vincristine sulfate (non-proprietary)**
  - Vincristine sulfate 1 mg per 1 ml Vincristine 1mg/1ml solution for injection vials | 1 vial (POM) £13.47 (Hospital only) | 5 vial (POM) £67.35

Vindesine sulfate

- **INDICATIONS AND DOSE**
  - Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)
  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**
Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS**
  - CONTRA-INDICATIONS. FURTHER INFORMATION
  - Intrathecal injection **contra-indicated**.
- **CAUTIONS**
  - Caution in handling—irritant to tissues • neuromuscular disease
- **INTERACTIONS**
  - **Rare** Diarrhoea • autonomic neuropathy • bone-marrow suppression • extravasation • hyperuricaemia • irritant to tissues • myelosuppression (dose-limiting) • nausea • neurotoxicity • oral mucositis • peripheral neuropathy • severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) • severe local irritation (if extravasated) • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.
  - Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.
- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **BREAST FEEDING**
  - Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - Dose reduction may be necessary.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **Eldisine** (Genus Pharmaceuticals Ltd)
  - Vindesine sulfate 5 mg Eldisine 5mg powder for solution for injection vials | 1 vial (POM) £66.55 (Hospital only)
Vinflunine

**INDICATIONS AND DOSE**

Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)

- **Adult:** (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

Vinflunine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

**CAUTIONS**

Cardiovascular disease - QT-interval prolongation (avoid hypokalaemia)

**INTERACTIONS**

→ Appendix 1 (vinflunine)

Caution with concomitant use of drugs that prolong QT-interval.

**SIDE-EFFECTS**

- **Common or very common**
  - Anorexia • cutaneous reactions • dehydration • diarrhoea • dyspepsia • fatigue • hypertension • hypotension • insomnia • oedema • sweating • tachycardia • thrombosis

- **Uncommon**
  - Increased weight • myocardial infarction • renal failure

- **Frequency not known**
  - Alopecia • autonomic neuropathy • blurred vision • extravasation • hyperuricaemia • inappropriate anti-diuretic hormone secretion • myelosuppression (dose-limiting) • nausea • neurotoxicity • oral mucositis • peripheral neuropathy • QT-interval prolongation • severe bronchospasm following administration (more commonly used when combined with mitomycin-C) • severe local irritation (if extravasated) • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Neurotoxicity • Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during and for up to 3 months after treatment.

- **PREGNANCY**

Avoid unless essential—teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING**

Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

Reduce dose—consult product literature.

- **RENAL IMPAIRMENT**

Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.

**NATIONAL FUNDING.ACCESS DECISIONS**

NICE technology appraisals (TAs)

- **Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013) NICE TA272**

Vinflunine is not recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.

www.nice.org.uk/TA272

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Javor (Pierre Fabre Ltd)**

  Vinflunine (as Vinflunine ditartrate) 25 mg per 1 ml Javor 250mg/10ml concentrate for solution for infusion | 1 vial £1.062.50

  Javor 50mg/2ml concentrate for solution for infusion | 1 vial £212.50

**Vinorelbine**

**DRUG ACTION**

Vinorelbine is a semi-synthetic vinca alkaloid.

**INDICATIONS AND DOSE**

Advanced breast cancer | Advanced non-small cell lung cancer

- **BY MOUTH**

  - Adult: 60 mg/m² once weekly for 3 weeks, then increased if tolerated to 80 mg/m² once weekly (max. per dose 160 mg once weekly)

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

  - Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Vinorelbine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

**CAUTIONS**

Caution in handling—irritant to tissues • ischaemic heart disease

**INTERACTIONS**

→ Appendix 1 (vinorelbine).

**SIDE-EFFECTS**

- **Rare**

  - Pancreatitis

- **Frequency not known**

  - Alopecia • autonomic neuropathy • extravasation • hyperuricaemia • hyponatraemia • inappropriate secretion of antidiuretic hormone • irritant to tissues • motor weakness • myelosuppression (dose-limiting) • nausea • neurotoxicity • oral mucositis • peripheral neuropathy • severe bronchospasm following administration of the vinca alkaloids (more commonly used in combination with mitomycin-C) • severe myelosuppression • severe local irritation (if extravasated) • tumour lysis syndrome • vomiting

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.
local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Neutropenia Neutropenia, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinorelbine. Patients with neutropenia commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neutropenia are severe, doses should be reduced.
- Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.
- **PREGNANCY** Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
  - With oral use Reduce oral dose in moderate impairment. Avoid oral use in severe impairment.
  - With intravenous use Reduce intravenous dose in severe impairment. Consult product literature.

- **Common or very common** Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis
- **Uncommon** Anaphylaxis · changes in blood lipids · hyperglycaemia
- **Rare** CNS depression
- **Very rare** Abdominal pain · hypertension · myalgia
- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**PREGNANCY** Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.
Eribulin

**INDICATIONS AND DOSE**
Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

- **BY INTRAVENOUS INJECTION**
  - Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

**CONTRA-INDICATIONS**
- Congenital long QT syndrome

**CAUTIONS**
- Bradyarrhythmias (increased susceptibility to QT-interval prolongation)
- Congestive heart failure (increased susceptibility to QT-interval prolongation)
- Electrolyte disturbances (increased susceptibility to QT-interval prolongation)
- Increased susceptibility to QT-interval prolongation

**INTERACTIONS**
- Caution with concomitant use of drugs that prolong QT-interval.

**SIDE-EFFECTS**
- Alopecia
- Bone-marrow suppression
- Extravasation
- Hyperuricaemia
- Myelosuppression
- Nausea
- Oral mucositis
- Peripheral neuropathy
- QT-interval prolongation
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side effects, consult product literature.

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during and for up to 3 months after treatment in men or women.

**PREGNANCY**
Avoid unless essential (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Reduce dose.

**RENAL IMPAIRMENT**
Consider dose reduction if creatinine clearance less than 40 mL/minute.

**MONITORING REQUIREMENTS**
- Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
- ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
- Monitor electrolytes periodically.

**NATIONAL FUNDING/ACCESS DECISIONS**
**NICE technology appraisals (TAs)**
- Eribulin for the treatment of locally advanced or metastatic breast cancer (April 2012) NICE TA250
  - Eribulin is not recommended for the treatment of locally advanced or metastatic breast cancer that has progressed after at least two chemotherapy regimens for advanced disease.
  - www.nice.org.uk/TA250

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (March 2016) that eribulin (Halaven®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capecitabine if indicated.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **EXCIPIENTS**: May contain Ethanol
- Halaven (Eisai Ltd)
  - Eribulin 44 mg per 1 ml
  - Halaven 0.88mg/2ml solution for injection vials | 1 vial £361.00 (Hospital only)
  - Halaven 1.32mg/3ml solution for injection vials | 1 vial £541.50 (Hospital only)

**Hydroxyurea**
(*Hydroxyurea*)

**INDICATIONS AND DOSE**
Treatment of chronic myeloid leukaemia | Treatment of cancer of the cervix in conjunction with radiotherapy | Polycythaemia

- **BY MOUTH**
  - Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

**Sickle-cell disease—consult with a specialist centre**

**SIDE-EFFECTS**
- Common or very common
  - Headache
- Reduced sperm count and skin reactions

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception before and during treatment.

**PREGNANCY**
Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

**RENAL IMPAIRMENT**
In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m².

- Use with caution in malignant disease.

**IMPORTANT SAFETY INFORMATION**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 797.

**CAUTIONS**
- Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)

**INTERACTIONS**
- Appendix 1 (hydroxyurea).

**SIDE-EFFECTS**
- Common or very common
  - Headache
- Myelosuppression
- Skin reactions
- Rare
  - Aminorrhoea (in sickle-cell disease)
  - Fever (in sickle-cell disease)

**FURTHER INFORMATION**
See Cytotoxic drugs 2016 p. 833

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (March 2016) that eribulin (Halaven®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capecitabine if indicated.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **EXCIPIENTS**: May contain Ethanol
- Halaven (Eisai Ltd)
  - Eribulin 44 mg per 1 ml
  - Halaven 0.88mg/2ml solution for injection vials | 1 vial £361.00 (Hospital only)
  - Halaven 1.32mg/3ml solution for injection vials | 1 vial £541.50 (Hospital only)
Mitotane

**DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

**INDICATIONS AND DOSE**
Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- **BY MOUTH**
- Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose can be increased up to 6 g daily; reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

**MONITORING REQUIREMENTS**
- Monitor renal and hepatic function before and during treatment.
- Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
- Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.

**PATIENT AND CARER ADVICE**
Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**SIDE-EFFECTS**
- Common or very common: Anaemia · anaorexia · asthenia · ataxia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · endocrine side effects · epigastric discomfort · gastro-intestinal disturbances · gynaecomastia · headache · hypercholesterolaemia · hypertriglyceridaemia · hypogonadism · leucopenia · liver disorders · movement disorder · myasthenia · nausea · neuropathy · neurotoxicity · paraesthesia · prolonged bleeding time · rash · thrombocytopenia · thyroid disorders · vomiting
- Rare: Flushing · haematuria · haemorrhagic cystitis · hypersalivation · hypertension · hypouricaemia · ocular disorders · postural hypotension · proteinuria · pyrexia · visual disturbances

**CAUTIONS**
- Avoid in acute porphyrias p. 930 · risk of accumulation in overweight patients

**INTERACTIONS** → Appendix 1 (mitotane).

**RENNAL IMPAIRMENT**
- Plasma-mitotane concentration for optimum response ~14–20 mg/litre.
- Monitor plasma-mitotane concentration—consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**
Corticosteroid replacement therapy
Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

**PREGNANCY**
Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
- Avoid in severe impairment. Manufacturer advises caution in mild to moderate impairment; monitoring of plasma-mitotane concentration is recommended.

**RENAI IMPAIRMENT**
- Avoid in severe impairment. Manufacturer advises caution in mild to moderate impairment; monitoring of plasma-mitotane concentration is recommended.

**MONITORING REQUIREMENTS**
- Plasma-mitotane concentration for optimum response ~14–20 mg/litre.
- Monitor plasma-mitotane concentration—consult product literature.

**SIDE-EFFECTS**
- Frequency not known: Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION**
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**Panobinostat**

**DRUG ACTION** Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

**INDICATIONS AND DOSE**
Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

- **BY MOUTH**
- Adult 18–74 years: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature
- Adult 75 years and over: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks),

---

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 797.

**Panobinostat**

**DRUG ACTION** Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

**INDICATIONS AND DOSE**
Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent

- **BY MOUTH**
- Adult 18–74 years: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature
- Adult 75 years and over: 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks),
alternatively initially 15 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 1 cycle, increased if tolerated to 20 mg once daily, for 7 subsequent cycles, patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), lower dose may be used for the first cycle depending on patient’s condition and co-morbidities, for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
Reduce dose to 10 mg with concomitant use of potent CYP3A4 inhibitors (such asitraconazole, ketoconazole, posaconazole, ritonavir, saquinavir, and telithromycin); if the potent CYP3A4 inhibitor is to be continued, consider increasing the dose to 15 mg if tolerated. Avoid potent CYP3A4 inhibitors if possible in patients taking a reduced panobinostat dose due to side-effects.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

- **CAUTIONS** Coagulation disorders · elderly · QT-interval prolongation · risk factors for QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (panobinostat). Contra-indicated with concomitant use of drugs that prolong the QT-interval. Avoid concurrent use of potent CYP3A4 inhibitors in patients with hepatic impairment.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension · abdominal pain · abnormal hepatic function · anaemia · atrial fibrillation · bradycardia · chilblains · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry mouth · dysgeusia · dyspepsia · dyspnoea · electrolyte disturbances · epistaxis · erythema · fatigue · flatulence · fluid retention · gastritis · haemorrhage (may lead to haemorrhagic shock) · headache · hyperglycaemia · hypertension · hypoalbuninaemia · hypotension (including orthostatic) · hypothyroidism · insomnia · joint swelling · leucopenia · lymphopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · QT-interval prolongation · rash · renal failure · respiratory failure · skin lesions · syncope · tachycardia · thrombocytopenia · tremor · urinary incontinence · vomiting · wheezing
  - **Uncommon** Colitis · myocardial infarction

- **SIDE-EFFECTS, FURTHER INFORMATION**

- **SIDE-EFFECTS** are reported when used in combination with bortezomib and dexamethasone.

- **Gastro-intestinal disorders** Manufacturer advises that patients are treated with anti-diarrhoeals, or any medicines used for diarrhoea. Patients are treated with anti-diarrhoeals, or any medicines used for diarrhoea. Patients are treated with anti-diarrhoeals, or any medicines used for diarrhoea.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before starting treatment in women of child-bearing potential, and ensure highly effective contraception used during treatment and for 3 months after last dose. Women using hormonal contraceptives should also use a barrier method of contraception. Highly effective contraception also required for men and their female partners during treatment and for 6 months after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—absence of data in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises reduce initial dose to 15 mg during the first treatment cycle in mild impairment—dose may be increased to 20 mg based on patient tolerability; reduce initial dose to 10 mg during the first treatment cycle in moderate impairment—dose may be increased to 15 mg based on patient tolerability. Manufacturer advises frequent monitoring of hepatic function in mild and moderate impairment, particularly during the dose escalation phase; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
  - Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle; QTCF should be <480 milliseconds before treatment initiation—consult product literature.
  - Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
  - Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastrointestinal toxicity.

- **PATIENT AND CARER ADVICE**

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Panobinostat for treating multiple myeloma after at least 2 previous treatments (January 2016) NICE TA380

  Panobinostat, in combination with bortezomib and dexamethasone, is recommended as an option for treatment relapsed or refractory multiple myeloma in patients who have received at least 2 prior regimens including bortezomib and an immunomodulatory agent when the manufacturer provides panobinostat with the discount agreed in the patient access scheme.

  www.nice.org.uk/TA380

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  CAUTIONARY AND ADVISORY LABELS 25

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

### INDICATIONS AND DOSE

**Hodgkin’s Lymphoma**

- **BY MOUTH**
- Adult: (consult local protocol)

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 797.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia - pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease - cerebrovascular disease - epilepsy - phaeochromocytoma - procarbazine is a mild monoamine oxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1 (procarbazine). Alcohol ingestion may cause a disulfiram-like reaction.
- **SIDE-EFFECTS**
  - Common or very common: Loss of appetite
  - Frequency not known: Alopecia - bone-marrow suppression - hypersensitivy rash (discontinue treatment) - hyperuricaemia - jaundice - myelosuppression - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). Avoid if creatinine clearance less than 25 mL/minute.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **Tomudex** (Hospira UK Ltd)
    - Raltitrexed 2 mg Tomudex 2mg powder for solution for infusion vials | 1 vial [POD] £148.75

### RETINOID AND RELATED DRUGS

#### Bexarotene

- **DRUG ACTION** Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.

### INDICATIONS AND DOSE

Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

- **BY MOUTH**
- Adult: Initially 300 mg/m² once daily, adjusted according to response, to be taken with a meal

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 797.

- **CONTRA-INDICATIONS** History of pancreatitis - hypervitaminosis A - uncontrolled hyperlipidaemia - uncontrolled hypothyroidism
- **CAUTIONS** Avoid in acute porphyrias p. 930 - hyperlipidaemia - hypothyroidism
- **INTERACTIONS** → Appendix 1 (bexarotene).
- **SIDE-EFFECTS** Alopecia - bone-marrow suppression - headache - hyperlipidaemia - hyperuricaemia - hypothyroidism - immunosuppression - leucopenia - myelosuppression - nausea - oral mucositis - pruritus - rash - thromboembolism - tumour lysis syndrome - vomiting

### ALLERGY AND CROSS-SENSITIVITY

Caution—hypersensitivity to retinoids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 month after treatment in men and women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.

### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (November 2002) that bexarotene is recommended for restricted use...
as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Targretin (Teva UK Ltd)

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

- Retinoid acid syndrome
- Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

**CONCEPTION AND CONTRACEPTION**

Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

**PREGNANCY**

Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

Avoid (discontinue breast-feeding).

**HEPATIC IMPAIRMENT**

Reduce dose to 25 mg/m².

**RENAL IMPAIRMENT**

Reduce dose to 25 mg/m².

**MONITORING REQUIREMENTS**

Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**

Tretinoin is the acid form of vitamin A.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Tretinoin (Non-proprietary)
  - Tretinoin 10 mg  Tretinoin 10mg capsules | 100  capsule

---

### 2.1 Cytotoxic drug-induced side effects

#### ANTIDOTES AND CHELATORS ▶ IRON CHELATORS

**Dexrazoxane**

- **DRUG ACTION**
  - Dexrazoxane is an iron chelator.

**INDICATIONS AND DOSE**

**Cardoxane**

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m² of doxorubicin or a prior cumulative dose of 540 mg/m² of epirubicin when further anthracycline treatment is required

- **BY INTRAVENOUS INFUSION**
  - Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

**Savene**

**Anthracycline extravasation**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 1 g/m² daily (max. per dose 2 g) for 2 days, then 500 mg/m² for 1 day, first dose to be given as soon as possible and within 6 hours after injury

**CAUTIONS**

- Myelosuppression (effects may be additive to those of chemotherapy)

**Cardoxane**

- Manufacturer advises caution in patients with heart failure, myocardial infarction in previous 12 months, symptomatic valvular heart disease, uncontrolled angina—no information available

**INTERACTIONS**

- Appendix 1 (dextrazoxane).

**SIDE-EFFECTS**

**Cardoxane**

- **Common or very common**
  - Anorexia - asthenia - diarrhoea - dizziness - dry mouth - dysphonia - erythema - infection - malaise - nausea - oedema - paraesthesia - peripheral neuropathy - stomatitis - syncope - vomiting

- **Uncommon**
  - Abdominal pain - acute myeloid leukaemia - constipation - cough - dyspepsia - headache - lymphoedema - nail disorder - reduced ejection fraction - tachycardia - thromboembolism (when given with cytotoxic drugs)

- **Frequency not known**
  - Alopecia - anaemia - blood disorders - fatigue - injection-site reactions - leucopenia - phlebitis - pruritus - pyrexia - thrombocytopenia

**Savene**

- **Common or very common**

- **Uncommon**
  - Drowsiness - myalgia - thromboembolism (when given with cytotoxic drugs) - weight loss

**CONCEPTION AND CONTRACEPTION**

Ensure effective contraception during and for at least 3 months after treatment in men and women.

- **PREGNANCY**
  - Avoid unless essential (toxicity in animal studies).

- **BREAST FEEDING**
  - Discontinue breast-feeding.
Keratinocyte growth factors

Breast feeding

Pregnancy

Side-effects

Drug action

Medicinal forms

Detoxifying drugs

Palifermin

Drug action

Indications and dose

Management of oral mucositis in patients with haematological malignancies receiving myeloblastic radiochemotherapy with autologous haematopoietic stem-cell support

BY INTRAVENOUS INJECTION

Adult: 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloblastic therapy) then 3 further doses at least 24 hours after myeloblastic therapy, and more than 4 days after most recent palifermin injection, starting on the same day as (but after) stem-cell infusion

Side-effects

Arthralgia • discoloration of the tongue • erythema • fever • oedema • oral paraesthesia • pruritus • rash • skin hyperpigmentation • taste disturbance • thickening of the tongue

Pregnancy

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

Breast feeding

Manufacturer advises avoid—no information available.

Indications and dose

Cytotoxic induced urothelial toxicity

BY MOUTH, OR BY INTRAVENOUS INJECTION

Adult: Dose to be calculated according to oxazophosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

Side-effects

Common or very common

Colic • depression • diarrhoea • fatigue • headache • hypotension • irritability • joint pains • limb pains • nausea • rash • tachycardia • vomiting

Rare

Hypersensitivity reactions (more common in patients with auto-immune disorders)

Allergy and cross-sensitivity

Contra-indicated if history of hypersensitivity to thiol-containing compounds.

Pregnancy

Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

Effect on laboratory tests

False positive urinary ketones. False positive or false negative urinary erythrocytes.

Directions for administration

For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

Mesna (Non-proprietary)

Mesna 400 mg Mesna 400mg tablets | 10 tablet £134.30–£134.40

Mesna 600 mg Mesna 600mg tablets | 10 tablet £190.60

Solution for injection

Mesna (Non-proprietary)

Mesna 100 mg per 1 ml Mesna 18/18ml solution for injection ampoules | 15 ampoule £441.15

Mesna 400mg/4ml solution for injection ampoules | 5 ampoule no price available | 15 ampoule £201.15

Vitamins and trace elements

Folinic acid

Indications and dose

Prevention of methotrexate-induced adverse effects

BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdosage

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjuvant to fluorouracil in colorectal cancer

BY SLOW INTRAVENOUS INJECTION

Adult: (consult product literature)
Levofolinic acid

**DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

**INDICATIONS AND DOSE**

Prevention of methotrexate-induced adverse effects

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

Suspected methotrexate overdosage

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

- **BY SLOW INTRAVENTOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Intrathecal injection

**CAUTIONS** Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

**INTERACTIONS** → Appendix 1 (folates).

**SIDE-EFFECTS**

- Rare Agitation (after high doses) - depression (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

**PREGNANCY** Not known to be harmful; benefit outweighs risk.

**BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.

www.nice.org.uk/TA212

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Folinic acid (Non-proprietary)**

  - Calcium folinate 300mg/30ml solution for injection vials | 1 vial Pom £100.00 (Hospital only) | 1 vial Pom £100.00
  - Calcium folinate 100mg/10ml solution for injection vials | 1 vial Pom £37.50 (Hospital only) | 1 vial Pom £37.50
  - Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial Pom £24.70
  - Disodium folinate 200mg/4ml solution for injection vials | 1 vial Pom £80.40
  - Refolinon (Pfizer Ltd) Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule Pom £23.12
  - Sodiofolin (medac UK) Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial Pom £126.25

2.1a Hyperuricaemia associated with cytotoxic drugs

Other drugs used for Hyperuricaemia associated with cytotoxic drugs: Allopurinol, p. 980 - Febuxostat, p. 981

**DETOXIFYING DRUGS** Urate oxidases

**Rasburicase**

**INDICATIONS AND DOSE**

Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis

- **BY INTRAVENOUS INFUSION**
  - Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-urate acid concentration

**CONTRA-INDICATIONS** G6PD deficiency

**CAUTIONS** Atopic allergies
Hormone responsive malignancy

3 Hormone responsive malignancy

Breast cancer

Description of condition

Breast cancer is the most common form of malignancy in women. The causes of breast cancer are complex and there are several risk factors. Established risk factors include age, early onset of menstruation, late menopause, greater age at first completed pregnancy, and a family history. The use of oral contraceptives and postmenopausal HRT are also associated with a small excess risk.

Non-invasive breast cancer, also known as ductal carcinoma in situ, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (operable, primary, stage I/II), locally advanced disease (inoperable local, stage III) and advanced disease (metastatic, stage IV).

Aims of treatment

Reducing mortality, increasing progression-free and disease-free survival and improving quality of life are the main aims of the available treatments for breast cancer and are dependant on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, while adjuvant drug therapy aims to reduce the risk of recurrence and the risk of developing invasive disease. Advanced breast cancer is not curable and treatment aims to achieve remission, to prolong the disease free survival, to relieve symptoms and improve quality of life.

Treatment

The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer; factors such as patient age and menopausal status, tumour size and grade, involvement of axillary lymph nodes or skin, and presence of hormone receptors within the tumour may inform the extent and aggressiveness of the disease. The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

Early and locally advanced breast cancer

For operable breast cancer, primary treatment is surgical using breast-conserving surgery or mastectomy, followed by adjuvant therapy to eradicate the micrometastases that cause relapses. Radiotherapy is recommended after breast conserving surgery, as it reduces local recurrence rates. It is also used after mastectomy if there is a high risk of recurrence.

Drug therapy can be used after surgery (adjuvant therapy) or may be offered before surgery (neoadjuvant therapy) to achieve local tumour downsizing in order to make breast-conserving surgery possible. The choice of adjuvant therapy is determined by the safety and efficacy of the drugs, the oestrogen-receptor status, and the human epidermal growth factor 2 (HER2) status of the primary tumour.

Adjuvant chemotherapy or radiotherapy should be considered for all patients, irrespective of age, and it should be started as soon as clinically possible within 31 days of surgery.

A high-dose anthracycline-based chemotherapy regimen is usually preferred to a low-dose anthracycline-based regimen or to a non-anthracycline-based regimen. Choice of chemotherapy regimen is usually guided by local policy, Clinical Cancer Networks, and funding arrangements.

Adjuvant anthracycline-taxane combination chemotherapy should be considered in patients where the additional benefit outweighs risks. For patients with lymph node-positive breast cancer, docetaxel p. 826 can be added as part of an adjuvant chemotherapy regimen; paclitaxel p. 827 is not recommended.

Following surgery, tamoxifen p. 848, alone or in combination with chemotherapy, can be given to premenopausal women with oestrogen-receptor-positive early invasive breast cancer. If chemotherapy has not been selected, tamoxifen can be used in combination with ovarian ablation or suppression. Tamoxifen is not recommended for non-invasive (ductal carcinoma in situ) early breast cancer. Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin p. 675 or ovarian ablation.

For postmenopausal women with oestrogen-receptor-positive early invasive breast cancer, not considered to be low risk, an aromatase inhibitor, such as anastrozole p. 849 or letrozole p. 850, is first-line therapy. Tamoxifen is an alternative if an aromatase inhibitor is not tolerated or is contra-indicated. An aromatase inhibitor should be given as initial adjuvant therapy for 5 years, or by switching to an aromatase inhibitor after 2–3 years of tamoxifen for a total of 5 years. Postmenopausal women who have already received tamoxifen for 5 years may be considered for extended therapy (5 years) with letrozole.

Adjuvant trastuzumab p. 795 is recommended as an option in patients with HER2 positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy. Trastuzumab should not be given concurrently with anthracycline-containing regimens (because of the risk of congestive heart failure) but it may be given either concurrently with taxane-based regimens or sequentially.

Advanced breast cancer

Treatment of advanced breast cancer depends on the patient’s drug history, disease severity, and oestrogen receptor and HER2 status.

For the majority of patients with oestrogen-receptor-positive advanced breast cancer, endocrine therapy is first-line treatment. Aromatase inhibitors, such as anastrozole, letrozole and exemestane p. 850, may be offered to patients...
with no previous history of endocrine treatment or in those previously treated with tamoxifen.

Tamoxifen should be considered as first-line treatment for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen.

In patients with advanced breast cancer that is imminent life-threatening or with visceral organ involvement, which requires early relief of symptoms, an anthracycline-based chemotherapy regimen is the preferred treatment. If anthracyclines are not suitable, the alternative is docetaxel monotherapy as first-line treatment, vinorelbine p. 831 or capecitabine p. 811 as second-line treatment or, for third-line treatment, whichever of the two drugs was not used second line. Gemcitabine p. 815 in combination with paclitaxel is recommended for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel with capecitabine are also considered appropriate.

Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel in those who have not received chemotherapy for metastatic breast cancer and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab National funding/access decisions).

Lapatinib p. 870 in combination with an aromatase inhibitor, fulvestrant p. 848, trastuzumab emtansine p. 796, and toremifene p. 849 are all licensed for use in patients with metastatic breast cancer, however their use is not recommended (see drug monographs for Indications and National funding/access decisions).

The gonadorelin analogue, goserelin is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation. Some progesterone preparations, such as medroxyprogesterone acetate p. 741, norethisterone p. 699, megestrol acetate p. 847 are also licensed for the treatment of breast cancer (see drug monographs).

The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

Familial breast cancer

Chemoprevention may be an option for patients who have been identified as having a high or moderate risk of developing breast cancer. The decision whether to consider or offer either tamoxifen p. 848 or raloxifene hydrochloride p. 689 [unlicensed indications] for 5 years is dependent on menopausal status and past history or risk of developing thromboembolic disease or endometrial cancer.

Tamoxifen [unlicensed indication] is recommended for pre- and postmenopausal women with or without uterus. Raloxifene hydrochloride [unlicensed indication] is recommended only for postmenopausal women with a uterus. Neither, tamoxifen nor raloxifene should be given to patients at high risk of developing breast cancer who have had a bilateral mastectomy.

Breast cancer in men

Breast cancer in men is rare. Although, not fully understood, risk factors may be associated with sex hormone metabolism, including those acquired through liver disease or testicular trauma, environmental risk factors such as industrial exposure to heat, and genetic predisposition. Treatment is similar to that for women involving surgery, radiotherapy, drug therapy, or a combination of these.

Hormone responsive malignancy

Prostate Cancer

Description of condition

Prostate cancer is the most common form of cancer affecting men. The main risk factors are age (most cases being diagnosed in men over 65 years of age), ethnicity (more common in black African-Caribbean men), and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient’s life expectancy (based on age and comorbid conditions), treatment morbidity, and patient preference.

Aims of treatment

In early or locally advanced prostate cancer, radical treatment aims to eliminate the malignancy. In metastatic disease, drug therapy is aimed at prolonging survival and reducing symptoms.

Drug treatment

Treatment options for patients with prostate cancer include active monitoring, radical prostatectomy, external beam radiotherapy, and brachytherapy. Hormone therapy (androgen deprivation or anti-androgens) is the primary treatment for metastatic prostate cancer, but is also increasingly being used for patients with locally advanced, non-metastatic disease.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour stage.

Localised or locally advanced prostate cancer

In patients with low-risk localised prostate cancer, and those at intermediate risk who decline radical treatments (prostatectomy or radiotherapy), active monitoring is a suitable option. This involves close monitoring to avoid unnecessary treatment until disease progression occurs (or until the patient requests treatment). In patients with intermediate-risk or high-risk localised prostate cancer (when there is a realistic prospect of long-term disease control) and in those with locally advanced disease, radical prostatectomy or radical radiotherapy should be offered. Other treatment options include a combination of radical radiotherapy and androgen deprivation therapy, consisting of 6 months of androgen deprivation therapy before, during or after radiotherapy. Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy.

Androgen deprivation therapy involves the use of a luteinising hormone-releasing hormone (LHRH) agonist (buserelin p. 674, goserelin p. 575, leuprorelin acetate p. 676, or triptorelin p. 677), or bilateral orchidectomy, which removes the supply of endogenous hormone. Androgen deprivation therapy may be continued for up to 3 years in patients with high-risk localised prostate cancer.
Patients should be informed about the side-effects of treatment, particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, and hot flushes. Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy, to reduce drug toxicity. Tumour flare, due to an initial surge in testosterone concentrations, has been reported in the initial stages of treatment with androgen deprivation therapy and prophylactic anti-androgen therapy (such as cyproterone acetate p. 704) may be added.

Medroxyprogesterone acetate p. 741 [unlicensed indication] can be used, initially for up to 10 weeks, to manage troublesome hot flushes caused by long-term androgen suppression; cyproterone acetate is an alternative if medroxyprogesterone acetate is not effective or not tolerated.

Patients who experience a reduction in libido and loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type-5 inhibitor.

Osteoporosis and fatigue may also be a problem with androgen deprivation therapy. A bisphosphonate can be offered to men who have osteoporosis; denosumab p. 670 is an alternative if bisphosphonates are not appropriate. Gynaecomastia can occur with long-term (6 months) bicalutamide p. 843 treatment. Prophylactic radiotherapy (within the first month of treatment), or weekly tamoxifen p. 848 [unlicensed indication], if radiotherapy is unsuccessful, can be considered.

**Metastatic prostate cancer**

Bilateral orchidectomy should be offered to all patients with metastatic prostate cancer as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Abiraterone (in combination with prednisone p. 623 or prednisolone p. 622) and enzalutamide p. 843 are both recommended as options for the treatment of castration-resistant metastatic prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel p. 826–containing chemotherapy regimen.

In patients who develop hormone-relapsed metastatic tumour, chemotherapy with docetaxel can be used. It is recommended to stop the treatment with docetaxel after 10 cycles, or if severe adverse events occurred, or if there is evidence of disease progression.

Abiraterone acetate (in combination with prednisone or prednisolone) is also recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with hormone-relapsed prostate cancer, a corticosteroid, such as dexamethasone p. 618, can be offered as third line therapy, after androgen deprivation therapy and anti-androgen therapy.

## ANTINEOPLASTIC DRUGS > ANTI-ANDROGENS

### Abiraterone acetate

**INDICATIONS AND DOSE**

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone). Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone).

- **BY MOUTH**
  - Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

**CAUTIONS**

Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) • history of cardiovascular disease

**CAUTIONS, FURTHER INFORMATION**

- Cardiovascular disease Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

**INTERACTIONS**

Appendix 1 (abiraterone).

- Caution with concurrent chemotherapy—safety and efficacy not established.
- Caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis.

**SIDE-EFFECTS**

- Common or very common Angina • arrhythmia • atrial fibrillation • diarrhoea • dyspepsia • fractures • haematuria • heart failure • hepatotoxicity • hypertension • hypertriglyceridaemia • hypokalaemia • peripheral oedema • rash • sepsis • tachycardia • urinary tract infection

- Uncommon Adrenal insufficiency • myopathy • rhabdomyolysis

**RARE**

Allergic alveolitis

**CONCEPTION AND CONTRACEPTION**

Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—risk to the foetus.

**HEPATIC IMPAIRMENT**

Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.

- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.
**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259
  Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:
  - their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and
  - the manufacturer provides abiraterone with the discount agreed in the patient access scheme.
  Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.
  [www.nice.org.uk/TA259](http://www.nice.org.uk/TA259)
- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (April 2016) NICE TA387
  Abiraterone, in combination with prednisone or prednisolone, is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated. In addition, the manufacturer is required to rebate the cost of abiraterone from the 11th month until the end of treatment for patients who remain on treatment for more than 10 months.
  [www.nice.org.uk/TA387](http://www.nice.org.uk/TA387)

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES
- **Degarelix**
  - **INDICATIONS AND DOSE**
    - Advanced hormone-dependent prostate cancer
      - **BY SUBCUTANEOUS INJECTION**
        - Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region
  - **CAUTIONS** Diabetes - susceptibility to QT-interval prolongation
  - **INTERACTIONS** Avoid concomitant use of drugs that prolong QT interval.
  - **SIDE-EFFECTS**
    - Common or very common Asthenia - dizziness - drowsiness - headache - hot flushes - influenza-like symptoms - injection-site reactions - insomnia - nausea - night sweats - sweating - weight gain
    - Uncommon Abdominal discomfort - alopecia - anaemia - anorexia - anxiety - atrio-ventricular block - constipation -
depression · diarrhoea · dry mouth · fainting ·
gynaecomastia · hypersensitivity reactions · hypertension ·
micturition urgency · musculoskeletal pain · oedema ·
pelvic pain · prostatitis · QT-interval prolongation · rash ·
renal impairment · sexual dysfunction · testicular pain ·
tinnitus · urticaria · vomiting

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor bone density.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solution for injection**
  - **Firmagon** (Ferring Pharmaceuticals Ltd)
    - Degarelix (as Degarelix acetate) 80 mg Firmagon 80mg powder and solution for solution for injection vials | 1 vial £129.37
    - Degarelix (as Degarelix acetate) 120 mg Firmagon 120mg powder and solution for solution for injection vials | 2 vial £260.00

### Pituitary and Hypothalamic Hormones and Analogues

#### Somatostatin analogues, malignant disease

**Overview**

Lanreotide below, octreotide p. 846 and pasireotide p. 847 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (Somatuline Autogel®) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 613 and terlipressin acetate p. 85. Pasireotide is licensed for the treatment of Cushing’s disease when surgery has failed or is inappropriate.

### Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) · may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)

- **SIDE-EFFECTS**
  - **Rare** Pancreatitis (shortly after administration)
  - **Frequency not known** Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting

### Monitoring Requirements

- **MONITORING REQUIREMENTS**
  - Monitor for signs of tumour expansion (e.g. visual field defects).
  - Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.

### Directions for Administration

- **Adults**
  - **BY INTRAMUSCULAR INJECTION**
    - Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region
  - **BY DEEP SUBCUTANEOUS INJECTION**
    - Adult: 120 mg every 28 days

### Acromegaly (if somatostatin analogue not given previously)

- **BY DEEP SUBCUTANEOUS INJECTION**
  - Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

### Neuroendocrine (particularly carcinoid) tumours

- **BY DEEP SUBCUTANEOUS INJECTION**
  - Adult: 120 mg every 28 days

### Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

- **BY DEEP SUBCUTANEOUS INJECTION**
  - Adult: 120 mg every 28 days

### Acromegaly and neuroendocrine (particularly carcinoid) tumours

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

### Thyroid tumours

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

- **CAUTIONS**
  - Cardiac disorders (including bradycardia) · patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment

- **INTERACTIONS**
  - Appendix 1 (lanreotide).

- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · biliary dilatation · bradycardia · constipation · dizziness · dyspepsia · headache · lethargy · malaise · musculoskeletal pain · myalgia · raised bilirubin
  - **Uncommon** Hot flushes · insomnia
  - **Rare** Hypothyroidism

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS** Monitor for hypothyroidism when clinically indicated.
**846 Hormone responsive malignancy**

---

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Somatuline Autogel (Ipsen Ltd)**
  - Lanreotide (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (PfM) £55.00
  - Lanreotide (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (PfM) £73.00
  - Lanreotide (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (PfM) £93.00

- **Powder and solvent for suspension for injection**
  - Somatuline LA (Ipsen Ltd)
    - Lanreotide (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial (PfM) £22.00

### Indications and Dose

**Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas**

- **By subcutaneous injection**
  - Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increased to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilution)

**Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective**

- **By subcutaneous injection**
  - Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

**Prevention of complications following pancreatic surgery**

- **By subcutaneous injection**
  - Adult: (consult product literature)

**Test dose before use of depot preparation**

- **By subcutaneous injection**
  - Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

**Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide**

- **By deep intramuscular injection using depot injection**
  - Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for acromegaly, start depot 1 day after the last dose of subcutaneous octreotide, for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

**Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded**

- **By deep intramuscular injection using depot injection**
  - Adult: 30 mg every 4 weeks

**Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care**

- **By continuous subcutaneous infusion**
  - Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

### Interactions

- **Appendix 1 (octreotide).**

### Side-effects

- **Alopecia | arrhythmias | biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) | bradycardia | dehydration | dizziness | dyspnoea | headache | hepatitis | pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) | rash**

### Further Information

- **Gastro-intestinal side-effects** Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

### Conception and Contraception

- **Effective contraception required during treatment.**

### Pregnancy

- **Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.**

### Breast Feeding

- **Manufacturer advises avoid—present in milk in animal studies.**

### Hepatic Impairment

- **Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.**

### Monitoring Requirements

- **Monitor thyroid function on long-term therapy.**
- **Monitor liver function.**
- **With intravenous use ECG monitoring required with intravenous administration.**

### Treatment Cessation

- **Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).**

### Directions for Administration

- **For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.**

### Prescribing and Dispensing Information

- **Palliative care**

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Octreotide (Non-proprietary)**
  - Lanreotide (as Octreotide acetate) 50 microgram per 1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PfM) £15.85–£18.85 DT price = £18.85
  - Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule (PfM) £14.85–£18.60
  - Octreotide 50micrograms/1ml solution for injection vials | 5 vial (PfM) £14.87–£22.00 DT price = £22.00
  - Octreotide (as Octreotide acetate) 100 microgram per 1 ml Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule (PfM) £29.99–£32.65 DT price = £27.97
  - Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PfM) £28.90–£32.90
  - Octreotide 100micrograms/1ml solution for injection vials | 5 vial (PfM) £27.37–£32.65
  - Octreotide (as Octreotide acetate) 200 microgram per 1 ml Octreotide 1mg/5ml solution for injection vials | 1 vial (PfM) £65.00–£69.66
  - Octreotide (as Octreotide acetate) 500 microgram per 1 ml Octreotide 500micrograms/1ml solution for injection vials | 5 vial (PfM) £139.43–£169.00
  - Sandostatin (Novartis Pharmaceuticals UK Ltd)
    - Octreotide (as Octreotide acetate) 50 microgram per 1 ml Sandostatin 50micrograms/1ml solution for injection ampoules | 5 ampoule (PfM) £14.87
    - Octreotide (as Octreotide acetate) 100 microgram per 1 ml Sandostatin 100micrograms/1ml solution for injection ampoules | 5 ampoule (PfM) £27.97 DT price = £27.97
Octreotide (as Octreotide acetate) 200 microgram per 1 ml Sandostatin 1mg/5ml solution for injection vials | 1 vial | £55.73
Octreotide (as Octreotide acetate) 500 microgram per 1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule | £135.47 DT price = £135.47

Powder and solvent for suspension for injection
- Sandostatin LAR (Novartis Pharmaceuticals UK Ltd) Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial | £549.11
Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial | £799.33
Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial | £998.41

Pasireotide

- INDICATIONS AND DOSE
  Cushing’s disease when surgery has failed or is inappropriate
    - BY SUBCUTANEOUS INJECTION
    - Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response within 2 months, for dose adjustment due to side effects—consult product literature

- CAUTIONS
  Cardiac disorders (including bradycardia) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

- INTERACTIONS
  Appendix 1 (pasireotide). Caution with concomitant use of drugs that prolong QT interval.

- SIDE-EFFECTS
  Adrenal insufficiency - alopecia - anaemia - arthralgia - bradycardia - decreased appetite - fatigue - headache - hyperglycaemia - hypotension - myalgia - pruritus - QT-interval prolongation

- PREGNANCY
  Avoid—toxicity in animal studies.

- BREAST FEEDING
  Avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT
  Reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment. Avoid in severe impairment.

- MONITORING REQUIREMENTS
  - Monitor liver function before treatment and after one week, and periodically thereafter.
  - Monitor ECG and electrolytes in patients susceptible to QT-prolongation before treatment, after one week, and periodically thereafter.
  - Diabetes mellitus: In diabetic patients, assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Signifor (Novartis Pharmaceuticals UK Ltd) Pasireotide (as Pasireotide diasparte) 300 microgram per 1 ml Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule | £2,800.00
  Pasireotide (as Pasireotide diasparte) 600 microgram per 1 ml Signifor 0.6mg/1ml solution for injection ampoules | 60 ampoule | £3,240.00
  Pasireotide (as Pasireotide diasparte) 900 microgram per 1 ml Signifor 0.9mg/1ml solution for injection ampoules | 60 ampoule | £3,240.00

  Powder and solvent for suspension for injection
  - Signifor (Novartis Pharmaceuticals UK Ltd) Pasireotide (as Pasireotide pamoate) 20 mg Signifor 20mg powder and solvent for suspension for injection vials | 1 vial | £2,300.00
  Pasireotide (as Pasireotide pamoate) 40 mg Signifor 40mg powder and solvent for suspension for injection vials | 1 vial | £2,300.00
  Pasireotide (as Pasireotide pamoate) 60 mg Signifor 60mg powder and solvent for suspension for injection vials | 1 vial | £2,300.00

PROGESTOGENS

Megestrol acetate

- INDICATIONS AND DOSE
  Treatment of breast cancer
  - BY MOUTH
  - Adult: 160 mg once daily

- CONTRA-INDICATIONS
  Acute porphyrias p. 930 - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of pemphigoid gestations - history during pregnancy of severe pruritus - history of liver tumours - severe arterial disease - undiagnosed vaginal bleeding

- CAUTIONS
  Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

- INTERACTIONS
  Appendix 1 (progestogens).

- SIDE-EFFECTS
  Acne - adrenal insufficiency - alopecia - anaphylactoid reactions - anaphylactoid reactions - angina - bloating - breast - carpal tunnel syndrome - change in libido - constipation - Cushing’s syndrome - depression - diarrhoea - dizziness - drowsiness - fluid retention - headache - hirsutism - indigestion - insomnia - jaundice - loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) - menstrual disturbances - nausea - premenstrual-like syndrome - pruritus - rash - skin reactions - tumour flare (with or without hypercalcaemia) - urinary frequency - urticaria - vomiting - weight change - weight gain

- PREGNANCY
  Avoid. Reversible feminisation of male fetuses reported in animal studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.

- BREAST FEEDING
  Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in severe impairment.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

  Tablet
  - Megestrol acetate (Non-proprietary) Megestrol acetate 40 mg Megestrol 40mg tablets | 100 tablet no price available
  - Megace (Swedish Orphan Biovitrum Ltd) Megace 160 mg Megace 160mg tablets | 30 tablet | £19.52 DT price = £19.52
  Oral suspension
  - Megestrol acetate (Non-proprietary) Megestrol acetate 40 mg per 1 ml Megestrol 200mg/5ml oral suspension | 240 ml | no price available | 480 ml | no price available
3.1 Hormone responsive breast cancer

**ANTINEOPLASTIC DRUGS > ANTI-OESTROGENS**

### Fulvestrant

- **INDICATIONS AND DOSE**
  - Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy
  - **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock

- **SIDE-EFFECTS**
  - Common or very common: Anorexia, asthenia, back pain, diarrhoea, headache, hot flushes, hypertension, injection-site reactions, nausea, rash, urinary tract infections, venous thromboembolism, vomiting
  - Uncommon: Leucorrhea, vaginal candidiasis, vaginal haemorrhage

- **PREGNANCY**
  - Manufacturer advises avoid—increased incidence of fetal abnormalities and death in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

- **DIRECTIONS FOR ADMINISTRATION**
  - 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Faslodex (AstraZeneca UK Ltd)
    - Fulvestrant 50 mg per 1 ml Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (POM) £522.41

### Tamoxifen

- **DRUG ACTION**
  - An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; choriocarcinoma is sometimes used as an adjunct in the treatment of female infertility.

- **INDICATIONS AND DOSE**
  - Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen
    - **BY MOUTH**
    - Adult: 20 mg daily
  - Anovulatory infertility
    - **BY MOUTH**
    - Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

  - **CONTRA-INDICATIONS**
    - Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

  - **CAUTIONS**
    - Porphyria

  - **INTERACTIONS**
    - Rare: Angioedema, bullous pemphigoid, cholestasis, fatty liver, hepatitis, hypersensitivity reactions, hypertriglyceridaemia, interstitial pneumonitis, neutropenia, Stevens-Johnson syndrome.

  - **Frequency not known**
    - Alopecia, anaemia, cataracts, corneal changes, decreased platelet counts, endometrial changes, gastrointestinal disturbances, headache, hot flushes, hypercalcaemia if bony metastases, increased risk of thromboembolic events, especially when used with cytotoxics, leucopenia, light-headedness, liver enzyme changes, occasional cystic ovarian swellings in premenopausal women, occasionally oedema, pancreatitis, pruritus vulvae, rash, retinopathy, suppression of menstruation in some premenopausal women, thrombocytopenia, thromboembolic events, tumour flare, uterine fibroids, vaginal bleeding, vaginal discharge, visual disturbances

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Endometrial changes: Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

  - Risk of thromboembolism: Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).

  - **CONCEPTION AND CONTRACEPTION**
    - Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).

  - **PREGNANCY**
    - Avoid—possible effects on fetal development.

  - **BREAST FEEDING**
    - Suppresses lactation. Avoid unless potential benefit outweighs risk.

  - **PATIENT AND CARER ADVICE**
    - Endometrial changes: Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism: Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  - Tamoxifen (Non-proprietary) 10 mg Tamoxifen 10mg tablets | 30 tablet (POM) £61.12 DT price = £37.81
  - Tamoxifen (as Tamoxifen citrate) 20 mg Tamoxifen 20mg tablets | 30 tablet (POM) £13.00 DT price = £2.73
  - Tamoxifen (as Tamoxifen citrate) 40 mg Tamoxifen 40mg tablets | 30 tablet (POM) £54.75 DT price = £33.47

  **Oral suspension**
  - Tamoxifen (Non-proprietary) 2 mg per 1 ml Tamoxifen 10mg/5ml oral suspension | 150 ml (POM) no price available
Toremifene

**INDICATIONS AND DOSE**
Hormone-dependent metastatic breast cancer in postmenopausal women
- **BY MOUTH**
- Adult: 60 mg daily

**CONTRA-INDICATIONS**
- Bradycardia, electrolyte disturbances (particularly uncorrected hypokalaemia), endometrial hyperplasia, heart failure with reduced left-ventricular ejection fraction, history of arrhythmias, QT prolongation

**CAUTIONS**
- Avoid in acute porphyrias

**INTERACTIONS**
- Avoid concomitant administration of drugs that prolong QT interval

**SIDE-EFFECTS**
- Common or very common: Depression, dizziness, fatigue, hot flushes, nausea, oedema, rash, sweating, vaginal bleeding, vaginal discharge, vomiting
- Uncommon: Anorexia, constipation, dyspnoea, endometrial hypertrophy, headache, increased weight, insomnia, thromboembolic events
- Very rare: Alopecia, jaundice, transient corneal opacity
- Frequency not known: Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Endometrial changes: Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

**PREGNANCY**
- Avoid.

**BREAST FEEDING**
- Avoid.

**HEPATIC IMPAIRMENT**
- Elimination decreased in hepatic impairment—avoid if severe.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Fareston** (Orion Pharma (UK) Ltd)
- **Toremifene (as Toremifene citrate) 60 mg** Fareston 60 mg tablets
  - 30 tablet [P on M] £29.08

---

**HORMONE ANTAGONISTS AND RELATED AGENTS**

**Anastrozole**

**INDICATIONS AND DOSE**
- Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women
- Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy
- Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen
- **BY MOUTH**
- Adult: 1 mg daily

**CONTRA-INDICATIONS**
- Not for premenopausal women

**CAUTIONS**
- Susceptibility to osteoporosis

**SIDE-EFFECTS**
- Very rare: Allergic reactions, anaphylaxis, angioedema
- Frequency not known: Anorexia, arthralgia, arthritis, asthenia, bone fractures, bone pain, cutaneous vasculitis, diarrhoea, drowsiness, hair thinning, headache, hot flushes, nausea, rash, slight increases in total cholesterol levels, Stevens-Johnson syndrome, vaginal bleeding, vaginal dryness, vomiting

**PREGNANCY**
- Avoid.

**BREAST FEEDING**
- Avoid.

**HEPATIC IMPAIRMENT**
- Avoid in moderate to severe impairment.

**RENAL IMPAIRMENT**
- Avoid if creatinine clearance less than 20 ml/minute.

**PRE-TREATMENT SCREENING**
- Laboratory test for menopause if doubt.

**MONITORING REQUIREMENTS**
- Osteoporosis: Assess bone mineral density before treatment and at regular intervals.

**PATIENT AND CARER ADVICE**
- Asthenia and drowsiness may initially affect ability to drive or operate machinery.

**NATIONAL FUNDING/ACCESS DECISIONS**

**ARIMIDEX®**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Anastrozole (Non-proprietary)**
- **Anastrozole 1 mg** Anastrozole 1mg tablets
  - 28 tablet [P on M] £65.13 DT price = £1.19
- **Arimidex** (AstraZeneca UK Ltd)
- **Anastrozole 1 mg** Arimidex 1mg tablets
  - 28 tablet [P on M] £68.56 DT price = £1.19
**Exemestane**

- **INDICATIONS AND DOSE**
  Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed
  - **BY MOUTH**
  - **Adult:** 25 mg daily

- **CONTRA-INDICATIONS**
  Not indicated for premenopausal women

- **INTERACTIONS**
  → Appendix 1 (exemestane).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain | alopecia | anorexia | constipation | depression | dizziness | dyspepsia | fatigue | headache | hot flushes | insomnia | nausea | rash | vomiting
  - **Uncommon** Asthenia | drowsiness | peripheral oedema
  - **Rare** Leucopenia | thrombocytopenia

- **PREGNANCY**
  Avoid.

- **BREAST FEEDING**
  Avoid.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution.

- **RENAL IMPAIRMENT**
  Manufacturer advises caution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  **CAUTIONARY AND ADVISORY LABELS**
  21
  - Exemestane (Non-proprietary)
    - Exemestane 25 mg | Exemestane 25mg tablets | 30 tablet | POM

      - £88.80 DT price = £5.75

- **Letrozole**

  - **INDICATIONS AND DOSE**
    First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom another anti-oestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated
    - **BY MOUTH**
    - **Adult:** 2.5 mg daily

  - **CONTRA-INDICATIONS**
    Not indicated for premenopausal women

  - **CAUTIONS**
    Susceptibility to osteoporosis

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain | alopecia | anorexia | appetite increase | arthralgia | bone fracture | constipation | depression | diarrhoea | dizziness | dry skin | dyspepsia | fatigue | headache | hot flushes | hypercholesterolaemia | hypertension | increased sweating | musculoskeletal pain | nausea | osteoporosis | peripheral oedema | rash | vaginal bleeding | vomiting | weight changes
  - **Uncommon** Anxiety | arthritis | blurred vision | breast pain | cardiac events | cataract | cerebrovascular events | cough | dysaesthesia | dyspnoea | eye irritation | general oedema | insomnia | leucopenia | memory impairment | mucosal dryness | palpitation | pruritus | pyrexia | stomatitis | tachycardia | taste disturbance | thrombophlebitis | tumour pain | urinary frequency | urinary-tract infection | urticaria | vaginal discharge
  - **Rare** Arterial thrombosis | pulmonary embolism
  - **Frequency not known** Hepatitis | toxic epidermal necrolysis

- **CONCEPTION AND CONTRACEPTION**
  Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).

- **PREGNANCY**
  Avoid (isolated cases of birth defects reported).

- **BREAST FEEDING**
  Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT**
  Manufacturer advises caution if creatinine clearance less than 10 ml/minute.

- **MONITORING REQUIREMENTS**
  Osteoporosis | Assess bone mineral density before treatment and at regular intervals.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Letrozole (Non-proprietary)
    - Letrozole 2.5 mg | Letrozole 2.5mg tablets | 14 tablet | POM
      - £49.90 DT price = £1.32 | 28 tablet | POM
      - £73.24
  - Femara (Novartis Pharmaceuticals UK Ltd)
    - Letrozole 2.5 mg | Femara 2.5mg tablets | 30 tablet | POM
      - £90.92

**4 Immunotherapy responsive malignancy**

**IMMUNOSTIMULANTS**

**INTERFERONS**

- **Interferon alfa**

  - **DRUG ACTION**
    Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

  - **INDICATIONS AND DOSE**
    **INTRONA® PEN**
    Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Haemat cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma
    - **BY SUBCUTANEOUS INJECTION**
    - **Adult:** (consult local protocol)
INTRONA® VIALS
Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma
BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
Adult: (consult local protocol)

ROFERON-A®
Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi’s sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin’s lymphoma
BY SUBCUTANEOUS INJECTION
Adult: (consult local protocol)

**CONTRA-INDICATIONS**
CONTRA-INDICATIONS, FURTHER INFORMATION
For contra-indications consult product literature and local treatment protocol.

**CAUTIONS**
CAUTIONS, FURTHER INFORMATION
For cautions consult product literature and local treatment protocol.

**INTERACTIONS** → Appendix 1 (interferons).

**SIDE-EFFECTS**
Common or very common | Anorexia | diarrhoea | influenza-like symptoms | lethargy | nausea
Frequency not known | Alopecia | arrhythmias | cardiovascular problems | coma (usually with high doses in the elderly) | confusion | depression | hepatotoxicity | hyperglycaemia | hypersensitivity reactions | hypertension | hypertriglyceridaemia (sometimes severe) | hypotension | myelosuppression (particularly affecting granulocyte counts) | nephrotoxicity | ocular side-effects | palpitation | psoriasiform rash | seizures (usually with high doses in the elderly) | suicidal behaviour | thyroid abnormalities
SIDE-EFFECTS, FURTHER INFORMATION
Consult product literature and local treatment protocols for information on side-effects.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Unlikely to be harmful.

**HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.

**RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.

**MONITORING REQUIREMENTS** Monitoring of liver concentration is recommended.

**DIRECTIONS FOR ADMINISTRATION**
ROFERON-A® | Roferon-A® injection for subcutaneous injection.
INTRONA® VIALS | IntronA® injection vials for subcutaneous injection or intravenous infusion.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
PEGinterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.
www.nice.org.uk/TA200

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**
EXCIPIENTS: May contain Benzyl alcohol

Interferon alfa-2b 10 mega u per 1 ml IntronA 10 million units/1 ml solution for injection vials | 1 vial (Pfizer) $103.94
Interferon alfa-2b 15 mega u per 1 ml IntronA 15 million units/1 ml solution for injection multidose pens | 1 pre-filled disposable injection (Pfizer) $74.83
Interferon alfa-2b 25 mega u per 1 ml IntronA 25 million units/1 ml solution for injection multidose vials | 1 vial (Pfizer) $249.45

Roferon-A (Roche Products Ltd)
Interferon alfa-2a 6 mega u per 1 ml Roferon-A 3 million units/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Pfizer) $14.20
Interferon alfa-2a 9 mega u per 1 ml Roferon-A 4.5 million units/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Pfizer) $21.29
Interferon alfa-2a 12 mega u per 1 ml Roferon-A 6 million units/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Pfizer) $42.57

**Interferon gamma-1b**
(Immune interferon)

**INDICATIONS AND DOSE**
To reduce the frequency of serious infection in chronic granulomatous disease
BY SUBCUTANEOUS INJECTION
Adult: 50 micrograms/m² 3 times a week
To reduce the frequency of serious infection in severe malignant osteoporosis
BY SUBCUTANEOUS INJECTION
Adult: 50 micrograms/m² 3 times a week

**CAUTIONS**
Arrhythmias - cardiac disease - congestive heart failure - ischaemia - seizure disorders (including seizures associated with fever)

**INTERACTIONS** → Appendix 1 (interferons).
Avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response).

**SIDE-EFFECTS**
Common or very common | Abdominal pain | arthralgia | chills | depression | diarrhoea | fatigue | fever | headache | injection-site reactions | myalgia | nausea | rash | vomiting
Rare | Confusion | systemic lupus erythematosus
Frequency not known | Neutropenia | proteinuria | raised liver enzymes | thrombocytopenia
IMMUNOSTIMULANTS  >  INTERLEUKINS

**Aldesleukin**

- **DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

- **INDICATIONS AND DOSE**
  
  **Metastatic renal cell carcinoma (specialist use only)**
  
  - By subcutaneous injection, or by intravenous infusion
  
  - Adult: (consult product literature)

- **UNLICENSED USE**
  
  Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Cooperative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

- **CONTRA-INDICATIONS**
  
  **CONTRA-INDICATIONS, FURTHER INFORMATION** Consult product literature for information about aldesleukin contra-indications.

- **CAUTIONS**
  
  **CAUTIONS, FURTHER INFORMATION** Consult product literature for information about aldesleukin cautions.

- **INTERACTIONS** → Appendix 1 (aldesleukin).

- **SIDE-EFFECTS**
  
  - Common or very common Bone-marrow toxicity · CNS toxicity · hepatic toxicity · renal toxicity · thyroid toxicity
  
  - Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

  **SIDE-EFFECTS, FURTHER INFORMATION** Also consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Use only if potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Aldesleukin is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for injection**
  
  - **Proleukin** (Novartis Pharmaceuticals UK Ltd)
    
    Aldesleukin 18 mega u Proleukin 18 million powder for solution for injection vials | 1 vial (POD) £112.00 | 10 vial (POD) £1,036.00

**IMMUNOSTIMULANTS  >  OTHER**

**Bacillus Calmette-Guérin**

- **DRUG ACTION** Bacillus Calmette-Guérin is a live attenuated strain derived from *Mycobacterium bovis*.

- **INDICATIONS AND DOSE**
  
  Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection

  - By intravesical instillation
  
  - Adult: (consult product literature)

- **CONTRA-INDICATIONS**
  
  - Fever of unknown origin · HIV infection · impaired immune response · severe haematuria · tuberculosis · urinary-tract infection

- **CAUTIONS**
  
  - Bladder injury (delay administration until mucosal damage healed) · traumatic catheterisation (delay administration until mucosal damage healed) · urethral injury (delay administration until mucosal damage healed)

- **SIDE-EFFECTS**
  
  - Rare Arthralgia · bladder contracture · hypersensitivity reactions · orchitis · rash · renal abscess · transient urethral obstruction
  
  - Frequency not known Cystitis · dysuria · fever · haematuria · influenza-like syndrome · malaise · ocular symptoms · systemic BCG infection (with fatalities)—consult product literature · urinary frequency

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **PRE-TREATMENT SCREENING** Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for reconstitution for installation**
  
  - ImmuCyst (Alliance Pharmaceuticals Ltd)
    
    Connaught strain Bacillus of Calmette-Guérin 81 mg ImmuCyst 81 mg powder for reconstitution for installation vials | 1 vial (POD) £118.73 (Hospital only)
  
  - OncoTICE (Merck Sharp & Dohme Ltd)
    
    TICE strain Bacillus of Calmette-Guérin 12.5 mg OncoTICE 12.5 mg powder for reconstitution for installation vials | 1 vial (POD) £71.61 (Hospital only)

**Histamine dihydrochloride**

- **INDICATIONS AND DOSE**
  
  Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission

  - By subcutaneous injection
  
  - Adult: (consult local protocol)

- **CONTRA-INDICATIONS**
  
  **CONTRA-INDICATIONS, FURTHER INFORMATION** Consult product literature for information about histamine dihydrochloride contra-indications.
Mifamurtide

**INDICATIONS AND DOSE**

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- **BY INTRAVENOUS INFUSION**
  - Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

**UNLICENSED USE**

Not licensed for use in patients over 30 years of age at initial diagnosis.

**CAUTIONS**

Asthma—consider prophylactic bronchodilator therapy; chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune disease; history of collagen disease; history of inflammatory disease

**INTERACTIONS**

- Appendix 1 (mifamurtide).

**SIDE-EFFECTS**

Abdominal pain; alopecia; anaemia; anorexia; anxiety; blurred vision; confusion; constipation; cough; depression; diarrhoea; dizziness; drowsiness; dry skin; dyspepsia; dyspnoea; dysuria; epistaxis; flushing; gastro-intestinal disturbances; granulocytopenia; haematuria; haemoptysis; headache; hearing loss; hypertension; hypoaesthesia; hypokalaemia; hypotension; insomnia; leucopenia; musculoskeletal pain; nausea; oedema; palpitations; paraesthesia; phlebitis; pleural effusion; pollakiuria; rash; respiratory disorders; sweating; tachycardia; tachypnoea; thrombocytopenia; tinnitus; tremor; vertigo; vomiting

**CONCEPTION AND CONTRACEPTION**

Effective contraception required.

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Avoid—no information available.

**HEPATIC IMPAIRMENT**

Use with caution—no information available.

**RENAL IMPAIRMENT**

Use with caution—no information available.

**MONITORING REQUIREMENTS**

- Monitor renal function, hepatic function and clotting parameters.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (Tas)

- Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

www.nice.org.uk/TA235

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

Lenalidomide

**DRUG ACTION**

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

**INDICATIONS AND DOSE**

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression

- **BY MOUTH**
  - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy

- **BY MOUTH**
  - Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature

Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone

- **BY MOUTH**
  - Adult: 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature
Treatment of transfusion-dependent anaemia due to low-or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate

- **BY MOUTH**
  - Adult: 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects, consult product literature

- **CAUTIONS**
  - High tumour burden—risk of tumour lysis syndrome
  - Patients with risk factors for myocardial infarction

- **CAUTIONS, FURTHER INFORMATION**
  - Thromboembolism
  - Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.

- **SECONDARY MALIGNANCY**
  - Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- **INTERACTIONS**
  - Appendix 1 (lenalidomide).
  - Use caution with concomitant drugs that increase the risk of thromboembolism.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain
    - Anaemia
    - Arrhythmias
    - Arthralgia
    - Ataxia
    - Atrial fibrillation
    - Bacterial infections
    - Bradycardia
    - Cardiac failure
    - Cataract
    - Cerebrovascular events
    - Chest pain
    - Cholestasis
    - Constipation
    - Decreased appetite
    - Deep vein thrombosis
    - Dehydration
    - Depression
    - Diarrhoea
    - Dizziness
    - Dry mouth
    - Dyspnoea
    - Epilepsy
    - Electrolyte disturbances
    - Falls
    - Flu-like illness
    - Fungal infections
    - Haematoma
    - Haematuria
    - Haemorrhagic disorders
    - Headache
    - Hearing disturbances
    - Hyperglycaemia
    - Hyperhidrosis
    - Hypertension
    - Hypothyroidism
    - Insomnia
    - Iron-overload
    - Leukopenia
    - Malaise
    - Mood changes
    - Musculoskeletal disorders
    - Myalgia
    - Myocardial infarction
    - Nausea
    - Oedema
    - Peripheral neuropathy
    - Pneumonia
    - Pruritus
    - Pulmonary embolism
    - Pyrexia
    - Rash
    - Renal failure
    - Respiratory distress
    - Respiratory tract infections
    - Sepsis
    - Severe neutropenia
    - Sexual dysfunction
    - Sinusitis
    - Skin disorders
    - Stomatitis
    - Syncope
    - Tachycardia
    - Taste disturbances
    - Thrombocytopenia
    - Tremor
    - Urinary incontinence
    - Urinary retention
    - Vasculitis
    - Viral infections
    - Visual disturbances
    - Vomiting
  - **Uncommon**
    - Acquired Fanconi syndrome
    - Angioedema
    - Blindness
    - Caecitis
    - Clotting disorders
    - Colitis
    - Haemolytic anaemia
    - Hepatic failure
    - Ischaemia
    - Secondary malignancies
  - **Rare**
    - Stevens-Johnson syndrome
    - Toxic epidermal necrolysis
    - Tumour lysis syndrome
  - **Frequency not known**
    - Cholestatic hepatitis
    - Cyclofosfamide hepatitis
    - Interstitial pneumonitis
    - Leukocytoclastic vasculitis
    - Pancreatitis
    - Toxic hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash
  - If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.
  - Discontinue permanently if angioedema, exfoliative or bullous rash, or Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.
  - For information on side effects consult product literature.

- **CONCEPTION AND CONTRACEPTION**
  - For women of childbearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation).
  - Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

- **PREGNANCY**
  - Important: teratogenic risk. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

- **BREAST FEEDING**
  - Discontinue breast-feeding—no information available.

- **RENAL IMPAIRMENT**
  - Reduce dose in moderate to severe impairment—consult product literature.

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).
  - Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).

- **Monitor thyroid function.**

- **Monitor signs and symptoms of peripheral neuropathy.**

- **Monitor visual ability regularly (risk of cataract).**

- **Hepatic disorders**
  - Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

**PRESCRIBING AND DISPENSING INFORMATION**

- Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE**
  - Thromboembolism
  - Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.
  - Neutropenia and thrombocytopenia
  - Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

  - **Patient advice required around conception and contraception**
    - **Pregnancy and contraception**
      - Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014) NICE TA322
    - Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low-or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:
    - the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than
Lenalidomide for the treatment of multiple myeloma (June 2009) NICE TA171

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

www.nice.org.uk/TA171

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies and (March 2014) for those who have received prior treatment with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.

The Scottish Medicines Consortium has advised (December 2015) that lenalidomide is accepted for restricted use within NHS Scotland for patients with previously untreated multiple myeloma who are not eligible for transplant and when thalidomide-containing regimens are unsuitable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 25

- Revlimid (Celgene Ltd)
- Lenalidomide 2.5 mg: Revlimid 2.5 mg capsules | 21 capsule POM £3,426.00
- Lenalidomide 5 mg: Revlimid 5 mg capsules | 21 capsule POM £3,570.00
- Lenalidomide 7.5 mg: Revlimid 7.5 mg capsules | 21 capsule POM £3,675.00
- Lenalidomide 10 mg: Revlimid 10 mg capsules | 21 capsule POM £3,780.00
- Lenalidomide 15 mg: Revlimid 15 mg capsules | 21 capsule POM £3,965.00
- Lenalidomide 20 mg: Revlimid 20 mg capsules | 21 capsule POM £4,163.50
- Lenalidomide 25 mg: Revlimid 25 mg capsules | 21 capsule POM £4,368.00

Pomalidomide

DRUG ACTION

Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

INDICATIONS AND DOSE

Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)

- BY MOUTH
  - Adult: 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B REACTIVATION

An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

CAUTIONS

- Cardiac disease • cardiac risk factors • hepatitis B infection • high tumour burden—risk of tumour lysis syndrome • interstitial lung disease—discontinue if suspected • peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

- Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.

- Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- Hepatitis B infection The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.

INTERACTIONS • Appendix 1 (pomalidomide).

Use caution with concomitant drugs that increase the risk of bleeding or thromboembolism.

SIDE-EFFECTS

- Common or very common Anaemia • bone pain • cardiac failure • confusion • constipation • cough • decreased appetite • diarrhoea • dizziness • dyspnoea • febrile neutropenia • hyperkaemia • hypotension • impaired consciousness • interstitial lung disease • leucopenia • malaise • muscle spasms • nasopharyngitis • nausea • neutropenia • neutropenic sepsis • pelvic pain • peripheral neuropathy • peripheral oedema • pneumonia • pruritus • pyrexia • rash • renal failure • respiratory tract infection • thrombocytopenia • thromboembolic events • tremor • urinary retention • vertigo • vomiting

- Uncommon Hepatitis

- Frequency not known Atrial fibrillation • hepatitis B reactivation • pulmonary oedema

CONCEPTION AND CONTRACEPTION

For women of child-bearing potential, pregnancy must be excluded before starting treatment with pomalidomide (perform pregnancy test on initiation or within 3 days prior to initiation).

Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

PREGNANCY

Important: teratogenic risk.

BREAST FEEDING

Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution—no information available.

RENAL IMPAIRMENT

Manufacturer advises caution—no information available.

MONITORING REQUIREMENTS

- Manufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).

- Manufacturer advises monitor for arterial or venous thromboembolism.

- Manufacturer advises monitor for signs and symptoms of cardiac failure.

- Manufacturer advises monitor for acute onset or
Immune system and malignant disease

CAUTIONS
- Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.

PRESCRIBING AND DISPENSING INFORMATION
- Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

PATIENT AND CARER ADVICE
- Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.
- Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patient advice required around conception and contraception
- Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Pomalidomide for relapsed and refractory multiple myeloma previously treated with lenalidomide and bortezomib (March 2015) NICE TA338
  - Pomalidomide, in combination with dexamethasone, is not recommended for the treatment of relapsed and refractory multiple myeloma in adults who have had at least 2 previous treatments, including lenalidomide and bortezomib, and whose disease has progressed on the last therapy.
  - www.nice.org.uk/TA338

- CAUTIONARY AND ADVISORY LABELS 3, 25
- CAUTIONS, FURTHER INFORMATION
- Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.
- Second primary malignancy Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instigated as indicated.
- Peripheral neuropathy Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

SIDE-EFFECTS
- Common or very common Anaemia · asthenia · bradycardia · cardiac failure · confusion · constipation · deep vein thrombosis · depression · dizziness · dry mouth · dysaesthesia · dyspepsia · dyspnoea · interstitial lung disease · leucopenia · lymphopenia · neutropenia · paraesthesia · peripheral neuropathy · peripheral oedema · pneumonia · pulmonary embolism · pyrexia · skin reactions · Stevens-Johnson syndrome · syncope · thrombocytopenia · tremor · vomiting
- Frequency not known Atrial fibrillation · atrioventricular block · cerebrovascular events · convulsions · gastrointestinal haemorrhage · gastrointestinal perforation · hearing loss · hepatic disorders · hypothyroidism · intestinal obstruction · menstrual disorders · myocardial infarction · renal failure · second primary malignancy · sexual dysfunction · toxic epidermal necrolysis · worsening of Parkinson’s disease symptoms

SIDE-EFFECTS, FURTHER INFORMATION
- Rash If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.
- Peripheral neuropathy If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

CONCEPTION AND CONTRACEPTION
- For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation).
- Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer’s Pregnancy Prevention Programme.

PREGNANCY
- Important: teratogenic risk.

BREAST FEEDING
- Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Caution in severe impairment—no information available.

RENAL IMPAIRMENT
- Caution in severe impairment—no information available.

MONITORING REQUIREMENTS
- Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).

Monitor for arterial or venous thromboembolism.

Thalidomide
- DRUG ACTION
  - Thalidomide has immunomodulatory and anti-inflammatory activity.

INDICATIONS AND DOSE
- First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone
  - BY MOUTH
    - Adult 18–75 years: 200 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime
    - Adult 76 years and over: 100 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

CAUTIONS
- High tumour burden—risk of tumour lysis syndrome · patients aged 76 years and over—increased risk of serious side-effects
Photodynamic therapy responsive malignancy

5 Photodynamic therapy responsive malignancy

PHOTOSENSITISERS

Porfimer sodium

- **DRUG ACTION** Porfimer sodium accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- **INDICATIONS AND DOSE** Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer
  - **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · broncho-oesophageal fistula · tracheo-oesophageal fistula

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · constipation · extravasation · hyperuricaemia · nausea · oral mucositis · photosensitivity (sunscreens offer no protection) · thromboembolism · tumour lysis syndrome · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** No information available—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **PATIENT AND CARER ADVICE** Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

- **MEDICAL FORMS**
  - **Powder for solution for injection**
    - **Porfimer sodium 15 mg** Photofrin 15mg powder for solution for injection vials | 1 vial (£POM) no price available (Hospital only)
    - **Porfimer sodium 75 mg** Photofrin 75mg powder for solution for injection vials | 1 vial (£POM) no price available (Hospital only)

Temoporfin

- **DRUG ACTION** Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

- **INDICATIONS AND DOSE** Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments
  - **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 930 · concomitant photosensitising treatment · diseases exacerbated by light · elective surgery · ophthalmic slit-lamp examination for 30 days after administration

- **INTERACTIONS** → Appendix 1 (temoporfin).

- **SIDE-EFFECTS** Alopecia · blistering · bone-marrow suppression · constipation · dysphagia · erythema · extravasation · facial pain · giddiness · haemorrhage · hyperpigmentation · hyperuricaemia · injection site pain · nausea · oedema · oral mucositis · photosensitivity (sunscreens ineffective) · scarring · skin necrosis · thromboembolism · trismus · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy for at least 3 months after treatment.

- **PREGNANCY** Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.

- **PATIENT AND CARER ADVICE** Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration. Avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration. If extravasation occurs protect area from light for at least 3 months.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - **Photofrin (Axcyan Pharma Inc)**
      - **Porfimer sodium 15 mg** Photofrin 15mg powder for solution for injection vials | 1 vial (£POM) no price available (Hospital only)
      - **Porfimer sodium 75 mg** Photofrin 75mg powder for solution for injection vials | 1 vial (£POM) no price available (Hospital only)

6 Targeted therapy responsive malignancy

**ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS**

### Afatinib

#### DRUG ACTION
Afatinib is a protein kinase inhibitor.

#### INDICATIONS AND DOSE
Treatment of locally advanced or metastatic non-small-cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor

- **BY MOUTH**
  - Adult: 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 797.

- **CAUTIONS**
  - Cardiac risk factors - conditions which may affect left ventricular ejection fraction - consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment - diarrhea - protracted management recommended (consult product literature) - exposure to sun (protect skin from exposure to sun) - history of keratitis - new pulmonary symptoms (including dyspnea, cough, fever) - interrupt treatment until interstitial lung disease is excluded - severe dry eyes - signs and symptoms of keratitis - promptly refer to ophthalmologist for assessment - signs and symptoms of skin reaction - treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) - ulcerative keratitis - use of contact lenses - worsening pulmonary symptoms (including dyspnea, cough, fever) - interrupt treatment until interstitial lung disease is excluded

- **INTERACTIONS**
  - Appendix 1 (afatinib).

- **SIDE-EFFECTS**
  - Common or very common
    - Acne
    - Conjunctivitis
    - Cystitis
    - Decreased appetite
    - Dehydration
    - Diarrhea
    - Dry eyes
    - Dry skin
    - Dysgeusia
    - Dyspepsia
    - Epistaxis
    - Hand-foot syndrome
    - Hypokalaemia
    - Muscle spasms
    - Paronychia
    - Pruritus
    - Pyrexia
    - Rash (see Cautions)
    - Renal failure
    - Rhinorrhea
    - Weight loss
  - Uncommon
    - Interstitial lung disease - keratitis
  - Frequency not known
    - Alopecia
    - Bone-marrow suppression
    - Hyperuricaemia
    - Nausea
    - Oral mucositis
    - Thromboembolism
    - Tumour lysis syndrome
    - Vomiting

- **CONCEPTION AND CONTRACEPTION**
  - Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

- **PREGNANCY**
  - Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT**
  - Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in severe hepatic impairment.

- **RENAL IMPAIRMENT**
  - Manufacturer advises avoid in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose.
  - Giotrif™ tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

- **PATIENT AND CARER ADVICE**
  - Patient counselling advised (administration).
  - Driving and skilled tasks
    - Ocular adverse reactions may affect performance of skilled tasks e.g. driving.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014) NICE TA310
  - Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:
    - whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, and
    - who have not previously had an EGFR-TK inhibitor, and
    - if the manufacturer provides afatinib with the discount agreed in the patient access scheme.
    - www.nice.org.uk/TA310

### Axitinib

#### DRUG ACTION
Axitinib is a tyrosine kinase inhibitor.

#### INDICATIONS AND DOSE
Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)

- **BY MOUTH**
  - Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 797.

- **CONTRA-INDICATIONS**
  - Recent active gastrointestinal bleeding - untreated brain metastases
**CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)

**INTERACTIONS** → Appendix 1 (axitinib).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anal fistula · arthralgia · asthenia · cerebral haemorrhage · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · gastrointestinal haemorrhage · gastro-intestinal perforation · haemoptysis · haemorrhage · haemorrhoids · hand-foot syndrome · headache · hypercalcaemia · hyperkalaemia · hypertension · hyperthyroidism · hypothyroidism · myalgia · proteinuria · pruritus · rash · renal failure · tinnitus · weight loss
- **Uncommon** Hypertensive crisis · polycythaemia · posterior reversible encephalopathy syndrome
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during and for up to 1 week after treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**HEPATIC IMPAIRMENT** Reduce starting dose in moderate impairment. Avoid in severe impairment—no information available.

**MONITORING REQUIREMENTS**
- Monitor for thyroid dysfunction.
- Monitor haemoglobin or haematocrit before and during treatment.
- Monitor for symptoms of gastro-intestinal perforation.
- Monitor for symptoms of fistula.
- Monitor for proteinuria before and during treatment.
- Monitor liver function before and during treatment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- **Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)**
  NICE TA333
  Axitinib is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, only if the company provides axitinib with the discount agreed in the patient access scheme. [www.nice.org.uk/TA333](http://www.nice.org.uk/TA333)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 25

- **Inlyta (Pfizer Ltd)**
  - **Axitinib 1 mg** Inlyta 1mg tablets | 56 tablet PBM £703.40 (Hospital only)
  - **Axitinib 3 mg** Inlyta 3mg tablets | 56 tablet PBM £2,110.20 (Hospital only)
  - **Axitinib 5 mg** Inlyta 5mg tablets | 56 tablet PBM £3,517.00 (Hospital only)
  - **Axitinib 7 mg** Inlyta 7mg tablets | 56 tablet PBM £4,923.80 (Hospital only)

**INDICATIONS AND DOSE**

**Treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate**

- **BY MOUTH**
  - Adult: 500 mg once daily, consult product literature for dose adjustment due to side effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS** Cardiac disease · hepatitis B infection · history of pancreatitis—hold treatment if lipase elevated and abdominal symptoms occur · history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder

**CONCEPTION, FURTHER INFORMATION**

- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

**INTERACTIONS** → Appendix 1 (bosutinib).

Caution with concomitant use of drugs that prolong the QT interval (monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · abnormal liver function · acne · arthralgia · biochemical disturbances · cough · decreased appetite · dehydration · diarrhoea · dizziness · dysgeusia · dysphonia · electrolyte disturbances · gastritis · headache · hepatotoxicity · infection · malaise · myalgia · oedema · pericardial effusion · pleural effusion · pruritus · pyrexia · QT prolongation · rash · renal failure · renal impairment · urticaria
- **Uncommon** Gastric haemorrhage · pancreatitis · pericarditis · pulmonary hypertension · pulmonary oedema · respiratory failure · tinnitus
- **Frequency not known** Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment in women.

**PREGNANCY** Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Caution—no information available.
MONITORING REQUIREMENTS
- Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

NATIONAL FUNDING/ACCESS DECISIONS
- NICE technology appraisals (TAs)
  - Bosutinib for previously treated chronic myeloid leukaemia (August 2016) NICE TA401
    Bosutinib is recommended as a treatment option, within its marketing authorisation, for chronic, accelerated and blast phase Philadelphia–chromosome-positive CML in adults, when:
    - they have previously been treated with 1 or more tyrosine kinase inhibitor, and
    - imatinib, nilotinib and dasatinib are not appropriate, and
    - the manufacturer provides bosutinib with the discount agreed in the patient access scheme.
    www.nice.org.uk/TA401

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21
- Bosulif (Pfizer Ltd) ▼
  - Bosutinib 100 mg Bosulif 100mg tablets | 28 tablet POM £859.17 (Hospital only)
  - Bosutinib 500 mg Bosulif 500mg tablets | 28 tablet POM £3,436.67 (Hospital only)

DRUG ACTION
Bosutinib is an inhibitor of several protein kinases.

INDICATIONS AND DOSE
Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma
- BY MOUTH
  - Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy)

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 797.

CONTRA-INDICATIONS
Reversible Posterior Leukoencephalopathy Syndrome

CAUTIONS
Hypertension—discontinue treatment if uncontrolled despite medical intervention - palmar-plantar erythrodyssasia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 • patients at increased risk of fistulas—consult product literature • patients at increased risk of gastro-intestinal perforation—consult product literature • patients at increased risk of intra-abdominal abscess—consult product literature • patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop • patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop • risk of osteonecrosis of the jaw • susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically

CAUTIONS, FURTHER INFORMATION
- Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
- Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.

INTERACTIONS ▶ Appendix 1 (cabozantib), Caution with concomitant use of drugs which increase the risk of osteonecrosis of the jaw e.g. bisphosphonates. Caution with concomitant use of drugs that prolong the QT interval.

SIDE-EFFECTS
- Common or very common Abdominal pain • abnormal hair growth • abscess • acne • alopecia • anal fissure • anxiety • arthralgia • aspiration • atrial fibrillation • blurred vision • chelitis • chills • cholelithiasis • constipation • decreased appetite • dehydration • depression • diarrhoea • dizziness • dry skin • dysgeusia • dyspepsia • dysphagia • dysuria • erythema • face oedema • folliculitis • fungal infection • gastrointestinal perforation • gastrointestinal haemorrhage • glossodynia • haematuria • haemorrhoids • hair colour changes • headache • hyperbilirubinaemia • hyperkeratosis • hypertension • hypoaIbuminaemia • hypocalcaemia • hypokalaemia • hypophosphataemia • hypotension • hypothyroidism • impaired wound healing • lymphopenia • mucosal inflammation • muscle spasms • musculoskeletal chest pain • nausea • neumonia • non-gastro-intestinal fistula • oropharyngeal pain • osteonecrosis of jaw • pallor • palmar-plantar erythrodyssasia syndrome • pancreatitis • paraesthesia • peripheral coldness • peripheral neuropathy • platelet disorders • pneumonia • proteinuria • pulmonary embolism • rash • respiratory tract haemorrhage • skin exfoliation • skin hypopigmentation • stomatitis • tinnitus • tremor • venous thrombosis • vomiting
- Uncommon Hypoacusia • acute renal failure • amniunorrhoea • angina • arterial thrombosis • aspergillosis • ataxia • atelectasis • cataract • conjunctivitis • cyst • delirium • facial pain • gastro-intestinal fistula • hepatic encephalopathy • loss of consciousness • oesophagitis • pharyngeal oedema • pneumonitis • posterior reversible encephalopathy syndrome • rhadomyolysis • skin ulcer • speech disorder • supraventricular tachycardia • telangiectasia • transient ischaemic attack • vaginal haemorrhage
- Frequency not known Bone-marrow suppression • hyperuricaemia • oral mucositis • thromboembolism • tumour lysis syndrome

CONCEPTION AND CONTRACEPTION
Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

BREAST FEEDING
Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.

HEPATIC IMPAIRMENT
Manufacturer advises avoid.

RENAL IMPAIRMENT
Manufacturer advises caution in renal impairment. Avoid in severe impairment.

MONITORING REQUIREMENTS
Monitor urine protein regularly and discontinue if nephrotic syndrome develops.

Cabozantinib

DRUG ACTION
Cabozantinib is an inhibitor of several protein kinases.

INDICATIONS AND DOSE
Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma
- BY MOUTH
  - Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy)
Patient and carer advice
Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

Driving and skilled tasks
Fatigue and weakness may affect performance of skilled tasks e.g. driving.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Cabozantinib (non-proprietary)
  - Cabozantinib (as Cabozantinib s-malate) 20 mg
  - Cabozantinib (as Cabozantinib s-malate) 40 mg

Capsule
- Cometriq
  - Cabozantinib (as Cabozantinib s-malate) 20 mg
  - Cabozantinib (as Cabozantinib s-malate) 80 mg

Patient and carer advice

Drug action
Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

Indications and dose
Treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib
- By mouth
- Adult: 750 mg once daily, dose should be taken at the same time every day, temporary dose interruption or dose reduction may be required based on tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 300 mg daily

Dose adjustments due to interactions
Consider reducing the dose by one third (rounded to the nearest multiple of the 150 mg dosage form) if concomitant use of potent inhibitors of CYP3A4 (e.g. itraconazole, ketoconazole, posaconazole, ritonavir, saquinavir, telithromycin, or voriconazole) is unavoidable.

Important safety information
Risks of incorrect dosing of oral-anticancer medicines
See Cytotoxic drugs p. 797.

Contra-indications
Congenital long QT syndrome

Cautions
- Diabetes mellitus - history or susceptibility to QT-interval prolongation

Cautions, further information
- QT-interval prolongation
  - QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsades de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.

Interactions
- Appendix 1 (ceritinib)
  - Caution with concomitant use of drugs that prolong the QT-interval.

Side-effects
- Common or very common
  - Abdominal pain, anaemia, bradycardia, constipation, decreased appetite, diarrhoea, dyspepsia, dysphagia, fatigue, gastro-oesophageal reflux disease, hyperglycaemia, hypophosphataemia, nausea, pericarditis, pneumonitis, QT-interval prolongation, rash, renal failure, renal impairment, visual disorders, vomiting
- Uncommon
  - Hepatotoxicity, pancreatitis

Side-effects, further information
- Gastro-intestinal effects
  - Manufacturer advises monitor for signs of gastro-intestinal toxicity and consider dose reduction or discontinuation of treatment.
- Interstitial lung disease
  - Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.

Conception and contraception
Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.

Pregnancy
- Manufacturer advises avoid unless essential—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

Breast feeding
- Manufacturer advises avoid—no information available.

Hepatic impairment
- Manufacturer advises avoid in moderate to severe impairment—no information available but extensively metabolised by the liver.

Renal impairment
- Manufacturer advises caution in severe impairment—no information available.

Monitoring requirements
- Manufacturer advises to monitor fasting blood glucose concentration prior to initiation of treatment and periodically thereafter. Also monitor for amylase and lipase elevations periodically during treatment. Consider dose reduction, interruption or discontinuation of treatment if outside of normal range.
  - In addition, manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first month and monthly thereafter; consider discontinuation if severe changes in liver function occur—increased risk of hepatotoxicity. Monitor heart rate and blood pressure regularly; consider dose reduction or discontinuation if bradycardia is reported—consult product literature.

Directions for administration
Capsules should be taken on an empty stomach—no food should be eaten for 2 hours before or after dose.

Patient and carer advice
- Patients and carers should be counselled on the administration of capsules.

Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Driving and skilled tasks
Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

National funding/access decisions
NICE technology appraisals (Tas)
- Ceritinib for previously treated anaplastic lymphoma kinase-positive non small cell lung cancer (June 2016) NICE TA395
  - Ceritinib is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme.
  - www.nice.org.uk/guidance/ta395

- **DRUG ACTION**
  - Crizotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**
- Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer
  - **BY MOUTH**
  - Adult: 250 mg twice daily, for dose adjustments due to side-effect, consult product literature

**IMPORTANT SAFETY INFORMATION**
- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
  - See Cytotoxic drugs p. 797.
  - **MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE**
  - Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:
    - Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
    - Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur

**CAUTIONS FURTHER INFORMATION**
- History of diverticulitis (risk of gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs) - metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) - patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required - risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs - vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

**CAUTIONS, FURTHER INFORMATION**
- **FATAL INTERSTITIAL LUNG DISEASE AND PNEUMONITIS**
  - Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).

**INTERACTIONS**
- Appendix 1 (crizotinib).
  - Caution with concomitant use of drugs that prolong QT interval—periodic renal monitoring required.
  - Caution with concomitant use of drugs which may cause gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs.

**SIDE-EFFECTS**
- **Frequency not known**
  - Alopecia - hyperuricaemia - oral mucositis - thromboembolism - tumour lysis syndrome

**PREGNANCY**
- Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**
- Avoid—no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
- Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

**MONITORING REQUIREMENTS**
- Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated. Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter. Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

**PATIENT AND CARER ADVICE**
- Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advice to seek immediate medical attention.

**Driving and skilled tasks**
- Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

**NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
  - **Crizotinib for previously treated non-small-cell lung cancer associated with an anaplastic lymphoma kinase fusion gene (September 2013) NICE TA296**
  - Crizotinib is **not** recommended within its marketing authorisation, for treating adults with previously treated anaplastic-lymphoma-kinase-positive advanced non-small-cell lung cancer.
  - **www.nice.org.uk/TA296**

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **CAUTIONARY AND ADVISORY LABELS** 25
  - **Xalkori** (Pfizer Ltd)
  - **Crizotinib 200 mg**
    - Xalkori 200mg capsules  | 60 capsule  **PO**
    - £4,689.00 (Hospital only)
  - **Crizotinib 250 mg**
    - Xalkori 250mg capsules  | 60 capsule  **PO**
    - £4,689.00 (Hospital only)
### Dabrafenib

**DRUG ACTION** Dabrafenib is a BRAF kinase inhibitor.

**INDICATIONS AND DOSE**

**Monotherapy for the treatment of unresectable or metastatic melanoma with BRAF V600 mutation**

- **BY MOUTH**
  - Adult: 150 mg every 12 hours, for dose adjustments due to side effects consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CONTRA-INDICATIONS**

- BRAF wild-type melanoma • long QT syndrome • uncorrectable electrolyte abnormalities (including magnesium)

**CAUTIONS**

- Pyrexia (interrupt treatment if ≥38.5°C and assess for signs and symptoms of infection—consult product literature)

**INTERACTIONS**

- Contra—indicated with concomitant use of drugs that prolong the QT interval.

**SIDE-EFFECTS**

- Common or very common
  - Acrochordon • arthralgia • basal cell carcinoma • chills • constipation • cough • cutaneous squamous cell carcinoma • decrease in left ventricular ejection fraction • decreased appetite • diarrhoea • dry skin • erythema • hand-foot syndrome • headache • hyperglycaemia • hyperkeratosis • hypophosphataemia • influenza-like symptoms • keratosis • malaise • myalgia • papilloma • pruritus • pyrexia • rash • skin lesions

- Uncommon
  - Nephritis • new primary melanoma • pancreatitis • panniculitis • QT-interval prolongation • renal failure • uveitis

- Frequency not known
  - Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis
  - Promptly investigate signs and symptoms of pancreatitis—consult product literature.

**CONCEPTION AND CONTRACEPTION**

- Effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential.

**PREGNANCY**

- Manufacturer advises caution in the establishment of pregnancy before treatment in women of childbearing potential.

**BREAST FEEDING**

- Manufacturer advises caution in breast feeding.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in moderate to severe impairment. Additional monitoring of ECG and electrolytes required in hepatic impairment—consult product literature.

**RENAL IMPAIRMENT**

- Manufacturer advises caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment.

- Assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature.

- Monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate.

- Monitor for ophthalmologic reactions including uveitis and iritis.

- Monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (Tas)**
  - Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014) NICE TA321
  - Dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme. www.nice.org.uk/TA321

- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (February 2015) that dabrafenib (Tafinlar®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic BRAFV600 mutation-positive melanoma in patients who have received no prior therapy.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 23, 25
    - **Tafinlar** (Novartis Pharmaceuticals UK Ltd)
      - Dabrafenib (as Dabrafenib mesilate) 75 mg capsules
        - 28 capsule (£33.33 Hospital only)
      - Dabrafenib (as Dabrafenib mesilate) 50 mg capsules
        - 28 capsule (£43.00 Hospital only)

**Dasatinib**

**DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

**Chronic phase chronic myeloid leukaemia (consult product literature for details)**

- **BY MOUTH**
  - Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

**Accelerated and blast phase chronic myeloid leukaemia (consult product literature for details) Acute lymphoblastic leukaemia (consult product literature for details)**

- **BY MOUTH**
  - Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS**

- Hepatitis B infection • risk of cardiac dysfunction (monitor closely) • susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)

**CAUTIONS, FURTHER INFORMATION**

- Pulmonary arterial hypertension
  - Patients should be evaluated for signs and symptoms of underlying cardiopulmonary
Erlotinib

**DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy. Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

BY MOUTH

- Adult: 150 mg once daily
- Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

**BY MOUTH**

- Adult: 100 mg once daily

**IMPORTANT SAFETY INFORMATION**

**EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CAUTIONS**

- **CAUTIONS, FURTHER INFORMATION**
  - Smoking: Dose adjustment may be necessary if smoking started or stopped during treatment.
  - **INTERACTIONS** → Appendix 1 (erlotinib).
  - Caution with concomitant use with hepatotoxic drugs—monitor liver function.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, anorexia, conjunctivitis, depression, diarrhoea, dry skin, dyspepsia, fatigue, flatulence, headache, neuropathy, pruritus, rigor

---

864 Targeted therapy responsive malignancy
Uncommon  Eyelash changes - gastro-intestinal perforation - interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur

Rare  Hepatic failure

Very rare  Corneal perforation - corneal ulceration - Stevens-Johnson syndrome - toxic epidermal necrolysis

Frequency not known  Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

CONCEPTION AND CONTRACEPTION  Effective contraception required during and for at least 2 weeks after treatment.

Pregnancy  Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

Breast feeding  Manufacturer advises avoid—no information available.

Hepatic impairment  Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. Monitor liver function in pre-existing liver disease.

Renal impairment  Manufacturer advises avoid in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)

Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011) NICE TA227
Erlotinib monotherapy is not recommended for maintenance treatment in patients with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy. www.nice.org.uk/TA227

Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012) NICE TA258
Erlotinib is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation and
- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012). www.nice.org.uk/TA258

Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374
Erlotinib is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours of unknown epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation status, only if all of the following criteria are met:
- the result of an EGFR-TK mutation diagnostic test is unobtainable because of an inadequate tissue sample or poor-quality DNA,
- the treating clinician considers that the tumour is very unlikely to be EGFR-TK mutation-positive,
- the patient's condition responds to the first 2 cycles of treatment with erlotinib, and,
- the manufacturer provides erlotinib with the discount agreed in the patient access scheme.

Erlotinib is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients who are already receiving erlotinib should continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA374

Everolimus

Drug action  Everolimus is a protein kinase inhibitor.

Indications and dose
Afinitor®
Treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy/ Treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin | Treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor

By mouth
Adult: 10 mg once daily

Certican®
Liver transplantation

By mouth
Adult: Initially 1 mg twice daily, to be started approximately 4 weeks after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

Renal transplantation | Heart transplantation

By mouth
Adult: Initially 750 micrograms twice daily, to be started as soon as possible after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

Votubia®
Subependymal giant cell astrocytoma associated with tuberous sclerosis complex

By mouth
Adult: (consult product literature)

Renal angiomyolipoma associated with tuberous sclerosis complex

By mouth
Adult: (consult product literature)

Important safety information
Risks of incorrect dosing of oral anti-cancer medicines
See Cytotoxic drugs p. 797.

Caution
History of bleeding disorders

Interactions  Appendix 1 (everolimus), Caution with concomitant use of drugs that increase risk of bleeding.

Side-effects
Common or very common  Abdominal pain - anorexia - arthralgia - asthenia - chest pain - convulsions - dehydration - diarrhoea - dry mouth - dysphagia - electrolyte disturbance - epistaxis - eyelid oedema - fatigue
Immune system and malignant disease

Everolimus for the second-line treatment of advanced renal cell carcinoma (April 2011) NICE TA219
Everolimus is not recommended for the second-line treatment of advanced renal cell carcinoma.
www.nice.org.uk/TA219

Everolimus in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013) NICE TA295
Everolimus, in combination with exemestane, is not recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor.
www.nice.org.uk/TA295

• Frequency not known
  • Alopecia
  • Bone-marrow suppression
  • Haemorrhage
  • Hepatitis B reactivation
  • Hyperuricaemia
  • Nausea
  • Oral mucositis
  • Thromboembolism
  • Tumour lysis syndrome
  • Vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Reduce dose or discontinue if severe side-effects occur—consult product literature.

• CONCEPTION AND CONTRACEPTION
  Effective contraception must be used during and for up to 8 weeks after treatment.

• PREGNANCY
  Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

• BREAST FEEDING
  Manufacturer advises avoid.

• HEPATIC IMPAIRMENT
  Consult product literature.

• MONITORING REQUIREMENTS
  For Certican®, manufacturer advises pre-dose (“trough”) whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using chromatographic assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.

  • Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.

  • Monitor renal function before treatment and periodically thereafter.

• DIRECTIONS FOR ADMINISTRATION

  VOTUBIA® Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

• PATIENT AND CARER ADVICE

  Pneumonitis
  Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

• NATIONAL FUNDING/ACCESS DECISIONS

  NICE technology appraisals (TAs)

  ▶ Everolimus for preventing organ rejection in liver transplantation (July 2015) NICE TA348
  Everolimus (Certican®) is not recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

  www.nice.org.uk/TA348

  ▶ Afinitor®

  Scottish Medicines Consortium (SMC) Decisions

  The Scottish Medicines Consortium has advised (April 2012) that everolimus (Afinitor®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

  ▶ MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

  Tablet

  CAUTIONARY AND ADVISORY LABELS 25

  ▶ Afinitor (Novartis Pharmaceuticals UK Ltd)
  Everolimus 2.5 mg Afinitor 2.5mg tablets | 30 tablet (PO)
  £1,200.00
  Everolimus 5 mg Afinitor 5mg tablets | 30 tablet (PO) £2,250.00
  Everolimus 10 mg Afinitor 10mg tablets | 30 tablet (PO) £2,673.00

Geftinib

• DRUG ACTION

  Gefitinib is a tyrosine kinase inhibitor.

• INDICATIONS AND DOSE

  Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor

  ▶ BY MOUTH

  ▶ Adult: 250 mg once daily

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

RISKS OF INCORRECT DOING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 797.
Ibrutinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

**Treatment of relapsed or refractory mantle cell lymphoma**

- **By mouth**
  - Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

**Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 1p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy**

- **By mouth**
  - Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

**Treatment of relapsed or refractory mantle cell lymphoma (reduced dose for patients taking concomitant moderate or potent CYP3A4 inhibitors)**

- **By mouth**
  - Adult: 140 mg once daily, for dose adjustments due to side effects consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Reduce dose in patients taking concomitant potent CYP3A4 inhibitors (such as cobicistat, clarithromycin, darunavir boosted with ritonavir, indinavir, itraconazole, ketoconazole, ritonavir, saquinavir, telithromycin, and voriconazole) or moderate CYP3A4 inhibitors (such as amiodarone, aprepitant, azanavir, ciprofloxacin, crizotinib, diltiazem, dronedaron, erythromycin, fluconazole, fosamprenavir, imatinib, and verapamil); alternatively temporarily stop ibrutinib if the potent CYP3A4 inhibitor is only required for 7 days or less. Avoid concomitant use with these drugs unless unavoidable.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CAUTIONS**

- Family history of congenital short QT syndrome
- Increased lymphocytes—increased risk of leukostasis, consider withholding treatment temporarily and monitor closely—patients at risk from further shortening of QTc interval—personal history of congenital short QT syndrome—risk of haemorrhagic events— withholding ibrutinib treatment for at least 3 to 7 days before and after surgery depending on risk of bleeding

**INTERACTIONS**

- Appendix 1 (ibrutinib).

Avoid concomitant use of drugs that increase risk of bleeding

**SIDE-EFFECTS**

- Common or very common Arthralgia, atrial fibrillation, blurred vision, bruising, constipation, dehydration, diarrhoea, dizziness, dry mouth, epistaxis, haemorrhage, headache, hypertension, interstitial lung disease, nausea, oral mucositis, rash, rhinitis, sinusitis, Steven Johnson syndrome, thrombocytopenia, vomiting.

- Uncommon Corneal erosion, pancreatitis.

- Rare Hepatitis, toxic epidermal necrolysis.

**FREQUENCY NOT KNOWN**

- Allopecia, bone marrow suppression, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting.

**SIDE-EFFECTS**

- Common or very common Acne, anorexia, asthma, blepharitis, conjunctivitis, diarrhoea, dry eye, dry mouth, dry skin, epistaxis, haematuria, interstitial lung disease—discontinue if confirmed—nail disorder—proteinuria, pruritus, pyrexia, rash, skin reactions.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises caution unless contraceptive advice is available.

**RENAL IMPAIRMENT**

Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

**PREGNANCY**

Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate to severe impairment due to cirrhosis.

**MONITORING REQUIREMENTS**

- Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.

- Monitor liver function—consider discontinuing if severe changes in liver function occur.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Gefitinib** for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192
  - Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.
  - www.nice.org.uk/TA192

- **Erlotinib** and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374
  - Gefitinib is not recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

- Patients who are already receiving gefitinib should continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA374

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (December 2015) that gefitinib (Iressa®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with previously untreated locally advanced or metastatic non-small cell lung cancer (NSCLC) with activating mutations of epidermal growth factor receptor tyrosine kinase (EGFR-TK).

**MEDICINAL FORMS**

- **Tablet**

  - **Iressa** (AstraZeneca UK Ltd)

  - Gefitinib 250 mg Iressa 250mg tablets | 30 tablet | £2,167.71

**Drug action**

**Indications and dose**

**Treatment of relapsed or refractory mantle cell lymphoma**

- **By mouth**
  - Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

**Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 1p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy**

- **By mouth**
  - Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

**Treatment of relapsed or refractory mantle cell lymphoma (reduced dose for patients taking concomitant moderate or potent CYP3A4 inhibitors)**

- **By mouth**
  - Adult: 140 mg once daily, for dose adjustments due to side effects consult product literature
headache · musculoskeletal pain · peripheral oedema · petechiae · pyrexia · rash · respiratory tract infection · sepsis · sinusitis · skin infection · subdural haematoma · urinary tract infection

- **Uncommon** Leukostasis
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

**PREGNANCY** Manufacturer advises avoid—tobacco in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.

**HEPATIC IMPAIRMENT** Reduce dose to 280 mg daily in mild impairment and reduce dose to 140 mg daily in moderate impairment—monitor for toxicity and adjust dose if necessary (consult product literature). Avoid in severe impairment.

**RENAL IMPAIRMENT** Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

**MONITORING REQUIREMENTS**

- Monitor full blood count once a month.
- Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

**Capsule**

| CAUTIONARY AND ADVISORY LABELS 25 |

**Idelalisib**

16-Nov-2016

**DRUG ACTION** Idelalisib is a protein kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab).

Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)

- **BY MOUTH**
  - Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**MHRA/CHM ADVICE: IDELALISIB (ZYDELIG®): UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)**

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of *Pneumocystis jiroveci* pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

**CAUTIONS**

- Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withhold treatment (consult product literature)

**INTERACTIONS** → Appendix 1 (idelalisib).

**SIDE-EFFECTS**

- Alopecia · bone-marrow suppression · diarrhoea · hyperuricaemia · infections · nausea · neutropenia · oral mucositis · pneumonitis · pyrexia · rash · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Highly effective contraception (in addition to barrier method) required during and for one month after treatment.

**PREGNANCY**

- Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in hepatic impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function—consult product literature.

- Manufacturer advises monitor for signs and symptoms of infection, including *cytomegalovirus* infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm$^3$ should be monitored weekly.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359

Idelalisib, in combination with rituximab, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia or
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and

- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients who are already receiving idelalisib should continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/guidance/TA359

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (March 2015) that idelalisib (Zydelig®) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemomunotherapy, only whilst idelalisib is available at the price agreed in the patient access scheme.

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

**Tablet**

| CAUTIONARY AND ADVISORY LABELS 25 |
| Idelalisib 100 mg | Zydelig 100mg tablets | 60 tablet (Pom) £1,114.75 (Hospital only) |
| Idelalisib 150 mg | Zydelig 150mg tablets | 60 tablet (Pom) £1,114.75 (Hospital only) |
**Imatinib**

**DRUG ACTION** Imatinib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

- **BY MOUTH**
- Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

- **BY MOUTH**
- Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy) | Monotherapy for relapsed or refractory acute lymphoblastic leukaemia

- **BY MOUTH**
- Adult: 600 mg once daily

Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

- **BY MOUTH**
- Adult: 400 mg once daily

Treatment of unresectable dermatofibrosarcoma protubera nier or metastatic dermatofibrosarcoma protubera nier, in patients who cannot have surgery

- **BY MOUTH**
- Adult: 800 mg daily in 2 divided doses

Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia

- **BY MOUTH**
- Adult: 100–400 mg once daily

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS**

- Cardiac disease • hepatitis B infection • history of renal failure • risk factors for heart failure

**CAUTIONS, FURTHER INFORMATION**

- Hepatitis B infection • The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

**INTERACTIONS**

- Appendix 1 (imatinib).

**SIDE-EFFECTS**

- Common or very common • Abdominal pain • appetite changes • arthralgia • ascites • conjunctivitis • constipation • cough • cramps • diarrhea • dizziness • dry eyes • dry mouth • dry skin • dysphagia • epistaxis • fatigue • flatulence • flushing • gastro-oesophageal reflux • haemorrhage • headache • hypoesthesia • increased lacrimation • influenza-like symptoms • insomnia • oedema • paraesthesia • photosensitivity • pleural effusion • pruritus • pulmonary oedema • rash • sweating • taste disturbance • visual disturbances • weight changes

- Uncommon • Acute respiratory failure • anxiety • cold extremities • cough • depression • drowsiness • dysphagia • electrolyte disturbances • gastric ulceration • gout • gynaecomastia • haemoptysis • hearing loss • heart failure • hepatic dysfunction • hepatitis • hypertension • hypotension • impaired memory • irregular menstruation • menorrhagia • migraine • palpitation • pancreatitis • peripheral neuropathy • renal failure • sexual dysfunction • skin hyperpigmentation • syncope • tachycardia • tinnitus • tremor • urinary frequency • vertigo

- Rare • Angina • angioedema • arrhythmia • asptic necrosis of bone • atrial fibrillation • ataraxia • confusion • convulsions • exfoliative dermatitis • gastro-intestinal perforation • glaucoma • haemolytic anaemia • hepatic failure • hepatic failure (fatal cases reported) • hepatic necrosis • increased intracranial pressure • inflammatory bowel disease • intestinal obstruction • myocardial infarction • myopathy • pulmonary fibrosis • pulmonary hypertension • rhabdomyolysis • Stevens-Johnson syndrome

- Frequency not known • Alopecia • bone-marrow suppression • drug rash with eosinophilia and systemic symptoms (DRESS) • growth retardation in children • hepatitis B reactivation • hyperurcaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomit ing

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment.

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Max. 400 mg daily; reduce dose further if not tolerated.

**RENAL IMPAIRMENT**

Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.

**MONITORING REQUIREMENTS**

- Monitor for gastrointestinal haemorrhage.
- Monitor complete blood counts regularly.
- Monitor for fluid retention.
- Monitor liver function.

**DIRECTIONS FOR ADMINISTRATION**

Tablets may be dispersed in water or apple juice.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer imatinib tablets.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014) NICE TA326
  Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for kit (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years.
  Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.
  www.nice.org.uk/TA326

- Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012) NICE TA251
  Standard-dose imatinib is recommended as an option for the first-line treatment of adults with chronic phase...
Philadelphia–chromosome-positive chronic myeloid leukaemia (CML).

www.nice.org.uk/TA251

- **Imatinib for chronic myeloid leukaemia (October 2003)**
  NICE TA70
  Imatinib is recommended as first-line treatment for Philadelphia–chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.
  www.nice.org.uk/TA70

- **Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)**
  NICE TA241
  High-dose imatinib is not recommended for the treatment of chronic, accelerated or blast-crisis phase Philadelphia-chromosome-positive CML that is resistant to standard-dose imatinib.
  www.nice.org.uk/TA241

- **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)**
  NICE TA86
  Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment (as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86) is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.
  www.nice.org.uk/TA86

- **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)**
  NICE TA209
  Imatinib 600 mg daily or 800 mg daily is not recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.
  www.nice.org.uk/TA209

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The **Scottish Medicines Consortium** has also advised (February 2012) that imatinib (Glivec®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

**Lapatinib**

- **DRUG ACTION** Lapatinib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**

  Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)
  
  **BY MOUTH**
  
  - Adult: 1 g once daily

  Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)
  
  **BY MOUTH**
  
  - Adult: 1.25 g once daily

  Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)
  
  **BY MOUTH**
  
  - Adult: 1.5 g once daily

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

- **CAUTIONS** Diarrhoea— withhold treatment if severe (consult product literature) - low gastric pH (reduced absorption) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

- **INTERACTIONS** → Appendix 1 (lapatinib).
  
  Caution with concomitant use of drugs that prolong QT-interval.

- **SIDE-EFFECTS**
  
  - **Common or very common** Anorexia - cardiac failure (fatal cases reported) - decreased left ventricular ejection fraction - diarrhoea (treat promptly) - hepatotoxicity (discontinue permanently if severe) - hyperbilirubinaemia - malaise - nail disorders - rash

  - **Uncommon** Interstitial lung disease

  - **Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - respiratory failure (including fatal cases) - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **PREGNANCY** Avoid unless potential benefit outweighs risk— toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment— metabolism reduced.

- **RENAL IMPAIRMENT** Caution in severe impairment— no information available.

- **MONITORING REQUIREMENTS**
  
  - **DIRECTIONS FOR ADMINISTRATION** Always take at the same time in relation to food: either one hour before or one hour after food.
Nilotinib

27-Jul-2016

Drug action
Nilotinib is a tyrosine kinase inhibitor.

indications and dose
Treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase
- **By mouth**
  - Adult: 300 mg twice daily

Treatment of chronic and accelerated phase chronic myeloid leukaemia in patients who have resistance to or intolerance of previous therapy, including imatinib
- **By mouth**
  - Adult: 400 mg twice daily

Caution
- **History of pancreatitis**
- **Susceptibility to QT-interval prolongation (including electrolyte disturbances)**

Important safety information
Risks of incorrect dosing of oral anti-cancer medicines
See Cytotoxic drugs p. 797.

MHRA/CHM advice (May 2016): Risk of Hepatitis B Virus Reactivation with Tyrosine Kinase Inhibitors
An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

Side-effects
- **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · blood glucose changes · bone pain · constipation · cough · diarrhoea · dizziness · dry skin · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · flushing · headache · hyperhidrosis · hyperkaemia · hypertension · hypomagnesaemia · insomnia · muscle spasm · oedema · palpitation · paraesthesia · pruritus · QT-interval prolongation · rash · urticaria · vertigo · weight changes

Uncommon
- Anxiety · arthralgia · bradycardia · breast pain · cardiac failure · cardiac murmur · cardiomyalgia · chest pain · conjunctivitis · coronary artery disease · decreased visual acuity · dehydration · depression · dry eyes · dry mouth · dysuria · ecchymosis · epistaxis · erectile dysfunction · gynaecomastia · haematoma · haemorrhage · hepatitis · hyperaesthesia · hypertensive crisis · hyperthyroidism · hypoaesthesia · hypocalcaemia · hypokalaemia · hyponatraemia · hypophosphataemia · influenza-like symptoms · interstitial lung disease · melaena · migrane · pancreatitis · peripheral effusion · pleural effusion · tremor · urinary frequency
- Frequency not known
  - Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis D reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

Conception and contraception
Effective contraception required during treatment.

Pregnancy
Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

Breast feeding
Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment
Manufacturer advises caution.

NATIONAL FUNDING / ACCESS DECISIONS

NICE technology appraisals (TAs)
- Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012) NICE TA251
- Dasatinib, nilotinib and high-dose imatinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012) NICE TA241

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2008) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.
Pazopanib

**DRUG ACTION** Pazopanib is a tyrosine kinase inhibitor.

**INDICATIONS AND DOSE**

First-line treatment of advanced renal cell carcinoma

Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy

**BY MOUTH**

Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

Treatment of selective subtypes of advanced soft-tissue sarcoma

**BY MOUTH**

Adult: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CONTRA-INDICATIONS**

Cerebral haemorrhage - clinically significant gastro-intestinal haemorrhage - haemoptysis in the past 6 months

**CAUTIONS**

Cardiac disease - increased risk of gastro-intestinal fistulas - increased risk of gastro-intestinal perforation - increased risk of haemorrhage - increased risk of thrombotic microangiopathy - permanently discontinue if symptoms develop - ischaemic stroke - myocardial infarction - risk of thrombotic events - susceptibility to QT-interval prolongation (including electrolyte disturbances) - transient ischaemic attack

**CAUTIONS, FURTHER INFORMATION**

Elective surgery Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.

Blood pressure Blood pressure must be controlled before initiating treatment.

**INTERACTIONS** ▶ Appendix 1 (pazopanib).

Caution with concomitant use of drugs that prolong QT-interval.

**SIDE-EFFECTS**

**Rare** Thrombotic microangiopathy

**Frequency not known** Alopecia - bone-marrow suppression - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRAPLICATION** Effective contraception advised during treatment.

**PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose to 200 mg once daily in moderate impairment. Use with caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 30 ml/minute—no information available.

**MONITORING REQUIREMENTS**

Monitor liver function before treatment and at weeks 3, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.

Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).

Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.

Monitor for proteinuria.

Monitor thyroid function.

Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.

**PATIENT AND CARER ADVICE** Patients should be advised not to take antacids for at least 1 hour before or 2 hours after pazopanib.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013) NICE TA215

Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:

who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 and

if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

www.nice.org.uk/TA215

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (February 2011) that pazopanib (Votrient®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is not recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.
CAUTIONS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 23, 25
▶ Votrient (Novartis Pharmaceuticals UK Ltd)
Pazopanib (as Pazopanib hydrochloride) 200 mg Votrient 200mg tablets | 30 tablet | £660.50
Pazopanib (as Pazopanib hydrochloride) 400 mg Votrient 400mg tablets | 30 tablet | £1,121.00

Ponatinib

INDICATIONS AND DOSE
Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

BY MOUTH
Adult: 45 mg once daily, for dose adjustment due to side effects—consult product literature

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Consider reducing the initial dose to 30 mg once daily with concomitant use of potent inhibitors of cytochrome P450 enzyme CYP3A4 (e.g. clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, telithromycin or voriconazole).

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS (NOVEMBER 2014)
The benefits and risks of ponatinib have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which has recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. The review concluded that available evidence shows that the risk of blood vessel blockage with ponatinib is likely to be dose-dependent. However, the data is insufficient to recommend reducing the dose of ponatinib, and there is a risk that a lower dose might not be as effective as the current dose in all patients and in long-term treatment. Therefore, no change has been made to the recommended starting dose.

Prescribers may wish to consider reducing the dose in patients with chronic phase chronic myeloid leukaemia who are responding well to treatment, and who might be at high risk of blood vessel blockage. Stop ponatinib if a complete response has not occurred within 3 months of treatment, and monitor patients for high blood pressure or signs of heart problems.

MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 797.

CAUTIONS
Alcohol abuse—increased risk of pancreatitis—current severe hypertriglyceridaemia—increased risk of pancreatitis—discontinue treatment if a complete haematologic response has not occurred within 3 months—hepatitis B infection—history of myocardial infarction—do not use unless potential benefit outweighs potential risk—history of pancreatitis—history of stroke—do not use unless potential benefit outweighs potential risk—hypertension—medically control during treatment and interrupt treatment if uncontrolled

CAUTIONS, FURTHER INFORMATION

Dose adjustments due to interactions

Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

INTERACTIONS
Appendix 1 (ponatinib).

SIDE-EFFECTS

Uncommon Atopic dermatitis—cerebral artery stenosis—cerebral infarction—gastro haemorrhage—hepatotoxicity—jaundice—retinal vein occlusion—retinal vein thrombosis—visual impairment

Frequency not known Alopecia—bone/marrow suppression—hepatic failure (fatal cases reported)—hepatitis—hepatitis B reactivation—hyperuricaemia—nausea—oral mucositis—thromboembolism—tumour lysis syndrome—vomiting

CONCEPTION AND CONTRACEPTION
Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.

PREGNANCY
Avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

BREAST FEEDING
Manufacturer advises discontinue breastfeeding—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises caution in severe impairment.

RENAL IMPAIRMENT
No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.

MONITORING REQUIREMENTS

Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter—withdraw treatment if lipase elevated and abdominal symptoms occur.

Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.

Manufacturer advises monitor liver function periodically.

Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.

Immune system and malignant disease

Targeted therapy responsive malignancy 873
Regorafenib

**DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

**INDICATIONS AND DOSE**

Treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor. Treatment of unresectable or metastatic gastrointestinal stromal tumours in patients who progressed on or are intolerant to previous treatment with imatinib and sunitinib.

- **By mouth**
  - Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOsing OF ORAL ANti-CANCer MEDICINES**

See Cytotoxic drugs p. 797.

**CAUTIONS**

Ensure measures to prevent hand-foot skin reaction. Gilbert’s syndrome—risk of hyperbilirubinaemia. History of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop. Hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs). May impair wound healing— withhold treatment for major surgical procedures. Predisposition to bleeding.

**INTERACTIONS** → Appendix 1 (regorafenib).

Caution in concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events).

**SIDE-EFFECTS**

- **Uncommon** Gastro-intestinal perforation (including fatal cases) and fistula—discontinue treatment. Hypertensive crisis. Myocardial infarction. Myocardial ischaemia. Severe (including fatal) liver injury.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

3, 25

- **Iclusig** (Ariad Pharma (UK) Ltd)

Ponatinib (as Ponatinib hydrochloride) 45 mg Iclusig 45 mg tablets 30 tablet (POM) £5.050.00

**Ruxolitinib**

**DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

**INDICATIONS AND DOSE**

Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis.

- **By mouth**

  - Adult: (consult product literature or local protocols)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOsing OF ORAL ANti-CANCer MEDICINES**

See Cytotoxic drugs p. 797.
Ruxolitinib for treating disease-related splenomegaly or symptoms (March 2016)
NICE TA386
Ruxolitinib is recommended as an option for treating disease-related splenomegaly or symptoms in patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, and if the manufacturer provides ruxolitinib with the discount agreed in the patient access scheme.

Patients currently receiving ruxolitinib whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA386

### Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Jakavi (Novartis Pharmaceuticals UK Ltd)

  - **Ruxolitinib (as Ruxolitinib phosphate) 5 mg** Jakavi 5mg tablets | 56 tablet blister pack | £1,428.00
  - **Ruxolitinib (as Ruxolitinib phosphate) 10 mg** Jakavi 10mg tablets | 56 tablet blister pack | £2,856.00
  - **Ruxolitinib (as Ruxolitinib phosphate) 15 mg** Jakavi 15mg tablets | 56 tablet blister pack | £2,856.00
  - **Ruxolitinib (as Ruxolitinib phosphate) 20 mg** Jakavi 20mg tablets | 56 tablet blister pack | £2,856.00

### Indications and dose
**Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable**

- Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine
- Treatment of hepatocellular carcinoma

**Drug action**
Sorafenib is an inhibitor of multiple kinases.

**Common or very common**
- Dizziness
- Flatulence
- Headache
- Hypercholesterolaemia
- Weight gain

**Uncommon**
- Tuberculosis

**Frequency not known**
- Alopecia
- Bone-marrow suppression
- Hyperuricaemia
- Nausea
- Oral mucositis
- Progressive multifocal leucoencephalopathy
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**Conception and contraception**
Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Pregnancy**
Avoid—activity in animal studies.

**Breast feeding**
Avoid—present in milk in animal studies.

**Hepatic impairment**
Reduce dose (consult product literature).

**Renal impairment**
Reduce dose in severe impairment (consult product literature).

**Monitoring requirements**
- Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
- Monitor for infection during treatment.
- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.

**National funding/access decisions**

### Sorafenib

**DRUG ACTION**
Sorafenib is an inhibitor of multiple kinases.

**Indications and dose**

**Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable**

- Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine
- Treatment of hepatocellular carcinoma

**By mouth**
- Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

**Important safety information**

**Risks of incorrect dosing of oral anti-cancer medicines**
See Cytotoxic drugs p. 797.

**Caution**
- Cardiac ischaemia
- Major surgical procedures
- Potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding—susceptibility to QT-interval prolongation

**Interactions**
Appendix 1 (sorafenib).

**Side-effects**
- Common or very common
  - Acne
  - Anorexia
  - Arthralgia
  - Asthenia
  - Congestive heart failure
  - Constipation
  - Depression
  - Dermatitis
  - Desquamation
  - Diarrhoea
  - Dry skin
  - Dyspepsia
  - Dysphagia
  - Dysphonia
  - Electrolyte disturbances
  - Erectile dysfunction
  - Erythema
  - Fatigue

- Rare
  - Hepatitis
  - Leucocytoelastic vasculitis
  - Nephrotic syndrome
  - QT-interval prolongation
  - Rhabdomyolysis
  - Stevens-Johnson syndrome
  - Toxic epidermal necrolysis
- Frequency not known
  - Alopecia
  - Bone-marrow suppression
  - Hyperuricaemia
  - Nausea
  - Oral mucositis
  - Thromboembolism
  - Tumour lysis syndrome
- Cautions
  - Cardiac ischaemia
  - Major surgical procedures
  - Potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding—susceptibility to QT-interval prolongation

**Conception and contraception**
Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Pregnancy**
Manufacturer advises avoid unless essential—activity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 797.

**Breast feeding**
Discontinue breast-feeding.

**Hepatic impairment**
Manufacturer advises caution in severe impairment—no information available.

**Monitoring requirements**
- Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
- Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
- Monitor plasma—calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
Targeted therapy responsive malignancy

- Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010) NICE TA189
  - Sorafenib is not recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.
  - www.nice.org.uk/TA189

- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
  - Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.
  - Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.
  - www.nice.org.uk/TA178

**Scottish Medicines Consortium (SMC) Decisions**

- The Scottish Medicines Consortium (SMC) has advised (January 2016) that sorafenib (Nexavar®) is accepted for restricted use within NHS Scotland for the treatment of advanced hepatocellular carcinoma in patients where surgical or loco-regional therapies have failed or are unsuitable.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 23
- Nexavar (Bayer Plc)
- Sorafenib (as Sorafenib tosylate) 200 mg Nexavar 200mg tablets
- 112 tablet (Pack) £3,576.56

### Drug Action

- Sunitinib is a tyrosine kinase inhibitor.

#### Indications and Dose

- Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib.
- Treatment of advanced or metastatic renal cell carcinoma
  - BY MOUTH
  - Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

- Treatment of unresectable or metastatic pancreatic neuroendocrine tumours
  - BY MOUTH
  - Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

#### Important Safety Information

**Risk of Osteonecrosis of the Jaw (January 2011)**

- Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.
- Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.
- Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.
- If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**

- See Cytotoxic drugs p. 797.

#### CAUTIONS

- Cardiovascular disease—discontinue if congestive heart failure develops.
- Hypertension—increased risk of bleeding.
- Susceptibility to QT-interval prolongation.

#### Interactions

- Appendix 1 (sunitinib).

#### Side-Effects

- Rare
  - Nephrotic syndrome
- Frequency not known
  - Abdominal pain, alopecia, anorexia, arthralgia, bone-marrow suppression, constipation, cough, dehydration, diarrhoea, dizziness, dry skin, dysphoria, epistaxis, fatigue, fistula formation (interrupt treatment if occurs), gastro-intestinal perforation, hair discoloration, hand-foot syndrome, headache, hepatic failure, hypertension, hyperuricaemia, hypothyroidism, increased lacrimation, insomnia, myalgia, nausea, oedema, oral mucositis, osteonecrosis of the jaw, pancreatitis, paraesthesia, peripheral neuropathy, proteinuria, rash, seizures, skin discoloration, taste disturbance, thromboembolism, tumour lysis syndrome, urine discoloration, vomiting

#### Conception and Contraception

- Effective contraception required during treatment.

#### Pregnancy

- Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

#### Breast Feeding

- Discontinue breast-feeding.

#### Monitoring Requirements

- Monitor for thyroid dysfunction.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Sunitinib for advanced or metastatic renal cell carcinoma (March 2009) NICE TA169
  - Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.
  - www.nice.org.uk/TA169

- Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009) NICE TA179
  - Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.
  - www.nice.org.uk/TA179

- Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
  - Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.
  - www.nice.org.uk/TA178

**Scottish Medicines Consortium (SMC) Decisions**

- The Scottish Medicines Consortium (SMC) has advised (October 2009 and April 2011) that sunitinib (Sutent®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.
Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 14**

- **Sutent (Pfizer Ltd)**
  - Sunitinib (as Sunitinib malate) 12.5 mg: Sutent 12.5 mg capsules | 28 capsule [POM] £784.70
  - Sunitinib (as Sunitinib malate) 25 mg: Sutent 25 mg capsules | 28 capsule [POM] £1,569.40
  - Sunitinib (as Sunitinib malate) 50 mg: Sutent 50 mg capsules | 28 capsule [POM] £3,130.80

Drug Action

**Temosirolimus**

- **INDICATIONS AND DOSE**
  - First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma
  - **BY INTRAVENOUS INFUSION**
  - **Adult:** (consult product literature or local protocols)

- **INTERACTIONS**
  - **Uncommon** Intracerebral bleeding
  - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersensitivity reactions
  - Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- **CONCEPTION AND CONTRA IndICATIONS**
  - Ensure effective contraception during treatment in men and women.

- **PREGNANCY**
  - Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- **BREAST FEEDING**
  - Manufacturer advises discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**

In mantle cell lymphoma, avoid in moderate or severe impairment.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor respiratory function.
  - Monitor blood lipids.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
  - Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.
  - www.nice.org.uk/TA178

**Vandetanib**

- **DRUG ACTION**
  - Vandetanib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**
  - Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease
  - **BY MOUTH**
  - **Adult:** 300 mg once daily, for dose adjustment due to side effects—consult product literature

- **CONTRA-INDICATIONS**
  - Congenital long QT syndrome - QT interval greater than 480 milliseconds

- **CAUTIONS**
  - Brain metastases (intracranial haemorrhage reported) - electrolyte disturbances - history of torsades de pointes - hypertension - phototoxicity reactions reported (wear protective clothing and/or sunscreen) - susceptibility to QT-prolongation

- **INTERACTIONS**

- **SIDE-EFFECTS**
  - Caution with concomitant use of drugs that prolong QT interval.

**IMPORTANT SAFETY INFORMATION**

**RISks OF INCORRECT DOsiNG OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.
Vemurafenib

**DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

**INDICATIONS AND DOSE**

Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma

- **BY MOUTH**
  - Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)**

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY

Potentiation of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy—use with caution.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 797.

**CONTRA-INDICATIONS**

Wild-type BRAF malignant melanoma

**CAUTIONS**

Electrolyte disturbances - prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression - susceptibility to QT-prolongation

**INTERACTIONS** → Appendix 1 (vemurafenib). Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

- **Uncommon** Non-cutaneous squamous cell carcinoma - peripheral neuropathy - retinal vein occlusion - Stevens-Johnson syndrome - toxic epidermal necrolysis - vasculitis

- **Rare** Progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia

- **Frequency not known** Alopecia - bone-marrow suppression - hypersensitivity reactions - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

**BREAST FEEDING** Avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in moderate to severe hepatic

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Caprelsa (AstraZeneca UK Ltd)
- Vandetanib 100 mg Caprelsa 100mg tablets | 30 tablet £2,500.00
- Vandetanib 300 mg Caprelsa 300mg tablets | 30 tablet £5,000.00
impairment (including monthly ECG monitoring during first 3 months of treatment).

- **RENAI L IMPAI RMENT** Manufacturer advises caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).
  - Monitor liver function before treatment and periodically thereafter.
  - Monitor for uveitis, iritis and retinal vein occlusion.

- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).

- **PATIENT AND CARER ADVICE** Counselling advised (administration).

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012) NICE TA269
      - Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresctable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised (November 2013) that vemurafenib (Zelboraf®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresctable or metastatic melanoma.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 25
    - Zelboraf (Roche Products Ltd)
    - Vemurafenib 240 mg Zelboraf 240mg tablets | 56 tablet (PaM £1,750.00 (Hospital only))

- **ANTINEOPLASTIC DRUGS**

  - **PROTEIN KINASE INHIBITORS**
  - **ANTIFIBROTICS**

  - **Nin tedan ib** 23-Feb-2016

  - **DRUG ACTION**
    - Nin tedan ib is a tyrosine protein kinase inhibitor.

  - **INDICATIONS AND DOSE**
    - **OFEV®**
      - Treatment of idiopathic pulmonary fibrosis
        - **BY MOUTH**
        - Adult: 150 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to side-effects, consult product literature

- **VARGATEF®**
  - Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)
    - **BY MOUTH**
    - Adult: 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

  - **IMPORTANT SAFETY INFORMATION FOR VARGATEF®—RISKS OF INCORRECT DOSING OF ORAL ANTICANCER MEDICINES**
    - See Cytotoxic drugs p. 797.

  - **CAUTIONS**
    - History of organ perforation - history or risk factors for QT prolongation - impaired wound healing - increased risk of bleeding - patients at high risk of cardiovascular disease - previous abdominal surgery - theoretical increased risk of gastrointestinal perforation - theoretical increased risk of venous thromboembolism

  - **INTERACTIONS**
    - **Common or very common** Abdominal pain - decreased appetite - diarrhoea - hyperbilirubinaemia - hypertension - nausea - raised hepatic enzymes - vomiting
    - **OFEV®**
      - Epistaxis - weight loss
    - **VARGATEF®**
      - Abductory - bleeding - dehydration - electrolyte imbalance - mucositis - neutropenia - peripheral neuropathy - venous thromboembolism
      - **Uncommon** Gastrointestinal perforation

  - **ALLERGY AND CROSS-SENSITIVITY**
    - Contra-indicated in patients with peanut or soya hypersensitivity.

  - **CONCEPTION AND CONTRACEPTION**
    - Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.

  - **PREGNANCY**
    - Manufacturer advises avoid—toxicity in animal studies.

  - **VARGATEF®** See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

  - **BREAST FEEDING**
    - Manufacturer advises avoid—present in milk in animal studies.

  - **HEPATIC IMPAIRMENT**
    - Consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in moderate to severe impairment—no information available.

  - **RENAI L IMPAI RMENT**
    - Manufacturer advises caution in severe impairment—no information available.

  - **MONITORING REQUIREMENTS**
    - For Vargatef®, monitor full blood count and hepatic function before each treatment cycle and regularly thereafter, monitor prothrombin time and INR if used concomitantly with anticoagulants and monitor for signs and symptoms of cerebral bleeding.

  - **PRESCRIBING AND DISPENSING INFORMATION**
    - VARGATEF® Not to be taken on the same day as docetaxel therapy.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

    - **NICE technology appraisals (TAs)**
      - Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small cell lung cancer (July 2015) NICE TA347
      - Nintedanib (Vargatef®), in combination with docetaxel is recommended as an option for the treatment of patients...
with locally advanced, metastatic, or locally recurrent non-small cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA347
- Nintedanib for treating idiopathic pulmonary fibrosis (January 2016) NICE TA379
  - Nintedanib is recommended as an option for treating idiopathic pulmonary fibrosis, only if:
    - the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
    - the manufacturer provides nintedanib with the discount agreed in the patient access scheme, and,
    - treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.

www.nice.org.uk/TA379
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2015) that nintedanib (Ofev®) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

- ANTINEOPLASTIC DRUGS ► OTHER

Bortezomib

- INDIICATIONS AND DOSE
  Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) ▶ Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) ▶ Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)
  - By INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: (consult local protocol)

- IMPORTANT SAFETY INFORMATION
  Bortezomib injection is for intravenous or subcutaneous administration only. Inadvertent intrathecal administration with fatal outcome has been reported.

- CONTRA-INDICATIONS
  Acute diffuse infiltrative pulmonary disease • pericardial disease

- CAUTIONS
  Amyloidosis • cardiovascular disease • consider antiviral prophylaxis for herpes zoster infection • dehydration • history of syncope • pulmonary disease (discontinue if interstitial lung disease develops) • risk factors for seizures • risk of neuropathy—consult product literature

- INTERACTIONS ▶ Appendix 1 (bortezomib).
  Caution with concurrent use of medication which may cause hypotension.

- SIDE-EFFECTS
  ◀ Common or very common Constipation (cases of ileus reported) • decreased appetite • diarrhoea • dyspnoea • fatigue • headache • herpes zoster • hypotension • myalgia • paraesthesia • peripheral neuropathy • pyrexia • rash • reactivation of herpes zoster • sensory neuropathy
  ◀ Uncommon Acute diffuse infiltrative pulmonary disorders • heart failure • posterior reversible encephalopathy syndrome (discontinue treatment) • pulmonary hypertension • seizures
  ◀ Rare Autonomic neuropathy
  ◀ Very rare Progressive multifocal leucoencephalopathy
  ◀ Frequency not known Alopecia • bone marrow suppression • extravasation • hyperuriaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
For further information on side-effects, consult product literature.

- CONCEPTION AND CONTRACEPTION
  Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

- PREGNANCY
  Toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 797.

- BREAST FEEDING
  Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  Reduce dose in moderate to severe impairment—consult product literature.

- RENAL IMPAIRMENT
  No information available for creatinine clearance less than 20 mL/minute/1.73 m².

- MONITORING REQUIREMENTS
  Monitor blood-glucose concentration in patients on oral antidiabetics.

  Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.

  Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.

- NATIONAL FUNDING/ACCESS DECISIONS
  NICE technology appraisals (TAs)
  ◀ Bortezomib for previously untreated mantle cell lymphoma (December 2015) NICE TA370
  Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma in adults for whom haematopoietic stem cell transplantation is unsuitable.
  www.nice.org.uk/TA370
  ◀ Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014) NICE TA311
  Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.
  www.nice.org.uk/TA311

14-Apr-2016

BNF 73

Immune system and malignant disease
Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228
Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:
- high-dose chemotherapy with stem cell transplantation is considered inappropriate and
- the person is unable to tolerate or has contra-indications to thalidomide.
www.nice.org.uk/TA228

Bortezomib monotherapy for relapsed multiple myeloma (October 2007) NICE TA129
Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:
- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.
www.nice.org.uk/TA129

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection
- Velcade® (Janssen-Cigli Ltd)
  Bortezomib 3.5 mg Velcade 3.5mg powder for solution for injection vials | 1 vial (60) £76.23 (Hospital only)

Olaparib
14-Dec-2016

DRUG ACTION
Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

INDICATIONS AND DOSE
Monotherapy for the maintenance treatment of patients with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy (initiated under specialist supervision)
- BY MOUTH
  - Adults: 400 mg twice daily; reduced if not tolerated to 200 mg twice daily, then reduced if not tolerated to 100 mg twice daily, take at least 1 hour after food and avoid food for 2 hours after taking, patients should start treatment within 8 weeks of receiving the final dose of their platinum-containing chemotherapy regimen

DOSE ADJUSTMENTS DUE TO INTERACTIONS
Avoid concomitant use, or reduce dose to 150 mg twice daily with concomitant use of potent or moderate CYP3A4 inhibitors (e.g. boceprevir, ciprofloxacin, clarithromycin, diltiazem, erythromycin, fluconazole, HIV-protease inhibitors boosted with cobicistat or ritonavir, itraconazole, telaprevir, or verapamil).

PHARMACOKINETICS
Peak plasma concentrations are typically achieved 1 to 3 hours after dosing; steady-state is achieved within 3 to 4 days.

INTERACTIONS
- Appendix 1 (olaparib).

SIDE-EFFECTS
- Common or very common: Anaemia, decreased appetite, diarrhoea, dizziness, dysgeusia, dyspepsia, fatigue, headache, lymphopenia, nausea, neutropenia, stomatitis, thrombocytopenia, upper abdominal pain, vomiting
- Frequency not known: Pneumonitis (occasionally fatal)

SIDE-EFFECTS, FURTHER INFORMATION
Haematological toxicity Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.
- Pneumonitis: If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.

CONCEPTION AND CONTRACEPTION
Manufacturer advises effective contraception during treatment and for 1 month after receiving the last dose. Consider an additional non-hormonal method of contraception.

PREGNANCY
Manufacturer advises avoid—xicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.

HEPATIC IMPAIRMENT
Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT
Manufacturer advises avoid if creatinine clearance less than 50 mL/minute/1.73m² unless benefit outweighs potential risk—limited information available.

MONITORING REQUIREMENTS
Manufacturer advises monitor full blood count every month for the first 12 months of treatment and periodically thereafter.

PATIENT AND CARER ADVICE
Missed doses
If a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

Driving and skilled tasks
Malaise and dizziness may affect performance of skilled tasks e.g. driving or operating machinery.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy (January 2016) NICE TA381
Olaparib is recommended as an option for treating adults with relapsed, platinum sensitive ovarian, fallopian tube or peritoneal cancer who have BRCA1 or BRCA2 mutations and whose disease has responded to platinum-based chemotherapy only if:
- they have had 3 or more courses of platinum-based chemotherapy and;
- the drug cost of olaparib for people who remain on treatment after 15 months will be met by the company.
www.nice.org.uk/guidance/ta381

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2015) that olaparib (Lynparza®) is not recommended for use within NHS Scotland as monotherapy for the maintenance...
treatment of patients with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  
  **Capsule**
  - Lynparza (AstraZeneca UK Ltd) ▼
  Olaparib 50 mg Lynparza 50mg capsules | 448 capsule £3,550.00

- **Vismodegib**
  - **DRUG ACTION**
    Vismodegib is a hedgehog pathway inhibitor.
  
  - **INDICATIONS AND DOSE**
    Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy
    - **BY MOUTH**
    - Adult: 150 mg once daily

- **SIDE-EFFECTS**
  - Common or very common
    Abdominal pain • abnormal hair growth • alopecia • amenorrhoea • arthralgia • constipation • decreased appetite • dehydration • diarrhoea • dyspepsia • hyponatraemia • malaise • muscle spasms • musculoskeletal pain • nausea • pruritus • rash • taste disturbances • vomiting • weight loss
  
  - Uncommon
    Abdominal pain • aphthous stomatitis • arthralgia • constipation • decreased appetite • diarrhoea • dyspepsia • fatigue • fever • headache • hypertension • increased intracranial pressure • increased intraocular pressure • alopecia • pruritus • rash • taste disturbances • vomiting • weight loss
  
  - Rare
    Abdominal pain • alopecia • constipation • decreased appetite • diarrhoea • dyspepsia • fatigue • fever • headache • hypertension • increased intracranial pressure • increased intraocular pressure • skin rash • taste disturbances • vomiting • weight loss

- **CONCEPTION AND CONTRACEPTION**
  For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.

- **PREGNANCY**
  Important: teratogenic risk — may cause severe birth defects and embryo–foetal death.

- **BREAST FEEDING**
  Avoid during treatment and for 24 months after final dose.

- **HEPATIC IMPAIRMENT**
  No information available — manufacturer advises caution in moderate to severe impairment.

- **RENAL IMPAIRMENT**
  No information available — manufacturer advises caution in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer’s Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme’s pregnancy prevention measures—consult product literature for further information.

- **PATIENT AND CARER ADVICE**
  Patient advice required around conception and contraception. Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer’s pregnancy prevention programme.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  
  **Capsule**
  - CAUTIONARY AND ADVISORY LABELS
    - Erivedge (Roche Products Ltd) ▼
    - Vismodegib 150 mg Erivedge 150mg capsules | 28 capsule £6,285.00 (Hospital only)

- **ANTINEO VASCULARISATION DRUGS**
  VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

- **Aflibercept**
  - **DRUG ACTION**
    Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

  - **INDICATIONS AND DOSE**
    In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen
    - **BY INTRAVENOUS INFUSION**
    - Adult: (consult local protocol)

  - **CONTRA-INDICATIONS**
    Moderate or severe congestive heart failure • uncontrolled hypertension

  - **CAUTIONS**
    Febrile neutropenia • history of cardiovascular disease (may be exacerbated by hypertension) • increased risk of haemorrhage (including fatal events) • increased risk of hypertension • increased risk of thromboembolic events (consult product literature if event occurs) • may impair wound healing— withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed • neutropenic infection • risk of fistula formation (discontinue if fistula develops) • risk of neutropenia • risk of thrombocytopenia

  - **SIDE-EFFECTS**
    - Common or very common
      Abdominal pain • aphthous stomatitis • decreased appetite • dehydration • diarrhoea • dyspnoea • increased risk of thromboembolic events (consult product literature if event occurs) • may impair wound healing— withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed • neutropenic infection • risk of fistula formation (discontinue if fistula develops) • risk of neutropenia • risk of thrombocytopenia

- **CONCEPTION AND CONTRACEPTION**
  Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).

- **PREGNANCY**
  Manufacturer advises avoid—toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
● BREAST FEEDING  Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT  Caution in severe impairment—no information available.

● RENAL IMPAIRMENT  Caution in severe impairment—no information available.

● MONITORING REQUIREMENTS
  ▶ Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment.
  ▶ Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
  ▶ Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
  ▶ Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
  ▶ Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
  ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

● NATIONAL FUNDING/ACCESS DECISIONS
  ∨ Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307
  Aflibercept in combination with irinotecan and fluorouracil-based therapy is not recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 833 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency
Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous;
- susceptibility to the haemolytic risk from drugs varies;
thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
• manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
• the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

**Drugs with definite risk of haemolysis in most G6PD-deficient individuals**

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rashburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

**Drugs with possible risk of haemolysis in some G6PD-deficient individuals**

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

**Drugs used in hypoplastic, haemolytic, and renal anaemias**

Anabolic steroids, pyridoxine hydrochloride p. 950, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

**Antilymphocyte immunoglobulin** given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin p. 766 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. Reversible sideroblastic anaemias respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 541 treatment, pyridoxine hydrochloride is also indicated.

**Corticosteroids** have an important place in the management of haematological disorders. They include conditions with an autoimmune haemolytic anaemia, immune thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukemias, and paraproteinaemias, including multiple myeloma.

**Erythropoietins**

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 889 is also used for the prevention of anaemia in preterm neonates of low birth-weight: only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol. Darbepoetin alfa p. 886 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 891 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

### 1.1 Hypoplastic, haemolytic, and renal anaemias

Epoetins

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in
patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

CONTRA-INDICATIONS

- Patients unable to receive thromboprophylaxis - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension

CAUTIONS

- Aluminium toxicity (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment - during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident - risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

SIDE-EFFECTS

- Common or very common Aggravation of hypertension (dose-dependent) - cardiovascular events - diarrhoea - dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) - headache - hypertensive crisis (in isolated patients with normal or low blood pressure) - increase in blood pressure (dose-dependent) - influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) - nausea - shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications - vomiting

- Very rare Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure

- Frequency not known Anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - peripheral oedema - skin reactions

SIDING EFFECTS, FURTHER INFORMATION

- Hypertensive crisis - In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

- Pure red cell aplasia - There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

MONITORING REQUIREMENTS

- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.

- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

Darbepoetin alfa

INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 2 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, reduce dose to be adjusted according to response by approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- BY SUBCUTANEOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, reduce dose, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment
changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- **BY INTRAVENOUS INJECTION**
- **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

- **BY SUBCUTANEOUS INJECTION**
- **Adult:** Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

- **SIDE-EFFECTS** Injection-site pain • oedema
- **PREGNANCY** No evidence of harm in animal studies—manufacturer advises caution.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323

Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used. www.nice.org.uk/TA323

888 ANAEMIAS

Moderate anaemia (haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- BY INTRAVENOUS INJECTION
  - Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- BY INTRAVENOUS INJECTION
  - Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- BY SUBCUTANEOUS INJECTION
  - Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

Eprex® pre-filled syringes

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults receiving cancer chemotherapy

- BY SUBCUTANEOUS INJECTION
  - Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Discontinue approximately 4 weeks after ending chemotherapy

Subcutaneous injection maximum 1 mL before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- BY SUBCUTANEOUS INJECTION
  - Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

Initial injection to be given over 5 minutes, subcutaneous injection maximum 1 mL before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- BY SUBCUTANEOUS INJECTION
  - Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

BNF 73
To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

▷ BY INTRAVENOUS INJECTION
▷ Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

▷ BY SUBCUTANEOUS INJECTION
▷ Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

- BREAST FEEDING Unlikely to be present in milk. Minimal effect on infant.
- HEPATIC IMPAIRMENT Manufacturers advise caution in chronic hepatic failure.
- PRESCRIBING AND DISPENSING INFORMATION Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

NICE funding/access decisions

▷ Erythropoiesis-stimulating agents (epoetin and darbepoetin for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323

Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

Epoetin beta

- INDICATIONS AND DOSE
Symptomatic anaemia associated with chronic renal failure

▷ BY SUBCUTANEOUS INJECTION
▷ Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

▷ BY INTRAVENOUS INJECTION
▷ Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

▷ BY SUBCUTANEOUS INJECTION
▷ Adult: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved), increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week continued

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS** Monitor for 1 hour after infusion.
  - For paroxysmal nocturnal haemoglobinuria, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
  - For atypical haemolytic uraemic syndrome, monitor for thrombotic microangiopathy (measure platelet count, serum–lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Soliris®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur). Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** A patient information card should be provided. Patient or carers should be advised to report promptly any signs of meningococcal infection.

**MEDICINAL FORMS**

### 1.2 Iron deficiency anaemia

**Anaemia, iron deficiency**

**Treatment and prophylaxis**

_Treatment_ with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastrointestinal cancer).

_Prophylaxis_ with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

**Oral iron**

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

**Compound preparations**

Preparations containing iron and folic acid p. 898 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anemia.

Some oral preparations contain ascorbic acid p. 952 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women).

**Modified-release preparations**

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is released past the first part of the duodenum into an area of the gut where absorption may be poor.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 894, ferric carboxymaltose, below, or iron isomaltoside 1000 p. 894. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

**MINERALS AND TRACE ELEMENTS**

**Iron (injectable)**

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**Ferric carboxymaltose**

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: Dose calculated according to body-weight and iron deficit (consult product literature)

**CAUTIONS**

- Allergic disorders - asthma, eczema, hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available; infection (discontinue if ongoing bacteraemia); oral iron should not be given until 5 days after last injection

**SIDE-EFFECTS**

- **Common or very common** Dizziness - gastro-intestinal disturbances - headache - injection-site reactions - rash
- **Uncommon** Anaphylaxis - arthralgia - back pain - chest pain - fatigue - flushing - hypertension - hypotension - malaise - myalgia - paraesthesia - peripheral oedema - pruritus - pyrexia - rigors - urticaria
- **Rare** Dyspnoea

**PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ferinject®), give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.
Iron dextran

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

**CONTRA-INDICATIONS** Active rheumatoid arthritis - asthma - eczema - history of allergic disorders - infection

**CAUTIONS** Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - oral iron should not be given until 5 days after last injection

**SIDE-EFFECTS**
- **Uncommon** Abdominal pain - anaphylaxis - blurred vision - cramps - dyspnoea - flushing - nausea - numbness - pruritus - rash - vomiting
- **Rare** Angioedema - arrhythmias - arthralgia - chest pain - diarrhea - dizziness - fatigue - hypotension - impaired consciousness - injection-site reactions - myalgia - restlessness - seizures - sweating - tachycardia - tremor
- **Very rare** Haemolysis - headache - hypertension - palpitation - paraesthesia - transient deafness

**PREGNANCY** Avoid in first trimester.

**HEPATIC IMPAIRMENT** Avoid in compensated liver disease and hepatitis.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Monofer®), give intermittently in Sodium chloride 0.9%. For details consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **CosmoFer** (Pharmacosmos UK Ltd) ▼
  - **Iron (as Iron dextran) 50 mg per 1 ml** CosmoFer 500mg/10ml solution for injection ampoules | 2 ampoule | £33.70
  - CosmoFer 100mg/2ml solution for injection ampoules | 5 ampoule | £59.85
Iron deficiency anaemia 895

**SIDE-EFFECTS**
- **Common or very common** Taste disturbances
- **Uncommon** Abdominal pain; bronchospasm; chest pain; diarrhoea; dizziness; dyspnoea; fever; flushing; headache; hypotension; injection-site reactions; myalgia; nausea; palpitation; pruritus; rash; tachycardia; vomiting
- **Rare** Anaphylaxis; asthma; fatigue; hypertension; paraesthesia; peripheral oedema
- **Frequency not known** Arthralgia; bradycardia; confusion; increased sweating
- **PREGNANCY** Avoid in first trimester.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Venofer®), give intermittently in Sodium chloride 0.9%, dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 3.33 mg/minute.

**PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.

**MINERALS AND TRACE ELEMENTS**  
**IRON, ORAL**

**SIDE-EFFECTS**
- Constipation
- Diarrhoea
- Epigastric pain
- Gastritis
- Headache
- Rash
- Vomiting

**Ferrous fumarate**

**INDICATIONS AND DOSE**
- **Iron-deficiency anaemia (prophylactic)**
  - **BY MOUTH USING TABLETS**
    - Child 1–12 years: 210 mg 1–2 times a day
    - Adult: 210 mg 1–2 times a day
  - **BY MOUTH USING SYRUP**
    - Child 12–17 years: 140 mg twice daily
    - Adult: 140 mg twice daily
- **Iron-deficiency anaemia (therapeutic)**
  - **BY MOUTH USING TABLETS**

  - Child 6–17 years: 200 mg daily
  - Adult: 200 mg daily

Iron-deficiency anaemia (therapeutic)
- **BY MOUTH USING TABLETS**
  - Child 6–17 years: 200 mg 2–3 times a day
  - Adult: 200 mg 2–3 times a day

**FEOSPAN®**
Iron-deficiency anaemia
- **BY MOUTH**
  - Child 1–7 years: 1 capsule daily, capsule can be opened and sprinkled on food
  - Adult: 1–2 capsules daily, capsule can be opened and sprinkled on food

**FERROGRAD®**
Iron-deficiency anaemia (prophylactic and therapeutic)
- **BY MOUTH**
  - Child 12–17 years: 1 tablet daily
  - Adult: 1 tablet daily

**IRONORM® DROPS**
Iron-deficiency anaemia (prophylactic)
- **BY MOUTH**
  - Adult: 2.4–4.8 mL daily

Iron-deficiency anaemia (therapeutic)
- **BY MOUTH**
  - Adult: 4 mL 1–2 times a day

**INTERACTIONS** → Appendix 1 (iron salts).

**PRESCRIBING AND DISPENSING INFORMATION**
Iron content Ferrous sulfate 200 mg is equivalent to 65 mg iron; Ironorm® drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; Feospan® suspensions contains ferrous sulfate 150 mg (47 mg iron) (spansule (= capsules m/r)); Ferrogard® tablets contain ferrous sulfate 325 mg (105 mg iron).

With oral use in adults Modified-release preparations of iron
are licensed for once-daily dosage, but have no therapeutic
advantage and should not be used. These preparations are
formulated to release iron gradually; the low incidence of
side-effects may reflect the small amounts of iron available
for absorption as the iron is carried past the first part of the
duodenum into an area of the gut where absorption may
be poor.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Ferrous sulfate for iron-deficiency anaemia www.medicinesforchildren.org.uk/ferrous-sulfate-iron-deficiency-anaemia
Iron (as Polysaccharide-iron complex) 100 mg
(Tillomed Laboratories Ltd)
Iron-deficiency anaemia (prophylactic)
BY MOUTH
Child 1 month–1 year: 1 drop (approximately 500 micrograms iron) per 450 g body-weight to be given 3 times a day, dose to be administered from dropper bottle, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established
Child 1–12 years: 2.5 mL daily
Adult: 2.5 mL daily
Iron-deficiency anaemia (therapeutic)
BY MOUTH
Child 2–5 years: 2.5 mL daily
Child 6–11 years: 5 mL daily
Child 12–17 years: 5 mL 1–2 times a day
Adult: 5 mL 1–2 times a day
Iron-deficiency anaemia (therapeutic) if required during second and third trimester of pregnancy
BY MOUTH
Child 12–17 years: 5 mL once daily
Adult: 5 mL once daily
INTERACTIONS Appendix 1 (iron salts).
PATIENT AND CARER ADVICE Counselling on the use of the dropper advised.
NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Niferex® is not available on prescription under NHS, except 30-mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'.

898 Anaemias

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Most megaloblastic anaemias result from a lack of either vitamin B\textsubscript{12} or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B\textsubscript{12}.

Vitamin B\textsubscript{12} is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B\textsubscript{12} should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B\textsubscript{12} absorption test shows vitamin B\textsubscript{12} malabsorption).

Apart from dietary deficiency, all other causes of vitamin B\textsubscript{12} deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B\textsubscript{12} orally and none for vitamin B\textsubscript{12} intrinsic factor complexes given by mouth. Vitamin B\textsubscript{12} in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 899 has completely replaced cyanocobalamin p. 899 as the form of vitamin B\textsubscript{12} of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B\textsubscript{12} neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B\textsubscript{12} is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 838 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B\textsubscript{12} or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 958.

VITAMINS AND TRACE ELEMENTS ▶ FOLATES

Folic acid

09-Jun-2016
Prevention of methotrexate side-effects in severe Crohn’s disease | Prevention of methotrexate side-effects in severe psoriasis

- BY MOUTH
  - Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis in chronic haemolytic states

- BY MOUTH
  - Adult: 5 mg every 1–7 days, frequency dependent on underlying disease

Prophylaxis of folate deficiency in dialysis

- BY MOUTH
  - Child 1 month–11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
  - Child 12–17 years: 5–10 mg once daily
  - Adult: 5 mg every 1–7 days

Prophylaxis of folate deficiency in patients receiving parenteral nutrition

- BY INTRAVENOUS INFUSION
  - Adult: 15 mg 1–2 times a week, usually given by intravenous infusion in the parenteral nutrition solution

- UNLICENSED USE
  - In adults Not licensed for prevention of methotrexate-induced side-effects in severe Crohn’s disease, rheumatic disease, or severe psoriasis.

- CAUTIONS
  - Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

- INTERACTIONS
  - Rare Gastro-intestinal disturbances

- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia

- EXCEPTIONS TO LEGAL CATEGORY
  - With oral use Can be sold to the public provided daily doses do not exceed 500 micrograms.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection

**Tablet**

- **Folic acid (Non-proprietary)**
  - Folic acid 400 microgram | 90 tablet [P] no price available DT price = £2.71 | 90 tablet £2.71 DT price = £2.71
  - Folic acid 5 mg | 28 tablet [P] £1.17 DT price = £0.92 | 1000 tablet [P] £33.21

**Oral solution**

- **Folic acid (Non-proprietary)**
  - Folic acid 2.5mg/5ml oral solution sugar free | 150 ml [P] £9.16 DT price = £9.16
  - Lepec (Rosemont Pharmaceuticals Ltd)
  - Folic acid 500 microgram per ml | 150 ml [P] £9.16 DT price = £9.16

**VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP**

### Cyanocobalamin

- **INDICATIONS AND DOSE**
  - Vitamin B12 deficiency of dietary origin
    - BY MOUTH
    - Adult: 50–150 micrograms daily, dose to be taken between meals
    - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg every 2–3 days for 11 doses; maintenance 1 mg every month

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The BP directs that when vitamin B12 injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied.
  - Currently available brands of the tablet may not be suitable for vegans.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NHS restrictions Cyanocobalamin liquid, Cytac® tablets, and Cytamen® injection are not available on prescription under the NHS.

- **LESS SUITABLE FOR PRESCRIBING**
  - Cyanocobalamin is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

  **Tablet**

  - Cyanocobalamin (Non-proprietary)
    - Cyanocobalamin 50 microgram | 50 tablet [P] £6.24 DT price = £8.99 | 50 tablet £8.99 DT price = £8.99 | 100 tablet no price available
    - Cytac® (AMCo)
    - Cyanocobalamin 50 microgram | 50 tablet [P] £8.99 DT price = £8.99

  **Oral solution**

  - Cyanocobalamin (Non-proprietary)
    - Cyanocobalamin 7 microgram per 1 ml | 75 micrograms/5ml oral solution | 200 ml [P] £8.75

  **Solution for injection**

  - Cytac® (Focus Pharmaceuticals Ltd)
    - Cyanocobalamin 1 mg per 1 ml | Cytamen 1000 micrograms/1ml solution for injection ampoules | 5 ampoule [P] £14.50 DT price = £14.50

### Hydroxocobalamin

- **INDICATIONS AND DOSE**
  - **Prophylaxis of macrocytic anaemias associated with vitamin B12 deficiency**
    - BY INTRAMUSCULAR INJECTION
    - Adult: 1 mg every 2–3 months
  - **Pernicious anaemia and other macrocytic anaemias without neurological involvement**
    - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 3 months
  - **Pernicious anaemia and other macrocytic anaemias with neurological involvement**
    - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months
  - **Tobacco amblyopia**
    - BY INTRAMUSCULAR INJECTION
    - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months
Leber’s optic atrophy
▶ By intramuscular injection
▶ Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

**CYANOKIT®**
 Poisoning with cyanides
▶ By intravenous infusion
▶ Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes – 2 hours depending on severity of poisoning and patient stability
▶ Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes – 2 hours depending on severity of poisoning and patient stability

**CAUTIONS**
▶ With intramuscular use should not be given before diagnosis fully established
▶ INTERACTIONS ➔ Appendix 1 (hydroxocobalamin).

**SIDE-EFFECTS**
**GENERAL SIDE-EFFECTS**
Dizziness • headache • pruritus

**SPECIFIC SIDE-EFFECTS**
▶ With intramuscular use Hypokalaemia (during initial treatment) • injection-site reactions • rash • thrombocytosis (during initial treatment) • Chromatia • fever • hypersensitivity reactions • nausea
▶ With intravenous use Dyspnoea • eye disorders • gastrointestinal disturbances • hot flush • lymphocytopenia • memory impairment • peripheral oedema • pustular rashes • red coloration of urine • restlessness • reversible red coloration of skin and mucous membranes • throat disorders • transient hypertension
▶ BREAST FEEDING Present in milk but not known to be harmful.

**EFFECT ON LABORATORY TESTS**
▶ With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (Cyanokit®), given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).

**PRESCRIBING AND DISPENSING INFORMATION**
▶ With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
▶ With intravenous use Cyanokit® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

**NATIONAL FUNDING/ACCESS DECISIONS**
**NHS restrictions** Cobalin-H® is not prescribable under National Health Service (NHS).
Neo-Cytamen® is not prescribable under National Health Service (NHS).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug

**Solution for injection**
▶ Hydroxocobalamin (Non-proprietary)

Hydroxocobalamin 1 mg per 1 ml Hydroxocobalamin 1mg/1ml solution for injection ampoules | 5 ampoule [POT] £12.49 DT price = £7.11

▶ Cobalin (AMCo)
Hydroxocobalamin 1 mg per 1 ml Cobalin-H 1mg/1ml solution for injection ampoules | 5 ampoule [POT] £9.50 DT price = £7.11

▶ Neo-Cytamen (Focus Pharmaceuticals Ltd)
Hydroxocobalamin 1 mg per 1 ml Neo-Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule [POT] £12.49 DT price = £7.11

**Powder for solution for infusion**
▶ Cyanokit (Swedish Orphan Biovitrum Ltd)
Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [POT] no price available

### 2 Iron overload

**Iron overload**

**Overview**
Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 902 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 952 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate. Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

**ANTIDOTES AND CHELATORS ➔ IRON CHELATORS**

**Deferasirox**

**DRUG ACTION**
Deferasirox is an oral iron chelator.

**INDICATIONS AND DOSE**
Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias | Treatment of chronic iron overload in patients with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells)
▶ BY MOUTH
▶ Adult: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature; adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to
serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

**Treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate (with non-transfusion-dependent thalassaemia syndromes)**

- **BY MOUTH**
  - Adult: Initially 10 mg/kg once daily; adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 20 mg/kg per day

- **CAUTIONS** Elderly (increased risk of side-effects) - history of liver cirrhosis - not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) - platelet count less than 50x10^9/litre - risk of gastro-intestinal ulceration and haemorrhage - unexplained cytopenia—consider treatment interruption

- **INTERACTIONS** → Appendix 1 (deferasirox).

- **SIDE-EFFECTS**
  - **Common or very common** Fatal gastro-intestinal haemorrhage - gastro-intestinal disturbances - gastro-intestinal ulceration - headache - proteinuria - pruritus - rash
  - **Uncommon** Anxiety - cholelithiasis - disturbances of hearing and vision - dizziness - fatigue - glucosuria - hepatitis - lens opacity - maculopathy - oedema - pharyngitis - pyrexia - renal tubulopathy - skin pigmentation - sleep disorder
  - **Frequency not known** Acute renal failure - agranulocytosis - alopecia - anaemia - anaphylaxis - angioedema - blood disorders - hepatic failure - hypersensitivity reactions - neutropenia - pancytopenia - thrombocytopenia - tubulointerstitial nephritis

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m² and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction. Avoid if eGFR less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Eye and ear examinations required before treatment and annually during treatment.
  - Monitor serum-ferritin concentration monthly.
  - Test liver function before treatment, then every 2 weeks during the first month, and then monthly.
  - Measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter.
  - Test for proteinuria monthly.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dispensed in water, orange juice, or apple juice; if necessary resuspend residue.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox dispersible tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Deferasirox (non-proprietary) ▼
      - Deferasirox 90 mg □ Exjade 90 mg tablets | 30 tablet | £126.00
      - Deferasirox 180 mg □ Exjade 180 mg tablets | 30 tablet | £252.00
      - Deferasirox 360 mg □ Exjade 360 mg tablets | 30 tablet | £504.00

**Deferiprone**

- **DRUG ACTION** Deferiprone is an oral iron chelator.

- **INDICATIONS AND DOSE**
  - Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate
  - **BY MOUTH**
    - Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

- **INTERACTIONS** → Appendix 1 (deferiprone).

- **SIDE-EFFECTS** Agranulocytosis - arthropathy - blood dyscrasias - gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) - headache - increased appetite - neutropenia - red-brown urine discoloration - zinc deficiency

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in animal studies. Contraception advised in females of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor neutrophil count weekly and discontinue if recurrent neutropenia develops.
  - Monitor plasma-zinc concentration.

- **PATIENT AND CARER ADVICE** Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.
Desferrioxamine mesilate (Deferoxamine Mesilate)

**INDICATIONS AND DOSE**

**Iron poisoning**
- BY CONTINUOUS INTRAVENOUS INFUSION
  - Adult: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

**Aluminium overload in dialysis patients**
- BY INTRAVENOUS INFUSION
  - Adult: (consult product literature or local protocols)

**Chronic iron overload (low iron overload)**
- BY SUBCUTANEOUS INFUSION
  - Adult: The dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**
- BY SUBCUTANEOUS INFUSION
  - Adult: 20–50 mg/kg daily

**CAUTIONS**
- Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

**SIDE-EFFECTS**
- Common or very common
  - Abdominal pain
  - arthralgia
  - bone disorders
  - growth retardation
  - headache
  - hearing disturbances
  - injection-site reactions
  - myalgia
  - nausea
  - pyrexia
  - vomiting

- Rare
  - Anaphylaxis
  - blood dyscrasias
  - bone pain
  - diarrhoea
  - hepatic impairment
  - hypotension (especially when given too rapidly by intravenous injection)
  - leg cramps
  - lens opacity
  - leucopenia
  - rash
  - retinopathy
  - thrombocytopenia
  - visual disturbances
  - Yersinia and mucormycosis infections

- Very rare
  - Acute respiratory distress
  - convulsions
  - dizziness
  - neurological disturbances
  - neuropathy
  - paraesthesia
  - renal impairment

- Frequency not known
  - Muscle spasms

**PREGNANCY**
Teratogenic in animal studies. Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Manufacturer advises use only if potential benefit outweighs risk—no information available.

**RENAI IMPAIRMENT**
Use with caution.

**MONITORING REQUIREMENTS**
- Eye and ear examinations before treatment and at 3-month intervals during treatment.

**DIRECTIONS FOR ADMINISTRATION**
For full details and warnings relating to administration, consult product literature.

For intravenous infusion (Desferal®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%.

Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Desferrioxamine mesilate (Non-proprietary)
  - Desferrioxamine mesilate 500 mg
    - Desferrioxamine 500mg powder for solution for injection vials | 10 vial
    - £39.90–£50.00
  - Desferrioxamine mesilate 2 gram
    - Desferrioxamine 2g powder for solution for injection vials | 1 vial
    - £17.95–£20.00

- Desferal (Novartis Pharmaceuticals UK Ltd)
  - Desferal mesilate 2 gram
    - Desferal 2g powder for solution for injection vials | 1 vial
    - £18.66
  - Desferal mesilate 500 mg
    - Desferal 500mg powder for solution for injection vials | 10 vial
    - £46.63

**IMMUNOSTIMULANTS**
- GRANULOCYTE-COLONY STIMULATING FACTORS

**Granulocyte-colony stimulating factors**

**DRUG ACTION**
Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

**CAUTIONS**
Malignant myeloid conditions—pre-malignant myeloid conditions—risk of splenomegaly and rupture—spleen size should be monitored—sickle-cell disease

**CAUTIONS, FURTHER INFORMATION**
- Acute respiratory distress syndrome
  - There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

**SIDE-EFFECTS**
- Common or very common
  - Alopecia
  - anorexia
  - asthenia
  - bone pain
  - chest pain
  - fever
  - gastro-intestinal disturbances
  - headache
  - injection-site reactions
  - leucocytosis
  - musculoskeletal pain
  - rash
  - thrombocytopenia

**Neutropenia and stem cell mobilisation**

**3.1 Neutropenia**

**Neutropenia**

**Management**
Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim, p. 903 (unglycosylated rhG-CSF) and lenograstim p. 904 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 904 is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipegfilgrastim p. 904 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

**IMMUNOSTIMULANTS**
- GRANULOCYTE-COLONY STIMULATING FACTORS

**Granulocyte-colony stimulating factors**

**DRUG ACTION**
Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

**MONITORING REQUIREMENTS**

**BREAST FEEDING**

**PREGNANCY**

Pulmonary infiltration

Rare potential benefits outweigh the risk.

**PERSISTENT NEUTROPENIA IN HIV INFECTION (SPECIALIST USE ONLY)**

Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

### Filgrastim

*(Recombinant human granulocyte-colony stimulating factor; G-CSF)*

**INDICATIONS AND DOSE**

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

**BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**

**Adult:** 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

**BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION**

**Adult:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

**BY SUBCUTANEOUS INJECTION**

**Adult:** 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

**BY SUBCUTANEOUS INJECTION**

**Adult:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogenic infusion (specialist use only)

**BY SUBCUTANEOUS INJECTION**

**Adult 18–59 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

**CONTRA-INDICATIONS**

Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics

**CAUTIONS**

Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia

**INTERACTIONS**

Appendix 1 (filgrastim).

**SIDE-EFFECTS**

- Common or very common: Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucositis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities
- Uncommon: Capillary leak syndrome (including fatal cases)
- Rare: Splenic rupture

**MONITORING REQUIREMENTS**

Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

**DIRECTIVE FOR ADMINISTRATION**

For intravenous infusion (Neupogen®); (Nivestim®); (Ratiogran®); (Zarzio®) give continuously or intermittently in glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

**PRESCRIBING AND DISPENSING INFORMATION**

Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Accofil (Accord Healthcare Ltd)**
  - Filgrastim 60 mega u per 1 ml Accofil 30 million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection £284.20

Filgrastim 60 mega u per 1 ml Zarzio 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £250.75
Filgrastim 96 mega u per 1 ml Zarzio 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection PoM £399.50

---

**Lenograstim**

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

- **INDICATIONS AND DOSE**
  Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)
  Reduction in the duration of neutropenia and associated complications following peripheral stem cell transplantation for non-myeloid malignancy (specialist use only)
  - **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes
  
  Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy
  
  Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)
  
  Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

- **SIDE-EFFECTS**
  Mucositis · splenic rupture · toxic epidermal necrolysis

- **DIRECTIONS FOR ADMINISTRATION**
  For intravenous infusion (Granocyte®), give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 ml water for injection provided (do not shake vigorously) then dilute with up to 50 ml infusion fluid for each vial of Granocyte-13 or up to 100 ml infusion fluid for Granocyte-34; give over 30 minutes.

- **PRESCRIBING AND DISPENDING INFORMATION**
  Granocyte® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

EXCIPIENTS: May contain Phenylalanine

- **Granocyte** (Chugai Pharma UK Ltd)
  Lenograstim 13.4 mega u Granocyte-13 powder and solvent for solution for injection vials | 1 vial PoM £40.11 | 5 vial PoM £200.55
  Lenograstim 33.6 mega u Granocyte-34 powder and solvent for solution for injection vials | 1 vial PoM £62.54 | 5 vial PoM £312.69

---

**Lipegfilgrastim**

(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

- **INDICATIONS AND DOSE**
  Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

- **CAUTIONS**
  Myelosuppressive chemotherapy

- **INTERACTIONS** → Appendix 1 (lepifilgrastim).

- **SIDE-EFFECTS**
  Hypokalaemia

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - Lonquex (Teva UK Ltd) Lipegfilgrastim 10 mg per 1 ml Lonquex 6 mg/0.6 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £652.06

---

**Pegfilgrastim**

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

- **INDICATIONS AND DOSE**
  Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)
  - **BY SUBCUTANEOUS INJECTION**
  - Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose expressed as filgrastim

- **CAUTIONS**
  Acute leukaemia · myelosuppressive chemotherapy

- **INTERACTIONS** → Appendix 1 (pegfilgrastim).

- **SIDE-EFFECTS**
  Rare · Capillary leak syndrome (including fatal cases)
  Very rare · Splenic rupture
3.2 Stem cell mobilisation

IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

Plerixafor

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

- **INDICATIONS AND DOSE**
  
  Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)
  
  ▶ **BY SUBCUTANEOUS INJECTION**
  
  ▶ Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

- **SIDE-EFFECTS**
  
  ▶ Common or very common Arthralgia · dizziness · dry mouth · erythema · fatigue · gastrointestinal disturbances · headache · injection-site reactions · insomnia · musculoskeletal pain · oral hypoaesthesia · sweating
  
  ▶ Uncommon Dyspnoea · hypersensitivity reactions · periorbital swelling

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment—teratogenic in animal studies.

- **PREGNANCY**
  
  Manufacturer advises avoid unless essential—teratogenic in animal studies.

- **BREAST FEEDING**
  
  Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**
  
  Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 ml/minute. No information available if creatinine clearance less than 20 ml/minute.

- **MONITORING REQUIREMENTS**
  
  Monitor platelets and white blood cell count.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  
  ▶ Mozobil (Sanofi)
  
  Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials | 1 vial £4.88,277

4 Platelet disorders

Platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone p. 622, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh) immunoglobulin p. 1140 is effective in raising the platelet count in about 80% of unspenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1141 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 765, cyclophosphamide p. 802, vincristine sulfate p. 830, ciclosporin p. 766, and danazol p. 678. Rituximab p. 792 may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 104 may be given to reduce the severity of haemorrhage.

Eltrombopag p. 906 and romiplostim p. 907 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

Essential thrombocytopenia

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocytopenia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than 1000 x 10⁹/L, or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

4.1 Essential thrombocytopenia

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

- **INDICATIONS AND DOSE**
  
  Essential thrombocytopenia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)
  
  ▶ **BY MOUTH**
  
  ▶ Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS**
  
  Cardiovascular disease—assess cardiac function before and regularly during treatment · concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment · risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment
Blood and nutrition

906 Platelet disorders

INTERACTIONS
Caution with concomitant aspirin in patients at risk of haemorrhage. Appendix 1 (anagrelide).

SIDE-EFFECTS
- Common or very common Anaemia, dizziness, fatigue, fluid retention, gastro-intestinal disturbances, headache, palpitation, rash, tachycardia
- Uncommon Alopecia, anemia, anorexia, arrhythmias, arthralgia, back pain, blood disorders, chest pain, confusion, congestive heart failure, depression, dry mouth, dysphonia, ecchymosis, epistaxis, fever, gastro-intestinal haemorrhage, haemorrhage, hypertension, hypoaesthesia, impotence, malaise, myalgia, nervousness, oedema, pancreatitis, paraesthesia, pneumonia pleural effusion, pruritus, skin discoloration, sleep disturbances, syncope, weight changes
- Rare Angina, asthenia, cardiomegaly, cardiomyopathy, colitis, dry skin, dysarthria, gastritis, gingival bleeding, impaired coordination, migraine, myocardial infarction, nocturia, pericardial effusion, postural hypotension, pulmonary hypertension, pulmonary infiltrates, renal failure, somnolence, tinnitus, vasodilatation, visual disturbances
- Frequency not known Hepatitis, interstitial lung disease, Torsades de pointes, tubulointerstitial nephritis

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment.

PREGNANCY
Manufacturer advises avoid (toxicity in animal studies).

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

RENAL IMPAIRMENT
Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m².

MONITORING REQUIREMENTS
- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

PATIENT AND CARER ADVICE
- Driving and skilled tasks
  Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Xagrid (Shire Pharmaceuticals Ltd) ▼
- Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule POM £40.57

4.2 Idiopathic thrombocytopenic purpura

ANTIHAEMORRHAGICS ▶ THROMBOPOIETIN RECEPTOR AGONISTS

Eltrombopag

INDICATIONS AND DOSE
Treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision) ▶ Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)

▶ BY MOUTH
- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10⁹/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)

▶ BY MOUTH
- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75x10⁹/litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day.

CAUTIONS
Patients of East Asian origin—risk factors for thromboembolism

INTERACTIONS ▶ Appendix 1 (eltrombopag).

SIDE-EFFECTS
- Common or very common Abdominal pain, alopecia, arthralgia, bone pain, cataract, constipation, diarrhoea, dry eye, fatigue, gastro-intestinal disturbances, headache, insomnia, myalgia, nausea, paraesthesia, peripheral oedema, pruritus, rash
- Uncommon Acute myocardial infarction, anaemia, anorexia, anxiety, blood disorders, changes in appetite, cholesterol, cough, deep vein thrombosis, depression, dizziness, dry mouth, ecchymosis, eosinophilia, epistaxis, eye disorders, flushing, gingival bleeding, gout, haemolysis, haemorrhoids, hemiparesis, hepatitis, hypertension, migraine, mood changes, myelocytosis, nocturia, palpitation, peripheral neuropathy, pulmonary embolism, QT-interval prolongation, rectosigmoid cancer, renal failure, respiratory infections, skin reactions, sleep disorders, sweating, tachycardia, taste disturbances, thromboembolic events, tremor, urinary tract infections, vertigo, weight gain

CONCEPTION AND CONTRACEPTION
Ensure effective contraception during treatment.

PREGNANCY
Avoid—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid.
Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura

PATIENT AND CARER ADVICE
- Regular ophthalmological examinations for cataract
- Monitor liver function before treatment, every two weeks

RENAL IMPAIRMENT
- Use with caution.

HEPATIC IMPAIRMENT
- Monitor full blood count and peripheral blood smears for ecchymosis before and during treatment.
- Initially, dose adjustment, then monthly thereafter.

DIRECTIONS FOR ADMINISTRATION
- Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

PATIENT AND CARER ADVICE
- Patient counselling is advised on how to administer eltrombopag tablets.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013) NICE TA293
  - Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:
    - the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme and
    - their condition is refractory to standard active treatments and rescue therapies or
    - they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.
  - Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - www.nice.org.uk/TA293

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised (July 2010) that eltrombopag (Revolade®) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Revolade (Novartis Pharmaceuticals UK Ltd)
      - Eltrombopag (as Eltrombopag olamine) 25 mg Revolade 25mg tablets | 28 tablet (POM) £770.00
      - Eltrombopag (as Eltrombopag olamine) 50 mg Revolade 50mg tablets | 28 tablet (POM) £1,540.00

INDICATIONS AND DOSE
- Treatment of chronic immune thrombocytopenic purpura in splenectomised patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)
- Second-line treatment of chronic idiopathic thrombocytopenic purpura in non-splenectomised patients when surgery is contra-indicated (under expert supervision)
  - By subcutaneous injection
    - Adult: Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of 50x10^9/litre or more is reached, discontinue treatment if inadequate response after 4 weeks at maximum dose, consult product literature for dose adjustments

SIDE-EFFECTS
- Arthralgia, asthenia, bone pain, dizziness, ecchymosis, fatigue, flushing, gastro-intestinal disturbances, increased bone marrow reticulin, influenza-like symptoms, injection site reactions, insomnia, migraine, muscle spasm, myalgia, oedema, paraesthesia, rash

PREGNANCY
- Manufacturer advises use only if essential—tocolic in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
- Avoid in moderate or severe impairment unless potential benefit outweighs risk (e.g. of portal vein thrombosis).

RENAL IMPAIRMENT
- Manufacturer advises caution—no information available.

DIRECTIONS FOR ADMINISTRATION
- Monitor full blood count and peripheral blood smears for ecchymosis and platelet count before and after treatment.
- Initially, dose adjustment, then monthly thereafter.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011) NICE TA221
  - Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:
    - If the manufacturer provides romiplostim at the agreed discount as part of the patient access scheme and
    - whose condition is refractory to standard active treatments and rescue therapies or
    - who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.
  - www.nice.org.uk/TA221

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised (September 2009) that romiplostim (Nplate®) is accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopenic purpura or those at high risk of bleeding.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
- Nplate (Amgen Ltd)
  - Romiplostim 250 microgram Nplate 250microgram powder and solvent for solution for injection pre-filled disposable devices | 1 pre-filled disposable injection (POM) £482.00
Nutrition and metabolic disorders

1 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to compensate for potassium loss is especially necessary: mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 216 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 920 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 915 given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 239 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or complicating acidosis with sodium bicarbonate infusion p. 910 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

Oral sodium and water

Sodium chloride p. 914 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

Oral rehydration therapy (ORT)

As a worldwide problem diarrhoea is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na+ 75 mmol, K+ 20 mmol, Cl− 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children’s fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete, beta-blockade for prevention of myocardial deactivation is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breastfeeding or formula feeds should be offered between oral rehydration drinks.
Oral bicarbonate
Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium bicarbonate supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated. Where hyperchloremic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance
Electrolytes and water
Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 914 or glucose 5% p. 915) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium
Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion, which can arise from conditions associated with metabolic acidosis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloremic acidosis.

Sodium chloride with glucose solutions p. 915 are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Intravenous glucose
Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of hyperkalaemia. They are also given, after correction of hypoglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

Intravenous potassium
Potassium chloride with sodium chloride intravenous infusion p. 913 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and lactate
Sodium bicarbonate p. 910 is used to control severe metabolic acidosis (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Severe metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For chronic acidotic states, sodium bicarbonate can be given by mouth.

Plasma and plasma substitutes
Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then
Blood and nutrition

**Dextran**

Plasma substitutes required. Crystalloids can be given; packed red cells may also be given. Overload than isotonic solutions. Concentrated albumin because of interstitial patients with an intravascular correct plasma-volume de...

**Albumin solution**

They may be given without regard to the recipient factors, blood group antibodies, or plasma cholinesterases; they contain soluble proteins and electrolytes but no clotting...

**Albumin**

Recent evidence does not support the previous view that albumin increases mortality. Hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

**Albumin solution** (m/)

Maintenance of alkaline urine

**Sodium bicarbonate**

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

crystalloids can be given; packed red cells may also be required.

Albumin solution p. 920, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution p. 920 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

**Plasma substitutes**

Dextran, gelatin p. 921, and the hydroxyethyl starch, tetrastarch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or sepsicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

**Dextran**

Plasma substitutes are more appropriate. Concentrated albumin in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution p. 920 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Fluid and electrolyte imbalances

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

• BY MOUTH
  • Adult: 4.8 g daily, (57 mmol each of Na⁺ and HCO₃⁻), higher doses may be required and should be adjusted according to response

Severe metabolic acidosis

• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  • Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

• CONTRA-INDICATIONS
  • With oral use Salt restricted diet

• CAUTIONS
  • Avoid prolonged use in urinary conditions - cardiac disease - elderly - patients on sodium-restricted diet - respiratory acidosis

• INTERACTIONS
  • Appendix 1 (antacids).

• SIDE-EFFECTS
  • When used for alkalisation of urine Alkalosis on prolonged use - eructation
  • When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis Fluid retention (in those at risk) - hypokalaemia may be exacerbated - increase blood pressure - pulmonary oedema (in those at risk)
  • When used for maintenance of alkaline urine Fluid retention (in those at risk) - hypokalaemia may be exacerbated - increase blood pressure - pulmonary oedema (in those at risk)
  • When used for relief of discomfort in mild urinary-tract infections Alkalosis on prolonged use - eructation

• PREGNANCY
  • With oral use Use with caution in urinary conditions.

• HEPATIC IMPAIRMENT
  • In patients with fluid retention, avoid large amounts of sodium.

• RENAL IMPAIRMENT
  • With oral use Avoid (except for specialised role in some forms of renal disease).

• MONITORING REQUIREMENTS
  • With intravenous use Plasma-pH and electrolytes should be monitored.

• DIRECTIONS FOR ADMINISTRATION
  • For slow intravenous injection use a small volume of hypertonic solution (such as 50 ml of 8.4%). For continuous intravenous infusion a weaker solution of 1.26% solution can be infused over 3–4 hours.
  • With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

• PRESCRIBING AND DISPENSING INFORMATION
  • With oral use Sodium bicarbonate 500 mg capsules contain approximately 6 mmol each of Na⁺ and HCO₃⁻; Sodium bicarbonate 600 mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from ‘special-order’ manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
  • With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.

• PATIENT AND CARER ADVICE
  • Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

• MEDICINAL FORMS
  • There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, liquid

Electrolytes and Minerals

Potassium chloride with calcium chloride and sodium chloride and sodium lactate

(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, sodium chloride p. 914, calcium chloride p. 919.

• INDICATIONS AND DOSE
  • For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium
  • BY INTRAVENOUS INFUSION
  • Adult: (consult product literature)
Potassium chloride with calcium chloride dihydrate and sodium chloride

(Ringer’s solution)
The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, sodium chloride p. 914.

**INDICATIONS AND DOSE**

**Electrolyte imbalance**

- Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION**

Ringer’s solution for injection provides the following ions (in mmol/litre), Ca\(^{2+}\) 2.2, K\(^+\) 4, Na\(^+\) 147, Cl\(^-\) 156.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)**
  
  Potassium chloride 300 microgram per 1 ml, Calcium chloride 320 microgram per 1 ml, Sodium chloride 8.6 mg per 1 ml. Polyfloror C rinsers infusion 500ml bottles | 1 bottle POM £2.95 | 12 bottle POM no price available
  
  Steriflex No.9 rinsers infusion 1litre bags | 1 bag POM £2.22 | 10 bag POM no price available
  
  Steriflex No.9 rinsers infusion 500ml bags | 1 bag POM £1.96 | 15 bag POM no price available

- **Potassium chloride with sodium chloride (Non-proprietary)**
  
  Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml. Polyfloror C rinsers infusion 500ml bottles | 1 bottle POM £2.95 | 12 bottle POM no price available
  
  Steriflex No.9 rinsers infusion 1litre bags | 1 bag POM £2.22 | 10 bag POM no price available
  
  Steriflex No.9 rinsers infusion 500ml bags | 1 bag POM £1.96 | 15 bag POM no price available

- **Potassium chloride with calcium chloride dihydrate and sodium chloride (Proprietary)**
  
  Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml. Polyfloror C rinsers infusion 500ml bottles | 1 bottle POM £2.95 | 12 bottle POM no price available
  
  Steriflex No.10 rinsers infusion 1litre bags | 1 bag POM £2.22 | 10 bag POM no price available
  
  Steriflex No.10 rinsers infusion 500ml bags | 1 bag POM £1.96 | 15 bag POM no price available

- **Potassium chloride with glucose and sodium chloride (Non-proprietary)**
  
  Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml. Polyfloror C rinsers infusion 500ml bottles | 1 bottle POM £2.95 | 12 bottle POM no price available
  
  Steriflex No.10 rinsers infusion 1litre bags | 1 bag POM £2.22 | 10 bag POM no price available
  
  Steriflex No.10 rinsers infusion 500ml bags | 1 bag POM £1.96 | 15 bag POM no price available

**Potassium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, glucose p. 915, sodium chloride p. 914.

**INDICATIONS AND DOSE**

**Electrolyte imbalance**

- Adult: Dosed according to the deficit or daily maintenance requirements

**PRESCRIBING AND DISPENSING INFORMATION**

Potassium chloride 0.3% contains 40 mmol each of K\(^+\) and Cl\(^-\) /litre or 0.15% contains 20 mmol each of K\(^+\) and Cl\(^-\) /litre with 5% of anhydrous glucose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**

- **Potassium chloride with glucose (Non-proprietary)**
  
  Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml. Polyfloror C rinsers infusion 500ml bottles | 1 bottle POM £2.95 | 12 bottle POM no price available
  
  Steriflex No.10 rinsers infusion 1litre bags | 1 bag POM £2.22 | 10 bag POM no price available
  
  Steriflex No.10 rinsers infusion 500ml bags | 1 bag POM £1.96 | 15 bag POM no price available

- **Potassium chloride with calcium chloride dihydrate and sodium chloride**

  The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, glucose p. 915, sodium chloride p. 914.
**Potassium chloride with sodium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, sodium chloride p. 914.

**INDICATIONS AND DOSE**

*Electrolyte imbalance*

- **BY INTRAVENOUS INFUSION**
- **Adult:** Depending on the deficit or the daily maintenance requirements (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION**

Potassium chloride 0.15% with sodium chloride 0.9% contains K⁺ 20 mmol, Na⁺ 150 mmol, and Cl⁻ 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K⁺ 40 mmol, Na⁺ 150 mmol, and Cl⁻ 150 mmol/litre.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**

- **Potassium chloride with glucose and sodium chloride (Non-proprietary)**
  - Sodium chloride 1.8 mg per 1 ml, Potassium chloride 3 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml
  - Infusion 1 litre Viaflo bags | 1 bag (POM) £2.20 | 10 bag (POM) no price available

**Potassium chloride with sodium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, sodium chloride p. 914.

**INDICATIONS AND DOSE**

*Potassium depletion*

- **By Mouth**
- **Adult:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

**PRESCRIBING AND DISPENSING INFORMATION**

Each Sando-K® tablet contains potassium 470 mg (12 mmol of K⁺) and chloride 285mg (8 mmol of Cl⁻).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**

- **Potassium bicarbonate 400 mg, Potassium chloride 600 mg**
  - Sando-K effervescent tablets | 100 tablet (P) £7.65 at price + £7.65

**Potassium chloride with sodium chloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 929, sodium chloride p. 914.
Potassium chloride 0.15% (potassium 20mmol/1 litre) / Sodium chloride 0.9% infusion 1 litre Viaflo bags | 1 bag (Pom) no price available | 10 bag (Pom) no price available
Potassium chloride 0.15% (potassium 20mmol/1 litre) / Sodium chloride 0.9% infusion 1 litre Macoflex bags | 1 bag (Pom) no price available | 12 bag (Pom) no price available
Potassium chloride 2 mg per 1 ml, Sodium chloride 9 mg per 1 ml Steriflex No.28 potassium chloride 0.2% (potassium 13.3mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (Pom) £1.67 | 15 bag (Pom) no price available
Steriflex No.28 potassium chloride 0.2% (potassium 27mmol/1 litre) / sodium chloride 0.9% infusion 1 litre bags | 1 bag (Pom) £2.20 | 10 bag (Pom) no price available

**ELECTROLYTES AND MINERALS > SODIUM CHLORIDE**

**Sodium chloride**

- **INDICATIONS AND DOSE**
  - **Prophylaxis of sodium chloride deficiency**
    - **BY MOUTH**
      - Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

- **Chronic renal salt wasting**
  - **BY MOUTH**
    - Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

- **Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: 500 ml, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

- **Diluent for instillation of drugs to the bladder**
  - **BY INTRAVESICAL INSTILLATION**
    - Adult: (consult product literature)

- **CAUTIONS**
  - With intravenous use Avoid excessive administration - cardiac failure - dilutional hyponaatraemia especially in the elderly - hypertension - peripheral oedema - pulmonary oedema - restrict intake in impaired renal function - toxaemia of pregnancy

- **SIDE-EFFECTS**
  - With intravenous use Administration of large doses may give rise to sodium accumulation - hyperchloraemic acidosis - oedema

- **MONITORING REQUIREMENTS**
  - With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With intravenous use Sodium chloride 0.9% intravenous infusion contains Na+ and Cl− each 150 mmol/litre. The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

- With oral use Each Slow Sodium® tablet contains approximately 10 mmol each of Na+ and Cl−; tablets can be crushed before administration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion, irrigation

- **Modified-release tablet**

- **Slow Sodium (HK Pharma Ltd)**

Potassium chloride with calcium chloride dihydrate and sodium chloride, p. 912 - Potassium chloride with glucose and sodium chloride, p. 912 - Potassium chloride with sodium chloride, p. 913

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 914, glucose below.

- **INDICATIONS AND DOSE**
  - Combined water and sodium depletion
  - By intravenous infusion
  - Adult: (consult product literature)

- **MONITORING REQUIREMENTS**
  - Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

  - Sodium chloride with glucose (Non-proprietary)
    - Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 25 mg per 1 ml
    - Sodium chloride 4.5% / Glucose 2.5% infusion 500ml Viaflex bags | 1 bag (Pom) no price available | 20 bag (Pom) no price available
    - Sodium chloride 4.5% / Glucose 2.5% infusion 500ml Viaflo bags | 1 bag (Pom) no price available | 20 bag (Pom) no price available
    - Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml

**SUGARS**

Glucose

(Dextrose Monohydrate)

- **INDICATIONS AND DOSE**
  - Establish presence of gestational diabetes
  - By mouth
  - Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid
  - continued

**NUTRIENTS**

Blood and nutrition

Fluid and electrolyte imbalances

  - **Sodium chloride (Non-proprietary)**
    - Sodium chloride 9 mg per 1 ml Sodium chloride 0.9% intravascular solution 50ml bags | 1 bag (Pom) £5.00

**Combinations available:** 
- Potassium chloride with calcium chloride and sodium chloride and sodium lactate, p. 911.
Oral glucose tolerance test
▶ BY MOUTH
▶ Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Hypoglycaemia
▶ BY INTRAVENOUS INFUSION
▶ Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
▶ Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source
▶ BY INTRAVENOUS INFUSION
▶ Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

Water replacement
▶ BY INTRAVENOUS INFUSION
▶ Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)
▶ BY INTRAVENOUS INFUSION
▶ Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis
▶ BY INTRAVENOUS INFUSION
▶ Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
▶ Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion

DOSE EQUIVALENCE AND CONVERSION
▶ 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

● CAUTIONS Do not give alone except when there is no significant loss of electrolytes · prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
● SIDE-EFFECTS Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis
● DIRECTIONS FOR ADMINISTRATION
▶ With intravenous use in children: Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

● PRESCRIBING AND DISPENSING INFORMATION Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
● EXCEPTIONS TO LEGAL CATEGORY
▶ With intravenous use: Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Oral solution
▶ Rapilose OGTT (Aspire Pharma Ltd)
Glucose 250 mg per 1 ml Rapilose OGTT solution | 300 ml £3.48

Oral gel
▶ Glucose (Non-proprietary)
Glucose 400 mg per 1 gram YourGLUCO 40% gel | 75 gram £5.00 DT price = £7.16
▶ DextroGel (Neonetics Ltds)
Glucose 400 mg per 1 gram DextroGel 40% gel | 75 gram £7.16 DT price = £7.16 | 80 gram £6.84
▶ GlucoBoost (Ennogen Healthcare Ltd)
Glucose 400 mg per 1 gram GlucoBoost 40% gel | 75 gram £7.16 DT price = £7.16 | 80 gram £6.84
▶ GlucoGel (BBI Healthcare Ltd)
Glucose 400 mg per 1 gram GlucoGel 40% gel original | 75 gram £7.16 DT price = £7.16 | 80 gram £6.84
▶ Rapilose (Galen Ltd)
Glucose 400 mg per 1 gram Rapilose gel 40% gel | 75 gram £5.49 DT price = £7.16

Infusion
▶ Glucose (Non-proprietary)
Glucose anhydrous 50 mg per 1 ml Glucose 5% infusion 1 litre
Macoflex bags | 1 bag POM no price available | 12 bag POM no price available

Fluid and electrolyte loss in diarrhoea

**INDICATIONS AND DOSE**

**BY MOUTH**

- Child 1–11 months: 1–1½ times usual feed volume to be given
- Child 1–11 years: 200 mL, to be given after every loose motion
- Child 12–17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss
- Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

**PATIENT AND CARER ADVICE**

- After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Medicines for Children leaflet: Oral rehydration salts  
www.medicinesforchildren.org.uk/oral-rehydration-salts

---

**Potassium chloride with rice powder, sodium chloride and sodium citrate**  
(Formulated as oral rehydration salts)

**INDICATIONS AND DOSE**

**Fluid and electrolyte loss in diarrhoea**

**BY MOUTH**

- Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol and citrate 10 mmol.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include apricot, black currant, or raspberry.

**PATIENT AND CARER ADVICE**

- Patients and carers should be advised how to reconstitute Dioralyte® Relief oral powder. After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

- **Dioralyte** (Sanofi)  
  Disodium hydrogen citrate 530 mg, Glucose 3.56 gram,  
  Potassium chloride 300 mg, Sodium chloride 470 mg  
  Dioralyte oral powder sachets citrus | 20 sachet (£6.72)  
  Dioralyte oral powder sachets plain | 20 sachet (£6.72)  
  Dioralyte oral powder sachets blackcurrant | 20 sachet (£6.72)

---

**1.1 Calcium imbalance**

**Calcium**

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 920 should be given, with plasma-calcium...
Blood and nutrition

Bendroflumethiazide p. 157. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 914. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may have to be used. The bisphosphonates are useful and pamidronate disodium p. 665 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitriol (salmon) p. 686 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism

Paricalcitol p. 956 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 157. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Cinacalcet

Drug action

Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

Indications and dose

Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis
- By mouth
  - Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

Treatment of hypercalcaemia in parathyroid carcinoma

Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate
- By mouth
  - Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Caution

Treatment should not be initiated in patients with hypocalcaemia

Interactions

Appendix 1 (cinacalcet).

Side-effects

- Common or very common
  - Anorexia
  - Asthenia
  - Dizziness
  - Myalgia
  - Nausea
  - Paraesthesia
  - Rash
  - Reduced testosterone concentrations
  - Vomiting
- Uncommon
  - Diarrhoea
  - Dyspepsia
  - Seizures
- Frequency not known
  - Allergic reactions
  - Angioedema
  - Heart failure
  - Hypotension

Pregnancy

Manufacturer advises use only if potential benefit outweighs risk—no information available.

Breast feeding

Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment

Manufacturer advises caution in moderate to severe impairment. Monitor closely in hepatic impairment especially when increasing dose.

Monitoring requirements

- Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.
- In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.

National funding/access decisions

NICE technology appraisals (TAs)

Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TA117

Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) only in those:
1.1b Hypocalcaemia

ELECTROLYTES AND MINERALS

Calcium salts

CONTRA-INDICATIONS Conditions associated with hypocalcaemia (e.g. some forms of malignant disease) - conditions associated with hypercalciuria (e.g. some forms of malignant disease)

CAUTIONS History of nephrolithiasis • sarcoidosis

INTERACTIONS ▶ Appendix 1 (antacids, calcium salts).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Frequency not known Hypercalcaemia

SPECIFIC SIDE-EFFECTS

With intravenous use Arrhythmias • bradycardia • fall in blood pressure • injection-site reactions • peripheral vasodilatation • severe tissue damage with extravasation • sweating

RENAL IMPAIRMENT Use with caution.

Calcium carbonate

INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

BY MOUTH

Adult: (consult product literature)

Calcium deficiency

BY MOUTH

Adult: (consult product literature)

PRESCRIBING AND DISPENSING INFORMATION Adcal® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol); Calcichew® contains calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol); Calcichew Forte® contains calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol); Cacit® contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol); consult product literature for details of other available products.

Calcium chloride

INDICATIONS AND DOSE

Severe acute hypocalcaemia or hypocalcaemic tetany

BY INTRAVENOUS INJECTION

Adult: Dose according to requirements

CAUTIONS Avoid in respiratory acidosis • avoid in respiratory failure

DIRECTIONS FOR ADMINISTRATION Care should be taken to avoid extravasation.

PRESCRIBING AND DISPENSING INFORMATION Non-proprietary Calcium chloride dihydrate 7.35% (calcium...
Blood and nutrition

20 mg or Ca\(^{2+}\) 500 micromol/mL; \textit{Calcium chloride dihydrate} 10\% (calcium 27.3 mg or Ca\(^{2+}\) 680 micromol/mL); \textit{Calcium chloride dihydrate} 14.7\% (calcium 40.1 mg or Ca\(^{2+}\) 1000 micromol/mL).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**
- \textit{Calcium chloride (Non-proprietary)}
  - \textit{Calcium chloride dihydrate} 73.5 mg per 1 ml Calcium chloride 7.35\% solution for injection | 10 ml ampoule | £66.38
  - \textit{Calcium chloride dihydrate} 100 mg per 1 ml Calcium chloride 10\% solution for injection | 10 ml ampoule | £95.22
- \textit{Calcium lactate (Non-proprietary)}
  - \textit{Calcium lactate} 147 mg per 1 ml Calcium lactate 14.7\% solution for injection | 10 ml ampoule | £64.69–£68.50

**INDICATIONS AND DOSE**
- **Severe acute hypocalcaemia or hypocalcaemic tetany**
  - \textit{Initially by slow intravenous injection}
  - \textit{Adult:} Initially 10–20 ml, calcium gluconate injection 10\% (providing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 ml/hour, adjusted according to response, infusion to be administered using 100 ml of calcium gluconate 10\% diluted in 1 litre of glucose 5\% or sodium chloride 0.9\%.
- **Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)**
  - \textit{By slow intravenous injection}
  - \textit{Adult:} 10–20 ml, calcium gluconate 10\% should be administered, dose titrated and adjusted to ECG improvement

**Calcium deficiency / Mild asymptomatic hypocalcaemia**
- \textit{By mouth}
- \textit{Adult:} Dose according to requirements

**DOSE EQUIVALENT AND CONVERSION**
- 0.11 mmol/kg is equivalent to 0.5 ml/kg of calcium gluconate 10\%.

**CALCULATING ANTIDOTE DOSAGES**

**CALCULATION**

**METHOD**

1. Calculate the dose of sodium bicarbonate required

2. Divide by 6.5

3. Multiply by 100

4. Subtract from the total sodium bicarbonate required

**EXAMPLE**

**Patient:** 32 kg

**Problem:** Severe acute hypocalcaemia

**Calculation**

- **Total dose of sodium bicarbonate**
  - 10 ml of sodium bicarbonate 8.4% is 84 mmol
  - 32 kg \times 0.11 = 3.54 mmol
  - 84 mmol - 3.54 mmol = 80.46 mmol

**Solution**

- 80.46 mmol divided by 6.5 = 12.36 ml
- 12.36 ml \times 100 = 1236 ml
- 1236 ml - 10 ml = 1226 ml

**Important Safety Information**

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 ml glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

**MONITORING REQUIREMENTS**
- With intravenous use, Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use, For continuous intravenous infusion, dilute 100 ml of calcium gluconate 10\% in 1 litre of glucose 5\% or sodium chloride 0.9\% and give at an initial rate of 50 ml/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.

**PRESCRIBING AND DISPENSING INFORMATION**
Calcium gluconate 1 g contains calcium 89 mg or Ca\(^{2+}\) 2.23 mmol.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

**Effervescent tablet**
- **CAUTIONARY AND ADVISORY LABELS**
- **ELECTROLYTES**: May contain Sodium
- **Calcium gluconate (Non-proprietary)**
  - **Calcium gluconate 1 gram** Calcium gluconate 1g effervescent tablets | 28 tablet [GSL] £15.68 DT price = £15.68

**Solution for injection**
- **Calcium gluconate (Non-proprietary)**
  - Calcium gluconate 100 mg per 1 ml Calcium gluconate 10% solution for injection | 10 ml ampoule | £7.00–£7.50 DT price = £7.25

**Calcium lactate**

**INDICATIONS AND DOSE**
- **Calcium deficiency**
  - \textit{By mouth}
  - \textit{Adult:} Dose according to requirements

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Calcium lactate (Non-proprietary)**
  - Calcium lactate 300 mg Calcium lactate 300mg tablets | 84 tablet no price available DT price = £4.57 | 84 tablet [GSL] £4.57 DT price = £4.57

**Calcium phosphate**

**INDICATIONS AND DOSE**
- **Indications listed in combination monographs (available in the UK only in combination with other drugs)**
  - **By mouth**
  - **Adult:** Doses listed in combination monographs

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

1.2 Low blood volume

**BLOOD AND RELATED PRODUCTS** > **PLASMA PRODUCTS**

**Albumin solution**
- **(Human Albumin Solution)**

**INDICATIONS AND DOSE**
- **Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions)**
- **Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%)**
- **Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)**
  - **By intravenous infusion**
  - **Adult:** (consult product literature)**
**CONTRA-INDICATIONS** Cardiac failure • severe anaemia

**CAUTIONS** Correct dehydration when administering concentrated solution • history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • increased capillary permeability

**SIDE-EFFECTS** Anaphylaxis • chills • fever • hypersensitivity reactions • hypotension • increased salivation • nausea • tachycardia • vomiting

**MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Flexbumin** (Baxalta UK Ltd)
  - Albumin solution human 200 gram per 1 litre Flexbumin 20% infusion 100ml bags | 1 bag £25.50
  - Albumin 5% solution for infusion 250ml bottles | 1 vial £29.90
  - Albumin 5% solution for infusion 500ml bottles | 1 vial £51.00

- **Albunorm** (Octapharma Ltd)
  - Albumin solution human 50 mg per 1 ml Albunorm 5% solution for infusion 250ml bottles | 1 bottle £10.20
  - Albumin solution human 50 mg per 1 ml Albunorm 5% solution for infusion 500ml bottles | 1 bottle £51.00

- **AlbuReX** (CSL Behring UK Ltd)
  - Albumin solution human 50 mg per 1 ml Alburex 5% solution for infusion 500ml vials | 1 vial £42.50
  - Albumin solution human 200 mg per 1 ml Alburex 20% solution for infusion 100ml bottles | 1 bottle £40.80

- **Biotest** (Biotest (UK) Ltd)
  - Albumin solution human 50 mg per 1 ml Human Albumin Biotest 5% solution for infusion 250ml vials | 1 vial no price available
  - Albumin solution human 200 mg per 1 ml Human Albumin Biotest 20% solution for infusion 50ml vials | 1 vial £16.00

- **Grifols** (Grifols UK Ltd)
  - Albumin solution human 50 mg per 1 ml Human albumin Grifols 5% solution for infusion 500ml bottles | 1 bottle £49.50
  - Albumin solution human 50 mg per 1 ml Human albumin Grifols 5% solution for infusion 250ml bottles | 1 bottle £24.75
  - Albumin solution human 50 mg per 1 ml Human albumin Grifols 5% solution for infusion 100ml bottles | 1 bottle £19.90

- **Zenalb** (Bio Products Laboratory Ltd)
  - Albumin solution human 45 mg per 1 ml Zenalb 4.5% solution for infusion 250ml bottles | 1 bottle £26.31
  - Albumin solution human 200 mg per 1 ml Zenalb 20% solution for infusion 100ml bottles | 1 bottle £50.07

**EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

**PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextran with an average molecular weight of about 70 000.

### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Dextran 70 with sodium chloride**

- **INDICATIONS AND DOSE**
  - Initial treatment of hypovolaemia with hypotension induced by traumatic injury

  - **BY INTRAVENOUS INFUSION**
    - Adult: 250 mL, to be given over 2–5 minutes using RescueFlow®, followed immediately by administration of isotonic fluids.

- **CAUTIONS** Cardiac disease • hyperosmolality • severe hypoglycaemia • severe liver disease

- **SIDE-EFFECTS**
  - Rare • Severe anaphylactic reactions
  - **Frequency not known** Hypersensitivity reactions • transient increase in bleeding time

- **PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **MONITORING REQUIREMENTS**
  - Where possible, monitor central venous pressure.
  - Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

### Plasma Substitutes

- **Indications and dose**
  - Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

  - **By intravenous infusion**
    - Adult: Initially 500–1000 mL, use 3.5–4% solution

- **Caution** Cardiac disease • severe liver disease

- **Side-effects**
  - Rare • Severe anaphylactic reactions

- **Frequency not known** Hypersensitivity reactions • transient increase in bleeding time

- **Pregnancy** Manufacturer of Gelaplasma® advises avoid at the end of pregnancy.

- **Hepatic Impairment** Use with caution in severe impairment.

- **Renal Impairment** Use with caution in renal impairment.

### Gelatin

- **Indications and dose**
  - Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

  - **By intravenous infusion**

  - Adult: Initially 500–1000 mL, use 3.5–4% solution

- **Caution** Cardiac disease • severe liver disease

- **Side-effects**
  - Rare • Severe anaphylactic reactions

- **Frequency not known** Hypersensitivity reactions • transient increase in bleeding time

- **Pregnancy** Manufacturer of Gelaplasma® advises avoid at the end of pregnancy.

- **Hepatic Impairment** Use with caution in severe impairment.

- **Renal Impairment** Use with caution in renal impairment.
● **MONITORING REQUIREMENTS**

- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

● **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

**Gelaspan®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g. Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; **Gelofusine®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; **Geloplasma®** contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; **Isoplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre; **Volplex®** contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Gelaspan** (B.Braun Medical Ltd)
  - Gelatin 40 mg per 1 ml Gelaspan 4% infusion 500 ml Ecobags | 1 bag [Pack] £5.78 (Hospital only) | 20 bag [Pack] no price available (Hospital only)
- **Gelofusine** (B.Braun Medical Ltd)
  - Gelatin 40 mg per 1 ml Gelofusine 4% infusion 1 litre Ecobags | 1 bag [Pack] £9.04 | 10 bag [Pack] no price available
  - Gelofusine 4% infusion 500 ml Ecobags | 1 bag [Pack] £4.83 | 20 bag [Pack] no price available
- **Geloplasma** (Fresenius Kabi Ltd)
  - Gelatin 30 mg per 1 ml Geloplasma 3% infusion 500 ml Freeflex bags | 1 bag [Pack] £6.78 (Hospital only) | 20 bag [Pack] no price available
- **Isoplex** (Beacon Pharmaceuticals Ltd)
  - Gelatin 40 mg per 1 ml Isoplex 4% infusion 500 ml Freeflex bags | 10 bag [Pack] £75.30 (Hospital only)
  - Isoplex 4% infusion 1 litre Freeflex bags | 6 bag [Pack] £54.54 (Hospital only)
- **Volplex** (Beacon Pharmaceuticals Ltd)
  - Gelatin 40 mg per 1 ml Volplex 4% infusion 500 ml Freeflex bags | 10 bag [Pack] £47.00 (Hospital only)
  - Volplex 4% infusion 1 litre Freeflex bags | 6 bag [Pack] £54.54 (Hospital only)

**Tetrastarch**

● **INDICATIONS AND DOSE**

**VOLULYTE® INFUSION**

Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

- **BY INTRAVENOUS INFUSION**
  - **Adult:** Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

- **CONTRA-INDICATIONS** Burns - cerebral haemorrhage - critically ill patients - dehydration - hyperviscosity - intracranial haemorrhage - pulmonary oedema - sepsis - severe coagulopathy

- **CAUTIONS** Cardiac disease - care should be taken to avoid haematocrit concentration from falling below 25–30% - renal impairment - severe liver disease - surgery - trauma

- **SIDE-EFFECTS**
  - Rare - Severe anaphylactic reactions
  - **Frequency not known** Hypersensitivity reactions - pruritus - raised serum amylose - transient increase in bleeding time

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid.

- **MONITORING REQUIREMENTS**
  - Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.
  - Monitor renal function.
  - Monitor for hypersensitivity reactions.
  - **Urine output should be monitored.**

**PRESCRIBING AND DISPENSING INFORMATION** Hydroxyethyl starch is composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

**Volulyte®** contains hydroxyethyl starch 6% (average molecular weight 130 000) in sodium chloride intravenous infusion 0.6%, containing Na⁺ 137 mmol, K⁺ 4 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 110 mmol, acetate 34 mmol/litre.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- **Volulyte** (Fresenius Kabi Ltd) ▼
  - Magnesium chloride hexahydrate 300 mg per 1 litre, Potassium chloride 300 mg per 1 litre, Sodium acetate trihydrate 4.63 gram per 1 litre, Sodium chloride 6.02 gram per 1 litre, Tetrastarch 60 gram per 1 litre Volulyte 6% infusion 500 ml Freeflex bags | 15 bag [Pack] £229.60

- **Voluen** (Fresenius Kabi Ltd) ▼
  - **Tetrastarch 100 mg per 1 ml** Voluen 10% infusion 500 ml Freeflex bags | 20 bag [Pack] no price available
  - **Tetrastarch 60 mg per 1 gram** Voluen 6% infusion 500 ml Freeflex bags | 1 bag [Pack] £10.63 | 15 bag [Pack] no price available
1.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation and, magnesium glycerophosphate tablets below and liquid [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

Myocardial infarction

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully.

Magnesium glycerophosphate

Prevent recurrence of magnesium deficit

Magnesium glycerophosphate powder for oral use (magnesium salts, oral). There can be variation in the licensing of different medicines imported by manufacturers or specialist importing companies.

Magnesium (as Magnesium aspartate) 243 mg (£9.97)

Magnesium aspartate powder for oral solution below and liquid [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

Magnesiocard (magnesium aspartate, oral)

Magnesium aspartate powder for oral solution (magnesium salts, oral). There can be variation in the licensing of different medicines imported by manufacturers or specialist importing companies.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation and, magnesium glycerophosphate tablets below and liquid [unlicensed] are available from ‘special-order’ manufacturers or specialist importing companies.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

Myocardial infarction

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully.

Magnesium glycerophosphate powder for oral solution (magnesium salts, oral). There can be variation in the licensing of different medicines imported by manufacturers or specialist importing companies.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg²⁺ over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with eclampsia. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with pre-eclampsia in whom there is concern about developing eclampsia. The patient should be monitored carefully.
DIRECTIONS FOR ADMINISTRATION

MONITORING REQUIREMENTS

RENAL IMPAIRMENT

Avoid or reduce dose. Increased risk of toxicity.

MONITORING REQUIREMENTS

Monitor blood pressure, respiratory rate, urine output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

DIRECTIONS FOR ADMINISTRATION

Tablets may be dispersed in water.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution

Tablet

Magnesium glycerophosphate (Non-proprietary)

Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) tablets | 30 tablet £84.50

Chewable tablet

Magnesium glycerophosphate (Non-proprietary)

Magnesium (as Magnesium glycerophosphate) 97.2 mg YourMAg (magnesium 97.2mg (4mmol)) chewable tablets | 50 tablet £20.00

MagnaPhate (Arjun Products Ltd)

Magnesium (as Magnesium glycerophosphate) 97.2 mg MagnaPhate (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 30 tablet £84.50

Neomag (magnesium 97mg (4mmol)) chewable tablets sugar-free | 50 tablet £20.00

Magnesium sulfate heptahydrate should not exceed 4 g, to be given over 20 minutes

Capable

Magnesium glycerophosphate (Non-proprietary)

Magnesium (as Magnesium glycerophosphate) 48.6 mg Mag-4 (magnesium 48.6mg (2mmol)) capsules | 30 capsule £85.70

Magnesium (as Magnesium glycerophosphate) 97.2 mg Mag-4 (magnesium 97.2mg (4mmol)) capsules | 30 capsule £89.30

Oral solution

LiquaMag GP (Fontus Health Ltd)

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml LiquaMag GP (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution sugar-free | 250 ml £55.00

Magnesium sulfate

INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

BY INTRAVENOUS INFUSION

Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Adult: 1.2–2 g, to be given over 20 minutes

Prevention of seizures in pre-eclampsia

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

Treatment of seizures and prevention of seizure recurrence in eclampsia

INITIALLY BY INTRAVENOUS INJECTION

Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

Hypomagnesaemia

BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION

Adult: 2.5–5 g daily, usual dose 3 g daily

Emergency treatment of serious arrhythmias

BY INTRAVENOUS INJECTION

Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

Rapid bowel evacuation (acts in 2–4 hours)

BY MOUTH

Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

DOSE EQUIVALENCE AND CONVERSION

Magnesium sulfate heptahydrate 1 g equivalent to Mg2+ approx. 4 mmol.

UNLICENSED USE

With intravenous use Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.

CONTRA-INDICATIONS

With oral use in rapid bowel evacuation—acute gastrointestinal conditions

CAUTIONS

With oral use in rapid bowel evacuation—elderly and debilitated patients

INTERACTIONS

Appendix 1 (magnesium, parenteral).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Arrhythmias · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

SPECIFIC SIDE-EFFECTS

skin sensation of warmth, flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

PREGNANCY

When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis. Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression. Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

HEPATIC IMPAIRMENT

Avoid in hepatic coma if risk of renal failure.

RENAI IMPAIRMENT

Avoid or reduce dose. Increased risk of toxicity.

MONITORING REQUIREMENTS

Monitor blood pressure, respiratory rate, urine output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

DIRECTIONS FOR ADMINISTRATION

With intravenous use in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).

With intravenous use in adults. For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or
0.8 mmol/mL Mg\(^{2+}\)); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg\(^{2+}\)).

**PRESCRIBING AND DISPENSING INFORMATION**

- With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg\(^{2+}\)) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

**EXCEPTIONS TO LEGAL CATEGORY**

- With oral use in adults Magnesium sulfate is on sale to the public as Epsom Salts.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

**Solution for injection**

- **Magnesium sulfate (Non-proprietary)**
  
  Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule £11.85–£35.25
  Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial £46.40
  Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule £21.80–£58.34
  Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule £11.72–£17.90 DT price = £11.85

**Solution for infusion**

- **Magnesium sulfate (Non-proprietary)**
  
  Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule £57.12–£60.50
  Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial £66.70

**Powder**

- **Magnesium sulfate (Non-proprietary)**
  
  Magnesium sulfate dried 1 mg per 1 mg Numark Epsom Salts | 200 gram GSL £1.00
  Magnesium sulfate powder | 300 gram GSL £1.91–£2.02 | 500 gram GSL £3.20 DT price = £3.20 | 2000 gram GSL £5.60 | 5000 gram GSL £11.49
  
  Brands may include Epsom salts

### 1.4 Phosphate imbalance

**Phosphorus**

Oral phosphate supplements p. 928 may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 940.

**Phosphate-binding agents**

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 927 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 926 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

Sucroferric oxyhydroxide p. 927 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

#### 1.4a Hyperphosphataemia

**ELECTROLYTES AND MINERALS ▶ ALUMINIUM**

**Aluminium hydroxide**

- **INDICATIONS AND DOSE**
  
  Hyperphosphataemia in renal failure
  
  ▶ BY MOUTH USING CAPSULES
  
  Adult: 4–20 capsules daily in divided doses, to be taken with meals

  Antacid
  
  ▶ BY MOUTH USING CAPSULES
  
  Adult: 475 mg 5 times a day, last dose to be taken at bedtime

- **CONTRA-INDICATIONS**
  
  Hypophosphataemia

- **INTERACTIONS** ▶ Appendix 1 (antacids).

  Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.

  Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- **SIDE-EFFECTS**
  
  Constipation - hyperaluminaemia

- **HEPATIC IMPAIRMENT**
  
  Avoid; can cause constipation which can precipitate coma.

- **RENAL IMPAIRMENT**
  
  There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

**CALCIUM**

**Calcium acetate**

- **INDICATIONS AND DOSE**
  
  **PHOSEX® TABLETS**

  Hyperphosphataemia
  
  ▶ BY MOUTH
  
  Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose continued →
4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

**RENACET® TABLETS**

**Hyperphosphataemia**
- **BY MOUTH**
  - Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

**CONTRA-INDICATIONS**
- Please consider, calcium acetate p.
- Combination only. For the properties of the components see below

**PHOSPHATE BINDERS**

**Calcium acetate with magnesium carbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium acetate p. 925, magnesium carbonate p. 67.

**INDICATIONS AND DOSE**

**Hyperphosphataemia**
- **BY MOUTH**
  - Adult: Initially 1 tablet 3 times a day, adjusted according to serum-phosphate concentration, to be taken with food; usual dose 3–10 tablets daily; maximum 12 tablets per day

**CONTRA-INDICATIONS**
- Hypercalcaemia • hypermagnesaemia • myasthenia gravis • third-degree AV block

**DIRECTIONS FOR ADMINISTRATION**
- Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after calcium acetate with magnesium carbonate to reduce possible interference with absorption of other drugs.

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on how to administer calcium acetate with magnesium carbonate tablets.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 25
- **Rephoren** (Vifor Fresenius Medical Care Renal Pharma UK Ltd)
  - Magnesium carbonate heavy 235 mg, Calcium acetate 435 mg
  - Osvaren 435mg/235mg tablets | 180 tablet (Pom) £24.00

**Lanthanum**

**INDICATIONS AND DOSE**

Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) • Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet
- **BY MOUTH**
  - Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

**CAUTIONS**
- Acute peptic ulcer • bowel obstruction • Crohn’s disease • ulcerative colitis

**INTERACTIONS**
- → Appendix 1 (lanthanum).

**SIDE-EFFECTS**
- **Common or very common** Gastro-intestinal disturbances • headache • hypocalcaemia
- **Uncommon** Alopecia • anorexia • arthralgia • asthenia • chest pain • dizziness • dry mouth • eosinophilia • hypercalcaemia • hyperglycaemia • hyperparathyroidism • hypophosphataemia • increased appetite • malaise • myalgia • osteoporosis • peripheral oedema • stomatitis • sweating • taste disturbances • thirst • vertigo
- **Frequency not known** Accumulation of lanthanum in bone • transient changes in QT interval

**PREGNANCY**
- Manufacturer advises caution—no information available.

**BREAST FEEDING**
- Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT**
- Lanthanum excreted in bile—possible accumulation in obstructive jaundice.

**DIRECTIONS FOR ADMINISTRATION**
- Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

**PATIENT AND CARER ADVICE**
- Patient and carers should be given advice on how to administer lanthanum tablets and powder.

**NATIONAL FUNDING/ACCESS DECISIONS**

*Scottish Medicines Consortium (SMC) Decisions*

The Scottish Medicines Consortium has advised (March 2007) that lanthanum (Fosrenol®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.
Sevelamer

31-Oct-2016

**INDICATIONS AND DOSE**

**RENAGEL®**

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be given with meals and adjusted according to serum-phosphate concentration; usual dose 2.4–12 g daily in 3 divided doses

**RENVELA® 2.4G ORAL POWDER SACHETS (SANOFI)**

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis; Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

**RENVELA® 800MG TABLETS (SANOFI)**

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis; Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

- **BY MOUTH**
  - Adult: Initially 2.4–4.8 g daily in 3 divided doses, dose to be taken with meals and adjusted according to serum-phosphate concentration every 2–4 weeks; usual dose 6 g daily in 3 divided doses

**CONTRA-INDICATIONS** Bowel obstruction

**CAUTIONS** Gastro-intestinal disorders

**INTERACTIONS** → Appendix 1 (sevelamer).

**SIDE-EFFECTS**

- Common or very common Abdominal pain • constipation • diarrhoea • dyspepsia • flatulence • nausea • vomiting
- Frequency not known Ileus • intestinal obstruction (higher incidence with sevelamer hydrochloride salt) • intestinal perforation • pruritus • rash

**RENAVIA®** Diverticulitis

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**RENAVIA® 2.4G ORAL POWDER SACHETS (SANOFI)** Unlikely to be present in milk (however, manufacturer advises avoid).

**RENAVIA® 800MG TABLETS (SANOFI)** Unlikely to be present in milk (however, manufacturer advises avoid).

**RENAVIA®** Manufacturer advises use only if potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION**

**RENAVIA® 2.4G ORAL POWDER SACHETS (SANOFI)** For powder for oral suspension, each sachet to be dispersed in 60 ml water.

**PATIENT AND CARER ADVICE**

**RENAVIA® 2.4G ORAL POWDER SACHETS (SANOFI)** Patients and carers should be advised on how to administer powder for oral suspension.

**INDICATIONS AND DOSE**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 25

**EXCIPIENTS:** May contain Propylene glycol

- **Renagel** (Sanofi)
  - Sevelamer 250 mg Renagel 250mg tablets | 10 tablets (POD) £18.60 DT price = £193.59
  - Sevelamer 500 mg Renagel 500mg tablets | 90 tablets (POD) £124.06 DT price = £124.06

- **Renvela** (Sanofi)
  - Sevelamer 800 mg Renvela 800mg tablets | 180 tablets (POD) £167.04 DT price = £74.11

Relevant medicines are available as: chewable tablets sugar-free

**Sucroferric oxyhydroxide**

16-Feb-2016

**INDICATIONS AND DOSE**

Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

- **BY MOUTH**
  - Adult: Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2–4 weeks, dose adjusted according to serum-phosphate concentration; maintenance 1.5–2 g daily in divided doses; maximum 3 g per day

**CONTRA-INDICATIONS** Haemochromatosis • iron accumulation disorders

**CAUTIONS** Gastric disorders • hepatic disorders • major gastrointestinal surgery • peritonitis in the last 3 months

**INTERACTIONS** → Appendix 1 (iron salts).

**SIDE-EFFECTS**

- Common or very common Abdominal pain • constipation • diarrhoea • discoloration of faeces • dyspepsia • flatulence • taste disturbance • tooth discoloration • vomiting
- Uncommon Abdominal discomfort • abdominal distension • dysphagia • dysphoea • fatigue • gastritis • gastrointestinal reflux disease • headache • hypercalcaemia • hypocalcaemia • rash • tongue discoloration

**SIDE-EFFECTS, FURTHER INFORMATION**

Discoloured faeces may mask the visual signs of gastrointestinal bleeding.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**DIRECTIONS FOR ADMINISTRATION** Velphoro® tablets must be chewed or crushed, not swallowed whole.
1.4b Hypophosphataemia

**ELECTROLYTES AND MINERALS > PHOSPHATES**

**Phosphate**

**INDICATIONS AND DOSE**

Treatment of moderate to severe hypophosphatemia
- **BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

For established hypophosphataemia (with monobasic potassium phosphate)
- **BY INTRAVENOUS INFUSION**
- Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), dose only increased in critically ill patients; dose in critically ill patients is approximately equivalent to 30 mmol in adults, dose to be infused over 6–12 hours, according to severity

Vitamin D-resistant hypophosphataemic osteomalacia
- **BY MOUTH USING EFFERVESCENT TABLETS**
- Adult: 4–6 tablets daily, using Phosphate Sandoz®.

**SIDE-EFFECTS**

- Common or very common: Diarrhoea
- Frequency not known: Acute renal failure, hypocalcaemia, hypotension, metastatic calcification, nausea, oedema, phlebitis, tissue necrosis on extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

**RENAJ IMPAIRMENT**

Reduce dose. Monitor closely in renal impairment.

**MONITORING REQUIREMENTS**

It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

**PRESCRIBING AND DISPENSING INFORMATION** Phosphate Sandoz® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol); Polyfusor NA® contains Na⁺ 162 mmol/litre, K⁺ 19 mmol/litre, PO4³⁻ 100 mmol/litre; non-proprietary potassium dihydrogen phosphate injection (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Effervescent tablet**

CAUTIONARY AND ADVISORY LABELS 13

- Phosphate Sandoz® (HK Pharma Ltd)
- Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets | 100 tablet P £16.43

**Infusion**

- Phosphate (Non-proprietary)
  - Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles | 1 bottle P £5.15
  - Solution for infusion
  - Phosphate (Non-proprietary)
  - Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule P £80.25–£85.00

---

1.5 Potassium imbalance

1.5a Hyperkalaemia

Other drugs used for Hyperkalaemia Calcium gluconate, p. 920 - Insulin, p. 652

**ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS**

**Calcium polystyrene sulfonate**

**INDICATIONS AND DOSE**

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
- **BY MOUTH**
  - Adult: 15 g 3–4 times a day
- **BY RECTUM**
  - Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

SORBITERIT® POWDER

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
- **BY MOUTH**
  - Adult: 20 g 1–3 times a day
- **BY RECTUM**
  - Adult: 40 g 1–3 times a day, retained for 6 hours followed by irrigation to remove resin from colon

**CONTRA-INDICATIONS**

Hyperparathyroidism, metastatic carcinoma, multiple myeloma, obstructive bowel disease, sarcoidosis

**INTERACTIONS** → Appendix 1 (polystyrene sulfonate resins).

**SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Anorexia, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, gastric irritation, gastro-intestinal obstruction, hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment), hypomagnesaemia, intestinal necrosis (reported with concomitant sorbitol), ischaemic colitis, nausea, necrosis, ulceration, vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Gastro-intestinal concretions
- With rectal use Faecal impaction

**PREGNANCY**

Manufacturers advise use only if potential benefit outweighs risk—no information available.
This document includes various sections related to the administration, monitoring, and safety information of medications. It discusses different medicinal forms and provides detailed instructions for their use. The sections covered include:

- **DIRECTIONS FOR ADMINISTRATION**
- **MONITORING REQUIREMENTS**
- **SIDE-EFFECTS**
- **INTERACTIONS**
- **CAUTIONS**
- **CONTRA-INDICATIONS**
- **CONTRARY AND ADVISORY LABELS**
- **MEDICINAL FORMS**

### Hypokalaemia

**ELECTROLYTES AND MINERALS > POTASSIUM**

#### Potassium bicarbonate with potassium acid tartrate

- **INDICATIONS AND DOSE**
  - Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)
  - Adult: (consult product literature)

#### Contra-Indications

- Cardiac disease - elderly

#### ELECTROLYTES AND MINERALS

- **Sodium polystyrene sulfonate**
  - **INDICATIONS AND DOSE**
    - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
      - **BY MOUTH**
        - Adult: 15 g – 4 times a day
      - **BY RECTUM**
        - Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon
  - **CONTRA-INDICATIONS**
    - Obstructive bowel disease
  - **CAUTIONS**
    - Congestive heart failure - hypertension - oedema
  - **INTERACTIONS**
    - Appendix 1 (polystyrene sulfonate resins).
  - **SIDE-EFFECTS**
    - General Side-effects:
      - Anorexia - constipation (discontinue treatment—avoid magnesium-containing laxatives) - diarrhoea - gastric irritation - gastro-intestinal obstruction - hypocalcaemia - hypomagnesaemia - intestinal necrosis (reported with concomitant use of sorbitol) - ischaemic colitis - nausea - necrosis - sodium retention - ulceration - vomiting
    - Specific Side-effects:
      - With oral use: Gastro-intestinal concretions
      - With rectal use: Faecal impaction
  - **PREGNANCY**
    - Manufacturers advise use only if potential benefit outweighs risk—no information available.
  - **BREAST FEEDING**
    - Manufacturers advise use only if potential benefit outweighs risk—no information available.
  - **RENAAL IMPAIRMENT**
    - Use with caution.
  - **MONITORING REQUIREMENTS**
    - Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
  - **DIRECTIONS FOR ADMINISTRATION**
    - With rectal use: Mix each 30 g of resin with 150 mL of water or 10% glucose.
    - With oral use: Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

#### Potassium chloride

- **INDICATIONS AND DOSE**
  - Prevention of hypokalaemia (patients with normal diet)
    - **BY MOUTH**
      - Adult: 2-4 g daily in divided doses
  - **Electrolyte imbalance**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Dose dependent on deficit or the daily maintenance requirements

#### Important Safety Information

- Safe Practice
  - Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be thoroughly mixed. Local policies on avoiding...
Potassium Tablets

1 contains Kay-Cee-L 

mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice. Haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
  - With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
  - With oral use
    - Cardiac disease
    - elderly
    - hiatus hernia (with modified-release preparations)
    - history of peptic ulcer (with modified-release preparations)
    - intestinal stricture (with modified-release preparations)
- **INTERACTIONS** → Appendix 1 (potassium salts).
- **SIDE-EFFECTS**
  - Common or very common
    - Nausea
    - Vomiting
    - Abdominal pain
    - Diarrhoea
    - Flatulence
  - Frequency not known
  - With intravenous use
    - Heart toxicity (with rapid infusion)
  - With oral use
    - Bleeding (with modified-release preparations)
    - Gastro-intestinal obstruction (with modified-release preparations)
    - Ulceration (with modified-release preparations)
- **RENAL IMPAIRMENT** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
  - Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
  - With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use
    - Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states).
  - With intravenous use
    - Potassium chloride concentrate must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.
    - With intravenous use
      - Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K⁺ 20 mmol) in 10 mL, is thoroughly mixed with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L® contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets
  - With oral use
    - Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE**
  - Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.

- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations are inappropriate.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion
- **Modified-release tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 25, 27
  - Potassium chloride (Non-proprietary)
    - Potassium chloride 600 mg Kaleorid LP 600mg tablets | 30 tablet £0.48 no price available
    - Duro-K 600mg tablets | 100 tablet £0.48 no price available
- **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS** 21
  - Kay-Cee-L (Geistlich Sons Ltd)
    - Potassium chloride 75 mg per 1 ml Kay-Cee-L syrup sugar-free | 500 ml £7.95
- **Solution for infusion**
  - Potassium chloride (Non-proprietary)
    - Potassium chloride 150 mg per 1 ml Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule £6.50 | 20 ampoule £6.50
    - Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml Mini-Plasco ampoules | 20 ampoule £6.70
    - Potassium chloride 200 mg per 1 ml Potassium chloride 20% (potassium 13.3mmol/3ml) solution for infusion 5ml ampoules | 10 ampoule £3.64–£4.00
    - Potassium chloride 20% (potassium 27mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule £11.54

### 2 Metabolic disorders

#### 2.1 Acute porphyrias

**Acute porphyrias**

**Overview**

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrin crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 932 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

**Drugs unsafe for use in acute porphyrias**

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have
been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at www.wmic.wales.nhs.uk/specialist-services/drugs-in-porphyria/. Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre
University Hospital of Wales
CF14 4XW
Cardiff
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and tiapentol)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Hormone replacement therapy (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonamide derivatives (glipizide and glimepiride are thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
- Triazolone antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dextenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isomethylenepene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Mirtazapine
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
2.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levcarnitine (Carnitine)

- **INDICATIONS AND DOSE**
  - Primary carnitine deficiency due to inborn errors of metabolism
    - **BY MOUTH**
      - Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day.
    - **BY SLOW INTRAVENOUS INJECTION**
      - Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.
  - Secondary carnitine deficiency in haemodialysis patients
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
      - Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma–carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course.

- **CAUTIONS**
  - Diabetes mellitus
  - **SIDE-EFFECTS**
    - Abdominal pain • body odour • diarrhoea • nausea • vomiting
    - **SIDE-EFFECTS, FURTHER INFORMATION**
      - Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.
  - **PREGNANCY**
    - Appropriate use; no evidence of teratogenicity in animal studies.
  - **RENAL IMPAIRMENT**
    - Accumulation of metabolites may occur with chronic oral administration in severe impairment.
  - **MONITORING REQUIREMENTS**
    - Monitoring of free and acyl carnitine in blood and urine recommended.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
    - **Tablet**
      - Levcarnitine (Non-proprietary)
        - L-Carnitine 1 mg Carnitine 1g chewable tablets | 10 tablet £35.00
    - **Capsule**
      - Levcarnitine (Non-proprietary)
        - L-Carnitine 250 mg Bio-Carnitine 250mg capsules | 125 capsule £11.06
        - L-Carnitine 500 mg Lambert's L-Carnitine 500mg capsules | 60 capsule £11.67

- **Solution oral**
  - Levcarnitine (Non-proprietary)
    - L-Carnitine 150 mg/5ml Carnitine oral single dose 1g solution sugar-free | 10 unit dose £35.00

- **Solution for injection**
  - Levcarnitine (Non-proprietary)
    - L-Carnitine 200 mg/1 ml Carnitine 1g/5ml solution for injection ampoules | 5 ampoule £59.50

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Normosang (Orphan Europe (UK) Ltd)

---

**Blood and related products > Haem derivatives**

Haem arginate (Human hemin)

- **INDICATIONS AND DOSE**
  - Acute porphyrias • Acute intermittent porphyria • Porphyria variegata • Hereditary coproporphyria
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day.

- **SIDE-EFFECTS**
  - Common or very common • Pain at injection site • thrombophlebitis at injection site
  - Rare • Fever • hypersensitivity reactions
  - Frequency not known • Headache

- **PREGNANCY**
  - Manufacturer advises avoid unless essential.

- **CREATININE**
  - Manufacturer advises avoid unless essential—no information available.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Normosang®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter via large antibrachial or central vein; administer within 1 hour after dilution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Normosang (Orphan Europe (UK) Ltd)

---

**Blood and nutrition**
2.3 Fabry’s disease

ENZYMES

Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - **Fabry’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
    - Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** *Appendix 1 (agalsidase alfa and beta).
- **SIDE-EFFECTS**
  - **Common or very common** Acne, angioedema, arthralgia, asthenia, bradycardia, chest pain, cough, dizziness, dyspnoea, eye irritation, fatigue, flushing, gastrointestinal disturbances, headache, hypersensitivity reactions, hypotension, influenza-like symptoms, muscle spasms, myalgia, nasopharyngitis, neuropathic pain, oedema, palpitation, paraesthesia, pruritus, rash, rhinorrhoea, sleep disturbances, syncope, tachycardia, taste disturbances, tinnitus, tremor, urticaria
  - **Uncommon** Cold extremities, ear pain, eye swelling, injection-site reactions, parosmia, skin discoloration

SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions
  - Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - **Fabrazyme** (Genzyme Therapeutics Ltd)
      - Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial £1,068.64
      - Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial £1,962.59

Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - **Fabry’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
    - Adult: 1 mg/kg every 2 weeks

- **INTERACTIONS** *Appendix 1 (agalsidase alfa and beta).
- **SIDE-EFFECTS**
  - **Common or very common** Acne, angioedema, arthralgia, asthenia, bradycardia, chest pain, cough, dizziness, dyspnoea, eye irritation, fatigue, flushing, gastrointestinal disturbances, headache, hypersensitivity reactions, hypotension, influenza-like symptoms, muscle spasms, myalgia, nasopharyngitis, neuropathic pain, oedema, palpitation, paraesthesia, pruritus, rash, rhinorrhoea, sleep disturbances, syncope, tachycardia, taste disturbances, tinnitus, tremor, urticaria
  - **Uncommon** Cold extremities, ear pain, eye swelling, injection-site reactions, parosmia, skin discoloration

2.4 Gaucher’s disease

Other drugs used for Gaucher’s disease Miglustat, p. 937

ENZYMES

Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

- **INDICATIONS AND DOSE**
  - **Non-neurological manifestations of type I Gaucher’s disease (specialist use only)**
  - **Non-neurological manifestations of type III Gaucher’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly
934 Metabolic disorders

Betaine

- **INDICATIONS AND DOSE**
  - **Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)**
  - **BY MOUTH**
    - Adult: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

- **SIDE-EFFECTS**
  - Uncommon Agitation, alopecia, anorexia, depression, gastro-intestinal disorders, personality disorder, reversible cerebral oedema, sleep disturbances, urinary incontinence, urticaria
  - **PREGNANCY** Manufacturer advises caution—no information available.
  - **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

- **SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**
  - The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

  - **Powder**
    - Cystadane (Orphan Europe (UK) Ltd)
      - Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram £347.00

---

# Velaglucerase alfa

**DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

**INDICATIONS AND DOSE**

- **Type I Gaucher’s disease (specialist use only)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

**SIDE-EFFECTS** Abdominal pain, arthralgia, back pain, bone pain, dizziness, flushing, headache, hypersensitivity reactions, hypertension, hypotension, malaise, nausea, pyrexia, rash, tachycardia, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- Infusion-related reactions: Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

**PREGNANCY** Manufacturer advises use with caution—limited information available.

**BREAST FEEDING** Manufacturer advises use with caution—no information available.

**MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (VPRIV®), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - ELECTROLYTES: May contain Sodium
      - VPRIV (Shire Pharmaceuticals Ltd)
        - Velaglucerase alfa 400 unit VPRIV 400 units powder for solution for infusion vials | 1 vial £1,410.20

---

## 2.5 Homocystinuria

**METHYL DONORS**

**Betaine**

**INDICATIONS AND DOSE**

- **Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)**

---

**Velaglucerase alfa**

**INDICATIONS AND DOSE**

- **Type I Gaucher’s disease (specialist use only)**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

**SIDE-EFFECTS** Abdominal pain, arthralgia, back pain, bone pain, dizziness, flushing, headache, hypersensitivity reactions, hypertension, hypotension, malaise, nausea, pyrexia, rash, tachycardia, urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- Infusion-related reactions: Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

**PREGNANCY** Manufacturer advises use with caution—limited information available.

**BREAST FEEDING** Manufacturer advises use with caution—no information available.

**MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

**DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

  - **Powder**
    - Cystadane (Orphan Europe (UK) Ltd)
      - Betaine 1 gram per 1 gram Cystadane oral powder | 180 gram £347.00
2.6 Mucopolysaccharidosis

**ENZYMES**

### Elosulfase alfa

**DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

| CAUTIONS | Elderly—no information available • infusion-related reactions |
| CAUTIONS, FURTHER INFORMATION | Infusion-related reactions • Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction. |
| SIDE-EFFECTS | Common or very common • Abdominal pain • chills • diarrhea • dizziness • dyspnoea • headache • hypersensitivity • infusion-related reactions • myalgia • nausea • opharyngeal pain • pyrexia • vomiting |
| unemployed | Anaphylaxis |
| PREGNANCY | Manufacturer advises avoid unless essential |
| BREAST FEEDING | Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies |
| DIRECTIONS FOR ADMINISTRATION | For intravenous infusion (Vimizim®), give intermittently in Sodium Chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour. |
| HANDLING AND STORAGE | Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C. |
| PATIENT AND CARER ADVICE | Driving and skilled tasks • Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness. |
| MEDICINAL FORMS | There can be variation in the licensing of different medicines containing the same drug. |

#### Solution for infusion

- **Excipients:** May contain Polysorbates, sorbitol
- **Electrolytes:** May contain Sodium
- **Elosulfase alfa (non-proprietary)**
  - Elosulfase alfa 1 mg per 1 ml Vimizim 5mg/5ml solution for infusion vials | 1 vial £982.00

---

### Galsulfase

**DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

<table>
<thead>
<tr>
<th>INDICATIONS AND DOSE</th>
<th>Mucopolysaccharidosis VI (specialist use only)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BY INTRAVENOUS INFUSION</strong></td>
<td>Adult: 1 mg/kg once weekly</td>
</tr>
</tbody>
</table>

| CAUTIONS | Acute febrile illness (consider delaying treatment) • acute respiratory illness (consider delaying treatment) • infusion-related reactions can occur • respiratory disease |
| SIDE-EFFECTS | Abdominal pain • anaphylaxis • arreflexia • chest pain • conjunctivitis • corneal opacity • dyspnoea • ear pain • facial oedema • gastroenteritis • hypertension • infusion-related reactions • malaise • nasal congestion • pharyngitis • rigors • umbilical hernia |

#### SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details. |
| PREGNANCY | Manufacturer advises avoid unless essential. |
| BREAST FEEDING | Manufacturer advises avoid—no information available. |

#### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Naglazyme®), give intermittently in Sodium Chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

---

### Idursulfase

**DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

<table>

| CAUTIONS | Acute febrile respiratory illness (consider delaying treatment) • infusion-related reactions can occur • severe respiratory disease |
| SIDE-EFFECTS | Common or very common • Arrhythmia • arthralgia • bronchospasm • chest pain • cough • cyanosis • dizziness • dyspnoea • erythema • facial oedema • flushing • gastrointestinal disturbances • headache • hypertension • hypotension • hypoxia • infusion-site swelling • peripheral oedema • pruritus • pyrexia • rash • swollen tongue • tachycardia • tachypnoea • tremor • urticaria • wheezing |

---

#### Solution for infusion

- **Naglazyme** (BioMarin Europe Ltd)
- Galsulfase 1 mg per 1 ml Naglazyme 5mg/5ml solution for infusion vials | 1 vial £982.00
- **Frequency not known** Anaphylaxis · infusion-related reactions · pulmonary embolism

### SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Elaprase[^3]), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Elaprase** (Shire Pharmaceuticals Ltd)  
  - Idursulfase 2 mg per 1 mL Elaprase 6mg/3ml concentrate for solution for infusion vials [1 vial](http://example.com) £1.985.00

### Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

- **INDICATIONS AND DOSE**
  - Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Adult: 100 units/kg once weekly

- **CAUTIONS**
  - Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1 (laronidase).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dyspnoea · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pallor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting
  - **Frequency not known** Bronchospasm · infusion-related reactions · respiratory arrest

### DIRECTIONS FOR ADMINISTRATION

- **For intravenous infusion** (Aldurazyme[^4]), give intermittently in Sodium chloride 0.9%; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Elaprase** (Genzyme Therapeutics Ltd)  
  - Laronidase 100 unit per 1 mL Aldurazyme 500units/5ml solution for infusion vials [1 vial](http://example.com) £444.70

### 2.7 Nephropathic cystinosis

#### AMINO ACIDS AND DERIVATIVES

**Mercaptamine**

(Cysteamine)

- **INDICATIONS AND DOSE**
  - Nephropathic cystinosis (specialist use only)
    - **BY MOUTH**
      - Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

### DOSE EQUIVALENCE AND CONVERSION

- 1.3 g/m² is approximately equivalent to 50 mg/kg.

### IMPORTANT SAFETY INFORMATION

#### SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS**
  - Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

### SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · breath and body odour · diarrhoea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
  - **Uncommon** Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures

### ALLERGY AND CROSS-SENSITIVITY

- Contra-indicated if history of hypersensitivity to penicillamine.

#### PREGNANCY

- Avoid—teratogenic and toxic in animal studies.

#### BREAST FEEDING

- Avoid.

#### MONITORING REQUIREMENTS

- Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

#### PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.
### Pompe disease

#### ENZYMES

**Alglucosidase alfa**

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

- **INDICATIONS AND DOSE**
  - **Pompe disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction, infusion-related reactions—consult product literature.

- **SIDE-EFFECTS**
  - Common or very common: Agitation, anaphylaxis, antibody formation, blood pressure changes, bronchospasm, chest discomfort, cold extremities, cough, dyspnoea, dyspnoea, dyspepsia, flatulence, headache, hypoaesthesia, insomnia, malaise, muscle spasm, muscle weakness, nausea, paraesthesia, peripheral neuropathy, pruritus, pyrexia, rash, restlessness, sweating, tachycardia, tachypnoea, tremor, urticaria, vomiting
  - Frequency not known: Infusion-related reactions, necrotising skin lesions, severe skin reactions, ulcerative skin lesions

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related reactions
  - Consult product literature for details.

- **PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor closely if cardiac dysfunction.
  - Monitor closely if respiratory dysfunction.
  - Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Myozyme®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL of water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low-protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

#### Niemann-Pick type C disease

**ENZYME INHIBITORS**

- **Glucosylceramide synthase inhibitors**
  - Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

- **INDICATIONS AND DOSE**
  - Mild to moderate type I Gaucher’s disease for whom enzyme replacement therapy is unsuitable (under expert supervision)
    - **BY MOUTH**
      - Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day
  - Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)
    - **BY MOUTH**
      - Adult: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain, anorexia, ataxia, chills, constipation, decreased libido, depression, diarrhoea, dizziness, dyspepsia, flatulence, headache, hypoaesthesia, insomnia, malaise, muscle spasm, muscle weakness, nausea, paraesthesia, peripheral neuropathy, tachycardia, tremor, vomiting, weight changes

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid—tolerability in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m². For Gaucher’s disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m². For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m². Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m²

- **MONITORING REQUIREMENTS**
  - Monitor cognitive and neurological function.
  - Monitor growth and platelet count in Niemann-Pick type C disease.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - Cystagon (Orphan Europe (UK) Ltd)
    - Miglustat 100 mg Cystagon 100 mg capsules | 84 capsule £3,934.17 (Hospital only)

- **PREGNANCY**
  - Monitor immunoglobulin G (IgG) antibody concentration.
  - Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

- **BREAST FEEDING**
  - Manufactured advises avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor closely if cardiac dysfunction.
  - Monitor closely if respiratory dysfunction.
  - Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Myozyme®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL of water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low-protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - Zavesca (Actelion Pharmaceuticals UK Ltd)
    - Miglustat 100 mg Zavesca 100 mg capsules | 84 capsule £3,934.17 (Hospital only)
2.10 Tyrosinaemia type I

ENZYME INHIBITORS

4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

(NTBC)

- INDICATIONS AND DOSE
  Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)
  - BY MOUTH
  - Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- SIDE-EFFECTS
  - Common or very common Conjunctivitis - corneal opacity - eye pain - granulocytopenia - keratitis - leucopenia - photophobia - thrombocytopenia
  - Uncommon Blepharitis - erythematous rash - exfoliative dermatitis - leucocytosis - pruritus
  - PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.
  - BREAST FEEDING Manufacturer advises avoid — adverse effects in animal studies.
  - PRE-TREATMENT SCREENING Slit-lamp examination of eyes recommended before treatment.
  - MONITORING REQUIREMENTS
    - Monitor liver function regularly.
    - Monitor platelet and white blood cell count every 6 months.
  - DIRECTIONS FOR ADMINISTRATION Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  - Capsule
    - Orfadin (Swedish Orphan Biovitrum Ltd)
      Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule £564.00
      Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule £1,127.00
      Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule £2,062.00
      Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule £4,512.00
  - Oral suspension
    - Orfadin (Swedish Orphan Biovitrum Ltd)
      Nitisinone 4 mg per 1 ml Orfadin 4mg/1ml oral suspension sugar-free | 90 ml £1,692.00

2.11 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Carglumic acid

- INDICATIONS AND DOSE
  Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)
  - BY MOUTH
  - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

- INTERACTIONS
  - Appendix 1 (sodium phenylbutyrate).

- SIDE-EFFECTS
  - Common or very common Alkalosis - blood disorders - body odour - decreased appetite - depression - gastro-intestinal disturbances - headache - irritability - menstrual disorders - metabolic acidosis - oedema - rash - renal tubular acidosis - syncope - taste disturbance - weight gain
  - Uncommon Arrhythmias - pancreatitis - peptic ulcer - rectal bleeding

Hyperammonaemia due to organic acidaemia (under expert supervision)

- BY MOUTH
  - Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- SIDE-EFFECTS
  - Common or very common Sweating
  - Uncommon Bradycardia - diarrhoea - pyrexia - vomiting
  - PREGNANCY Manufacturer advises avoid unless essential — no information available.
  - BREAST FEEDING Manufacturer advises avoid — present in milk in animal studies.
  - DIRECTIONS FOR ADMINISTRATION Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  - Dispersible tablet
    - Carbaglu (Orphan Europe (UK) Ltd)
      Carglumic acid 200 mg: Carbaglu 200mg dispersible tablets sugar-free | 5 tablet £299.00 sugar-free | 60 tablet £3,499.00

DRUGS FOR METABOLIC DISORDERS

AMMONIA LOWERING DRUGS

Sodium phenylbutyrate

- INDICATIONS AND DOSE
  Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)
  - BY MOUTH
  - Adult: 9.9–13 g/m² daily in divided doses, with meals; maximum 20 g per day

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- CAUTIONS Congestive heart failure (preparations contain significant amounts of sodium)
- INTERACTIONS
  - Appendix 1 (sodium phenylbutyrate).
- SIDE-EFFECTS
  - Common or very common Alkalosis - blood disorders - body odour - decreased appetite - depression - gastro-intestinal disturbances - headache - irritability - menstrual disorders - metabolic acidosis - oedema - rash - renal tubular acidosis - syncope - taste disturbance - weight gain
  - Uncommon Arrhythmias - pancreatitis - peptic ulcer - rectal bleeding
SIDE-EFFECTS, FURTHER INFORMATION
Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

- CONCEPTION AND CONTRACEPTION Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises use with caution.
- RENAL IMPAIRMENT Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- DIRECTIONS FOR ADMINISTRATION
  - Granules should be mixed with food before taking. Pheburane® granules must not be administered by nasogastric or gastrostomy tubes.

2.12 Wilson’s disease

Other drugs used for Wilson’s disease Penicillamine, p. 964

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Zinc acetate

- INDICATIONS AND DOSE
  - Wilson’s disease (initiated under specialist supervision)
    - BY MOUTH
    - Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

DOSE EQUIVALENCE AND CONVERSION
- Doses expressed as elemental zinc.

PHARMACOKINETICS
Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- CAUTIONS Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- INTERACTIONS → Appendix 1 (zinc)
- SIDE-EFFECTS
  - Common or very common Gastric irritation (usually transient)
  - Uncommon Leucopenia · sideroblastic anaemia

SIDE-EFFECTS, FURTHER INFORMATION
Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- PREGNANCY Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.
- BREAST FEEDING Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.
- MONITORING REQUIREMENTS Monitor full blood count and serum cholesterol.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Capsule
  - CAUTIONARY AND ADVISORY LABELS 23
  - Wilson (Orphan Europe (UK) Ltd)
    - Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule POM £132.00
    - Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule POM £242.00

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Trientine dihydrochloride

- INDICATIONS AND DOSE
  - Wilson’s disease in patients intolerant of penicillamine
    - BY MOUTH
    - Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

- INTERACTIONS → Appendix 1 (trientine).
- SIDE-EFFECTS
  - Common or very common Nausea · rash
  - Very rare Anaemia
  - Frequency not known Colitis · duodenitis
- PREGNANCY Teratogenic in animal studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.
- PRESCRIBING AND DISPENSING INFORMATION Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Capsule
  - CAUTIONARY AND ADVISORY LABELS 6, 22
  - Trientine dihydrochloride (Non-proprietary)
    - Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule POM no price available

3  Mineral and trace elements deficiencies

3.1 Selenium deficiency

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.
VITAMINS AND TRACE ELEMENTS

Selenium

- **INDICATIONS AND DOSE**
  - Selenium deficiency
    - By mouth, or by intramuscular injection, or by intravenous injection
    - Adult: 100–500 micrograms daily
  - **INTERACTIONS** → Appendix 1 (selenium).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Selenium (Non-proprietary)
      - Selenium (as L-Selenomethionine) 100 microgram Solgar Selenium 100microgram tablets | 100 tablet no price available
      - L-Selenomethionine 200 microgram Solgar Selenium 200microgram tablets | 50 tablet no price available
      - 250 tablet no price available
      - EN-Selenium 200microgram tablets | 30 tablet £88.60
      - HealthAid Selenium 200microgram tablets | 60 tablet £3.90
      - Lamberts Selenium 200microgram tablets | 60 tablet £4.08
  - SelenoPrecise (Pharma Nord (UK) Ltd)

    - L-Selenomethionine 200 microgram SelenoPrecise 200microgram tablets | 60 tablet £4.02
  - **Capsule**
    - Selenium (Non-proprietary)
      - L-Selenomethionine 200 microgram Selenium 200microgram capsules | 30 capsule £3.20 | 60 capsule £5.79
  - **Oral solution**
    - Selense (Baxter Healthcare Ltd)
      - Selenium (as Sodium selenite) 50 microgram per 1 ml Selense 100micrograms/2ml oral solution 2ml unit-dose ampoules | 20 unit dose [P] no price available
      - Selense 500micrograms/10ml oral solution unit dose vials | 10 unit dose [P] no price available
  - **Solution for injection**
    - Selense (Baxter Healthcare Ltd)
      - Selenium (as Sodium selenite) 50 microgram per 1 ml Selense 100micrograms/2ml solution for injection ampoules | 10 ampoule [P] no price available
      - Selense 500micrograms/10ml solution for injection vials | 10 vial [P] no price available

3.2 Zinc deficiency

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson’s disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

Electrolytes and minerals → Zinc

Zinc sulfate

- **INDICATIONS AND DOSE**
  - Zinc deficiency or supplementation in zinc-losing conditions
    - By mouth using effervescent tablets
    - Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
    - Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
    - Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
    - Adult (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
  - Additional elemental zinc for intravenous nutrition
    - By intravenous injection
      - Adult: 6.5 mg daily (Zn²⁺ 100 micromol)
  - **INTERACTIONS** → Appendix 1 (zinc).
  - **SIDE-EFFECTS** Abdominal pain, diarrhoea, dyspepsia, gastric irritation, gastritis, headache, irritability, lethargy, nausea, vomiting
  - **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
  - **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
  - **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.
  - **PRESCRIBING AND DISPENSING INFORMATION** Each Solvazinc® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
  - **Effervescent tablet**
    - CAUTIONARY AND ADVISORY LABELS 13, 21
    - Solvazinc (Galen Ltd)
      - Zinc sulfate monohydrate 125 mg Solvazinc 125mg effervescent tablets sugar-free | 90 tablet [P] £16.45 DT price + £16.45

4 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 941.

1 1000 kcal = 4200kJ; 1000 kJ = 238.8 kcal. All entries are Prescription-only medicines.
2 Excludes protein- or amino acid-derived energy.
Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁₂, as hydroxocobalamin p. 899, is given by intramuscular injection; regular vitamin B₁₂ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 898 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric canulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 915) and electrolytes. Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily. Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives should not be mixed with fat emulsions unless compatibility is known.

Administration Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases product literature and other specialist literature should be consulted.

**NUTRIENTS > PARENTERAL NUTRITION**

### Parenteral nutrition supplements

#### INDICATIONS AND DOSE

**Dipeptiven 20g/100ml Concentrate for Solution for Infusion Bottles**

**Amino acid supplement for hypercatabolic or hypermetabolic states**

- **BY INTRAVENOUS INFUSION**
- Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

#### CAUTIONS

**Peditrave Solution for Infusion 10ml Vials** Reduced biliary excretion; reduced biliary excretion in cholestatic liver disease; reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month

#### DIRECTIONS FOR ADMINISTRATION

Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

**Cernevit Solution for Injection Vials and Diluent** Dissolve in 5 mL water for injections.

**Peditrave Solution for Infusion 10ml Vials** For addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions, and glucose intravenous infusions.

**Tracutil® Ampoules** For addition to infusion solutions.

**Decan Concentrate for Solution for Infusion 40mL Bottles** For addition to infusion solutions.

**Addiphos® Vials** For addition to Vamin® solutions and glucose intravenous infusions.

**Dipeptiven 20g/100ml Concentrate for Solution for Infusion Bottles** For addition to infusion solutions containing amino acids.

**Additrace Solution for Infusion 10ml Ampoules** For addition to Vamin® solutions and glucose intravenous infusions.

**Glycophos® Vials** For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions.

**Solviton Powder for Solution for Infusion Vials** Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only.

**Vitlipid N Infant Emulsion for Injection 10ml Ampoules** For addition to Intralipid®.

**Vitlipid N Adult Emulsion for Injection 10ml Ampoules** For addition to Intralipid®.
PRESCRIBING AND DISPENSING INFORMATION

Cernevit® solution contains dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, Biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantethionic acid (as dexpantethanol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dilyhydrated sodium phosphate) 4.14 mg, thiamine (as cocarcocobale tetrahydride) 3.51 mg.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS

Peditrace® solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁶⁻, I⁻, F⁻.

TRACUTIL® AMPULES

Tractuit® solution contains trace elements Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁶⁻, Mo⁶⁻, Cr³⁺.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES

For patients over 40 kg. Decan® solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁶⁻, Mo⁶⁻, Cr³⁺.

ADDIPHOS® VIALS

Addiphos® sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

Dipeptiven 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Dipeptiven® solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

ADDITRACE SOLUTION FOR INFUSION 10ML VIALS

Additrace solution contains traces of Fe²⁺, Zn²⁺, Cu²⁺, Cr³⁺, Se⁶⁻, Mo⁶⁻, F⁻.

GLYCOPHOS® VIALS

Glycophos® Sterile Concentrate Solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS

Solivito N® powder for reconstitution contains Biotin 60 micrograms, Cyanocobalamin 5 micrograms, Folic acid 400 micrograms, glycine 300 mg, Nicotinamide 40 mg, Pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 113 mg, thiamine mononitrate 3.1 mg.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPULES

Vitlipid N® infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPULES

Vitlipid N® adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For adults and children over 11 years.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

Cernevit® (Baxter Healthcare Ltd)

Alpha tocopherol 11.2 unit. Ascorbic acid 125 mg. Biotin 69 micrograms, Colecalciferol 220 unit. Cyanocobalamin 6 micrograms, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pantothenic acid (as Dexpantethanol) 17.25 mg, Folic acid 414 micrograms, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Nicotinamide 46 mg, Retinol 3500 unit. Cernevit solution for injection vials and diluent | 10 vial | no price available

Emulsion for injection

Vitlipid N Adult (Fresenius Kabi Ltd)

Alpha tocopherol 910 microgram per 1 mL. Ergocalciferol 500 nanogram per 1 mL. Phytomenadione 15 microgram per 1 mL. Retinol palmitate 99 microgram per 1 mL. Vitlipid N Adult emulsion for injection 10ml ampoules | 1 ampoule | £1.97 | 10 ampoules | no price available

Vitlipid N Infant (Fresenius Kabi Ltd)

Ergocalciferol 1 microgram per 1 mL. Phytomenadione 20 microgram per 1 mL. Retinol palmitate 69 microgram per 1 mL. Alpha tocopherol 640 microgram per 1 mL. Vitlipid N Infant emulsion for injection 10ml ampoules | 1 ampoule | £1.97 | 10 ampoules | no price available

Solution for infusion

Parenteral nutrition supplements (Non-proprietary)

Sodium glycerophosphate 216 mg per 1 mL. Glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial | £4.83 | 10 vial | no price available

Additrace (Fresenius Kabi Ltd)

Sodium molydate 0.85 microgram per 1 mL. Chronic chloride 5.33 microgram per 1 mL. Sodium selenite 10.5 microgram per 1 mL. Potassium iodide 16.6 microgram per 1 mL. Manganese chloride 99 microgram per 1 mL. Sodium fluoride 210 microgram per 1 mL. Copper chloride 340 microgram per 1 mL. Ferric chloride 544 microgram per 1 mL. Zinc chloride 1.36 mg per 1 mL. Additrace solution for infusion 10ml ampoules | 1 ampoule | £1.96 | 20 ampoules | no price available

Dipeptiven (Fresenius Kabi Ltd)

N(2)-L-alanyl-L-glutamine 200 mg per 1 mL. Dipeptiven 20G/100ML concentrate for solution for infusion bottles | 1 bottle | £25.93 | 10 bottle | no price available

Additrace (Fresenius Kabi Ltd)

Sodium molybdate dihydrate 2.42 microgram per 1 mL. Chronic chloride 5.3 microgram per 1 mL. Sodium selenite pentahydrate 7.89 microgram per 1 mL. Potassium iodide 16.6 microgram per 1 mL. Sodium fluoride 126 microgram per 1 mL. Manganese chloride 1979 microgram per 1 mL. Copper chloride 204.6 microgram per 1 mL. Zinc chloride 681.5 microgram per 1 mL. Ferrous chloride 695.8 microgram per 1 mL. Tracutil concentrate for solution for infusion 10ml ampoules | 5 ampoule | £7.96

Powder for solution for infusion

Solivito (Fresenius Kabi Ltd)

Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg. Solivito N powder for solution for infusion vials | 1 vial | £1.97 | 10 vial | no price available

5 Nutrition (oral)

Enteral nutrition

Overview

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or
free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

**Enteral nutrition in children**

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

### 5.1 Special diets

#### Nutrition in special diets

**Overview**

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

**Coeliac disease**

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 34.

**Phenylketonuria**

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

#### 5.1a Phenylketonuria

**Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)**

- **BY MOUTH**
- **Adult:** Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

- **CAUTIONS** History of convulsions
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain • cough • diarrhoea • headache • nasal congestion • pharyngolaryngeal pain • vomiting
  - **Frequency not known** Hypersensitivity reactions
- **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
  - Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### 6 Vitamin deficiency

**Vitamins**

**Overview**

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general ‘pick-me-ups’ is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 952 and pyridoxine hydrochloride p. 950, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of
Dental patients
It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.
Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A
Deficiency of vitamin A p. 949 (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin B group
Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine (B₁) p. 950, riboflavin (B₂), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantotheneic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.
The severe deficiency states Wernicke’s encephalopathy and Korsakoff’s psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (Parabinex®), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.
As with other vitamins of the B group, pyridoxine hydrochloride (B₆) deficiency is rare, but it may occur during isoniazid p. 541 therapy or penicillamine p. 964 treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.
Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 886 and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid p. 838 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C
Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.
Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.
Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

Vitamin D
The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D₂) p. 955, colecalciferol (vitamin D₃) p. 953, dihydrotachysterol p. 955, alfalcacidol (1α-hydroxycolecalciferol) p. 952, and calcitriol (1,25-dihydroxycolecalciferol) p. 953.
Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.
Preparations containing colecalciferol with calcium carbonate p. 954 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.
Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses.
Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfalcacidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.
Paricalcitol p. 956, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Vitamin E
The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.
Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K
Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.
Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 957 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.
Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

Other compounds
Potassium aminobenzoate p. 949 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie’s disease. In Peyronie’s disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.
VITAMINS AND TRACE ELEMENTS

MULTIVITAMINS

Vitamin A and D

- **INDICATIONS AND DOSE**
  - Prevention of vitamin A and D deficiency
  - **BY MOUTH**
    - Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
    - Adult: (consult product literature)

- **UNLICENSED USE** Not licensed in children under 6 months of age.
- **INTERACTIONS** → Appendix 1 (vitamins).
- **SIDE-EFFECTS**
  - **OVERDOSE**
    - Excessive ingestion: Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Capsule**
      - Vitamins a and d (Non-proprietary)
      - **Vitamin D 400 unit** capsule £0.71 [28 capsule £2.11] 84 capsule £6.58-£8.42 DT price = £7.47

Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 952.

- **INDICATIONS AND DOSE**
  - Prevention of vitamin deficiency
  - **BY MOUTH**
    - Child 1 month–4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

  - Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Oral drops**
      - Healthy Start Children’s Vitamin (Secretary of State for Health)
        - Vitamin A and D3 concentrate.55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml Healthy Start Children’s Vitamin drops | 10 ml no price available

- **VITAMINS AND TRACE ELEMENTS**
  - **VITAMIN A**
    - **INDICATIONS AND DOSE**
      - Vitamin A deficiency
      - **BY MOUTH**
        - Child 1–11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
        - Child 1–17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

- **UNLICENSED USE** Preparations containing only vitamin A are not licensed.
- **INTERACTIONS** → Appendix 1 (vitamins).
- **SIDE-EFFECTS**
  - **OVERDOSE**
    - Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

- **PREGNANCY** Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

- **BREAST FEEDING** Theoretical risk of toxicity in infants of mothers taking large doses.
- **MONITORING REQUIREMENTS** Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: drops
    - **Drops**
      - Vitamin a (Non-proprietary)
      - Vitamin A 50000 unit per 1 ml Arovit 150,000 units/ml drops | 7.5 ml [Potaba] no price available

  - Combinations available: *Vitamins A, C and D*, above

Potassium aminobenzoate

- **INDICATIONS AND DOSE**
  - Peyronie's disease | Scleroderma
  - **BY MOUTH**
    - Adult: 12 g daily in divided doses, to be taken after food

- **INTERACTIONS** → Appendix 1 (potassium aminobenzoate).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Capsule**

Pyridoxine hydrochloride
(Vitamin B₆)

- **INDICATIONS AND DOSE**
  - **Deficiency states**
    - **BY MOUTH**
      - Adult: 20–50 mg 1–3 times a day
  - **Isoniazid-induced neuropathy (prophylaxis)**
    - **BY MOUTH**
      - Adult: 10–20 mg daily
  - **Isoniazid-induced neuropathy (treatment)**
    - **BY MOUTH**
      - Adult: 50 mg 3 times a day
  - **Idiopathic sideroblastic anaemia**
    - **BY MOUTH**
      - Adult: 100–400 mg daily in divided doses
  - **Prevention of penicillamine-induced neuropathy in Wilson’s disease**
    - **BY MOUTH**
      - Adult: 20 mg daily
  - **Premenstrual syndrome**
    - **BY MOUTH**
      - Adult: 50–100 mg daily

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)

**Overdose** Overdosage induces toxic effects.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, cream

**Tablet**

- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 10 mg
    - Tablet [GSL] no price available | 28 tablet £0.50 | 50 tablet £1.90
  - Pyridoxine hydrochloride 20 mg
    - Tablet [GSL] no price available | 28 tablet £1.00 | 50 tablet £2.00
  - Pyridoxine hydrochloride 50 mg
    - Tablet [GSL] no price available | 28 tablet £2.00
  - **Pyridine** (Ennogen Healthcare Ltd)
    - Pyridine hydrochloride 10 mg
      - Tablet [GSL] no price available | 30 tablet £1.00
    - Pyridine hydrochloride 20 mg

  - Solution for injection
    - Pyridoxine hydrochloride 50 mg per 1 ml
      - Vitamin B6 Streuli 100mg/2ml solution for injection ampoules | 10 ampoule [POM] no price available

Thiamine
(Vitamin B₁)

- **INDICATIONS AND DOSE**
  - **Mild deficiency**
    - **BY MOUTH**
      - Adult: 25–100 mg daily
  - **Severe deficiency**
    - **BY MOUTH**
      - Adult: 200–300 mg daily in divided doses

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

- **CAUTIONS** Anaphylaxis may occasionally follow injection
- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methylglyoxal present in milk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Thiamine (Non-proprietary)**
  - Thiamine hydrochloride 50 mg
    - Thiamine 50mg tablets | 28 tablet | £1.80–2.00 | 100 tablet | £7.14
  - Thiamine hydrochloride 100 mg
    - Thiamine 100mg tablets | 28 tablet | £2.00–2.80 | 100 tablet | £10.00
  - Thiamine hydrochloride 200 mg
    - Thiamine 200mg tablets | 100 tablet | £6.99
  - **Tyvera (Audent McKenzie (Pharma Division) Ltd)**
    - Thiamine hydrochloride 50 mg
      - Tyvera 50mg tablets | 100 tablet | £4.99
    - Thiamine hydrochloride 100 mg
      - Tyvera 100mg tablets | 100 tablet | £6.99

**Modified-release tablet**

- **Thiamine (Non-proprietary)**
  - Thiamine hydrochloride 100 mg
    - HealthAid Vitamin B1 100mg modified-release tablets | 90 tablet £4.18

**Vitamin B complex**

- **INDICATIONS AND DOSE**
  - **Treatment of deficiency**
    - **BY MOUTH USING TABLETS**
      - Adult: 1–2 tablets 3 times a day, this dose is for vitamin B compound strong tablets
  - **Prophylaxis of deficiency**
    - **BY MOUTH USING TABLETS**
      - Adult: 1–2 tablets daily, this dose is for vitamin B compound tablets

- **LESS SUITABLE FOR PRESCRIBING** Vitamin B compound tablets and vitamin B compound strong tablets are less suitable for prescribing.
DIRECTIONS FOR ADMINISTRATION

UNLICENSED USE

Pabrinex® doses in BNF may differ from those in product literature.

DIRECTIONS FOR ADMINISTRATION

Give (Pabrinex® I/V High Potency) intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Ampoules contents should be mixed, diluted, and administered without delay; give over 30 minutes.

PRESCRIBING AND DISPENSING INFORMATION

Some formulations of Pabrinex® may contain benzyl alcohol. Pabrinex® I/V High Potency Injection is for intramuscular use only. Pabrinex® I/V High Potency injection is for intravenous use only.

Vitamin B substances with ascorbic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, thiamine p. 950, ascorbic acid p. 952.

INDICATIONS AND DOSE

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states) Maintenance of vitamins B and C in chronic intermittent haemodialysis

▶ BY INTRAVENOUS INFUSION
▶ Adult: See MHRA/CHM advice in thiamine monograph (consult product literature).

Treatment of Wernicke’s encephalopathy

▶ INITIALLY BY INTRAVENOUS INFUSION
▶ Adult: 2 – 3 pairs 3 times a day for 2 days, discontinue if no response, continue treatment if symptoms respond after 2 days; (by intravenous infusion or by deep intramuscular injection) 1 pair once daily for 5 days or for as long as improvement continues, give deep intramuscular injection into the gluteal muscle

Prophylaxis of Wernicke’s encephalopathy in alcohol dependence

▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
▶ Adult: 1 pair once daily for at least 3 – 5 days, give deep intramuscular injection into the gluteal muscle

Psychosis following narcosis or electroconvulsive therapy

▶ TOXICITY FROM ACUTE INFECTIONS
▶ BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION
▶ Adult: 1 pair twice daily for up to 7 days, give deep intramuscular injection into the gluteal muscle

Haemodialysis

▶ BY INTRAVENOUS INFUSION
▶ Adult: 1 pair every 2 weeks

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for Injection

EXCIPIENTS: May contain Benzyl alcohol

Pabrinex Intramuscular High Potency (Kyowa Kirin Ltd)

Pabrinex Intravenous High Potency solution for injection 5ml and 2ml ampoules | 20 ampoule Pot £22.53 DT price = £22.53

Pabrinex Intravenous High Potency (Kyowa Kirin Ltd)

Pabrinex Intravenous High Potency solution for injection 5ml and 5ml ampoules | 20 ampoule Pot £22.53 DT price = £22.53

Solution for Injection

There can be variation in the licensing of different medicines containing the same drug.

Vitamin deficiency

951

Vitamin and mineral deficiency and as adjunct in synthetic diets

▶ BY MOUTH
▶ Adult: 1 capsule daily, one hour after a meal

KETOVITE® LIQUID

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

▶ BY MOUTH
▶ Adult: 5 mL daily, use with Ketovite® Tablets for complete vitamin supplementation.

KETOVITE® TABLETS

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

▶ BY MOUTH
▶ Adult: 1 tablet 3 times a day, use with Ketovite® Liquid for complete vitamin supplementation.

PRESCRIBING AND DISPENSING INFORMATION

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

PATIENT AND CARER ADVICE

KETOVITE® LIQUID Ketovite® liquid may be mixed with milk, cereal, or fruit juice.

KETOVITE® TABLETS Tablets may be crushed immediately before use.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Ketovite (Essential Pharmaceuticals Ltd)

Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Alpha tocopherol acetate 5 mg, Ascorbic acid 16.6 mg, Biotin 170 microgram, Calcium pantothenate 1.16 mg, Folic acid 250 microgram, Nicotinamide 3.3 mg, Inositol 50 mg, Pyridoxine hydrochloride 330 microgram Ketovite tablets | 100 tablet Pot £5.21

Capsule

Forceval (Alliance Pharmaceuticals Ltd)

Ascorbic acid 60 mg, Biotin 100 microgram, Riboflavin 1.6 mg, Calcium 100 mg, Selenium 50 microgram, Chromium 200 microgram, Copper 2 mg, Cyanocobalamin 3 microgram, Ergocalciferol 400 unit, Iodine 140 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopheryl acetate 10 mg, Iron 12 mg, Magnesium 30 mg, Molybdenum 250 microgram, Zinc 15 mg, Nicotinamide 18 mg, Phosphorus 77 mg, Vitamin A 2500 unit Forceval capsules | 15 capsule Pot £4.42 | 30 capsule Pot £7.71 | 90 capsule Pot £23.13
**952** Vitamin deficiency

Oral emulsion
- Ketovite (Essential Pharmaceuticals Ltd)
  Choline chloride 30 mg per 1 ml, Cyanocobalamin 2.5 microgram per 1 ml, Ergocalciferol 80 unit per 1 ml, Vitamin A 500 unit per 1 ml Ketovite liquid sugar-free | 150 ml £19.10

**VITAMINS AND TRACE ELEMENTS** > **VITAMIN C**

**Ascorbic acid**
**(Vitamin C)**

- **INDICATIONS AND DOSE**
  - **Prevention of scurvy**
    - **Adult:** 25–75 mg daily
  - **Treatment of scurvy**
    - **Adult:** Not less than 250 mg daily in divided doses

- **INTERACTIONS** > Appendix 1 (vitamins).
- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**EXCIPIENTS:** May contain Aspartame
- **Ascorbic acid (Non-proprietary)**
  - Ascorbic acid 50 mg Ascorbic acid 50mg tablets | 28 tablet GSL £15.05 DT price = £15.05 | 28 tablet no price available DT price = £15.05 | 500 tablet GSL no price available

  - Ascorbic acid 1 gram Vitamin C 1000mg capsules | 100 capsule no price available | 250 capsule no price available
  - Ascorbic acid 500 mg Vitamin C 500mg capsules | 100 capsule no price available

**Combinations available:** *Vitamin B substances with ascorbic acid*, p. 951 - *Vitamins A, C and D*, p. 949

**VITAMINS AND TRACE ELEMENTS** > **VITAMIN D AND ANALOGUES**

**Vitamin D and analogues**
**(systemic)**

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification
- **INTERACTIONS** > Appendix 1 (vitamins).
- **SIDE-EFFECTS**
  - Overdose
    - Symptoms of overdose include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
  - **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
  - **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
  - **MONITORING REQUIREMENTS** Important: All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occurs.

**Alfacalcidol**
**(1α-Hydroxycholecalciferol)**

- **INDICATIONS AND DOSE**
  - **Patients with severe renal impairment requiring vitamin D therapy**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION**
      - **Adult:** Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
      - **Elderly:** Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
  - **Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION**
      - **Child 1 month–11 years:** 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
      - **Child 12–17 years:** 1 microgram once daily, dose to be adjusted as necessary
  - **Prevention of vitamin D deficiency in renal or cholestatic liver disease**
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION**
      - **Child 1 month–11 years (body-weight up to 20 kg):** 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
      - **Child 1 month–11 years (body-weight 20 kg and above):** 250–500 nanograms once daily, dose to be adjusted as necessary
      - **Child 12–17 years:** 250–500 nanograms once daily, dose to be adjusted as necessary
  - **DOSE EQUIVALENCE AND CONVERSION**
    - One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants
- **SIDE-EFFECTS**
  - Rare Nephrocalcinosis · pruritus · rash · urticaria
Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS**  Monitor plasma-calcium concentration in patients receiving high doses.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- **Calcitriol (Non-proprietary)**
  - Calcitriol 250 nanogram capsules | 30 capsule (Pom) £5.20 DT price = £2.49
  - Calcitriol 500 nanogram capsules | 30 capsule (Pom) £10.00 DT price = £5.66

  - Calcitriol 1 microgram capsules | 30 capsule (Pom) £8.75 DT price = £7.10

**Oral drops**

- **Calcitriol 2 microgram per 1 ml** One-Alfa 2 micrograms/ml oral drops sugar-free | 10 ml (Pom) £21.30 DT price = £21.30

**Solution for injection**

- **Calcitriol 2 microgram per 1 ml** One-Alfa 2 micrograms/ml oral solution for injection ampoules | 10 ampoule (Pom) £41.13

**Colecalciferol**  

(Cholecalciferol; Vitamin D₃)

**INDICATIONS AND DOSE**

**Prevention of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 400 units daily

**Treatment of vitamin D deficiency**

- **BY MOUTH**
  - Adult: 800 units daily, higher doses may be necessary for severe deficiency

**RENAL IMPAIRMENT**  Monitor plasma-calcium concentration in patients receiving high doses.

**MONITORING REQUIREMENTS**  Monitor plasma-calcium concentration in patients receiving high doses.

**DIRECTIONS FOR ADMINISTRATION**

- Contents of capsule may be administered by oral syringe.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- **Calcitriol (Non-proprietary)**
  - Calcitriol 250 nanogram capsules | 30 capsule (Pom) £18.04 DT price + £18.04
  - Calcitriol 500 nanogram capsules | 30 capsule (Pom) £32.25 DT price + £32.25

**Oral solution**

- **Calcitriol (Non-proprietary)**
  - Calcitriol 1 microgram per 1 ml Rocaltrol micrograms/ml oral solution sugar-free | 10 ml (Pom) no price available

**Calcitriol**  

(1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**

**Renal osteodystrophy**

- **BY MOUTH**
  - Adult: Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)**

- **BY MOUTH**
  - Adult: Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

**Established postmenopausal osteoporosis**

- **BY MOUTH**
  - Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

**HEPATIC IMPAIRMENT**  Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**  Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS**

- Monitor plasma calcium, phosphate, and creatinine during dosage titration.

**Blood and nutrition**

### Colecalciferol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 953, calcium carbonate p. 919.

#### INDICATIONS AND DOSE

Prevention and treatment of vitamin D and calcium deficiency

- **By mouth**
  - Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

#### PRESCRIBING AND DISPENSING INFORMATION

**Accrete D3®** contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); **Adcal-D3®** tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); **CalcitD® D3** contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 11 micrograms (440 units/sachet); **Calcios®** contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Calcichew-D3® Tablets** contain calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 5 micrograms (200 units); **Calcichew-D3® Forte Tablets** contain calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Calcichew-D3® 500 mg/400 unit caplets contain calcium carbonate (calcium 500 mg or Ca2+ 12.5 mmol), colecalciferol 10 micrograms (400 units); **Kalcinos-D®** contains calcium carbonate (calcium 500 mg or Ca2+ 15 mmol), colecalciferol 20 micrograms (800 units); **Natecal D3®** contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

### Table

**EXCIPIENTS:** May contain Propylene glycol
- **Calcioferril with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 400 mg, Calcioferril 100 unit
  - Calcium carbonate 2.5 gram, Calcioferril 220 unit
  - Calcium carbonate 1 gram, Calcioferril 112 unit

### Chewable tablet

**CAUTIONARY AND ADVISORY LABELS** 24
EXCIPIENTS: May contain Aspartame

- **Calcioferril with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 1.5 gram, Calcioferril 400 unit
  - Calcium carbonate 1.5 gram, Calcioferril 400 unit / Calcium carbonate 1.5g chewable tablets
  - Calcium carbonate 1.5 gram, Calcioferril 400 unit / Calcium carbonate 1.5g chewable tablets

### Oral solution

**CAUTIONARY AND ADVISORY LABELS** 13

- **Calcioferril with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 2.5 gram, Calcioferril 880 unit
  - Calcium carbonate 2.5 gram, Calcioferril 440 unit

### Effervescent granules

**CAUTIONARY AND ADVISORY LABELS** 13

- **Calcioferril with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 2.5 gram, Calcioferril 880 unit
  - Calcium carbonate 2.5 gram, Calcioferril 440 unit

### Dihydrotachysterol

**INDICATIONS AND DOSE**

**Acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism**
- **BY MOUTH**
- **Adult:** (consult product literature)

**RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Oral solution

**EXCIPIENTS:** May contain Arachis (peanut) oil

- **AT10 (Intrapharm Laboratories Ltd)**
  - Dihydrotachysterol 250 microgram per 1 ml
  - AT10 250micrograms/ml oral solution sugar-free

### Ergocalciferol (Calciferol; Vitamin D₂)

**INDICATIONS AND DOSE**

**Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease**
- **BY MOUTH**
- **Adult:** Up to 40 000 units daily

**Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia**
- **BY MOUTH**
- **Adult:** Up to 100 000 units daily

**Prevention of vitamin D deficiency**
- **BY MOUTH**
- **Adult:** 400 units daily

---

**Colecalfirop with calcium phosphate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 953, calcium phosphate p. 920.

---

**Colecalfirop with calcium carbonate**

- **BY MOUTH**
- **Adult:** (consult product literature)

**REMEDIAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Powder

**CAUTIONARY AND ADVISORY LABELS** 13

- **Calcioferril D3 (A. Menarini Farmaceutica Internazionale SRL)**
  - Calcium phosphate 3.1 gram, Calcioferril 800 unit
  - Calcioferril D3 oral powder sachets

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Oral solution

**EXCIPIENTS:** May contain Arachis (peanut) oil

- **AT10 (Intrapharm Laboratories Ltd)**
  - Dihydrotachysterol 250 microgram per 1 ml
  - AT10 250micrograms/ml oral solution sugar-free
Treatment of vitamin D deficiency

- **BY MOUTH**
- **Adult:** 800 units daily, higher doses may be necessary for severe deficiency

- **RENAL IMPAIRMENT** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied. When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution.

  **Tablet**
  - Ergocalciferol (Non-proprietary)
  - Ergocalciferol 12.5 microgram (Calcium and vitamin D) Ergocalciferol 12.5 microgram tablets | 30 tablet no price available
  - Ergoral (Cubic Pharmaceuticals Ltd)
  - Ergocalciferol 125 microgram (Calcium and vitamin D) Ergoral D2 5,000 unit tablets | 30 tablet £19.95
  - Ergocalciferol 250 microgram (Calcium and vitamin D) Ergoral D2 10,000 unit tablets | 30 tablet £23.95

  **Capsule**
  - Ergocalciferol (Non-proprietary)
  - Ergocalciferol 1.25 mg (Calcium and vitamin D) Ergocalciferol 1.25 mg capsules | 30 capsule £55.00 no price available | 50 capsule £93.00
  - Eciferol (Rhodes Pharma Ltd)
  - Ergocalciferol 1.25 mg (Calcium and vitamin D) Eciferol D2 50,000 unit capsules | 10 capsule £29.99
  - Ergoral (Cubic Pharmaceuticals Ltd)
  - Ergocalciferol 1.25 mg (Calcium and vitamin D) Ergoral D2 50,000 unit capsules | 10 capsule £19.95

  **Oral solution**
  - Ergocalciferol (Non-proprietary)
  - Ergocalciferol 1500 unit per 1 ml (Calcium and vitamin D) Ergocalciferol D 1,500 units/ml oral solution sugar-free | 20 ml £2.40 no price available
  - Ergocalciferol 20000 unit per 1 ml (Calcium and vitamin D) Ergocalciferol 100,000 units/5ml oral solution | 20 ml £25.00 no price available DT price = £185.19
  - Eciferol (Rhodes Pharma Ltd)
  - Ergocalciferol 3000 unit per 1 ml (Calcium and vitamin D) Eciferol D2 3,000 units/ml liquid | 60 ml £55.00 DT price = £107.95

### Ergocalciferol with calcium lactate and calcium phosphate

(Calcium and vitamin D)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol p. 955, calcium lactate p. 920.

- **INDICATIONS AND DOSE**
  - Prevention of calcium and vitamin D deficiency
  - Treatment of calcium and vitamin D deficiency
  - **BY MOUTH**
  - **Adult:** (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.

- **PRESCRIBING AND DISPENSING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 57 mg or Ca²⁺ 2.4 nmol), ergocalciferol 10 micrograms (400 units).

- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)
  - Calcium phosphate 150 mg, Calcium lactate 300 mg, Ergocalciferol 10 microgram (Calcium and vitamin D) Calcium and Ergocalciferol tablets | 28 tablet no price available DT price = £15.43 | 28 tablet £15.43

### Paricalcitol

- **INDICATIONS AND DOSE**
  - For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure
  - **BY MOUTH**
  - **Adult:** (consult product literature)

- **SIDE-EFFECTS** Acne, breast tenderness, dyspepsia, pruritus, rash, taste disturbance

- **PREGNANCY** Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
  - Monitor parathyroid hormone concentration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - Zemplar (AbbVie Ltd)
  - Paricalcitol 1 microgram (Calcium and vitamin D) Zemplar 1 microgram capsules | 28 capsule £69.44
  - Paricalcitol 2 microgram (Calcium and vitamin D) Zemplar 2 microgram capsules | 28 capsule £138.88

### Solution for injection

EXCIPIENTS: May contain Propylene glycol

- **Zemplar (AbbVie Ltd)**
  - Paricalcitol 5 microgram per 1 ml (Calcium and vitamin D) Zemplar 5 micrograms/1ml solution for injection ampoules | 5 ampoule £62.00 (Hospital only)
  - Zemplar 5 micrograms/1ml solution for injection vials | 5 vial £138.88 (Hospital only)

### Vitamins and trace elements

**Alpha tocopherol** (Tocopherol)

- **INDICATIONS AND DOSE**
  - Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestatics
  - **BY MOUTH USING ORAL SOLUTION**
  - **Child:** 17 mg/kg daily, dose to be adjusted as necessary

- **CAUTIONS** Predisposition to thrombosis

- **INTERACTIONS** → Appendix 1 (Vitamin E).
Alpha tocopheryl acetate
(Tocopherol)

**INDICATIONS AND DOSE**

**Vitamin E deficiency**
- **BY MOUTH**
  - Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

**Malabsorption in cystic fibrosis**
- **BY MOUTH**
  - Child 1-11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
  - Child 1-11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
  - Child 12-17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
  - Adult: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

**Vitamin E deficiency in cholestasis and severe liver disease**
- **BY MOUTH**
  - Child 1 month-11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
  - Child 12-17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

**Malabsorption in abetalipoproteinemia**
- **BY MOUTH**
  - Adult: 50–100 mg/kg once daily

**CAUTIONS**
- Predisposition to thrombosis

**INTERACTIONS**
- Appendix 1 (Vitamins).

**SIDE-EFFECTS**
- Abdominal pain (particularly with high doses) · diarrhoea (particularly with high doses)

**PREGNANCY**
- No evidence of safety of high doses.

**BREAST FEEDING**
- Excreted in milk; minimal risk, although caution with large doses.

**MONITORING REQUIREMENTS**
- Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

**Menadiol sodium phosphate**

**INDICATIONS AND DOSE**

**Prevention of Vitamin K deficiency in malabsorption syndromes**
- **BY MOUTH**
  - Adult: 10–40 mg daily, dose to be adjusted as necessary

**CAUTIONS**
- G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)

**INTERACTIONS**
- Appendix 1 (Vitamins).

**PREGNANCY**
- Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.
Phytonadione (Vitamin K₃)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Menadion sodium phosphate (Non-proprietary)
- Menadion as (Menadion sodium phosphate)

**INDICATIONS AND DOSE**

**Major bleeding in patients on warfarin** (in combination with dried prothrombin complex or fresh frozen plasma)
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5 mg for 1 dose, stop warfarin treatment

**INR > 8.0 with minor bleeding in patients on warfarin**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR < 5

**INR > 8.0 with no bleeding in patients on warfarin**
- **BY MOUTH**
  - Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR < 5

**INR 5.0–8.0 with minor bleeding in patients on warfarin**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR < 5

**Reversal of anticoagulation prior to elective surgery (after warfarin stopped)**
- **BY MOUTH**
  - Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥ 1.5

**Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6–12 hours)**
- **BY INTRAVENOUS INJECTION**
  - Adult: 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytonadione and the INR checked before surgery

**UNLICENSED USE**
Oral use of intravenous preparations is unlicensed.

**CAUTIONS**
Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM Reduce dose in elderly

**INTERACTIONS**
→ Appendix 1 (Vitamins).

**SIDE-EFFECTS**

KONAKION® MM Anaphylactoid reactions

**PREGNANCY**
Use if potential benefit outweighs risk.

**BREAST FEEDING**
Present in milk.

**HEPATIC IMPAIRMENT**
KONAKION® MM Caution—glycocholic acid may displace bilirubin.

**DIRECTIONS FOR ADMINISTRATION**

KONAKION® MM PAEDIATRIC KONAKION® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection.
- For intravenous injection, may be diluted with Glucose 5%; note for intramuscular injection. For intravenous infusion (Konakion® MM), give intermittently in Glucose 5%; dilute with 55 mL; may be injected into lower part of infusion apparatus.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, drops

**Solution for injection**

EXCIPIENTS: May contain Glycocholic acid, lecithin
- Konakion MM (Roche Products Ltd)
  - Phytonadione 10 mg per 1 ml Konakion MM Paediatric
    - 2mg/0.2ml solution for injection ampoules | 5 ampoule (P) £4.71
    - Konakion MM 10mg/1ml solution for injection ampoules | 10 ampoule (P) £3.78 DT price = £3.78

6.1 Neural tube defects (prevention in pregnancy)

**Neural tube defects (prevention in pregnancy)**

**Prevention in pregnancy**
Folic acid supplements p. 898 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anemia, or is taking antiepileptic medicines.

- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

Glucose 5%; not for intramuscular injection. For intravenous infusion (Konakion® MM), give intermittently in Glucose 5%; dilute with 55 mL; may be injected into lower part of infusion apparatus.

1 Arthritis

Arthritis

Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as paracetamol p. 414 or codeine phosphate p. 421 can also be used.

Drugs are also used to influence the rheumatic disease process itself. For rheumatoid arthritis these disease-modifying anti-rheumatic drugs (DMARDs) include methotrexate p. 817, cytokine modulators, azathioprine p. 765, ciclosporin p. 766, cyclophosphamide p. 802, leflunomide p. 963, penicillamine p. 964, gold, antimalarials (chloroquine p. 569 and hydroxychloroquine sulfate p. 962), and sulfasalazine p. 39. Corticosteroids also have a significant role in the management of rheumatoid arthritis.

Drugs which may affect the disease process in psoriatic arthritis include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin 0.025% p. 446 should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 961 and rubefacients are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (Durospan®️, Euflexxa®️, Fermaphon®️, Hyalgan®️, Orthovisc®️, Ostenil®, Ostenil Plus®, RenehaVis®️, Suplasyn®️, Synocrom®️, Synopsis®️️) or hylan G-F 20 (Synvisc®️️) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (SportVis®️️) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

Rheumatic disease, suppressing drugs

Overview

Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis; gold, penicillamine p. 964, hydroxychloroquine sulfate p. 962, chloroquine p. 569, and sulfasalazine p. 39 can also suppress the disease process in rheumatoid arthritis while sulfasalazine and possibly gold can suppress the disease process in psoriatic arthritis. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice

The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate p. 817, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

A combination of DMARDs (including methotrexate and at least one other DMARD) and a short-term corticosteroid, should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and penicillamine are effective in palindromic rheumatism. Systemic and discoid lupus erythematosus are
sometimes treated with chloroquine or hydroxychloroquine sulfate.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

**Gold**

Gold can be given as sodium aurothiomalate p. 965 for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

**Penicillamine**

Penicillamine has a similar action to gold. More patients are able to continue treatment with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

**Sulfasalazine**

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

**Antimalarials**

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine.

Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride is sometimes used in discoid lupus erythematosus [unlicensed].

**Drugs affecting the immune response**

Methotrexate is a disease-modifying anti-rheumatic drug suitable for moderate to severe rheumatoid arthritis.

Azathioprine p. 765, ciclosporin p. 766, cyclophosphamide p. 802, leflunomide p. 963, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 898 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide acts on the immune system as a disease-modifying anti-rheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide may be used for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

**Juvenile idiopathic arthritis**

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying anti-rheumatic drugs. Methotrexate is effective; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. Cytokine modulators have a role in juvenile idiopathic arthritis.

**Cytokine modulators**

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 969, certolizumab pegol p. 971, etanercept p. 973, golimumab p. 974, and infliximab p. 976 inhibit the activity of tumour necrosis factor alpha (TNF-α).

Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease modifying anti-rheumatic drugs (including methotrexate p. 817) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis and severe active ankylosing spondylitis that have not responded adequately to other disease-modifying anti-rheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to disease-modifying anti-rheumatic drugs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active ankylosing spondylitis in patients
who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs, and for severe ankylosing spondylitis inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive psoriatic arthritis, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active ankylosing spondylitis when there is an inadequate response to conventional treatment. Infliximab is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to disease-modifying antirheumatic drugs.

Rituximab p. 792 is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 968 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 965 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Belimumab p. 773 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Secukinumab p. 966 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active psoriatic arthritis, in combination with methotrexate or alone, which has not responded adequately to disease-modifying antirheumatic drugs; it is also licensed for the treatment of ankylosing spondylitis, in patients who have not responded adequately to conventional therapy. Secukinumab also has a role in plaque psoriasis.

Tocilizumab p. 966 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active rheumatoid arthritis when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 967 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

CHONDROPROTECTIVE DRUGS

Glucosamine

- **DRUG ACTION** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

- **INDICATIONS AND DOSE**

  **ALATERIS®**

  **Symptomatic relief of mild to moderate osteoarthritis of the knee**

  - **BY MOUTH**
  - Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

  **DOLENIO®**

  **Symptomatic relief of mild to moderate osteoarthritis of the knee**

  - **BY MOUTH**
  - Adult: 1500 mg once daily, review treatment if no benefit after 2–3 months

  **GLUSARTEL®**

  **Symptomatic relief of mild to moderate osteoarthritis of the knee**

  - **BY MOUTH**
  - Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

- **CAUTIONS** Asthma · impaired glucose tolerance · predisposition to cardiovascular disease

- **INTERACTIONS** → Appendix 1 (glucosamine).

- **SIDE-EFFECTS**

  ▶ Common or very common Abdominal pain · constipation · diarrhoea · drowsiness · dyspepsia · fatigue · flatulence · headache · nausea

  ▶ Uncommon Flushing · pruritus · rash

Other drugs used for Arthritis

Hydroxychloroquine sulfate

**INDICATIONS AND DOSE**
Active rheumatoid arthritis (administered on expert advice) Systemic and discoid lupus erythematosus (administered on expert advice) Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- **BY MOUTH**
  - Adult: 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

**CAUTIONS** Acute porphyrias p. 930 · elderly · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

**Screening for ocular toxicity** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

**Before treatment:**
- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

**During treatment:**
- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor’s advice about stopping treatment
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

**INTERACTIONS** ▶ Appendix 1 (hydroxychloroquine). Concurrent use of hepatotoxic drugs should be avoided.

**SIDE-EFFECTS** ▶ Common or very common Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- Uncommon Convulsions · discoloration of skin, nails, and mucous membranes · ECG changes · hair depigmentation · hair loss · keratopathy · otoxicity · retinal damage · visual changes
- Rare Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens–Johnson syndrome · thrombocytopenia

**Frequency not known** Bronchospasm · diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms

**Overdose** Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PRECAUTIONS** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**BREAST FEEDING** Avoid—risk of toxicity in infant.

**HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).

**PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

**PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
ELECTROLYTES: May contain Sodium
- Alateris (MKW Healthcare Ltd)
  - Glucosamine (as Glucosamine hydrochloride) 625 mg · Alateris 625mg tablets 60 tablet [P] £18.40 DT price + £18.40
- Dolenio (Allisa Healthcare Research Ltd)
  - Dolenio 1500mg tablets 30 tablet [P] £18.20 DT price + £18.20

Powder
CAUTIONARY AND ADVISORY LABELS 13
EXCIPIENTS: May contain Aspartame
- Glucosamine (Non-proprietary)
  - Glucosamine sulfate 1.5g oral powder sachets sugar free sugar-free 30 sachet [P] £30.09

**DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS**

**SCREENING FOR OCULAR TOXICITY** A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009). The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

**PRECAUTIONS** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**BREAST FEEDING** Avoid—risk of toxicity in infant.

**HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).

**PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

**PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 21**

- **Hydroxychloroquine sulfate (Non-proprietary)**
  
- **Plaquenil** (Sanofi)
  
- **Quinoric** (Bristol Laboratories Ltd)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

**CONCEPTION AND CONTRACEPTION** Effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.

**PREGNANCY** Avoid—active metabolite teratogenic in animal studies.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Avoid—active metabolite may accumulate.

**RENAI IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment—no information available.

**PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

**MONITORING REQUIREMENTS**
- Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- Monitor blood pressure.

**TREATMENT CESSION**
Washout Procedure The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give either colestyramine p. 186 or charcoal, activated p. 1211. Procedure may be repeated as necessary.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 4**

- **Leflunomide (Non-proprietary)**
  
- **Arava** (Sanofi)

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

**Leflunomide**

**INDICATIONS AND DOSE**

**Moderate to severe active rheumatoid arthritis (specialist use only)**

- **BY MOUTH**
  
- **Adult:** Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

**Active psoriatic arthritis (specialist use only)**

- **BY MOUTH**
  
- **Adult:** Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

**CONTRA-INDICATIONS** Serious infection · severe hypoproteinaemia · severe immunodeficiency

**CAUTIONS** Anaeemia (avoid if significant and due to causes other than rheumatoid arthritis) · history of tuberculosis · impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis) · leucopenia (avoid if significant and due to causes other than rheumatoid arthritis) · thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)

**INTERACTIONS**

- Appendix 1 (leflunomide).

Increased risk of toxicity with other haematotoxic and hepatotoxic drugs.

Caution if recent treatment with other hepatotoxic disease-modifying anti-rheumatic drugs.

Caution if recent treatment with other myelotoxic disease-modifying anti-rheumatic drugs.

Caution—washout procedures recommended before switching to other disease-modifying antirheumatic drugs (consult product literature).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · alopecia · anorexia · asthenia · diarrhea · dizziness · dry skin · headache · increased blood pressure · leucopenia · nausea · oral mucosal disorders · paraesthesia · pruritus · rash · tenosynovitis · vomiting

- **Uncommon** Anaemia · anxiety · hyperlipidaemia · hypokalaemia · hypophosphataemia · taste disturbance · tendon rupture · thrombocytopenia

- **Rare** Hepatitis · eosinophilia · interstitial lung disease · jaundice · pancytopenia · severe infection

- **Very rare** Hepatic failure · pancreatitis · peripheral neuropathy · progressive multifocal leucoencephalopathy · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasculitis

- **Frequency not known** Bone-marrow toxicity · hypouricaemia · malignancy · reduced sperm count · renal failure

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 21**

- **Leflunomide 10 mg** Arava 10mg tablets | 30 tablet £51.13 DT price £4.70

- **Leflunomide 20 mg** Arava 20mg tablets | 30 tablet £61.36 DT price £4.59

- **Leflunomide 100 mg** Arava 100mg tablets | 3 tablet £30.67
Penicillamine

- **DRUG ACTION**  Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

- **INDICATIONS AND DOSE**
  - **Severe active rheumatoid arthritis (administered on expert advice)**
    - **BY MOUTH**
      - Adult: Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks; dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
      - Elderly: Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day
  - **Wilson’s disease**
    - **BY MOUTH**
      - Adult: 1.5–2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75–1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day
      - Elderly: 20 mg/kg daily in divided doses, adjusted according to response
  - **Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)**
    - **BY MOUTH**
      - Adult: Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily
  - **Cystinuria, therapeutic**
    - **BY MOUTH**
      - Adult: 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food
  - **Cystinuria, prophylactic**
    - **BY MOUTH**
      - Adult: 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
      - Elderly: Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

- **CONTRA-INDICATIONS**  Lupus erythematosus
- **CAUTIONS**  Neurological involvement in Wilson’s disease
- **INTERACTIONS**  Appendix 1 (penicillamine). Caution with concomitant nephrotoxic drugs (increased risk of toxicity). Caution with gold treatment (avoid concomitant use if adverse reactions to gold).
- **SIDE-EFFECTS**
  - **Common or very common**  Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia
  - **Rare**  Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdraw immediately if cause unknown) · mouth ulceration · pseudoxanthoma elasticum · skin laxity · stomatitis
  - **Frequency not known**  Agranulocytosis · aplastic anaemia · blood disorders · bronchitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture’s syndrome · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropathy (especially if neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended) · neutropenia · pancreatitis · pemphigus · pneumonitis · polyneuropathy · pulmonary haemorrhage · rheumatoid arthritis · septic arthritis (in patients with rheumatoid arthritis) · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Proteinuria**  Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.
  - **Rash**  Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.
  - **Taste loss**  Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued.
  - **Nausea**  Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased.

- **ALLERGY AND CROSS-SENSITIVITY**  Patients who are hypersensitive to penicillin may react rarely to penicillamine.
- **PREGNANCY**  Fetal abnormalities reported rarely; avoid if possible.
- **BREAST FEEDING**  Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT**  Reduce dose and monitor renal function or avoid (consult product literature).
- **MONITORING REQUIREMENTS**
  - Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia). Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase).
  - A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
  - Longer intervals may be adequate in cystinuria and Wilson’s disease.
- **PATIENT AND CARER ADVICE**  Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**  6, 22

- **Penicillamine (Non-proprietary)**
  - **Penicillamine 125 mg**  Penicillamine 125mg tablets | 56 tablet £45.00 DT price = £44.97
  - **Penicillamine 250 mg**  Penicillamine 250mg tablets | 56 tablet £88.84 DT price = £88.72
  - **Distamine (Alliance Pharmaceuticals Ltd)**
    - **Penicillamine 125 mg**  Distamine 125mg tablets | 100 tablet £10.34
    - **Penicillamine 250 mg**  Distamine 250mg tablets | 100 tablet £17.78
Sodium aurothiomalate

INDICATIONS AND DOSE

Active progressive rheumatoid arthritis (administered on expert advice)

- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, dose to be reduced gradually. Benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given.

Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)

- BY DEEP INTRAMUSCULAR INJECTION
  - Adult: 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought.

CONTRA-INDICATIONS Exfoliative dermatitis · history of blood disorders · history of bone marrow aplasia · necrotising enterocolitis · pulmonary fibrosis · systemic lupus erythematosus

CAUTIONS Colitis · eczema · elderly · history of urticaria

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeated above 300 mg/litre.

INTERACTIONS → Appendix 1 (sodium aurothiomalate).

SIDE-EFFECTS Alopecia · blood disorders (sometimes sudden and fatal) · colitis · gold deposits in eye · hepatotoxicity with cholestatic jaundice · irreversible pigmentation in sun-exposed areas (on prolonged parenteral treatment) · mouth ulcers · nephrotic syndrome · peripheral neuropathy · proteinuria · pulmonary fibrosis · severe anaphylactic reactions · skin reactions · stomatitis · taste disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

PREGNANCY Consider reducing dose and frequency. Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.

BREAST FEEDING Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions.

HEPATIC IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe impairment.

MONITORING REQUIREMENTS

- Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
- Monitor for pulmonary fibrosis with annual chest X-ray.

PATIENT AND CARER ADVICE Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

solution for injection

- Myocrisin (Sanofi)
  - Sodium aurothiomalate 20 mg per 1 ml Myocrisin 10mg/0.5ml solution for injection ampoules | 10 ampoule £45.55
  - Sodium aurothiomalate 100 mg per 1 ml Myocrisin 50mg/0.5ml solution for injection ampoules | 10 ampoule £134.80

IMMUNOSUPPRESSANTS → INTERLEUKIN INHIBITORS

Anakinra

INDICATIONS AND DOSE

Treatment of rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone

- BY SUBCUTANEOUS INJECTION
  - Adult: 100 mg once daily

CONTRA-INDICATIONS Neutropenia

CAUTIONS History of asthma (risk of serious infection) · predisposition to infection

INTERACTIONS → Appendix 1 (anakinra).

SIDE-EFFECTS

Common or very common Neutropenia

Frequency not known Antibody formation · headache · infections · injection-site reactions · malignancy

SIDE-EFFECTS, FURTHER INFORMATION

Blood disorders. Neutropenia reported commonly—discontinue if neutropenia develops.

CONCEPTION AND CONTRACEPTION Effective contraception must be used during treatment.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Caution if eGFR 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months.

PATIENT AND CARER ADVICE

Blood disorders. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2002) that anakinra is not recommended for the treatment of rheumatoid arthritis within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Kineret (Swedish Orphan Biovitrum Ltd)
  - Anakinra 150 mg per 1 ml Kineret 100mg/0.67ml solution for injection pre-filled syringes | 28 pre-filled disposable injection £734.44

Arthritis 965

Musculoskeletal system
Secukinumab

16-Mar-2016

**INDICATIONS AND DOSE**

Psoriatic arthritis / Ankylosing spondylitis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNF treatment / Plaque psoriasis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

**CONTRA-INDICATIONS**

Severe active infection

**CAUTIONS**

Chronic infection - Crohn’s disease (monitor for exacerbations) - history of recurrent infection - predisposition to infection (discontinue if new serious infection develops)

**INTERACTIONS** → Appendix 1 (secukinumab).

**SIDE-EFFECTS**

- Common or very common Diarrhoea - oral herpes - rhinorrhea - upper respiratory tract infections
- Uncommon Conjunctivitis - neutropenia (usually mild and reversible) - oral candidiasis - otitis externa - tinea pedis
- Rare Anaphylactic reactions

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises that women of childbearing potential should complete anti-tuberculosis therapy before starting secukinumab.

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises to take the syringe or pen out of the refrigerator 20 minutes before administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Cosentyx® pre-filled pen.

**PATIENT AND CARER ADVICE**

Self-administration Patients and their carers should be given training in subcutaneous injection technique. Infection Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350

Secukinumab is recommended as an option for the treatment of moderate to severe plaque psoriasis in adults if:

- the disease has failed to respond to standard systemic treatments (including ciclosporin, methotrexate, and PUVA), or when standard treatments are contra-indicated or not tolerated; and
- the manufacturer provides secukinumab with the discount agreed in the patient access scheme

Secukinumab should be withdrawn in patients whose psoriasis has not responded adequately within 12 weeks of initial dose; further treatment cycles are not recommended.

Patients whose treatment with secukinumab was started before this guidance was published, but does not meet these criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA350

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2015) that secukinumab (Cosentyx®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), or when standard treatments cannot be used because of intolerance or contra-indications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Cosentyx** (Novartis Pharmaceuticals UK Ltd) ▼
  - Secukinumab 150 mg per 1 ml Cosentyx 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection | £218.78
  - Cosentyx 150mg/1ml solution for injection pre-filled syringes | 2 pre-filled disposable injection | £218.78

Tocilizumab

31-May-2016

**INDICATIONS AND DOSE**

Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs

- **BY INTRAVENOUS INFUSION**
  - Adult: 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count, consult product literature

**CONTRA-INDICATIONS**

Do not initiate if absolute neutrophil count less than 2 × 10^9/litre - severe active infection

**CAUTIONS**

History of diverticulitis - history of intestinal ulceration - history of recurrent or chronic infection (interrupt treatment if serious infection occurs) - low absolute neutrophil count - low platelet count - predisposition to infection (interrupt treatment if serious infection occurs)

**INTERACTIONS** → Appendix 1 (tocilizumab).

**SIDE-EFFECTS**

- Common or very common Abdominal pain - antibody formation - dizziness - gastritis - headache - hypercholesterolaemia - hypersensitivity - hypertension - infection - leucopenia - mouth ulceration - neutropenia - peripheral oedema - pruritus - raised hepatic transaminases - rash - upper respiratory tract infection
- Uncommon Anaphylaxis - gastric ulcer - gastro-intestinal perforation - hypertriglyceridaemia - hypothyroidism - infusion related reactions - nephrolithiasis

**Frequency not known** Thrombocytopenia
Tocilizumab for the treatment of rheumatoid arthritis (February 2012—updated February 2016) NICE TA247
Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:
- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, and
tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010)
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- and the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA247

Ustekinumab

INDICATIONS AND DOSE
Severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, discontinue if no response within 16 weeks
- Adult (body-weight 100 kg and above): Initially 45–90 mg, then 45–90 mg after 4 weeks, then 45–90 mg every 12 weeks, discontinue if no response within 16 weeks

Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs

BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, review treatment if no response within 28 weeks
- Adult (body-weight 100 kg and above): Initially 45–90 mg, then 45–90 mg after 4 weeks, then 45–90 mg every 12 weeks, review treatment if no response within 28 weeks

CONTRA-INDICATIONS
Active infection

CAUTIONS
Development of malignancy - elderly - history of malignancy - predisposition to infection - start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected
CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

  - **INTERACTIONS** → Appendix 1 (ustekinumab).

- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia, diarrhoea, dizziness, headache, infections (sometimes severe), injection-site reactions, malaise, myalgia, nausea, oropharyngeal pain, pruritus
  - **Uncommon** Depression, facial palsy, hypersensitivity reactions (possibly delayed onset), nasal congestion, pustular psoriasis
  - **Rare** Exfoliative dermatitis

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **PRE-TREATMENT SCREENING**
  - Tuberculosis Patients should be evaluated for tuberculous before treatment.

- **MONITORING REQUIREMENTS**
  - Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
  - Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

- **PATIENT AND CARER ADVICE**
  - Exfoliative dermatitis Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.
  - Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)**
    - **Ustekinumab for plaque psoriasis in adults** (September 2009) NICE TA180
      - Ustekinumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Ustekinumab should be withdrawn if the response is not adequate after 16 weeks.
      - For patients weighing over 100 kg, the manufacturer should provide the 90-mg dose of ustekinumab at the same price as the 45-mg dose.
      - www.nice.org.uk/TA180
    - **Ustekinumab for treating active psoriatic arthritis** (June 2015) NICE TA340
      - Ustekinumab is an option, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults only when:
        - treatment with tumour necrosis factor (TNF) alpha inhibitors is contra-indicated but would otherwise be considered (as described in the NICE guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (August 2010) and golimumab for the treatment of psoriatic arthritis (April 2011)) or
        - the patient has had treatment with 1 or more TNF-alpha inhibitors.
      - Ustekinumab is recommended only if the manufacturer provides the 90 mg dose of ustekinumab for patients who weigh more than 100 kg at the same cost as the 45 mg dose, as agreed in the patient access scheme.
      - Ustekinumab treatment should be stopped if the patient’s psoriatic arthritis has not shown an adequate response using the Psoriatic Arthritis Response Criteria (PsARC) at 24 weeks.
      - Patients currently receiving ustekinumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.
      - www.nice.org.uk/TA340

  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (February 2014) that ustekinumab (Stelara®) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

  - **MEDIcular forms**
    - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - CAUTIONARY AND ADVISORY LABELS 10
      - **Stelara** (Janssen-Cilag Ltd)
        - Ustekinumab 90 mg per 1 ml
        - Stelara 90mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection
          - £2,147.00
        - Stelara 45mg/0.5ml solution for injection vials | 1 vial
          - £2,147.00
        - Stelara 45mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection
          - £2,147.00

- **IMMUNOSUPPRESSANTS**

  - **Abatacept**
    - **INDICATIONS AND DOSE**
      - Moderate to severe active rheumatoid arthritis (in combination with methotrexate) in patients unresponsive to other disease-modifying antirheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor)
        - **INITIALLY BY INTRAVENOUS INFUSION**
          - Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 500 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
        - Adult (body-weight 60-100 kg): 750 mg every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 750 mg every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose
Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses (loading dose), then (by intravenous infusion) 1 g every 4 weeks, alternatively (by subcutaneous injection) 125 mg once weekly, first subcutaneous dose to be given within 1 day of the intravenous loading dose; patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

- CONTRA-INDICATIONS
  - Severe infection

- CAUTIONS
  - Do not initiate until active infections are controlled. Elderly (increased risk of side-effects) predisposition to infection (screen for latent tuberculosis and viral hepatitis). Progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

- INTERACTIONS
  - Appendix 1 (abatacept).

- SIDE-EFFECTS
  - Common or very common: Abdominal pain, conjunctivitis, cough, diarrhoea, dizziness, dyspepsia, fatigue, flushing, headache, hypertension, infection, leucopenia, nausea, pain in extremities, paraesthesia, stomatitis, vomiting
  - Uncommon: Psoriasis, alopecia, anxiety, arthralgia, basal and squamous cell carcinoma, bradycardia, bronchospasm, bruising, depression, dry eye, dry skin, dyspnoea, gastritis, hyperhidrosis, hypotension, menstrual disturbances, palpitation, skin papilloma, sleep disorder, tachycardia, thrombocytopenia, visual disturbance, weight gain
  - Frequency not known: Lung cancer, lymphoma

- CONCEPTION AND CONTRACEPTION
  - Effective contraception required during treatment and for 14 weeks after last dose.

- PREGNANCY
  - Manufacturer advises avoid unless essential.

- BREAST FEEDING
  - Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

- NATIONAL FUNDING/ACCESS DECISIONS

  - NICE technology appraisals (TAs)
    - Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
      - Abatacept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months. www.nice.org.uk/TA195
    - Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375
      - Abatacept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:
        - Disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
        - Disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
        - the manufacturers provide abatacept as agreed in the patient access schemes.
      - Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.
      - Patients currently receiving abatacept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA375

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Powder for solution for infusion
    - ELECTROLYTES: May contain Sodium
      - Orenzia (Bristol-Myers Squibb Pharmaceuticals Ltd)
      - Abatacept 250 mg (Orenzia 250mg powder for concentrate for solution for infusion vials | 1 vial £302.40 (Hospital only)

- IMMUNOSUPPRESSANTS

  - TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

- INDICATIONS AND DOSE
  - Severe plaque psoriasis either refractory to at least 2 standard systemic treatments or photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications
  - By subcutaneous injection
    - Adult: Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, discontinue treatment if no response within 16 weeks
  - Moderate to severe active rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) when response to other disease-modifying drugs (including methotrexate) has been inadequate
  - Severe, active, and progressive rheumatoid arthritis (in combination with methotrexate or alone if methotrexate inappropriate) not previously treated with methotrexate
  - By subcutaneous injection
    - Adult: 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks
  - Active and progressive psoriatic arthritis that has not responded adequately to other disease-modifying antirheumatic drugs
  - Severe active ankylosing spondylitis that has not responded adequately to other disease-modifying antirheumatic drugs
  - Severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of, NSAIDs
  - By subcutaneous injection
    - Adult: 40 mg every 2 weeks, discontinue treatment if no response within 12 weeks

Severe active Crohn’s disease

- By subcutaneous injection
  - Adult: Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose continued
Severe active Crohn’s disease (accelerated regimen)

- By subcutaneous injection
- Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active ulcerative colitis

- By subcutaneous injection
- Adult: Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 8 weeks of initial dose

Active moderate to severe hidradenitis suppurativa (acne inversa) in patients with an inadequate response to conventional systemic therapy

- By subcutaneous injection
- Adult: Initially 160 mg, given as either four 40 mg injections in one day or as two 40 mg injections per day for 2 consecutive days, followed by 80 mg after 2 weeks, given as two 40 mg injections in one day, then 40 mg after 2 weeks; maintenance 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature.

**CONTRA-INDICATIONS**
- Moderate or severe heart failure
- Severe infection

**CAUTIONS**
- Demyelinating disorders (risk of exacerbation)
- Development of malignancy—do not initiate until active infections are controlled (discontinue if new serious infection develops)
- Hepatitis B virus—monitor for active infection
- History of malignancy
- Mild heart failure
- Predisposition to infection

**CAUTIONS, FURTHER INFORMATION**
- Tuberculosis
  - Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

**INTERACTIONS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**
- Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

**PREGNANCY**
- Avoid.

**BREAST FEEDING**
- Avoid; manufacturer advises avoid for at least 5 months after last dose.

**PRE-TREATMENT SCREENING**
- Tuberculosis
  - Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**
- Monitor for infection before, during, and for 4 months after treatment.
- Monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

**PATIENT AND CARER ADVICE**
- An alert card should be provided.

**NATIONAL FUNDING/ACCESS DECISIONS**
- NICE technology appraisals (TAs)
  - Adalimumab for plaque psoriasis in adults (June 2008)
    - NICE TA146
      - Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.
      - www.nice.org.uk/TA146
  - Infliximab and adalimumab for Crohn’s disease (May 2010)
    - NICE TA187
      - Adalimumab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications. Adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab can be restarted.
      - www.nice.org.uk/TA187
† Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Adalimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Adalimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

† Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199

Adalimumab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

† Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195

Adalimumab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

† Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Adalimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Adalimumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving adalimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

† TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthropathy (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthropathy in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium issued similar advice for plaque psoriasis to NICE TA146 in May 2008.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

† Humira (AbbVie Ltd)

04-May-2016

INDICATIONS AND DOSE
Moderate to severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate
Severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate
Active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs
Severe ankylosing spondylitis inadequately responsive to conventional therapy

CONTRA-INDICATIONS Active infection

CAUTIONS Development of malignancy - diabetes mellitus - heart failure (risk of exacerbation) - hepatitis B virus— monitor for active infection - hepatitis C infection (monitor for worsening infection) - history of blood disorders - history of malignancy - history or increased risk of demyelinating disorders - predisposition to infection (avoid if predisposition to sepsicaemia) - significant exposure to herpes zoster virus—interrupt treatment and consider varicella—zoster immunoglobulin

CAUTIONS, FURTHER INFORMATION
- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculosis skin test, chemoprophylaxis can be given concurrently with etanercept.

INTERACTIONS Appendix 1 (etanercept).

SIDE-EFFECTS
- Uncommon Interstitial lung disease - new onset or worsening psoriasis - rash - skin cancer - uveitis
- Rare Demyelinating disorders - lymphoma - seizures - Stevens-Johnson syndrome - vasculitis
- Very rare Toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation.

CONCEPTION AND CONTRAINDICATIONS Effective contraception required during treatment and for 3 weeks after last dose.

PREGNANCY Avoid—limited information available.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Use with caution in moderate to severe alcoholic hepatitis.

PRE-TREATMENT SCREENING
Tuberculosis Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

PRESCRIBING AND DISPENSING INFORMATION
Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

PATIENT AND CARER ADVICE
An alert card should be provided.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Etanercept and efalizumab for plaque psoriasis (July 2006)

NICE TA103
Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks. www.nice.org.uk/TA103

- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
Etanercept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at
least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months. www.nice.org.uk/TA195

- Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010) NICE TA199

Etanercept is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept should be discontinued if there is an inadequate response at 12 weeks. www.nice.org.uk/TA199

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)

NICE TA375

Etanercept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs)

Etanercept can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving etanercept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA375

- TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)

NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response. www.nice.org.uk/TA383

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012).

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
CAUTIONARY AND ADVISORY LABELS 10

Golimumab

31-May-2016

- INDICATIONS AND DOSE

Treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it

- BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 80 kg): Initially 200 mg, then 100 mg after 2 weeks; maintenance 50 mg every 4 weeks, review treatment if no response after 4 doses

- Adult (body-weight 80 kg and above): Initially 200 mg, then 100 mg after 2 weeks; maintenance 100 mg every 4 weeks, review treatment if no response after 4 doses

Treatment of moderate to severe active rheumatoid arthritis (in combination with methotrexate) when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate | Treatment of severe, active, and progressive rheumatoid arthritis (in combination with methotrexate) in patients not previously treated with methotrexate | Treatment of active and progressive psoriatic arthritis as monotherapy or in combination with methotrexate when response to DMARD therapy has been inadequate | Treatment of severe active ankylosing spondylitis when there is inadequate response to conventional treatment

- BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 100 kg): 50 mg once a month, on the same date each month, review treatment if no response after 3–4 doses

- Adult (body-weight 100 kg and above): Initially 50 mg once a month for 3–4 doses, on the same date each month, dose may be increased if inadequate response, increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

- CONTRA-INDICATIONS

Moderate or severe heart failure - severe active infection

- CAUTIONS

Active infection (do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled), demyelinating disorders (risk of exacerbation), hepatitis B virus—monitor for active infection, history or development of malignancy, mild heart failure (discontinue if symptoms develop or worsen), predisposition to infection - risk factors for dysplasia or carcinoma of the colon—screen for dysplasia regularly

Blood disorders

Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

NATIONAL FUNDING/ACCESS DECISIONS

Golimumab for the treatment of psoriatic arthritis (April 2011) NICE TA220

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, and
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Golimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same cost as the 50 mg dose, as agreed in the patient access scheme.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Golimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if all the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturer provides golimumab as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving treatment with golimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are
intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011—updated February 2016) NICE TA225

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in patients who have had an inadequate response to DMARDs, including a TNF inhibitor, if golimumab is used as described in the NICE technology appraisal guidance 195 (August 2010) for other TNF inhibitors, and the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose.

www.nice.org.uk/TA225

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that golimumab (Simponi®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS

Simponi (Merck Sharp & Dohme Ltd)

Golimumab 100 mg per 1 ml Simponi 50mg/0.5ml solution for injection pre-filled disposable devices | 1 pre-filled disposable injection £762.97

Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection £1,525.94

Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £762.97

Infliximab

INDICATIONS AND DOSE

Severe active Crohn’s disease

▶ BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

Fistulating Crohn’s disease

▶ BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

Severe active ulcerative colitis

▶ BY INTRAVENOUS INFUSION

Adult: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response 14 weeks after initial dose

Rheumatoid arthritis (in combination with methotrexate)

▶ BY INTRAVENOUS INFUSION

Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 2 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks, increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

Ankylosing spondylitis

▶ BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

Psoriatic arthritis (in combination with methotrexate)

▶ BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks

Plaque psoriasis

▶ BY INTRAVENOUS INFUSION

Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

IMPORTANT SAFETY INFORMATION

Adequate resuscitation facilities must be available when infliximab is used.

CONTRA-INDICATIONS

Moderate or severe heart failure • severe infections

CAUTIONS

Demyelinating disorders (risk of exacerbation) • dermatomyositis • development of malignancy • hepatitis B virus—monitor for active infection • history of colon carcinoma (in inflammatory bowel disease) • history of dysplasia (in inflammatory bowel disease) • history of malignancy • history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis • mild heart failure (discontinue if symptoms develop or worsen) • predisposition to infection (discontinue if new serious infection develops) • risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)

CAUTIONS, FURTHER INFORMATION

Tuberculosis Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).

Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness—like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.
INTERACTIONS  Appendix 1 (infliximab).

SIDE-EFFECTS

- Common or very common  Alopecia, arthralgia, constipation, diarrhoea, dizziness, dry skin, dyspepsia, ecchymosis, epistaxis, flushing, gastro-intestinal haemorrhage, gastro-oesophageal reflux, hyperhydryosis, hypertension, hypoaesthesia, hypotension, myalgia, new onset or worsening psoriasis, palpitation, paraesthesia, rash, sleep disturbances, tachycardia

- Uncommon  Abnormal skin pigmentation, agitation, amnesia, arthrythmia, bradycardia, bullous eruption, chelitis, cholecystitis, confusion, eye disorders, heart failure, hepatitis, hyperkeratosis, impaired healing, intestinal perforation, nervousness, neuropathy, pancreatitis, peripheral ischaemia, pleurisy, pulmonary oedema, rosacea, seborrhoea, seizures, syncope, vaginitis

- Rare  Demyelinating disorders, interstitial lung disease, leukaemia, lymphoma, melanoma, pericardial effusion, Stevens-Johnson syndrome, toxic epidermal necrolysis, vasospasm

- Frequency not known  Abdominal pain, anaemia, antibody formation, aplastic anaemia, blood disorders, depression, fever, headache, hepatic failure, hepatosplenic T-cell lymphoma (more likely in inflammatory bowel disease), hypersensitivity reactions, injection-site reactions, leucopenia, lupus erythematosus-like syndrome, Merkel cell carcinoma, nausea, pancytopenia, pruritus, thrombocytopenia, worsening heart failure, worsening symptoms of dermatomyositis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

CONCEPTION AND CONTRAINDICATIONS

Manufacturer advises adequate contraception during and for at least 6 months after last dose.

PREGNANCY

Use only if essential.

BREAST FEEDING

Amount probably too small to be harmful.

PRE-TREATMENT SCREENING

Tuberculosis  Patients should be evaluated for tuberculosis before treatment.

MONITORING REQUIREMENTS

- Monitor for infection before, during, and for 6 months after treatment.
- All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
- Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

DIRECTIONS FOR ADMINISTRATION  For intravenous infusion (Remicade®), give intermittently in Sodium chloride 0.9%; reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

PRESCRIBING AND DISPENSING INFORMATION

Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

PATIENT AND CARER ADVICE

An alert card should be provided.

Tuberculosis  Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders  Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions  Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Infliximab for plaque psoriasis in adults (January 2008)  NICE TA134
  Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to phototherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.
  www.nice.org.uk/TA134

- Infliximab for acute exacerbations of ulcerative colitis (December 2008)  NICE TA163
  Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.
  www.nice.org.uk/TA163

- Infliximab and adalimumab for Crohn’s disease (May 2010)  NICE TA187
  Infliximab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn’s disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.
  Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.
  www.nice.org.uk/TA187

- Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)  NICE TA195
  Infliximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.
  www.nice.org.uk/TA195

- Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)  NICE TA199
  Infliximab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least
3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Infliximab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

- Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329

Infliximab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

- Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Infliximab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, and
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving infliximab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA375

- TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Infliximab is recommended only if treatment is started with the least expensive infliximab product.

Patients currently receiving infliximab should continue treatment with the same infliximab product until they and their clinician considers it appropriate to stop.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

www.nice.org.uk/TA383

- Infliximab is recommended only if treatment is started with the least expensive infliximab product.

www.nice.org.uk/TA383

**PHOSPHODIESTERASE TYPE-4 INHIBITORS**

**Apremilast**

- **DRUG ACTION** Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

- **INDICATIONS AND DOSE**

  Active psoriatic arthritis (in combination with disease-modifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy | Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications

  - **BY MOUTH**
    - Adult: Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 10 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

  - **SIDE-EFFECTS**

  - Common or very common

    - Back pain
    - Bronchitis
    - Cough
    - Decreased appetite
    - Diarrhoea
    - Dyspepsia
    - Fatigue
    - Gastroesophageal reflux disease
    - Headache
    - Insomnia
    - Migraine
    - Nasopharyngitis
    - Nausea
    - Tension headache
    - Upper abdominal pain
    - Upper respiratory tract infections
    - Vomiting

  - Uncommon

    - Rash

  - **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment.

  - **PREGNANCY** Avoid—teratogenic in animal studies.

  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

  - **RENAL IMPAIRMENT** Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration.

  - **MONITORING REQUIREMENTS** Monitor body-weight regularly.

- **CAUTIONS** Low body-weight—consider discontinuation if weight loss is unexplained or clinically significant

- **INTERACTIONS** Appendix 1 (apremilast).

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**

  - **RENAL IMPAIRMENT** Reduce dose if eGFR less than 30 mL/minute/1.73 m²; consult product literature for initial dose titration.

  - **MONITORING REQUIREMENTS** Monitor body-weight regularly.
Acute attacks of gout are usually treated with high doses of corticosteroid. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab p. 772, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

### Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term (‘interval’) treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat alternatively the uricosuric drug sulfinpyrazone p. 980 may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is not indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch–Nyhan syndrome.

Sulfinpyrazone can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment. Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

### Other drugs used for Hyperuricaemia and gout

- Ketoprofen with omeprazole, p. 1003
- Naproxen with esomeprazole, p. 1007
- Naproxen with misoprostol, p. 1007

## 2 Hyperuricaemia and gout

### Gout

#### Overview

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

### Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 993, diclofenac potassium p. 992, etoricoxib p. 996, indometacin p. 1001, ketoprofen p. 1002, naproxen p. 1006 or sulindac p. 1009. Colchicine below is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin p. 114 is not indicated in gout. Allopurinol p. 980, febuxostat p. 981, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a
Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

- **BY MOUTH**
- Adult: 500 micrograms twice daily

**Prophylaxis of familial Mediterranean fever (recurring polyserositis)**

- **BY MOUTH**
- Adult: 0.5–2 mg once daily

- **UNLICENSED USE** BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurring polyserositis) is an unlicensed indication.

- **CONTRA-INDICATIONS** Blood disorders

- **CAUTIONS** Cardiac disease · elderly · gastro-intestinal disease

- **INTERACTIONS** → Appendix 1 (colchicine).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · nausea · vomiting
  - **Rare** Alopecia · blood disorders with prolonged treatment · inhibition of spermatogenesis · myopathy · peripheral neuritis
  - **Frequency not known** Excessive doses may cause profuse diarrhoea · gastrointestinal haemorrhage · hepatic damage · rash · renal damage
  - **PREGNANCY** Avoid—teratogenicity in animal studies.
  - **BREAST FEEDING** Present in milk but no adverse effects reported. Manufacturers advise caution.
  - **HEPATIC IMPAIRMENT** Use with caution.
  - **RENAL IMPAIRMENT** Reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Colchicine (Non-proprietary) Colchicine 500 microgram Colchicine 500microgram tablets | 100 tablet (Pack) £42.56 DT price = £15.82

**URICOSURICS**

**Sulfinpyrazone** (Sulphinpyrazone)

- **INDICATIONS AND DOSE**
  - **Gout prophylaxis** | **Hyperuricaemia**
    - **BY MOUTH**
      - Adult: Initially 100–200 mg daily, dose to be taken with food (or milk); increased to 600–800 mg daily over 2–3 weeks, 800 mg daily is rarely given; continue until serum uric acid concentration normal then reduce dose for maintenance (maintenance dose may be as low as 200 mg daily)

- **CONTRA-INDICATIONS** Acute gout attack · acute porphyrias p. 950 · history of blood disorders · peptic ulceration

- **CAUTIONS** Cardiac disease (may cause salt and water retention) · ensure adequate fluid intake (about 2–3 litres daily) and render urine alkaline during initial treatment

- **INTERACTIONS** → Appendix 1 (sulfinpyrazone).

- **SIDE-EFFECTS**
  - **Common or very common** Gastro-intestinal disorders · rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence)
  - **Rare** Alopecia · aplastic anaemia · arthralgia · blood disorders · drowsiness · eosinophilia resembling Stevens-Johnson syndrome · hepatic damage · jaundice · myopathy · peripheral neuritis

- **ALLERGY AND CROSS-SENSITIVITY** Avoid in hypersensitivity to aspirin, salicylates, NSAIDs.

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** No information available.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose. Avoid in severe impairment.

- **MONITORING REQUIREMENTS** Regular blood counts before treatment and at regular intervals during treatment.

- **MEDICINAL FORMS**
  - Available in unlicensed preparations.

**XANTHINE OXIDASE INHIBITORS**

**Allopurinol**

- **INDICATIONS AND DOSE**
  - **Prophylaxis of gout of and of uric acid and calcium oxalate renal stones** | **Prophylaxis of hyperuricaemia associated with cancer chemotherapy**
    - **BY MOUTH**
      - Adult: Initially 100 mg daily, for maintenance adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

  **Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions)** | **Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)**
    - **BY MOUTH**
      - Adult: 100–200 mg daily, dose to be taken preferably after food

  **Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions)** | **Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)**
    - **BY MOUTH**
      - Adult: 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

  **Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in severe conditions)** | **Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in severe conditions)**
    - **BY MOUTH**
      - Adult: 700–900 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

- **CAUTIONS** Ensure adequate fluid intake (2–3 litres/day) · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

**CAUTIONS, FURTHER INFORMATION**

Administer prophylactic NSAID (not aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

- **INTERACTIONS** → Appendix 1 (allopurinol).

- **SIDE-EFFECTS**
  - **Common or very common** Gastro-intestinal disorders · rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence)
  - **Rare** Alopecia · aplastic anaemia · arthralgia · blood disorders · drowsiness · eosinophilia resembling Stevens-Johnson syndrome · hepatic damage · jaundice · myopathy · peripheral neuritis

- Very rare - Seizures
- PREGNANCY - Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- BREAST FEEDING - Present in milk — not known to be harmful.
- HEPATIC IMPAIRMENT - Reduce dose.
- RENAL IMPAIRMENT - Max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, and mouthwash.

### Febuxostat

#### INDICATIONS AND DOSE

**Treatment of chronic hyperuricaemia in gout**

- **BY MOUTH**
- Adult: Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg once daily

**Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies**

- **BY MOUTH**
- Adult: 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)**

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

**CONTRA-INDICATIONS** - Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately

**CAUTIONS** - Congestive heart failure - ischaemic heart disease - thyroid disorders - transplant recipients

**CAUTIONS, FURTHER INFORMATION**

Administer prophylactic NSAIDs (not aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack.

**INTERACTIONS** - Appendix 1 (febuxostat).

**SIDE-EFFECTS**

- **Common or very common** - Abnormal liver function tests - gastro-intestinal disturbances - headache - oedema - rash
- **Rare** - Asthenia - blurred vision - hepatitis - jaundice - mouth ulceration - nervousness - pancreatitis - pancytopenia - rhabdomyolysis - thirst - thrombocytopenia - tinnitus - tubulointerstitial nephritis
- **PREGNANCY** - Manufacturer advises avoid — limited information available.
- **BREAST FEEDING** - Manufacturer advises avoid — present in milk in animal studies.
- **HEPATIC IMPAIRMENT** - Max. 80 mg daily in mild impairment. No dose information available in moderate or severe impairment.
- **RENAL IMPAIRMENT** - Use with caution if eGFR less than 30 mL/minute/1.73 m² — no information available.
- **PRE-TREATMENT SCREENING** - Monitor liver function tests before treatment as indicated.
- **MONITORING REQUIREMENTS** - Monitor liver function tests periodically during treatment as indicated.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TAI64

Febuxostat is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

www.nice.org.uk/TAI64

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium issued similar advice to NICE guidance: Febuxostat for the management of hyperuricaemia in patients with gout (December 2008), in August 2010.

The Scottish Medicines Consortium has advised (June 2016) that febuxostat (Adenuric®) is accepted for restricted use within NHS Scotland for the prevention and treatment of hyperuricaemia in patients undergoing chemotherapy for haematological malignancies at intermediate to high risk of tumour lysis syndrome, only when allopurinol is not tolerated or contra-indicated.
3 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in ocular myasthenia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 765 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastrointestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1179.

Neostigmine p. 983 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 81 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 984 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

Corticosteroids are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In generalised myasthenia gravis prednisolone p. 622 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in ocular myasthenia. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In generalised myasthenia gravis azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Ciclosporin p. 766, methotrexate p. 817, or mycophenolate mofetil p. 773 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

Acetycholine-release enhancers

Amifampridine p. 984 is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 775 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 985 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon). A cannabis extract p. 985 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1191 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam p. 321 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 986 is an alpha2-adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.

Other muscle relaxants

The clinical efficacy of methocarbamol p. 986 and meprobamate p. 324 as muscle relaxants is not well established, although they have been included in compound analgesic preparations.
3.1 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

### ANTICHOLINESTERASES

#### Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
- **CONTRA-INDICATIONS** Intestinal obstruction - urinary obstruction
- **CAUTIONS** Arrhythmias - asthma (extreme caution) - atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage - bradycardia - epilepsy - hyperthyroidism - hypotension - parkinsonism - peptic ulceration - recent myocardial infarction - vagotonia
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) - diarrhoea - increased salivation - nausea - vomiting

**Overdose**

Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Amount probably too small to be harmful.

### Neostigmine

**(Neostigmine methylsulfate)**

- **INDICATIONS AND DOSE**

  **Treatment of myasthenia gravis**
  - **BY MOUTH**
    - Adult: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily
  - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Adult: 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

  **Reversal of non-depolarising (competitive) neuromuscular blockade**
  - **BY INTRAVENOUS INJECTION**
    - Adult: 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

- **CAUTIONS**
  - With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade

- **INTERACTIONS** → Appendix 1 (parasympathomimetics).

- **RENAL IMPAIRMENT** May need dose reduction.
Pyridostigmine bromide

**DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

**INDICATIONS AND DOSE**
- **Myasthenia gravis**
  - **INITIALLY BY MOUTH**
  - Adult: 30–120 mg, doses to be given at suitable intervals throughout day; usual dose 0.3–1.2 g daily in divided doses, it is advisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily.

**RENAI IMPAIRMENT** Reduce dose; excreted by kidney.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**
- Neostigmine (Non-proprietary)
  - Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet (£) £99.60

**Solution for injection**
- Neostigmine (Non-proprietary)
  - Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule (£) £4.95–£5.45

**CHOLINERGIC RECEPTOR STIMULATING DRUGS**

**Amifampridine**

**INDICATIONS AND DOSE**
- **Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)**
  - **BY MOUTH**
  - Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

**CONTRA-INDICATIONS** Congenital QT syndromes · epilepsy · uncontrolled asthma

**CAUTIONS** Non-paraneoplastic form of Lambert- Eaton myasthenic syndrome

**INTERACTIONS** Caution if concomitant use of drugs that lower convulsive threshold.
Avoid concomitant use of drugs that prolong QT interval.
Avoid concomitant use of drugs with a narrow therapeutic index.

**SIDE-EFFECTS** Anxiety · arrhythmias · blurred vision · bronchial hypersecretion · chorea · convulsions · cough · dizziness · drowsiness · exacerbation or precipitation of asthma · gastro-intestinal disorders · headache · myoclonia · palpitations · paraesthesia · Raynaud’s syndrome · sleep disturbances · weakness

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

**RENAL IMPAIRMENT** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days. In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days. Use with caution.

**MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (July 2012) that amifampridine phosphate (Firdapse) is not recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 3, 21
  - Firdapse (BioMarin Europe Ltd) ▼
  - Amifampridine (as Amifampridine phosphate) 10 mg Firdapse 10mg tablets | 100 tablet (£) £1,815.00

3.2 Nocturnal leg cramps

**Nocturnal leg cramps**

**Quinine salts**
Quinine salts p. 573, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep.
Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred.

3.3 Spasticity

Other drugs used for Spasticity Dantrolene sodium, p. 1191
- Diazepam, p. 321
CANNABINOIDS

Cannabis extract

● INDICATIONS AND DOSE
Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)
  ▶ BY BUCCAL ADMINISTRATION
  ▶ Adult: (consult product literature)

● CONTRA-INDICATIONS  Family history of psychosis · history of other severe psychiatric disorder · personal history of psychosis

● CAUTIONS  History of epilepsy · significant cardiovascular disease

● INTERACTIONS  → Appendix 1 (cannabis extract).

● SIDE-EFFECTS
  ▶ Common or very common  Amnesia · blurred vision · constipation · depression · diarrhoea · disorientation · dissociation · dizziness · drowsiness · dry mouth · dysarthria · impaired attention · increased or decreased appetite · malaise · mood disturbance · mouth ulcers · nausea · oral pain · taste disturbance · vertigo · vomiting
  ▶ Uncommon  Abdominal pain · delusions · hallucinations · hypertension · oremucosal discolouration · palpitation · paranoia · pharyngitis · stomatitis · suicidal thoughts · syncope · tachycardia · tooth discoloration

  ▶ Frequency not known  Anxiety · seizures

● CONCEPTION AND CONTRACEPTION  Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.

● PREGNANCY  Manufacturer advises use only if potential benefit outweighs risks.

● BREAST FEEDING  Avoid—present in milk.

● HEPATIC IMPAIRMENT  Manufacturer advises more frequent monitoring in significant hepatic impairment—possible risk of prolonged or enhanced effect.

● RENAL IMPAIRMENT  Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.

● MONITORING REQUIREMENTS  Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.

● PATIENT AND CARER ADVICE
  Driving and skilled tasks
  For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Spray
  EXCIPIENTS: May contain Propylene glycol
  ▶ Sativex (Bayer Plc)
  Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per 1 dose Sativex oromucosal spray | 270 dose £375.00 (£34.3)

MUSCLE RELAXANTS  CENTRALLY ACTING

Baclofen

● INDICATIONS AND DOSE
  Pain of muscle spasm in palliative care
  ▶ BY MOUTH
  ▶ Adult: 5–10 mg 3 times a day
  Hiccups due to gastric distension (in palliative care)
  ▶ BY MOUTH
  ▶ Adult: 5 mg twice daily

  Adults: 5 mg (max. 40 mg) 24 times a day, initially titrated to a satisfactory response over 1–2 weeks, with dosage increments of 5 mg 4 times a day.

  Adults: Test intrathecal dose 300 micrograms (max. 1000 micrograms) 4 times a day, initially titrated to a satisfactory response over 1–2 weeks, with dosage increments of 100 micrograms 4 times a day.

  Adults: 300 micrograms, to be given over 5 minutes via catheter or lumbar puncture, then increased in steps of 300 micrograms (max. per dose 1200 micrograms), not given more often than every 24 hours to determine appropriate dose, then dose—titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

  ▶ CONTRA-INDICATIONS  History of peptic ulcer · history of epilepsy · (serious) respiratory tract disease or (serious) respiratory problems · hyperhidrosis · malnutrition · previous spinal surgery · history of multiple sclerosis or traumatic partial section of spinal cord

  ▶ CAUTIONS
  ▶ With oral use  Avoid oral route in active peptic ulceration

  ▶ GENERAL CAUTIONS
  Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · Parkinson’s disease · psychiatric illness · respiratory impairment

  ▶ SPECIFIC CAUTIONS
  ▶ With intrathecal use  Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

  ▶ INTERACTIONS  → Appendix 1 (muscle relaxants).

  ▶ SIDE-EFFECTS
  ▶ Common or very common  Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastrointestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders

  ▶ Rare  Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances

  ▶ Very rare  Hypothermia

  ▶ PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

  ▶ BREAST FEEDING  Present in milk—amount probably too small to be harmful.

  ▶ HEPATIC IMPAIRMENT  With oral use  Manufacturer advises use with caution.

Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord
  ▶ BY MOUTH
  ▶ Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)
  ▶ BY INTRATHECAL INJECTION
  ▶ Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then dose—titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION
Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump— administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

CONTRA-INDICATIONS
  ▶ With intrathecal use  Local infection · systemic infection

  ▶ With oral use  Avoid oral route in active peptic ulceration

CAUTIONS

GENERAL CAUTIONS
Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · Parkinson’s disease · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS
  ▶ With intrathecal use  Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

INTERACTIONS  → Appendix 1 (muscle relaxants).

SIDE-EFFECTS
  ▶ Common or very common  Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastrointestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders

  ▶ Rare  Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances

  ▶ Very rare  Hypothermia

PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING  Present in milk—amount probably too small to be harmful.

HEPATIC IMPAIRMENT  With oral use  Manufacturer advises use with caution.
Musculoskeletal system

986 Neuromuscular disorders

RENAL IMPAIRMENT
With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m² manufacturer advises use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

TREATMENT CESSATION
Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include raspberry.

Palliative care
For further information on the use of baclofen in palliative care, see www.palliativecare.com/formulary/en/baclofen.html

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

Methocarbamol

INDICATIONS AND DOSE
Short-term symptomatic relief of muscle spasm
BY MOUTH
Adult: 1.5 g 4 times a day; reduced to 750 mg 3 times a day if required
Elderly: Up to 750 mg 4 times a day, dose may be sufficient

CONTRA-INDICATIONS
Brain damage • coma • epilepsy • myasthenia gravis • pre-coma

INTERACTIONS
Appendix 1 (muscle relaxants).

SIDE-EFFECTS
Amnesia • anaphylaxis • angioedema • anxiety • blurred vision • bradycardia • cholestatic jaundice • confusion • dizziness • drowsiness • dyspepsia • fever • headache • hypersensitivity reactions • hypotension • leucopenia • nasal congestion • nausea • pruritus • rash • restlessness • seizures • tremor • urticaria • vomiting

PREGNANCY
Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING
Present in milk in animal studies—manufacturer advises caution.

RENAL IMPAIRMENT
Manufacturer advises caution; half-life may be prolonged.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

LESS SUITABLE FOR PRESCRIBING
Less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

Tizanidine

INDICATIONS AND DOSE
Spasticity associated with multiple sclerosis or spinal cord injury or disease
BY MOUTH
Adult: Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3–4 days and adjust according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

CAUTIONS
Elderly

INTERACTIONS
Appendix 1 (muscle relaxants). Caution with concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS
Common or very common Altered liver enzymes
(discourage if persistently raised—consult product literature) • dizziness • drowsiness • dry mouth • fatigue • gastro-intestinal disturbance • hypotension • nausea
Uncommon Bradycardia
Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 414, but paracetamol is preferred, particularly in the elderly.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the osteoarthritis, NSAIDs are more appropriate than paracetamol often gives adequate pain control in inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Diclofenac p. 997 is as effective as naproxen, and flurbiprofen p. 998 may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 1002 has anti-inflammatory properties similar to ibuprofen and has more side-effects. Diclofenac p. 997 is similar in activity and tolerance to naproxen.

Ketoprofen p. 1002 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 1001 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. Mefenamic acid p. 1004 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment. Meloxicam p. 1004 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis. Nabumetone p. 1005 is comparable in effect to naproxen. Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1007 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions. Sulindac p. 1009 is similar in tolerance to naproxen. Tenoxicam p. 1009 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration. Tolfenamic acid p. 440 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1186 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1187, are licensed for the short-term management of postoperative pain. The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 996 and celecoxib p. 990, are as effective as non-selective
NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 114 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

Dental and orofacial pain
Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 992.

Asthma
Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

NSAIDs and cardiovascular events
All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac, treatment advice has been updated in line with diclofenac, based on aceclofenac’s structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events
All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam p. 1007, ketoprofen p. 1002, and ketorolac trometamol p. 1186 are associated with the highest risk; indomethacin, p. 1004, diclofenac, and naproxen p. 1006 are associated with intermediate risk, and ibuprofen p. 999 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose and not to use more than one oral NSAID at a time.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

**ANALGESICS** NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Aceclofenac

- **INDICATIONS AND DOSE**
  - Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis
    - **BY MOUTH**
      - Adult: 100 mg twice daily

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding
  - Active gastro-intestinal ulceration
  - Cerebrovascular disease
  - History of gastro-intestinal bleeding related to previous NSAID therapy
  - History of gastro-intestinal perforation related to previous NSAID therapy
  - History of recurrent gastro-intestinal haemorrhage
  - Two or more distinct episodes
  - History of recurrent gastro-intestinal ulceration
  - Ischaemic heart disease
  - Mild heart failure
  - Peripheral arterial disease
  - Severe heart failure

- **CAUTIONS**
  - Allergic disorders
  - Avoid in acute porphyrias
  - p. 930 Cardiac impairment (NSAIDs may impair renal function)
  - Coagulation defects
  - Connective-tissue disorders
  - Crohn’s disease (may be exacerbated)
  - Elderly
  - Risk of serious side-effects and fatalities
  - History of cardiac failure
  - Hypertension
  - Left ventricular dysfunction
  - Oedema
  - Risk factors for cardiovascular events
  - Ulcerative colitis (may be exacerbated)

- **INTERACTIONS**
  - Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - Rare
    - Alveolitis
    - Aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
    - Hepatic damage
    - Interstitial fibrosis associated with NSAIDs can lead to renal failure
    - Pancreatitis
    - Papillary necrosis associated with NSAIDs can lead to renal failure
    - Pulmonary eosinophilia
    - Stevens-Johnson syndrome
    - Toxic epidermal necrolysis
    - Visual disturbances

  - **Frequency not known**
    - Angioedema
    - Blood disorders
    - Bronchospasm
    - Colitis (induction of or exacerbation of)
    - Crohn’s disease (induction of or exacerbation of)
    - Depression
    - Diarrhoea
    - Dizziness
    - Drowsiness
    - Fluid retention (rarely precipitating congestive heart failure)
    - Gastro-intestinal bleeding
    - Gastro-intestinal discomfort
    - Gastro-intestinal disturbances
    - Gastro-intestinal ulceration
    - Haematuria
    - Headache
    - Hearing disturbances
    - Hypersensitivity reactions
    - Insomnia
    - Nausea
    - Nervousness
    - Photosensitivity
    - Raised blood pressure
    - Rash
    - Renal failure (especially in patients with pre-existing renal impairment)
    - Tinnitus
    - Vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
Acemetacin

**INDICATIONS AND DOSE**

- **Pain and inflammation in rheumatic disease**
- **Postoperative analgesia**

  - **By mouth**
  - Adult: 120 mg daily in divided doses, then increased if necessary to 180 mg daily in divided doses, dose to be taken with food

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding
  - History of gastro-intestinal ulceration
  - History of gastrointestinal perforation related to previous NSAID therapy
  - History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
  - History of recurrent gastro-intestinal ulceration (two or more distinct episodes)
  - Severe heart failure

- **CAUTIONS**
  - Allergic disorders
  - Cardiac impairment (NSAIDs may impair renal function)
  - Cerebrovascular disease
  - Coagulation defects
  - Connective-tissue disorders
  - Crohn’s disease (may be exacerbated)
  - Elderly (risk of serious side-effects and fatalities)
  - Epilepsy
  - Heart failure
  - Ischaemic heart disease
  - Parkinsonism
  - Peripheral arterial disease
  - Psychiatric disturbances
  - Risk factors for cardiovascular events
  - Ulcerative colitis (may be exacerbated)
  - Uncontrolled hypertension

**INTERACTIONS**

- Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- **Rare**
  - Alveolitis
  - Aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
  - Blood disorders
  - Confusion
  - Convulsions
  - Hepatic damage
  - Hyperglycaemia
  - Interstitial fibrosis associated with NSAIDs can lead to renal failure
  - Intestinal strictures
  - Pancreatitis
  - Papillary necrosis associated with NSAIDs can lead to renal failure
  - Peripheral neuropathy
  - Psychiatric disturbances
  - Pulmonary eosinophilia
  - Stevens-Johnson syndrome
  - Syncope
  - Thrombocytopenia
  - Toxic epidermal necrolysis
  - Visual disturbances

- **Frequency not known**
  - Angioedema
  - Blood disorders
  - Bronchospasm
  - Collitis (induction of or exacerbation of)
  - Crohn’s disease (induction of or exacerbation of)
  - Depression
  - Diarrhoea
  - Dizziness
  - Drowsiness
  - Fluid retention (rarely precipitating congestive heart failure)
  - Gastro-intestinal bleeding
  - Gastro-intestinal discomfort
  - Gastro-intestinal disturbances
  - Gastro-intestinal ulceration
  - Haematuria
  - Headache
  - Hearing disturbances
  - Hyperkalaemia
  - Hypersensitivity reactions
  - Insomnia
  - Nausea
  - Nervousness
  - Photosensitisation
  - Raised blood pressure
  - Rash
  - Renal failure (especially in patients with pre-existing renal impairment)
  - Tinnitus
  - Vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

- **BREAST FEEDING**
  - Use with caution during breast-feeding. Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - Initially 100 mg daily. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**
  - The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution; avoid in moderate to severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**DRUG ACTION**

Glycolic acid ester of indometacin.
### Celecoxib

**INDICATIONS AND DOSE**

Pain and inflammation in osteoarthritis

- **BY MOUTH**
  - Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Pain and inflammation in rheumatoid arthritis

- **BY MOUTH**
  - Adult: 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

Ankylosing spondylitis

- **BY MOUTH**
  - Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

**CONTRA-INDICATIONS**

Active gastro-intestinal bleeding, active gastro-intestinal ulceration, cerebrovascular disease, inflammatory bowel disease, ischaemic heart disease, mild to severe heart failure, peripheral arterial disease

**CAUTIONS**

Allergic disorders, cardiac impairment (NSAIDs may impair renal function), coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), history of cardiac failure, hypertension, left ventricular dysfunction, oedema, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated)

**INTERACTIONS**

Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- Common or very common: Dyspnoea, influenza-like symptoms
- Uncommon: Cerebral infarction, fatigue, muscle cramps, palpitation, paraesthesia, stomatitis
- Rare: Alopecia, alveolitis, aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible), hepatic damage, interstitial fibrosis associated with NSAIDs can lead to renal failure, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, pulmonary eosinophilia, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, visual disturbances
- Very rare: Seizures
- Frequency not known: Angioedema, blood disorders, bronchospasm, chest pain, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, fluid retention (rarely precipitating congestive heart failure), gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, headache, hearing disturbances, hypersensitivity reactions, insomnia, nausea, nervousness, photosensitivity, raised blood pressure, rashes, renal failure (especially in patients with pre-existing renal impairment), tinnitus, vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - Contra-indicated in patients with sulfonamide sensitivity.

**CONCEPTION AND CONTRACEPTION**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

Avoid (teratogenic in animal studies).

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Halve initial dose in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MONITORING REQUIREMENTS**

Monitor blood pressure before and during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Celecoxib (Non-proprietary)
  - Celecoxib 100 mg
    - Capsule (Pfizer Ltd) £21.55 0T price = £2.25
  - Celecoxib 200 mg
    - Capsule (Pfizer Ltd) £21.55 0T price = £1.98
- Celebrex (Pfizer Ltd)
  - Celecoxib 100 mg
    - Capsule (Pfizer Ltd) £21.55 0T price = £2.25
  - Celecoxib 200 mg
    - Capsule (Pfizer Ltd) £21.55 0T price = £1.98

### Dexibuprofen

**INDICATIONS AND DOSE**

- **BY MOUTH**
  - Adult: 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1.2 g daily (max. per dose 400 mg)

**Mild to moderate pain and inflammation in dysmenorrhoea**

- **BY MOUTH**
  - Adult: 600–900 mg daily in up to 3 divided doses (max. per dose 300 mg); maximum 900 mg per day

**CONTRA-INDICATIONS**

Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), severe heart failure

**CAUTIONS**

Allergic disorders, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension
Dexketoprofen

- **INDICATIONS AND DOSE**

  Short-term treatment of mild to moderate pain including dysmenorrhea
  - **BY MOUTH**
    - Adult: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours; maximum 75 mg per day
    - Elderly: 12.5 mg every 4–6 hours, alternatively 25 mg every 8 hours, initial max. 50 mg; maximum 75 mg daily

- **CONTRA-INDICATIONS**

  Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS**

  Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

  **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**

  Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

  **SIDE-EFFECTS, FURTHER INFORMATION**

  Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY**

  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**

  Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**

  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**

  Use with caution during breast-feeding. Present in milk—but risk to infant minimal.

- **HEPATIC IMPAIRMENT**

  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**

  Reduce initial dose. The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**Diclofenac potassium**

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders**
- **BY MOUTH**
  - Child 14-17 years: 75–100 mg daily in 2–3 divided doses
  - Adult: 75–150 mg daily in 2–3 divided doses

**Acute gout**
- **BY MOUTH**
  - Adult: 75–150 mg daily in 2–3 divided doses

**Postoperative pain**
- **BY MOUTH**
  - Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
  - Child 14–17 years: 75–100 mg daily in 2–3 divided doses
  - Adult: 75–150 mg daily in 2–3 divided doses

**Migraine**
- **BY MOUTH**
  - Adult: 50 mg, to be given at onset of migraine, then 50 mg after 2 hours if required, then 50 mg after 4–6 hours; maximum 200 mg per day

**Fever in ear, nose, or throat infection**
- **BY MOUTH**
  - Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

---

**Unlicensed Use**

Voltarol® Rapid not licensed for use in children under 14 years or in fever.

**Contra-Indications**

Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

---

**Caution**

Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

---

**Contraindications**

Reduce initial dose to 50 mg daily. The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in moderate to severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

---

**INTERACTIONS**

Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens–Johnson syndrome · toxic epidermal necrolysis · visual disturbances

- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

---

**Allergy and Cross-Sensitivity**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

---

**Conception and Contraception**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**Pregnancy**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**Breast Feeding**

Use with caution during breast-feeding. Amount in milk too small to be harmful.

**Hepatic Impairment**

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**Renal Impairment**

Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**INDICATIONS AND DOSE**

**Pain and inflammation in musculoskeletal disorders**

- **Acute gout**
  - Adult: 75–150 mg daily in 2–3 divided doses
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 75–150 mg daily in 2–3 divided doses

- **Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**
  - Adult: 75–150 mg daily in 2–3 divided doses
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Postoperative pain**
  - Adult: 75–150 mg daily in 2–3 divided doses
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

**DICLOMAX RETARD®**

- **Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
  - Adult: 1 capsule once daily
  - **BY MOUTH**

**DICLOMAX SR®**

- **Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
  - Adult: 1 capsule 1–2 times a day, alternatively 2 capsules once daily
  - **BY MOUTH**

**DYLOJECT®**

- **Acute exacerbations of pain and postoperative pain**
  - **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg once daily for maximum 2 days, to be administered into the gluteal muscle

**Acute exacerbations of pain and postoperative pain (severe cases)**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg twice daily for maximum 2 days, to be administered into the gluteal muscle

**Ureteric colic**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg, then 75 mg after 30 minutes if required

**Acute postoperative pain (in supervised settings)**

- **BY INTRAVENOUS INJECTION**
  - Adult: 75 mg every 4–6 hours if required for maximum 2 days; maximum 150 mg per day

**Prevention of postoperative pain**

- **BY INTRAVENOUS INJECTION**
  - Adult: 25–50 mg, to be given after surgery; further doses given after 4–6 hours if necessary; maximum 150 mg in 24 hours for 2 days

**MOTIFENE®**

- **Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
  - Adult: 1 capsule 1–2 times a day

**VOLTAROL® 75MG SR TABLETS**

- **Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
  - Adult: 1 tablet 1–2 times a day

**VOLTAROL® EMULGEL**

- **Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis**
  - **TO THE SKIN**
  - Adult: Apply 3–4 times a day, therapy should be reviewed after 14 days (or after 28 days for osteoarthritis)

**VOLTAROL® RETARD**

- **Pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders**
  - Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

**Acute exacerbations of pain**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

**Ureteric colic**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 75 mg, then 75 mg after 30 minutes if required

**Acute postoperative pain (in hospital setting)**

- **BY INTRAVENOUS INFUSION**
  - Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

**Prevention of postoperative pain (in hospital setting)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

**CONTRA-INDICATIONS**

- With intravenous use: Dehydration | history of asthma | history of confirmed or suspected cerebrovascular bleeding | history of haemorrhagic diathesis | hypovolaemia | operations with high risk of haemorrhage

- With systemic use: Active gastro-intestinal bleeding | active gastro-intestinal ulceration | avoid suppositories in proctitis | cerebrovascular disease | history of gastro-intestinal bleeding related to previous NSAID therapy | history of gastro-intestinal perforation related to previous NSAID therapy | history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) | history of recurrent gastro-intestinal ulceration (two or more distinct episodes) | ischaemic heart disease | mild to severe heart failure | peripheral arterial disease

**CAUTIONS**

- With systemic use: Allergic disorders | cardiac impairment (NSAIDs may impair renal function) | coagulation defects | connective-tissue disorders | Crohn’s disease (may be exacerbated) | elderly (risk of serious side-effects and fatalities) | history of cardiac failure | hypertension | left ventricular dysfunction | oedema | risk factors for cardiovascular events | ulcerative colitis (may be exacerbated)

- With topical use: Avoid contact with eyes | avoid contact with inflamed or broken skin | avoid contact with mucous membranes | not for use with occlusive dressings | topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
INTERACTIONS  Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs.

- With intravenous use Contra-indicated in concomitant NSAID use. Contra-indicated in concomitant anticoagulant use (including low-dose heparins).

SIDE-EFFECTS

- Rare

  - With systemic use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

  - Frequency not known

  - With intramuscular use or intravenous use Injection site reactions

  - With rectal use Suppositories may cause rectal irritation

  - With topical use Paraeesthesia - photosensitivity - rash (discontinue use if develops)

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

  - With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION

- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY

- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

  - With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

BREAST FEEDING

- With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.

  - With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

HEPATIC IMPAIRMENT

- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAI IMPAIRMENT

- With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

  - With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Voltarol®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of 5 mg/hour.

  - With topical use For topical preparations, apply with gentle massage only.

PRESCRIBING AND DISPENSING INFORMATION

- With oral use Voltarol® dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).

PATIENT AND CARER ADVICE For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity For topical preparations, patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

EXCEPTIONS TO LEGAL CATEGORY Various pack sizes of gel preparations may be available on sale to the public.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary Diclofenac Sodium Tablets may be prescribed.

NATIONAL FUNDING/ACCESS DECISIONS

DYLOJECT®

Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium (SMC) has advised (February 2008) that Dyloject® is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings.

MEDITICL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

Diclofenac sodium with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 993, misoprostol p. 73.

INDICATIONS AND DOSE

ARHTROTEC® 50/200
Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis
▶ Adult: 1 tablet 2–3 times a day, take with food

ARHTROTEC® 75/200
Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis
▶ BY MOUTH
▶ Adult: 1 tablet twice daily, take with food

MISOFEN® 50/200
Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis
▶ BY MOUTH
▶ Adult: 1 tablet 2–3 times a day, take with food

MISOFEN® 75/200
Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis
▶ BY MOUTH
▶ Adult: 1 tablet twice daily, take with food

UNLICENSED USE The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Gastro-resistant tablet

ETODOLAC

INDICATIONS AND DOSE
Pain and inflammation in rheumatoid arthritis and osteoarthritis
▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Adult: 300–600 mg daily in 1–2 divided doses
▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
▶ Adult: 600 mg daily

CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

CAUTIONS Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - colangitis - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

INTERACTIONS → Appendix 1 (NSAIDs).

SIDE-EFFECTS
▶ Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
▶ Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - confusion - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - dysphagia - dysuria - fatigue - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal
bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · palpitation · paraesthesia · photosensitivity · pruritus · pyrexia · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · stomatitis · tinnitus · tremor · urinary frequency · vasculitis · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING Use with caution during breast-feeding. Manufacturer advises avoid.
- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.
- RENAL IMPAIRMENT Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

Pain and inflammation in osteoarthritis

- BY MOUTH
  - Child 16-17 years: 30 mg once daily, increased if necessary to 60 mg once daily
  - Adult: 30 mg once daily, increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis | Ankylosing spondylitis

- BY MOUTH
  - Child 16-17 years: 60 mg once daily, increased if necessary to 90 mg once daily

- CONTRA-INDICATIONS Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)

- CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- INTERACTIONS → Appendix 1 (NSAIDs).

SIDE-EFFECTS, FURTHER INFORMATION

- Very rare Confusion · hallucinations
- Frequency not known Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
- Rare Alveolitis · asptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- PREGNANCY Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

CONTRA-INDICATIONS

For topical preparations, apply with gentle massage only. Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Foam

Cautions

Avoid contact with eyes • avoid contact with inflamed or broken skin • avoid contact with mucous membranes • not for use with occlusive dressings • topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported). • Interactions → Appendix 1 (NSAIDs). Interactions do not generally apply to topical NSAIDs. • Side-effects Photosensitivity • rash (discontinue use if develops)

Side-effects, further information

Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported). • Serious side-effects • For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

Allergy and cross-sensitivity

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Pregnancy

Patient packs for topical preparations carry a warning to avoid during pregnancy.

Patient packs for topical preparations carry a warning to avoid during breast-feeding.

Deterioration in renal function has also been reported after topical use.

For topical preparations, apply with gentle massage only.

For topical preparations patients and carers should be advised to wash hands immediately after use.

Aspirin or any other NSAID. • haemorrhage (two or more distinct episodes) • recurrent gastro-intestinal ulceration (two or more distinct episodes) • peripheral arterial disease • aseptic meningitis (patients with connective-tissue disorders). • interstitial lung disease (induction of or exacerbation of) • colitis (induction of or exacerbation of) • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

Avoid if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

Avoid if eGFR less than 30 ml/minute/1.73 m².

Avoid contact with eyes

Adult: Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

Adult: 300–600 mg 3–4 times a day; maximum 3 g per day

Topical preparations, apply with gentle massage only.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nasopharyngitis · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · upper respiratory-tract infection · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful.

- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- RENAL IMPAIRMENT Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

- Flennopron (Tyrpharm Ltd)
  - Fenoprofen (as Fenoprofen calcium) 300 mg
  - Fenoprofen 300 tablets

| 100 tablet (PSM) | £9.45 |

Flurbiprofen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

- BY MOUTH
  - Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
  - Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

- BY MOUTH
  - Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
  - Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

CONTRA-INDICATIONS Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- CAUTIONS Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

INTERACTIONS Appendix 1 (NSAIDs).

SIDE-EFFECTS

- Common or very common
  - Stomatitis

- Uncommon
  - Confusion · fatigue · hallucinations · paraesthesia

- Rare
  - Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

- Frequency not known
  - Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomina · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful.

- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- RENAL IMPAIRMENT Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- RENAL IMPAIRMENT Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

Deterioration in renal function has also been reported after topical use.
Ibuprofen

### INDICATIONS AND DOSE

#### Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Mild to moderate pain including dysmenorrhoea | Postoperative analgesia | Migraine | Dental pain

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

#### Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

#### Pain and inflammation

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

#### Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

#### Pain and inflammation in systemic juvenile idiopathic arthritis

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

### Post-immunisation pyrexia in infants (on doctor’s advice only)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

#### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- **TO THE SKIN**
  - Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

### FENBID® FORTE

#### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- **TO THE SKIN**
  - Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

### IBUGEL® FORTE

#### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

- **TO THE SKIN**
  - Adult: Apply up to 3 times a day

### UNLICENSED USE

- Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

### CONTRA-INDICATIONS

- With oral use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

### CAUTIONS

- With oral use Allergic disorders (in adults) - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) (in adults) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- With topical use Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

### CAUTIONS, FURTHER INFORMATION

- High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (>2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

### INTERACTIONS

- Appendix 1 (NSAIDs).

- Interactions do not generally apply to topical NSAIDs.

### SIDE-EFFECTS

- Rare

- With oral use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure -
pulmonary eosinophilia • Stevens-Johnson syndrome •
poisonous to epidermal necrosis • visual disturbances

- Frequency not known
  - With oral use Angioedema • blood disorders • bronchospasm
  • colitis (induction of or exacerbation of) • Crohn’s disease
  (induction of or exacerbation of) • depression • diarrhoea •
  dizziness • drowsiness • fluid retention (rarely precipitating
  congestive heart failure) • gastro-intestinal bleeding •
  gastro-intestinal discomfort • gastro-intestinal
  disturbances • gastro-intestinal ulceration • haematura •
  headache • hearing disturbances • hypersensitivity
  reactions • insomnia • nausea • nervousness •
  photosensitivity • raised blood pressure • rashes • renal
  failure (especially in patients with pre-existing renal
  impairment) • tinnitus • vertigo

- With topical use Photosensitivity • rash (discontinue use if
  develops)

### SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular
  and gastro-intestinal side-effects, and a possible
  exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- With topical use Topical application of large amounts can
  result in systemic effects, including hypersensitivity and
  asthma (renal disease has also been reported).

### Overdose

Overdosage with ibuprofen may cause nausea, vomiting,
epigastric pain, and tinnitus, but more serious toxicity is
very uncommon. Charcoal, activated p. 1211 followed by
symptomatic measures are indicated if more than
100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see
Emergency treatment of poisoning p. 1204.

- Allergy and cross-sensitivity Contra-indicated in
  patients with a history of hypersensitivity to aspirin or any
  other NSAID—which includes those in whom attacks of
  asthma, angioedema, urticaria or rhinitis have been
  precipitated by aspirin or any other NSAID.

- Conception and contraception Caution—long-term use of
  some NSAIDs is associated with reduced female
  fertility, which is reversible on stopping treatment.

- Pregnancy
  - With oral use Avoid unless the potential benefit outweighs
    the risk. Avoid during the third trimester (risk of closure of
    fetal ductus arteriosus in utero and possibly persistent
    pulmonary hypertension of the newborn); onset of labour
    may be delayed and duration may be increased.
  - With topical use Patient packs for topical preparations carry
    a warning to avoid during pregnancy.

- Breast feeding
  - With oral use Use with caution during breast-feeding.
    Amount too small to be harmful but some manufacturers
    advise avoid.
  - With topical use Patient packs for topical preparations carry
    a warning to avoid during breast-feeding.

- Hepatic impairment
  - With oral use Use with caution; there is an increased risk of
    gastro-intestinal bleeding and fluid retention. Avoid in
    severe liver disease.

- Renal impairment
  - With oral use Avoid if possible or use with caution. Avoid in
    severe impairment. The lowest effective dose should be
    used for the shortest possible duration. In renal
    impairment monitor renal function; sodium and water
    retention may occur and renal function may deteriorate,
    possibly leading to renal failure.
  - With topical use Deterioration in renal function has also
    been reported after topical use.

- Directions for administration For topical
  preparations, apply with gentle massage only.

### Prescribing and dispensing information

- Flavours of syrup may include orange.

### Patient and carer advice

- Medicines for Children leaflet: ibuprofen for pain and
  inflammation www.medicinesforchildren.org.uk/ibuprofen-for-
  pain-and-inflammation

- With topical use For topical preparations, patients and their
  carers should be advised to wash hands immediately after
  use.

- Photosensitivity For topical preparations, patients or their
  carers should be advised against excessive exposure to
  sunlight or area treated in order to avoid possibility of
  photosensitivity.

### Professional specific information

- Dental practitioners’ formulary
  Ibuprofen Oral Suspension Sugar-free may be prescribed.
  Ibuprofen Tablets may be prescribed.

### Exceptions to legal category

- Smaller pack sizes of gel
  preparations may be available on sale to the public.

- Oral preparations can be sold to the public in certain
  circumstances.

### Medicinal forms

There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension

- **Ibulieve** (Dendron Ltd)
  - Ibuprofen 50 mg per 1 gram: Ibulieve 5% gel | 30 gram [P] £2.64 | 50 gram [P] £3.70 DT price = £3.21 | 100 gram [P] £6.80 DT price = £6.80
  - Ibuprofen 100 mg per 1 gram: Ibulieve Maximum Strength 10% gel | 30 gram [P] £3.39 | 50 gram [P] £4.63

- **Phorpain** (AMCo)
  - Ibuprofen 50 mg per 1 gram: Phorpain 5% gel | 100 gram [P] £1.50 DT price = £1.50
  - Ibuprofen 100 mg per 1 gram: Phorpain Maximum Strength 10% gel | 50 gram [P] £4.00 | 100 gram [P] £4.00 DT price = £4.92

Indomethacin

**Indomethacin**

- **INDICATIONS AND DOSE**
  - **Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Adult: 50–200 mg daily in divided doses
    - **BY RECTUM**
      - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Adult: 75 mg 1–2 times a day

- **Acute gout**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: 150–200 mg daily in divided doses
  - **BY RECTUM**
    - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: 75 mg daily

- **Dysmenorrhoea**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Adult: Up to 75 mg daily
  - **BY RECTUM**
    - Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: 75 mg daily

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes), history of recurrent gastro-intestinal ulceration (two or more distinct episodes), severe heart failure

- **CAUTIONS**
  - Allergic disorders, avoid rectal administration in haemorrhoids, avoid rectal administration in proctitis, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), epilepsy, heart failure, ischaemic heart disease, parkinsonism, peripheral arterial disease, psychiatric disturbances, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension

- **INTERACTIONS**
  - Appendix I (NSAIDs)

- **SIDE-EFFECTS**
  - Rare: Alveolitis, aseptic meningo, patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible, blood disorders, confusion, convulsions, hepatic damage, hyperglycaemia, interstitial fibrosis associated with NSAIDs can lead to renal failure, intestinal strictures, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, peripheral neuropathy, psychiatric disturbances, pulmonary eosinophilia, Stevens-Johnson syndrome, syncope, thrombocytopenia, toxic epidermal necrolysis, visual disturbances

- **Frequency not known**
  - Angioedema, blood disorders, bronchospasm, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of)
1002  Pain and inflammation in musculoskeletal disorders

**Musculoskeletal system**

**MEDICINAL FORMS**

- Indometacin (Non-proprietary)
  - Indometacin 100 mg  Indometacin 100 mg suppositories  | 10 suppository  
    Barnardos  £17.61 DT price = £17.61
  - Indocid  (Aspen Pharma Trading Ltd)  
    - Indometacin 100 mg  Indocid 100mg suppositories  | 10 suppository  
      Barnardos  £17.61 DT price = £17.61

**Ketoprofen**

- **INDICATIONS AND DOSE**
  - **Pain and mild inflammation in rheumatic disease**
    ▶  **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      Adult: 100–200 mg daily in 2–4 divided doses
    ▶  **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      Adult: 100–200 mg once daily, dose to be taken with food
  - **BY RECTUM**
    Adult: 100 mg once daily, to be administered at bedtime, combined oral and rectal treatment, maximum total daily dose 200 mg

**Indications and dose**

**Pain in musculoskeletal disorders**

**SIDE-EFFECTS, FURTHER INFORMATION**

- **SPECIFIC SIDE-EFFECTS**
  - **Photosensitivity**
  - **General side-effects**
    - **Contra-indications**
    - **Interactions**
    - **Additional information**

**Suppository**

- **Indometacin (Non-proprietary)**
- **Indometacin 100 mg**  Indometacin 100 mg suppositories  | 10 suppository  
  - Barnardos  £17.61 DT price = £17.61

**PATIENT AND CARER ADVICE**

- With oral use  Nausea
- With rectal use  Suppositories may cause occasional bleeding  — suppositories may cause rectal irritation

**SIDE-EFFECTS**

- **Renal impairment**
  - Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**CONTRA-INDICATIONS**

- With systemic use  Active gastro-intestinal bleeding  · active gastro-intestinal ulceration  · history of gastro-intestinal bleeding  · history of gastro-intestinal perforation  · history of gastro-intestinal ulceration  · severe heart failure

**INTERACTIONS**

- With topical use  Avoid contact with eyes  — avoid contact with inflamed or broken skin  — avoid contact with mucous membranes  — not for use with occlusive dressings  — topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- With topical use  Interactions do not generally apply to topical NSAIDs.

**SIDE-EFFECTS**

- **General side-effects**
  - Photosensitivity
- **Specific side-effects**
  - **Rare**
    - With systemic use  Arthritis  · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus

**INDICATIONS AND DOSE**

**Pain and mild inflammation in rheumatic disease**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 100–200 mg daily in 2–4 divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 100–200 mg once daily, dose to be taken with food

**RELIEF OF PAIN IN MUSCULOSKELETAL DISORDERS**

**TREATMENT IN KNEE OR HAND OSTEARTHritis (adjunct)**

- **TO THE SKIN**
  - Adult: 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

**POWERGEL®**

**RELIEF OF PAIN IN MUSCULOSKELETAL CONDITIONS**

**ADJUNCTIVE TREATMENT IN KNEE OR HAND OSTEARTHritis**

- **TO THE SKIN**
  - Adult: Apply 2–3 times a day for up to max. 10 days

**CONTRA-INDICATIONS**

- With systemic use  Active gastro-intestinal bleeding  · active gastro-intestinal ulceration  · history of gastro-intestinal bleeding  · history of gastro-intestinal perforation  · history of gastro-intestinal ulceration  · severe heart failure

**CAUTIONS**

- With systemic use  Allergic disorders  · cardiac impairment (NSAIDs may impair renal function)  · cerebrovascular disease  · coagulation defects  · connective-tissue disorders  · Crohn’s disease (may be exacerbated)  · elderly (risk of serious side-effects and fatalities)  · heart failure  · ischaemic heart disease  · peripheral arterial disease  · risk factors for cardiovascular events  · ulcerative colitis (may be exacerbated)  · uncontrolled hypertension

- With topical use  Avoid contact with eyes  — avoid contact with inflamed or broken skin  — avoid contact with mucous membranes  — not for use with occlusive dressings  — topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS**
  - Appendix 1 (NSAIDs).
  - With topical use  Interactions do not generally apply to topical NSAIDs.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**Photosensitivity**

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With systemic use  Arthritis  · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus

**Driving and skilled tasks**

Dizziness may affect performance of skilled tasks (e.g. driving).

**Medication notes**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS**
  - 21
  - **Indometacin (Non-proprietary)**
    - Indometacin 25 mg  Indometacin 25mg capsules  | 28 capsule

    - Indometacin 50 mg  Indometacin 50mg capsules  | 28 capsule  
      Barnardos  £7.50 DT price = £1.37
  - **Modified-release capsule**
    - **CAUTIONARY AND ADVISORY LABELS**
      - 21, 25
      - **Indometacin (Non-proprietary)**
        - Indometacin 75 mg  Indometacin 75mg modified-release capsules  | 100 capsule  
          Barnardos  £8.65 DT price = £8.65
        - Berlind Retard  (Tillomed Laboratories Ltd)  
          Indometacin 75 mg  Berlind 75 Retard capsules  | 100 capsule  
          Barnardos  £8.65 DT price = £8.65

- **Driving and skilled tasks**
  - Dizziness may affect performance of skilled tasks (e.g. driving).
erythematous may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

- **Frequency not known**
  - With topical use Suppositories may cause rectal irritation
  - With systemic use Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn's disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo
  - With topical use Rash (discontinue use if develops)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
  - With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

- **BREAST FEEDING**
  - With systemic use Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.
  - With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- **HEPATIC IMPAIRMENT**
  - With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

- **RENAL IMPAIRMENT**
  - With systemic use Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
  - With topical use Deterioration in renal function has also been reported after topical use.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

- **Flavours of oral liquid formulations may include strawberry.**

- **PATIENT AND CARER ADVICE**
  - With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.
  - Photosensitivity
  - With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity. Patients should be advised not to expose area treated to sunbeds or sunlight (even on a bright but cloudy day) during, and for two weeks after stopping treatment; treated areas should be protected with clothing.

- **EXCEPTIONS TO LEGAL CATEGORY** Smaller pack sizes of gel preparations may be available on sale to the public.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Modified-release capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 21, 25

---

**Ketoprofen with omeprazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen p. 1002, omeprazole p. 76.

- **INDICATIONS AND DOSE**
  - Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
    - Adult: Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole
Mefenamic acid

## INDICATIONS AND DOSE

**Pain and inflammation in rheumatoid arthritis and osteoarthritis** | Postoperative pain | Mild to moderate pain
---|---|---
**BY MOUTH**
- Adult: 500 mg 3 times a day
- Child 12-17 years: 500 mg 3 times a day
- Adult: 500 mg 3 times a day

**Acute pain including dysmenorrhoea** | Menorrhagia
---|---
**BY MOUTH**
- Child 12-17 years: 500 mg 3 times a day
- Adult: 500 mg 3 times a day

## CONTRA-INDICATIONS

- Active gastro-intestinal bleeding
- active gastro-intestinal ulceration
- history of gastro-intestinal bleeding related to previous NSAID therapy
- history of gastro-intestinal perforation related to previous NSAID therapy
- history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- history of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- inflammatory bowel disease
- severe heart failure

## CAUTIONS

- Acute porphyrias p. 930 - allergic disorders
- cardiac impairment (NSAIDs may impair renal function)
- cerebrovascular disease - coagulation defects - connective-tissue disorders
- Crohn's disease (may be exacerbated)
- elderly (risk of serious side-effects and fatalities)
- epilepsy
- heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)
- uncontrolled hypertension

## INTERACTIONS

See Appendix 1 (NSAIDs).

## SIDE-EFFECTS

- Common or very common
  - Diarrhoea (withdraw treatment)
  - rashes
- Uncommon
  - Fatigue
  - paraesthesia
- Rare
  - Alveolitis
  - aplastic anaemia
  - aseptic meningitis
  - allergic disorders
  - connective-tissue disorders
  - glucose intolerance
  - haemolytic anaemia
  - hepatic damage
  - hypotension
  - interstitial fibrosis
  - kidney failure
  - skin disorders
  - thrombocytopenia
  - visual disturbances

## ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—-which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

## CONCEPTION AND CONTRACEPTION

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

## PREGNANCY

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

## BREAST FEEDING

Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

## HEPATIC IMPAIRMENT

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

## RENAL IMPAIRMENT

Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Meloxicam

## INDICATIONS AND DOSE

**Exacerbation of osteoarthritis (short-term)**

- **BY MOUTH**
- Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
- Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

---

**PRESCRIBING AND DISPENSING INFORMATION**

Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release capsule**
  - CAUTIONARY AND ADVISORY LABELS 21, 25
  - EXCIPIENTS: May contain Propylene glycol
  - Axorid (Meda Pharmaceuticals Ltd)
    - Omeprazole 20 mg, Ketoprofen 100 mg | Axorid 100mg/20mg modified-release capsules | 30 capsule(PM) £13.80
    - Omeprazole 20 mg, Ketoprofen 200 mg | Axorid 200mg/20mg modified-release capsules | 30 capsule(PM) £13.80

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
  - **Overdose**
    - Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.
    - For details on the management of poisoning, see Emergency treatment of poisoning p. 1204, in particular, Convulsions.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
Pain and inflammation in rheumatic disease | Ankylosing spondylitis
▶ BY MOUTH
▶ Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
▶ Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
▶ Elderly: 7.5 mg once daily

Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs
▶ BY MOUTH
▶ Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
▶ Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

● UNLICENSED USE Not licensed for use in children under 16 years.
● CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure
● CAUTIONS Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
● INTERACTIONS → Appendix 1 (NSAIDs).

● SIDE-EFFECTS
▶ Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
▶ Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SIDE-EFFECTS, FURTHER INFORMATION
Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
● ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
● CONCEPTION AND CONTRACEPTION Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

● PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
● BREAST FEEDING Use with caution during breast-feeding. Present in milk in animal studies—manufacturer advises avoid.
● HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
● RENAL IMPAIRMENT Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure. In adults Avoid if eGFR less than 25 ml/minute/1.73 m².
   In children Avoid if estimated glomerular filtration rate less than 25 ml/minute/1.73 m².

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 21
▶ Meloxicam (Non-proprietary)
Meloxicam 7.5 mg Meloxicam 7.5mg tablets | 30 tablet Pos £4.00 DT price = £1.12
Meloxicam 15 mg Meloxicam 15mg tablets | 30 tablet Pos £4.00 DT price = £1.16
Orodispersible tablet
▶ Meloxicam (Non-proprietary)
Meloxicam 7.5 mg Meloxicam 75mg orodispersible tablets sugar free sugar-free | 30 tablet Pos £15.50
Meloxicam 15 mg Meloxicam 15mg orodispersible tablets sugar free sugar-free | 30 tablet Pos £15.50

Nabumetone
● INDICATIONS AND DOSE
Pain and inflammation in osteoarthritis and rheumatoid arthritis
▶ BY MOUTH
▶ Adult: 1 g once daily, dose to be taken at night
▶ Elderly: 0.5–1 g daily
Pain and inflammation in osteoarthritis and rheumatoid arthritis (severe and persistent symptoms)
▶ BY MOUTH
▶ Adult: 0.5–1 g, dose to be taken in the morning and 1 g, dose to be taken at night
▶ Elderly: 0.5–1 g daily

● CONTRA-INDICATIONS Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure
● CAUTIONS Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
● INTERACTIONS → Appendix 1 (NSAIDs).
Musculoskeletal system

- **SIDE-EFFECTS**
  - Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis

### Naproxen

- **INDICATIONS AND DOSE**
  - **Pain and inflammation in rheumatic disease**
    - **BY MOUTH**
    - Adult: 0.5–1 g daily in 1–2 divided doses
  - **Acute gout**
    - **BY MOUTH**
    - Adult: Initially 750 mg, then 250 mg every 6–8 hours until attack has passed

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure
  - **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
  - **INTERACTIONS** Appendix 1 (NSAIDs).
  - **SIDE-EFFECTS**
    - Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
    - Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal ulceration - haematura - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
  - Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
PRESCRIBING AND DISPENSING INFORMATION

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1006, misoprostol p. 73.

### Naproxen with misoprostol

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1006, misoprostol p. 73.

#### MEDICATIONS

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

</tbody>
</table>

#### INDICATIONS AND DOSE

Patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration

- **BY MOUTH**
  - Adult: 500 mg twice daily, naproxen and 200 micrograms twice daily, misoprostol, taken together with food

#### PRESCRIBING AND DISPENSING INFORMATION

The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the misoprostol with naproxen combination pack.

### Piroxicam

**INDICATIONS AND DOSE**

Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)

- **BY MOUTH**
  - Adult: Up to 20 mg once daily

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

- **TO THE SKIN**
  - Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

#### IMPORTANT SAFETY INFORMATION

**CHMP ADVICE—PIROXICAM (JUNE 2007)**

- With systemic use

  The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

  - piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
  - piroxicam should not be used as first-line treatment
  - in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
  - piroxicam dose should not exceed 20 mg daily

### Naproxen with esomeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1006, esomeprazole p. 74.

#### INDICATIONS AND DOSE

Patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective

- **BY MOUTH**
  - Adult: 500/20 mg twice daily, dose expressed as x/y mg naproxen/esomeprazole

#### PRESCRIBING AND DISPENSING INFORMATION

Naproxen component is gastro-resistant.
• piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
• treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
• concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

**CONTRA-INDICATIONS**
- With systemic use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding - history of gastro-intestinal perforation - history of gastro-intestinal ulceration - inflammatory bowel disease - severe heart failure

**CAUTIONS**
- With systemic use Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension
- With topical use Avoid contact with eyes - avoid contact with inflamed or broken skin - avoid contact with mucous membranes - not for use with occlusive dressings - topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**INTERACTIONS** ➔ Appendix 1 (NSAIDs).
- With topical use Interactions do not generally apply to topical NSAIDs.

**SIDE-EFFECTS**
- Rare
  - With systemic use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
- Frequency not known
  - With topical use Photosensitivity - rash (discontinue use if develops)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.
- With topical use Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**
- With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**
- With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

**BREAST FEEDING**
- With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
- With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

**HEPATIC IMPAIRMENT**
- With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**
- With systemic use Avoid if possible or use with caution. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With topical use Deterioration in renal function has also been reported after topical use.

**DIRECTIONS FOR ADMINISTRATION**
Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. For topical preparations apply with gentle massage only.

**PATIENT AND CARER ADVICE**
- With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.
- Photosensitivity For topical preparations, patients should be advised against excessive exposure to sunlight or treatment in order to avoid possibility of photosensitivity.

**LESS SUITABLE FOR PRESCRIBING**
- With oral use Piroxicam is less suitable for prescribing.

**MEDIcINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Orodispersible tablet**

**Cautionary and advisory labels** 10, 21

**Excipients:** May contain Aspartame

Sulindac

**INDICATIONS AND DOSE**

Pain and inflammation in musculoskeletal disorders | Acute gout

- **BY MOUTH**
- **Adult:** 200 mg twice daily for maximum duration 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

**CONTRA-INDICATIONS**

- Active gastro-intestinal bleeding
- active gastro-intestinal ulceration
- history of gastro-intestinal bleeding related to previous NSAID therapy
- history of gastro-intestinal perforation related to previous NSAID therapy
- history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- history of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- severe heart failure

**CAUTIONS**

- Allergic disorders
- cardiac impairment (NSAIDs may impair renal function)
- cerebrovascular disease
- coagulation defects
- connective-tissue disorders
- Crohn’s disease (may be exacerbated)
- elderly (risk of serious side-effects and fatalities)
- ensure adequate hydration
- heart failure
- history of renal stones
- ischaemic heart disease
- peripheral arterial disease
- risk factors for cardiovascular events
- ulcerative colitis (may be exacerbated)
- uncontrolled hypertension

**INTERACTIONS** → Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- Rare
  - Alveolitis
  - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
  - hepatic damage
  - interstitial fibrosis associated with NSAIDs can lead to renal failure
  - pancreatitis
  - papillary necrosis associated with NSAIDs can lead to renal failure
  - pulmonary eosinophilia
  - Stevens-Johnson syndrome
  - toxic epidermal necrolysis
  - visual disturbances

- Frequency not known
  - Angioedema
  - blood disorders
  - bronchospasm
  - cholestasis
  - colitis (induction of or exacerbation of)
  - Crohn’s disease (induction of or exacerbation of)
  - depression
  - diarrhoea
  - dizziness
  - drowsiness
  - fluid retention (rarely precipitating congestive heart failure)
  - gastro-intestinal bleeding
  - gastro-intestinal discomfort
  - gastro-intestinal disturbances
  - gastro-intestinal ulceration
  - haematuria
  - headache
  - hearing disturbances
  - hepatic failure
  - hepatitis
  - hypersensitivity reactions
  - insomnia
  - jaundice
  - nausea
  - nervousness
  - photosensitivity
  - raised blood pressure
  - rashes
  - renal failure (especially in patients with pre-existing renal impairment)
  - tinnitus
  - urine discoloration
  - vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**

Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

Use with caution during breast-feeding.

**HEPATIC IMPAIRMENT**

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**
- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**
- Use with caution during breast-feeding. Present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**
- Avoid if possible or use with caution. Avoid in severe impairment. The lowest effective dose should be used for the shortest possible duration. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Tiaprofenic acid**

**INDICATIONS AND DOSE**
- Pain and inflammation in rheumatic disease and other musculoskeletal disorders
  - By mouth
  - Adult: 300 mg twice daily

**SPECIAL ADVISORY INFORMATION**

**CSM ADVICE**
- Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

- Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

**CONTRA-INDICATIONS**
- Active bladder disease (or symptoms) • active gastro-intestinal bleeding • active gastro-intestinal ulceration • active prostate disease (or symptoms) • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • history of recurrent urinary-tract disorders (if urinary symptoms develop immediately and perform urine tests and culture) • severe heart failure

**CAUTIONS**
- Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • elderly (risk of serious side-effects and fatalities) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

**INTERACTIONS**
- Appendix 1 (NSAIDs).

**SIDE-EFFECTS**
- Rare
  - Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

- Frequency not known
  - Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
- Serious side-effects: For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

**ALLERGY AND CROSS-SENSITIVITY**
- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**CONCEPTION AND CONTRACEPTION**
- Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

**PREGNANCY**
- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**
- Use with caution during breast-feeding. Amount too small to be harmful.

**HEPATIC IMPAIRMENT**
- Reduce dose in mild or moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
**RENAI IMPAIRMENT** Reduce dose in mild or moderate impairment. The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDIINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

5 Soft tissue and joint disorders

5.1 Local inflammation of joints and soft tissue

Other drugs used for local inflammation of joints and soft tissue  
Betamethasone p. 618

**CORTICOSTERADS**

**Corticosteroids, inflammatory disorders**

Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment.

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone p. 1012 up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone p. 1012 may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of prednisone p. 623 is also available for the treatment of moderate to severe rheumatoid arthritis.

*Polymyalgia rheumatica* and *giant cell (temporal) arteritis* are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

*Polyarteritis nodosa* and *polymyositis* are usually treated with corticosteroids.

*Systemic lupus erythematosus* is treated with corticosteroids when necessary using a similar dosage regimen to that for *polyarteritis nodosa* and *polymyositis*. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 569 or hydroxychloroquine sulfate p. 962, should be considered.

*Ankylosing spondylitis* should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

**Local corticosteroid injections**

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer’s elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate p. 1012 or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

**Dexamethasone**

06-Jun-2016

**INDICATIONS AND DOSE**

**Local inflammation of joints**

° BY INTRA-ARTICULAR INJECTION

° Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature

**Local inflammation of soft tissues**

° BY LOCAL INFILTRATION

° Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

**PREGNANCY** Dexamethasone readily crosses the placenta.

**PREScribing and dispensing information**

Dexamethasone 3.8 mg/mL. Injection has replaced Dexamethasone 4 mg/mL. Injection. All dosage recommendations for intravenous, intramuscular,
intra-articular use or local infiltration are given in units of dexamethasone base.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**CAUTIONARY AND ADVISORY LABELS 10**

- **Dexamethasone (Non-proprietary)**
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.3 mg per 1 ml Dexamethasone 6.6mg/2ml solution for injection vials | 5 vial £24.00 DT price = £24.00
  - Dexamethasone 6.6mg/2ml solution for injection ampoules | 5 ampoule £11.00 DT price = £11.00
  - Dexamethasone 3.3mg/1ml solution for injection ampoules | 5 ampoule £12.00 | 10 ampoule £12.00
  - Dexamethasone (as Dexamethasone sodium phosphate) 3.8 mg per 1 ml Dexamethasone 3.8mg/1ml solution for injection vials | 10 vial £19.99 DT price = £19.99

**Hydrocortisone**

- **INDICATIONS AND DOSE**

  **HYDROCORTISONE**

  **Local inflammation of joints and soft-tissues**

  ▶ **BY INTRA-ARTICULAR INJECTION**

  - Adult: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

  **Suspension for injection**

  ▶ **Hydrocortisone (AMCo)**

  Hydrocortisone acetate 25 mg per 1 ml Hydrocortisone 25mg/1ml suspension for injection ampoules | 10 ampoule £68.72 DT price = £68.72

**Methylprednisolone with lidocaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, methylprednisolone above, lidocaine hydrochloride p. 97.

- **INDICATIONS AND DOSE**

  **Local inflammation of joints**

  ▶ **BY INTRA-ARTICULAR INJECTION**

  - Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Depo-Medrone with Lidocaine (Pfizer Ltd)**

  Lidocaine hydrochloride 10 mg per 1 ml, MethyLPrednisolone acetate 40 mg per 1 ml Depo-Medrone with Lidocaine suspension for injection 2ml vials | 1 vial £7.06 DT price = £7.06 | 10 vial £70.13
  - Depo-Medrone with Lidocaine suspension for injection 1ml vials | 1 vial £3.94 DT price = £3.94 | 10 vial £38.88

**Prednisolone**

- **INDICATIONS AND DOSE**

  **DELTASTAB**

  **Local inflammation of joints**

  ▶ **BY INTRA-ARTICULAR INJECTION**

  - Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

  **PREGNANCY**

  As it crosses the placenta 88% of prednisolone is inactivated.

  **BREAST FEEDING**

  Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Deltastab (AMCo)**

  Prednisolone acetate 25 mg per 1 ml Deltastab 25mg/1ml suspension for injection ampoules | 10 ampoule £68.72

**Triamcinolone acetonide**

- **INDICATIONS AND DOSE**

  **ADCOR TYL INTRA-ARTICULAR/INTRADERMAL**

  **Local inflammation of joints and soft tissues**

  ▶ **BY INTRA-ARTICULAR INJECTION**

  - Adult: 2.5–15 mg, adjusted according to size (for larger doses use Kenalog®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.

  ▶ **BY INTRADERMAL INJECTION**

  - Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature

  **KENALOG® VIALS**

  **Local inflammation of joints and soft tissues**

  ▶ **BY INTRA-ARTICULAR INJECTION**

  - Adult: 5–40 mg (max. per dose 80 mg), for further details consult product literature, select dose according
to size. For doses below 5 mg use Adcortyl® Intra-articular/Intradermal injection, where appropriate dose may be repeated when relapse occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

CAUTIONARY AND ADVISORY LABELS 10 EXCPIENTS: May contain Benzyl alcohol

- Adcortyl Intra-articular / Intradermal (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Triamcinolone acetonide 10 mg per 1 ml Adcortyl Intra-articular / Intradermal 50mg/5ml suspension for injection vials | 1 vial (Pom) £3.63
  - Adcortyl Intra-articular / Intradermal 10mg/1ml suspension for injection ampoules | 5 ampoules (Pom) £4.47 DT price = £4.47
- Kenalog (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Triamcinolone acetonide 40 mg per 1 ml Kenalog Intra-articular / Intramuscular 40mg/1ml suspension for injection vials | 5 vial (Pom) £7.45 DT price = £7.45

**Triamcinolone hexacetonide**

**INDICATIONS AND DOSE**

Local inflammation of joints and soft-tissues (for details, consult product literature)

- **BY INTRA-ARTICULAR INJECTION**
  - Adult: 2–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day, where appropriate, may be repeated at intervals of 3–4 weeks
- **BY PERI-ARTICULAR INJECTION**
  - Adult: 10–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day

**CONTRA-INDICATIONS** Consult product literature

**CAUTIONS** Consult product literature

**SIDE-EFFECTS** Consult product literature

**PRESCRIBING AND DISPENSING INFORMATION** Various strengths available from ‘special order’ manufacturers or specialist importing companies.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCPIENTS: May contain Benzyl alcohol

- Triamcinolone hexacetonide (Non-proprietary)
  - Triamcinolone hexacetonide 20 mg per 1 ml Triamcinolone hexacetonide 20mg/1ml suspension for injection ampoules | 10 ampoule (Pom) £120.00

5.2 Soft tissue disorders

**Soft-tissue disorders**

**Extravasation**

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation**

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration.

Placing a glyceryl trinitrate patch p. 207 distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation**

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 1012 or dexamethasone p. 1011 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

**Antihistamines** and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 1014. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dextrazoxane p. 837 is licensed for the treatment of anthracycline-induced extravasation.

**Enzymes**

**Collagenase**

Collagenase p. 1014 are proteolytic enzymes that are derived from the fermentation of Clostridium histolyticum and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren’s contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

**Hyaluronidase**

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).
Rubefacients, topical NSAIDs, capsaicin, and poulitics

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotinate and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

Topical NSAIDs
The use of a NSAID by mouth is effective for relieving musculoskeletal pain. Topical NSAIDs (e.g. felibac p. 997, ibuprofen p. 999, ketoprofen p. 1002, and piroxicam p. 1007 may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

Capsaicin
A preparation containing capsaicin 0.025% p. 446 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

ENZYMES

Collagenase

**INDICATIONS AND DOSE**

Dupuytren's contracture in patients with a palpable cord

- **BY INTRALESIONAL INJECTION**
  - Adult: 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, maximum 3 injections per cord, maximum 8 injections in total and only one cord may be treated at a time

**CONTRA-INDICATIONS**
Avoid injecting into other structures containing collagen (e.g. tendons, nerves, and blood vessels)—risk of tendon rupture or ligament damage

**CAUTIONS**
Coagulation disorders - use of anticoagulants

**SIDE-EFFECTS**

- **Common or very common** Arthralgia - burning sensation - ecchymosis - hyperhidrosis - hypoesthesia - injection site reactions - joint swelling - lymphadenopathy - myalgia - paraesthesia

- **Uncommon** Complex regional pain syndrome - crepitus - ligament injury - monoplegia - muscle spasm - muscle weakness - tendon rupture - tremor - wound dehiscence

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
Systemic absorption by mother negligible.

**DIRECTIONS FOR ADMINISTRATION**
Reconstitution and injected volumes vary with site of injection—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium (SMC) has advised (April 2012) that collagenase Clostridium histolyticum (Xiapex®) is accepted for restricted use within NHS Scotland as an alternative to limited fasciectomy, for the treatment of Dupuytren's contracture of moderate severity (as defined by the British Society for Surgery of the Hand) in patients with a palpable cord and up to two affected joints per hand, who are suitable for limited fasciectomy, but for whom percutaneous needle fasciectomy is not considered a suitable treatment option.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Xiapex (Swedish Orphan Biovitrum Ltd)**
  - Collagenase clostridium histolyticum 900 microgram
  - Xiapex 0.5mg powder and solvent for solution for injection vials | 1 vial [POM] £650.00

Hyaluronidase

**INDICATIONS AND DOSE**

Enhance permeation of subcutaneous or intramuscular injections

- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

Enhance permeation of local anaesthetics

- **BY LOCAL INFILTRATION**
  - Adult: 1500 units, to be mixed with the local anaesthetic solution

Enhance permeation of ophthalmic local anaesthetic

- **TO THE EYE**
  - Adult: 15 units/mL, to be mixed with the local anaesthetic solution

Hypodermolysis

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

Haematoma

- **BY LOCAL INFILTRATION**
  - Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

**CONTRA-INDICATIONS**
Avoid sites where infection is present - avoid sites where malignancy is present - do not apply direct to cornea - not for anaesthesia in unexplained premature labour - not for intravenous administration - not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists - not to be used to reduce swelling of bites - not to be used to reduce swelling of stings

**CAUTIONS**
Elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**SIDE-EFFECTS**

- **Common or very common** Oedema
- **Rare** Bleeding - bruising - infection - local irritation
- **Frequency not known** Anaphylaxis - severe allergy

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Hyaluronidase (Non-proprietary)
  - Hyaluronidase 1500 unit
  - Hyaluronidase 1,500unit powder for solution for injection ampoules | 10 ampoule [POM] £136.55
Chapter 11
Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 1026 solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

Certain eye drops, e.g. amphotericin, ceftazidime, cefuroxime, colistimethate sodium, desferrioxamine mesilate, dexamethasone, gentamicin, and vancomycin can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk).

The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are
normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 254 and hydralazine hydrochloride p. 171). Other drugs that may affect contact lens wear are isotretinoin p. 1122 (can cause conjunctival inflammation), aspirin p. 114 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 535 and sulfasalazine p. 39 (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. Topical corticosteroids are applied frequently for the first 24–48 hours; once inflammation is reduced, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- a ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1019 (Ozurdex®) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 1048 (Fluiven®) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

Other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1018, and sodium cromoglicate p. 1018.

Eye drops containing antihistamines, such as antazoline (with xylometazoline hydrochloride p. 1057 as Otrivine–Antistin®), azelastine hydrochloride p. 1017, epinastine hydrochloride p. 1017, ketotifen p. 1017, and olopatadine p. 1018, can be used for allergic conjunctivitis.

Sodium cromoglicate (sodium cromoglycate) and nedocromil sodium p. 1018 eye drops can be useful for vernal
keratoconjunctivitis and other allergic forms of conjunctivitis. Lodocamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis. Diclofenac sodium eye drops p. 1034 and edemastine eye drops below are also licensed for seasonal allergic conjunctivitis. Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment. Ciclosporin p. 1022 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

### 1.1 Allergic conjunctivitis

#### Antihistamines

**Antazoline with xylometazoline**

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply 2–3 times a day for maximum 7 days
    - Adult: Apply 2–3 times a day for maximum 7 days

- **CAUTIONS**
  - Angle-closure glaucoma, cardiovascular disease, diabetes mellitus, hypertension, hyperthyroidism, phaeochromocytoma, urinary retention

- **INTERACTIONS**
  - Appendix 1 (antihistamines and sympathomimetics). Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

- **SIDE-EFFECTS**
  - Common or very common: Transient stinging
  - Frequency not known: Bitter taste, mild transient irritation

  **SIDE-EFFECTS, FURTHER INFORMATION**

  Absorption of antazoline and xylometazoline may result in systemic side-effects.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
    - **Otrivine Antistin** (Thea Pharmaceuticals Ltd)
      - Antazoline sulphate 5 mg per 1 ml, Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Antistin 0.5%/0.09% eye drops | 10 ml P | £3.35 DT price = £3.35

**Azelastine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
    - Adult: Apply twice daily, increased if necessary to 4 times a day
  - **Perennial conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
    - Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

- **SIDE-EFFECTS**
  - Frequency not known: Bitter taste, mild transient irritation

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
    - **Optilast** (Meda Pharmaceuticals Ltd)
      - Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05% eye drops | 8 ml P | £6.40 DT price = £6.40

**Emedastine**

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 3-17 years: Apply twice daily
    - Adult: Apply twice daily

- **SIDE-EFFECTS**
  - Blurred vision, corneal infiltrates (discontinue), corneal staining, dry eye, headache, irritation, keratitis, lacrimation, local oedema, photophobia, rhinitis, transient burning, transient stinging

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride
    - **Emadine** (Alcon Laboratories (UK) Ltd)
      - Emedastine (as Emedastine difumarate) 500 microgram per 1 ml Emadine 0.5mg/ml eye drops | 5 ml P | £7.31 DT price = £7.31

**Epinastine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 12-17 years: Apply twice daily for maximum 8 weeks
    - Adult: Apply twice daily for maximum 8 weeks

- **SIDE-EFFECTS**
  - Common or very common: Burning
  - Uncommon: Conjunctival hyperaemia, dry eye, eye pain, eye pruritus, headache, increased lacrimation, nasal irritation, rhinitis, taste disturbance, visual disturbance

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride
    - **Relestat** (Allergan Ltd)
      - Epinastine hydrochloride 500 microgram per 1 ml Relestat 500 micrograms/ml eye drops | 5 ml P | £9.90 DT price = £9.90

**Ketotifen**

- **INDICATIONS AND DOSE**
  - **Seasonal allergic conjunctivitis**
    - **TO THE EYE**
    - Child 3-17 years: Apply twice daily
    - Adult: Apply twice daily

- **INTERACTIONS**
  - Interactions do not generally apply to antihistamines used for topical action.
Nedocromil sodium

- **INDICATIONS AND DOSE**
  - **Seasonal and perennial conjunctivitis**
    - **TO THE EYE**
    - Child 6-17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
    - Adult: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
  - **Seasonal keratoconjunctivitis**
    - **TO THE EYE**
    - Child 6-17 years: Apply 4 times a day
    - Adult: Apply 4 times a day

- **SIDE-EFFECTS**
  - Distinctive taste • transient burning • transient stinging

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride
    - Zaditen (Thea Pharmaceuticals Ltd)
      - Zaditen (as Ketotifen fumarate) 250 microgram per 1 ml Zaditen 250 micrograms/ml eye drops | 5 ml [POM] £7.80 DT price = £7.80
    - Opatanol (Alcon Laboratories (UK) Ltd)
      - Opatanol (as Opatanol hydrochloride) 1 mg per 1 ml Opatanol 1mg/ml eye drops | 5 ml [POM] £4.68 DT price = £4.68

Mast-cell stabilisers

- **Lodoxamide**
  - **INDICATIONS AND DOSE**
    - **Seasonal allergic conjunctivitis**
      - **TO THE EYE**
      - Child 3-17 years: Apply twice daily for maximum 4 months
      - Adult: Apply twice daily for maximum 4 months
  - **SIDE-EFFECTS**
    - Local irritation
    - Asthenia • dizziness • dry eye • headache • keratitis • local oedema • photophobia
    - Dry mouth • transient burning • transient stinging
    - Distinctive taste
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
      - Optrex Allergy
        - Sodium cromoglicate 20 mg per 1 ml Optrex Allergy 2% eye drops | 10 ml [POM] £3.57 DT price = £3.35
      - Opticrom Aqueous
        - Sodium cromoglicate 20 mg per 1 ml Opticrom Aqueous 2% eye drops | 10 ml [POM] £3.35 DT price = £3.35
      - Trometamol
        - Sodium cromoglicate 20 mg per 1 ml Trometamol 2% eye drops | 10 ml [POM] £3.35 DT price = £3.35
  - **Exceptions to Legal Category**
    - Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 ml) for treatment of acute seasonal and perennial allergic conjunctivitis.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Eye drops**
      - Sodium cromoglicate (Non-proprietary)
        - Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [POM] £8.03 DT price = £1.72
      - Catacrom (Moornfields Pharmaceuticals)
        - Sodium cromoglicate 20 mg per 1 ml Catacrom 2% eye drops 0.3ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99
      - Cromolux (Tublux Pharma Ltd)
        - Sodium cromoglicate 20 mg per 1 ml Cromolux 2% eye drops | 13.5 ml [POM] £3.20 DT price = £1.72
      - Opticrom (Sanofi)
        - Sodium cromoglicate 20 mg per 1 ml Opticrom Allergy 2% eye drops | 5 ml [P] £2.74 | 10 ml [P] £3.35
        - Opticrom Aqueous 2% eye drops | 13.5 ml [POM] £8.03 DT price = £1.72
      - Optrex Allergy (Reckitt Benckiser Healthcare (UK) Ltd)
        - Sodium cromoglicate 20 mg per 1 ml Optrex Allergy 2% eye drops | 10 ml [P] £3.88
      - Pollenase (sodium cromoglicate) (E M Pharma)
        - Sodium cromoglicate 20 mg per 1 ml Pollenase Allergy 2% eye drops | 10 ml [P] £2.08
      - Vividrin (Bausch & Lomb UK Ltd)
        - Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [POM] £10.95 DT price = £1.72

Sodium cromoglicate (Sodium cromoglycate)

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis | Seasonal keratoconjunctivitis**
    - **TO THE EYE**
    - Child: Apply 4 times a day
    - Adult: Apply 4 times a day
  - **SIDE-EFFECTS**
    - Transient burning • transient stinging
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
1.2 Inflammatory eye conditions

**ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS**

**Nepafenac**

- **INDICATIONS AND DOSE**
  
  Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery
  
  - **Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients**
  
  - **TO THE EYE**
  
  - **Adul:** (consult product literature)

- **CAUTIONS**
  
  Avoid sunlight - corneal epithelial breakdown (if evidence of, then discontinue immediately)

- **SIDE-EFFECTS**
  
  - **Common or very common**
    
    Punctate keratitis
  
  - **Uncommon**
    
    Allergic conjunctivitis - blurred vision - choroidal effusion - conjunctival hyperaemia - corneal deposits - corneal epithelium defect - dry eye - eye pruritus - headache - increased lacrimation - iritis - keratitis - nausea - ocular discomfort - photophobia
  
  - **Frequency not known**
    
    Corneal opacity - dermatochalasis - dizziness - eye swelling - impaired corneal healing - reduced visual acuity

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  
  - **Nepafenac** (Focus Pharmaceuticals Ltd)
    
    Nepafenac 1 mg per 1 ml
    
    Nevanac 1 mg/ml eye drops | 5 ml [Pos] £14.92

**CORTICOSTEROIDS**

**Betamethasone**

- **INDICATIONS AND DOSE**
  
  **Local treatment of inflammation (short-term)**

  - **TO THE EYE USING EYE DROP**
  
  - **Child:** Apply every 1–2 hours until controlled then reduce frequency
  
  - **Adult:** Apply every 1–2 hours until controlled then reduce frequency
  
  - **TO THE EYE USING EYE OINTMENT**
  
  - **Child:** Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops
  
  - **Adult:** Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **SIDE-EFFECTS**
  
  Corneal thinning - scleral thinning

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Ear/eye/nose drops solution**

  - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
  
  - **Betamethasone (Non-proprietary)**
    
    Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% eye/ear/nose drops | 5 ml [Pos] no price available
  
  - **Betnesol (Focus Pharmaceuticals Ltd)**
    
    Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [Pos] £2.32 DT price = £2.32
  
  - **Vistamethasone (Martindale Pharmaceuticals Ltd)**
    
    Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% eye/ear/nose drops | 5 ml [Pos] £0.87 | 10 ml [Pos] £0.99 DT price = £2.32

**Dexamethasone**

- **INDICATIONS AND DOSE**
  
  **Local treatment of inflammation (short-term)**

  - **TO THE EYE USING EYE DROP**
  
  - **Child:** Apply 4–6 times a day
  
  - **Adult:** Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

  **Short term local treatment of inflammation (severe conditions)**

  - **TO THE EYE USING EYE DROP**
  
  - **Child:** Apply every 30–60 minutes until controlled, reduce frequency when control achieved

- **CAUTIONS**
  
  - **Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only)**
    
    Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only)

  - **For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)**

  - **BY INTRAVITREAL INJECTION**
  
  - **Adult:** 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature

- **UNLICENSED USE**

  - **Maxidex®** not licensed for use in children under 2 years. **Dropeedex®** not licensed for use in children.

- **CONTRA-INDICATIONS**

  - **With intravitreal use**
    
    Active ocular herpes simplex - active or suspected ocular infection - active or suspected periocular infection - rupture of the posterior lens capsule in patients with aphakia, iris or transcleral fixated intra-ocular lens or anterior chamber intra-ocular lens - uncontrolled advanced glaucoma

- **CAUTIONS**

  - **With intravitreal use**
    
    History of ocular viral infection (including herpes simplex) - posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) - retinal vein occlusion with significant retinal ischaemia

- **INTERACTIONS**

  - **With intravitreal use**
    
    Caution with concomitant administration of anticoagulant or antiplatelet drugs—increased risk of haemorrhagic events.

- **SIDE-EFFECTS**

  - **Uncommon**

    - **With intravitreal use**
      
      Eyelid pruritus - glaucoma - migraine - necrotising retinitis
    
  - **Frequency not known**

    - **When used by eye**
      
      Corneal thinning - scleral thinning
    
  - **With intravitreal use**

    - **Blepharitis - cataract - headache - ocular hypertension - raised intra-ocular pressure - secondary ocular infection - visual disturbance

- **PREGNANCY**

  - **Dexamethasone readily crosses the placenta.**

  - **With intravitreal use**
    
    Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
**MEDICINAL FORMS**

- **Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015) NICE TA349**
  - Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:
    - the implant is to be used in an eye with an intraocular (pseudophakic) lens and
    - the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.
  - www.nice.org.uk/TA349

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (May 2012) that dexamethasone intravitreal implant (Ozurdex®) is accepted for restricted use within NHS Scotland for the treatment of adults with macular oedema (i) following central retinal vein occlusion, and (ii) with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

- **Dexmedetomidine (Non-proprietary)**
  - Dexamethasone sodium phosphate 1 mg per 1 ml
    - Dexamethasone 0.1% eye drops 0.4ml unit dose preservative free | 20 unit dose (Pom) £3.75 DT price = £3.75
    - Dexafree (Thea Pharmaceuticals Ltd)
      - Dexamethasone sodium phosphate 1 mg per 1 ml
        - Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose (Pom) £9.70
    - **Dropodex** (Moorefields Pharmaceuticals)
      - Dexamethasone sodium phosphate 1 mg per 1 ml
        - Dropodex Dexamethasone 0.1% eye drops 0.4ml unit dose | 20 unit dose (Pom) £9.75 DT price = £9.75
      - **Maxidex** (Alicon Laboratories (UK) Ltd)
        - Dexamethasone 1 mg per 1 ml
          - Maxidex 0.1% eye drops | 5 ml (Pom) £1.42 DT price = £1.42 | 10 ml (Pom) £2.80 DT price = £2.80

**Fluorometholone**

- **INDICATIONS AND DOSE**
  - Local treatment of inflammation (short term)
    - TO THE EYE
      - Child: 2-7 years: Apply every 1 hour for 24-48 hours, then reduced to 2–4 times a day
      - Adult: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**Prednisolone**

- **INDICATIONS AND DOSE**
  - Local treatment of inflammation (short-term)
    - TO THE EYE
      - Child: Apply every 1–2 hours until controlled then reduce frequency
      - Adult: Apply every 1–2 hours until controlled then reduce frequency

**SIDE-EFFECTS** Corneal thinning - scleral thinning

- **MEDITICIAN FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPENTS:** May contain Benzalkonium chloride, disodium edetate, polysorbates
  - FML Liquifilm (Allergan Ltd)
    - Fluorometholone 1 mg per 1 ml FML Liquifilm 0.1% ophthalmic suspension | 5 ml (Pom) £1.71 DT price = £1.71 | 10 ml (Pom) £2.95 DT price = £2.95

**Predsol (Focus Pharmaceuticals Ltd)**

- **Prednisolone sodium phosphate 5 mg per 1 ml**
  - Predsol 0.5% eye/ear drops | 10 ml (Pom) £2.00 DT price = £2.00

**Ear/eye drops solution**

- **EXCIPENTS:** May contain Benzalkonium chloride, disodium edetate, polysorbates
  - Predsol (Focus Pharmaceuticals Ltd)
    - Prednisolone sodium phosphate 1 mg per 1 ml Predsol 0.1% eye drops preservative free | 10 ml (Pom) £27.68 DT price = £27.68
    - Prednisolone sodium phosphate 3 mg per 1 ml Prednisolone sodium phosphate 0.3% eye drops preservative free | 10 ml (Pom) £23.02 DT price = £23.02
    - Prednisolone sodium phosphate 5 mg per 1 ml
      - Prednisolone sodium phosphate 0.5% eye drops 0.5ml unit dose | 20 unit dose (Pom) £11.78 DT price = £11.78
Rimexolone

**INDICATIONS AND DOSE**

Local treatment of postoperative inflammation (short term use)

- TO THE EYE
- Adult: Apply 4 times a day for 2 weeks, treatment to begin 24 hours after surgery

Local treatment of steroid-responsive inflammation (short term use)

- TO THE EYE
- Adult: Apply in at least 4 times a day divided doses for up to 4 weeks

Uveitis (short term use)

- TO THE EYE
- Adult: Apply every 1 hour during the day time for week 1, then apply every 2 hours for week 2, then apply 4 times a day for week 3, then apply twice daily for the first 4 days of week 4, then apply once daily for the remaining 3 days of week 4

**SIDE-EFFECTS** Corneal thinning; scleral thinning

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines identified.

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1019.

**INDICATIONS AND DOSE**

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Adult: Apply up to 6 times a day

**LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

- Betnesol-N (Focus Pharmaceuticals Ltd)
  - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml (Pod) £2.39 DT price = £2.39

Dexamethasone with framcyetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply 4–6 times a day, may be administered every 30–60 minutes until severe conditions until controlled, then reduce frequency
- Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**LESS SUITABLE FOR PRESCRIBING** Sofradex® is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

- Sofradex® (Sanofi)
  - Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml, Gramicidin 50 microgram per 1 ml Sofradex ear/eye drops | 10 ml (Pod) £7.50

Dexamethasone with hypropemellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE DROP
- Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)

- TO THE EYE USING EYE OINTMENT
- Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

**LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- Maxitrol® (Alcon Laboratories (UK) Ltd)
  - Dexamethasone 1 mg per 1 ml, Neomycin (as Neomycin sulfate) 3.5 mg per 1 ml, Hypropemellose 5 mg per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml Maxitrol eye drops | 5 ml (Pod) £1.68

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

- Maxitrol® (Alcon Laboratories (UK) Ltd)
  - Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram Maxitrol eye ointment | 3.5 g (Pod) £1.44
### Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1019

#### INDICATIONS AND DOSE

**Local treatment of inflammation (short-term)**
- **TO THE EYE**
- Adult: (consult product literature)

#### MEDICINE FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate
  - **Tobradex** (Alcon Laboratories (UK) Ltd)
    - Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per ml
      - **5 ml POM**: £5.37 DT price = £5.37

#### IMMUNOSUPPRESSANTS

**IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS**

### Ciclosporin

(Cyclosporin)

**DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

#### INDICATIONS AND DOSE

**Severe keratitis in dry eye disease that has not responded to tear substitutes (initiated by a specialist)**
- **TO THE EYE**
  - Adult: Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months

#### CONTRA-INDICATIONS

Active or suspected ocular or peri-ocular infection

#### CAUTIONS

Glucoma—limited information available · history of ocular herpes—no information available

#### SIDE-EFFECTS

- Common or very common: Blurred vision · instillation site pain · local erythema · local irritation · local oedema · local pain · ocular hyperaemia
- Uncommon: Bacterial keratitis · blepharitis · chalazion · conjunctivitis · corneal decompensation · corneal infiltrates · corneal scar · eye discharge · herpes zoster (ophthalmic) · iridocyclitis · keratitis · local pruritus

#### CONCEPTION AND CONTRACEPTION

Manufacturer recommends effective contraception during treatment in women of child-bearing potential.

#### PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

#### BREAST FEEDING

Manufacturer advises avoid—limited information.

#### DIRECTIONS FOR ADMINISTRATION

Keep eyes closed for 2 minutes after using Ikervis® eye drops, to increase local drug action and reduce systemic absorption.

### Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015)

NICE TA369

Ciclosporin (Ikervis®) is recommended as an option for treating dry eye disease that has not improved despite treatment with tear substitutes.

[www.nice.org.uk/TA369](http://www.nice.org.uk/TA369)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Ikervis** (Santen UK Ltd)
  - Ciclosporin 1 mg per 1 ml
    - Ikervis 0.1% eye drops 0.3ml unit dose
      - **30 unit dose POM**: £72.00 DT price = £72.00

### 1.2a Anterior uveitis

#### ANTIMUSCARINICS

**Antimuscarinics (eye)**

- **CAUTIONS**: Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia (in children) · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber) (in adults) · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) (in children)

- **SIDE-EFFECTS**: Conjunctivitis (on prolonged administration) · contact dermatitis · eye oedema (on prolonged administration) · hyperaemia (on prolonged administration) · local irritation (on prolonged administration) · raised intraocular pressure · transient stinging

- **PATIENT AND CARER ADVICE**: Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

### Atropine sulfate

**INDICATIONS AND DOSE**

**Cycloplegia**
- **TO THE EYE USING EYE DROP**
- Adult: (consult product literature)

**Anterior uveitis**
- **TO THE EYE USING EYE DROP**
- Adult: (consult product literature)

**SIDE-EFFECTS** Systemic side-effects can occur, particularly in children and the elderly.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose atropine sulfate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**
- **Atropine sulfate (Non-proprietary)**
  - Atropine sulfate 10 mg per 1 ml
    - Atropine 1% eye drops
      - **10 ml POM**: £64.55 DT price = £59.28
2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine p. 1062 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose p. 1024 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of carbomers to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 1025 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1026 are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 1026 are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

**INDICATIONS AND DOSE**

Tear deficiency | Impaired or abnormal mucus production

▶ TO THE EYE
▶ Adult: Apply 3–4 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

Acetylcysteine 50 mg per 1 ml Ilube 5% eye drops | 10 ml [POM]

£14.93 DT price = £14.93

Ilube (Moorfields Pharmaceuticals)

Carbomers

(Polycrylic acid)

**INDICATIONS AND DOSE**

Dry eyes including keratoconjunctivitis sicca, unstable tear film

▶ TO THE EYE
▶ Child: Apply 3–4 times a day or when required
▶ Adult: Apply 3–4 times a day or when required

**UNLICENSED USE** Some preparations not licensed for use in children.

**PRESCRIBING AND DISPENSING INFORMATION** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerithritol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Hydroxyethylcellulose

#### Indications and Dose

**Tear deficiency**

- **Adult:** Apply as required
  - **Child:** Apply as required

#### Prescribing and Dispensing Information

Although multi-dose hydroxyethylcellulose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

### Eye Drops

- **Artificial tears** (Bausch & Lomb UK Ltd)
  - Hydroxyethylcellulose 4.4 mg per 1 ml Minims artificial tears 0.44% eye drops 0.5ml unit dose | 20 unit dose (£8.97

### Hydroxypropyl Guar with Polyethylene Glycol and Propylene Glycol

(Formulated as an ocular lubricant)

#### Indications and Dose

**Dry eye conditions**

- **Adult:** Apply as required
  - **Child:** Apply as required

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

### Eye Drops

- **Systane** (Alcon Laboratories (UK) Ltd)
  - Systane Gel eye drops | 10 ml £7.49

### Hypermellose

#### Indications and Dose

**Tear deficiency**

- **Adult:** Apply as required
  - **Child:** Apply as required

#### Prescribing and Dispensing Information

The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypermellose prescribed, the prescriber should be contacted to clarify the strength intended.

Although multi-dose hypermellose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
**Liquid paraffin with white soft paraffin and wool alcohols**

**INDICATIONS AND DOSE**

**Dry eye conditions**

- **TO THE EYE**
  - Child: Apply as required, best suited for application before sleep
  - Adult: Apply as required, best suited for application before sleep

**PATIENT AND CARER ADVICE**

- May cause temporary visual disturbance. Should not be used during contact lens wear.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Lacri-Lube** (Allergan Ltd)
  
  - Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram

**Paraffin, yellow, soft**

**INDICATIONS AND DOSE**

**Eye surface lubrication**

- **TO THE EYE**
  - Child: Apply every 2 hours as required
  - Adult: Apply every 2 hours as required

**PATIENT AND CARER ADVICE**

- Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- **Paraffin, yellow, soft (Non-proprietary)**
  
  - Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram, Yellow soft paraffin 800 mg per 1 gram

**Polyvinyl alcohol**

**INDICATIONS AND DOSE**

**Tear deficiency**

- **TO THE EYE**
  - Child: Apply as required
  - Adult: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

- **Tear-Lac** (Scope Ophthalmics Ltd)
  
  - Polyvinyl alcohol 14 mg per 1 ml

- **PVA** (Tubilux Pharma Ltd)
  
  - Polyvinyl alcohol 14 mg per 1 ml

**Hypermellose with dextran 70**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypermellose p. 1024.

3 Eye infections

Eye, infections of

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal. Bacterial blepharitis is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

Corneal ulcer and keratitis require specialist treatment and may call for hospital admission for intensive therapy. Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimiicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1030 has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1028, levofloxacin p. 1029, moxifloxacin p. 1029, and ofloxacin p. 1029; the aminoglycosides, gentamicin p. 1028 and tobramycin p. 1028 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1028 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. Trachoma which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isethionate p. 1030 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *Acanthamoeba keratitis* [unlicensed indication].

Cefuroxime p. 1028 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1031 or ganciclovir p. 1031. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.
3.1 Bacterial eye infection

**ANTIBACTERIALS > AMINOGYCOSIDES**

**Gentamicin**

- **INDICATIONS AND DOSE**
  - **Bacterial eye infections**
    - **TO THE EYE**
      - Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient.
      - Adult: Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing; frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Eye drops may be sourced as a manufactured special or from specialist importing companies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
    - **Ear/eye drops solution**
      - **EXCIPIENTS**: May contain Benzalkonium chloride
        - **Gentamicin (Non-proprietary)**
          - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml
          - Gentamicin 0.3% ear/eye drops | 10 ml (POSm) no price available DT price = £2.27
          - Gentamicin 0.3% eye/ear drops | 10 ml (POSm) £2.13–£2.27 DT price = £2.27

**Tobramycin**

- **INDICATIONS AND DOSE**
  - **Local treatment of infections**
    - **TO THE EYE**
      - Child: 1–17 years: Apply twice daily for 6–8 days
      - Adult: Apply twice daily for 6–8 days
  - **Local treatment of infections (severe infection)**
    - **TO THE EYE**
      - Child: 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days
      - Adult: Apply 4 times a day for first day, then apply twice daily for 5–7 days

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS**: May contain Benzododecinium bromide
    - **Tobradisc (Alcon Laboratories (UK) Ltd)**
      - Tobramycin 3 mg per 1 ml Tobradisc 3mg/ml eye drops | 5 ml (POSm) £4.74

**Ciprofloxacin**

- **INDICATIONS AND DOSE**
  - **Superficial bacterial eye infection**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply 4 times a day for maximum duration of treatment 21 days
      - Adult: Apply 4 times a day for maximum duration of treatment 21 days
    - **TO THE EYE USING EYE OINTMENT**
      - Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
      - Adult: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

**Azithromycin**

- **INDICATIONS AND DOSE**
  - **Trachomatous conjunctivitis caused by Chlamydia trachomatis**
    - **Purulent bacterial conjunctivitis**
      - **TO THE EYE**
        - Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
        - Adult: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
  - **SIDE-EFFECTS**
    - **Common or very common**
      - Blurred vision
      - Ocular burning
      - Ocular discomfort
      - Ocular pruritus
    - **Uncommon**
      - Conjunctival hyperaemia
      - Eyelid eczema
      - Eyelid erythema
      - Eyelid oedema
      - Keratitis

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **Azyter (Thea Pharmaceuticals Ltd)**
      - Azithromycin dihydrate 15 mg per 1 gram
      - Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose (POSm) £6.99 DT price = £6.99

**Cefuroxime**

- **INDICATIONS AND DOSE**
  - **PROKAM® INTRACAMERAL INJECTION**
    - **Prophylaxis of endophthalmitis after cataract surgery**
      - **BY INTRACAMERAL INJECTION**
        - Adult: 1 mg, dose to be injected into the anterior chamber of the eye at the end of cataract surgery
  - **CAUTIONS**
    - Combined operations with cataract surgery - complicated cataracts - reduced corneal endothelial cells (less than 2000) - severe risk of infection - severe thyroid disease
  - **PREGNANCY**
    - Not known to be harmful.
  - **BREAST FEEDING**
    - Present in milk in low concentration, but appropriate to use.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injections**
    - **Aprokam (Thea Pharmaceuticals Ltd)**
      - Cefuroxime sodium 50 mg
      - Aprokam powder for solution for injection | 10 vial (POSm) £49.95

**ANTIBACTERIALS > MACROLIDES**

**Ciprofloxacin**

- **INDICATIONS AND DOSE**
  - **Superficial bacterial eye infection**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply 4 times a day for maximum duration of treatment 21 days
      - Adult: Apply 4 times a day for maximum duration of treatment 21 days
    - **TO THE EYE USING EYE OINTMENT**
      - Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
      - Adult: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

**Azithromycin**

- **INDICATIONS AND DOSE**
  - **Trachomatous conjunctivitis caused by Chlamydia trachomatis**
    - **Purulent bacterial conjunctivitis**
      - **TO THE EYE**
        - Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
        - Adult: Apply twice daily for 3 days, review if no improvement after 3 days of treatment
  - **SIDE-EFFECTS**
    - **Common or very common**
      - Blurred vision
      - Ocular burning
      - Ocular discomfort
      - Ocular pruritus
    - **Uncommon**
      - Conjunctival hyperaemia
      - Eyelid eczema
      - Eyelid erythema
      - Eyelid oedema
      - Keratitis

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **Azlyter (Thea Pharmaceuticals Ltd)**
      - Azithromycin dihydrate 15 mg per 1 gram
      - Azlyter 15mg/g eye drops 0.25g unit dose | 6 unit dose (POSm) £6.99 DT price = £6.99

**ANTIBACTERIALS > QUINOLONES**

**Ciprofloxacin**

- **INDICATIONS AND DOSE**
  - **Superficial bacterial eye infection**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply 4 times a day for maximum duration of treatment 21 days
      - Adult: Apply 4 times a day for maximum duration of treatment 21 days
    - **TO THE EYE USING EYE OINTMENT**
      - Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
      - Adult: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
Superficial bacterial eye infection (severe infection)

- **TO THE EYE USING EYE DROP**
- Adult: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
- Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

**Corneal ulcer**

- **TO THE EYE USING EYE DROP**
- Adult: Apply every 30 minutes for the remainder of day 1, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night

**Side-effects**

- **Common or very common** Corneal deposits (reversible after completion of treatment) • ocular discomfort • ocular hyperaemia • taste disturbance
- **Uncommon** Increased lacrimation • blurred vision • conjunctival hyperaemia • corneal infiltrates • corneal staining • eye dryness • eye irritation • eye pain • eye pruritus • eye swelling • eyelid disorders • eyelid erythema • eyelid exfoliation • eyelid oedema • headache • keratopathy • pruritus • rash • photophobia
- **Rare** Abdominal pain • asthenopia • corneal disorders • corneal epithelium defect • dermatitis • diarrhoea • diplopia • dizziness • ear pain • eye hypoesthesia • keratitis • parasanal sinus hyperssecretion • rhinitis

**Pregnancy** Manufacturer advises use only if potential benefit outweighs risk.

**Breastfeeding** Manufacturer advises caution.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.
- **Eye drops**
  - EXCIPIENTS: May contain Benzalkonium chloride
  - *Levofoxacin (Non-proprietary)*
    - Levofoxacin (as Levofoxacin hemihydrate) 5 mg per 1 ml
    - Levofoxacin 5 mg/ml eye drops | 5 ml £6.25
  - Oftaquix (Santen UK Ltd)
    - Levofoxacin (as Levofoxacin hemihydrate) 5 mg per 1 ml
    - Oftaquix 5 mg/ml eye drops | 5 ml £6.95

**Eye ointment**

- *Ciprofloxacin* (as Ciprofloxacin hydrochloride) 3 mg per 1 gram
  - Ciprofloxacin 3 mg/g eye ointment | 3.5 gram £5.22

---

**Moxifloxacin**

**Indications and dose**

**Local treatment of infections**

- **To the eye**
- Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days
- Adult: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

**Side-effects**

- **Common or very common** Hyperaemia • ocular discomfort • ocular dryness • ocular irritation • eye pain • taste disturbances
- **Uncommon** Conjunctival haemorrhage • corneal disorders • corneal erosion • corneal keratitis • corneal staining • eyelid erythema • headache • nasal discomfort • paraesthesia • pharyngolaryngeal pain • visual disturbances • vomiting
- **Frequency not known** Dizziness • dyspnoea • nausea • palpitation • photophobia • pruritus • raised intra-ocular pressure • rash

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.
- **Eye drops**
  - *Moxivig* (Alcon Laboratories (UK) Ltd)
    - Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml
    - Moxivig 0.5% eye drops | 5 ml £9.80

---

**Levofoxacin**

**Indications and dose**

**Local treatment of eye infections**

- **To the eye**
- Child: Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

---

**Oftloxacin**

**Indications and dose**

**Local treatment of infections**

- **To the eye**
- Child: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment
**CHLORAMPHENICOL**  
**DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

**TO THE EYE USING EYE DROP**

- **Adult:** Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient.
- **Child:** Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient.

**SIDE-EFFECTS** Transient stinging

**PREGNANCY** Avoid unless essential—no information on topical use but risk of neonatal grey-baby syndrome with oral use in third trimester.

**BREAST FEEDING** Avoid unless essential— theoretical risk of bone-marrow toxicity.

**EXCIPIENTS:** May contain Benzalkonium chloride

- **Exocin (Allergan Ltd)**
- **Oflloxacin 3 mg per 1 ml** Exocin 0.3% eye drops | 5 ml | £2.17

**MEDICINAL FORMS**

- Chloramphenicol 10 mg per 1 gram
- Chloramphenicol 5 mg per 1 ml
- Opitex Infected Eyes (Reckitt Benckiser Healthcare (UK) Ltd)

**SIDE-EFFECTS**

- Common or very common: Eye irritation, ocular discomfort
- Frequency not known: Dry eyes, facial oedema, increased lacrimation, keratitis, ocular hyperaemia, ocular oedema, photophobia, visual disturbances

**PREGNANCY**

- **Frequency not known:** Eye irritation, ocular discomfort
- **Common or very common:** Dry eyes, facial oedema, increased lacrimation, keratitis, ocular hyperaemia, ocular oedema, photophobia, visual disturbances

**BREAST FEEDING**

- **Frequency not known:** Eye irritation, ocular discomfort
- **Common or very common:** Dry eyes, facial oedema, increased lacrimation, keratitis, ocular hyperaemia, ocular oedema, photophobia, visual disturbances

**Ganciclovir**

- **INDICATIONS AND DOSE**
  - **Local treatment of herpes simplex infections**
    - **TO THE EYE**
    - Adult:  Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days

- **SIDE-EFFECTS**  Burning sensation - superficial punctate keratitis - tingling

- **ALLERGY AND CROSS-SENSITIVITY**  Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or aciclovir.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:**  May contain Benzalkonium chloride
    - **Ganciclovir 1.5 mg per 1 gram**  Virgan 0.15% eye gel  |  5 gram  |  £19.99 DT price  =  £19.99

### 4 Eye procedures

#### Mydriatics and cycloplesics

**Overview**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

- Short-acting, relatively weak mydriatics, such as tropicamide 0.5%, below, (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1023 (action up to 24 hours) or atropine sulfate p. 1022 (action up to 7 days).

- Phenylephrine hydrochloride p. 1032 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

- Mydriatics and cycloplesics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids.

- Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1023 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Other drugs used for Eye procedures** *Apraclonidine p. 1043
- Lidocaine hydrochloride, p. 97*

#### Antimuscarinics

**Tropicamide**

- **INDICATIONS AND DOSE**
  - **Fundoscopy**
    - **TO THE EYE**
    - Child:  0.5% eye drops to be applied 20 minutes before examination
    - Adult:  (consult product literature)

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:**  May contain Benzalkonium chloride, edetic acid (edta)
    - **Mydriacyl** *(Alcon Laboratories (UK) Ltd)*
      - **Tropicamide 5 mg per 1 ml**  Mydriacyl 0.5% eye drops  |  5 ml  |  £1.29
      - **Tropicamide 10 mg per 1 ml**  Mydriacyl 1% eye drops  |  5 ml  |  £1.60
    - **Tropicamide** *(Bausch & Lomb UK Ltd)*
      - **Tropicamide 5 mg per 1 ml**  Minims tropicamide 0.5% eye drops 0.5ml unit dose  |  20 unit dose  |  £0.75
      - **Tropicamide 10 mg per 1 ml**  Minims tropicamide 1% eye drops 0.5ml unit dose  |  20 unit dose  |  £1.00

  Combinations available:  *Phenylephrine with tropicamide, p. 1033*
Eye procedures

Povidone-iodine

**INDICATIONS AND DOSE**
Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery
- **TO THE EYE**
- **Adult:** Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

**CONTRA-INDICATIONS**
Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives

**SIDE-EFFECTS**
- **Rare** Conjunctival hyperaemia - superficial punctuate keratitis
- **Frequency not known** Cytotoxicity on deep tissue - cytotoxicity on mucous membranes - residual yellow coloration of the conjunctiva

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)
  - **Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml.** Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose | £1.24

Fluorescein sodium

**INDICATIONS AND DOSE**
Detection of lesions and foreign bodies
- **TO THE EYE**
- **Adult:** Use sufficient amount to stain damaged areas

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Minims fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml.** Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose | £1.24

Fluorescein with lidocaine

**INDICATIONS AND DOSE**
Local anaesthesia
- **TO THE EYE**
- **Adult:** Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)
  - **Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml.** Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose | £1.24
4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery are included here.

Oxybuprocaine hydrochloride p. 1032, flurbiprofen p. 1034, ketorolac trometamol p. 1035, and nepafenac p. 1019, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1034 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 1043, an alpha₂-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1032, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 1026 and balanced salt solution are used during surgical procedures on the eye. Povidone-iodine p. 1032 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride, below, and tetracaine p. 1034 are widely used topical local anaesthetics. Proxymetacaine hydrochloride, p. 1034 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1032 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 211, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

  Flurbiprofen sodium 200 microgram per 1 ml Voltarol Ophtha Multidose 0.2% eye drops | 5 ml £6.68
5 Glaucoma and ocular hypertension

Glaucoma

Overview

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range. The most common form of glaucoma is primary open-angle glaucoma (chronic open-angle glaucoma), where drainage of the aqueous humour through the trabecular meshwork is restricted. The condition is often asymptomatic, but the patient may present with significant loss of visual field. Patients with ocular hypertension are at high risk of developing primary open-angle glaucoma.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing ocular hypertension and glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice for the treatment of ocular hypertension. A prostaglandin analogue should be used to manage patients with early or moderate primary open-angle glaucoma. After checking compliance and eye drop instillation technique, it may be necessary to combine these drugs or add others, such as sympathomimetics, carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Acute angle-closure glaucoma

Acute angle-closure glaucoma occurs when the outflow of aqueous humour from the eye is obstructed by bowing of the iris against the trabecular meshwork; it is a medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision. Patients with acute angle-closure glaucoma should be referred immediately for specialist ophthalmology assessment and treatment.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, laser treatment, or drainage surgery in either primary open-angle or acute angle-closure glaucoma.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol p. 1037, carteolol hydrochloride p. 1036, levobunolol hydrochloride p. 1036, and timolol maleate p. 1036.

Prostaglandin analogues and prostanamides

The prostaglandin analogues latanoprost p. 1041, tafluprost and travoprost p. 1043, and the synthetic prostanamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure in ocular hypertension or open-angle glaucoma.

Sympathomimetics

Brimonidine tartrate, a selective alpha2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow. It is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other anti-glaucoma therapy.

Apraclonidine p. 1043 is another alpha2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used short-term to delay laser treatment or surgery in patients with glaucoma not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery. Apraclonidine may not provide additional benefit in patients already using two drugs that suppress the production of aqueous humour.

Carbonic anhydrase inhibitors and systemic drugs

The carbonic anhydrase inhibitors, acetazolamide p. 1037, brinzolamide p. 1038, and dorzolamide p. 1039, reduce intra-ocular pressure.
ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis. Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue or the alpha2-adrenoceptor agonist, brimonidine tartrate p. 1044.

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

The osmotic diuretics, intravenous hypertonic mannitol p. 217 or glycerol by mouth are useful short-term ocular hypotensive drugs.

**Miotics**
Miotics act by opening the inefficient drainage channels in the trabecular meshwork.

Pilocarpine p. 1039, a miotic, is not commonly used for the treatment of primary open-angle glaucoma because side-effects are poorly tolerated. It is used mainly in the treatment of primary angle-closure glaucoma and in some secondary glaucomas.

**BETA-ADRENOCETOR BLOCKERS > NON-SELECTIVE**

**Carteolol hydrochloride**

- **INDICATIONS AND DOSE**
  - Primary open-angle glaucoma
    - **TO THE EYE**
    - Adult: Apply twice daily

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

- **CAUTIONS** Patients with corneal disease

  **CAUTIONS, FURTHER INFORMATION**
  Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

- **INTERACTIONS** → Appendix 1 (beta-blockers). Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

- **SIDE-EFFECTS** Anaphylaxis - anterior uveitis - blepharoconjunctivitis - burning - corneal disorders - dry eyes - erythema - itching - ocular stinging - pain

  **SIDE-EFFECTS, FURTHER INFORMATION**
  Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulphite
  → Betagan (Allergan Ltd)
  | Levobunolol hydrochloride 5 mg per 1 ml Betagan 0.5% eye drops | 5 ml | £1.85 DT price = £1.85
  Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose | £0.98

**Timolol maleate**

- **INDICATIONS AND DOSE**
  Reduction of intra-ocular pressure in primary open-angle glaucoma
  → TO THE EYE
  → Adult: Apply twice daily

  **TIMOPTOL-LA®**
  Reduction of intra-ocular pressure in primary open-angle glaucoma
  → TO THE EYE
  → Adult: Apply once daily

  **TIOPLEX®**
  Reduction of intra-ocular pressure in primary open-angle glaucoma
  → TO THE EYE
  → Adult: Apply once daily, to be applied in the morning

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

- **CAUTIONS** Consider also cautions listed for systemically administered beta blockers - patients with corneal disease

- **INTERACTIONS** Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.
CAUTIONS, FURTHER INFORMATION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

INTERACTIONS

Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

SIDE-EFFECTS

Anaphylaxis, blepharoconjunctivitis, burning, corneal disorders, dry eyes, erythema, itching, ocular stinging, pain

SYSTEMIC ABSORPTION

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose timolol eye drops commonly contain preservatives, preserved formulation unit dose vials may be available.

NATIONAL FUNDING/ACCESS DECISIONS

TIOPLEX®

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (TIOPLEX®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- Timolol maleate (Non-proprietary)
  - Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml (Pom) £1.76 DT price = £1.07
  - Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml (Pom) £1.95 DT price = £1.01
- Timoptic (Santen UK Ltd)
  - Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptic 0.25% eye drops | 5 ml (Pom) £3.12 DT price = £1.07
  - Timoptic Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose (Pom) £8.45
- Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml (Pom) £3.12 DT price = £1.01
  - Timoptic Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose (Pom) £9.65 DT price = £9.65
- Tiopex (Thea Pharmaceuticals Ltd)
  - Timolol (as Timolol maleate) 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose (Pom) £7.49 DT price = £7.49

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

- Timolol-LA (Santen UK Ltd)
  - Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml (Pom) £3.13 DT price = £3.13
  - Timolol (as Timolol maleate) 5 mg per 1 ml Timolol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml (Pom) £3.12 DT price = £3.12

BETA-ADRENOCEPTOR BLOCKERS

Betaxolol

INDICATIONS AND DOSE

Primary open-angle glaucoma
- TO THE EYE
- Adult: Apply twice daily

CONTRA-INDICATIONS

Also consider contra-indications listed for systemically administered beta blockers: bradycardia, heart block

CAUTIONS

Patients with corneal disease

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

INDICATIONS AND DOSE

Reduction of intra-ocular pressure in open-angle glaucoma / Reduction of intra-ocular pressure in secondary glaucoma / Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

Glaucma
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 250–500 mg daily

Epilepsy
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

CONTRA-INDICATIONS

Adrenocortical insufficiency · hyperchloremaic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma

CAUTIONS

Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

INTERACTIONS

Appendix 1 (diuretics).
Brinzolamide with brimonidine 27-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide, above, brimonidine tartrate p. 1044.

**INDICATIONS AND DOSE**
**Raised intra-ocular pressure in open-angle glaucoma and in ocular hypertension when monotherapy is inadequate**

**TO THE EYE**

Adult: Apply 1 drop twice daily

**SIDE-EFFECTS**
- Common or very common Somnolence
- Uncommon Dermatitis - dry throat - hypotension - vertigo

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
**EXCIPIENTS:** May contain Sodium chloride, sodium propionate, gluconic acid, hydrogenated castor oil, polysorbate 80.

**Brinzolamide**
- **Brinzolamide 10 mg per 1 ml** Brinzolamide 10mg/ml eye drops | 5 ml POM £6.92 DT price = £2.24
- **Azopt** (Alcon Laboratories (UK) Ltd) Brinzolamide 10 mg per 1 ml Azopt 10mg/ml eye drops | 5 ml POM £6.92 DT price = £2.24

**Brimonidine**
- **Brimonidine 0.2 mg per 1 ml** Brimonidine 0.2 mg/ml eye drops | 5 ml POM £6.45 DT price = £2.24
- **Simbrinza** (Alcon Laboratories (UK) Ltd) Brimonidine 0.2 mg/ml + Brinzolamide 0.12 mg/ml eye drops | 5 ml POM £6.45 DT price = £2.24

**Brinzolamide**
- **Indications and dose**
  - Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated
  - **TO THE EYE**
  - Adult: Apply twice daily, then increased if necessary up to 3 times a day

**Contra-Indications**
- Hyperchloraeic acidosis

**CAUTIONS**
- Renal tubular immaturity or abnormality - systemic absorption follows topical application

**INTERACTIONS**
Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.

**SIDE-EFFECTS**
- **Common or very common** Corneal erosion - corneal oedema - dry mouth - headache - ocular disturbances - photophobia - reduced visual acuity - taste disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated if history of sulfonamide hypersensitivity.

**PREGNANCY**
Avoid - toxicity in animal studies.

**BREAST FEEDING**
Use only if benefit outweighs risk.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid.

**RENAL IMPAIRMENT**
Avoid - risk of metabolic acidosis.

**Monitoring Requirements**
Monitor blood count and plasma electrolyte concentrations with prolonged use.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- CAUTIONARY AND ADVISORY LABELS 3

  - Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial POM £1.76

**Brinzolamide**
- **INDICATIONS AND DOSE**
  - Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated
  - **TO THE EYE**
  - Adult: Apply twice daily

**Contra-Indications**
- Hyperchloraeic acidosis

**CAUTIONS**
- Renal tubular immaturity or abnormality - systemic absorption follows topical application
**Brinzolamide with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1038, timolol maleate p. 1036.

**INDICATIONS AND DOSE**

**Raised intraocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate**

- TO THE EYE
- Adult: Apply twice daily

**INDICATIONS AND DOSE**

**Raised intraocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated**

- TO THE EYE
- Adult: Apply 3 times a day

**MEDICINAL FORMS**

- **Eye drops**
  - **EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate
    - Azarga (Alcon Laboratories (UK) Ltd)
      - Timolol (as Timolol maleate) 5 mg per 1 ml, Brinzolamide 10 mg per 1 ml

**Dorzolamide**

**INDICATIONS AND DOSE**

**Raised intraocular pressure in ocular hypertension as adjunct to beta-blocker**

- TO THE EYE
- Adult: Apply twice daily

**CONTRA-INDICATIONS**

- **Hyperchloremic acidosis**
- **CAUTIONS**
  - Chronic corneal defects • history of intraocular surgery • history of renal calculi • low endothelial cell count • systemic absorption follows topical application
- **INTERACTIONS**
  - Appendix 1 (dorzolamide).
  - Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.

**SIDE-EFFECTS**

- **Common or very common**
  - Asthenia • bitter taste • blurred vision • conjunctivitis • eyelid inflammation • headache • lacrimation • nausea • ocular irritation • superficial punctate keratitis
- **Uncommon**
  - Iridocyclitis
- **Rare**
  - Contact dermatitis • corneal oedema • dizziness • dry mouth • epistaxis • eyelid crusting • paraesthesia • Stevens-Johnson syndrome • throat irritation • toxic epidermal necrolysis • transient myopia • urolithiasis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated if history of sulfonamide hypersensitivity.

**PREGNANCY**

- Manufacturer advises avoid—no information available.

**BREAST FEEDING**

- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution—no information available.

**RENAL IMPAIRMENT**

- Avoid if eGFR less than 30 ml/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
  - Dorzolamide (Non-proprietary)
    - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
      - Dorzolamide 2% eye drops | 5 ml £6.33 DT price = £1.96
      - Trusopt (Santen UK Ltd)
        - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
          - Trusopt 2% eye drops | 5 ml £6.33 DT price = £1.96
          - Trusopt 2% eye drops 0.2ml unit dose preservative free | 60 unit dose £24.18 DT price = £24.18

**Dorzolamide with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide, above, timolol maleate p. 1036.

**INDICATIONS AND DOSE**

**Raised intraocular pressure in ocular hypertension when beta-blockers alone not adequate**

- TO THE EYE
- Adult: Apply twice daily

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
  - Dorzolamide with timolol (Non-proprietary)
    - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
      - Dorzolamide 2% / Timolol 0.5% eye drops | 5 ml £27.16 DT price = £1.94
      - Dorzolamide 2% / Timolol 0.5% eye drops 0.2ml unit dose preservative free | 60 unit dose £27.16 DT price = £28.59
      - Cosopt (Santen UK Ltd)
        - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
          - Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose £28.59 DT price = £28.59
          - Cosopt eye drops | 5 ml £10.05 DT price = £1.94

**PARESYPATHOMIMETICS**

**Pilocarpine**

**INDICATIONS AND DOSE**

**Primary angle-closure glaucoma • Some secondary glaucomas**

- TO THE EYE
- Adult: Apply up to 4 times a day

**CONTRA-INDICATIONS**

- Acute inflammatory disease of the anterior segment • acute iritis • anterior uveitis • conditions
where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage • asthma • cardiac disease • care in conjunctival damage • care in corneal damage • epilepsy • gastrointestinal spasm • hypertension • hyperthyroidism • hypotension • marked vasomotor instability • Parkinson’s disease • peptic ulceration • retinal detachment has occurred in susceptible individuals and those with retinal disease • urinary-tract obstruction

- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **Systemic effects** rare following application to the eye.

- **SIDE-EFFECTS**
  - **Rare** Parasympathomimetics systemic side effects
  - **Frequency not known** Blurred vision • ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) • conjunctival vascular congestion • lens changes (with chronic use) • myopia • ocular burning • ocular itching • pupillary block • smarting • vitreous haemorrhage

- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
  
  **Eye drops**

  **EXCEPTANTS:** May contain Benzalkonium chloride

  - **Pilocarpine (Non-proprietary)**
    - Pilocarpine hydrochloride 10 mg per 1 ml
    - Pilocarpine hydrochloride 1% eye drops | 10 ml PPM | £9.54 DT price = £8.77
    - Pilocarpine hydrochloride 20 mg per 1 ml
    - Pilocarpine hydrochloride 2% eye drops | 10 ml PPM | £11.72 DT price = £10.76
    - Pilocarpine hydrochloride 40 mg per 1 ml
    - Pilocarpine hydrochloride 4% eye drops | 10 ml PPM | £13.04 DT price = £11.97
    - Pilocarpine nitrate (Bausch & Lomb UK Ltd)
      - Pilocarpine nitrate 20 mg per 1 ml
      - Minims pilocarpine nitrate 2% eye drops 0.5 ml unit dose | 20 unit dose PPM | £1.99

- **PROSTAGLANDIN ANALOGUES AND PROSTAMIDES**

  **Bimatoprost**

  - **INDICATIONS AND DOSE**
    - **Raised intra-ocular pressure in open-angle glaucoma**
    - **Ocular hypertension**
      - **TO THE EYE**
      - **Adult:** Apply once daily, to be administered preferably in the evening

  - **CAUTIONS** Angle-closure glaucoma (no experience of use) • aphakia • asthma • chronic obstructive pulmonary disease • compromised respiratory function • congenital glaucoma (no experience of use) • contact lens wearers • history of significant ocular viral infections • inflammatory ocular conditions (no experience of use) • narrow-angle glaucoma (no experience of use) • neovascular glaucoma (no experience of use) • predisposition to bradycardia • predisposition to hypotension • pseudophakia with torn posterior lens capsule or anterior chamber lenses • risk factors for cystoid macular oedema • risk factors for iritis • risk factors for uveitis

  - **SIDE-EFFECTS**
    - **Common or very common** Blepharitis • blood pressure changes • brown pigmentation particularly in those with mixed-colour irides • conjunctival disorders • corneal erosion • darkening, thickening and lengthening of eye lashes • eyelash and vellus hair changes • headache • ocular discomfort • photophobia • pigmentation of periocular skin • punctate keratitis • reduced visual acuity • transient punctate epithelial erosion
    - **Uncommon** Asthenopia • dizziness • skin rash
    - **Rare** Arthralgia • darkening of palpebral skin • facial oedema • iritis • macular oedema • myalgia • uveitis
    - **Very rare** Chest pain • exacerbation of angina • palpitation • periorbital changes resulting in deepening of the eyelid sulcus
    - **Frequency not known** Asthma • blepharospasm • bradycardia • dyspnoea • exacerbation of asthma • exacerbation of COPD • eyelid retraction • malaise • myopia • ocular infection • reactivation of previous corneal infiltrates • retinal haemorrhage
    - **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
    - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
    - **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—no information available.
    - **RENAL IMPAIRMENT** Use with caution—no information available.
    - **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
    - **PATIENT AND CARER ADVICE** Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed colour irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

  - **NATIONAL FUNDING/ACCESS DECISIONS**

  **LUMIGAN®**

  Scottish Medicines Consortium (SMC) Decisions

  The Scottish Medicines Consortium has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (Lumigan® single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in adults who have proven sensitivity to benzalkonium chloride.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- Lumigan (Allergan Ltd)
- Bimatoprost 100 microgram per 1 ml Lumigan 100 micrograms/ml eye drops 3 ml (POM) £11.71 DT price = £11.71 | 9 ml (POM) £35.13
- Bimatoprost 300 microgram per 1 ml Lumigan 300 micrograms/ml eye drops 0.4 ml unit dose | 30 unit dose (POM) £13.75 DT price = £13.75

**INDICATIONS AND DOSE**

**Bimatoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost p. 1040, timolol maleate p. 1036.

**NATIONAL FUNDING/ACCESS DECISIONS**

**GANFORT® SINGLE USE**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2013) that Ganfort™ unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- Ganfort (Allergan Ltd)
- Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Ganfort 0.3 mg/ml / 5 mg/ml eye drops | 3 ml (POM) £13.95 DT price = £13.95 | 9 ml (POM) £37.59
- Ganfort 0.3 mg/ml / 5 mg/ml eye drops 0.4 ml unit dose | 30 unit dose (POM) £17.50

**Latanoprost**

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension

- TO THE EYE
- Adult: Apply once daily

**NATIONAL FUNDING/ACCESS DECISIONS**

**MONOPOST®**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2013) that Monopost™ is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- Monopost (Thea Pharmaceuticals Ltd)
- Latanoprost 50 microgram per 1 ml Latanoprost 50 micrograms/ml eye drops 2.5 ml (POM) £12.48 DT price = £12.48
- Monopost (Thea Pharmaceuticals Ltd) Latanoprost 50 microgram per 1 ml Monopost 50 micrograms/ml eye drops 0.2 ml unit dose | 30 unit dose (POM) £8.49 DT price = £8.49 | 90 unit dose (POM) £25.47 DT price = £25.47
**Latanoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, latanoprost p. 1041, timolol maleate p. 1036.

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate

- **TO THE EYE**
- **Adult:** Apply once daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- *Latanoprost with timolol (Non-proprietary)*
  - Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Latanoprost 50micrograms/ml / Timolol 5mg/ml eye drops 2.5 ml \( \text{PoM} \) £14.32 DT price = £2.73
- *Xalacom* (Pfizer Ltd)
  - Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml xalacom eye drops 2.5 ml \( \text{PoM} \) £14.32 DT price = £2.73

**Tafluprost**

**INDICATIONS AND DOSE**

Raised intra-ocular pressure in open-angle glaucoma

- **Ocular hypertension**
  - **TO THE EYE**
  - **Adult:** Apply once daily, to be administered preferably in the evening

**CAUTIONS**

- Angle-closure glaucoma (no experience of use)
- - aphakia • astigmatism • chronic obstructive pulmonary disease
- - compromised respiratory function • congenital glaucoma (no experience of use) • contact lens wearers • history of significant ocular viral infections • inflammatory ocular conditions (no experience of use) • narrow-angle glaucoma (no experience of use) • neovascular glaucoma (no experience of use) • pseudophakia with torn posterior lens capsule or anterior chamber lenses • risk factors for cystoid macular oedema • risk factors for iritis • risk factors for uveitis

**SIDE-EFFECTS**

- **Common or very common**
  - Blurred vision • ocular hyperaemia
  - Anterior chamber inflammation • conjunctivitis

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Blurred vision may affect performance of skilled tasks (e.g. driving or operating machinery).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2015) that Taptiqom™ (talfuprost with timolol) is accepted for restricted use within NHS Scotland, within the licensed indications, in patients who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Disodium edetate

- *Tafloprost (Non-proprietary)*
  - Tafloprost 15 microgram per 1 ml Tafloprost 15micrograms/ml eye drops 2.5 ml \( \text{PoM} \) no price available

Travoprost

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma**

**Ocular hypertension**

- **TO THE EYE**
- **Adult:** Apply once daily, to be administered preferably in the evening

**CAUTIONS**

- History of significant ocular viral infections - angle-closure glaucoma (no experience of use) - aphakia - asthma - chronic obstructive pulmonary disease - compromised respiratory function - congenital glaucoma (no experience of use) - contact lens wearers - inflammatory ocular conditions (no experience of use) - narrow-angle glaucoma (no experience of use) - neovascular glaucoma (no experience of use) - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cytokoid macular oedema - risk factors for iris - risk factors for uveitis

**SIDE-EFFECTS**

- **Common or very common**
  - Blepharitis - blood pressure changes - brown pigmentation particularly in those with mixed-colour irides - conjunctival disorders - corneal erosion - darkening, thickening and lengthening of eye lashes - eyelash and vellus hair changes - headache - ocular discomfort - photophobia - pigmentation of perilous skin - punctate keratitis - reduced visual acuity - transient punctate epithelial erosion
- **Uncommon**
  - Asthenopia - dizziness - skin rash
- **Rare**
  - Arthralgia - darkening of palpebral skin - facial oedema - iritis - macular oedema - myalgia - uveitis
- **Very rare**
  - Chest pain - exacerbation of angina - palpitation - periorbital changes resulting in deepening of the eyelid sulcus
- **Frequency not known**

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING**

Present in milk in animal studies; manufacturer advises avoid.

**PATIENT AND CARER ADVICE**

Changes to eye colour

Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Propylene glycol
- **Travatan** (Alcon Laboratories (UK) Ltd)
  - Travoprost 40 microgram per 1 ml Travatan 40micrograms/ml eye drops
    - **2.5 ml (POD)** £10.95 DT price = £10.95
    - **5 ml (POD)** £17.95 DT price = £17.95

**Travoprost with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost, above, timolol maleate p. 1036.

**INDICATIONS AND DOSE**

**Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

- **TO THE EYE**
- **Adult:** Apply once daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Propylene glycol
  - **DuoTrav** (Alcon Laboratories (UK) Ltd)
    - Timolol (as Timolol maleate) 5 mg per 1 ml, Travoprost 40 microgram per 1 ml
    - **DuoTrav 40micrograms/ml / 5mg/ml eye drops**
      - **2.5 ml POD** £13.95 DT price = £13.95
      - **7.5 ml POD** £39.68

**SYMPATHOMIMETICS > ALPHA 2-ADRENOCEPTOR AGONISTS**

Apraclonidine

**DRUG ACTION**

Apraclonidine is an alpha,2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

- **TO THE EYE**
- **Adult:** Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

- **TO THE EYE**
- **Adult:** Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**CONTRA-INDICATIONS**

History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS**

Cerebrovascular disease - depression - heart failure - history of angina - hypertension - loss of effect may occur over time - Parkinson’s syndrome - Raynaud’s syndrome - recent myocardial infarction - reduction in vision in end-stage glaucoma (suspend treatment) - severe coronary insufficiency - thromboangiitis obliterans - vasovagal attack

**INTERACTIONS**

Appendix 1 (apraclonidine).

**SIDE-EFFECTS**

- **Common or very common**
  - Conjunctivitis - dry eye - ocular intolerance - rhinitis - taste disturbance
- **Uncommon**
  - Asthma - blepharitis - blepharospasm - chest pain - conjunctival vascular disorders - corneal erosion and infiltrates - dyspnoea - eyelid ptosis or retraction - impaired co-ordination - irritability - keratitis - keratopathy - myalgia - mydriasis - nervousness - parosmia - photophobia - rhinorrhoea - throat irritation - visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION**

- Ocular intolerance
  - Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- Systemic effects
  - Since absorption may follow topical application, see clonidine hydrochloride p. 136.
Brimonidine tartrate

- **DRUG ACTION** Brimonidine, an alpha2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

- **INDICATIONS AND DOSE**
  - Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate
  - Ocular hypertension in patients for whom beta-blockers are inappropriate
  - Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy

  - **TO THE EYE**
  - Adult: Apply twice daily

- **CAUTIONS**
  - Cerebral insufficiency
  - Coronary insufficiency
  - Depression
  - Postural hypotension
  - Raynaud’s syndrome
  - Severe cardiovascular disease
  - Thromboangiitis obliterans

- **INTERACTIONS** ➔ Appendix 1 (brimonidine).

- **SIDE-EFFECTS**
  - Common or very common
    - Burning sensation at application site
    - Conjunctival blanching
    - Conjunctival disturbances
    - Conjunctival follicles
    - Conjunctival infection
    - Corneal erosion
    - Corneal staining
    - Dizziness
    - Drowsiness
    - Dry mouth
    - Eyelid inflammation
    - Gastro-intestinal disturbances
    - Headache
    - Malaise
    - Ocular disturbances
    - Ocular dryness
    - Ocular hyperaemia
    - Ocular pain
    - Ocular pruritus
    - Photophobia
    - Stinging at application site
    - Taste disturbances
    - Upper respiratory symptoms
    - Visual disturbances
  - Uncommon
    - Arrhythmia
    - Bradycardia
    - Depression
    - Nasal dryness
    - Palpitation
    - Tachycardia
  - Rare
    - Drowsiness
  - Very rare
    - Hypertension
    - Hypotension
    - Insomnia
    - Iritis
    - Miosis
    - Syncope

- **PREGNANCY** Limited information available; manufacturer advises use only if benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.

- **RENAL IMPAIRMENT** Manufacturer advises use with caution.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
    - Iopidine (Alcon Laboratories (UK) Ltd)
      - Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml Iopidine 5mg/eye drops | 5 ml (POD) £10.88 DT price = £10.88
      - Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose (POD) £77.85 DT price = £77.85

**Brimonidine with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, brimonidine tartrate, above, timolol maleate p. 1036.

- **INDICATIONS AND DOSE**
  - Raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate
    - **TO THE EYE**
    - Adult: Apply twice daily

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
    - **Brimonidine tartrate (Non-proprietary)**
      - Brimonidine tartrate 2 mg per 1 ml Brimonidine 0.2% eye drops | 5 ml (POD) £6.85 DT price = £6.85
      - Alphagan (Allergan Ltd)
        - Brimonidine tartrate 2 mg per 1 ml Alphagan 0.2% eye drops | 5 ml (POD) £6.85 DT price = £6.85
      - Brymont (Blumont Pharma Ltd)
        - Brimonidine tartrate 2 mg per 1 ml Brymont 2mg/ml eye drops | 5 ml (POD) £2.27 DT price = £2.27
    - **Combinations available:** *Brinzolamide with brimonidine*, p. 1038

**6 Retinal disorders**

6.1 Macular degeneration

**Subfoveal choroidal neovascularisation**

**Treatment**

Aflibercept p. 1045, pegaptanib sodium p. 1046 and ranibizumab p. 1046 are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration. Aflibercept is also licensed for the treatment of macular oedema secondary to central retinal vein occlusion, and diabetic macular oedema; ranibizumab is also licensed for the treatment of visual impairment due to diabetic macular oedema, macular oedema secondary to branch or central retinal vein occlusion, and choroidal neovascularisation secondary to pathologic myopia. Ranibizumab can be administered...
concomitantly with laser photocoagulation for the treatment of diabetic macular oedema and for macular oedema secondary to branch retinal vein occlusion.

ANTINEOVASCULARISATION DRUGS

VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

Aflibercept

**DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PIGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

**INDICATIONS AND DOSE**

Neovascular (wet) age-related macular degeneration (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: Initially 2 mg once a month for 3 months, to be injected into the affected eye, then 2 mg every 2 months, review treatment frequency after 12 months

Macular oedema secondary to central retinal vein occlusion (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: Initially 2 mg once a month, to be injected into the affected eye, monitor visual and anatomic outcomes monthly; continue treatment until visual and anatomic outcomes are stable for 3 monthly assessments (discontinue treatment if no improvement in visual and anatomic outcomes after initial 3 injections); if necessary subsequent doses may be given at least 1 month apart

Diabetic macular oedema (specialist use only)

- **BY INTRAVITREAL INJECTION**
  - Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, to be injected into the affected eye, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

**CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss - ocular or periorcular infection - severe intra-ocular inflammation

**CAUTIONS** Active systemic infection - diabetic patients with uncontrolled hypertension - discontinue treatment if stage 3 or 4 macular holes develop - consult product literature for full details - discontinue treatment in the event of a retinal break - consult product literature for full details - discontinue treatment in the event of rhegmatogenous retinal detachment - consult product literature for full details - patients at risk of retinal pigment epithelial tear - poorly controlled glaucoma - recent history of myocardial infarction - recent history of stroke - recent history of transient ischaemic attack

**CAUTIONS, FURTHER INFORMATION** Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections - patients should be advised to report any signs of infection immediately.

**SIDE-EFFECTS**

- Common or very common - Blurred vision - cataract formation - conjunctival haemorrhage - conjunctival hyperaemia - corneal abrasion or oedema - corneal erosion - eye pain - eyelid oedema - foreign body sensation in eye - increased lacrimation - injection-site haemorrhage - injection-site pain - ocular hyperaemia - punctate keratitis - raised intra-ocular pressure - reduced visual acuity - retinal degeneration - retinal pigment epithelium detachment - retinal pigment epithelium tear - vitreous detachment - vitreous floaters - vitreous haemorrhage
- Uncommon - Anterior chamber flare - blindness - corneal epithelial defect - eyelid irritation - iridocyclitis - iritis - lenticular opacities - retinal detachment - retinal tear - uveitis
- Rare - Hypopyon - viritis

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS** Monitor intra-ocular pressure following injection.

**DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013) NICE TA294
  - Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
    - it is used in accordance with the recommendations for ranibizumab in NICE TA 155 and
    - the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme
  [www.nice.org.uk/TA294](http://www.nice.org.uk/TA294)

- Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014) NICE TA305
  - Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme
  [www.nice.org.uk/TA305](http://www.nice.org.uk/TA305)

- Aflibercept for treating diabetic macular oedema (July 2015) NICE TA346
  - Aflibercept solution for injection is recommended as an option for treating visual impairment caused by diabetic macular oedema only if:
    - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment and
    - the company provides aflibercept with the discount agreed in the patient access scheme
  [www.nice.org.uk/TA346](http://www.nice.org.uk/TA346)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Eylea (Bayer Plc) ▼
- **Aflibercept 40 mg per 1 ml** Eylea 2mg/50 microlitres solution for injection vials | 1 vial [POM] £816.00
**Pegaptanib sodium**

- **INDICATIONS AND DOSE**
  - Treatment of neovascular (wet) age-related macular degeneration (specialist use only)
    - By intravitreal injection
    - Adult: 300 micrograms every 6 weeks, to be administered into the affected eye, review treatment if no benefit after 2 consecutive injections

- **CONTRA-INDICATIONS** Ocular or periocular infection
- **CAUTIONS** Pegaptanib is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **SIDE-EFFECTS**
  - **Common or very common** Anterior chamber inflammation • cataract • conjunctival haemorrhage • conjunctivitis • corneal dystrophy • dry eye • eye discharge • eye irritation • eye pain • flashing lights • headache • local oedema • macular degeneration • mydriasis • periorbital haematoma • photophobia • punctate keratitis • raised intra-ocular pressure • retinal haemorrhage • rhinorrhoea • vitreous disorders • vitreous floaters
  - **Uncommon** Aortic aneurysm • asthenopia • back pain • blepharitis • chalazion • changes in hair colour • chest pain • corneal deposits • deafness • decreased intra-ocular pressure • depression • dyspepsia • ectropion • eczema • eye movement disorder • eyelid ptosis • hypertension • influenza-like symptoms • injection-site reactions • iritis • nasopharyngitis • night sweats • nightmares • occlusion of retinal blood vessels • optic nerve cupping • palpatation • pruritus • pupillary disorder • rash • retinal detachment • retinal exudates • vertigo • vitreous haemorrhage • vomiting

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor intra-ocular pressure (transient increase may occur following injection, and small, sustained increases reported after repeated dosing).
  - Monitor for vitreous haemorrhage and for signs of ocular infection for 2 weeks following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155
    - Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.
    - www.nice.org.uk/TA155

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

---

**Ranibizumab**

- **INDICATIONS AND DOSE**
  - Neovascular (wet) age-related macular degeneration (specialist use only)
    - By intravitreal injection
    - Adult: 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months, thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

- **Diabetic macular oedema / Macular oedema secondary to retinal vein occlusion (specialist use only)**
  - By intravitreal injection
  - Adult: Initially 500 micrograms once a month, to be administered into the affected eye, monitor visual acuity monthly, continue treatment until visual acuity is stable for 3 consecutive months (discontinue treatment if no improvement in visual acuity after initial 3 injections), thereafter monitor visual acuity monthly, if necessary subsequent doses may be given at least 1 month apart

- **Choroidal neovascularisation secondary to pathologic myopia (specialist use only)**
  - By intravitreal injection
  - Adult: Initially 500 micrograms, to be administered as a single injection into the affected eye, monitor for disease activity monthly for first 2 months, then at least every 3 months thereafter during the first year, then as required, if necessary subsequent doses may be given at least 1 month apart

- **Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photoacoagulation (specialist use only)**
  - By intravitreal injection
  - Adult: 500 micrograms, to be administered at least 30 minutes after laser photoacoagulation

- **CONTRA-INDICATIONS** Ocular or periocular infection • severe intra-ocular inflammation • signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

- **CAUTIONS** Active systemic infection • diabetic macular oedema due to type 1 diabetes (limited information available) • diabetic patients with HbA1c over 12% • history of stroke • history of transient ischaemic attack • patients at risk of retinal pigment epithelial tear • previous intravitreal injections • proliferative diabetic retinopathy • retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) • uncontrolled hypertension

- **CAUTIONS, FURTHER INFORMATION**
  - Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **SIDE-EFFECTS**
  - **Common or very common** Allergic skin reactions • anaemia • anterior chamber flare • anxiety • arthralgia • blepharitis • cataract • conjunctival disorders • conjunctivitis • cough • eye haemorrhage • eyelid oedema • headache • iridocyclitis • iritis • nasopharyngitis • nausea • ocular discomfort • photophobia • photopsia • posterior capsule opacification • punctuate keratitis • raised intra-ocular pressure • retinal disorders • urinary tract infection • uveitis • visual disturbance • vitreous disorders
Ranibizumab for the treatment of diabetic macular oedema

**NATIONAL FUNDING/ACCESS DECISIONS**

Monitor visual acuity, see individual indications and dose

Monitor intra-ocular pressure, perfusion of the optic nerve

**MONITORING REQUIREMENTS**

Uncommon information available.

www.nice.org.uk/TA274

It is appropriate to stop.

Visual impairment due to diabetic macular oedema whose best corrected visual acuity is between 6/12 and 6/96;

the lesion size is less than or equal to 12 disc areas in greatest linear dimension;

there is evidence of recent disease progression;

the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

www.nice.org.uk/TA155

**Scottish Medicines Consortium (SMC) Decisions**

The **Scottish Medicines Consortium** has advised (May 2007) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

The **Scottish Medicines Consortium** has advised (October 2011 and April 2013) that ranibizumab (Lucentis®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion, and (November 2012) for restricted use for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline, and (October 2013) for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults; SMC advice is contingent upon the continuing availability of ranibizumab at the price agreed in the patient access scheme.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

**Lucentis** (Novartis Pharmaceuticals UK Ltd)

Ranibizumab 10 mg per 1 ml

Lucentis 2.3mg/0.23ml solution for injection vials 1 vial (Pom) £551.00 (Hospital only) Lucentis 1.65mg/0.165ml solution for injection pre-filled syringes 1 pre-filled disposable injection (Pom) £551.00

**PHOTOSENSITISERS**

**Verteporfin**

**DRUG ACTION**

Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

**INDICATIONS AND DOSE**

Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)

> **BY INTRAVENOUS INFUSION**

> Adult: 6 mg/m², dose to be given over 10 minutes

**CONTRA-INDICATIONS** Acute porphyria p. 930

**CAUTIONS** Avoid extravasation · biliary obstruction · photosensitivity

**INTERACTIONS** Caution on concomitant use with other photosensitising drugs.

**SIDE-EFFECTS**

Common or very common Back pain · flashlights · hypercholesterolaemia · malaise · nausea · photosensitivity · reduced visual acuity · visual disturbances · visual-field defects

Uncommon Hyperaesthesia · hypertension · pyrexia · retinal detachment · subretinal, retinal or vitreous haemorrhage

Rare Retinal or choroidal vessel non-perfusion

Frequency not known Chest pain · macular oedema · myocardial infarction · retinal oedema · vasovagal reactions

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk (teratogenic in animal studies).
Eye

6.2 Macular oedema

**Other drugs used for Macular oedema**
- Afibercept p. 1045
- Dexamethasone p. 1019
- Ranibizumab p. 1046

**Fluocinolone acetonide**

- **INDICATIONS AND DOSE**
  Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)
  - **BY INTRAVITREAL INJECTION**
    - Adult: 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS**
  - Active or suspected ocular infection
  - Raised baseline intra-ocular pressure

- **CAUTIONS**
  - Anticoagulant or antiplatelet drugs (higher incidence of conjunctival haemorrhage).

- **SIDE-EFFECTS**
  - Common or very common: Blurred vision, cataract, conjunctival haemorrhage, glaucoma, ocular discomfort, raised intra-ocular pressure, reduced visual acuity, vitreous floats, vitreous haemorrhage

- **Uncommon**
  - Conjunctival ulcer, endophthalmitis, eye discharge, eye pruritus, headache, iris adhesions, iritis, neovascularisation, maculopathy, ocular hyperaemia, optic atrophy, optic nerve disorder, posterior capsule opacification, retinal exudates, retinal vascular occlusion, sclera thinning, vitreous degeneration, vitreous detachment

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises avoid unless essential.

- **MONITORING REQUIREMENTS**
  - Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
  - Monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months).

- **DIRECTIONS FOR ADMINISTRATION**
  - Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301
      - Fluocinolone acetonide intravitreal implant is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:
        - the implant is to be used in an eye with a intra-ocular (pseudophakic lens) and
        - the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.
    - Scottish Medicines Consortium (SMC) Decisions
      - The Scottish Medicines Consortium has advised (February 2014) that fluocinolone acetonide intravitreal implant (Iluvien®) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Implant**
  - Iluvien (Alimera Sciences Ltd)
    - Flucinolone acetonide 190 microgram ILUVIEN 190microgram intravitreal implant in applicator | 1 device £5,500.00
6.3 Vitreomacular traction

RECOMBINANT PROTEOLYTIC ENZYMES

Ocriplasmin

- **INDICATIONS AND DOSE**
  Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)
  ▶ BY INTRAVITREAL INJECTION
  ▶ Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

- **CONTRA-INDICATIONS**
  Active or suspected ocular or periocular infection • aphakia • exudative age-related macular degeneration • high myopia • history of rhegmatogenous retinal detachment • ischaemic retinopathies • large diameter macular hole (> 400 microns) • lens zonule instability • proliferative diabetic retinopathy • recent intra-ocular injection (including laser therapy) • recent ocular surgery • retinal vein occlusions • vitreous haemorrhage

- **CAUTIONS**
  History of uveitis (including severe active inflammation) • non-proliferative diabetic retinopathy • significant eye trauma

- **SIDE-EFFECTS**
  ▶ Common or very common
    Abnormal retinograph • anterior chamber cell or flare • chromatopsia • conjunctival disorders • eyelid oedema • iris • macular degeneration • macular hole • macular oedema • metamorphopsia • ocular discomfort • ocular hyperaemia • photophobia • photopsia • raised intra-ocular pressure • reduced visual acuity • retinal disorders • retinal pigment epitheliopathy • vitreous disorders
  ▶ Uncommon
    Anterior chamber inflammation • corneal abrasion • diplopia • eye inflammation • hyphaema • lens subluxation • miosis • scotoma • transient blindness • unequal pupils • visual field defect

- **PREGNANCY**
  Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS**
  Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.

- **DIRECTIONS FOR ADMINISTRATION**
  For further information on administration, consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  **NICE technology appraisals (TAs)**
  Ocriplasmin for treating vitreomacular traction (October 2013) NICE TA297
  Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:
  ▶ an epiretinal membrane is not present and
  ▶ they have a stage II full-thickness macular hole with a diameter of 400 microns or less and/or
  ▶ they have severe symptoms.
  www.nice.org.uk/TA297

  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised (July 2014) that ocriplasmin (Jetrea®) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Solution for injection**
  ▶ Jetrea (Alcon Laboratories (UK) Ltd)
  Ocriplasmin 2.5 mg per 1 ml Jetrea 0.5mg/0.2ml concentrate for solution for injection vials | 1 vial £2,500.00

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the rela
cessively affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 1054. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 1052 or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 1052 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients.

Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contra-indicate treatment with topical aminoglycosides or polymyxins in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic supplicative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an antiinflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol, may be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell.

When a resistant staphylococcal infection (a boil) is present spreading cellulitis or if the patient is systemically unwell.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the patient is systemically unwell, if the patient is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic.
Otitis media with effusion
Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media
Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 506 (or erythromycin p. 497 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax
Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 1054 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 1054 or urea hydrogen peroxide p. 1055 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

1 Otitis externa
Other drugs used for Otitis externa Hydrocortisone with miconazole, p. 1107

ANTIBACTERIALS > AMINOGLYCOSIDES

Framycetin sulfate

- INDICATIONS AND DOSE
  - Bacterial infection in otitis externa
    - TO THE EAR
    - Adult: (consult product literature)

- CONTRA-INDICATIONS
  - Perforated tympanic membrane

- CAUTIONS
  - Avoid prolonged use

- Side-effects
  - Local sensitivity

Gentamicin

- INDICATIONS AND DOSE
  - Bacterial infection in otitis externa
    - TO THE EAR
    - Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)
    - Adult: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- CONTRA-INDICATIONS
  - Patent grommet (although may be used by specialists, see Ear p. 1050) - perforated tympanic membrane (although may be used by specialists, see Ear p. 1050)

- CAUTIONS
  - Avoid prolonged use

- SIDE-EFFECTS
  - Local sensitivity

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

Combinations available: Dexamethasone with framycetin sulfate and gramicidin, p. 1053

Ear, nose and oropharynx
Gentamicin with hydrocortisone

- **INDICATIONS AND DOSE**
  - **Eczematous inflammation in otitis externa**
    - **TO THE EAR**
    - **Child:** Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)
    - **Adult:** Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1050) • perforated tympanic membrane (although may be used by specialists, see Ear p. 1050)
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity reactions

**SIDE-EFFECTS**

- Local sensitivity reactions
- Avoid prolonged use
CORTICOSTEROIDS CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1052, neomycin sulfate p. 1052.

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

TO THE EAR

Child: Apply 2–3 drops 3–4 times a day

Adult: Apply 2–3 drops 3–4 times a day

CONTRA-INDICATIONS Patent grommet (although may be used by specialists, see Ear p. 1050) • perforated tympanic membrane (although may be used by specialists, see Ear p. 1050)

CAUTIONS Avoid prolonged use

SIDE-EFFECTS Local sensitivity

MEDICINAL FORMS

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Betnesol-N (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml

Betnesol-N ear/eye/nose drops | 10 ml £0.39 DT price = £2.39

Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, framycetin sulfate p. 1051.

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

TO THE EARDrops

Child: 2–3 drops 3–4 times a day

Adult: 2–3 drops 3–4 times a day

LESS SUITABLE FOR PRESCRIBING Sofradex® is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

Sofradex (Sanofi)

Gramicidin 50 micrograms per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 10 ml £7.50

Dexamethasone with glacial acetic acid and neomycin sulfate

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

TO THE EAR

Child 2–17 years: Apply 1 spray 3 times a day

Adult: Apply 1 spray 3 times a day

CONTRA-INDICATIONS Patent grommet (although may be used by specialists, see Ear p. 1050) • perforated tympanic membrane
membrane (although may be used by specialists, see Ear p. 1050)

- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- **EXCIPIENTS**: May contain Hydroxybenzoates (parabens)
  - Otomize (Teva UK Ltd)
    - Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram, Acetic acid glacial 20 mg per 1 gram
  - Otomize ear spray 5 ml £0.85 | 20 ml £1.73 | 200 ml £2.05 | 500 ml £11.67

**DERMATOLOGICAL DRUGS**

- **INDICATIONS AND DOSE**
  - **Removal of earwax**
  - **To the ear**
    - Adult: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**DIRECTIVES FOR ADMINISTRATION**
For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

**2 Removal of earwax**

**BICARBONATE**

- **Sodium bicarbonate**

  - **INDICATIONS AND DOSE**
    - **Removal of earwax (with 5% ear drop solution)**
      - **To the ear**
      - **Child**: (consult product literature)
      - **Adult**: (consult product literature)

  - **SIDE-EFFECTS** Dryness of the ear canal

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ear drops**
  - **Sodium bicarbonate (Non-proprietary)**
    - Sodium bicarbonate 50 mg per 1 ml
      - Sodium bicarbonate 5% ear drops 10 ml £1.25–£1.28

**SOFTENING DRUGS**

- **Almond oil**

  - **INDICATIONS AND DOSE**
    - **Removal of earwax**
      - **To the ear**
      - **Child**: Allow drops to warm to room temperature before use (consult product literature)
      - **Adult**: Allow drops to warm to room temperature before use (consult product literature)

  - **DIRECTIONS FOR ADMINISTRATION**
    - The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Liquid**
  - **Almond oil (Non-proprietary)**
    - Almond oil 1 ml per 1 ml
      - Almond oil liquid: 50 ml £0.85
      - 70 ml £1.73
      - 200 ml £2.37
      - 500 ml £11.67

**Arachis oil with chlorobutanol**

- **INDICATIONS AND DOSE**
  - **Removal of earwax**
    - **To the ear**
    - **Adult**: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING**
  - Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ear drops**
  - **Cerumol (Thornton & Ross Ltd)**
    - Chlorobutanol 50 mg per 1 ml, Arachis oil 573 mg per 1 ml
      - Cerumol ear drops: 11 ml [£] £2.05

**Docusate sodium**

- **(Dioctyl sodium sulphosuccinate)**

  - **INDICATIONS AND DOSE**
    - **Removal of ear wax**
      - **To the ear**
      - **Adult**: (consult product literature)

  - **LESS SUITABLE FOR PRESCRIBING**
    - Ear drops less suitable for prescribing.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

    **Ear drops**
    - **Molcer (Wallace Manufacturing Chemists Ltd)**
      - Docusate sodium 50 mg per 1 ml
        - Docusate sodium ear drops: 15 ml [£] £8.08
    - **Waxsol (Meda Pharmaceuticals Ltd)**
      - Docusate sodium 5 mg per 1 ml
        - Waxsol ear drops: 10 ml [£] £1.95

**Olive oil**

- **INDICATIONS AND DOSE**
  - **Removal of earwax**
    - **To the ear**
      - **Child**: Apply twice daily for several days (if wax is hard and impacted)
      - **Adult**: Apply twice daily for several days (if wax is hard and impacted)

  - **DIRECTIONS FOR ADMINISTRATION**
    - The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.
Rhinitis and bacterial sinusitis

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibiotics. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution p. 914 may be used as a douche or ‘sniff’ following endonasal surgery.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 259) or topical nasal corticosteroids; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal corticosteroids; sodium cromoglicate p. 1061 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1017 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 251 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhea. Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 1059, budesonide p. 1059, fluticasone p. 1060, or sodium cromoglicate may be considered.

Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of warm moist air is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 277).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal passages.
nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride nasal drops, below, are the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1057 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhea often responds well to treatment with the antimuscarinic ipratropium bromide p. 1058.

Sinusitis and oral pain
Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 475).

Nasal preparations for infection
There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci.

Nasal staphylococci
Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulate-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1058 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant Staphylococcus aureus (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

1 Nasal congestion

SYMPATHOMIMETICS ▶ VASOCONSTRICTOR

Ephedrine hydrochloride

• INDICATIONS AND DOSE
  - Nasal congestion
    - Sinusitis affecting the maxillary antrum
      - BY INTRanasAL ADMINISTRATION
        - Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril
        - Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

  - Important Safety Information
    - CHM/MHRA Advice
      - The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

  - CAUTIONS
    - Avoid excessive or prolonged use:
      - cardiovascular disease (in children) - diabetes mellitus - elderly - hypertension - hyperthyroidism - ischaemic heart disease (in adults) - prostatic hypertrophy (risk of acute urinary retention) (in adults)

  - INTERACTIONS ▶ Appendix 1 (sympathomimetics).

  - SIDE-EFFECTS
    - Common or very common
      - Headache - nausea
    - Frequency not known
      - After excessive use tolerance with diminished effect - cardiovascular effect - local irritation - rebound congestion

  - PREGNANCY
    - Manufacturer advises avoid.

  - BREASTFEEDING
    - Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

  - PRESCRIBING AND DISPENSING INFORMATION
    - For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.

  - PROFESSION SPECIFIC INFORMATION
    - Dental practitioners’ formulary
      - Ephedrine nasal drops may be prescribed.

  - EXCEPTIONS TO LEGAL CATEGORY
    - Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

  - MEDICINAL FORMS
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

  - Nasal drops
    - Ephedrine hydrochloride (Non-proprietary)
      - Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops ▶ 10 ml ▶ £1.75 DT price = £1.75
      - Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops ▶ 10 ml ▶ £1.81 DT price = £1.81

Pseudoephedrine hydrochloride

• INDICATIONS AND DOSE
  - Congestion of mucus membranes of upper respiratory tract
    - BY MOUTH
      - Child 6–11 years: 30 mg 3–4 times a day
      - Child 12–17 years: 60 mg 3–4 times a day
      - Adult: 60 mg 3–4 times a day

  - Important Safety Information
    - MHRA/CHM Advice (March 2008 and February 2009): Over-the-counter cough and cold medicines for children
      - Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

    - CAUTIONS
      - Diabetes - heart disease - hypertension - hyperthyroidism - ischaemic heart disease (in adults) - prostatic hypertrophy (in adults) - raised intra-ocular pressure (in children) - susceptibility to angle-closure glaucoma (in adults)

    - INTERACTIONS ▶ Appendix 1 (sympathomimetics).
      - Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.
Xylometazoline hydrochloride

**DRUG ACTION** Xylometazoline is a sympathomimetic.

**INDICATIONS AND DOSE**

**Nasal congestion**

- **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
  - Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
  - Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

**IMPORTANT SAFETY INFORMATION**

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

**SIDE-EFFECTS**

- Cardiovascular effects - hallucinations in small children - headache - local irritation - nausea - rebound congestion - restlessness in small children - sleep disturbances in small children - tolerance with diminished effect (after excessive use) - transient visual disturbances

**CAUTIONS**

- Hallucinations in small children - Discontinue treatment if the hallucinations occur.

**PREGNANCY**

- Manufacturer advises avoid.

**BREAST FEEDING**

- Manufacturer advises caution—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Pseudoephedrine hydrochloride (Non-proprietary)
  - Pseudoephedrine hydrochloride 60 mg 60mg tablets | 12 tablet [P] no price available
  - Galpseud (Thornton & Ross Ltd)
    - Pseudoephedrine hydrochloride 60 mg Galpseud 60mg tablets | 24 tablet [PoSt] £2.25 | 100 tablet [PoSt] £5.42 DT price = £5.42
  - Sudafed Non-Drowsy Decongestant (pseudoephedrine) (McNeil Products Ltd)
    - Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet [P] £2.04

**Oral solution**

EXCIPIENTS: May contain Alcohol

- Pseudoephedrine hydrochloride (Non-proprietary)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml 30mg/5ml oral liquid sugar-free | 100 ml [P] £1.57 DT price = £1.57
  - Galpseud (Thornton & Ross Ltd)
    - Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus sugar-free | 2000 ml [PoSt] £14.00
  - Sudafed Non-Drowsy Decongestant (pseudoephedrine) (McNeil Products Ltd)
    - Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml [P] £1.92

**Spray**

- Otrivine (Novartis Consumer Health UK Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Congestion Relief 0.1% nasal spray | 10 ml | [GSL] £3.05 DT price = £2.18
  - Otrivine Adult Measured Dose Sinusitis spray | 10 ml | [GSL] £2.62 DT price = £2.18
  - Otrivine Allergy Relief 0.1% nasal spray | 10 ml | [GSL] £2.62 DT price = £2.18
  - Otrivine Adult nasal spray | 10 ml | [GSL] £2.18 DT price = £2.18
  - Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml | [GSL] £2.62 DT price = £2.18
  - Sudafed Congestion Relief (McNeil Products Ltd)
    - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Congestion Relief 0.1% nasal spray | 10 ml | [GSL] £3.25 DT price = £2.18
  - Sudafed Mucus Relief (McNeil Products Ltd)
    - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 15 ml | [GSL] £2.37
  - Sudafed Non-Drowsy Decongestant (xylometazoline) (McNeil Products Ltd)
    - Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml | [GSL] £2.38

**Nasal drops**

- Otrivine (Novartis Consumer Health UK Ltd)
  - Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml | [GSL] £2.18 DT price = £2.18
  - Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml | [P] £1.91 DT price = £1.91
2 Nasal infection

**ANTIBACTERIALS**  >  **AMINOGYCOSIDES**

### Chlorhexidine with neomycin

- **INDICATIONS AND DOSE**
  - **Eradication of nasal carriage of staphylococci**
    - **BY INTRanasAL ADMINISTRATION**
    - **Child:** Apply 4 times a day for 10 days
    - **Adult:** Apply 4 times a day for 10 days
  - **Preventing nasal carriage of staphylococci**
    - **BY INTRanasAL ADMINISTRATION**
    - **Child:** Apply twice daily
    - **Adult:** Apply twice daily

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)
    - **Nasapen (Alliance Pharmaceuticals Ltd)**
      - Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
      - Nasapen nasal cream | 15 gram | £2.24

### Mupirocin

- **INDICATIONS AND DOSE**
  - **BACTROBAN NASAL**
    - **FOR ERADICATION OF NASAL CARRIAGE OF STAPHYLOCOCCUS AUREUS (MRSA)**
      - **BY INTRanasAL ADMINISTRATION**
      - **Child:** Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
      - **Adult:** Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

### Other drugs used for Nasal inflammation, nasal polyps and rhinitis

- **Deslortatine**, p. 262
- **Fexofenadine hydrochloride**, p. 269

### AMINOSTEROLIDS  >  **AMINOGLYCOSIDES**

#### Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1052, neomycin sulfate p. 480.

- **INDICATIONS AND DOSE**
  - **Nasal infection**
  - **BY INTRanasAL ADMINISTRATION USING NASAL DROPS**
    - **Child:** Apply 2–3 drops 2–3 times a day, to be applied into each nostril
    - **Adult:** Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **LESS SUITABLE FOR PRESCRIBING**
  - Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ear/eye/nose drops solution**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
    - **Betnesol-N (Focus Pharmaceuticals Ltd)**
      - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml
      - Betnesol-N ear/eye/nose drops | 10 ml | £2.39

3 Nasal inflammation, nasal polyps and rhinitis

### Ipratropium bromide

24-Feb-2016

- **INDICATIONS AND DOSE**
  - **RHINORRHOEA ASSOCIATED WITH ALLERGIC AND NON-ALLERGIC RHINITIS**
  - **BY INTRanasAL ADMINISTRATION**
  - **Child 12–17 years:** 2 sprays 2–3 times a day, dose to be sprayed into each nostril
  - **Adult:** 2 sprays 2–3 times a day, dose to be sprayed into each nostril

- **DOSE EQUIVALENCE AND CONVERSION**
  - 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS**
  - Avoid spraying near eyes, bladder outflow obstruction, cystic fibrosis, prostatic hyperplasia (in adults), susceptibility to angle-closure glaucoma

- **SIDE-EFFECTS**
  - **Common or very common**
    - Epistaxis, nasal dryness, nasal irritation
  - **Uncommon**
    - Headache, nausea
  - **Very rare**
    - Gastro-intestinal motility disturbances, palpitations, urinary retention

- **PREGNANCY**
  - Manufacturer advises only use if potential benefit outweighs the risk.

- **BREAST FEEDING**
  - No information available—manufacturer advises only use if potential benefit outweighs risks.
Corticosteroids (intranasal)

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) - avoid in pulmonary tuberculosis - avoid in the presence of untreated nasal infections - patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

- **CAUTIONS, FURTHER INFORMATION**
  - Systemic absorption: Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

- **SIDE-EFFECTS**
  - Rare: Glaucoma - raised intra-ocular pressure
  - Very rare: Nasal septal perforation (usually following nasal surgery)

- **FREQUENCY NOT KNOWN**
  - Aggression (particularly in children) - anxiety (particularly in children) - bronchospasm - depression (particularly in children) - dryness - epistaxis - headache - hyperactivity (particularly in children) - hypersensitivity reactions - nasal irritation - nasal ulceration - sleep disturbances (particularly in children) - smell disturbances - taste disturbances - throat irritation

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Systemic absorption: Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

- **MONITORING REQUIREMENTS**
  - The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Betamethasone**

- **INDICATIONS AND DOSE**
  - **BETNESOL®**
    - Non-infected inflammatory conditions of nose
      - **BY INTRANASAL ADMINISTRATION**
        - Adult: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril
    - **VISTAMETHASONE®**
      - Non-infected inflammatory conditions of nose
        - **BY INTRANASAL ADMINISTRATION**
          - Adult: Apply 2–3 drops twice daily, dose to be applied into each nostril

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ear/eye/nose drops solution**
    - **EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate
      - **Betnesol** (Focus Pharmaceuticals Ltd)
        - Betamethasone sodium phosphate 1 mg per 1 ml
          - Betnesol 0.1% ear/eye/nose drops | 10 ml £2.32 DT price = £2.32
      - **Vistamethasone** (Martinvale Pharmaceuticals Ltd)
        - Betamethasone sodium phosphate 1 mg per 1 ml
          - Vistamethasone 0.1% ear/eye/nose drops | 5 ml £0.87 | 10 ml £0.99 DT price = £2.32

**Budesonide**

- **INDICATIONS AND DOSE**
  - **BY INTRANASAL ADMINISTRATION**
    - Child 12–17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved continued
Ear, nose and oropharynx  

Adult: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved.

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION**
  - Child 12-17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril.
  - Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril.

**RHINOCORT AQUA®**

**Rhinitis**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril.

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION**
  - Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril.

**EXCEPTIONS TO LEGAL CATEGORY** Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium sorbate.

- Budesonide (Non-proprietary)
  - Budesonide 100 microgram per 1 dose
    - Budeflam Aquanase 100 micrograms/dose nasal spray | 150 dose | no price available
    - Rhinocort 100 micrograms/dose nasal spray | 200 dose | no price available
  - Rhinocort (AstraZeneca UK Ltd)
  - Budesonide 64 microgram per 1 dose
    - Rhinocort Aqua 64 microgram nasal spray | 120 dose | £3.49 DT price = £4.77

---

**Fluticasone**

**04-Jan-2016**

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis and perennial rhinitis**

- **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
  - Child 4-11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily.
  - Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved.
  - Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved.

**Nasal polyps**

- **BY INTRANASAL ADMINISTRATION USING NASAL SPRAY**
  - Child 16-17 years: 200 micrograms 1-2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops).
  - Adult: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops).

**AVAMYS® SPRAY**

**Prophylaxis and treatment of allergic rhinitis**

- **BY INTRANASAL ADMINISTRATION**
  - Child 6-11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose.
  - Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose.
  - Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose.

**DOSE EQUIVALENCE AND CONVERSION**

- For Avamys® spray: 1 spray equivalent to 27.5 micrograms.

**SIDE-EFFECTS** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

**EXCEPTIONS TO LEGAL CATEGORY**

Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

1 Dry mouth

Treatment of dry mouth

Overview
Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Agural®, Biôtène Oralbalance® gel or Xerolin® can be used for any condition giving rise to a dry mouth. BioXtra®, Glandosane®, Saliva Orthana®, and Saliveze®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. Salivix® pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts). Pilocarpine tablets, below, are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren’s syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

LUBRICANTS

Artificial saliva products

● ARTIFICIAL SALIVA PRODUCTS
AS SALIVA ORTIANA® LOZENGES
Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

● INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy / Sicca syndrome

BY MOUTH
Adult: 5 mg twice daily; children and adults over 60 may be given 2.5 mg daily

AS SALIVA ORTIANA® SPRAY
Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified

● CONTRA-INDICATIONS
Acute iritis · chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) · uncontrolled asthma (increased bronchial secretions and increased airways resistance) · uncontrolled cardiorenal disease

● CAUTIONS
Asthma (avoid if uncontrolled) · biliary-tract disease · cardiovascular disease (avoid if uncontrolled) · cholelithiasis · chronic obstructive pulmonary disease (avoid if uncontrolled) · cognitive disturbances · maintain adequate fluid intake to avoid dehydration associated with excessive sweating · peptic ulceration · psychiatric disturbances · risk of increased renal colic · risk of increased urethral smooth muscle tone · susceptibility to angle-closure glaucoma

● INTERACTIONS
Appendix 1 (parasympathomimetics).

● SIDE-EFFECTS
Common or very common
Influenza-like symptoms · abdominal pain · asthenia · conjunctivitis · constipation · diarrhoea · dizziness · dyspepsia · flushing · headache · hypertension · increased urinary frequency · lacrimation · nausea · ocular pain · palpitation · pruritus · rash · rhinitis · sweating · visual disturbances · vomiting

Uncommon
Flatulence · urinary urgency

PREGNANCY
Avoid—smooth muscle stimulant; toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Reduce initial oral dose in moderate or severe cirrhosis.

RENAL IMPAIRMENT
Manufacturer advises caution with tablets.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

Manufacturer advises caution with

Salagen® (Merus Labs Luxembourg S.A.R.L.)
Pilocarpine hydrochloride 5 mg, 84 tablet pack £41.14 DT price = £41.14

Patient and carer advice

Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren’s syndrome

BY MOUTH
Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

Pilocarpine

INDICATIONS AND DOSE
Xerostomia following irradiation for head and neck cancer

BY MOUTH
Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

Dry mouth and dry eyes in Sjögren’s syndrome

BY MOUTH
Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

PARASYMPATHOMIMETICS

**Glandosane** Synthetic saliva spray citrus (Fresenius Kabi Ltd) 50 ml(ACBS) - NHS indicative price = £5.58

**Saliveze mouth spray** (Wyvern Medical Ltd) 50 ml (ACBS) - NHS indicative price = £3.50

**Salivix** Spray, Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium...
Ear, nose and oropharynx

Mouthwash is ideal and can be prepared either by dissolving must be used frequently and vigorously. A warm saline cause some local hyperaemia. However, to be effective, they mouthwashes which have a mechanical cleansing effect and Super Mouthwashes, gargles, and dentifrices preparations also contain local anaesthetics which relieve and cause sore tongue and sore lips. Some of these Lozenges and sprays preparations for oropharyngeal use Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays
There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes, gargles, and dentifrices
Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1066 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1065, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine, below, is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immuno compromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Chlorhexidine

**INDICATIONS AND DOSE**

**Symptomatic treatment of dry mouth**

- **By mouth**
  - Adult: 1 spray as required

**PROFESSION SPECIFIC INFORMATION**

**2 Oral hygiene**

**Mouthwashes and other preparations for oropharyngeal use**

**Lozenges and sprays**

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

**Mouthwashes, gargles, and dentifrices**

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1066 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1065, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine, below, is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immuno compromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

**ANTISEPTICS AND DISINFECTANTS > OTHER**

**Chlorhexidine**

**INDICATIONS AND DOSE**

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers**

- **By mouth using mouthwash**
  - Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
  - Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

**Denture stomatitis**

- **Mouthwash**
  - Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Oral hygiene and plaque inhibition and gingivitis**

- **By mouth using dental gel**
  - Child: Apply 1–2 times a day, to be brushed on the teeth
  - Adult: Apply 1–2 times a day, to be brushed on the teeth

**Oral candidiasis | Management of aphthous ulcers**

- **By mouth using dental gel**
  - Child: Apply 1–2 times a day, to affected areas
  - Adult: Apply 1–2 times a day, to affected areas

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers**

- **By mouth using oromucosal spray**
  - Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
  - Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

**Bladder irrigation and catheter patency solutions**

- **By intravesical instillation**
  - Adult: (consult product literature)

**UNLICENSED USE**

Corsodyl® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

**SIDE-EFFECTS**

Anaphylaxis | hypersensitivity | mucosal irritation | parotid gland swelling | reversible brown staining of composite restorations | reversible brown staining of silicate compositions | reversible brown staining of teeth | taste disturbance | tongue discolouration

**SIDE-EFFECTS, FURTHER INFORMATION**

If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

**PATIENT AND CARER ADVICE**

Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; Corsodyl® mouthwash may be prescribed as Chlorhexidine Mouthwash; Corsodyl® oral spray may be prescribed as Chlorhexidine Oral Spray.

**PEROXYL®**

**Oral hygiene**

- **BY MOUTH USING MOUTHWASH**
  - Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
  - Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

**SIDE-EFFECTS**

Hypertrophy of papillae of tongue on prolonged use

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

**HANDLING AND STORAGE**

Hydrogen peroxide bleaches fabric.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Hydrogen Peroxide Mouthwash may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**

- **Peroxyl®** (Colgate-Palmolive (UK) Ltd)
  - **Hydrogen peroxide 15 mg per 1 ml**
    - Peroxyl 1.5% mouthwash sugar-free | 300 mL **£2.94**

---

**Chlorhexidine with chlorobutanol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1064.

**INDICATIONS AND DOSE**

**Oral hygiene and plaque inhibition**

- **BY MOUTH USING MOUTHWASH**
  - Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided
  - Adult: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

**Denture disinfection**

- Adult: Soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of mouthwash may include mint.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines identified.

---

**Hexetidine**

**INDICATIONS AND DOSE**

**Oral hygiene**

- **BY MOUTH USING MOUTHWASH**
  - Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
  - Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

**SIDE-EFFECTS**

- Very rare Taste disturbance • transient anaesthesia
- Frequency not known Local irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**

- **Oraldene (McNeil Products Ltd)**
  - Hexetidine 1 mg per 1 ml
    - Oraldene Icemint 0.1% mouthwash sugar-free | 200 mL **£2.21 DT price = £2.21**
    - Oraldene 0.1% mouthwash peppermint sugar-free | 100 mL **£1.43 sugar-free | 200 mL **£2.21 DT price = £2.21**

Dental practitioners’ formulary

Hydrogen Peroxide Mouthwash may be prescribed.
**Sodium bicarbonate with sodium chloride**

- **INDICATIONS AND DOSE**
  - **Oral hygiene**
    - BY MOUTH USING MOUTHWASH
    - Adult: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION**
  For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Flavours of mouthwash may include peppermint.

- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners' formulary
  Compound sodium chloride mouthwash may be prescribed.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Flavors available from special-order manufacturers include: mouthwash

**Sodium chloride**

- **INDICATIONS AND DOSE**
  - **Oral hygiene**
    - BY MOUTH USING MOUTHWASH
    - Child: Rinse or gargle as required
    - Adult: Rinse or gargle as required

### 2.1 Dental caries

**Fluoride**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

**VITAMINS AND TRACE ELEMENTS**

**Sodium fluoride**

- **INDICATIONS AND DOSE**
  - **Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion**
    - BY MOUTH USING TABLETS
    - Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
    - Adult: 1 mg daily, doses expressed as fluoride ion (F⁻)
  - **Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3–0.7 parts per million) of fluoride ion**
    - BY MOUTH USING TABLETS
    - Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
    - Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)
    - Adult: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
  - **Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion**
    - Child 6 months–17 years: Supplements not advised
    - Adult: Supplements not advised
  - **Prophylaxis of dental caries for individuals who are caries prone or medically compromised**
    - BY MOUTH USING PASTE
    - Child 10–17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
    - Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush
  - **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**
    - **Prophylaxis of dental caries**
      - BY MOUTH USING PASTE
      - Child 10–17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
      - Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
EN-DE-KAY® FLUORINSE
Prophylaxis of dental carries for individuals who are caries prone or medically compromised
▶ BY MOUTH USING MOUTHWASH
▶ Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL.
DOSE EQUIVALENCE AND CONVERSION
▶ Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
▶ These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7).

● CONTRA-INDICATIONS Not for areas where drinking water is fluoridated
● SIDE-EFFECTS
▶ Uncommon Occasional white flecks on teeth with recommended doses
▶ Rare Yellowish-brown discoloration if recommended doses are exceeded
● DIRECTIONS FOR ADMINISTRATION
▶ With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
▶ With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.
COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE Brush teeth for 1 minute before spitting out.
COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE Brush teeth for 3 minutes before spitting out.
● PRESCRIBING AND DISPENSING INFORMATION Flavours of oral tablet formulations may include orange.
● PATIENT AND CARER ADVICE
Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.
COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.
COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.
● PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops. Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.
COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 0.619%.
COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 1.1%.
Dental information Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).
There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.
Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
▶ Endekay (Manx Healthcare Ltd)
Sodium fluoride 1.1 mg Endekay Fluotabs 3–6 Years 1.1 mg tablets | 200 tablet | £2.38 DT price = £2.38
Sodium fluoride 2.2 mg Endekay Fluotabs 6+ Years 2.2 mg tablets | 200 tablet | £2.38 DT price = £2.38
Chewable tablet
▶ Fluor-a-day (Dental Health Products Ltd)
Sodium fluoride 1.1 mg Fluor-a-day 1.1 mg chewable tablets sugar-free | 200 tablet | £2.79 DT price = £2.79
Sodium fluoride 2.2 mg Fluor-a-day 2.2 mg chewable tablets sugar-free | 200 tablet | £2.79 DT price = £2.79
Oral drops

Sodium fluoride 3.7 mg per 1 ml Endekay Fluodrops 0.37% drops paediatric sugar-free | 60 ml | £2.38 DT price = £2.38
Paste
▶ Colgate Duraphat (Colgate-Palmolive (UK) Ltd)
Fluoride (as Sodium fluoride) 2.8 mg per 1 gm Colgate Duraphat 2800 ppm fluoride toothpaste sugar-free | 75 ml | £3.26 DT price = £3.26
Fluoride (as Sodium fluoride) 5 mg per 1 gm Colgate Duraphat 5000 ppm fluoride toothpaste sugar-free | 51 gm | £6.50 DT price = £6.50
Mouthwash
▶ Sodium fluoride (Non-proprietary)
Sodium fluoride 500 microgram per 1 mL Sodium fluoride 0.05% mouthwash sugar-free sugar-free | 250 ml | £3.51 no price available
Sodium fluoride 5000 microgram per 1 mL Sodium fluoride 0.5% daily dentine rinse alcohol-free sugar-free | 250 ml | £3.51 no price available
Colgate FluorGard (Colgate-Palmolive (UK) Ltd)
Sodium fluoride 500 microgram per 1 mL Colgate FluorGard 0.05% daily dentine rinse alcohol free sugar-free | 400 mL | £2.99
Colgate FluorGard 0.05% daily dentine rinse sugar-free | 400 mL | £2.99
Endekay (Manx Healthcare Ltd)
Sodium fluoride 500 microgram per 1 mL Endekay 0.05% daily fluoride mouthrinse sugar-free | 250 mL | £1.51 DT price = £1.51
Sodium fluoride 2 mg per 1 mL Endekay 0.5% daily fluoride mouthrinse sugar-free | 200 mL | £1.14

3 Oral ulceration and inflammation

Ulceration and inflammation
Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy induced mucositis and myelosuppression under Cytotoxic drugs p. 797). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

Simple mouthwashes
A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.
Antiseptic mouthwashes
Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1064 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids
Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 1070 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions. Beclometasone dipropionate tablets p. 1052 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication]. Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1011), is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics
Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be prolonged. For this purpose lidocaine hydrochloride 5% ointment, below, or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Preparations on sale to the public: many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—this might lead to choking.

Avoid anaesthesia of the pharynx before meals—risk of choking. Some preparations, such as those containing lidocaine or flurbiprofen, are allowed to be used in the mouth without the need for dilution. If a preparation contains two or more active ingredients, it may not be possible to estimate their relative effect. Consult the product literature when using such preparations.

Mouthwashes and other preparations for oropharyngeal use p. 1064 for mouthwashes used for oral hygiene and plaque inhibition.

ANAESTHETICS, LOCAL

Lidocaine hydrochloride
(Lignocaine hydrochloride)

- **INDICATIONS AND DOSE**

  - **Dental practice**
    - BY BUCCAL ADMINISTRATION USING OINTMENT
    - Adult: Rub gently into dry gum
  - **Relief of pain in oral lesions**
    - TO THE LESION USING OINTMENT
    - Adult: Apply as required, rub sparingly and gently on affected areas

  **LARYNGOJET®**

  - **Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract**
    - TO MUCOUS MEMBRANES
    - Adult: Up to 20 doses
  - **Dental practice**
    - TO MUCOUS MEMBRANES
    - Adult: 1–5 doses
  - **Maxillary sinus puncture**
    - TO MUCOUS MEMBRANES
    - Adult: 3 doses
  - **Relief of pain in oral lesions**
    - TO THE LESION
    - Adult: Apply thinly to the ulcer using a cotton bud

- **UNLICENSED USE** Spray not licensed for the relief of pain in oral lesions.

- **CAUTIONS** Avoid anaesthesia of the pharynx before meals—risk of choking, can damage plastic cuffs of endotracheal tubes

- **INTERACTIONS** → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

- **SIDE-EFFECTS** A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

- **ALLERGY AND CROSS-SENSITIVITY**

  - Hypersensitivity and cross-sensitivity
  - Reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
**Renal Impairment**  Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

**Profession Specific Information**

- **Dental Practitioners’ Formulary**
  - Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%
  - **Xylocaine®** May be prescribed as lidocaine spray 10%

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

- **Spray**
  - Benzydamine hydrochloride (Non-proprietary)
  - Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% oromucosal spray sugar-free sugar-free | 30 ml | £4.64 DT price | £4.15
  - Difflam (Meda Pharmaceuticals Ltd)
  - Benzydamine hydrochloride 1.5 mg per 1 ml Difflam 0.15% spray sugar-free | 30 ml | £4.24 DT price | £4.15

- **Mouthwash**
  - Benzydamine hydrochloride (Non-proprietary)
  - Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% mouthwash sugar-free sugar-free | 300 ml | £7.14 DT price | £6.24
  - Difflam (Meda Pharmaceuticals Ltd)
  - Benzydamine hydrochloride 1.5 mg per 1 ml Difflam Oral Rinse 0.15% solution sugar-free | 300 ml | £6.50 DT price | £6.24
  - Difflam 0.15% Sore Throat Rinse sugar-free | 200 ml | £4.64

**Analgesics**  >  **Non-Steroidal Anti-Inflammatory Drugs**

**Benzydamine Hydrochloride**

- **Indications and Dose**
  - **Painful Inflammatory Conditions of Oropharynx**
    - **To the lesion using mouthwash**
      - Child 13-17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
      - Adult: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
    - **To the lesion using oromucosal spray**
      - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto the affected area
      - Adult: 4–8 sprays every 1.5–3 hours, to be administered onto the affected area

- **Side-effects**
  - Rare  Hypersensitivity reactions
  - Frequency not known  Occasional numbness or stinging

**Profession Specific Information**

- **Dental Practitioners’ Formulary**
  - Benzydamine oromucosal spray 0.15% may be prescribed. Benzydamine mouthwash may be prescribed as Benzydamine mouthwash 0.15%.

**Medicinal Forms**

**Flurbiprofen**

- **Indications and Dose**
  - Relief of sore throat
    - **By mouth using lozenges**
      - Child 12-17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day
      - Adult: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

- **Interactions**  >  Appendix 1 (NSAIDs).

- **Side-effects**  Mouth ulcers (move lozenge around mouth) - taste disturbance

- **Allergy and Cross-sensitivity**  Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**Corticosteroids**

**Beclometasone Dipropionate**  (Beclometasone dipropionate)

- **Indications and Dose**
  - Management of oral ulceration
    - **By buccal administration**
      - Adult: 50–100 micrograms twice daily, use inhaler device to spray dose on to the oral mucosa

- **Unlicensed Use**  Use of inhaler unlicensed in oral ulceration.

**Medicinal Forms**

For preparations, see inhaled beclometasone, p. 244
Betamethasone

- **INDICATIONS AND DOSE**

  **Oral ulceration**
  - Child 12-17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
  - Adult: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE**
  - In children Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

- **SIDE- EFFECTS**
  - Candidal infection • exacerbation of local infection

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for betamethasone soluble tablets (administration).

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Soluble tablet**
    - **CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)**
    - Betamethasone (Non-proprietary)
      - Betamethasone (as Betamethasone sodium phosphate)
      - 500 microgram Betamethasone 500microgram soluble tablets sugar free-sugar-free | 100 tablet  | £42.60 DT price = £42.57

Hydrocortisone

- **INDICATIONS AND DOSE**

  **Oral and perioral lesions**
  - Child 1 month–11 years: Only on medical advice
  - Child 12-17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
  - Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE**
  - Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).

- **SIDE-EFFECTS**
  - Untreated local infection

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Muco-adhesive buccal tablet**
    - Hydrocortisone (Non-proprietary)
      - Hydrocortisone (as Hydrocortisone sodium succinate)
      - 2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free-sugar-free | 20 tablet | £6.83 DT price = £6.29

Choline salicylate

- **INDICATIONS AND DOSE**

  **Mild oral and perioral lesions**
  - To the lesion
  - Child 16-17 years: Apply 0.5 inch, with gentle massage, not more often than every 3 hours
  - Adult: Apply 0.5 inch, with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS**
  - Children under 16 years

- **FURTHER INFORMATION**
  - **Reye’s syndrome**
    - The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
  - **CAUTIONS**
    - Frequent application, especially in children, may give rise to salicylate poisoning - not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

- **SIDE-EFFECTS**
  - Transient local burning sensation

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Choline Salicylate Dental Gel may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oromucosal gel**
    - Bonjela (Reckitt Benckiser Healthcare (UK) Ltd)
      - Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free | 15 gram GSP £3.07 DT price = £2.58
      - Bonjela Original gel sugar-free | 15 gram GSP £2.58 DT price = £2.58

Salicylic acid with rhubarb extract

- **INDICATIONS AND DOSE**

  **Mild oral and perioral lesions**
  - To the lesion
  - Child 16-17 years: Apply 3–4 times a day maximum duration 7 days
  - Adult: Apply 3–4 times a day maximum duration 7 days

- **CONTRA-INDICATIONS**
  - Children under 16 years

- **FURTHER INFORMATION**
  - **Reye’s syndrome**
    - The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
  - **CAUTIONS**
    - Frequent application, especially in children, may give rise to salicylate poisoning - not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures

- **SIDE-EFFECTS**
  - Temporary discoloration of oral mucosa - temporary discolouration of teeth - transient local burning sensation

- **PATIENT AND CARER ADVICE**
  - May cause temporary discoloration of teeth and oral mucosa.
**Suggested duration of treatment**

In severe infection, initial parenteral therapy with phenoxymethylpenicillin p. 495. If penicillin-allergic, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497).

**Antibacterial therapy for pericoronitis**

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 499, or alternatively, amoxicillin p. 506
- **Suggested duration of treatment** 3 days or until symptoms resolve.

**Antibacterial therapy for gingivitis: acute necrotising ulcerative**

Antibacterial required only if systemic features of infection.

- Metronidazole, or alternatively, amoxicillin
- **Suggested duration of treatment** 3 days or until symptoms resolve.

**Antibacterial therapy for periapical or periodontal abscess**

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or alternatively, metronidazole
- **Suggested duration of treatment** 5 days.

**Antibacterial therapy for periodontitis**

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or alternatively in adults and children over 12 years, doxycycline below

**Antibacterial therapy for throat infections**

Most throat infections are caused by viruses and many do not require antibiotic therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 505
  - In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 504, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 507). Avoid amoxicillin if possibility of glandular fever.
  - **Suggested duration of treatment** 10 days.
- If penicillin-allergic, clarithromycin p. 496 (or azithromycin p. 495 or erythromycin p. 497)
- **Suggested duration of treatment** 10 days

**Doxycycline**

- **INDICATIONS AND DOSE**
  - Treatment of recurrent aphthous ulceration
    - **BY MOUTH USING SOLUBLE TABLETS**
      - Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
      - Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
  - **UNLICENSED USE** Not licensed for use in children under 12 years. Not licensed for severe recurrent aphthous ulceration.
  - **CAUTIONS** Alcohol dependence
  - **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
  - **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · tinnitus
  - **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
  - **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary
    - Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**

- **CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 13
  - **Vibramycin-D (Pfizer Ltd)**
    - Doxycycline (as Doxycycline monohydrate) 100 mg
    - 100mg dispersible tablets sugar-free | 8 tablet £4.91 DT price = £4.91

**5 Oropharyngeal fungal infections**

**Oropharyngeal fungal infections**

**Overview**

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush**

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1073 or
Miconazole below may be needed. Fluconazole p. 548 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

**Acute erythematous candidiasis**
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

**Denture stomatitis**
Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance. Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

**Chronic hyperplastic candidiasis**
Chronic hyperplastic candidiasis (candidal leukoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overlay. Patients should avoid the use of tobacco.

**Angular cheilitis**
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to oro-facial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 527; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1107 can be used.

**Immunocompromised patients**
See advice on prevention of fungal infections in Immunocompromised patients under Antifungals, systemic use p. 544.

**Drugs used in oropharyngeal candidiasis**
Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 550 can be used for fluconazole-resistant infections. If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient’s partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

**ANTIFUNGALS ➔ IMIDAZOLE ANTIFUNGALS**

### Miconazole

- **INDICATIONS AND DOSE**
  - **PREVENTION AND TREATMENT OF ORAL CANDIDIASIS**
    - By mouth using oral gel
      - Child 2–17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
      - Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
  - **PREVENTION AND TREATMENT OF INTESTINAL CANDIDIASIS**
    - By mouth using oral gel
      - Child 4 months–17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
      - Adult: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

- **SIDE-EFFECTS**
  - Very rare
  - Common or very common

- **INTERACTIONS**
  - Appendix 1 (antifungals, imidazole).

- **CAUTIONS**
  - Avoid in acute porphyrias p. 930

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral gel may include orange.

- **UNLICENSED USE**
  - Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

- **CONTRA-INDICATIONS**
  - Infants with impaired swallowing reflex

- **PREGNANCY**
  - Manufacturer advises avoid if possible—toxicity at high doses in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT**
  - Avoid.

- **DIRECTIONS FOR ADMINISTRATION**
  - Oral gel should be held after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer miconazole oromucosal gel.

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - Miconazole Oromucosal Gel may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - 15-g tube of oral gel can be sold to the public.
6 Oropharyngeal viral infections

Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 1069. The use of chlorhexidine mouthwash p. 1064 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 585 is required. Valaciclovir p. 587 and famciclovir p. 587 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.
Chapter 13

Skin

Skin conditions, management

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk/specials.

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
<th>Lotions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face</td>
<td>15–30 g</td>
<td>100 ml</td>
</tr>
<tr>
<td>Both hands</td>
<td>25–50 g</td>
<td>200 ml</td>
</tr>
<tr>
<td>Scalp</td>
<td>50–100 g</td>
<td>200 ml</td>

<tr>
<td>Trunk</td>
<td>400 g</td>
<td>500 ml</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15–25 g</td>
<td>100 ml</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.
Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be regular—preferably daily—because emollients soak into fabric and can become a fire hazard.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone may be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream may be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

Barrier creams and ointments

- INDICATIONS AND DOSE
  - For use as a barrier preparation
    - TO THE SKIN
    - Child: (consult product literature)
    - Adult: (consult product literature)

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin.

- Conotrane (LEO Pharma)
  - Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram Conotrane cream | 100 gram $2.90 DT price = $0.88 |

DERMAL®
200 SHOWER EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis
- TO THE SKIN
  Child: To be applied to the skin or used as a soap substitute
  Adult: To be applied to the skin or used as a soap substitute

DERMAL®
600® BATH EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis
- TO THE SKIN
  Child 1-23 months: 5–10 mL/bath, not to be used undiluted
  Child 2-17 years: 15–30 mL/bath, not to be used undiluted
  Adult: Up to 30 mL/bath, not to be used undiluted

DERMAL®
WASH EMULSION

Dry and pruritic skin conditions including eczema and dermatitis
- TO THE SKIN
  Child: To be applied to the skin or used as a soap substitute
  Adult: To be applied to the skin or used as a soap substitute

EMULSIDERM®

Dry skin conditions including eczema and ichthyosis
- TO THE SKIN
  Child 1-23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
  Child 2-17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
  Adult: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

OLLATUM® PLUS

Topical treatment of eczema, including eczema at risk from infection
- TO THE SKIN
  Child 6-11 months: 1 mL/bath, not to be used undiluted
  Child 1-17 years: 1–2 capfuls/bath, not to be used undiluted
  Adult: 1–2 capfuls/bath, not to be used undiluted

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1075.

DIRECTIONS FOR ADMINISTRATION

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

PRESCRIBING AND DISPENSING INFORMATION

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

CAUTIONARY AND ADVISORY LABELS 15

Dry skin conditions including dermatitis and ichthyosis

- **TO THE SKIN**
  - Child 1 month–11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**Pruritus of the elderly**

- **TO THE SKIN**
  - Elderly: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**OILATUM**<sup>®</sup> JUNIOR BATH ADDITIVE

Dry skin conditions including dermatitis and ichthyosis

- **TO THE SKIN**
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse
  - Adult: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

**Pruritus of the elderly**

- **TO THE SKIN**
  - Elderly: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

**QV**<sup>®</sup> BATH OIL

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

- **TO THE SKIN**
  - Child 1–11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 1–7 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Adult: 10 mL/bath, alternatively, to be applied to wet skin and rinse

**QV**<sup>®</sup> GENTLE WASH

Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus

- **TO THE SKIN**
  - Child: To be used as a soap substitute
  - Adult: To be used as a soap substitute

**ZEROLATUM**<sup>®</sup>

Dry skin conditions | Dermatitis | Ichthyosis

- **TO THE SKIN**
  - Child 1 month–11 years: 5–10 mL/bath
  - Child 12–17 years: 15–20 mL/bath
  - Adult: 15–20 mL/bath

**Pruritus of the elderly**

- **TO THE SKIN**
  - Elderly: 15–20 mL/bath

**IMPORTANT SAFETY INFORMATION**

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

See Emollient and barrier preparations p. 1075.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Aqueous cream**
  - Phenoxyethanol 10 mg per 1 gram, Liquid paraffin 60 mg per 1 gram, Emulsifying wax 90 mg per 1 gram, White soft paraffin 150 mg per 1 gram, Purified water 690 mg per 1 gram

  **Aqueous cream | 100 gram (GSL) £1.81 DT price = £0.91 | 500 gram (GSL) £6.35 DT price = £4.55**

**Gel**

CAUTIONARY AND ADVISORY LABELS 15

There can be variation in the licensing of different medicines containing the same drug.
Emollients, urea-containing

Empollients

**DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

**INDICATIONS AND DOSE**

**AQUADRATÉ®**

**Dry, scaling, and itching skin**

- **TO THE SKIN**
- **Child:** Apply twice daily, to be applied thinly
- **Adult:** Apply twice daily

**BALNEUM® CREAM**

**Dry skin conditions**

- **TO THE SKIN**
- **Child:** Apply twice daily
- **Adult:** Apply twice daily

**CALMURID®**

**Dry, scaling, and itching skin**

- **TO THE SKIN**
- **Child:** Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- **Adult:** Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

**DERMATONICS ONCE HEEL BALM®**

**Dry skin on soles of feet**

- **TO THE SKIN**
- **Child:** 12–17 years: Apply once daily
- **Adult:** Apply once daily

**E4S® ITCH RELIEF CREAM**

**Dry, scaling, and itching skin**

- **TO THE SKIN**
- **Child:** Apply twice daily
- **Adult:** Apply twice daily

**EUROCRÉME® INTENSIVE CREAM**

**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

- **TO THE SKIN**
- **Child:** Apply twice daily, to be applied thinly and rubbed into area
- **Adult:** Apply twice daily, to be applied sparingly and rubbed into area

**EUROCRÉME® INTENSIVE LOTION**

**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

- **TO THE SKIN**
- **Child:** Apply twice daily, to be applied sparingly and rubbed into area
- **Adult:** Apply twice daily, to be applied sparingly and rubbed into area

**2 Infections of the skin**

**Skin infections**

**Antibacterial preparations**

**Cellulitis,** a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas,* a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of fusidic acid p. 1089; mupirocin p. 1086 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as fluclaxacin p. 511 (or clarithromycin p. 496 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be avoided on *leg ulcers* unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1084, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 479. *If large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1085), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1032, chlorhexidine p. 1064, or alcohol can be used; their use should be discussed with the local microbiologist.

Retapamulin p. 1086 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Tedizolid p. 528 is licensed for the treatment of acute bacterial skin and skin structure infections. Silver sulfadiazine p. 1085 is used in the treatment of infected burns.

**Antibacterial preparations also used systemically**

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.
An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1071 for further information on angular cheilitis.

Metronidazole p. 1084 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

**Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophytes**

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1087, econazolene nitrate p. 1087, ketoconazole p. 1087, and miconazole p. 1088 are all effective. Terbinafine cream p. 1089 is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1089 and the undecenoates. **Compound benzoic acid ointment** (Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete’s foot containing tolnaftate are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing relapse. Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1088 or tioconazole p. 1088 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor**

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

**Candidiasis**

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1073 is also effective for candidiasis but it is ineffective against dermatophytes. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 548; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

**Angular cheilitis**

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida.

**Compound topical preparations**

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 620) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin p. 1073 may be of use in the treatment of intertrigo associated with candida.

**Antiviral preparations**

Aciclovir cream p. 1092 is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles).

**Herpes labialis**

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lips and before vesicles appear. Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

**Parasiticidal preparations**

**Suitable quantities of parasiticidal preparations**

<td></td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for single application.

**Scabies**

Permethrin p. 1092 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 1092 can be used if permethrin is inappropriate.

Benzy1 benzoate p. 1091 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 557 (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone; further doses may be required.

**Application**

Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.
All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Intox**
The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1117 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine at night may also be useful.

**Head lice**
Dimeticone p. 1091 is effective against head lice (Pediculus humanus capitis). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorous insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

**Wet combing methods**
Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusines.hscni.net/services/2034.htm
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

**Crab lice**
Permethrin and malathion are used to eliminate crab lice (Pthirus pubis). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

### 2.1 Bacterial skin infections

**ANTIBACTERIALS ➔ AMINOGLYCOSIDES**

**Neomycin sulfate**

- **INDICATIONS AND DOSE**
  - **Bacterial skin infections**
    - **TO THE SKIN**
      - Child: Apply up to 3 times a day, for short-term use only
      - Adult: Apply up to 3 times a day, for short-term use only
    - **UNLICENSED USE**
      - In children Neomycin Cream BPC—no information available.
    - **CONTRA-INDICATIONS**
      - Neomatoses
    - **CAUTIONS**
      - If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, the elderly, and in those with renal impairment.
    - **INTERACTIONS**
      - Sensitisation (cross sensitivity with other aminoglycosides may occur)
    - **RENAI IMPAIRMENT**
      - Ototoxicity may be a hazard if large areas of skin are treated.
    - **LESS SUITABLE FOR PRESCRIBING**
      - Neomycin sulfate cream is less suitable for prescribing.

**AMINOGLYCOSIDES ➔ NITROIMIDAZOLE DERIVATIVES**

**Metronidazole**

- **DRUG ACTION**
  - Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

- **INDICATIONS AND DOSE**
  - **ACEA®**
    - Acute inflammatory exacerbation of rosacea
      - **TO THE SKIN**
        - Adult: Apply twice daily for 8 weeks, to be applied thinly
    - **ANABACT®**
      - Malodor fungating tumours and malodor gravitational and decubitus ulcers
        - **TO THE SKIN**
          - Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing
    - **METROGEL®**
      - Acute inflammatory exacerbation of rosacea
        - **TO THE SKIN**
          - Adult: Apply twice daily for 8–9 weeks, to be applied thinly
      - Malodor fungating tumours
        - **TO THE SKIN**
          - Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing
ANTIBACTERIALS

Acute exacerbation of rosacea
- TO THE SKIN
- Adult: Apply twice daily for up to 8 weeks, to be applied thinly

CAUTIONS
Avoid exposure to strong sunlight or UV light

SIDE-EFFECTS
Skin irritation

MEDICINAL FORMS
There can be variation in the licensing in the UK of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, gel

Cream
EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate, propylene glycol
- Rozex® Cream (Galderma (UK) Ltd)
- Metrogel® (Cambridge Healthcare Supplies Ltd)

Gel
EXCIPIENTS: May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol
- Acea® (Ferndale Pharmaceuticals Ltd)
- Anabact® (Cambridge Healthcare Supplies Ltd)
- Metrogel® (Galderma (UK) Ltd)
- Metrosa® (M & A Pharmachem Ltd)
- Rozex® (Galderma (UK) Ltd)

Antibacterials > Sulfonamides

Silver sulfadiazine

INDICATIONS AND DOSE
Prophylaxis and treatment of infection in burn wounds
- TO THE SKIN
  - Child: Apply daily, may be applied more frequently if very exudative
  - Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries
- TO THE SKIN
  - Child: Apply every 2–3 days, consult product literature for details
  - Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions
- TO THE SKIN
  - Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores
- TO THE SKIN
  - Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers
- TO THE SKIN
  - Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

UNLICENSED USE
- In children No age range specified by manufacturer.

CONTRA-INDICATIONS
Not recommended for neonates

CAUTIONS
- G6PD deficiency
- Severe blood and skin disorders: Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

INTERACTIONS
- Appendix 1 (sulfonamides)—if large amounts given. May inactivate enzymatic degrading agents—concomitant use may be inappropriate

SIDE-EFFECTS
Allergic reactions - argea (following treatment of large areas of skin or prolonged use) - burning - itching - leucopenia - rashes

POLYMYXINS

INDICATIONS AND DOSE
Bacterial skin infections
- TO THE SKIN
  - Adult: Apply twice daily, may be applied more frequently if required

CAUTIONS
If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.

SIDE-EFFECTS
Sensitisation

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

No licensed medicines identified.

Bacterial skin infections

Silver sulfadiazine

INDICATIONS AND DOSE
Prophylaxis and treatment of infection in burn wounds
- TO THE SKIN
  - Child: Apply daily, may be applied more frequently if very exudative
  - Adult: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries
- TO THE SKIN
  - Child: Apply every 2–3 days, consult product literature for details
  - Adult: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions
- TO THE SKIN
  - Adult: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores
- TO THE SKIN
  - Adult: Apply once daily or on alternate days

As an adjunct to short-term treatment of infection in leg ulcers
- TO THE SKIN
  - Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

UNLICENSED USE
- In children No age range specified by manufacturer.

CONTRA-INDICATIONS
Not recommended for neonates

CAUTIONS
G6PD deficiency
CAUTIONS, FURTHER INFORMATION
- Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

INTERACTIONS
- Appendix 1 (sulfonamides)—if large amounts given. May inactivate enzymatic degrading agents—concomitant use may be inappropriate

SIDE-EFFECTS
Allergic reactions - argyria (following treatment of large areas of skin or prolonged use) - burning - itching - leucopenia - rashes

SIDE-EFFECTS, FURTHER INFORMATION
- Severe blood and skin disorders: Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with sensitivity to sulfonamides.
Mupirocin ointment is licensed for use in the following conditions:

- **Skin infections**, particularly those caused by Gram-positive organisms (except pseudomonal infection)

**INDICATIONS AND DOSE**

- **To the skin**
  - **Child**: Apply up to 3 times a day for up to 10 days
  - **Adult**: Apply up to 3 times a day for up to 10 days

**SIDE-EFFECTS**
- Burning sensation, local reactions, pruritus, rash, urticaria

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**
- No information available.

**RENAI IMPAIRMENT**
- Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **Excipients**: May contain benzyl alcohol, cetyl alcohol, stearyl alcohol.
  - **Flamazine** (Smith & Nephew Healthcare Ltd)
    - **Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream**: 20 gram (PO) £2.91, 50 gram (PO) £3.85, 250 gram (PO) £10.32 2007 DT medicine price = £8.27

**Antibacterials**

### Bacitracin with polymyxin B

**Bacterial skin infections**
- **To the skin**
  - **Child**: Apply twice daily, can be applied more frequently if required
  - **Adult**: Apply twice daily, can be applied more frequently if required

**Unlicensed use**
- Licensed for use in children (age range not specified by manufacturer).

**Cautionary and Advisory Labels**

- **Nephrotoxicity**: Neutropenia
  - **Further information**: If large areas of skin are being treated nephrotoxicity and neutropenia may be a hazard, particularly in children with renal impairment.

**Side-effects**
- Contact sensitisation

**Renal impairment**
- Renal impairment increases the risk of nephrotoxicity and neutropenia.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

- **Ointment**
  - **Polyfax** (Teva UK Ltd)
    - Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram Polyfax ointment: 4 gram (PO) £1.26, 20 gram (PO) £4.62 2007 DT medicine price = £4.62

### Mupirocin

**Indications and dose**

- **Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)**
  - **To the skin**
    - **Child**: Apply up to 3 times a day for up to 10 days
    - **Adult**: Apply up to 3 times a day for up to 10 days

**Unlicensed use**
- Mupirocin ointment is licensed for use in children (age range not specified by manufacturer). Bactroban® cream not recommended for use in children under 1 year.

**Side-effects**
- Burning sensation, local reactions, pruritus, rash, urticaria

**Pregnancy**
- Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**Breast-feeding**
- No information available.

**Renal impairment**
- Manufacturer advises caution when mupirocin ointment in moderate or severe impairment because it contains macrogols (polyethylene glycol).

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **Excipients**: May contain benzyl alcohol, cetyl alcohol, stearyl alcohol.
    - **Mupirocin (as Mupirocin calcium) 20 mg per 1 gram**: Bactroban 2% cream: 15 gram (PO) £5.26 2007 DT medicine price = £5.26

- **Ointment**
  - **Mupirocin (Non-proprietary)**
    - Mupirocin 20 mg per 1 gram: Mupirocin 2% ointment: 15 gram (PO) £14.25 2007 DT medicine price = £14.25
  - **Bactroban** (GlaxoSmithKline Ltd)
    - Mupirocin 20 mg per 1 gram: Bactroban 2% ointment: 15 gram (PO) £5.26

**Retapamulin**

**Indications and dose**

- **Superficial bacterial skin infection caused by Staphylococcus aureus and Streptococcus pyogenes (if resistant to first line topical antibacterials)**
  - **To the skin**
    - **Child**
      - 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days
    - **Adult**
      - Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 100 cm² or lesion length 10 cm, review treatment if no response within 2–3 days

**Contra-indications**
- Contact with eyes, contact with mucous membranes

**Side-effects**
- Contact dermatitis, localised erythema, localised irritation, localised pain, pruritus

**National funding/access decisions**

- Scottish Medicines Consortium (SMC) Decisions

  - The Scottish Medicines Consortium has advised (March 2008) that Retapamulin (Altargo®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

- **Ointment**
  - **Excipients**: May contain Butylated hydroxytoluene
    - **Altargo** (GlaxoSmithKline Ltd)
      - Retapamulin 10 mg per 1 gram: Altargo 10mg/g ointment: 5 gram (PO) £7.89
2.2 Fungal skin infections

**ANTIFUNGALS** > **IMIDAZOLE ANTIFUNGALS**

### Clotrimazole

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - TO THE SKIN
    - Child: Apply 2–3 times a day
    - Adult: Apply 2–3 times a day
  - **Fungal nail infections**
    - By transungual application
    - Child: Apply once daily, applied under occlusive dressing
    - Adult: Apply once daily, applied under occlusive dressing

- **CAUTIONS** Contact with eyes and mucous membranes should be avoided
- **SIDE-EFFECTS** Local irritation - erythema - hypersensitivity reactions - itching - mild burning sensation
  - **SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Butylated hydroxyanisole, fragrances
    - **Econazole nitrate** 10 mg per 1 gram
      - Pevaryl (Janssen-Cilag Ltd)
      - Econazole nitrate 10 mg per 1 gram
      - Pevaryl 1% cream | 30 gram £3.71

### Econazolone nitrate

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - TO THE SKIN
    - Child: Apply twice daily
    - Adult: Apply twice daily
  - **Fungal nail infections**
    - BY TRANSGUNGAL APPLICATION
    - Child: Apply once daily, applied under occlusive dressing
    - Adult: Apply once daily, applied under occlusive dressing

- **CAUTIONS** Avoid contact with eyes - avoid contact with mucous membranes
- **SIDE-EFFECTS** Burning sensation - erythema - hypersensitivity reactions - itching - occasional local irritation
  - **SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if side-effects are severe.
- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

### Ketoconazole

- **INDICATIONS AND DOSE**
  - **Tinea pedis**
    - TO THE SKIN USING CREAM
      - Adult: Apply twice daily
  - **Fungal skin infection (not Tinea pedis)**
    - TO THE SKIN USING CREAM
      - Adult: Apply 1–2 times a day
  - **Treatment of seborrhoeic dermatitis and dandruff**
    - TO THE SKIN USING SHAMPOO
      - Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
  - **Prophylaxis of seborrhoeic dermatitis and dandruff**
    - TO THE SKIN USING SHAMPOO
      - Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
  - **Treatment of pityriasis versicolor**
    - TO THE SKIN USING SHAMPOO
      - Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
  - **Prophylaxis of pityriasis versicolor**
    - TO THE SKIN USING SHAMPOO
      - Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing
      - Adult: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CAUTIONS** Avoid contact with eyes - avoid contact with mucous membranes
- **INTERACTIONS** Appendix 1 (antifungals, imidazole).
- **SIDE-EFFECTS** Erythema - hypersensitivity reactions - itching - mild burning sensation - occasional local irritation
  - **SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if side-effects are severe.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NHS restrictions** Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed ‘SLS’.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - With topical use for Fungal skin infections in adults: A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.
  - With topical use for Seborrhoeic dermatitis and dandruff: Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.
**Miconazole**

**INDICATIONS AND DOSE**

**Fungal skin infections**

- **TO THE SKIN**
  - Child: Apply twice daily for 10 days, or until lesion is resolved
  - Adult: Apply twice daily for 10 days, or until lesion is resolved

**Fungal nail infections**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day
  - Adult: Apply 1–2 times a day

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Avoid in acute porphyrias and contact with eyes and mucous membranes.

**INTERACTIONS**

Appendix 1 (antifungals, imidazole).

**SIDE-EFFECTS**

- Frequency not known: Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation, rash

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.

**PREGNANCY**

Absorbed from the skin in small amounts; manufacturer advises caution.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**PROFESSIONAL INFORMATION**

Dental practitioners’ formulary

**NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions: Miconazole nitrate 2% powder may not be prescribable on the NHS.

**MEDITINAL FORMS**

- **Cream**
  - **EXCIPIENTS:** May contain cetostearyl alcohol, propylene glycol, and stearyl alcohol.
  - **Daktarin Gold**: (McNeil Products Ltd), Miconazole nitrate 20 mg per gram 15 gram, price £3.16
  - **Daktarin Intensive**: (McNeil Products Ltd), Miconazole nitrate 20 mg per gram 15 gram, price £3.16
  - **Nizoral**: (Janssen-Cilag Ltd), Miconazole nitrate 20 mg per gram 30 gram, price £4.24

- **Shampoo**
  - **EXCIPIENTS:** May contain imidurea.
  - **Ketoconazole (Non-proprietary)**
    - Miconazole nitrate 20 mg per gram 120 ml, price £2.74
  - **Dandranozol (Transdermal Ltd)**
    - Dandralo Anti-dandruff 2% shampoo, 60 ml, price £3.24
  - **Nizoral** (Janssen-Cilag Ltd, McNeil Products Ltd), Miconazole nitrate 20 mg per gram 120 ml, price £3.59

**Tioconazole**

**INDICATIONS AND DOSE**

**Fungal nail infections**

- **BY TRANSUNGUAL APPLICATION**
  - Child: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin
  - Adult: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Contact with eyes and mucous membranes should be avoided • use with caution if child likely to suck affected digits (in children)

**SIDE-EFFECTS**

- Burning sensation, dry skin, erythema, exfoliation, hypersensitivity reactions, itching, local oedema, nail discoloration, nail pain, occasional local irritation, periungual inflammation, rash

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.

**PREGNANCY**

Manufacturer advises caution.

**MEDITINAL FORMS**

- **Paint**
  - **Tioconazole** (Non-proprietary)
    - Tioconazole 283 mg per 1 ml, price £27.38
  - **Trosyl**: (Pfizer Ltd)
    - Tioconazole 283 mg per 1 ml, price £28.72

**ANTIFUNGALS > OTHER**

**Amorolfin**

**INDICATIONS AND DOSE**

**Fungal nail infections**

- **BY TRANSUNGUAL APPLICATION**
  - Child 12–17 years: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
  - Adult: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allowing to dry for approximately 3 minutes
### Terbinafine

**INDICATIONS AND DOSE**

**Tinea pedis**
- **To the skin using cream**
  - Adult: Apply 1–2 times a day for up to 1 week, to be applied thinly
  - By mouth using tablets
  - Adult: 250 mg once daily for 2–6 weeks

**Tinea corporis**
- **To the skin using cream**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - By mouth using tablets
  - Adult: 250 mg once daily for 4 weeks

**Tinea cruris**
- **To the skin using cream**
  - Adult: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
  - By mouth using tablets
  - Adult: 250 mg once daily for 2–4 weeks

**Dermatophyte infections of the nails**
- **By mouth using tablets**
  - Adult: 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

**Cutaneous candidiasis**/Pythiosis versicolor
- **To the skin using cream**
  - Adult: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

**CAUTIONS**
- With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) • psoriasis (risk of exacerbation)
- With topical use Contact with eyes and mucous membranes should be avoided

**INTERACTIONS**
- With oral use
  - Appendices 1 (terbinafine).

**SIDE-EFFECTS**
- Common or very common
  - With oral use Abdominal discomfort • anorexia • arthralgia • diarrhoea • dyspepsia • headache • myalgia • nausea • rash • urticaria
- Uncommon
  - With oral use Taste disturbance
- Rare
  - With oral use Cholestatic • dizziness • hepatitis • hypoaesthesia • jaundice • liver toxicity • malaise • paraesthesia
- Very rare
  - With oral use Alopecia • blood disorders • lupus erythematosus-like effect • neutropenia • photosensitivity • serious skin reactions • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis
- Frequency not known
  - With oral use Disturbances in smell • exacerbation of psoriasis • hearing disturbances • influenza-like symptoms • pancreatitis • rhabdomyolysis • vasculitis
- With topical use Erythema • hypersensitivity reactions • itching • mild burning sensation • occasional local irritation

**MEDICINAL FORMS**

- **Spray**

  **Spray cautionary and advisory labels 15**
  - Excipients: May contain Benzyl alcohol
  - Grisofulvin 10 mg per 1 gram Grisol AF 1% spray 20 ml £3.35

**Griseofulvin**

**INDICATIONS AND DOSE**

**Tinea pedis**
- **To the skin using cream**
  - Adult: Apply 400 micrograms once daily, apply to an area approximately 13 cm²; increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application

**CAUTIONS**
- Avoid contact with eyes and mucous membranes

**INTERACTIONS**
- Appendix 1 (griseofulvin).

**SIDE-EFFECTS**
- Burning sensation • erythema • hypersensitivity reactions • itching • occasional local irritation

**MEDICINAL FORMS**

- **Spray**

  **Spray cautionary and advisory labels 15**
  - Excipients: May contain Benzyl alcohol
  - Grisofulvin 10 mg per 1 gram Grisol AF 1% spray | 20 ml £3.35
**PREGNANCY**
- With topical use: Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.
- With oral use: Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**
- With topical use: Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's breast.
- With oral use: Avoid—present in milk.

**HEPATIC IMPAIRMENT**
- With oral use: Monitor hepatic function before treatment and then every 4–6 weeks during treatment—discontinue if abnormalities in liver function tests.

**RENAL IMPAIRMENT**
- With oral use: Use half normal dose if eGFR less than 30 mL/minute/1.73 m² and no suitable alternative available.

**SIDE-EFFECTS**
- Pain, burning and redness at the site of application, mild skin irritation and occasional local burning sensation.
- Hypersensitivity reactions—erythema, pruritus, local irritation.
- Pain and burning sensations may occur when broken skin is contacted.
- Treatment should be discontinued if side-effects are severe.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), Fragrances
  - **Undecenoic acid with zinc undecenoate (Non-proprietary)**
    - Undecenoic acid 50 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram Mycota cream | 25 gram GSL £2.01
  - **Powder**
    - **EXCIPIENTS**: May contain Fragrances
      - **Undecenoic acid with zinc undecenoate (Non-proprietary)**
        - Undecenoic acid 20 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram Mycota powder | 70 gram GSL £2.71

**OTHER**

**Chlorhexidine with nystatin**

**INDICATIONS AND DOSE**
- Skin infections due to **Candida** spp.
  - **TO THE SKIN**
    - Child: Apply 2–3 times a day, continuing for 7 days after lesions have healed
    - Adult: Apply 2–3 times a day, continuing for 7 days after lesions have healed

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **EXCIPIENTS**: May contain Benzyl alcohol, Cetostearyl alcohol (including cetyl and stearyl alcohol), polyols, and colourings.

**Antiseptics and Disinfectants**

**Undecenoates**

**Undecenoic acid with zinc undecenoate**

**INDICATIONS AND DOSE**
- Treatment of athletes foot
  - **TO THE SKIN**
    - Child: Apply twice daily, continue use for 7 days after lesions have healed
  - Adult: Apply once daily

**UNLICENSED USE**
- **Mycota** licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**
- Avoid broken skin—contact with eyes should be avoided—contact with mucous membranes should be avoided.

**SIDE-EFFECTS**
- Erythema, hypersensitivity reactions—itching, local irritation, mild burning sensation.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Treatment should be discontinued if side-effects are severe.
BENZOATES

Benzoic acid with salicylic acid

- **INDICATIONS AND DOSE**
  - **Ringworm** (tinea)
    - **TO THE SKIN**
    - Child: Apply twice daily
    - Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid broken or inflamed skin - avoid contact with eyes - avoid contact with mucous membranes

- **SIDE-EFFECTS** Erythema - hypersensitivity reactions - itching - mild burning sensation - occasional local irritation

- **PRESCRIBING AND DISPENSING INFORMATION** Benzoic Acid Ointment, Compound, BP has also been referred to as Whitfield’s ointment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

SALICYLIC ACID AND DERIVATIVES

Boric acid with salicylic acid and tannic acid

- **INDICATIONS AND DOSE**
  - **Fungal nail infection, particularly tinea**
    - **BY TRANSGENIC APPLICATION**
    - Child 5–17 years: Apply twice daily, and after washing
    - Adult: Apply twice daily, and after washing

- **CAUTIONS** Avoid broken or inflamed skin - contact with eyes and mucous membranes should be avoided - use with caution in children likely to suck affected digits

- **SIDE-EFFECTS** Burning sensation - erythema - hypersensitivity reactions - itching - occasional local irritation

- **PRESCRIBING AND DISPENSING INFORMATION** Treatment should be discontinued if side effects are severe.

- **PREGNANCY** Avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

2.3 Parasitic skin infections

PARASITICIDES

Benzyl benzoate

- **INDICATIONS AND DOSE**
  - **Scabies**
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
    - Adult: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

- **CAUTIONS** Avoid contact with eyes - children under 6 months, medical supervision required

- **SIDE-EFFECTS** Skin irritation

- **PATIENT AND CARER ADVICE** Patients should be told to keep hair away from fire and flames during treatment.

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Dimeticone

- **INDICATIONS AND DOSE**
  - **Head lice**
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)
    - Adult: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

- **CAUTIONS** Avoid contact with eyes - children under 6 months, medical supervision required

- **SIDE-EFFECTS** Skin irritation

- **PATIENT AND CARER ADVICE** Patients should be told to keep hair away from fire and flames during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- **Hedrin** (Thornton & Ross Ltd)
  - Dimeticone 40 mg per 1 gram
    - Hedrin 4% lotion | 50 ml £2.98
    - DT price = £2.98
    - 150 ml £6.92
    - DT price = £6.92

**Cutaneous spray solution**

- **Hedrin** (Thornton & Ross Ltd)
  - Dimeticone 40 mg per 1 gram
    - Hedrin 4% spray | 120 ml £7.13
Malathion

**INDICATIONS AND DOSE**

**Head lice**
- **TO THE SKIN**
  - Child: Apply once weekly for 2 doses, rub preparation over dry hair and scalp, allow to dry naturally, remove by washing after 12 hours
  - Adult: Apply once weekly for 2 doses, rub preparation over dry hair and scalp, allow to dry naturally, remove by washing after 12 hours

**Crab lice**
- **TO THE SKIN**
  - Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight
  - Adult: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight

**Scabies**
- **TO THE SKIN**
  - Child: Apply once weekly for 2 doses, apply preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated
  - Adult: Apply once weekly for 2 doses, apply preparation over whole body, wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

**UNLICENSED USE**
- Not licensed for use in children under 6 months except under medical supervision.
- **CAUTIONS**
  - Alcoholic lotions not recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice - avoid contact with eyes - children under 6 months, medical supervision required - do not use lotion more than once a week for 3 consecutive weeks - do not use on broken or secondarily infected skin
- **SIDE-EFFECTS**
  - Chemical burns - hypersensitivity reactions - skin irritation
- **PRESCRIBING AND DISPENSING INFORMATION**
  - For scabies, manufacturer recommends application to the body but not exclude head and neck. However, application should be extended to the scalp, neck, face, and ears. It is not recommended for head lice in children under 18 years. Creme Rinse (head lice) not licensed for use in children under 6 months except under medical supervision.

**PERMITRIN**

**INDICATIONS AND DOSE**

**Scabies**
- **TO THE SKIN**
  - Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream
  - Adult: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 8–12 hours. If hands are washed with soap within 8 hours of application, they should be treated again with cream

**UNLICENSED USE**
- Dermal Cream (scabies), not licensed for use in children under 2 months; not licensed for treatment of crab lice in children under 18 years. Creme Rinse (head lice) not licensed for use in children under 6 months except under medical supervision.
- **CAUTIONS**
  - Avoid contact with eyes - children aged 2 months–2 years, medical supervision required for dermal cream (scabies) - children under 6 months, medical supervision required for creme rinse (head lice) - do not use on broken or secondarily infected skin
- **SIDE-EFFECTS**
  - Rare: Oedema - rashes
  - Frequency not known: Erythema - pruritus - stinging
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears.
  - Larger patients may require up to two 30-g packs for adequate treatment.
- **LESS SUITABLE FOR PRESCRIBING**
  - Lyclear® Creme Rinse is less suitable for prescribing.

**MEDICINAL FORMS**

**Liquid**
- There can be variation in the licensing of different medicines containing the same drug.
  - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)
    - Lyclear (Omega Pharma Ltd)
      - Permethrin 10 mg per 1 gram Lyclear 1% creme rinse 59 ml £3.55 DT price = £3.55
      - 118 ml £6.46 DT price = £6.46

**Cream**
- CAUTIONARY AND ADVISORY LABELS 10 (Dermal cream only)
  - EXCIPIENTS: May contain Butylated hydroxytoluene, wool fat and related substances including lanolin
    - Permethrin (Non-proprietary)
      - Permethrin 50 mg per 1 gram Permethrin 5% cream 30 gram £7.46 DT price = £7.46
    - Lyclear (Omega Pharma Ltd)
      - Permethrin 50 mg per 1 gram Lyclear 5% dermal cream 30 gram £5.71 DT price = £7.46

2.4 Viral skin infections

**ANTIVIRALS**

**ACICLOVIR**

**INDICATIONS AND DOSE**

**Herpes simplex infection (local treatment)**
- **TO THE SKIN**
  - Child: Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack
  - Adult: Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack

**UNLICENSED USE**
- Cream licensed for use in children (age range not specified by manufacturer).
3.1 Eczema and psoriasis

Eczema

Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and disseoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires emollients applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1108) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See Wound management products and elasticated garments for details of elasticated visco stockinette tubular bandages and garments, and silk clothing.

Infection

Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema and requires treatment with topical or systemic antibacterial drugs. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antiminocular.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Interginginuous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug. Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

Management of other features of eczema

Lichenification, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol paste p. 1410 (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar and ichthammol can be useful in some cases of chronic eczema.

A non-sedating antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine can be used if itching causes sleep disturbance.

Exudative (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 1128 can be used in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1113 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 624 and coal tar) and combinations of mild corticosteroids with suitable antimicrobials are used.
Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1111 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 1112 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 766 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 765 or mycophenolate mofetil p. 773 are used for severe refractory eczema [unlicensed indication].

Methotrexate p. 817 can be used for severe psoriasis, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 898 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 973, adalimumab p. 969, and infliximab p. 976 inhibit the activity of tumour necrosis factor (TNF-α). They are used for severe plaque psoriasis either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 966 inhibits the activity of interleukin-17A. It is used for moderate to severe plaque psoriasis in patients who are candidates for systemic therapy. Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 967 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for severe plaque psoriasis that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab and ustekinumab are also licensed for psoriatic arthritis.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar p. 1109, dithranol p. 1108, and the retinoid tazarotene p. 1114. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

Facial, flexural and genital psoriasis can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcipotriol p. 1115 or tacalcitol p. 1115 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1115 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1111 or tacrolimus p. 1112 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar or morillonite BP is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess.

Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however,
irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless. A topical corticosteroid is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat systemic or very potent topical corticosteroids should be used only under specialist supervision. Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid or coal tar, or both.

Phototherapy
Phototherapy is available in specialist centres under the supervision of a dermatologist. Ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for guttate psoriasis. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including localised palmoplantar pustular psoriasis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment
Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 766 and methotrexate p. 817).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose. Acitretin p. 1112, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

Topical treatment
The vitamin D and analogues, calcipotriol p. 1115, calcitriol p. 1115, and tacalcitol p. 1115 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

Corticosteroids
Corticosteroids

Topical corticosteroids

Overview
Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.
When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

**Perioral lesions**

Hydrocortisone cream 1% p. 1102 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1107 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Choice of formulation**

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

**Absorption through the skin**

Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

<table>
<thead>
<tr>
<th>Area of body</th>
<th>Creams and Ointments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Face and neck</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both hands</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Scalp</td>
<td>15 to 30 g</td>
</tr>
<tr>
<td>Both arms</td>
<td>30 to 60 g</td>
</tr>
<tr>
<td>Both legs</td>
<td>100 g</td>
</tr>
<tr>
<td>Trunk</td>
<td>100 g</td>
</tr>
<tr>
<td>Groins and genitalia</td>
<td>15 to 30 g</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for an adult for a single daily application for 2 weeks

### Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1137 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

**Topical corticosteroid preparation potencies**

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

**Mild**

- Hydrocortisone 0.1–2.5%
- Dicortin
- Mildison
- Synalar 1 in 10 dilution

**Mild with antimicrobials**

- Canesten HC
- Daktacort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

**Moderate**

- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

**Moderate with antimicrobials**

- Trimovate

**Moderate with urea**

- Alphaderm

**Potent**

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Betamousse
- Betnovate
- Cultivate
- Diprosone
- Elocon
- Hydrocortisone butyrate
- Locoid
- Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

**Potent with antimicrobials**

- Aureocort
- Betamethasone and clioquinol
- Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

**Potent with salicylic acid**

- Diprosalic

**Very potent**

- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

**Very potent with antimicrobials**

- Clopobetasol with neomycin and nystatin
Use in children
Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Corticosteroids (topical)

- **CONTRA-INDICATIONS** Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · rosacea (in adults) · untreated bacterial, fungal or viral skin lesions
- **CAUTIONS** Avoid prolonged use (particularly on the face) · cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision (in children) · use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)
- **SIDE-EFFECTS**
  - Rare · Adrenal suppression · Cushing’s syndrome
  - Frequency not known · Acne · contact dermatitis · hypertrichosis · irreversible striae atrophicae · irreversible telangiectasia · mild depigmentation (may be reversible) · perioral dermatitis · side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · spread and worsening of untreated infection · thinning of the skin (may be restored over a period after stopping treatment but the original structure may never return) · worsening of acne · worsening of rosacea

**SIDE-EFFECTS, FURTHER INFORMATION**
In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

- **DIRECTIONS FOR ADMINISTRATION** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.
  - In children ‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

**PRESCRIBING AND DISPENSING INFORMATION** The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

Alclometasone dipropionate

- **INDICATIONS AND DOSE**
  - **Inflammatory skin disorders such as eczemas**
    - **TO THE SKIN**
      - Child: Apply 1–2 times a day, to be applied thinly
      - Adult: Apply 1–2 times a day, to be applied thinly

- **POTENCY**
  - Alclometasone dipropionate cream 0.05%: moderate

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of alclometasone dipropionate cream.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

- **Alclometasone dipropionate (Non-proprietary)**
  - Alclometasone dipropionate 500 microgram per 1 gram Boots Dermcare Eczema & Dermatitis Flare-Up 0.05% cream 15 gram no price available

Beclometasone dipropionate

(Beclomethasone dipropionate)

- **INDICATIONS AND DOSE**
  - **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**
    - **TO THE SKIN**
      - Child: Apply 1–2 times a day, thin layer to be applied
      - Adult: Apply 1–2 times a day, thin layer to be applied

- **POTENCY**
  - Beclometasone dipropionate cream and ointment 0.025%: potent.

- **UNLICENSED USE** Not licensed for use in children under 1 year.
Betamethasone

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
- **Child:** Apply 1–2 times a day, to be applied thinly
- **Adult:** Apply 1–2 times a day, to be applied thinly

**POTENCY**

Betamethasone valerate 0.025% cream and ointment: moderate.
Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent.
Betamethasone valerate 0.12% foam: potent.
Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

**UNLICENSED USE**

Betacap®, Betnovate® and Betnovate-RD® are not licensed for use in children under 1 year. Bettamousse® is not licensed for use in children under 6 years.

**CAUTIONS**

Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**PATIENT AND CARER ADVICE**

Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**

**Calcipotriol with betamethasone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcipotriol p. 1115, betamethasone above.

**INDICATIONS AND DOSE**

**DOVOBET® GEL**

**Scalp psoriasis**

- **TO THE SKIN**
  - Adult: Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcipotriol used together, maximum total calcipotriol 5 mg in any one week
Mild to moderate plaque psoriasis

- **TO THE SKIN**
- Adult: Apply once daily for 8 weeks; if necessary, treatment may be continued beyond 8 weeks or repeated, on the advice of a specialist, to apply maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

**DOVOBET® OINTMENT**

Stable plaque psoriasis

- **TO THE SKIN**
- Adult: Apply once daily for 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, to apply to a maximum 30% of body surface, when different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week; maximum 15 g per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

      - 40 cm £19.99
      - 80 cm £28.66

### Diflucortolone valerate

- **INDICATIONS AND DOSE**
  - **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.3% diflucortolone valerate)**
    - **Short-term treatment of severe exacerbations (using 0.3% diflucortolone valerate)**
      - **Psoriasis (using 0.3% diflucortolone valerate)**
        - **TO THE SKIN**
          - Child 4–17 years: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week
          - Adult: Apply 1–2 times a day for up to 2 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week
  - **Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (using 0.1% diflucortolone valerate)**
    - **Psoriasis (using 0.1% diflucortolone valerate)**
      - **TO THE SKIN**
        - Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
        - Adult: Apply 1–2 times a day for up to 4 weeks, to be applied thinly
  - **POTENCY**
    - Diflucortolone valerate 0.1% cream and ointment: potent.
    - Diflucortolone valerate 0.3% cream and ointment: very potent.

- **UNLICENSED USE** Nerisone® licensed for use in children (age range not specified by manufacturer); Nerisone Forte® not licensed for use in children under 4 years.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients or carers should be advised on application of diflucortolone valerate containing preparations.
**Fluocinolone acetonide**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas

Psoriasis

- **TO THE SKIN**
  - Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reduce strength as condition responds
  - Adult: Apply 1–2 times a day, to be applied thinly, reduce strength as condition responds

**POTENCY**

Fluocinolone acetonide 0.025% cream, gel, and ointment: potent.

Fluocinolone acetonide 0.00625% cream and ointment: moderate.

Fluocinolone acetonide 0.0025% cream: mild.

**UNLICENSED USE** Not licensed for use in children under 1 year.

**PRESCRIBING AND DISPENSING INFORMATION** Gel is useful for application to the scalp and other hairy areas.

**PATIENT AND CARER ADVICE** Patient counselling is advised for fluocinolone acetonide cream, gel and ointment (application).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polymers, propylene glycol

- **Synalar** (Derma UK Ltd)

  - Fluocinonide 500 microgram per 1 gram Metosyn 0.05% ointment | 25 gram £3.50 DT price = £3.50 | 100 gram £13.15 DT price = £13.15

**Flucortolone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**

Flucortolone hexanoate 0.25% cream and ointment; flucortolone pivalate 0.25% cream and flucortolone 0.25% ointment: moderate.

**PRESCRIBING AND DISPENSING INFORMATION** Patients or carers should be counselled on the application of flucortolone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

**Fluticasone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly
  - Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Fluticasone cream 0.05%: potent.

Fluticasone ointment 0.005%: potent.

**UNLICENSED USE** Not licensed for use in children under 3 months.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of fluticasone creams and ointments.
Hydrocortisone

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

► TO THE SKIN
► Child: Apply 1–2 times a day, to be applied thinly
► Adult: Apply 1–2 times a day, to be applied thinly

**NAPPY RASH**
► TO THE SKIN
► Child: Apply 1–2 times a day for no longer than 1 week, discontinue as soon as the inflammation subsides

**POTENCY**
Hydrocortisone cream and ointment 0.5 to 2.5%: mild

**PRESCRIBING AND DISPENSING INFORMATION**
When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although Dioderm® contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.

**PATIENT AND CARER ADVICE**
Patient counselling is advised for hydrocortisone cream and ointment (application).

**PROFESSIONAL INFORMATION**
Dental practitioners’ formulary
Hydrocortisone Cream 1% 15 g may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**
Over-the-counter hydrocortisone preparations Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**
CAUTIONARY AND ADVISORY LABELS 28
EXCipients: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), imidurea, propylene glycol

► Hydrocortisone (Non-proprietary)
Hydrocortisone 5 mg per 1 gram Hydrocortisone 0.5% cream | 15 gram (POT) | £3.00 DT price = £1.17 | 50 gram (POT) | £16.69–£49.90
Hydrocortisone 10 mg per 1 gram Hydrocortisone 1% cream | 15 gram (POT) | £1.64 DT price = £0.94 | 15 gram (POT) | £10.50 DT price = £0.94 | 30 gram (POT) | £23.48 DT price = £1.88 | 50 gram (POT) | £36.12 DT price = £3.13

Hydrocortisone butyrate

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

► TO THE SKIN
► Child 1–17 years: Apply 1–2 times a day, to be applied thinly
► Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**
Hydrocortisone butyrate 0.1% cream, liquid, and ointment: potent

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer hydrocortisone butyrate lotion, cream, ointment and scalp lotion.

Medicines for Children leaflet: Hydrocortisone (topical) for eczema [www.medicinesforchildren.org.uk/hydrocortisone-topical-for-eczema](http://www.medicinesforchildren.org.uk/hydrocortisone-topical-for-eczema)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Liquid**
CAUTIONARY AND ADVISORY LABELS 15(excluding Locoid Crelo topical emulsion), 28
EXCipients: May contain Butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol

► Locoid (LEO Pharma)
Hydrocortisone butyrate 1 mg per 1 ml Locoid 0.1% scalp lotion | 100 ml (POT) | £6.83 DT price = £6.83
Hydrocortisone with urea

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102.

**INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**
- **TO THE SKIN**
  - **Child:** To be applied thinly (consult product literature)
  - **Adult:** To be applied thinly (consult product literature)

**POTENCY**
Hydrocortisone 1% with urea cream: moderate

**PATIENT AND CARER ADVICE**
Patients or carers should be advised on application of hydrocortisone with urea cream.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, clotrimazole p. 758.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**POTENCY**
Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

**UNLICENSED USE** Lotriderm® not licensed for use in children under 12 years.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol
    - Lotriderm (Merck Sharp & Dohme Ltd)
      - Betamethasone dipropionate 640 microgram per 1 gram, Clotrimazole 10 mg per 1 gram
      - Lotriderm cream | 30 gram [PoD] £6.34 DT price = £6.34

Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, fusidic acid p. 527.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**POTENCY**
Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

**UNLICENSED USE** Fucibet® Lipid Cream is not licensed for use in children under 6 years.

**PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)
    - Fucibet Lipid Cream (LEO Pharma)
      - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram
      - Fucibet Lipid cream | 30 gram [PoD] £6.74 DT price = £6.38

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, neomycin sulfate p. 480.

**INDICATIONS AND DOSE**
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- TO THE SKIN USING OINTMENT, OR TO THE SKIN USING CREAM
- Child 2-17 years: Apply 1–2 times a day, to be applied thinly
- Adult: Apply 1–2 times a day, to be applied thinly

**POTENCY**
Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

**UNLICENSED USE** Betamethasone and neomycin preparations not licensed for use in children under 2 years.

**PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol
    - Betamethasone with neomycin (Non-proprietary)
      - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
        - Betamethasone valerate 0.1% / Neomycin 0.5% cream | 30 gram [PoD] £28.88 DT price = £17.74
        - 100 gram [PoD] £48.00 DT price = £59.14

- **Ointment**
  - CAUTIONARY AND ADVISORY LABELS 28
    - Betamethasone with neomycin (Non-proprietary)
      - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
        - Betamethasone valerate 0.1% / Neomycin 0.5% ointment | 30 gram [PoD] £28.88 DT price = £17.74
        - 100 gram [PoD] £48.00 DT price = £59.14

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1098, salicylic acid p. 1157.

**INDICATIONS AND DOSE**
DIPROSALIC® OINTMENT
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- TO THE SKIN
- Child: Apply 1–2 times a day, max. 60 g per week
- Adult: Apply 1–2 times a day, max. 60 g per week

**POTENCY**
For Dipsoralic® ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.
PATIENT AND CARER ADVICE
Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Liquid
CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Disodium edetate

Diprosalic (Merck Sharp & Dohme Ltd)
Betamethasone (as Betamethasone dipropionate)
500 microgram per 1 ml, Salicylic acid 20 mg per 1 ml
Diprosalic 0.05%/2% scalp application | 100 ml | £10.10 DT price = £10.10

Ointment
CAUTIONARY AND ADVISORY LABELS 28

Diprosalic (Merck Sharp & Dohme Ltd)
Betamethasone (as Betamethasone dipropionate)
500 microgram per 1 gram, Salicylic acid 30 mg per 1 gram
Diprosalic 0.05%/3% ointment | 30 gram | £3.18 DT price = £3.18

PATIENT AND CARER ADVICE
Stains clothing. Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.

POTENCY
For Diprosalic® scalp ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

Chlortetracycline with triamcinolone

INDICATIONS AND DOSE
Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)

TO THE SKIN

Adult: To be applied thinly (consult product literature)

POTENCY
Triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3% ointment: potent.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ointment
CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Wool fat and related substances including lanolin

Aureocort (AMCo)
Triamcinolone acetonide 1 mg per 1 gram, Chlortetracycline hydrochloride 30.9 mg per 1 gram
Aureocort ointment | 15 gram | £3.51

PATIENT AND CARER ADVICE
Stains clothing. Patients or carers should be counselled on the application of chlortetracycline with triamcinolone products.

Clobetasol propionate with neomycin sulfate and nystatin
The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 1099, neomycin sulfate p. 480.

INDICATIONS AND DOSE
Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection

TO THE SKIN

Adult: (consult product literature)

POTENCY
Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
CAUTIONARY AND ADVISORY LABELS 28

Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram
Clobetasol 500 microgram / Neomycin 5 mg / Nystatin 100,000 units/g cream | 30 gram | £64.00 DT price = £64.00

Ointment
CAUTIONARY AND ADVISORY LABELS 28

Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram
Clobetasol 500 microgram / Neomycin 5 mg / Nystatin 100,000 units/g ointment | 30 gram | £64.00 DT price = £64.00

PATIENT AND CARER ADVICE
Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

Clobetasone butyrate with nystatin and oxytetracycline
The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 1099, oxytetracycline p. 523.

INDICATIONS AND DOSE
Steroid-responsive dermatoses where candidal or bacterial infection is present

TO THE SKIN

Adult: (consult product literature)

POTENCY
Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
CAUTIONARY AND ADVISORY LABELS 28
EXCIPIENTS: May contain Cellosolve alcohol (including cetyl and stearyl alcohol), chlorocresol, sodium metabisulfite

Trimovate (GlaxoSmithKline UK Ltd)
Clobetasone butyrate 500 microgram per 1 gram, Nystatin 100000 unit per 1 gram, Oxytetracycline (as Oxytetracycline calcium) 30 mg per 1 gram
Trimovate cream | 30 gram | £3.29

PATIENT AND CARER ADVICE
Stains clothing.

Skin
Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorocinolone acetonide p. 1101.

- **INDICATIONS AND DOSE**
  - **Inflammatory skin disorders such as eczemas associated with infection**
    - **Psoriasis associated with infection**
    - **TO THE SKIN**
    - Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

- **PATIENT AND CARER ADVICE**: Patient counselling is advised for clioquinol with fluorocinolone acetonide cream and ointment (application). Ointment stains clothing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS: 28

    - Synalar C (Derma UK Ltd)
      - Clioquinol 30 mg per 1 gram, Fluocinolone acetonide 250 microgram per 1 gram
      - Synalar C ointment | 15 gram £2.66
  - **Ointment**
    - CAUTIONARY AND ADVISORY LABELS: 28
    - EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin
    - Synalar C (Derma UK Ltd)
      - Clioquinol 30 mg per 1 gram, Fluocinolone acetonide 250 microgram per 1 gram
      - Synalar C ointment | 15 gram £2.66

Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorocinolone acetonide p. 1101, neomycin sulfate p. 480.

- **INDICATIONS AND DOSE**
  - **Inflammatory skin disorders such as eczemas associated with infection**
  - **Psoriasis associated with infection**
  - **TO THE SKIN**
  - Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

- **PATIENT AND CARER ADVICE**: Patients or carers should be counselled on the application of fluorocinolone acetonide with neomycin preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS: 28
    - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol
    - Synalar N (Derma UK Ltd)
      - Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram
      - Synalar N cream | 30 gram £4.36

Hydrocortisone with benzalkonium chloride, dimeticon and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas associated with infection**
  - **Psoriasis associated with infection**
  - **TO THE SKIN**
  - Child: Apply 3 times a day until lesion has healed, to be applied thinly
  - Adult: Apply 3 times a day until lesion has healed, to be applied thinly

- **PATIENT AND CARER ADVICE**: Patients or carers should be advised on application of benzalkonium with dimeticon and hydrocortisone and nystatin preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS: 28
    - EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid
    - Timodine (Alliance Pharmaceuticals Ltd)
      - Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Nystatin 100000 unit per 1 gram
      - Timodine cream | 30 gram £3.37

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, chlorhexidine p. 1064.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas**
  - **Psoriasis associated with infection**
  - **TO THE SKIN**
  - Child: To be applied thinly (consult product literature)
  - Adult: To be applied thinly (consult product literature)

- **PATIENT AND CARER ADVICE**: Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.
Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, fusidic acid p. 527.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child: (consult product literature)
  - Adult: (consult product literature)

**POTENCY**

Hydrocortisone with fusidic acid cream: mild

Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, clotrimazole p. 758.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas (associated with fungal infection)

- **TO THE SKIN**
  - Child: (consult product literature)
  - Adult: (consult product literature)

**POTENCY**

Clotrimazole with hydrocortisone 1% cream: mild

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

**INTERACTIONS**

→ Appendix 1 (antifungals, imidazole).

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Miconazole and Hydrocortisone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - Canesten HC (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram | £2.42
  - Canesten Hydrocortisone (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten Hydrocortisone cream | 15 gram | £3.11

- **Ointment**
  - Daktacort (McNeil Products Ltd, Janssen-Cilag Ltd)

    - Daktacort 2%/1% cream | 30 gram | £2.49

Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, miconazole p. 760.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas associated with infections

- **TO THE SKIN**
  - Child: (consult product literature)
  - Adult: (consult product literature)

**POTENCY**

Hydrocortisone 1% with miconazole cream and ointment: mild

**INTERACTIONS**

→ Appendix 1 (antifungals, imidazole).

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Miconazole and Hydrocortisone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - Canesten HC (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten HC cream | 30 gram | £2.42
  - Canesten Hydrocortisone (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten Hydrocortisone cream | 15 gram | £3.11

- **Ointment**
  - Daktacort (Janssen-Cilag Ltd)
    - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram | £2.50
Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1102, oxytetracycline p. 523.

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- **TO THE SKIN**
  - Child 12-17 years: (consult product literature)
  - Adult: (consult product literature)

**POTENCY**

Hydrocortisone 1% with oxytetracycline ointment: mild.

**CONTRA-INDICATIONS**

- Children under 12 years
- Pregnancy: Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth.
- Breastfeeding: Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

**PATIENT AND CARER ADVICE**

Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- Terra-Cortril (Intrapharm Laboratories Ltd)
  - Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram [POM] £5.01 DT price = £5.01

**DERMATOLOGICAL DRUGS > ANTI-INFECTIVES**

Ichthammol

**INDICATIONS AND DOSE**

Chronic lichenified eczema

- **TO THE SKIN**
  - Child 1-7 years: Apply 1–3 times a day
  - Adult: Apply 1–3 times a day

**UNLICENSED USE**

- In children: No information available.

**SIDE-EFFECTS**

- Skin irritation

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

**Liquid**

- Ichthammol (Non-proprietary)
  - Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram [GSL] £11.42 DT price = £11.42 | 500 gram [GSL] £34.27

Ichthammol with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

**INDICATIONS AND DOSE**

Chronic lichenified eczema

- **TO THE SKIN**
  - Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Impregnated dressing**

- Ichthopaste (Smith & Nephew Healthcare Ltd)
  - Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.72

**Dermatological Drugs > Antracen Derivatives**

Dithranol

(Anthralin)

**INDICATIONS AND DOSE**

Subacute and chronic psoriasis

- **TO THE SKIN**
  - Adult: (consult product literature)

**DITHROCREAM®**

Subacute and chronic psoriasis

- **TO THE SKIN**
  - Adult: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL®**

Subacute and chronic psoriasis

- **TO THE SKIN**
  - Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

**CONTRA-INDICATIONS**

- Acute and postural psoriasis - hypersensitivity
- **CAUTIONS**
  - Avoid sensitive areas of skin - avoid use near eyes
- **SIDE-EFFECTS**
  - Local burning sensation - local irritation - stains hair - stains skin
- **PREGNANCY**
  - No adverse effects reported.
- **BREAST FEEDING**
  - No adverse effects reported.
- **DIRECTIONS FOR ADMINISTRATION**
  - When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.
- **MICANOL®**
  - At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

**PRESCRIBING AND DISPENSING INFORMATION**

Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

**PATIENT AND CARER ADVICE**

Dithranol can stain the skin, hair and fabrics.

**EXCEPTIONS TO LEGAL CATEGORY**

Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.
DERMATOLOGICAL DRUGS > TARS

 Coal tar

• INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema
► TO THE SKIN USING PASTE
► Child: Apply 1–3 times a day, start application with low-strength preparations
► Adult: Apply 1–3 times a day, start application with low-strength preparations
► TO THE SKIN
► Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child’s bath. Use Coal Tar Solution BP
► Adult: 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

ALPHOSYL 2 IN 1® SHAMPOO
Psoriasis | Seborrhoeic dermatitis | Scaling | Itching
► TO THE SKIN
► Adult: Apply every 2–3 days

Dandruff
► TO THE SKIN
► Adult: Apply 1–2 times a week as required

EXOREX® LOTION
Psoriasis
► TO THE SKIN
► Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

• CONTRA-INDICATIONS
Avoid broken or inflamed skin. Avoid eye area, avoid genital area, avoid mucosal areas, avoid rectal area, infection, sore, acute, or purulent psoriasis

• CAUTIONS
Application to face. Application to skin flexures

• SIDE-EFFECTS
Acne-like eruptions, photosensitivity, skin irritation

• PRESCRIBING AND DISPENSING INFORMATION
Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%. May stain skin, hair and fabric.

• PATIENT AND CARER ADVICE
May stain skin, hair and fabric.

Coal tar with arachis oil extract of coal tar, cade oil, light liquid paraffin and tar

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1108, salicylic acid p. 1137.

DERMATOLOGICAL DRUGS > MEDICINAL FORMS

Dithranol with salicylic acid and zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol p. 1108, salicylic acid p. 1137.

• INDICATIONS AND DOSE

Subacute and chronic psoriasis
► TO THE SKIN
► Adult: (consult local protocol)

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

MEDICINAL FORMS

Cream

CAUTIONARY AND ADVISORY LABELS

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

► Dithrocream (Dermal Laboratories Ltd)
Dithranol 10 mg per 1 gram Dithrocream 1% foam | 50 gram £5.77
Dithranol 5 mg per 1 gram Dithrocream 0.5% cream | 50 gram £4.66
Dithranol 10 mg per 1 gram Dithrocream HP 1% cream | 50 gram £6.42
Dithranol 20 mg per 1 gram Dithrocream 2% cream | 50 gram £6.77

► Micanol (Derma UK Ltd)
Dithranol 10 mg per 1 gram Micanol 1% cream | 50 gram £16.18
Dithranol 30 mg per 1 gram Micanol 3% cream | 50 gram £20.15

Combinations available: Coal tar with dithranol and salicylic acid, p. 1110

Coal tar

• INDICATIONS AND DOSE

Psoriasis | Eczema | Atopic dermatoses | Pruritic dermatoses
► TO THE SKIN
► Child: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child’s bath)
► Adult: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

EXOREX® LOTION
Psoriasis
► TO THE SKIN
► Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

### Coal tar with calamine

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

- **INDICATIONS AND DOSE**
  - Psoriasis | Chronic atopic eczema (occasionally)
  - **TO THE SKIN**
  - **Adult:** Apply 1–2 times a day

- **IMPORTANT SAFETY INFORMATION**

  MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

  See Emollient and barrier preparations p. 1075.

- **PRESCRIBING AND DISPENSING INFORMATION**

  When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  Forms available from special order manufacturers include: ointment.

### Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

- **INDICATIONS AND DOSE**
  - Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap
  - **TO THE SKIN USING SHAMPOO**
  - **Child:** Apply daily as required
  - **Adult:** Apply daily as required

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  Forms available from special order manufacturers include: scalp lotion.

  - Capasal (Dermal Laboratories Ltd)
  - Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram, Coconut oil 10 mg per 1 gram
  - Capasal Therapeutic shampoo | 250 ml £4.69

### Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, dithranol p. 1108, salicylic acid p. 1137.

- **INDICATIONS AND DOSE**
  - Subacute and chronic psoriasis
  - **TO THE SKIN**
  - **Child:** Apply up to twice daily
  - **Adult:** Apply up to twice daily

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment.

### Coal tar with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

- **INDICATIONS AND DOSE**
  - Psoriasis | Chronic atopic eczema
  - **TO THE SKIN USING OINTMENT**
  - **Adult:** Apply 1–2 times a day

- **IMPORTANT SAFETY INFORMATION**

  MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

  See Emollient and barrier preparations p. 1075.

- **PRESCRIBING AND DISPENSING INFORMATION**

  When prepared extemporaneously, the BP states Coal Tar and Salicylic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate ‘80’ 4 g, liquid paraffin 7.6 g.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment.
Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109, salicylic acid p. 1137.

- INDICATIONS AND DOSE

COCOIS® OINTMENT
Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

▷ INITIALLY TO THE SKIN USING SCALP OINTMENT
▷ Child 6-11 years: Medical supervision required
▷ Child 12-17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
▷ Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

SEBCO® OINTMENT
Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff

▷ TO THE SKIN USING SCALP OINTMENT
▷ Adult: Apply once weekly as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
▷ Child: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

IMMUNOSUPPRESSANTS ▶ CALCINEURIN INHIBITORS AND RELATED DRUGS

Pimecrolimus

- INDICATIONS AND DOSE

Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)

▷ TO THE SKIN
▷ Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)

▷ TO THE SKIN
▷ Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- UNLICENSED USE

Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.

- CONTRA-INDICATIONS

Application to malignant or potentially malignant skin lesions - application under occlusion - congenital epidermal barrier defects - contact with eyes - contact with mucous membranes - generalised erythoderma - immunodeficiency - inflammation at treatment site

- CAUTIONS

Alcohol consumption (risk of facial flushing and skin irritation) - avoid other topical treatments except emollients at treatment site - UV light (avoid excessive exposure to sunlight and sunlamps)

- INTERACTIONS

Concomitant use with drugs that cause immunosuppression is contra-indicated (may be prescribed in exceptional circumstances by specialists).

- SIDE-EFFECTS

▷ Common or very common Burning sensation, erythema, folliculitis, pruritus, skin infections
▷ Uncommon Herpes simplex, herpes zoster, impetigo, molluscum contagiosum
▷ Rare Dryness, local reactions including pain, oedema, papilloma, paraesthesia, peeling, skin discoloration, worsening of eczema
▷ Frequency not known Skin malignancy

- PREGNANCY

Manufacturer advises avoid; toxicity in animal studies following systemic administration.

- BREAST FEEDING

Manufacturer advises caution; ensure infant does not come in contact with treated areas.

Coal tar with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

- INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema

▷ TO THE SKIN
▷ Child: Apply 1–2 times a day
▷ Adult: Apply 1–2 times a day

- IMPORTANT SAFETY INFORMATION

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

See Emollient and barrier preparations p. 1075.

- PRESCRIBING AND DISPENSING INFORMATION

No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, stearch 38%, yellow soft paraffin 45%.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

Extract of coal tar with arachis oil

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1109.

- INDICATIONS AND DOSE

Scalp disorders | Psoriasis | Seborrhoea | Eczema | Pruritus | Dandruff

▷ TO THE SKIN
▷ Child: Apply 1–2 times a week, to the scalp
▷ Adult: Apply 1–2 times a week, to the scalp

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

- PREGNANCY

Manufacturer advises avoid; toxicity in animal studies following systemic administration.

- BREAST FEEDING

Manufacturer advises caution; ensure infant does not come in contact with treated areas.
Tacrolimus

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

### INDICATIONS AND DOSE

**Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)**

- **TO THE SKIN**
  - Adult: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

**Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)**

- **TO THE SKIN**
  - Adult: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)**

- **TO THE SKIN**
  - Adult: Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

### UNLICENSED USE

Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.

### CONTRA-INDICATIONS

Application to malignant or potentially malignant skin lesions; application under occlusion; avoid contact with eyes; avoid contact with mucous membranes; congenital epidermal barrier defects; generalised erythema; immunodeficiency; infection at treatment site

### CAUTIONS

UV light (avoid excessive exposure to sunlight and sunlamps)

### INTERACTIONS

Interactions do not generally apply to tacrolimus used topically.

Concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists).

Risk of facial flushing and skin irritation with alcohol consumption (does not apply to tacrolimus taken systemically).

### SIDE-EFFECTS

- **Common or very common** Application-site infections • application-site reactions • herpes simplex infection • irritation (at application-site) • Kaposi’s varicelliform eruption • pain at application-site • rash
- **Uncommon** Acne
- **Frequency not known** Cutaneous lymphoma • malignancies • other types of lymphomas • rosacea • skin malignancy

### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if history of hypersensitivity to macrolides.

### PREGNANCY

Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.

### BREAST FEEDING

Avoid—present in breast milk (following systemic administration).

### PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light including sunlight.

### NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

**Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**

Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

www.nice.org.uk/TA82

### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2010) that tacrolimus ointment (Protopic®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged over 2 years with moderate to severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 4, 11, 28

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

- **Elidel** (Meda Pharmaceuticals Ltd)
  - **Pimecrolimus 10 mg per 1 gram** Elidel 1% cream | 30 gram [Pom] £19.69 DT price = £19.69 | 60 gram [Pom] £37.41 DT price = £37.41 | 100 gram [Pom] £59.07 DT price = £59.07

### RETINOID AND RELATED DRUGS

**Acitretin**

**DRUG ACTION** Acitretin is a metabolite of etretinate.

- **INDICATIONS AND DOSE**

  **Severe extensive psoriasis resistant to other forms of therapy (under expert supervision)**

  - **Palmoplantar pustulosis psoriasis (under expert supervision)**

    - **Severe congenital ichthyosis (under expert supervision)**

    - **Severe Darier’s disease (keratosis follicularis) (under expert supervision)**

- **BY MOUTH**

  - Adult: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

### CONTRA-INDICATIONS

Hyperlipidaemia
CAUTIONS Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance - initial frequent blood glucose checks) - do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - investigate atypical musculoskeletal symptoms

INTERACTIONS → Appendix 1 (retinoids). Avoid concomitant use of keratolytics.

SIDE-EFFECTS
▶ Common or very common Abdominal pain - abnormal hair texture - alopecia (reversible on withdrawal) - arthralgia - brittle nails - dermatitis - diarrhoea - dryness and inflammation of mucous membranes - dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) - epidermal fragility - erythema - headache - myalgia - nausea - paronychia - peripheral oedema - pruritus - reversible increase in serum-cholesterol (with high doses) - reversible increase in serum-triglyceride concentrations (with high doses) - skin exfoliation - sticky skin - vomiting
▶ Uncommon Dizziness - hepatitis - photosensitivity - visual disturbances
▶ Rare Peripheral neuropathy
▶ Very rare Benign intracranial hypertension - bone pain - exostosis - nystagmus - ulcerative keratitis

FREQUENCY NOT KNOWN Drowsiness - dry skin - flushing - granulomatous lesions - impaired hearing - initial worsening of psoriasis - malaise - rectal haemorrhage - sweating - taste disturbance - tinnitus

CAUTIONARY AND ADVISORY LABELS

CONCEPTION AND CONTRACEPTION Effective contraception must be used. Pregnancy prevention In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

PREGNANCY Avoid - teratogenic.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Avoid in severe impairment - risk of further impairment.

RENAL IMPAIRMENT Avoid in severe impairment; increased risk of toxicity.

MONITORING REQUIREMENTS
▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
▶ Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.

PRESCRIBING AND DISPENSING INFORMATION
Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.

PATIENT AND CARER ADVICE A patient information leaflet should be provided. Patient advice required around conception and contraception Females of child-bearing potential must be advised on pregnancy prevention.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 10, 11, 21
▶ Acitretin (Non-proprietary)
Acitretin 10 mg Acitretin 10 mg capsules | 60 capsule £23.80 DT price = £23.80
Acitretin 25 mg Acitretin 25 mg capsules | 60 capsule £55.24 DT price = £55.24
▶ Neotigason (Teva UK Ltd)
Acitretin 10 mg Neotigason 10 mg capsules | 60 capsule £17.30 DT price = £23.80 (Hospital only)
Acitretin 25 mg Neotigason 25 mg capsules | 60 capsule £43.00 DT price = £55.24 (Hospital only)

ALITRETINOIN

INDICATIONS AND DOSE
Severe chronic hand eczema refractory to potent topical corticosteroids
▶ BY MOUTH
Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease
▶ BY MOUTH
Adult (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

CONTRA-INDICATIONS Hypervitaminosis A - uncontrolled hyperlipidaemia - uncontrolled hypothyroidism

CAUTIONS Avoid blood donation during treatment and for at least 1 month after stopping treatment - dry eye syndrome - history of depression

INTERACTIONS → Appendix 1 (retinoids).

SIDE-EFFECTS
▶ Common or very common Alopecia - anaemia - arthralgia - changes in thyroid function tests - cheilitis - conjunctivitis - dry eyes - dryness of lips - dryness of skin - erythema - eye irritation - flushing - headache - myalgia - raised creatine kinase - raised serum concentration of triglycerides and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre)
▶ Uncommon Ankylosing spondylitis - osteoarthritic eczema - blurred vision - catarexis - epistaxis - hyperostosis - pruritus
▶ Rare Benign intracranial hypertension - vasculitis
▶ Frequency not known Decreased tolerance to contact lenses - depression - impaired night vision - keratitis - mood changes - suicidal ideation
alitretinoin for the treatment of severe chronic hand eczema

1114 inflammatory skin conditions

side-effects, further information

- dry eyes: dry eyes may respond to lubricating eye ointment or tear replacement therapy.
- benign intracranial hypertension: discontinue treatment if severe headache, nausea, vomiting, papilloedema, or visual disturbances occur.

conception and contraception: effective contraception must be used.

Pregnancy: In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle.

Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.

Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

Pregnancy: Avoid—teratogenic.

breast feeding: Manufacturer advises avoid.

hepatic impairment: Manufacturer advises avoid—no information available.

renal impairment: Manufacturer advises avoid in severe impairment—no information available.

monitoring requirements: Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.

prescribing and dispensing information: Prescribing for women of child-bearing potential. Each prescription for alitretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.

Alitretinoin is teratogenic and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

PATIENT AND CARER ADVICE: A patient information leaflet should be provided.

Patient advice required around conception and contraception.

Women of child-bearing potential must be counselled on pregnancy prevention.

National funding/access decisions

NICE technology appraisals (TAs)

- Alitretinoin for the treatment of severe chronic hand eczema in adults (August 2009) NICE TA177

Alitretinoin is recommended for the treatment of severe chronic hand eczema that has not responded to potent topical corticosteroids. Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

www.nice.org.uk/TA177

medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS: 10, 11, 21

- Toc tin (Stiefel Laboratories (UK) Ltd)
  - Alitretinoin 10 mg: Toc tin 10mg capsules | 30 capsule £411.43
  - Alitretinoin 30 mg: Toc tin 30mg capsules | 30 capsule £411.43

Tazarotene

indications and dose

Mild to moderate plaque psoriasis affecting up to 10% of skin area

- TO THE SKIN
- Adult: Apply once daily usually for up to 12 weeks, apply in the evening

- CAUTIONS: Avoid contact with eczematous skin • avoid contact with eyes • avoid contact with face • avoid contact with hair-covered scalp • avoid contact with inflamed skin • avoid contact with intertriginous areas

- SIDE-EFFECTS

  - Rare: Dry or painful skin • stinging and inflammation
  - Frequency not known: Burning • contact dermatitis • desquamation • erythema • local irritation • non-specific rash • pruritus • worsening of psoriasis

- Local irritation: Local irritation is more common with higher concentration and may require discontinuation.

- CONCEPTION AND CONTRACEPTION: Effective contraception required (oral progestogen-only contraceptives not considered effective).

- PREGNANCY: Avoid.

- BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.

- PATIENT AND CARER ADVICE: Avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.

medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Gel

EXCIPIENTS: May contain Benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polyacrylates

- Zorac (Allergan Ltd)
  - Tazarotene 1 mg per 1 gram: Zorac 0.1% gel | 30 gram £14.80
  - Tazarotene 500 microgram per 1 gram: Zorac 0.05% gel | 30 gram £14.09

Salicylic acid and derivatives

Salicylic acid with zinc oxide

- INDICATIONS AND DOSE

Hyperkeratotic skin disorders

- TO THE SKIN
- Adult: Apply twice daily

- CAUTIONS: Avoid broken skin • avoid inflamed skin

- SIDE-EFFECTS: Excessive drying • irritation • sensitivity • systemic effects (after widespread use)
Calcipotriol
(1,25-Dihydroxycholecalciferol)

**INDICATIONS AND DOSE**
Mild to moderate plaque psoriasis

- **TO THE SKIN**
  - Adult: Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

**CONTRA-INDICATIONS**
Do not apply under occlusion - patients with calcium metabolism disorders

**CAUTIONS**
- Erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)

**SIDE-EFFECTS**
- **Common or very common** Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia
- **Rare** Facial dermatitis - perioral dermatitis
- **Frequency not known** Aggravation of psoriasis - dry skin - photosensitivity

**PREGNANCY**
Manufacturers advise avoid unless essential.

**BREAST FEEDING**
No information available.

**PATIENT AND CARER ADVICE**
Advice on application. Patient information leaflet for Dovonex ® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

**MEDITICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- **Siliks** (Gelderma (UK) Ltd)
  - Calcitriol 3 microgram per 1 gram Siliks ointment | 100 g | £18.06 DT price = £18.06

**Tacalcitol**

**INDICATIONS AND DOSE**
Plaque psoriasis

- **TO THE SKIN**
  - Adult: Apply once daily, preferably at bedtime, maximum 10 g in week

**CONTRA-INDICATIONS**
Calcium metabolism disorders

**CAUTIONS**
- Avoid eyes - erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia) - if used in conjunction with UV treatment

**SIDE-EFFECTS**
- **Common or very common** Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia

**Calcipotriol 50 microgram per 1 gram**
- **Dovonex** (LEO Pharma)
  - Calcipotriol 50 microgram per 1 gram Dovonex 50 micrograms/g ointment | 30 gram (Pos) £5.78 DT price = £5.78 | 60 gram (Pos) £11.56

Combinations available: Calcipotriol with betamethasone, p. 1098
Skin

ANTIMUSCARINICS

Glycopyrronium bromide
(Glycopyrrolate)

- INDICATIONS AND DOSE
  - Iontophoretic treatment of hyperhidrosis
    - TO THE SKIN
      - Adult: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

- CONTRA-INDICATIONS
  - Infections affecting the treatment site

- CONTRA-INDICATIONS, FURTHER INFORMATION
  - Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

- CAUTIONS
  - Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

- SIDE-EFFECTS
  - Tingling at administration site

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Liquid
    - EXCipients: May contain Disodium edetate, propylene glycol
      - Curadeterm (Almirall Ltd)
        - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curadeterm 4micrograms/g lotion | 30 ml (PoM) £12.73
      - Curadeterm (Almirall Ltd)
        - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curadeterm 4micrograms/g ointment | 30 gram (PoM) £13.40 DT price = £13.40 | 60 gram (£p) £23.14 DT price = £23.14 | 100 gram (£p) £30.86 DT price = £30.86

  - There can be variation in the licensing of different medicines containing the same drug.

  - Powder for solution for iontophoresis
    - Glycopyrronium bromide (Non-proprietary)
      - Glycopyrronium bromide 1 mg per 1 mg glycopyrronium bromide powder for solution for iontophoresis | 3 gram (£p) £131.92

DERMATOLOGICAL DRUGS

Aluminium chloride hexahydrate

- INDICATIONS AND DOSE
  - Hyperhidrosis affecting axillae, hands or feet
    - TO THE SKIN
      - Adult: Apply once daily, apply liquid formulation at night to dry skin, wash off the following morning, reduce frequency as condition improves—do not bathe immediately before use
    - Hyperhidrosis | Bromidrosis | Intertrigo | Prevention of tinea pedis and related conditions
      - TO THE SKIN
      - Adult: Apply powder to dry skin

- CAUTIONS
  - Avoid contact with eyes • avoid contact with mucous membranes • avoid use on broken or irritated skin • do not shave axillae or use depilatories within 12 hours of application

- SIDE-EFFECTS
  - Skin irritation

- PATIENT AND CARER ADVICE
  - Avoid contact with clothing.

- EXCEPTIONS TO LEGAL CATEGORY
  - A 30 mL pack of aluminium chloride hexahydrate 20% is on sale to the public.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Liquid
    - CAUTIONARY AND ADVISORY LABELS
      - Aluminium chloride hexahydrate (Non-proprietary)
        - Aluminium chloride 200 mg per 1 ml Aluminium chloride 20% solution | 60 ml (£p) no price available DT price = £2.51
        - Anhydrol (Dermal Laboratories Ltd)
          - Aluminium chloride 200 mg per 1 ml Anhydrol Forte 20% solution | 60 ml (£) £2.51 DT price = £2.51
        - Driclor (GlaxoSmithKline Consumer Healthcare)
          - Aluminium chloride 200 mg per 1 ml Driclor 20% solution | 75 ml (£) £3.01 DT price = £3.01

4 Perspiration

Antiperspirants

Overview
Aluminium chloride hexahydrate below is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide below as a hyperhidrosis. A 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. Botox® contains botulinum toxin type A complex p. 380 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

4.1 Hyperhidrosis

Other drugs used for Hyperhidrosis Botulinum toxin type A, p. 380

ANTIMUSCARINICS

Glycopyrronium bromide

17-Oct-2016
5 Pruritus

Topical local antipruritics

Overview
Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An emollient may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient.

Preparations containing crotamiton below are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective. A topical preparation containing doxepin 5% below is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation. Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 186 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

Other drugs used for Pruritus

ANTIPRURITICS

Calamine with zinc oxide

INDICATIONS AND DOSE
Pruritus
► TO THE SKIN
► Child: (consult product literature)
► Adult: (consult product literature)

CONTRA-INDICATIONS
Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

IMPORANT SAFETY INFORMATION
MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING
See Emollient and barrier preparations p. 1075.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Liquid
► Calamine with zinc oxide (Non-proprietary)
Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml Calamine lotion 200 ml GSI £0.81–£0.96 DT price = £0.96
► Cala Soothe (Ennogen Healthcare Ltd)
Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml Cala Soothe lotion 200 ml £19.50 DT price = £0.96

Cream

OTHER DRUGS

Crotamiton

INDICATIONS AND DOSE
Pruritus (including pruritus after scabies)
► TO THE SKIN
► Child 1 month–2 years (on doctor's advice only): Apply once daily
► Child 3–17 years: Apply 2–3 times a day
► Adult: Apply 2–3 times a day

CONTRA-INDICATIONS
Acute exudative dermatoses

CAUTIONS
Avoid use in buccal mucosa - avoid use near eyes - avoid use on broken skin - avoid use on very inflamed skin - use on doctor's advice for children under 3 years

PREGNANCY
Manufacturer advises avoid, especially during the first trimester — no information available.

BREAST FEEDING
No information available; avoid application to nipple area.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)
► Crotamiton (Non-proprietary)
Crotamiton 100 mg per 1 gram 30 gram GSI no price available DT price = £2.50
► Brains may include Eurax

Doxepin

INDICATIONS AND DOSE
Pruritus in eczema
► TO THE SKIN
► Child 12–17 years: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
► Adult: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

LESS SUITABLE FOR PRESCRIBING
Less suitable for prescribing.
MENTHOL AND DERIVATIVES

Levomenthol

- INDICATIONS AND DOSE
  - Pruritus
  - TO THE SKIN
  - Adult: Apply 1–2 times a day

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

Menthol and derivatives

6 Rosacea and acne

Rosacea and Acne

Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations. Systemic treatment with oral antibacterials is generally used for *moderate to severe acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindol (cyproterone acetate with ethinylestradiol) p. 1119; it is for women only.

Severe acne, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1122 for administration by mouth.

Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1121 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 1120 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1121 has antimicrobial and comedomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl...
peroxide or azelaic acid may eliminate any resistant propionibacteria);  
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

**Topical retinoids and related preparations for acne**

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1122 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

**Other topical preparations for acne**

Preparations containing aluminium oxide p. 1121 are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1125 is available for inflammatory acne.

**Oral preparations for acne**

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomедonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline p. 523 or tetracycline p. 523 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycline p. 521 and lymecycline p. 522 are alternatives to tetracycline.

Although minocycline p. 522 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 529 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

Co-cyprindiol (cyproterone acetate and ethinylestadiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is teratogenic and must not be given to women of child-bearing age unless they practise effective contraception (oral progesterone-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin p. 1122 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1125 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1121, topical ivermectin or to topical metronidazole p. 499. Alternatively oral administration of oxytetracycline p. 523 or tetracycline p. 523, or erythromycin p. 497, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 521 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

---

### 6.1 Acne

**ANTI-ANDROGENS**

#### Co-cyprindiol

- **INDICATIONS AND DOSE**
  - Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism
    - **BY MOUTH**
    - Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS**
  - Acute porphyria • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of pruritus • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable • history of haemolytic uraemic syndrome • migraine with aura • personal history of venous or arterial thrombosis • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease or for venous thromboembolism • systemic lupus erythematosus with (or unknown) antiphospholipid antibodies • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding
CAUTIONS  Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - gene mutations associated with breast cancer (e.g. BRCA 1).- history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia—seek specialist advice - inflammatory bowel disease including Crohn’s disease - migraine - personal or family history of hereditary haemorrhagic telangiectasia (increased risk of pancreatitis) - risk factors for venous thromboembolism - sickle-cell disease - undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

Venous thromboembolism  There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third-generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

INTERACTIONS  

Rarely gallstones - systemic lupus erythematosus

Very rare Photosensitivity

Frequency not known Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in libido - changes in lipids - metabolism - changes in vaginal discharge - chloasma - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hyperthermia - irritability - leg cramps - liver impairment - nausea - nervousness - reduced menstrual loss - skin reactions - thrombosis (more common when factor V Leiden present in blood groups A, B, and AB) - visual disturbances - vomiting. 'Spotting' in early cycles

PREGNANCY  Avoid — risk of feminisation of male fetus with cyproterone.

BREAST FEEDING  Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.

HEPATIC IMPAIRMENT  Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

PRESCRIBING AND DISPENSING INFORMATION  A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Cyproterone acetate 2 mg, Ethinylestradiol 35 microgram Teragezza 2000microgram/35microgram tablets | 63 tablet (Pom) £11.10 DT price = £5.70

ANTIBACTERIALS  LINCOSAMIDES

Clindamycin

INDICATIONS AND DOSE

DALACIN T® LOTION
Acne vulgaris

TO THE SKIN

Child: Apply twice daily, to be applied thinly

Adult: Apply twice daily, to be applied thinly

DALACIN T® SOLUTION
Acne vulgaris

TO THE SKIN

Child: Apply twice daily, to be applied thinly

Adult: Apply twice daily, to be applied thinly

ZINDACLIN® GEL
Acne vulgaris

TO THE SKIN

Child 12–17 years: Apply once daily, to be applied thinly

Adult: Apply once daily, to be applied thinly

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol

Dalacin T® (Pfizer Ltd)
Clindamycin (as Clindamycin phosphate) 10 mg per 1 ml Dalacin T® 1% topical lotion | 30 ml (Pom) £5.08 DT price = £5.08 | 60 ml (Pom) £10.16
Dalacin T® 1% topical solution | 30 ml (Pom) £4.34 DT price = £4.34 | 50 ml (Pom) £7.23

Gel

EXCIPIENTS: May contain Propylene glycol

Zindacin (Crawford Healthcare Ltd)
Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram Zindacin 1% gel | 30 gram (Pom) £6.66 DT price = £6.66

Combinations available: Benzoyl peroxide with clindamycin, p. 1121 - Tretinoin with clindamycin, p. 1124

ANTIBACTERIALS  MACROLIDES

Erythromycin with zinc acetate

INDICATIONS AND DOSE

Acne vulgaris

TO THE SKIN

Child: Apply twice daily

Adult: Apply twice daily

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

Zinryten (LEO Pharma)
Zinc acetate 12 mg per 1 ml, Erythromycin 40 mg per 1 ml Zinryten lotion | 30 ml (Pom) £7.71 DT price = £7.71 | 90 ml (Pom) £16.68 DT price = £16.68

Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide.
ANTISEPTICS AND DISINFECTANTS > PEROXIDES

Benzoyl peroxide

INDICATIONS AND DOSE

Acne vulgaris

➤ TO THE SKIN
➤ Child 12-17 years: Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations
➤ Adult: Apply 1–2 times a day, preferably apply after washing with soap and water, start treatment with lower-strength preparations

CAUTIONS
Avoid contact with broken skin - avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes - avoid excessive exposure to sunlight

SIDE-EFFECTS
Skin irritation

SIDE-EFFECTS, FURTHER INFORMATION
Skin irritation Reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency.

PATIENT AND CARER ADVICE
May bleach fabrics and hair.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, isopropyl palmitate, propylene glycol
➤ Brevoxyl® (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 40 mg per 1 gram Brevoxyl 4% cream | 50 gram | £4.13 DT price = £4.13

Gel
EXCIPIENTS: May contain Fragrances, propylene glycol
➤ Acnecide® (Salderna UK Ltd)
Benzoyl peroxide 50 mg per 1 gram Acnecide 5% gel | 30 gram | £5.44 DT price = £5.44 | 60 gram | £10.68 DT price = £10.68
Acnecide Wash 5% gel | 50 gram | £5.44 DT price = £5.44
➤ Panoxyl Aquegel® (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 100 mg per 1 gram Panoxyl 10 Aquegel | 40 gram | £2.13 DT price = £2.13
Panoxyl Acnegel® (GlaxoSmithKline Consumer Healthcare)
Benzoyl peroxide 100 mg per 1 gram Panoxyl 10 Acnegel | 40 gram | £1.99 DT price = £1.99
Combinations available: Adapalene with benzoyl peroxide, p. 1122

Benzoyl peroxide with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzoyl peroxide above, clindamycin p. 1120.

INDICATIONS AND DOSE

Acne vulgaris

➤ TO THE SKIN
➤ Child 12-17 years: Apply once daily, dose to be applied in the evening
➤ Adult: Apply once daily, dose to be applied in the evening

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Gel
EXCIPIENTS: May contain Disodium edetate
➤ Duac® (Stiefel Laboratories (UK) Ltd)
Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram, Benzoyl peroxide 75 mg per 1 gram Duac Once Daily gel (5% and 1%) | 30 gram | £6.60 DT price = £6.60 | 60 gram | £13.14 DT price = £13.14
➤ Brevoxyl® (GlaxoSmithKline Consumer Healthcare)
Clindamycin (as Clindamycin phosphate) 50 mg per 1 gram, Benzoyl peroxide 50 mg per 1 gram Duac Once Daily gel (5% and 1%) | 30 gram | £13.14 DT price = £13.14 | 60 gram | £26.28 DT price = £26.28

DERMATOLOGICAL DRUGS > ABRASIVE AGENTS

Aluminium oxide

INDICATIONS AND DOSE

Acne vulgaris

➤ TO THE SKIN
➤ Adult: Apply 1–3 times a day, to be used instead of soap

CONTRA-INDICATIONS
Superficial venules - telangiectasia

CAUTIONS
Avoid contact with eyes

SIDE-EFFECTS
Skin irritation (discontinue use temporarily)

PATIENT AND CARER ADVICE
Patients should discontinue use temporarily if skin becomes irritated.

LESS SUITABLE FOR PRESCRIBING
Less suitable for prescribing (not considered beneficial).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Paste
EXCIPIENTS: May contain Fragrances, n-(3-chlorallyl)hexaminium chloride (quaternium 15)
➤ Brasivol® (GlaxoSmithKline Consumer Healthcare)
Aluminium oxide 380 mg per 1 gram Brasivol Fine No.1 38% paste | 75 gram | £2.76

Acne vulgaris in patients with sensitive skin

➤ TO THE SKIN
➤ Child 12-17 years: Apply once daily for 7 days, then apply twice daily
➤ Adult: Apply once daily for 1 week, then apply twice daily

CAUTIONS
Avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes

SIDE-EFFECTS
➤ Common or very common Local irritation (reduce frequency or discontinue temporarily)
➤ Uncommon Skin discoloration
➤ Frequency not known Worsening of asthma
**Adapalene with benzoyl peroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene, above, benzoyl peroxide p. 1121.

- **INDICATIONS AND DOSE**
  - **Acne vulgaris**
    - TO THE SKIN
    - Child 9–17 years: Apply once daily, to be applied thinly in the evening
    - Adult: Apply once daily, to be applied thinly in the evening

- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The **Scottish Medicines Consortium** has advised (March 2014) that **Epiduo®** should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

**Isotretinoin**

- **INDICATIONS AND DOSE**
  - **Topical treatment of mild to moderate acne**
    - TO THE SKIN
    - Adult: Apply 1–2 times a day, to be applied thinly
  - **Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)**
    - BY MOUTH
    - Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

- **CONTRA-INDICATIONS**
  - With oral use Hyperlipidaemia · Hypervitaminosis A
  - With topical use Perioral dermatitis · Rosacea

- **CAUTIONS**
  - With oral use Avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression
CONCEPTION AND CONTRACEPTION

Pregnancy prevention

With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogens—only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

With topical use Females of child-bearing age must use effective contraception (oral progestogen—only contraceptives not considered effective).

PREGNANCY Contra-indicated in pregnancy (teratogenic).

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT

With oral use Avoid—further impairment may occur.

RENAL IMPAIRMENT

With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.

MONITORING REQUIREMENTS

With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

PREScribing AND DISPensing INFORMATION Isotretinoin is an isomer of tretinoin.

PATIENT AND CARER ADVICE

With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.

With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Tretinoin with clindamycin**
The properties listed below are those particular to the combination only. For the properties of the components please consider, clindamycin p. 1120.

**INDICATIONS AND DOSE**

**TO THE SKIN**

- Child: 1–2 times a day, apply thinly
- Adult: 1–2 times a day, apply thinly

**CONTRA-INDICATIONS** Perioral dermatitis - personal or familial history of non-melanoma skin cancer - rosacea

**CAUTIONS** Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck

**SIDE-EFFECTS** Blistering of skin - burning - crusting of skin - dry or peeling skin (discontinue if severe) - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging - temporary changes of skin pigmentation

**CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

7 Scalp and hair conditions

Scalp and hair conditions

Overview
Dandruff is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium below may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo p. 1087 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

Corticosteroid gels and lotions can also be used. Shampoos containing coal tar with salicylic acid p. 1110 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in seborrhoeic dermatitis of the scalp. Cradle cap in infants may be treated with coconut oil or olive oil applications followed by shampooing.

Hirsutism
Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1127, corticosteroids, anabolic steroids, androgens, danazol p. 678, and progesterones. Weight loss can reduce hirsutism in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Efollithine p. 1127 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical efollithine can be used as an adjunct to laser therapy for facial hirsutism in women. Co-cyprindiol p. 1119 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 631 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

Androgenetic alopecia
Finasteride p. 720 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued. Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

Other drugs used for Scalp and hair conditions
Coal tar, p. 1109 - Coal tar with lecithin, p. 1110 - Coal tar with salicylic acid and precipitated sulfur, p. 1111.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Shampoo
- Ceanel (Alliance Pharmaceuticals Ltd)
  Undecenoic acid 10 mg per 1 ml, Phenylethyl alcohol 75 mg per 1 ml, Cetrimide 100 mg per 1 ml
  Ceanel Concentrate shampoo | 150 ml | £3.40 | 500 ml | £9.80

Antiseptics and disinfectants

Benzalkonium chloride

Indications and dose
Seborrhoeic scalp conditions associated with dandruff and scaling
- To the skin
  - Child: Apply as required
  - Adult: Apply as required

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Shampoo
- Dermax (Dermal Laboratories Ltd)
  Benzalkonium chloride 5 mg per 1 ml
  Dermax Therapeutic 0.5% shampoo | 250 ml | £5.69

Vitamins and trace elements

Selenium

Indications and dose
Seborrhoeic dermatitis | Dandruff
- To the skin using shampoo
  - Child 5–17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
  - Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

Pityriasis versicolor
- To the skin using shampoo
  - Adult: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

Unlicensed use
The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

Patient and carer advice
Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Antiseptics and disinfectants

Cetrimide with undecenoic acid

Indications and dose
Scalp psoriasis | Seborrhoeic dermatitis | Dandruff
- To the skin
  - Child: Apply 3 times a week for 1 week, then apply twice weekly
  - Adult: Apply 3 times a week for 1 week, then apply twice weekly
7.1 Alopecia

Other drugs used for Alopecia

REGAINE® FOR MEN EXTRA STRENGTH FOAM

Androgenetic alopecia

TO THE SKIN

Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

REGAINE® FOR MEN EXTRA STRENGTH SOLUTION

Androgenetic alopecia

TO THE SKIN

Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

REGAINE® FOR WOMEN REGULAR STRENGTH

Androgenetic alopecia

TO THE SKIN

Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Avoid contact with broken, infected, shaved, or inflamed skin • avoid contact with eyes • avoid contact with mouth • avoid contact with mucous membranes • avoid inhalation of spray mist • avoid occlusive dressings

CAUTIONS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

INTERACTIONS Caution—avoid topical drugs which enhance absorption.

SIDE-EFFECTS

Common or very common Headache • local irritation

Uncommon Changes in hair colour or texture (discontinue if increased hair loss persists for more than 2 weeks) • hypotension

SIDE-EFFECTS, FURTHER INFORMATION

When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

PREGNANCY Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

BREAST FEEDING Present in milk but not known to be harmful.

PATIENT AND CARER ADVICE Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Foam

CAUTIONARY AND ADVISORY LABELS

EXCIPIENTS: May contain Propylene glycol

REGAINE (McNeil Products Ltd)

Minoxidil 20 mg per 1 mL Regaine for Women Regular Strength 2% solution | 60 mL | £14.16

Minoxidil 50 mg per 1 mL Regaine for Men Extra Strength 5% solution | 180 mL | £39.71

7.2 Hirsutism

Other drugs used for Hirsutism

CO-CYPRINDIOL, p. 1119

ANTIPROTOZOAIS

Efornithine

Drug Action

An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

INDICATIONS AND DOSE

Adjunct to laser therapy for facial hirsutism in women

TO THE SKIN

Adult: Apply twice daily, to be applied thinly, discontinue if no improvement after 4 months of treatment

SIDE-EFFECTS

Common or very common Acne • burning at application site • rash • stinging at application site

Uncommon Abnormal hair growth • abnormal hair texture

PREGNANCY Toxicity in animal studies—manufacturer advises avoid.

BREAST FEEDING Manufacturer advises avoid—no information available.

PATIENT AND CARER ADVICE

Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after efornithine, do not wash treated area for 4 hours after application.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2005) that efornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

VANIQA (Almirall Ltd)

Efornithine (as Efornithine monohydrate chloride) 115 mg per 1 gram Vaniqa 11.5% cream | 60 gram | £56.87

8 Skin cleansers, antiseptics and desloughing agents

Skin cleansers, antiseptics and desloughing agents

Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or...
emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1129 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1130, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10000 below, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing.

For desloughing wounds or ulcers, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10 000 below, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by absorption and perilesional skin is easily sensitised.

For desloughing wounds or ulcers, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

**VIDENE® SURGICAL SCRUB®**

**Skin disinfection**
- TO THE SKIN
- Child: Use as a pre-operative scrub for hand and skin disinfection
- Adult: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE® TINCTURE**

**Skin disinfection**
- TO THE SKIN
- Adult: Apply undiluted in pre-operative skin disinfection

**CONTRA-INDICATIONS** Avoid regular use in patients with thyroid disorders (in adults) - concomitant use of lithium - corrected gestational age under 32 weeks - infants body weight under 1.5 kg - regular use in neonates

**CAUTIONS** Broken skin - large open wounds

**SIDE-EFFECTS** Rare Sensitivity

**PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

**BREAST FEEDING** Avoid regular or excessive use.

**RENAL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.

**EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

- **Liquid**
  - CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)
  - **Videne** (Ecolab Healthcare Division)
    - Povidone-Iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution | 500 ml | £7.30
    - Povidone-Iodine 100 mg per 1 ml Videne 10% antiseptic solution | 500 ml | £7.30
  - **Spray**
    - Betadine (Aspire Pharma Ltd)
      - Povidone-Iodine 25 mg per 1 gram Betadine 2.5% dry powder spray | 100 ml | £9.95 DT price = £9.95

**ANTISEPTICS AND DESLoughING AGENTS > OTHER**

**Chlorhexidine**

- **INDICATIONS AND DOSE**
  - **CX ANTISEPTIC DUSTING POWDER**
    - For skin disinfection
      - TO THE SKIN
      - Adult: (consult product literature)
  - **CEPTON® LOTION**
    - For skin disinfection in acne
      - TO THE SKIN
      - Child: (consult product literature)
      - Adult: (consult product literature)

**CEPTON® SKIN WASH**

For use as skin wash in acne
- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**HIBITANE PLUS 5% CONCENTRATE SOLUTION**

General and pre-operative skin disinfection
- TO THE SKIN
- Child: (consult product literature)

**HIBISCRUB®**

Pre-operative hand and skin disinfection | General hand and skin disinfection
- TO THE SKIN
- Child: Use as alternative to soap (consult product literature)
- Adult: Use as alternative to soap (consult product literature)

**HIBITANE OBSTETRIC®**

For use in obstetrics and gynaecology as an antiseptic and lubricant
- TO THE SKIN
- Adult: To be applied to skin around vulva and perineum and to hands of midwife or doctor

**HIBI® LIQUID HAND RUB+**

Hand and skin disinfection
- TO THE SKIN
- Child: To be used undiluted (consult product literature)
- Adult: To be used undiluted (consult product literature)

**HYDREX® SOLUTION**

For pre-operative skin disinfection
- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**HYDREX® SURGICAL SCRUB**

For pre-operative hand and skin disinfection | General hand disinfection
- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**UNISEPT®**

For cleansing and disinfecting wounds and burns and swabbing in obstetrics
- TO THE SKIN
- Child: (consult product literature)
- Adult: (consult product literature)

**CONTRA-INDICATIONS** Alcoholic solutions not suitable before diathermy - not for use in body cavities

**CAUTIONS** Avoid contact with brain - avoid contact with eyes - avoid contact with meninges - avoid contact with middle ear

**SIDE-EFFECTS** Sensitivity

**DIRECTIONS FOR ADMINISTRATION**

**HIBITANE PLUS 5% CONCENTRATE SOLUTION** For pre-operative skin preparation, dilute 1 in 10 (0.5%) with alcohol 70%. For general skin disinfection, dilute 1 in 100 (0.05%) with water. Alcoholic solutions not suitable for use before diathermy or on neonatal skin.
Chlorhexidine with cetrimide

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1129.

### Indications and dose

**Skin disinfection such as wound cleansing and obstetrics**

- **To the skin**
- **Child:** To be used undiluted
- **Adult:** To be used undiluted

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- Savlon disinfectant (Novartis Consumer Health UK Ltd)
  - Chlorhexidine gluconate 3 mg per 1 ml, Cetrime 30 mg per 1 ml
  - Savlon disinfectant liquid | 500 ml £1.32
- Sterets Tisept (Molnlycke Health Care Ltd)
  - Cetrime 1.5 mg per 1 ml, Chlorhexidine gluconate 150 microgram per 1 ml
  - Sterets Tisept solution 25ml sachets | 25 sachet £0.53
  - Sterets Tisept solution 100ml sachets | 10 sachet £6.85

**Cream**

- Chlorhexidine with cetrimide (Non-proprietary)
  - Chlorhexidine gluconate 1 mg per 1 gram, Cetrime 5 mg per 1 gram
  - Savlon antiseptic cream | 15 gram £0.91 | 60 gram £1.19 | 100 gram £2.78

**Irrigation solution**

- Chlorhexidine with cetrimide (Non-proprietary)
  - Cetrime 1.5 mg per 1 ml, Chlorhexidine acetate 150 microgram per 1 ml
  - Chlorhexidine acetate 0.015% / Cetrime 0.15% irrigation solution 1 litre bottles | 1 bottle no price available

Diethyl phthalate with methyl salicylate

### Indications and dose

**Skin preparation before injection**

- **To the skin**
- **Child:** Apply to the area to be disinfected

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- **Diethyl phthalate with methyl salicylate (Non-proprietary)**
  - Methyl salicylate 5 ml per 1 litre, Diethyl phthalate 20 ml per 1 litre
  - Castor oil 25 ml per 1 litre, Industrial methylated spirit 950 ml per 1 litre
  - Surgical spirit | 200 ml G55 £0.63 | 500 ml G55 £1.95 | 1000 ml G55 £3.35

Hydrogen peroxide

### Drug action

Hydrogen peroxide is an oxidising agent.

### Indications and dose

**For skin disinfection, particularly cleansing and deodorising wounds and ulcers**

- **To the skin**
- **Adult:** Use 3% and 6% solutions (consult product literature)

**Cryosadie®**

**Superficial bacterial skin infection**

- **To the skin**
- **Child:** Apply 2–3 times a day for up to 3 weeks
- **Adult:** Apply 2–3 times a day for up to 3 weeks

8.1 Minor cuts and abrasions

Minor cuts and abrasions

Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavin above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1130 is used to clean minor cuts and abrasions.

Flexible colloid (see castor oil with collodion and colophony p. 1132) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.
9 Skin disfigurement

Camouflages

Overview
Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances
The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

- **Camouflages**

  **Covermark classic foundation** (Derma UK Ltd)
  15 ml (ACBS) - NHS indicative price = £11.86

  **Veil finishing powder** (Thomas Blake Cosmetic Creams Ltd)
  35 gram (ACBS) - NHS indicative price = £24.58

10 Sun protection and photodamage

Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel p. 1133 is suitable for the treatment of superficial
lesions in mild disease. Fluorouracil cream below is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid below is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1136 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1134 is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix®, available from Galderma) or 5-aminolaevulinic acid gel (Ameluz®, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing. Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinic acid cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

**ANTINEOPLASTIC DRUGS**

**Fluorouracil**

**INDICATIONS AND DOSE**

**Superficial malignant and pre-malignant skin lesions**
- TO THE SKIN USING CREAM
  - Adult: Apply once daily for up to 3 weeks, reduced to 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm² (e.g. 23 cm x 23 cm) treated at one time, alternative regimens may be used in some settings

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

| Excipients: May contain Benzyl alcohol, fragrances, propylene glycol
| Solaraze (Almirall Ltd) | Diclofenac sodium 30 mg per 1 gram | Solaraze 3% gel | 50 gram | £38.30 DT price = £38.30 | 100 gram | £76.60 |

**Fluorouracil with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1137.

**INDICATIONS AND DOSE**

**Low or moderately thick hyperkeratotic actinic keratosis**
- TO THE SKIN
  - Adult: Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm² (e.g. 5 cm x 5 cm)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cutaneous solution**
CAUTIONARY AND ADVISORY LABELS 15

- Actikerall (Almirall Ltd)
- Fluorouracil 5 mg/g. Salicylic acid 100 mg/g. Actikerall 5mg/g / 100mg/g cutaneous solution | 25 ml | £38.30

**PROTEIN KINASE C ACTIVATORS**

- **INDICATIONS AND DOSE**
  - **Actinic keratosis on face and scalp**
    - TO THE SKIN
    - Adult: Apply once daily for 3 days, use the 150 microgram/g gel
  - **Actinic keratosis on trunk and extremities**
    - TO THE SKIN
    - Adult: Apply once daily for 2 days, use the 500 microgram/g gel

- **CAUTIONS**
  - Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area

- **SIDE-EFFECTS**
  - Common or very common Blistering · crusting · erosion · erythema · exfoliation · headache · infection · local reactions · oedema · pain · pruritus
  - Uncommon Local ulceration · paraesthesia

- **PREGNANCY**
  - Not absorbed from skin, but manufacturer advises avoid.

- **BREAST FEEDING**
  - Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

- **DIRECTIONS FOR ADMINISTRATION**
  - One tube covers skin area of 25 cm². Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Gel**
    - CAUTIONARY AND ADVISORY LABELS 15
    - EXCIPIENTS: May contain Benzyl alcohol

    - Hirudoid (Genus Pharmaceuticals Ltd)
      - Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram | £3.99 DT price = £3.99

---

**12 Warts and calluses**

**Warts and calluses**

**Overview**
Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid. Podophyllotoxin, p. 1135, glutaraldehyde p. 1135, formaldehyde p. 1135, imiquimod p. 1136 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of corns and callouses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

**Anogenital warts**
The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin, p. 1135, (the major active ingredient of podophyllum) may be used for soft, non-keratinised external anogenital warts. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod p. 1136 cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis.

Inosine pranobex p. 585 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.
ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Podophyllotoxin

- **INDICATIONS AND DOSE**
  **CONDYLINE®**
  Condylomata acuminata affecting the penis or the female external genitalia
  - TO THE LESION
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of 5 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications (‘loops’) per session (consult product literature)

  **WARTICON® CREAM**
  Condylomata acuminata affecting the penis or the female external genitalia
  - TO THE LESION
  - Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature)

- **CAUTIONS** Avoid normal skin • avoid open wounds • keep away from face • very irritant to eyes
- **SIDE-EFFECTS** Local irritation
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Liquid**
  - **Condyline** (Takeda UK Ltd)
    - Podophyllotoxin 5 mg per 1 ml Condyline 0.5% solution | 3.5 ml £14.49
    - **Warticon** (Stiefel Laboratories (UK) Ltd)
      - Podophyllotoxin 5 mg per 1 ml Warticon 0.9% solution | 3 ml £14.86
  **Cream**
  EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid
  - **Warticon** (Stiefel Laboratories (UK) Ltd)
    - Podophyllotoxin 1.5 mg per 1 gram Warticon 0.15% cream | 5 gram £17.83 DT price = £17.83

ANTISEPTICS AND DISINFECTANTS > ALDEHYDES AND DERIVATIVES

Formaldehyde

- **INDICATIONS AND DOSE**
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily
  - Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Impaired peripheral circulation • not suitable for application to anogenital region • not suitable for application to face • not suitable for application to large areas • patients with diabetes at risk of neuropathic ulcers • protect surrounding skin and avoid broken skin • significant peripheral neuropathy
- **SIDE-EFFECTS** Skin irritation • skin ulceration (with high concentrations)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid
  **Liquid**
  - **Formaldehyde (Non-proprietary)**
    - Formaldehyde 40 mg per 1 ml Formaldehyde (Buffered) 4% solution | 1000 ml £3.90
  **Gel**
  - **Veracur** (Typharm Ltd)
    - Formaldehyde 7.5 mg per 1 gram Veracur 0.75% gel | 15 gram £2.41
  **Liquid**
  - **Formaldehyde (Non-proprietary)**
    - Formaldehyde 350 mg per 1 gram Formaldehyde solution | 500 ml £5.84 DT price = £5.84 | 2000 ml £16.67

Glutaraldehyde

- **INDICATIONS AND DOSE**
  Warts, particularly plantar warts
  - TO THE LESION
  - Child: Apply twice daily
  - Adult: Apply twice daily

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Not for application to anogenital areas • not for application to face • not for application to mucosa • protect surrounding skin
- **SIDE-EFFECTS** Rashes • skin irritation (discontinue if severe) • stains skin brown

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Paint**
  - **Glutarol** (Dermal Laboratories Ltd)
    - Glutaraldehyde 100 mg per 1 ml Glutarol 10% cutaneous solution | 10 ml £2.07 DT price = £2.07
**Silver nitrate**

### Indications and Dose

**Common warts**
- **Child:** Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.
- **Adult:** Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.

** verrucas**
- **Child:** Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.
- **Adult:** Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application.

**Umbilical granulomas**
- **Child:** Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.
- **Adult:** Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin.

### Unlicensed Use

No age range specified by manufacturer.

### Cautions

- Avoid broken skin · not suitable for application to ano-genital region · not suitable for application to face · not suitable for application to large areas · protect surrounding skin.

### Side-effects

Chemical burns on surrounding skin · stains skin.

### Patient and Carer Advice

Patients should be advised that silver nitrate may stain fabric.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Silver nitrate (Non-proprietary)**
- Silver nitrate 400 mg per 1 gram: Silver nitrate 40% caustic pencils | 1 applicator (P) no price available.
- Avoca 40% silver nitrate pencils | 1 applicator (P) £1.03.
- Silver nitrate 750 mg per 1 gram: Avoca 75% silver nitrate applicators | 100 applicator (P) £44.48.
- Avoca 75% silver nitrate applicators with thick handles | 50 applicator (P) £43.41.
- Silver nitrate 950 mg per 1 gram: Avoca 95% silver nitrate applicators | 100 applicator (P) £44.52.
- Avoca 95% silver nitrate pencils | 1 applicator (P) £1.99 DT price = £2.44.

## Imiquimod

### Indications and Dose

**Aldara®**

**Warts (external genital and perianal)**
- **Common or very common:** Burning sensation · erosion · erythema · excoriations · headache · influenza-like symptoms · itching · local reactions · myalgia · oedema · scabbing.
- **Rare:** Cutaneous lupus erythematosus-like effect · Stevens-Johnson syndrome.
- **Very rare** Dysturia.

**Actinic keratoses**
- **Common or very common** Burning sensation · eritema · excoriations · headache · influenza-like symptoms · itching · local reactions · myalgia · oedema · scabbing.
- **Rare:** Cutaneous lupus erythematosus-like effect · Stevens-Johnson syndrome.
- **Very rare** Dysturia.

**Frequency not known** Permanent hyperpigmentation · permanent hypopigmentation.

**Conception and Contraception** May damage latex condoms and diaphragms.

**Pregnancy** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

**Breastfeeding** No information available.

**Directions for Administration**

**Aldara®**

**Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

**Zyclara®**

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

**Patient and Carer Advice** A patient information leaflet should be provided.
Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid, above.

- **INDICATIONS AND DOSE**

  **CUPLEX®**

  Plantar and mosaic warts | Corns | Calluses

  ➤ TO THE LESION
  ➤ Adult: Apply daily, treatment may need to be continued for up to 3 months

  **DUOFILM®**

  Plantar and mosaic warts

  ➤ TO THE LESION
  ➤ Adult: Apply daily, treatment may need to be continued for up to 3 months

- **PREScribing AND Dispensing INFORMATION**

  Preparations of salicylic acid in a collodion basis (Cuplex® and Salactol®) are available but some patients may develop an allergy to colophony in the formulation.

- **MEdICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Gel**

  CAUTIONARY AND ADVISORY LABELS 15

  - Cuplex (Crawford Healthcare Ltd)
    Salicylic acid 40 mg per 1 gram, salicylic acid 110 mg per 1gram
    Cuplex Verruca gel | 1 gram £2.88 DT price = £2.88
  - Salatac (Dermal Laboratories Ltd)
    Salicylic acid 40 mg per 1 gram, salicylic acid 120 mg per 1 gram
    Salatac gel | 8 gram | £2.98 DT price = £2.98

  **Paint**

  CAUTIONARY AND ADVISORY LABELS 15

  - Duofilm (GlaxoSmithKline UK Ltd)
    Lactic acid 150 mg per 1 gram, Salicylic acid 167 mg per 1 gram
    Duofilm paint | 15 ml | £2.25
  - Salactol (Dermal Laboratories Ltd)
    Lactic acid 167 mg per 1 gram, Salicylic acid 167 mg per 1 gram
    Salactol paint | 10 ml | £1.71 DT price = £1.71

- **SALICYLIC ACID AND DERIVATIVES**

  **Salicylic acid**

  - **INDICATIONS AND DOSE**

    **OCCLUSAL®**

    Common and plantar warts

    ➤ TO THE LESION
    ➤ Child: Apply daily, treatment may need to be continued for up to 3 months
    ➤ Adult: Apply daily, treatment may need to be continued for up to 3 months

    **VERRUGON®**

    For plantar warts

    ➤ TO THE LESION
    ➤ Child: Apply daily, treatment may need to be continued for up to 3 months
    ➤ Adult: Apply daily, treatment may need to be continued for up to 3 months

  - **UNLICENSED USE** Not licensed for use in children under 2 years.

  - **CAUTIONS** Avoid broken skin - impaired peripheral circulation - not suitable for application to anogenital region - not suitable for application to face - not suitable for application to large areas - patients with diabetes at risk of neuropathic ulcers - significant peripheral neuropathy

  - **SIDE-EFFECTS** Skin irritation - skin ulceration (with high concentrations)

  - **PATIENT AND CARER ADVICE** Advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly.

  - **MEdICINAL FORMS**

    There can be variation in the licensing of different medicines containing the same drug.

    **Liquid**

    CAUTIONARY AND ADVISORY LABELS 15

    - Occlusal (Alliance Pharmaceuticals Ltd)
      Salicylic acid 260 mg per 1 ml Occlusal 26% solution | 10 ml £3.56 DT price = £3.56

    **Ointment**

    - Verrugon (Optima Consumer Health Ltd)
      Salicylic acid 500 mg per 1 gram Verrugon complete 50% ointment | 6 gram £3.61 DT price = £3.61

Vaccines

I 1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1141 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England’s Immunoglobulin Handbook www.gov.uk/phe, and in the Department of Health’s publication, Immunisation against Infectious Disease, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1143 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1143 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1141 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A, measles, mumps, rubella, varicella, and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for intravenous administration is used as replacement therapy for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain–Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 1164 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.
Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1169 for prophylaxis following exposure to measles.

**Rubella**

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1169.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1141 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin p. 1141 (‘HBIG’) is available for use in association with hepatitis B vaccine p. 1165 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1143 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1170 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1143 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 499 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin p. 1144 (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella–zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: children 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; adults about 40 mg daily for more than 1 week.

**Important:** for full details consult Immunisation against Infectious Disease. Varicella–zoster vaccine p. 1171 is available.

**Anti-D (Rh(D)) immunoglobulin**

Anti-D (Rh(D)) immunoglobulin p. 1140 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh(D)) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh(D)) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh(D)) immunoglobulin is also given when significant fetomaternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh(D)) immunoglobulin is
determined according to the level of exposure to rhesus-positive blood.

Use of routine antenatal anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh₀) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

MMR vaccine

Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.
