Anti-D (Rh₀) immunoglobulin

**INDICATIONS AND DOSE**

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks’ gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks’ gestation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatibility blood transfusion

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following birth of rhesus-positive infant

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Females of childbearing potential: 1000–1500 units, dose to administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh₀(D) sensitisation, following Rh₀(D) incompatibility blood transfusion

- **BY INTRAVENOUS INJECTION**
  - Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

**CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients • treatment of idiopathic thrombocytopenia purpura in splenectomised patients

**CAUTIONS** Immunoglobulin A deficiency • possible interference with live virus vaccines

**CAUTIONS, FURTHER INFORMATION**

MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh₀) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

**INTERACTIONS** Appendix 1 (immunoglobulins).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare Anaphylaxis • dyspnoea • hypotension • tachycardia • urticaria

- Frequency not known Abdominal pain • arthralgia • asthenia • back pain • diarrhoea • dizziness • drowsiness • fever
headache • hypertension • hypotension • injection site pain • malaise • myalgia • nausea • pruritus • rash • sweating • vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use: Abdominal distension • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

**HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**
- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156
  - Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
  - www.nice.org.uk/TA156

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **D-Gam (Bio Products Laboratory Ltd)**
  - Anti-D (RH0) immunoglobulin 250 unit | 1 vial £23.75
  - Anti-D (RH0) immunoglobulin 500 unit | 1 vial £33.75
  - Anti-D (RH0) immunoglobulin 1,500 unit | 1 vial £58.00
- **Rhophylac (CSL Behring UK Ltd)**
  - Anti-D (RH0) immunoglobulin 750 unit per 1 ml Rhophylac 1,500 units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £39.52

**Hepatitis B immunoglobulin**

**INDICATIONS AND DOSE**
- **Prophylaxis against hepatitis B infection**
  - **By intramuscular injection**
    - Adult: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure
- **Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material**
  - **By intravenous infusion**
    - Adult: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)
- **Prevention of hepatitis B in haemodialysed patients**
  - **By intravenous infusion**
    - Adult: (consult product literature)
- **Prophylaxis against re-infection of transplanted liver**
  - **By intravenous infusion**
    - Adult: (consult product literature)
- **Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients**
  - **By subcutaneous injection**
    - Adult (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly

**dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin**
- Adult (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

**CAUTIONS**
- IgA deficiency • interference with live virus vaccines

**SIDE-EFFECTS**
**GENERAL SIDE-EFFECTS**
- **Common or very common** Injection site reactions
- **Uncommon** Abdominal pain • anaphylaxis • arthralgia • buccal ulceration • chest pain • dizziness • dyspnoea • glossitis • headache • tremor

**SPECIFIC SIDE-EFFECTS**
- With intravenous use: Abdominal distension • blood pressure fluctuations • deep vein thrombosis • haemolytic anaemia • injection site reactions • myocardial infarction • pulmonary embolism • stroke • thromboembolic events

**PRESCRIBING AND DISPENSING INFORMATION**
Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Hepatitis B immunoglobulin (Non-proprietary)**
  - Hepatitis B immunoglobulin human 200 unit | 1 vial £122.44
  - Hepatitis B immunoglobulin human 500 unit | 1 vial £266.33
- **Zutectra (Biotest (UK) Ltd)**
  - Zutectra 500 units/1ml solution for injection pre-filled syringes | 5 syringe £1,275.00

**Solution for infusion**
- **Hepactep (Biotest (UK) Ltd)**
  - Hepactep CP human 50 unit per 1 ml | 1 vial £93.35
  - Hepactep CP 200 units/40ml solution for infusion vials | 1 vial £237.50
  - Omri-Hep-B (Imported (Israel))
  - Hepatitis B immunoglobulin human 50 unit per 1 ml | 1 vial £1,150.00

**Normal immunoglobulin**

**INDICATIONS AND DOSE**
- **To control outbreaks of hepatitis A**
  - **By deep intramuscular injection**
    - Adult: 500 mg
- **Rubella in pregnancy, prevention of clinical attack**
  - **By deep intramuscular injection**
    - Females of childbearing potential: 750 mg continued →
Antibody deficiency syndromes

- **BY SUBCUTANEOUS INFUSION**
- **Adult:** (consult product literature)

**SUBGAM**

**Hepatitis A prophylaxis in outbreaks**

- **BY INTRAMUSCULAR INJECTION**
- **Adult:** 750 mg

**UNLICENSED USE**

SUBGAM is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**CONTRA-INDICATIONS**

Patients with selective IgA deficiency who have known antibody against IgA PRIVIGEN Hyperprolinaemia (contains -proline)

GAMMAPLEX Hereditary fructose intolerance (contains sorbitol)

HIZENTRA Hyperprolinaemia (contains -proline)

FLEBOGAMMA® DIF Hereditary fructose intolerance (contains sorbitol)

**CAUTIONS**

Agammaglobulinaemia with or without IgA deficiency - hypogammaglobulinaemia with or without IgA deficiency - interference with live virus vaccines

**CAUTIONS, FURTHER INFORMATION**

Interference with live virus vaccines. Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

OCTAGAM False elevated results with blood glucose testing systems (contains maltose)

**INTERACTIONS** → Appendix 1 (immunoglobulins).

**SIDE-EFFECTS**

- **Rare** Acute renal failure - anaphylaxis - aseptic meningitis - cutaneous skin reactions - hypotension
- **Frequency not known** Arthralgia - chills - diarrhoea - dizziness - fever - headache - low back pain - muscle spasms - myalgia - nausea

**SIDE-EFFECTS, FURTHER INFORMATION**

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

**MONITORING REQUIREMENTS**

Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

**DIRECTIONS FOR ADMINISTRATION**

Preparations for subcutaneous use may be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.

GAMUNEK® KIOVIG® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**PRESCRIBING AND DISPENSING INFORMATION**

Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers — formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

- With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES:** May contain Sodium

- Gammanorm (Octapharma Ltd)
  - Normal immunoglobulin human 165 mg per 1 ml Gammanorm 8g/48ml solution for injection vials | 1 vial [Pom] £469.20
  - Gammanorm 2g/12ml solution for injection vials | 1 vial [Pom] £117.30
  - Gammanorm 4g/24ml solution for injection vials | 1 vial [Pom] £234.60
  - Gammanorm 1.65g/10ml solution for injection vials | 1 vial [Pom] £96.77 | 10 vial [Pom] no price available (Hospital only)
  - Gammanorm 3.3g/20ml solution for injection vials | 1 vial [Pom] £193.55 | 10 vial [Pom] no price available (Hospital only)
  - Gammanorm 1g/6ml solution for injection vials | 1 vial [Pom] £58.65

- Subcutiva (Baxalta UK Ltd)
  - Normal immunoglobulin human 160 mg per 1 ml Subcutiva 800mg/5ml solution for injection vials | 1 vial [Pom] no price available
  - Subcutiva 1.6g/10ml solution for injection vials | 1 vial [Pom] no price available

- Subgam (Bio Products Laboratory Ltd)
  - Normal immunoglobulin human 150 mg per 1 ml Subgam 750mg/5ml solution for injection vials | 1 vial [Pom] £34.20
  - Subgam 1.5g/10ml solution for injection vials | 1 vial [Pom] £68.40

**Powder and solvent for solution for injection**

- Gammagard S/D (Baxalta UK Ltd)
  - Normal immunoglobulin human 500 mg Gammagard S/D 500mg powder and solvent for solution for injection bottles | 1 bottle [Pom] no price available
  - Normal immunoglobulin human 2.5 gram Gammagard S/D 2.5g powder and solvent for solution for injection bottles | 1 bottle [Pom] no price available
  - Normal immunoglobulin human 5 gram Gammagard S/D 5g powder and solvent for solution for injection bottles | 1 bottle [Pom] no price available
  - Normal immunoglobulin human 10 gram Gammagard S/D 10g powder and solvent for solution for injection bottles | 1 bottle [Pom] no price available

**Solution for infusion**

**EXCIPIENTS:** May contain Glucose, maltose, sorbitol, sucrose

- Normal immunoglobulin human 100 mg per 1 ml Normal immunoglobulin human 5g/50ml solution for infusion vials | 1 vial [Pom] no price available
  - Normal immunoglobulin human 2.5g/25ml solution for infusion vials | 1 vial [Pom] no price available
  - Normal immunoglobulin human 20g/200ml solution for infusion vials | 1 vial [Pom] no price available
  - Normal immunoglobulin human 10g/100ml solution for infusion vials | 1 vial [Pom] no price available
  - Normal immunoglobulin human 30g/300ml solution for infusion vials | 1 vial [Pom] no price available

- Aragam (Oxbridge Pharma Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Aragam 5g/100ml solution for infusion vials | 1 vial [Pom] no price available
  - Aragam 2.5g/50ml solution for infusion vials | 1 vial [Pom] no price available

- FlebogammaDif (Grifols UK Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Flebogamma Dif 10g/200ml solution for infusion vials | 1 vial [Pom] £10.00
  - Flebogamma Dif 2.5g/50ml solution for infusion vials | 1 vial [Pom] £127.50
Immunoglobulin therapy

Rabies immunoglobulin

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis against rabies infection**
    - **By local infiltration, or by intramuscular injection**
    - **Child:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site).
    - **Adult:** 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site).

- **CAUTIONS**
  - IgA deficiency - interference with live virus vaccines.
  - **SIDE-EFFECTS**
    - Rare: Anaphylaxis, arthralgia, buccal ulceration, chest tightness, dizziness, dyspnoea, glossitis, tremor.
    - Frequency not known: Facial oedema, injection site pain, injection site swelling.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.
  - Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

- **HANDLING AND STORAGE**
  - Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **Rabies immunoglobulin (Non-proprietary)**
    - **Rabies immunoglobulin human 500 unit**
      - Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial (Pom) £412.13

Tetanus immunoglobulin

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis**
    - **By intramuscular injection**
    - **Child:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns.
    - **Adult:** Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns.
Treatment of tetanus infection

- **BY INTRAMUSCULAR INJECTION**
  - Child: 150 units/kg, dose may be given over multiple sites
  - Adult: 150 units/kg, dose may be given over multiple sites

- **CAUTIONS** IgA deficiency - interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare Anaphylaxis, arthralgia (in children) - buccal ulceration (in children) - chest tightness (in children) - dizziness (in children) - dyspnoea (in children) - glossitis (in children) - tremor (in children)
  - Frequency not known Facial oedema (in children) - injection site swelling - pain at injection site
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Varicella-Zoster** (Bio Products Laboratory Ltd)
      - Varicella-Zoster immunoglobulin human 250 mg
      - Varicella-Zoster immunoglobulin human 250 mg solution for injection vials | 1 vial

**Botulism antitoxin**

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis of botulism**
    - **BY INTRAMUSCULAR INJECTION**
    - **Adult:** (consult product literature)

- **SIDE-EFFECTS**
  - Hypersensitivity reactions

- **FURTHER INFORMATION**
  - Hypersensitivity reactions It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **PRE-TREATMENT SCREENING**
  - All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

  - The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - **Botulism-antitoxin** (Novartis Vaccines and Diagnostics Ltd)
      - Botulinum antitoxin type E 50 unit per 1 ml
      - Botulinum antitoxin type B 500 unit per 1 ml
      - Botulinum antitoxin type A 750 unit per 1 ml

  - **Botulinum-Antitoxin Behring** 25g/250ml solution for infusion bottles | 1 bottle

**Varicella-zoster immunoglobulin**

*(Antivaricella-zoster Immunoglobulin)*

- **INDICATIONS AND DOSE**
  - **Prophylaxis against varicella infection**
    - **BY DEEP INTRAMUSCULAR INJECTION**
    - **Adult:** 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease

- **CAUTIONS** IgA deficiency - interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare Anaphylaxis
  - Frequency not known Injection site pain - injection site swelling
- **DIRECTIONS FOR ADMINISTRATION** Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Available from selected Public Health England and NHS laboratories (also from BPL).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

| **INDICATIONS AND DOSE**
  - Passive immunisation in suspected cases of diphtheria
    - **BY INTRAVENOUS INFUSION**
    - **Adult:** Dose should be given without waiting for bacteriological confirmation (consult product literature)
## Vaccination

### Tuberculosis diagnostic test

#### DIAGNOSTIC AGENTS

**Tuberculin purified protein derivative** (Tuberculin PPD)

- **INDICATIONS AND DOSE**
  - **Mantoux test**
    - **BY INTRADERMAL INJECTION**
      - Child: 2 units for one dose
      - Adult: 2 units for one dose
  - **Mantoux test (if first test is negative and a further test is considered appropriate)**
    - **BY INTRADERMAL INJECTION**
      - Child: 10 units for 1 dose
      - Adult: 10 units for 1 dose

- **DOSE EQUIVALENCE AND CONVERSION**
  - 2 units is equivalent to 0.1 mL of 20 units/mL strength.
  - 10 units is equivalent to 0.1 mL of 100 units/mL strength.

- **CAUTIONS**
  - Mantoux test: Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Available from ImmForm (SSI brand).
    - The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- **Solution for injection**
  - **Tuberculin purified protein derivative (Non-proprietary)**
    - tuberculin purified protein derivative 10 tuberculin unit per 1 ml
    - tuberculin purified protein derivative 20 tuberculin unit per 1 ml
  - **Tuberculin purified protein derivative 100 tuberculin unit per 1 ml**

### 4 Vaccination

#### Vaccines

**Active immunity**

Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- **a live attenuated form of a virus** (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- **inactivated preparations of the virus** (e.g. influenza vaccine) or bacteria, or
- **detoxified exotoxins produced by a micro-organism** (e.g. tetanus vaccine), or
- **extracts of a micro-organism**, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

**Inactivated vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

#### Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm ([www.immform.dh.gov.uk](http://www.immform.dh.gov.uk) — not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

For the most up to date immunisation schedule consult ‘The complete routine immunisation schedule’, available at [www.gov.uk](http://www.gov.uk).

**Preterm birth**

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the

| **2-7 years (including children in school years 1, 2 and 3)** | ▶ Influenza vaccine p. 1167 Each year from September. *Note:* Flu nasal spray is recommended (*Fluenz Tetra*®). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine |
| **Between 3 years and 4 months, and 5 years** | ▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1158 Single booster dose. *Note:* Preferably allow interval of at least 3 years after completing primary course  
▶ Measles, mumps and rubella vaccine, live p. 1169 Second dose |
| **11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-13 years of age in Scotland.** | ▶ Human papillomavirus vaccines p. 1167 2 doses; second dose 6-24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only Gardasil® is offered as part of the national immunisation programme; for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®. |
| **13-15 years** | ▶ Meningococcal groups A with C and W135 and Y vaccine p. 1161 Single booster dose |
| **13-18 years** | ▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1158 Single booster dose. *Note:* Can be given at the same time as the dose of meningococcal group A with C and W135 and Y vaccine at 13-15 years of age. |
| **During adult life, women of child-bearing age susceptible to rubella** | ▶ Measles, mumps and rubella vaccine, live p. 1169 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation. |
| **Pregnant women** | ▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1158 (*Boostrix-IPV*®) 1 dose from the 16th week of pregnancy, preferably after the foetal anomaly scan (weeks 18-20)  
▶ Influenza vaccine p. 1167 (inactivated), Single dose administered from September, regardless of the stage of pregnancy |
| **Under 25 years, those entering university who are at risk of meningococcal disease** | ▶ Meningococcal groups A with C and W135 and Y vaccine p. 1161 Single dose. *Note:* Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine p. 1161 over the age of 10 years |
| **During adult life, if not previously immunised** | ▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1158 |
| **65 years** | ▶ Pneumococcal polysaccharide vaccine p. 1162 |
| **From 65 years** | ▶ Influenza vaccine p. 1167 Each year from September |
| **70 years** | ▶ Varicella-zoster vaccine p. 1171 Single dose |

Second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* type b, meningococcal C, and hepatitis B after primary immunisation.

## Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster
immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should not receive:
- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought)

The above advice differs from that for other immunocompromised patients; Immunisation Guidelines for HIV-infected Adults issued by British HIV Association (BHIVA) are available at www.bhiva.org and, immunisation of HIV-infected Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk

Vaccines and asplenia
The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type B with meningococcal group C vaccine p. 1160;
- Influenza vaccine p. 1167;
- Meningococcal groups A with C and W135 and Y vaccine p. 1161 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161;
- pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type B with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

Vaccines and antisera availability
Anthrax vaccine p. 1159 and yellow fever vaccine, live p. 1172, botulism antitoxin p. 1144, diphtheria antitoxin p. 1144, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency treatment of poisoning p. 1204.

Enquiries for vaccines not available commercially can also be made to:

- Vaccines and Countermeasures Response Department
  Public Health England
  Wellington House
  133–155 Waterloo Road
  London
  SE1 8UG
  vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:
- Welsh Medicines Information Centre
  University Hospital of Wales
  Cardiff
  CF14 4XW
  (029) 2074 2979

In Northern Ireland:
- Pharmacy and Medicines Management Centre
  Northern Health and Social Care Trust
  Beech House
  Antrim Hospital Site
  Bush Road
  Antrim
  BT41 2RL
  rphs.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine
Anthrax vaccine is made from antigens from B. anthracis. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with B. anthracis. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with B. anthracis, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis. Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from Public Health England Colindale (tel. 020 8200 4400).

BCG vaccine
Bacillus Calmette-Guérin vaccine p. 1159 should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculosis protein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;

newly immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
• new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100,000;
• contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
• healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients’ clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
• individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100,000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100,000 is available at www.gov.uk/phe.

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 533 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

Tuberculosis Diagnostic Agents

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at www.gov.uk/phe.

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative (PPD) p. 1145.

The Heaf test (involving the use of multiple puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuantiFERON® TB Gold and T-SPOT. TB. Both tests measure T-cell mediates immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see www.gov.uk/phe.

Botulism antitoxin

A polyvalent botulism antitoxin p. 1144 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by Clostridium botulinum types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Cholera vaccine

Cholera vaccine p. 1160 (oral) contains inactivated Inaba (including El–Tor biotype) and Ogawa strains of Vibrio cholerae, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of V. cholerae, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Diphtheria vaccine

Diphtheria–containing vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine. A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine should be administered.

Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.
Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

**Haemophilus influenzae type B conjugate vaccine**

**Haemophilus influenzae type b (Hib) vaccine** is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated vaccine), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 1158. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

**Invasive Haemophilus influenzae type b disease**

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 535 in the prevention of secondary cases of *Haemophilus influenzae* type b disease.

**Hepatitis A vaccine**

Hepatitis A vaccine p. 1164 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine Ambirix® can also be used.

Intramuscular normal immunoglobulin p. 1141 is recommended for use in addition to hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed or over 50 years of age.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

**Hepatitis B vaccine**

Hepatitis B vaccine p. 1165 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B. In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
Vaccines

- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances. Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis.

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook Immunisation against Infectious Disease. Specific hepatitis B immunoglobulin p. 1141 (‘HBIG’) is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection.

A combined hepatitis A and B vaccine p. 1163 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Since 2012, only Gardasil® is offered as part of the national immunisation programme. Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the human papillomavirus vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papillomavirus, routine cervical screening should continue.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 1167 in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily] and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine (inactivated) is also recommended for all pregnant women, for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals. The Joint Committee on Vaccination and Immunisation (JCVI) has also advised that morbidity obese people (defined as BMI greater than 40 kg/m²) could also benefit from influenza vaccination.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved
in patient care. Employers of social care workers should consider similar action.

Unless contra-indicated, the live influenza vaccine, Fluenz Tetra™, is preferred in children aged 2–17 years because it provides a higher level of protection than inactivated influenza vaccine. In the 2016/2017 national influenza immunisation programme, seasonal influenza vaccine will also be offered to all children aged 2–7 years (including those in school years 1, 2 and 3).

Information on pandemic influenza, avian influenza and swine influenza may be found at www.gov.uk/guidance/pandemic-flu and at www.gov.uk/phe.

Japanese encephalitis vaccine
Japanese encephalitis vaccine p. 1168 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathc.net).

Measles, Mumps and Rubella vaccine
Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine, live p. 1169 (MMR vaccine).

Measles, mumps and rubella vaccine, live aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Each child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, measles, mumps and rubella vaccine, live immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of measles, mumps and rubella vaccine, live in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live are required, the second dose should be given one month after the initial dose. The decision on whether to vaccinate adults should take into consideration their vaccination history, the likelihood of the individual remaining susceptible, and the future risk of exposure and disease.

Measles, mumps and rubella vaccine, live p. 1169 should be used to protect against rubella in seronegative women of child-bearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts
Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin after exposure to measles; routine measles, mumps and rubella vaccine, live immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (see advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin.

Travel
Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccines
Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C and Meningococcal group B vaccine protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer–lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A meningococcal group B vaccine, Bexsero®, is licensed in the UK against infection caused by Neisseria meningitidis serogroup B and is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ.98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.
Childhood immunisation

Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type B with meningococcal group C vaccine p. 1160) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 1161) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of *Neisseria meningitidis*. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) p. 1161 followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines). Unimmunised children aged 12–23 months should be given 2 doses meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received less than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type B with meningococcal group C vaccine) followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Patients under 25 years of age with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel

Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.net).

Proof of vaccination with the tetravalent meningococcal groups A with C and W135 and Y vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts

For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

**Pertussis vaccine**

**Pertussis vaccine** is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation Schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed. Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

**Vaccination of pregnant women against pertussis**

In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis–specific antibodies that are transferred through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; *Boostrix-IPV®*) between 16 and 32 weeks of pregnancy.

Public Health England has advised (2016) that the vaccine is probably best offered after the foetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

**Contacts**

Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

**Side-effects**

Local reactions do not contra–indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
• persistent crying or screaming for more than 3 hours;
• severe local reaction, irrespective of extent.

**Pneumococcal vaccine**

Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1162 protects against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. **Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococci, whereas **pneumococcal polysaccharide conjugate vaccine (adsorbed)** contains polysaccharide from either 10 capsular types (*Synflorix®*) or 13 capsular types (*Prevenar 13®*) and the polysaccharide is conjugated to protein.

The 13-valent conjugate vaccine (*Prevenar 13®*) is used in the childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule).

Pneumococcal polysaccharide conjugate vaccine (adsorbed) is recommended for individuals at increased risk of pneumococcal infection as follows:

• age over 65 years;
• asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
• chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
• chronic heart disease;
• chronic renal disease;
• chronic liver disease;
• chronic neurological conditions;
• complement disorders;
• diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
• immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: adult and child over 20 kg, 20 mg or more daily; child under 20 kg, 1 mg/kg or more daily);
• presence of cochlear implant;
• conditions where leakage of cerebrospinal fluid may occur;
• child under 5 years with a history of invasive pneumococcal disease;
• at risk of occupational exposure to metal fume (e.g. welders).

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; patients should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Propylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

**Choice of vaccine**

Children under 2 years at increased risk of pneumococcal infection (see list) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

**Revaccination**

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

**Poliomyelitis vaccine**

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccine (for injection) and live (oral) poliomyelitis vaccine. **Inactivated** poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines, starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised adults; no adult should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses are only necessary for adults at special risk, such as travellers to endemic areas, or laboratory staff likely to be exposed to the viruses, or healthcare workers in possible contact with cases; booster doses should be given to such individuals every 10 years.

**Live (oral) poliomyelitis vaccine** is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

**Travel**

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of **adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine**. Information about countries with a high incidence of poliomyelitis can be obtained from [www.travax.nhs.uk](http://www.travax.nhs.uk) or from the National Travel Health Network and Centre ([www.nathic.net](http://www.nathic.net)).
Rabies vaccine
Rabies vaccine p. 1170 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.net) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management
Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 1143 is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1143 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine p. 1170. The immunisation course can be discontinued if it is proved that the individual was not at risk.

Rabies immunoglobulin
Rabies immunoglobulin p. 1145 contains human antirabies serum and is produced by the fractionation of human plasma. It is used to prevent rabies in persons who are at risk of exposure to rabies but who have neither been vaccinated against rabies nor received post-exposure prophylaxis.

Vaccination should be performed as soon as possible after exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 1143 is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin p. 1143 is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine p. 1170. The immunisation course can be discontinued if it is proved that the individual was not at risk.

Rotavirus vaccine
Rotavirus vaccine p. 1170 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

Smallpox vaccine
Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

Tetanus vaccine
Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only provides protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

When an individual presents for a booster dose but has not been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster
For Typhoid vaccine most prevalent, are at greatest risk of tick-borne Japan, particularly from April to November when ticks are warm forested areas of Central and Eastern Europe, in chick embryo cells. It is recommended for immunisation Tick-borne encephalitis vaccine, inactivated p.

\[\text{capsular polysaccharide}\] typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

**Oral** typhoid vaccine p. 1163 is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Varicella-zoster vaccine**

The live varicella–zoster vaccine p. 1171, Varilrix® and Varivax®, are licensed for immunisation against varicella (chickenpox) in seronegative individuals. They are not recommended for routine use in children, but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infection. The Department of Health recommends these vaccines for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy;
- Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

**National shingles immunisation programme**

The aim of the national shingles immunisation programme is to lower the incidence and severity of shingles in older people using the high potency, live varicella–zoster vaccine, Zostavax®. It is recommended that vaccination is routinely offered to people aged 70 years. A catch-up programme has also been rolled out (since 2013) in those aged 70–79 years, as this age group is likely to have the greatest benefit from vaccination.

In the 2016–2017 immunisation programme, varicella–zoster vaccine is recommended in adults who were 70 or 78 years of age on 1st September 2016. Patients who were eligible for vaccination in the first 3 years of the programme but have not been vaccinated against herpes zoster remain eligible until their 80th birthday; this includes patients who were aged 71–73 or 79 on 1st September 2016. Patients who have reached 80 years are no longer eligible for vaccination. A single dose of Zostavax® is likely to give protection for at least 7 years, but the need for, or timing of, a booster dose has not been established. Although Zostavax® is not recommended for the treatment of shingles or post-herpetic neuralgia, it can be given to those with a previous history of shingles; ideally the vaccine should be delayed until systemic antiviral therapy has been completed.

Varicella–zoster immunoglobulin p. 1144 is used to protect susceptible individuals at increased risk of varicella infection.
Yellow fever vaccine

Yellow fever vaccine, live p. 1172 is indicated for those travelling or living in areas where infection is endemic and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Vaccines for travel

Immunisation

See advice on Malaria, treatment p. 566.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100,000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100,000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world.

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabbies is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbable diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in Health Information for Overseas Travel.

Food hygiene

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.net.

The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

VACCINES

Vaccines

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (APRIL 2016)

Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-α) inhibitor in utero, the MHRA has issued the following advice:

- any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
- in the case of infants who have been exposed to TNF-α inhibitors and other biological medicines in utero, any live attenuated vaccination should be deferred until the infant is age 6 months, after which time vaccination should be considered.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

CAUTIONS Acute illness - minor illnesses

CAUTIONS, FURTHER INFORMATION

Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.

Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convolution not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

INTERACTIONS → Appendix 1 (vaccines).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Fatigue, fever, gastro-intestinal disturbances, headache, irritability, loss of appetite, lymphangitis, malaise, myalgia
- Very rare Anaphylaxis (can be fatal), angioedema (can be fatal), bronchospasm (can be fatal), hypersensitivity reactions (can be fatal), urticaria (can be fatal)

FREQUENCY NOT KNOWN Arthralgia, asthenia, dizziness, drowsiness, influenza-like symptoms, lymphadenopathy, paraesthesia, rash

SPECIFIC SIDE-EFFECTS

- Common or very common

With intradermal use or intramuscular use or subcutaneous use Induration may develop at the injection site, inflammation, local reactions, pain, redness, sterile abscess may develop at the injection site

SIDE-EFFECTS, FURTHER INFORMATION Occasionally serious adverse reactions can occur—these should always be reported to the CHM.

Post-immunisation pyrexia in infants The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as antibacterials in viral vaccines).

PREGNANCY Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

BREAST FEEDING Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

DIRECTIONS FOR ADMINISTRATION If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also Bacillus Calmette-Guérin vaccine p. 1159.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders.
such as haemophilia or thrombocytopenia, vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

**HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

**VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED**

Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

**INDICATIONS AND DOSE**

Primary immunisation

- **By Intramuscular Injection**
  - Child 2 months-10 years: 0.5 mL every month for 3 doses

**Unlicensed Use** Infanrix-IPV + Hib® not licensed for use in children over 36 months; Pediacel not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

**SIDE-EFFECTS** Atopic dermatitis · hypotonia · restlessness · sleep disturbances · unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**

- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contraindicate further doses.

  - The vaccine should not be withheld from children with a history to a preceding dose of:
    - fever, irrespective of severity;
    - persistent crying or screaming for more than 3 hours;
    - severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PRESCRIBING AND DISPENSING INFORMATION** Pregnant women should be vaccinated using low dose vaccines (brands may include Boostrix-IPV® or Repevax®).

Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin

- Pediacel (sanofi pasteur MSD Ltd)
  - Pediacel vaccine suspension for injection 0.5mL vials | 1 vial [PoS] £32.00

- Infanrix-IPV + Hib (GlaxoSmithKline UK Ltd)
  - Infanrix-IPV + Hib vaccine powder and suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection [PoS] £27.86

**Diphtheria with poliomyelitis and tetanus vaccine**

**INDICATIONS AND DOSE**

Primary immunisation

- **By Intramuscular Injection**
  - Child 10–17 years: 0.5 mL every month for 3 doses
  - Adult: 0.5 mL every month for 3 doses
Booster doses

- **BY INTRAMUSCULAR INJECTION**
  - Child 10–17 years: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine
  - Adult: 0.5 mL for 1 dose, first booster dose—should be given 3 years after primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed), then 0.5 mL for 1 dose, second booster dose—should be given 10 years after first booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed), second booster dose may also be used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine.

**SIDE-EFFECTS** Restlessness · sleep disturbances · unusual crying in infants

**PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for Injection**
- Revaxis (sanofi pasteur MSD Ltd)
  - Revaxis vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection

**VACCINES**

### Anthrax vaccine

#### INDICATIONS AND DOSE

**Pre-exposure immunisation against anthrax | Post-exposure immunisation**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 1 dose every 3 weeks for 3 doses, followed by 1 dose after 6 months, to be administered in the deltoid region, 1 dose is equivalent to 0.5 mL.

**Booster**

- **BY INTRAMUSCULAR INJECTION**

- Adult: 1 dose every 12 months, to be administered in deltoid region, 1 dose is equivalent to 0.5 mL.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for Injection**
- EXCIPIENTS: May contain Thiomersal
- Anthrax vaccine (Non-proprietary)
  - Anthrax vaccine (alum precipitated sterile filtrate) suspension for injection 0.5mL ampoules | 5 ampoule

### Bacillus Calmette-Guérin vaccine

**DRUG ACTION**

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

#### INDICATIONS AND DOSE

**Immunisation against tuberculosis**

- **BY INTRADERMAL INJECTION**
  - Child 1–11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1–17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Adult: 0.1 mL, to be injected in deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

#### CONTRA-INDICATIONS
Generalised septic skin conditions

#### CAUTIONS

**CAUTIONS, FURTHER INFORMATION**

BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**SIDE-EFFECTS**

- Rare: Disseminated complications · osteitis · osteomyelitis
- Frequency not known: Prolonged ulceration at the injection site · subcutaneous abscess at the injection site

**PRE-TREATMENT SCREENING**

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see tuberculin purified protein derivative p. 1145). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**DIRECTIONS FOR ADMINISTRATION**

**Intradermal injection technique**

Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**PRESCRIBING AND DISPENSING INFORMATION**

Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).
Cholera vaccine

**INDICATIONS AND DOSE**
Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

- **BY MOUTH**
  - Child 2–5 years: 1 dose every 1–6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
  - Child 6–17 years: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
  - Adult: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

**Booster**

- **BY MOUTH**
  - Child 2–5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
  - Child 6–17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated
  - Adult: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**CONTRA-INDICATIONS**
Acute gastro-intestinal illness

**SIDE-EFFECTS**
- Rare: Cough, respiratory symptoms, rhinitis
- Very rare: Insomnia, sore throat
- Frequency not known: Abdominal pain and cramps, diarrhoea, nausea, vomiting

**DIRECTIONS FOR ADMINISTRATION**
- In children: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.
- In adults: Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). Add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

**PATIENT AND CARER ADVICE**
Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

Haemophilus influenzae type B with meningococcal group C vaccine

**INDICATIONS AND DOSE**

- **Booster dose (for infants who have received primary immunisation with a vaccine containing Haemophilus influenzae type b component) and primary immunisation against Neisseria meningitidis**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 12–13 months: 0.5 mL for 1 dose
    - Immunisation against Neisseria meningitidis in an unimmunised patient
      - **BY INTRAMUSCULAR INJECTION**
        - Child 1–9 years: 0.5 mL for 1 dose

- **Booster dose after recovery from Haemophilus influenzae type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 1–9 years: 0.5 mL for 1 dose

- **Booster dose after recovery from Haemophilus influenzae type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 1–7 years: 0.5 mL for 1 dose
    - Adult: 0.5 mL for 1 dose

- **Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

  **Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 2–17 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)
    - Adult: 0.5 mL for 1 dose, this booster dose should be followed 1 month later by one dose of meningococcal A, C, W135, and Y conjugate vaccine

**UNLICENSED USE**
Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**
- Rare: Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known: Atopic dermatitis, hypotonia

**PRESCRIBING AND DISPENSING INFORMATION**
Available as part of the childhood immunisation schedule from ImmForm.
Meningococcal B vaccine (rDNA, component, adsorbed)

**INDICATIONS AND DOSE**

Immunisation against *Neisseria meningitidis*, primary immunisation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 414.
  - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants), for information about the use of paracetamol for prophylaxis of post-immunisation pyrexia, see p. 414.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given between 1–2 years of age and at least 2 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12–24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region
  - Adult: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

**SIDE-EFFECTS**

- **Rare** Kawasaki disease (in children) - symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- **Frequency not known** Unusual crying (in children)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Bexsero (GlaxoSmithKline UK Ltd)**
  - Bexsero vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection (Pom) £75.00

Meningococcal groups A with C and W135 and Y vaccine

**INDICATIONS AND DOSE**

**MENVEO®**

Primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 13-15 years: 0.5 mL for 1 dose, preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
  - Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- **BY INTRAMUSCULAR INJECTION**
  - Child 3-11 months: 0.5 mL every month for 2 doses, dose preferably injected into deltoid region
  - Child 1-7 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region
  - Adult: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)

- **BY INTRAMUSCULAR INJECTION**
  - Adult 18-24 years: 0.5 mL for 1 dose
NIMENRIX®
Primary immunisation against Neisseria meningitidis
- By intramuscular injection
  - Child 13-15 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region

Immunisation against Neisseria meningitidis in an unimmunised patient
- By intramuscular injection
  - Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required
  - Adult 18-24 years: 0.5 mL for 1 dose, booster dose is not required

Immunisation against Neisseria meningitidis in those at risk of exposure
- By intramuscular injection
  - Child 1-17 years: 0.5 mL for 1 dose, to be injected preferably into deltoid region (or anterolateral thigh in child 12-23 months), then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of Neisseria meningitidis serogroup A infection
  - Adult: 0.5 mL for 1 dose, to be injected preferably into deltoid region, then 0.5 mL after 1 year if required for 1 dose, second dose should be considered in those who continue to be at risk of Neisseria meningitidis serogroup A infection

Patients attending university for the first time (who have not received the routine meningococcal A, C, W135, and Y conjugate vaccine over the age of 10 years)
- By intramuscular injection
  - Adult 18-24 years: 0.5 mL for 1 dose

- **UNLICENSED USE** Menevo® is not licensed for use in children under 2 years.
- **SIDE-EFFECTS**
  - Rare Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Powder and solvent for solution for injection**
  - Menevo (GlaxoSmithKline UK Ltd)
    Menevo vaccine powder and solvent for solution for injection 0.5mL vials | 1 vial £30.00
  - Nimenrix (Pfizer Ltd)
    Nimenrix vaccine powder and solvent for solution for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £30.00

  **Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)**
  - By intramuscular injection
    - Child 12 months-4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

  **Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)**
  - By intramuscular injection
    - Child 12 months-4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

SYNFLORIX®
Immunisation against pneumococcal infection
- By intramuscular injection
  - Child 6 weeks-4 years: Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants (consult product literature)

- **UNLICENSED USE** PREVENAR 13® The dose in BNF publications may differ from that in product literature.
- **CONTRA-INDICATIONS** Concomitant use of high potency varicella-zoster vaccine (Zostavax®) with pneumococcal polysaccharide vaccine (in adults)
- **PRESCRIBING AND DISPENSING INFORMATION** PREVENAR 13® Available as part of childhood immunisation schedule from ImForm www.immform.dh.gov.uk.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Suspension for injection**
  - Prevenar (Pfizer Ltd)
    Prevenar 13 vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £49.10 | 10 pre-filled disposable injection £491.00
  - Synflorix (GlaxoSmithKline UK Ltd)
    Synflorix vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £27.60

Pneumococcal polysaccharide conjugate vaccine

- **INDICATIONS AND DOSE**

  **PREVENAR 13®**
  Primary immunisation against pneumococcal infection
  (first dose)
  - By intramuscular injection
    - Child 2-17 years: 0.5 mL for 1 dose
    - Adult: 0.5 mL for 1 dose
  Primary immunisation against pneumococcal infection
  (second dose)
  - By intramuscular injection
    - Child 2-4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
    - Child 5-17 years: 0.5 mL for 1 dose
    - Adult: 0.5 mL for 1 dose

- **INDICATIONS AND DOSE**

  **Immunisation against pneumococcal infection**
  - By intramuscular injection, or by subcutaneous injection
    - Child 2-17 years: 0.5 mL for 1 dose
    - Adult: 0.5 mL for 1 dose
  Immunisation in patients at increased risk of pneumococcal disease
  - By intramuscular injection, or by subcutaneous injection
    - Child 2-4 years: 0.5 mL for 1 dose, dose should be administered after the second birthday or at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed)
    - Child 5-17 years: 0.5 mL for 1 dose
    - Adult: 0.5 mL for 1 dose
**Typhoid vaccine**

### Indications and dose

**Immunisation against typhoid fever in children at high risk of typhoid fever**
- **By intramuscular injection**
  - Child 12-23 months: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection, response may be suboptimal

**Immunisation against typhoid fever**
- **By intramuscular injection**
  - Child 2-17 years: 0.5 mL for 1 dose, dose should be given at least 2 weeks before potential exposure to typhoid infection
  - Adult: 0.5 mL for 1 dose, should be given at least 2 weeks before potential exposure to typhoid infection
  - **By mouth**
  - Child 6-17 years: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)
  - Adult: 1 capsule every 2 days for 3 doses (on days 1, 3, and 5)

**Unlicensed use**
- Not licensed for use in children under 2 years.

**Contra-indications**
- With oral use: Acute gastrointestinal illness

**Interactions**
- Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:
  - Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
  - *Mefloquine* should be avoided for at least 12 hours before or after oral typhoid;
  - For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**Side-effects**
- With oral use: Abdominal cramps, abdominal pain, diarrhoea, nausea, vomiting

**Directions for administration**
- Capsule should be taken once a day after a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

**Handling and storage**
- With oral use: It is important to store capsules in a refrigerator.

**Patient and carer advice**
- With oral use: Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**
- **Cautionary and advisory labels 25**
  - **Vivotif** (PaxVax Ltd)
  - Vivotif vaccine gastro-resistant capsules | 3 capsule | £14.77

**Solution for injection**
- **Typherix** (GlaxoSmithKline UK Ltd)
  - *Salmonella typhi* Vi capsule polysaccharide 50 microgram per 1 mL Typherix 25 micrograms/0.5 mL vaccine solution for injection pre-filled syringes | 1 pre-filled disposable injection | £9.30 | 10 pre-filled disposable injection | £99.32

**Combinations available:** *Hepatitis A with typhoid vaccine*, p. 1165

**Vaccines > Viral vaccines**

### Hepatitis A and B vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1164, hepatitis B vaccine p. 1165.

**Indications and dose**
- **Ambirix**
  - **Immunisation against hepatitis A and hepatitis B infection (primary course)**
    - **By intramuscular injection**
    - Child 1-15 years: Initially 1 mL for 1 dose, then 1 mL after 6-12 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
    - Adult: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Twirnx adult**
- **Immunisation against hepatitis A and hepatitis B infection (primary course)**
  - **By intramuscular injection**
  - Child 16-17 years: Initially 1 mL every month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**Immunisation against hepatitis A and hepatitis B infection—accelerated schedule for travellers departing within 1 month**
- **By intramuscular injection**
  - Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
  - Adult: Initially 1 mL for 1 dose, then 1 mL after 7 days for 1 dose, then 1 mL after 14 days for 1 dose, then 1 mL for 1 dose given 12 months after the first dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)
AVAXIM®

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL every month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**IMPORANT SAFETY INFORMATION**

Ambirix® and Twinrix® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **TWINRIX® PAEDIATRIC** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).
  - **AMBIRIX®** Primary course should be completed with Ambirix® (single component vaccines given at appropriate intervals may be used for booster dose).
  - **TWINRIX® ADULT** Primary course should be completed with Twinrix® (single component vaccines given at appropriate intervals may be used for booster dose).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Ambirix®** (GlanzSmithKline UK Ltd)
  - Ambirix vaccine suspension for injection 1 mL pre-filled disposable syringes | 1 pre-filled disposable injection | £31.18
- **Twinrix®** (GlanzSmithKline UK Ltd)
  - Twinrix Paediatric vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £20.79
  - Twinrix Adult vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection | £33.31 | 10 pre-filled disposable injection | £333.13

**AVAXIM®**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

  - Adult: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

  - Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

  - Adult: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

**VAQTA® ADULT**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 1 mL for 1 dose, then 1 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be delayed)

**VAQTA® PAEDIATRIC**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Avaxim®** (sanofi pasteur MSD Ltd)
  - Avaxim vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £18.10 | 10 pre-filled disposable injection | £181.00
- **Havrix®** (GlanzSmithKline UK Ltd)
  - Havrix monodose vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £22.14 | 10 pre-filled disposable injection | £221.43
  - Havrix Junior monodose vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £16.77 | 10 pre-filled disposable injection | £167.68
- **VAQTA®** (sanofi pasteur MSD Ltd)
  - VAQTA Adult vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection | £18.10
  - VAQTA Adult vaccine suspension for injection 1 mL vials | 1 vial | £18.10
  - VAQTA Paediatric vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £14.74
Hepatitis A with typhoid vaccine

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 1164, typhoid vaccine p. 1163.

**INDICATIONS AND DOSE**

**HENPATRIX®**

Immunisation against hepatitis A and typhoid infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 15-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
  - Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

**VIATIM®**

Immunisation against hepatitis A and typhoid infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines
  - Adult: 1 mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- **Hepatryx** (GlaxoSmithKline UK Ltd)
  - Hepatryx vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection [Pack] £37.21 | 10 pre-filled disposable injection [Pack] £372.10
- **VIATIM** (sanofi pasteur MSD Ltd)
  - VIATIM vaccine suspension for injection 1 mL pre-filled syringes | 1 pre-filled disposable injection [Pack] £29.80

Hepatitis B vaccine

**INDICATIONS AND DOSE**

**ENERGIRX B®**

Immunisation against hepatitis B infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
  - Child 16-17 years: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
  - Adult: 20 micrograms for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule)

- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
  - Child 1 month-15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
  - Child 16-17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
  - Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection, alternative accelerated schedule

- **BY INTRAMUSCULAR INJECTION**
  - Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (accelerated schedule in exceptional cases, e.g. for travellers departing within 1 month)

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 20 micrograms for 1 dose, then 20 micrograms after 7 days for 1 dose, followed by 20 micrograms after 14 days for 1 dose, followed by 20 micrograms for 1 dose, to be given 12 months after the first dose, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1 month-15 years: 10 micrograms every month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
  - Child 16-17 years: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
  - Adult: 40 micrograms every month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))

► BY INTRAMUSCULAR INJECTION

- Child 1 month–15 years: 10 micrograms every month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is a preferred site of injection in older children; anterolateral thigh is preferred site in infants and young children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

HBVAXPRO®

Immunisation against hepatitis B infection

► BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.
- Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)
- Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

Immunisation against hepatitis B infection (in renal insufficiency, including pre-haemodialysis and haemodialysis patients)

► BY INTRAMUSCULAR INJECTION

- Child 15–17 years: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 20 micrograms every month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)
- Chronic haemodialysis patients

► BY INTRAMUSCULAR INJECTION

- Child 16–17 years: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in older children; not to be injected into the buttock (vaccine efficacy reduced)
- Adult: 40 micrograms every month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

EXCIPIENTS: May contain Thiomersal

- Engerix B (GlaxoSmithKline UK Ltd)
  - Hepatitis B virus surface antigen 20 microgram per 1 ml
  - Engerix B 20micrograms/1ml vaccine suspension for injection vials | 1 vial (PoM) £12.34 | 10 vial (PoM) £123.41
  - Engerix B 10micrograms/0.5ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £3.67
  - Engerix B 20micrograms/1ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £12.99 | 10 pre-filled disposable injection (PoM) £129.92
Human papillomavirus vaccines

- **INDICATIONS AND DOSE**

**CERVARIX®**

**Prevention of premalignant genital lesions and cervical cancer**

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.
  - Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**GARDASIL®**

**Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts**

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–13 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Child 14–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
  - Adult (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, second dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–13 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

**PREGNANCY**

Not known to be harmful, but vaccination should be postponed until completion of pregnancy.

**PRESCRIBING AND DISPENSING INFORMATION**

To avoid confusion, prescribers should specify the brand to be dispensed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Cervarix (GlaxoSmithKline UK Ltd)**
  - Cervarix vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £80.50
- **Gardasil (sanofi pasteur MSD Ltd)**
  - Gardasil vaccine suspension for injection 0.5 mL pre-filled syringes | 1 pre-filled disposable injection | £86.50

Influenza vaccine

- **INDICATIONS AND DOSE**

**Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL after at least 4 weeks for 1 dose
  - **BY INTRanasal ADMINISTRATION**
  - Adult: 0.5 mL for 1 dose
  - **BY INTRAderal INJECTION**
  - Adult 18–59 years: 9 micrograms for 1 dose, dose to be injected into deltoid region
  - Adult 60 years and over: 15 micrograms for 1 dose, dose to be injected into deltoid region
  - **BY INTRanasal ADMINISTRATION**
  - Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

**UNLICENSED USE**

Some products containing inactivated influenza vaccine (surface antigen) are not licensed for use in children under 4 years—check product literature.

**FLUVIRIN®**

Not licensed for use in children under 4 years.

**FLUARIX TETRA®**

Not licensed for use in children under 3 years of age.
OPTAFLU® Not licensed for use in children and adolescents under 18 years.

- CONTRA-INDICATIONS Preparations marketed by Pfizer, or CSL Bioteherapies in child under 5 years— increased risk of febrile convulsions
- FLUENZ TETRA® Active wheezing - concomitant use with antiviral therapy for influenza - severe asthma
- CONTRA-INDICATIONS, FURTHER INFORMATION
  - Concomitant use with antivirals Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.
- ENZIRA® Child under 5—increased risk of febrile convulsions
- CAUTIONS Increased risk of fever in child 5—9 years with preparations marketed by Pfizer or CSL Bioteherapies—use alternative influenza vaccine if available
- ENZIRA® Child 5—9 years (increased risk of fever)—use alternative influenza vaccine if available
- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS
  - Uncommon Epistaxis
  - Frequency not known Febrile convulsions • transient thrombocytopenia • vasculitis (in adults)
  - SPECIFIC SIDE-EFFECTS
    - With intranasal use Rhinorrhea
  - ALLERGY AND CROSS-SENSITIVITY Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.
  - PREGNANCY Inactivated vaccines not known to be harmful.
  - FLUENZ TETRA® Avoid in pregnancy.
  - BREAST FEEDING Inactivated vaccines not known to be harmful.
  - FLUENZ TETRA® Avoid in breast-feeding.
  - PRESCRIBING AND DISPENSING INFORMATION
  - FLUARIK TETRA® Ovalbumin content less than 100 nanograms/mL.
  - PATIENT AND CARER ADVICE
  - FLUENZ TETRA® Avoid close contact with severely immunocompromised patients for 1—2 weeks after vaccination.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Suspension for injection
    - EXCIPIENTS: May contain Gelatin, kanamycin, neomycin penicillins, polymyxin b, thiomersal
      - Influenza vaccine (Non-proprietary)
        - Influenza vaccine (split virion, inactivated) suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £5.00—£6.59 | 10 pre-filled disposable injection (PO) £55.90
        - Influenza vaccine (surface antigen, inactivated) suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection (PO) £61.50
        - Agrippal (Sequoris Ltd)
          - Agrippal vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection (PO) £58.50
        - Enzira (Pfizer Ltd)
          - Enzira vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £5.25 | 10 pre-filled disposable injection (PO) £52.50

  - Fluarix Tetra (GlawoSmithkline UK Ltd)
    - Fluarix Tetra vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £9.90 | 10 pre-filled disposable injection (PO) £99.40
  - Imuvac (BGP Products Ltd)
    - Imuvac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £6.59 | 10 pre-filled disposable injection (PO) £65.90
  - Influvac Sub-unit (BGP Products Ltd)
    - Influvac Sub-unit vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £5.22 | 10 pre-filled disposable injection (PO) £52.20
  - Intanza (sanofi pasteur MSD Ltd)
    - Intanza 150microgram strain vaccine suspension for injection 0.1ml pre-filled syringes | 1 pre-filled disposable injection (PO) £9.05 | 10 pre-filled disposable injection (PO) £90.50
  - Optafu (Novartis Vaccines and Diagnostics Ltd)
    - Optafu vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PO) £6.59

- Spray
  - EXCIPIENTS: May contain Gelatin, gentamicin
    - FluMist Quadrivalent (AstraZeneca UK Ltd)
      - FluMist Quadrivalent vaccine nasal suspension 0.2ml unit dose | 10 unit dose (PO) £180.00
    - Fluarix Tetra (AstraZeneca UK Ltd)
      - Fluarix Tetra vaccine nasal suspension 0.2ml unit dose | 10 unit dose (PO) £180.00

Japanese encephalitis vaccine

- INDICATIONS AND DOSE
  - Immunisation against Japanese encephalitis
    - BY INTRAMUSCULAR INJECTION
      - Child 2 months—2 years: 0.25 mL every 28 days for 2 doses, anterolateral thigh is preferred site of injection in infants, the subcutaneous route may be used for patients with bleeding disorders
      - Child 3—17 years: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site in older children; anterolateral thigh is preferred in infants, the subcutaneous route may be used for patients with bleeding disorders
      - Adult: 0.5 mL every 28 days for 2 doses, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders
    - Booster dose
      - BY INTRAMUSCULAR INJECTION
        - Adult: 0.5 mL after 1—2 years, deltoid muscle is preferred site of injection, the subcutaneous route may be used for patients with bleeding disorders, for those at continued risk, the booster dose should be given 1 year after completing the primary course

- SIDE-EFFECTS
  - Uncommon Cough (in children) • migraine (in adults) • vertigo (in adults)
  - Rare Dyspnoea (in adults) • neuritis (in adults) • palpitation (in adults) • tachycardia (in adults) • thrombocytopenia (in adults)
  - PREGNANCY Although manufacturer advises avoid because of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Japanese encephalitis vaccine (Non-proprietary)
      - Japanese encephalitis GCV vaccine solution for injection 1ml vials | 1 vial no price available
      - Japanese encephalitis GCV vaccine solution for injection 20ml vials | 1 vial no price available
      - Japanese encephalitis GCV vaccine solution for injection 10ml vials | 1 vial no price available
Measles, mumps and rubella vaccine, live

**INDICATIONS AND DOSE**

Primary immunisation against measles, mumps, and rubella (first dose)
- By intramuscular injection, or by deep subcutaneous injection
- Child 12-13 months: 0.5 mL for 1 dose

Primary immunisation against measles, mumps, and rubella (second dose)
- By intramuscular injection, or by deep subcutaneous injection
- Child 40 months-5 years: 0.5 mL for 1 dose

Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)
- By intramuscular injection, or by deep subcutaneous injection
- Females of childbearing potential: (consult product literature or local protocols)

Children presenting for pre-school booster, who have not received the primary immunisation (first dose)
- Immunisation for patients at school-leaving age or at entry into further education, who have not completed the primary immunisation course

Control of measles
- Where measles is endemic or epidemic, who have not completed the primary immunisation
- By intramuscular injection, or by deep subcutaneous injection
- Child 6 months-17 years: (consult product literature or local protocols)
- Adult: (consult product literature or local protocols)

**SIDE-EFFECTS**

- Frequency of side effects
- Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine.
- Children with post-vaccination symptoms are not infectious.
- Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

**UNLICENSED USE**

Not licensed for use in children under 9 months.

**IMPORTANT SAFETY INFORMATION**

MMR VACCINATION AND BOWEL DISEASE OR AUTISM

Reviews undertaken on behalf of the CSM, the Medical Research Council, and the Cochrane Collaboration, have not found any evidence of a link between MMR vaccination and bowel disease or autism. The Chief Medical Officers have advised that the MMR vaccine is the safest and best way to protect children against measles, mumps, and rubella. Information (including fact sheets and a list of references) may be obtained from www.dh.gov.uk/immunisation.

**ALLERGY AND CROSS-SENSITIVITY**

MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

**CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

**PRESCRIBING AND DISPENSING INFORMATION**

Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**EXCIPIENTS:** May contain Neomycin
- Priorix (GlaxoSmithKline UK Ltd) Priorix vaccine powder and solvent for solution for injection 0.5ml vials 1 vial £7.64

**Powder and solvent for suspension for injection**

**EXCIPIENTS:** May contain Gelatin, neomycin
- M-M-RVAXPRO (sanofi pasteur MSD Ltd) M-M-RVAXPRO vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes 1 1 pre-filled disposable injection £11.00
Rabies vaccine

- **INDICATIONS AND DOSE**
  - **Pre-exposure prophylaxis**
    - **BY INTRAMUSCULAR INJECTION**
      - Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel.
      - Adult: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel.
  - **Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)**
    - **BY INTRAMUSCULAR INJECTION**
      - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies.
      - Adult: 1 mL for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies.
  - **Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)**
    - **BY INTRAMUSCULAR INJECTION**
      - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants.
      - Adult: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region.
  - **Post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine)**
    - **BY INTRAMUSCULAR INJECTION**
      - Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary.
      - Adult (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region, rabies immunoglobulin is not necessary.
  - **Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)**
    - **BY INTRAMUSCULAR INJECTION**
      - Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk.
      - Adult (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk.

- **SIDE-EFFECTS** Paresis
- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for solution for injection**
    - EXCIPIENTS: May contain Neomycin.
    - Rabipur vaccine powder and solvent for solution for injection 1 mL vial £3.45
    - Rabipur vaccine powder and solvent for suspension for injection 1 mL vial £3.90

Rotavirus vaccine

- **DRUG ACTION** Rotavirus vaccine is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection.

- **INDICATIONS AND DOSE**
  - **Immunisation against gastro-enteritis caused by rotavirus**
    - **BY MOUTH**
      - Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks).

- **CONTRA-INDICATIONS** History of intussusception · predisposition to intussusception · severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Immunosuppression With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

**CAUTIONS** Diarrhoea (postpone vaccination) · immunosuppressed close contacts · vomiting (postpone vaccination)

**CAUTIONS, FURTHER INFORMATION** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.
 Tick-borne encephalitis vaccine, inactivated

**INDICATIONS AND DOSE**

**Initial immunisation against tick-borne encephalitis**

- **By intramuscular injection**
  - Child 1-15 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1-3 months for 1 dose, then 0.25 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Child 16-17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Adult: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
  - Elderly: 0.5 mL for 1 dose, followed by 0.5 mL after 1-3 months for 1 dose, then 0.5 mL after further 5-12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, dose to be administered in deltoid region, antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

**Immunisation against tick-borne encephalitis, booster doses**

- **By intramuscular injection**
  - Child 1-17 years: First dose to be given within 3 years after initial course completed and then every 3-5 years, dose to be administered in deltoid region or anterolateral thigh in infants
  - Adult: First dose to be given within 3 years after initial course completed and then every 3-5 years, dose to be administered in deltoid region (consult product literature)

**ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Exipients:** May contain Gentamicin, neomycin
  - **TicoVac** (Masta Ltd)
    - TicoVac Junior vaccine suspension for injection 0.25ml pre-filled syringes | 1 pre-filled disposable injection (£28.00)
    - TicoVac vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (£32.00)

Varicella-zoster vaccine

**INDICATIONS AND DOSE**

**VARILRIX®**

**Prevention of varicella infection (chickenpox)**

- **By subcutaneous injection, or by intramuscular injection**
  - Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region
  - Adult: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region

**VARIVAX®**

**Prevention of varicella infection (chickenpox)**

- **By subcutaneous injection, or by intramuscular injection**
  - Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
  - Child 13-17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region
  - Adult: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

**Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection**

- **By subcutaneous injection, or by intramuscular injection**
  - Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)

**ZOSTAVAX®**

**Prevention of herpes zoster (shingles)**

- **By subcutaneous injection**
  - Adult 70-79 years: 0.65 mL for 1 dose, to be administered preferably into the deltoid region

**CAUTIONS** Post-vaccination close contact with susceptible individuals

**CAUTIONS, FURTHER INFORMATION**

Rarely, the varicella–zoster virus vaccine has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella–susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.
Administration with MMR vaccine
Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

SIDE-EFFECTS
- Rare
- Frequency not known

CONCEPTION AND CONTRACEPTION
Avoid pregnancy for 3 months after vaccination.

PRESCRIBING AND DISPENSING INFORMATION
ZOSTAVAX® Advice in the BNF may differ from that in product literature.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
EXCIPIENTS: May contain Neomycin
- Varilrix (GlaxoSmithKline UK Ltd)
  Varilrix vaccine powder and solvent for solution for injection 0.5ml vials | 1 vial £5.51

Powder and solvent for suspension for injection
EXCIPIENTS: May contain Gelatin, neomycin
- Varivax (sanofi pasteur MSD Ltd)
  Varivax vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial £4.28
- Zostavax (sanofi pasteur MSD Ltd)
  Zostavax vaccine powder and solvent for suspension for injection 0.65ml pre-filled syringes | 1 pre-filled disposable injection £99.96

Yellow fever vaccine, live

INDICATIONS AND DOSE
Immunisation against yellow fever
- BY DEEP SUBCUTANEOUS INJECTION
  - Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
  - Child 9 months–17 years: 0.5 mL for 1 dose
  - Adult: 0.5 mL for 1 dose

CONTRA-INDICATIONS
- Children under 6 months - history of thymus dysfunction
- Individuals over 60 years — greater risk of adverse effects

CAUTIONS, FURTHER INFORMATION
- Administration with MMR vaccine
  Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

SIDE-EFFECTS
- Neurotropic disease - viscerotropic disease

SIDE-EFFECTS, FURTHER INFORMATION
- Vaccine-associated adverse effects
  - Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

ALLERGY AND CROSS-SENSITIVITY
- Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

PREGNANCY
- Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

BREAST FEEDING
- Avoid; seek specialist advice if exposure to virus cannot be avoided.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection
- Stamaril (sanofi pasteur MSD Ltd)
  Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial £33.10
Chapter 15
Anaesthesia

Contents

General anaesthesia

Overview

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The doses of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’); lower doses may be required in premedicated patients.

Total intravenous anaesthesia

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

Drugs used for intravenous anaesthesia

Propofol p. 1175, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in adults and children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures and sedation in adults in intensive care.

Thiopental sodium p. 316 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

Etomidate p. 1177 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 1189 is used rarely. Ketamine causes less hypotension than thiopental sodium and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 321 or midazolam p. 318.

Inhalational anaesthetics

Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 1177 is being administered.
Anaesthesia

Volatile liquid anaesthetics

Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic.

Isofluorane p. 1177 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure and cardiac output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 1177 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 1178 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia; it has little effect on heart rhythm compared with other volatile liquid anaesthetics.

Nitrous oxide

Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, nitrous oxide is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox™, Equanox™) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 1181 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene sodium p. 1191 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice

Overview

Sedation for dental procedures should be limited to conscious sedation. Diazepam p. 321 and temazepam p. 451 are effective anxiolytics for dental treatment in adults.

For details of sedation, anaesthesia, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Standards for Conscious Sedation in the Provision of Dental Care; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 www.rcseng.ac.uk/dental-faculties/fds/publications-guidelines/standards-for-conscious-sedation-in-the-provision-of-dental-care

Surgery and long-term medication

Overview

The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovascular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. See general advice on surgery in diabetic patients in Insulins and anti-diabetic drugs p. 627, Diabetes and surgery.

Patients taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 125 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 723; for advice on hormone replacement therapy, see Sex hormones p. 686. MAOIs can have important interactions with some drugs used during surgery, such as pethidine hydrochloride p. 434. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can
be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

**ANAESTHETICS, GENERAL** > **INTRAVENOUS ANAESTHETICS**

**Etomidate**

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia**
    - By slow intravenous injection
      - Adult: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)
      - Elderly: 150–200 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous)

**IMPORTANT SAFETY INFORMATION**

Etomidate should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS**
  - Acute circulatory failure (shock) • Acute porphyrias p. 930 (avoid) • Adrenal insufficiency • Cardiovascular disease • Elderly • Fixed cardiac output • Hypovolaemia

- **INTERACTIONS**
  - Appendix 1 (anaesthetics, general).

- **SIDE-EFFECTS**
  - Common or very common
    - Apnoea • Hyperventilation • Hypotension • Nausea • Rash • Stridor • Vomiting
  - Uncommon
    - Arrhythmias • Cough • Hiccups • Hypersalivation • Hypertension • Phlebitis
  - Frequency not known
    - AV block • Cardiac arrest • Excessive muscle movement (high incidence) • Pain on injection • Respiratory depression • Seizures • Shivering • Stevens-Johnson syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Pain on injection Can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction.
  - Excessive muscle movement Excessive muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

- **PREGNANCY**
  - May depress neonatal respiration if used during delivery.

- **BREAST FEEDING**
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **HEPATIC IMPAIRMENT**
  - Reduce dose in liver cirrhosis.

- **DIRECTIONS FOR ADMINISTRATION**
  - To be administered over 30–60 seconds (60 seconds in patients in whom hypotension might be hazardous).

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for injection**
    - **EXCIPIENTS:** May contain Propylene glycol
      - Hypnomidate (Janssen-Cilag Ltd)
        - Etomidate 2 mg per 1 ml Hypnomidate 20mg/10ml solution for injection ampoules | 5 ampoule £6.90
    - **Emulsion for injection**
      - Etomidate-Lipuro (B Braun Medical Ltd)
        - Etomidate 2 mg per 1 ml Etomidate-Lipuro 20mg/10ml emulsion for injection ampoules | 10 ampoule £15.62

**Propofol**

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia using 0.5% or 1% injection**
    - By slow intravenous injection, or by intravenous infusion
  - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response, for debilitated patients use dose for 55 years and over
  - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

  - **Induction of anaesthesia using 2% injection**
    - By intravenous infusion
  - Adult 18–54 years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response. For debilitated patients use dose for 55 years and over
  - Adult 55 years and over: Usual dose 1–1.5 mg/kg, to be administered at a rate of 20 mg every 10 seconds until response

  - **Maintenance of anaesthesia using 1% injection**
    - Initially by intravenous infusion
  - Adult: Usual dose 4–12 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response, for debilitated patients use dose for elderly
  - Elderly: Usual dose 3–6 mg/kg/hour, alternatively (by slow intravenous injection) 25–50 mg, dose may be repeated according to response

  - **Maintenance of anaesthesia using 2% injection**
    - By intravenous infusion
  - Adult: Usual dose 4–12 mg/kg/hour, for debilitated patients use dose for elderly
  - Elderly: Usual dose 3–6 mg/kg/hour

  - **Sedation of ventilated patients in intensive care using 1% or 2% injection**
    - By continuous intravenous infusion
  - Adult: Usual dose 0.3–4 mg/kg/hour, adjusted according to response

  - **Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**
    - By slow intravenous injection
  - Adult: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

  - **Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection**
    - Initially by intravenous infusion
  - Adult: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by continued →
Anaesthesia

RENAL IMPAIRMENT

Propofol infusion syndrome

Extraneous muscle movement

Bradycardia

Frequency not known

SIDE-EFFECTS, FURTHER INFORMATION

Bradyarrhythmias - hypotension - tachycardia - transient anaphylaxis

SIDE-EFFECTS

CAUTIONS Acute circulatory failure (shock) - cardiac impairment - cardiovascular disease - elderly - epilepsy - fixed cardiac output - hypotension - hypervolaemia - raised intracranial pressure - respiratory impairment

INTERACTIONS Appendix 1 (anaesthetics, general).

SIDE-EFFECTS

Common or very common Headache - hypotension - tachycardia - transient anaphylaxis

Uncommon Phlebitis - thrombosis

Rare Anaphylaxis - arrhythmia - convulsions (onset can be delayed) - delayed recovery from anaesthesia - euphoria

Very rare Discoloration of urine - pancreatitis - pulmonary oedema - sexual disinhibition

Frequency not known Bradyarrhythmias - pain on intravenous injection - propofol infusion syndrome - significant extraneous muscle movements

SIDE-EFFECTS, FURTHER INFORMATION

Bradyarrhythmias - hypotension - tachycardia - transient anaphylaxis

Extraneous muscle movement

Pain on injection

Propofol infusion syndrome

Pregnancy

Breast feeding

Hepatic impairment

Renal impairment

MONITORING REQUIREMENTS

Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

DIRECTIONS FOR ADMINISTRATION

Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site or administered with Glucose 5% or Sodium chloride 0.9% 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/ml. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or Propofol-Lipuro® or Sodium chloride 0.9% (Propofol-Lipuro®) only; dilute to a concentration not less than 2 mg/ml; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Emulsion for injection

Diprivan (AstraZeneca UK Ltd)

Propofol 10 mg per 1 ml Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoule £15.36 (Hospital only)

Propofol-Lipuro (B.Braun Melsungen AG)

Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoule £14.71

Emulsion for infusion

Diprivan (AstraZeneca UK Ltd)

Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection £10.68

Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection £15.16

ANAESTHETICS, GENERAL > VOLATILE LIQUID ANAESTHETICS

Volatile halogenated anaesthetics

IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

CONTRA-INDICATIONS

Susceptibility to malignant hyperthermia

CAUTIONS Can trigger malignant hyperthermia - raised intracranial pressure (can increase cerebrospinal pressure)

SIDE-EFFECTS

Common or very common Arrhythmias - cardiorespiratory depression - hypotension

Frequency not known Convulsions - mood changes (that can last several days)

ALLERGY AND CROSS-SENSITIVITY

Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

DIRECTIONS FOR ADMINISTRATION

Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the...
carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

### Desflurane

**INDICATIONS AND DOSE**

**Induction of anaesthesia (but not recommended)**
- **BY INHALATION**
  - Adult: 4–11%, to be inhaled through specifically calibrated vaporiser

**Maintenance of anaesthesia (in nitrous oxide-oxygen)**
- **BY INHALATION**
  - Adult: 2–6%, to be inhaled through a specifically calibrated vaporiser

**INTERACTIONS** → Appendix 1 (anaesthetics, general).

**SIDE-EFFECTS** Apnoea, breath-holding, cough, increased secretions, laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Desflurane (Non-proprietary)**
  - Desflurane 1 ml per 1 ml | 240 ml [P]
  - Desflurane volatile liquid | 250 ml [P]
  - no price available (Hospital only)

### Isoflurane

**INDICATIONS AND DOSE**

**Induction of anaesthesia (in oxygen or nitrous oxide-enriched air)**
- **BY INHALATION**
  - Adult: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser

**Maintenance of anaesthesia (in oxygen or oxygen-enriched air)**
- **BY INHALATION**
  - Adult: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser

**INTERACTIONS** → Appendix 1 (anaesthetics, general).

**SIDE-EFFECTS** Apnoea, breath-holding, cough, increased secretions, laryngospasm

**PREGNANCY** May depress neonatal respiration if used during delivery.

**BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking **alcohol** should also be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- **Isoflurane (Non-proprietary)**
  - Isoflurane 1 ml per 1 ml | 250 ml [P] £35.29 (Hospital only)
  - Isoflurane volatile liquid | 250 ml [P] £47.50 (Hospital only)
  - AErrane (Baxter Healthcare Ltd)
    - Isoflurane 1 ml per 1 ml | 250 ml [P] no price available (Hospital only)

### Nitrous oxide

**INDICATIONS AND DOSE**

**Maintenance of anaesthesia in conjunction with other anaesthetic agents**
- **BY INHALATION**
  - Adult: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen

**Anaesthesia**
- **BY INHALATION**
  - Adult: Up to 50%, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs

**IMPORTANT SAFETY INFORMATION**

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CAUTIONS** Entrapped air following recent underwater dive, pneumothorax, presence of intracranial air after head injury, recent intra-ocular gas injection

**CAUTIONS, FURTHER INFORMATION**

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

**INTERACTIONS** → Appendix 1 (anaesthetics, general).
Sevoflurane

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia (in oxygen or nitrous oxide-oxygen)**
    - **By Inhalation**
      - Adult: Initially 0.5–1 %, then increased to up to 8 %, increased gradually, according to response, to be administered using specifically calibrated vaporiser
  - **Maintenance of anaesthesia (in oxygen or nitrous oxide-oxygen)**
    - **By Inhalation**
      - Adult: 0.5–3 %, adjusted according to response, to be administered using specifically calibrated vaporiser

- **CAUTIONS** Susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
  - Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

- **SIDE-EFFECTS** Cardiac arrest - dystonia - leucopenia - torsade de pointes - urinary retention

- **PREGNANCY** May depress neonatal respiration if used during delivery.

- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **MEDICINAL FORMS**
  - Inhalation vapour
    - Sevoflurane (Non-proprietary)
      - Sevoflurane 1 ml per 1 ml: Sevoflurane volatile liquid | 250 ml (Pres No 1175)

1 Anaesthesia adjuvants

**Pre-medication and peri-operative drugs**

**Drugs that affect gastric pH**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastroesophageal reflux disease and in circumstances where gastric emptying may be delayed.

A H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate p. 721 are preferred.

**Antimuscarinic drugs**

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 583 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 1175 and suxamethonium chloride p. 1181.

Atropine sulfate p. 1179 is now rarely used for premedication but still has an emergency role in the
treatment of vagotonic side-effects. Atropine sulfate may have a role in acute arrhythmias after myocardial infarction. Hyoscine hydrobromide p. 409 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyronium bromide p. 1180 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs.

Phenothiazines do not effectively reduce secretions when used alone.

**Sedative drugs**

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures.

Premedics can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

**Benzodiazepines**

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation. Flumazenil p. 1213 is used to antagonise the effects of benzodiazepines.

Diazepam p. 321 is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of administration. Peri-operative use of diazepam in children is not recommended; its effect and timing of administration depend on the severity of poisoning.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritating and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection.

Temazepam p. 451 is given by mouth for premedication and has a shorter duration of action and a more rapid onset than oral diazepam; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

Lorazepam p. 317 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Midazolam p. 318 is a water-soluble benzodiazepine that is often used in preference to intravenous diazepam; recovery is faster than from diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing. Midazolam is associated with profound sedation when high doses are given intravenously or when it is used with certain other drugs.

**Other drugs for sedation**

Dexmedetomidine p. 1190 and clonidine hydrochloride p. 136 are alpha₂-adrenergic agonists with sedative properties. Dexmedetomidine is licensed for the sedation of patients receiving intensive care who need to remain responsive to verbal stimulation. Clonidine hydrochloride [unlicensed indication] can be used by mouth or by intravenous injection as a sedative agent when adequate sedation cannot be achieved with standard treatment.

**Antagonists for central and respiratory depression**

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone hydrochloride p. 1214. Naloxone hydrochloride will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone hydrochloride; however, naloxone hydrochloride will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become resedated.

Doxapram hydrochloride p. 280 is a central and respiratory stimulant but is of limited value in anaesthesia.

**ANTIMUSCARINICS**

**Atropine sulfate**

- **INDICATIONS AND DOSE**
  - Bradycardia due to acute massive overdose of beta-blockers
    - **BY INTRAVENOUS INJECTION**
      - Child: 40 micrograms/kg (max. per dose 3 mg)
      - Adult: 3 mg
  - Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)
    - **BY INTRAVENOUS INJECTION**
      - Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
      - Adult: 2 mg every 5–10 minutes until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning
  - Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
    - **BY MOUTH**
      - Adult: 0.6–1.2 mg daily, dose to be taken at night
  - Premedication
    - **BY INTRAVENOUS INJECTION**
      - Child 12-17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
      - Adult: 300–600 micrograms, to be administered immediately before induction of anaesthesia
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Child 12-17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
      - Adult: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
  - **Intra-operative bradycardia**
    - **BY INTRAVENOUS INJECTION**
      - Child 12-17 years: 300–600 micrograms, larger doses may be used in emergencies
      - Adult: 300–600 micrograms, larger doses may be used in emergencies
Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block

- **BY INTRAVENOUS INJECTION**
- Child 12–17 years: 0.6–1.2 mg
- Adult: 0.6–1.2 mg

Excessive bradycardia associated with beta-blocker use

- **BY INTRAVENOUS INJECTION**
- Adult: 0.6–2.4 mg in divided doses (max. per dose 600 micrograms)

Bradycardia following myocardial infarction (particularly if complicated by hypotension)

- **BY INTRAVENOUS INJECTION**
- Adult: 500 micrograms every 3–5 minutes; maximum 3 mg per course

**UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication.

### IMPORTANT SAFETY INFORMATION

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **PREGNANCY** Not known to be harmful; manufacturer advises caution.
- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block. Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.

- **LESS SUITABLE FOR PRESCRIBING** Atropine tablets less suitable for prescribing. Any clinical benefit as a gastro-intestinal antispasmodic is outweighed by atropinic side-effects.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use or subcutaneous use Prescription medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution containing the same drug.

**Tablet**

- **Atropine sulfate (Non-proprietary)**
  - Atropine sulfate 600 microgram Atropine 600microgram tablets | 28 tablet £52.92 DT price = £49.53

**Solution for injection**

- **Atropine sulfate (Non-proprietary)**
  - Atropine sulfate 100 microgram per 1 ml Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.40–£13.00 | 10 pre-filled disposable injection £69.00–£130.00
  - Atropine sulfate 1 mg per 1 ml Atropine 1mg/1ml solution for injection ampoules | 10 ampoule £68.72–£72.77 DT price = £70.75
  - Atropine sulfate 200 microgram per 1 ml Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.08–£13.00 | 10 pre-filled disposable injection £69.00–£130.00
  - Atropine sulfate 300 microgram per 1 ml Atropine 3mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.08–£13.00 DT price = £7.29 | 10 pre-filled disposable injection £69.00–£130.00
  - Atropine sulfate 400 microgram per 1 ml Atropine 400micrograms/1ml solution for injection ampoules | 10 ampoule £74.14–£78.94 DT price = £76.54

**Glycopyrronium bromide**

(Glycopyrrolate)

**INDICATIONS AND DOSE**

Premedication at induction

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS**
- Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

Intra-operative bradycardia

- **BY INTRAVENOUS INJECTION**
- Adult: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms), repeated if necessary

Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block

- **BY INTRAVENOUS INJECTION**
- Adult: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

Bowel colic in palliative care | Excessive respiratory secretions in palliative care

- **BY SUBCUTANEOUS INJECTION**
- Adult: 200 micrograms every 4 hours and when required, hourly use is occasionally necessary, particularly in excessive respiratory secretions

- **BY SUBCUTANEOUS INFUSION**
- Adult: 0.6–1.2 mg/24 hours

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care

For further information on the use of glycopyrronium bromide in palliative care, see www.palliativedrugs.com/formulary/en/glycopyrronium.html.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Glycopyrronium bromide (Non-proprietary)**
  - Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 200micrograms/1ml solution for injection ampoules | 10 ampoule £14.00 DT price = £10.88
  - Glycopyrronium bromide 600micrograms/3ml solution for injection ampoules | 3 ampoule £8.00–£9.75 | 10 ampoule £11.50

Combinations available: Neostigmine with glycopyrronium bromide, p. 1185

### 1.1 Neuromuscular blockade

**Neuromuscular blockade**

Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the
neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

**Non-depolarising neuromuscular blocking drugs**

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 983. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 1183, rocuronium bromide p. 1184, and vecuronium bromide p. 1184, and the benzylisoquinolinium group, comprising atracurium besilate p. 1182, cisatracurium p. 1183, and mivacurium p. 1183.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride below. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vercuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

**Depolarising neuromuscular blocking drugs**

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required, e.g. with tracheal intubation. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Individuals with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

**NEUROMUSCULAR BLOCKING DRUGS › DEPOLARISING**

### Suxamethonium chloride (sucinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

- **INDICATIONS AND DOSE**

  **Neuromuscular blockade (short duration) during surgery and intubation**

  - BY INTRAVENOUS INJECTION
  - Adult: 1–1.5 mg/kg

  - **UNLICENSED USE** Doses of suxamethonium in BNF may differ from those in product literature.

- **IMPORTANT SAFETY INFORMATION**

  Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy · family history of malignant hyperthermia · hyperkalaemia · low plasma-cholinesterase activity (including severe liver disease) · major trauma · neurological disease involving acute wasting of major muscle · personal or family history of congenital myotonic disease · prolonged immobilation of the musculature (risk of hyperkalaemia) · severe burns
**NEUROMUSCULAR BLOCKING DRUGS**

### Non-depolarising neuromuscular blocking drugs

**IMPORTANT SAFETY INFORMATION**

Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CAUTIONS** Burns (resistance can develop, increased doses may be required) - cardiovascular disease (reduce rate of administration) - electrolyte disturbances (response unpredictable) - fluid disturbances (response unpredictable) - hypothermia (activity prolonged, lower doses required) - myasthenia gravis (activity prolonged, lower doses required) - neuromuscular disorders (response unpredictable)

- **INTERACTIONS** Appendix 1 (muscle relaxants).

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

- **BREAST FEEDING** Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

---

**Atracurium besilate**

(Atracurium besylate)

- **INDICATIONS AND DOSE**
  - **Neuromuscular blockade (short to intermediate duration)**
    - **for surgery and intubation**
      - **INITIALLY BY INTRAVENOUS INJECTION**
        - **Adult**: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg as required, alternatively (by intravenous injection) initially 300–600 micrograms/kg, followed by (by intravenous infusion) 300–600 micrograms/kg/hour
  - **Neuromuscular blockade during intensive care**
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - **Adult**: Initially 300–600 micrograms/kg, initial dose is optional, then (by intravenous infusion) 270–1770 micrograms/kg/hour; (by intravenous infusion) usual dose 650–780 micrograms/kg/hour

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS**
  - **Very rare** Anaphylactoid reactions
  - **Frequency not known** Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - seizures - skin flushing - tachycardia

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection
- Suxamethonium chloride (Non-proprietary)
  - Suxamethonium chloride 50 mg per 1 ml: Suxamethonium chloride 100mg/2ml solution for injection ampoules 10 ampoule £28.80–£50.00
  - Anectine (GlaxoSmithKline UK Ltd)
  - Suxamethonium chloride 50 mg per 1 ml: Anectine 100mg/2ml solution for injection ampoules 5 ampoule £3.57

---

Cisatracurium

**INDICATIONS AND DOSE**

Neuromuscular blockade (intermediate duration) during surgery and intubation

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 150 micrograms/kg, then (by intravenous injection) maintenance 30 micrograms/kg every 20 minutes, alternatively (by intravenous infusion) initially 180 micrograms/kg/hour, then (by intravenous infusion) maintenance 60–120 micrograms/kg/hour, maintenance dose administered after stimulation.

Neuromuscular blockade (intermediate duration) during intensive care

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 150 micrograms/kg, initial dose is optional, then (by intravenous infusion) 180 micrograms/kg/hour, adjusted according to response; (by intravenous infusion) usual dose 30–600 micrograms/kg/hour.

**SIDE-EFFECTS**

Acute myopathy (after prolonged use in intensive care) - bradycardia.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Nimbex®, Nimbex Forte®), give continuously in Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**INDICATIONS AND DOSE**

Neuromuscular blockade (long duration) during surgery and intubation

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 100 micrograms/kg, then 20 micrograms/kg as required.

Neuromuscular blockade (long duration) during intensive care

- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 100 micrograms/kg, initial dose is optional, then 60 micrograms/kg every 60–90 minutes.

**SIDE-EFFECTS**

Acute myopathy (after prolonged use in intensive care) - hypertension - tachycardia

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of 500 micrograms/mL; may also be given undiluted. Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**SIDE-EFFECTS**

Burns (low plasma cholinesterase activity; dose titration required) - elderly

**SIDE-EFFECTS**

- Very rare: Anaphylactoid reactions
- Frequency not known: Bronchospasm - hypotension - skin flushing - tachycardia

**HEPATIC IMPAIRMENT**

Reduce dose in severe impairment.

**RENAI IMPAIRMENT**

Clinical effect prolonged in renal failure—reduce dose according to response.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Mivacron (GlaxoSmithKline UK Ltd)
  - Mivacurium (as Mivacurium chloride) 2 mg per 1 mL
    - Mivacron 10 mg/5 mL solution for injection ampoules | 5 ampoule £55.00
    - Mivacron 20 mg/10 mL solution for injection ampoules | 5 ampoule £22.57

**Mivacron**

**INDICATIONS AND DOSE**

Neuromuscular blockade (short duration) during surgery and intubation

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 70–250 micrograms/kg; (by intravenous injection) maintenance 100 micrograms/kg every 15 minutes, alternatively (by intravenous infusion) maintenance 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 6–7 micrograms/kg/minute.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.
Rocuronium bromide

**INDICATIONS AND DOSE**

Neuromuscular blockade (intermediate duration) during surgery and intubation

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: Initially 600 micrograms/kg; (by intravenous injection) maintenance 150 micrograms/kg, alternatively (by intravenous infusion) maintenance 300–600 micrograms/kg/hour, adjusted according to response.
  - Elderly: Initially 600 micrograms/kg; (by intravenous injection) maintenance 75–100 micrograms/kg, alternatively (by intravenous infusion) maintenance up to 400 micrograms/kg/hour, adjusted according to response.

**RENAL IMPAIRMENT**

Very rare

**SIDE-EFFECTS**

- Very rare Anaphylactoid reactions
- Frequency not known Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - skin flushing - tachycardia

**HEPATIC IMPAIRMENT**

Reduce dose.

**RENAI IMPAIRMENT**

Reduce maintenance dose; prolonged paralysis.

**DIRECTIONS FOR ADMINISTRATION**

For continuous intravenous infusion or via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Rocuronium bromide (Non-proprietary) Rocuronium bromide 10 mg per 1 ml Rocuronium bromide 50mg/5ml solution for injection ampoules | 10 ampoule £24.00
  - Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial £28.00–£30.00
  - Rocuronium bromide 100mg/10ml solution for injection vials | 10 vial £57.00–£57.90
- Esmeron (Merck Sharp & Dohme Ltd) Esmeron 10 mg per 1 ml Esmeron 50mg/5ml solution for injection vials | 10 vial £28.92 (Hospital only)
  - Esmeron 100mg/10ml solution for injection vials | 10 vial £57.85 (Hospital only)

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.

**Vecuronium bromide**

**INDICATIONS AND DOSE**

Neuromuscular blockade (intermediate duration) during surgery and intubation

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Adult: 80–100 micrograms/kg; (by intravenous injection) maintenance 20–30 micrograms/kg, adjusted according to response, max. 100 micrograms/kg in caesarian section, alternatively (by intravenous infusion) maintenance 0.8–1.4 micrograms/kg/minute, adjusted according to response.

**SIDE-EFFECTS**

- Very rare Anaphylactoid reactions
- Frequency not known Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - skin flushing - tachycardia

**HEPATIC IMPAIRMENT**

Use with caution in significant impairment.

**RENAI IMPAIRMENT**

Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

Reconstitute each vial with 5 mL Water for Injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections—unsuitable for further dilution if not reconstituted with Water for Injections. For continuous intravenous infusion, dilute reconstituted solution to a concentration up to 40 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- Norcuron (Merck Sharp & Dohme Ltd) Vecuronium bromide 10 mg Norcuron 10mg powder and solvent for solution for injection vials | 10 vial £33.73 (Hospital only)

1.2 Neuromuscular blockade reversal

**Neuromuscular blockade reversal**

**Drugs for reversal of neuromuscular blockade**

**Anticholinesterases**

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug succinylcholine chloride.

- Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary.
- Glycopyronium bromide p. 1180 or alternatively atropine sulfate p. 1179, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

**Other drugs for reversal of neuromuscular blockade**

Sugammadex p. 1185 is a modified gamma cyclodextrin that can be used for rapid reversal of neuromuscular blockade induced by rocuronium bromide or vecuronium bromide. In
practice, sugammadex is used mainly for rapid reversal of neuromuscular blockade in an emergency.

**ANTICHOLINESTERASES**

Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 983, glycopyrronium bromide p. 1180.

- **INDICATIONS AND DOSE**
  - Reversal of non-depolarising neuromuscular blockade
    - **BY INTRAVENOUS INJECTION**
    - Adult: 1–2 mL, repeated if necessary, alternatively 0.02 mL/kilogram, repeated if necessary; maximum 2 mL per course

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over 10–30 seconds.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Neostigmine with glycopyrronium bromide (Non-proprietary)
      - Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine methylsulfate 2.5 mg per 1 mL Neostigmine 2.5mg/1mL / Glycopyrronium bromide 500micrograms/1mL solution for injection ampoules | 10 ampoule £11.50

ANTIDOTES AND CHELATORS

Sugammadex

- **INDICATIONS AND DOSE**
  - Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium
    - **BY INTRAVENOUS INJECTION**
    - Adult: Initially 2–4 mg/kg, then 4 mg/kg if required, administered if recurrence of neuromuscular blockade occurs; consult product literature for further details
  - Immediate reversal of neuromuscular blockade induced by rocuronium
    - **BY INTRAVENOUS INJECTION**
    - Adult: 16 mg/kg (consult product literature)

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CAUTIONS**
  - Cardiovascular disease (recovery may be delayed) - elderly (recovery may be delayed) - pre-existing coagulation disorders - recurrence of neuromuscular blockade— monitor respiratory function until fully recovered - use of anticoagulants (unrelated to surgery) - wait 24 hours before re-administering rocuronium - wait 24 hours before re-administering vecuronium
- **INTERACTIONS** Appendix 1 (sugammadex).
- **SIDE-EFFECTS** Bradycardia - bronchospasm - cardiac arrest - hypersensitivity reactions
- **PREGNANCY** Use with caution—no information available.
- **RENA L IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **ELECTROLYTES:** May contain Sodium
    - Bridion (Merck Sharp & Dohme Ltd)
      - Sugammadex (as Sugammadex sodium) 100 mg per 1 ml Bridion 500mg/5ml solution for injection vials | 10 vial £149.00 (Hospital only)
      - Bridion 200mg/2ml solution for injection vials | 10 vial £596.40 (Hospital only)

1.3 Peri-operative analgesia

**Peri-operative analgesia**

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not affect coagulation, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain. Acetaminophen p. 989, diclofenac sodium p. 993, diclofenac potassium p. 992, flurbiprofen p. 998, ibuprofen p. 999, ketoprofen p. 1002, paracetamol p. 414, parecoxib p. 1187, and ketorolac trometamol p. 1186, are licensed for postoperative use. Diclofenac and paracetamol can be given by injection as well as by mouth. Diclofenac sodium can be given by intravenous infusion for the treatment or prevention of postoperative pain. Intramuscular injections of diclofenac sodium and ketoprofen are rarely used; they are given deep into the gluteal muscle to minimise pain and tissue damage. Ketorolac trometamol is less irritant on intramuscular injection but has been reported; it can also be given by intravenous injection.

Suppositories of diclofenac sodium and ketoprofen may be effective alternatives to the parenteral use of these drugs.

Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. See general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 1178.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

 Alfentanil p. 1187, fentanyl p. 424, and remifentanil p. 1188 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive. Alfentanil, fentanyl, and remifentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by
nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

**ANAESTHETICS, LOCAL**

### Bupivacaine with fentanyl

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1193, fentanyl p. 424.

#### INDICATIONS AND DOSE

**During labour (once epidural block established)**

- **BY CONTINUOUS LUMBAR EPIDURAL INFUSION**
  - Adult: 10–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 16–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours

**Postoperative pain (once epidural block established)**

- **BY CONTINUOUS EPIDURAL INFUSION**
  - Adult: 4–18.75 mg/hour, dose of bupivacaine to be administered, maximum 400 mg bupivacaine in 24 hours and 8–30 micrograms/hour, dose of fentanyl to be administered, maximum 720 micrograms fentanyl in 24 hours, to be administered by thoracic, upper abdominal or lower abdominal epidural infusion

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Solution for infusion**

- **Bufyl (AMCo)**
  - Bupivacaine hydrochloride 1 mg per 1 ml, Fentanyl 2 microgram per 1 ml Bufyl 1mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag (£9.20) (Hospital only) [CD2]
  - Bufyl 1mg/ml and 2micrograms/ml 500ml infusion bags | 20 bag (£17.00) (Hospital only) [CD2]
  - Bupivacaine hydrochloride 1.25 mg per 1 ml, Fentanyl (as Fentanyl citrate) 2 microgram per 1 ml Bufyl 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 20 bag (£18.00) (Hospital only) [CD2]
  - Bufyl 1.25mg/ml and 2micrograms/ml 500ml infusion bags | 10 bag (£9.20) (Hospital only) [CD2]

**ANAALGESICS**

### Ketorolac trometamol

#### INDICATIONS AND DOSE

**Short-term management of moderate to severe acute postoperative pain only**

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Adult (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
  - Adult (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day

- **CONTRA-INDICATIONS**
  - Active or history of gastrointestinal bleeding, active or history of gastrointestinal ulceration, coagulation disorders, complete or partial syndrome of nasal polyps, confirmed or suspected cerebrovascular bleeding, dehydration, following operations with high risk of haemorrhage or incomplete haemostasis, haemorrhagic diatheses, history of gastrointestinal perforation, hypovolaemia, severe heart failure

- **CAUTIONS**
  - Allergic disorders, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), elderly (risk of serious side-effects and fatalities), heart failure, ischaemic heart disease, peripheral arterial disease, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension

- **INTERACTIONS** → Appendix 1 (NSAIDs).

#### SIDE-EFFECTS

- **Rare**
  - Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **Frequency not known**
  - Abnormal dreams · angioedema · asthma · blood disorders · bradycardia · bronchospasm · chest pain · colitis (induction of or exacerbation of) · confusion · convulsions · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · dry mouth · dyspnoea · euphoria · fluid retention (rarely precipitating congestive heart failure) · flushing · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haemorrhagia · hallucinations · headache · hearing disturbances · hyperkalaemia · hyperkinesia · hypersensitivity reactions · hypertension · hyponatraemia · insomnia · malaise · myalgia · nausea · nervousness · optic neuritis · pain at injection site · pallor · palpitation · paraesthesia · photosensitivity · psychosis · purpura · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · sweating · taste disturbances · thirst · tinnitus · urinary frequency · vertigo · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - Avoid until the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
**Parecoxib**

- **DRUG ACTION** Parecoxib is a selective inhibitor of cyclooxygenase-2.

- **INDICATIONS AND DOSE**
  - **Short-term management of acute postoperative pain**
    - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
      - Adult: Initially 40 mg, then 20–40 mg every 6–12 hours as required for up to 3 days; maximum 80 mg per day
      - Elderly (body-weight up to 50 kg): Initially 20 mg; maximum 40 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • cerebral vascular disease • inflammatory bowel disease • ischaemic heart disease • mild to severe heart failure • peripheral arterial disease

- **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • dehydration • elderly (risk of serious side-effects and fatalities) • following coronary artery bypass graft surgery • history of cardiac failure • hypertension • left ventricular dysfunction • oedema • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - Common or very common • Alveolar osteitis • flatulence • hypoaesthesia • hypokalaemia • hypotension • postoperative anaemia • sweating
  - Uncommon • Anorexia • arthralgia • bradycardia • cardiovascular events • ecchymosis • hyperglycaemia • malaise • pulmonary embolism
  - Rare • Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances
  - Frequency not known • Angioedema • blood disorders • blood pressure may be raised • bronchospasm • circulatory collapse • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • rashes • renal failure (especially in patients with pre-existing renal impairment) • tachycardia • tinnitus • vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 987.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID. Contra-indicated in patients with a history of allergic drug reactions including sulfonamide hypersensitivity.

- **CONCEPTION AND CONCEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Halve dose in moderate impairment (max. 40 mg daily). Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium (SMC) has advised (January 2003) that parecoxib is not recommended for use within NHS Scotland.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - Ketorolac tromethamol (Non-proprietary) Ketorolac tromethamol 30 mg per 1 ml Ketorolac 30mg/1ml solution for injection ampoules | 6 ampoule (Pom) £6.56
  - Toradol (AstraZeneca UK Ltd) Ketorolac tromethamol 30 mg per 1 ml Toradol 30mg/1ml solution for injection ampoules | 5 ampoule (Pom) £5.36

**ALGESICS ▶ OPIOIDS**

- **Alfentanil**

  - **INDICATIONS AND DOSE**
    - **Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures**
      - **BY INTRAVENOUS INJECTION**
        - Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms
**Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures**
- **BY INTRAVENOUS INJECTION**
  - Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg
- **Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour
- **Assisted ventilation: analgesia and suppression of respiratory activity during intensive care for up to 4 days**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**
- Repeated intra-operative doses: Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**SIDE-EFFECTS**
- **Common or very common** Hypertension - myoclonic movements
- **Uncommon** Arrhythmias - hiccup - laryngospasm
- **Rare** Epistaxis
- **Frequency not known** Cardiac arrest - convulsions - cough - muscle rigidity - pyrexia

**SIDE-EFFECTS, FURTHER INFORMATION**
- Muscle rigidity: Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**BREAST FEEDING**
Present in milk — withhold breastfeeding for 24 hours.

**RENAI IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.

**Alfentanil**

- **INDICATIONS AND DOSE**
  - **Premedication**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Adult: 0.5–1 mL
  - **LESS SUITABLE FOR PRESCRIBING** Hydrobromide with papaveretum is less suitable for prescribing.

**Rapifen**

- **INDICATIONS AND DOSE**
  - **BY INTRAVENOUS INFUSION**
    - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary
  - **Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 30–60 micrograms/kg/hour, if patient is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary
  - **Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds
  - **Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, in light anaesthesia additional doses can be given by intravenous injection every 2–5 minutes during the intravenous infusion

**Spontaneous respiration: analgesia and enhancement of anaesthesia during maintenance of anaesthesia**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 2.4 micrograms/kg/hour, adjusted according to response; usual dose 1.5–6 micrograms/kg/hour

**Papaveretum with hyoscine hydrobromide**
The properties listed below are those particular to the combination only. For the properties of the components please consider, papaveretum p. 434, hyoscine hydrobromide p. 409.
**Assisted ventilation: analgesia and sedation in intensive-care patients (for max 3 days)**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 6–9 micrograms/kg/hour, then adjusted in steps of 1.5 micrograms/kg/hour, allow at least 5 minutes between dose adjustments; usual dose 0.36–44.4 micrograms/kg/hour, if an infusion rate of 12 micrograms/kg/hour does not produce adequate sedation add another sedative (consult product literature for details)

**Assisted ventilation: additional analgesia during stimulating or painful procedures in intensive-care patients**

- **BY INTRAVENOUS INFUSION**
  - Adult: Usual dose 15–45 micrograms/kg/hour, maintain infusion rate of at least 6 micrograms/kg/hour for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements

**Cardiac surgery**

- Adult: (consult product literature)

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- ** UNLICENSED USE** Remifentanil doses in BNF may differ from those in product literature.
- ** CONTRA-INDICATIONS** Analgesia in conscious patients
- ** SIDE-EFFECTS**
  - Common or very common Hypertension
  - Uncommon Hypoxia
  - Rare Asystole
  - Frequency not known AV block · convulsions

**SIDE-EFFECTS, FURTHER INFORMATION**

- Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.
- Respiratory depression In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by non-specific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression.

- ** PREGNANCY** No information available.
- ** BREAST FEEDING** Avoid breast-feeding for 24 hours after administration—present in milk in animal studies.
- ** RENAL IMPAIRMENT** No dose adjustment necessary in renal impairment.
- ** DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ultiva®), give continuously in Glucose 5% or Sodium Chloride 0.9% or Water for Injections; reconstitute with infusion fluid to a concentration of 1 mg/mL then dilute further to a concentration of 20–250 micrograms/mL. (50 micrograms/mL recommended for general anaesthesia, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device).

- ** PRESCRIBING AND DISPENSING INFORMATION** Remifentanil should not be given by intravenous injection intra-operatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

- ** MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Remifentanil (Non-proprietary)
  - Remifentanil (as Remifentanyl hydrochloride) 1 mg Remifentanil 1mg powder for concentrate for solution for injection vials | 5 vial (Pow) £25.58–£25.60 (Hospital only) [G2]

---

**Remifentanil (as Remifentanyl hydrochloride) 2 mg** Remifentanil 2mg powder for concentrate for solution for injection vials | 5 vial (Pow) £51.13–£51.15 (Hospital only) [G2]

**Remifentanil (as Remifentanyl hydrochloride) 5 mg** Remifentanil 5mg powder for concentrate for solution for injection vials | 5 vial (Pow) £127.75–£127.90 (Hospital only) [G2]

**Ultiva** (GlaxoSmithKline UK Ltd)

- Remifentanil (as Remifentanyl hydrochloride) 1 mg Ultiva 1mg powder for solution for injection vials | 5 vial (Pow) £25.58 (Hospital only) [G2]

- Remifentanil (as Remifentanyl hydrochloride) 2 mg Ultiva 2mg powder for solution for injection vials | 5 vial (Pow) £51.15 (Hospital only) [G2]

- Remifentanil (as Remifentanyl hydrochloride) 5 mg Ultiva 5mg powder for solution for injection vials | 5 vial (Pow) £127.88 (Hospital only) [G2]

---

## 1.4 Peri-operative sedation

### Conscious sedation for clinical procedures

**Overview**

Sedation of patients during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure; some procedures are safer and more successful under anaesthesia. The patient should be monitored carefully; monitoring should begin as soon as the sedative is given or when the patient becomes drowsy, and should be continued until the patient wakes up.

**ANAESTHETICS, GENERAL › NMDA RECEPTOR ANTAGONISTS**

### Ketamine

- **INDICATIONS AND DOSE**
  - **Induction and maintenance of anaesthesia for short procedures**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 6.5–13 mg/kg, adjusted according to response, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia
    - **BY INTRAVENOUS INJECTION**
      - Adult: Initially 1–4.5 mg/kg, adjusted according to response, to be administered over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia
  - **Diagnosis manoeuvres and procedures not involving intense pain**
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: Initially 4 mg/kg
  - **Induction and maintenance of anaesthesia for long procedures**
    - **BY INTRAVENOUS INFUSION**
      - Adult: Initially 0.5–2 mg/kg, using an infusion solution containing 1 mg/ml; maintenance 10–45 micrograms/kg/minute, adjusted according to response

**IMPORTANT SAFETY INFORMATION**

Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.
HYPNOTICS, SEDATIVES AND ANXIOLYTICS

NON-BENZODIAZEPINE HYPNOTICS AND SEDATIVES

Dexmedetomidine

INDICATIONS AND DOSE

Maintenance of sedation during intensive care

BY INTRAVENOUS INFUSION

Adult: 0.7 microgram/kg/hour, adjusted according to response; usual dose 0.2–1.4 micrograms/kg/hour

CONTRA-INDICATIONS

Acute cerebrovascular disorders - second- or third-degree AV block (unless pacemaker fitted) - uncontrolled hypotension

CAUTIONS

Abrupt withdrawal after prolonged use - bradycardia - ischaemic heart disease - malignant hyperthermia - severe cerebrovascular disease (especially at higher doses) - severe neurological disorders - spinal cord injury

SIDE-EFFECTS

Common or very common Agitation - blood pressure changes - bradycardia - changes in blood sugar - dry mouth - hyperthermia - myocardial infarction - myocardial ischaemia - nausea - tachycardia - vomiting

Uncommon Abdominal distension - AV block - decreased cardiac output - dyspnoea - hallucination - hypoalbuiminaemia - metabolic acidosis - thirst

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

HEPATIC IMPAIRMENT

Dose reduction may be required. Manufacturer advises caution.

MONITORING REQUIREMENTS

Monitor cardiac function.

Monitor respiratory function in non-intubated patients.

DIRECTIONS FOR ADMINISTRATION

To be diluted before use. For intravenous infusion given continuously in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 4 micrograms/mL.

MEDIcular FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for infusion

> Dexdor (Orion Pharma (UK) Ltd)

Dexmedetomidine (as Dexmedetomidine hydrochloride)

100 microgram per 1 ml

Dexdor 1mg/10ml concentrate for solution for infusion vials | 4 vial (Pom) £313.20 (Hospital only)

Dexdor 400micrograms/4ml concentrate for solution for infusion vials | 4 vial (Pom) £125.28 (Hospital only)

Dexdor 200micrograms/2ml concentrate for solution for infusion ampoules | 5 ampoule (Pom) £78.30 (Hospital only) | 25 ampoule (Pom) £391.50 (Hospital only)

> MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

> Ketamine (Non-proprietary)

Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml

Ketamin 50mg/5ml solution for injection ampoules | 10 ampoule (Pom) no price available (CD)

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml

Ketamine 100mg/2ml solution for injection ampoules | 10 ampoule (Pom) no price available (CD)

Ketalar (Pfizer Ltd)

Ketamine (as Ketamine hydrochloride) 10 mg per 1 ml Ketalar 200mg/20ml solution for injection vials | 1 vial (Pom) £5.06 (Hospital only) (CD)

Ketamine (as Ketamine hydrochloride) 50 mg per 1 ml Ketalar 500mg/10ml solution for injection vials | 1 vial (Pom) £8.77 (Hospital only) (CD)

Ketalar (Hydromorphone hydrochloride) 100 mg per 1 ml Ketalar 1g/10ml solution for injection vials | 1 vial (Pom) £16.10 (Hospital only) (CD)
2 Malignant hyperthermia

MUSCLE RELAXANTS  DIRECTLY ACTING

Dantrolene sodium

- **DRUG ACTION** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

- **INDICATIONS AND DOSE**
  - **Malignant hyperthermia**
    - **BY RAPID INTRAVENOUS INJECTION**
    - Adult: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course
  - **Chronic severe spasticity of voluntary muscle**
    - **BY MOUTH**
    - Adult: Initially 25 mg daily, then increased to up to 100 mg 4 times a day, dose increased at weekly intervals; usual dose 75 mg 3 times a day

- **SIDE-EFFECTS**
  - **Common or very common**
    - With oral use Abdominal pain, anorexia, asthenia, chills, diarrhea (withdraw if severe, discontinue treatment if recurs on re-introduction), dizziness, drowsiness, fatigue, fever, headache, hepatotoxicity, nausea, pericarditis, pleural effusion, rash, respiratory depression, seizures, speech disturbances, visual disturbances, vomiting
  - **Uncommon**
    - With oral use Confusion, constipation, crystalluria, depression, dysphagia, dyspnoea, erratic blood pressure, exacerbation of cardiac insufficiency, haematuria, increased sweating, increased urinary frequency, insomnia, nervousness, tachycardia, urinary incontinence, urinary retention
  - **Frequency not known**
    - With intravenous use Dizziness, erythema, hepatotoxicity, injection-site reactions, pulmonary oedema, rash, swelling, thrombophlebitis, weakness

- **FURTHER INFORMATION**
  - Hepatotoxicity Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

- **PREGNANCY**
  - With intravenous use Use only if potential benefit outweighs risk.
  - With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

- **BREAST FEEDING**
  - With intravenous use Present in milk—use only if potential benefit outweighs risk.
  - With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

- **HEPATIC IMPAIRMENT**
  - Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

- **MONITORING REQUIREMENTS**
  - With oral use Test liver function before and at intervals during therapy.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - Hepatotoxicity
    - With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **CAPSULE**
  - **CAUTIONARY AND ADVISORY LABELS 2**
  - **Dantrium** (Norgine Pharmaceuticals Ltd)
    - Dantrolene sodium 25 mg
      - Dantrium 25mg capsules 100 capsule 16.87 DT price = £16.87
      - Dantrium 25mg capsules 160 capsule 43.07 DT price = £43.07
    - **Powder for solution for injection**
      - Dantrium (Norgine Pharmaceuticals Ltd)
        - Dantrolene sodium 20 mg
          - Dantrium Intravenous 20mg powder for solution injection vials 12 vial 836 (Hospital only)
          - 36 vial 1,836.00 (Hospital only)

Local anaesthesia

Local anaesthesia

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 1193 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Chloroprocaine hydrochloride p. 1195, a para-aminobenzoic acid ester, is used for spinal anaesthesia in adults where the planned procedure should not exceed 40 minutes.
Levobupivacaine p. 1196, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 1197 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 211) is about 30 minutes.

Prilocaine hydrochloride p. 1201 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride. A hyperbaric solution of prilocaine hydrochloride (containing glucose) may be used for spinal anaesthesia.

Ropivacaine hydrochloride p. 1202 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 1203, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

**Administration by injection**

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The patient’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity.

NHS Improvement has advised (September 2016) that, prior to administration, all injectable medicines must be drawn directly from their original ampoule or container into a syringe and should never be decanted into gallipots or open containers. This is to avoid the risk of medicines being confused with other substances, e.g. skin disinfectants, and to reduce the risk of contamination.

Great care should be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential.

**Use of vasoconstrictors**

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline/epinephrine should be used.

**Dental anaesthesia**

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine.

The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 1200 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine and articaine is available with adrenaline.

In patients with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

**Toxicity**

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

### Severe local anaesthetic-induced cardiovascular toxicity

**Overview**

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed.

In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.

If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® [unlicensed indication] should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability and adequate circulation are restored or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service.

Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.
Adrenaline with articaine hydrochloride
(Carticaine hydrochloride with epinephrine)

- **INDICATIONS AND DOSE**
  - **Infiltration anaesthesia in dentistry**
  - **BY REGIONAL ADMINISTRATION**
  - Adult: Consult expert dental sources

- **DOSES AT EXTREMES OF BODY-WEIGHT**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **CONTRA-INDICATIONS**
  - Application to damaged skin.
  - Application to the middle ear (may cause ototoxicity).
  - Complete heart block.
  - Injection into inflected tissues.
  - Injection into inflamed tissues.
  - Preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia.

- **CAUTIONS**
  - Arrhythmias.
  - Arteriosclerosis.
  - Cardiovascular disease.
  - Cerebrovascular disease.
  - Cor pulmonale.
  - Debilitated patients (consider dose reduction).
  - Diabetes mellitus.
  - Elderly (consider dose reduction).
  - Epilepsy.
  - Hypercalcemia.
  - Hyperreflexia.
  - Hypertension.
  - Hyperthyroidism.
  - Hypokalaemia.
  - Hypovolaemia.
  - Impaired cardiac conduction.
  - Impaired respiratory function.
  - Ischaemic heart disease.
  - Myasthenia gravis.
  - Obstructive cardiomyopathy.
  - Occulsive vascular disease.
  - Organic brain damage.
  - Phaeochromocytoma.
  - Prostate disorders.
  - Psychoneurosis.
  - Severe angina.
  - Shock.
  - Susceptibility to angle-closure glaucoma.

- **CAUTIONS, FURTHER INFORMATION**
  - Use of vasoconstrictors.
  - In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

- **INTERACTIONS**
  - Appendix 1 (sympathomimetics).

- **SIDE-EFFECTS**
  - Angina.
  - Angle-closure glaucoma.
  - Anorexia.
  - Anxiety.
  - Arrhythmias.
  - Blurred vision.
  - Cardiac arrest.
  - Cold extremities.
  - Confusion.
  - Convulsions.
  - Difficulty in micturition.
  - Dizziness.
  - Drowsiness.
  - Dry mouth.
  - Dysphonia.
  - Feeling of inebriation.
  - Headache.
  - Hyperglycaemia.
  - Hypersalivation.
  - Hypertension (risk of cerebral haemorrhage).
  - Hypokalaemia.
  - Insomnia.
  - Lightheadedness.
  - Metabolic acidosis.
  - Methaemoglobinemia.
  - Muscle twitching.
  - Mydriasis.
  - Myocardial depression (resulting in hypotension and bradycardia).
  - Nausea.
  - Numberness of the tongue and perioral region.
  - Pallor.
  - Palpitation.
  - Paraesthesia (including sensations of hot and cold).
  - Peripheral vasodilatation (resulting in hypotension and bradycardia).
  - Psychosis.
  - Pulmonary oedema.
  - Severe hypertension (risk of cerebral haemorrhage).
  - Twitching.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Toxic effects.
  - Hypersensitivity and cross-sensitivity.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity.

- **PREGNANCY**
  - Use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT**
  - Use with caution.

- **RENAI IMPAIRMENT**
  - Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- EXCIPIENTS: May contain Sulphites.
- Septanest (Septodont Ltd)
  - Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml.
  - Articaine hydrochloride 40 mg per 1 ml.
  - Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge (POM) no price available.
- Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml.
  - Articaine hydrochloride 40 mg per 1 ml.
  - Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge (POM) no price available.

Bupivacaine hydrochloride

- **INDICATIONS AND DOSE**
  - **Surgical anaesthesia, lumbar epidural block**
  - **BY REGIONAL ADMINISTRATION**
  - Adult: 75–150 mg, dose administered using a 5 mg/mL (0.5%) solution.

- **Surgical anaesthesia, field block**
  - **BY REGIONAL ADMINISTRATION**
  - Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution.

continued →
Surgical anaesthesia, thoracic epidural block
► BY THORACIC EPIDURAL
► Adult: 12.5–50 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, caudal epidural block
► BY REGIONAL ADMINISTRATION
► Adult: 50–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

Surgical anaesthesia, major nerve block
► BY REGIONAL ADMINISTRATION
► Adult: 50–175 mg, dose administered using 5 mg/mL (0.5%) solution

Acute pain, intra-articular block
► BY INTRA-ARTICULAR INJECTION
► Adult: Up to 100 mg, dose administered using a 2.5 mg/mL (0.25%) solution; when co-administered with bupivacaine by another route, total max. 150 mg

Acute pain, thoracic epidural block
► BY CONTINUOUS EPIDURAL INFUSION
► Adult: 6.3–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, labour
► BY CONTINUOUS EPIDURAL INFUSION
► Adult: 6.25–12.5 mg/hour, dose administered using a 1.25 mg/mL (0.125%) solution; maximum 400 mg per day

Acute pain, lumbar epidural block
► INITIALLY BY LUMBAR EPIDURAL
► Adult: 15–37.5 mg, then (by lumbar epidural) 15–37.5 mg, repeated when required at intervals of at least 30 minutes, dose administered by intermittent injection using a 2.5 mg/mL (0.25%) solution, alternatively (by continuous epidural infusion) 12.5–18.8 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

Acute pain, field block
► BY REGIONAL ADMINISTRATION
► Adult: Up to 150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

MARCAIN HEAVY®

Intrathecal anaesthesia for surgery
► BY INTRATECAL INJECTION
► Adult: 10–20 mg

DOSES AT EXTREMES OF BODY-WEIGHT
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

IMPORTANT SAFETY INFORMATION
The licensed doses stated may not be appropriate in some settings and expert advice should be sought.
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION
Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

CAUTIONS Cardiovascular disease • cerebral atheroma • debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypertension • hypotension • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • myocardial depression may be more severe and more resistant to treatment • shock

INTERACTIONS → Appendix 1 (bupivacaine).

SIDE-EFFECTS Arrhythmias • blurred vision • cardiac arrest • convulsions • dizziness • drowsiness • feeling of inebriation • headache • lightheadedness • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region • paraesthesia (including sensations of hot and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • restlessness • tinnitus • transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremors • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.
The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

ALLERGY AND CROSS-SENSITIVITY
Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block.

BREAST FEEDING Amount too small to be harmful.

HEPATIC IMPAIRMENT Use with caution in severe impairment.

RENAL IMPAIRMENT Use with caution in severe impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for injection
► Bupivacaine hydrochloride (Non-proprietary)
Bupivacaine hydrochloride 2.5 mg per 1 ml Bupivacaine 0.25% solution for injection 10ml Sure-Amp ampoules | 20 ampoule | £17.50
Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 0.5% solution for injection 10ml Sure-Amp ampoules | 20 ampoule | £18.30
Bupivacaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule | no price available
► Marcain (AstraZeneca UK Ltd)
Bupivacaine hydrochloride 2.5 mg per 1 ml Marcain 0.25% solution for injection 10ml Polyamp Steripack ampoules | 5 ampoule | £7.92
Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 1193, adrenaline/epinephrine p. 211.

● INDICATIONS AND DOSE

Surgical anaesthesia
▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION, OR BY CAUDAL EPIDURAL
Adult: (consult product literature)

Acute pain management
▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION
Adult: (consult product literature)

IMPORTANT SAFETY INFORMATION
Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION
In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
▶ Bupivacaine with adrenaline (Non-proprietary)
Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride 5 mg per 1 ml Bupivacaine 25mg/10ml (0.25%) / Adrenaline (base) 50micrograms/10ml (1 in 200,000) solution for injection ampoules | 10 ampoule (£0.40)
Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Bupivacaine hydrochloride anhydrous 2.5 mg per 1 ml Carbostesin-adrenaline 0.25% / 100micrograms/20ml (1 in 200,000) solution for injection ampoules | 1 ampoule (£0.27)
Carbostesin-adrenaline 0.25% / 25micrograms/5ml (1 in 200,000) solution for injection ampoules | 1 ampoule (£0.27)
anesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepipvacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Avoid—no information available.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- Chloroprocaine hydrochloride 10 mg per 1 ml Ampres (AMCo) solution for injection ampoules | 10 ampoule (£0.50) £87.50

---

### Levobupivacaine

#### INDICATIONS AND DOSE

**Acute postoperative pain**

- BY CONTINUOUS EPIDURAL INFUSION
  - Adult: 12.5–18.75 mg/hour, dose administered using a 1.25 mg/mL (0.125%) or 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Acute labour pain**

- BY LUMBAR EPIDURAL
  - Adult: 15–25 mg, repeated at intervals of at least 15 minutes, dose administered using a 2.5 mg/mL (0.25%) solution; maximum 400 mg per day

**Surgical anaesthesia, peripheral nerve block**

- BY REGIONAL ADMINISTRATION
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution

**Surgical anaesthesia, peribulbar nerve block**

- BY REGIONAL ADMINISTRATION
  - Adult: 37.5–112.5 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia for caesarean section**

- BY LUMBAR EPIDURAL
  - Adult: 75–150 mg, to be given over 15–20 minutes, dose administered using a 5 mg/mL (0.5%) solution

**Surgical anaesthesia**

- BY LUMBAR EPIDURAL
  - Adult: 50–150 mg, to be given over 5 minutes, dose administered using a 5 mg/mL (0.5%) or 7.5 mg/mL (0.75%) solution

- BY INTRATHECAL INJECTION
  - Adult: 15 mg, dose administered using a 5 mg/mL (0.5%) solution

- BY LOCAL INFILTRATION
  - Adult: 2.5–150 mg, dose administered using a 2.5 mg/mL (0.25%) solution

### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

---

**IMPORTANT SAFETY INFORMATION**

The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

---

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

- **CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) · should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

- **CAUTIONS** Cardiovascular disease · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

- **INTERACTIONS** → Appendix 1 (levobupivacaine).

**SIDE-EFFECTS**

**Anaemia** · arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · pyrexia · restlessness · sweating · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic effects: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

  Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

  The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**

  Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepipvacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

  - **PREGNANCY** Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

  - **BREAST FEEDING** Amount too small to be harmful.

  - **HEPATIC IMPAIRMENT** Use with caution.

  - **DIRECTIONS FOR ADMINISTRATION** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.
Prescribing and dispensing information

Levbupivacaine is an isomer of bupivacaine.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Chirocaine (AbbVie Ltd)**
  - Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules | 10 ampoule £14.11 (Hospital only)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml Chirocaine 50mg/10ml solution for injection ampoules | 10 ampoule £16.15 (Hospital only)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml Chirocaine 75mg/10ml solution for injection ampoules | 10 ampoule £24.23 (Hospital only)
  - Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Chirocaine 125mg/100ml infusion bags | 12 bag £174.22

Infusion

- **Chirocaine (AbbVie Ltd)**
  - Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Chirocaine 125mg/100ml infusion bags | 12 bag £174.22

Indications for injection

- **Infiltration anaesthesia**
  - Adult: Dose to be given according to patient’s weight and nature of procedure; max 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

Doses at extremes of body-weight

- When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

- **By regional administration**
  - Adult: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)

- **To the skin using ointment**
  - Adult: Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding

- **To the skin using ointment**
  - Adult: Apply using gauze and wash off immediately before next feed

LMX®

Anaesthesia before venous cannulation or venepuncture

- **To the skin**
  - Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 1-7 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

Solution for injection

- **XYLOCAINE®**
  - Postherpetic neuralgia
    - **To the skin**
    - Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

Dosing during delivery in obstetrics

- **To the skin**
  - Adult: Up to 20 doses

Important safety information

- When used by local infiltration
  - The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Contra-indications

- When used by regional administration
  - All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intraneuronal regional anaesthesia (Bier’s block) - severe myocardial depression - should not be applied to damaged skin - sino-atrial disorders

Contra-indications, further information

- When used by regional administration
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

Caution

- When used by regional administration
  - Acute porphyria (consider infusion with glucose for its antiporphyrinoic effects) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

Interactions

- Appendix 1 (lidocaine)

Side-effects

- When used by regional administration
  - Common or very common
    - Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - drowsiness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression

- Rare
  - When used by regional administration
    - Anaphylaxis

Lidoaaine hydrochloride

(Lignocaine hydrochloride)

**Indications and dose**

Infiltration anaesthesia

- **By local infiltration**
  - Adult: Dose to be given according to patient’s weight and nature of procedure; max 200 mg, maximum dose 500 mg if given in solutions containing adrenaline

Doses at extremes of body-weight

- When used by local infiltration To avoid excessive dosage in obese patients, weight-based doses for non-emergency indications may need to be calculated on the basis of ideal body-weight.

Intravenous regional anaesthesia and nerve block

- **By regional administration**
  - Adult: Seek expert advice

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)

- **To the skin using ointment**
  - Adult: Apply 1–2 mL as required, avoid long-term use

Sore nipples from breast-feeding

- **To the skin using ointment**
  - Adult: Apply using gauze and wash off immediately before next feed

LMX®

Anaesthesia before venous cannulation or venepuncture

- **To the skin**
  - Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 3-11 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 4 hours, remove cream with gauze and perform procedure after approximately 5 minutes
  - Child 1-7 years: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

- Adult: Apply 1–2.5 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 5 hours, remove cream with gauze and perform procedure after approximately 5 minutes

VERSATIS®

Postherpetic neuralgia

- **To the skin**
  - Adult: Apply once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks, to be applied to intact, dry, non-hairy, non-irritated skin, up to 3 plasters may be used to cover large areas; plasters may be cut

XYLOCAINE®

During delivery in obstetrics

- **To the skin**
  - Adult: Up to 20 doses
FREQUENCY NOT KNOWN
- When used by regional administration: transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma); arthrinamas, blurred vision, cardiac arrest, feeling of inebriation, headache, hypoglycaemia (following intrathecal or extradural administration); methaemoglobinaemia; muscle twitching, myocardial depression (resulting in hypotension and bradycardia); nausea; numbness of the tongue and perioral region; nystagmus; peripheral vasodilatation (resulting in hypotension and bradycardia); rash; restlessness; tinnitus; tremors; vomiting.

SIDE-EFFECTS, FURTHER INFORMATION
- Topical application: A single application of a topical lidocaine preparation does not generally cause systemic side-effects.
- Toxic effects
  - When used by regional administration: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.
- Methaemoglobinaemia
  - When used by regional administration: Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride.

ALLERGY AND CROSS-SENSITIVITY
- Hypersensitivity and cross-sensitivity: Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

PREGNANCY
- Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

BREAST FEEDING
- Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT
- Caution—increased risk of side-effects.

RENAL IMPAIRMENT
- Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

MONITORING REQUIREMENTS
- With systemic use: Monitor ECG and have resuscitation facilities available.

PROFESSION SPECIFIC INFORMATION
- Dental practitioners’ formulary: Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%

NATIONAL FUNDING/ACCESS DECISIONS
- VERSATIS®
- Scottish Medicines Consortium (SMC) Decisions: The Scottish Medicines Consortium has advised (July 2008) that Versatis® is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who are intolerant of first-line systemic therapies or when they have been ineffective.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

Solution for injection
- Lidocaine hydrochloride (Non-proprietary)
  - Lidocaine hydrochloride 5 mg per 1 ml
    - Lidocaine 50 mg/10 ml (0,5%) solution for injection ampoules | 10 ampoule (POM) £7.00
    - Lidocaine hydrochloride 10 mg per 1 ml

Lidocaine with adrenaline
The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, adrenaline/epinephrine p. 211.

INDICATIONS AND DOSE
Local anaesthesia
- BY LOCAL INFILTRATION
- Adult: Dosed according to the type of nerve block required (consult product literature)
The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, prilocaine hydrochloride p. 1201.

**Lidocaine with prilocaine**

Anaesthesia before minor skin procedures including venepuncture

**To the skin**

- Child 1–2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 1 dose per day
- Child 3–11 months: Apply up to 2 g for maximum 4 hours before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 1–11 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca); maximum 2 doses per day
- Child 12–17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mollusca)
- Adult: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing

Anaesthesia on genital skin before injection of local anaesthetics

**To the skin**

- Adult: Apply for 15 minutes (in adult men) and 60 minutes (in adult women), to be applied under occlusive dressing

Anaesthesia before surgical treatment of lesions on genital mucosa

**To the skin**

- Adult: Apply up to 10 g, to be applied 5–10 minutes before procedure

Anaesthesia before cervical curettage

**To the skin**

- Adult: Apply 10 g in lateral vaginal fornices for 10 minutes

Anaesthesia before mechanical cleansing or debridement of leg ulcer

**To the skin**

- Adult: Apply up to 10 g for 30–60 minutes, to be applied under occlusive dressing

**Patient and carer advice**

- Use in child less than 37 weeks corrected gestational age

 Medicines for Children leaflet: EMLA cream for local anaesthesia [www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia](http://www.medicinesforchildren.org.uk/emla-cream-for-local-anaesthesia)
CONTRA-INDICATIONS

MEDICINAL FORMS

Lidocaine with prilocaine (Non-proprietary)
Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram
5 % g / 70mg / 70mg/gram | 15 gram [P] £2.29
30 gram [P] £12.99

Denela (Teva UK Ltd)
Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram
5 % cream | 5 gram [P] £12.99
25 gram [P] £14.75
30 gram [P] £12.30

Emla (AstraZeneca UK Ltd)
Lidocaine 25 mg per 1 gram, Prilocaine 25 mg per 1 gram
5 % cream | 5 gram [P] £2.25
25 gram [P] £11.70
30 gram [P] £12.30

Contra-indications

Side-effects

Injection site

Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

Caution

Cardiovascular disease · children (consider dose reduction) · debilitated patients (consider dose reduction) · elderly (consider dose reduction) · epilepsy · hypovolaemia · impaired cardiac conduction · impaired respiratory function · myasthenia gravis · shock

Side-effects

Arrhythmias · blurred vision · cardiac arrest · convulsions · dizziness · drowsiness · feeling of inebriation · headache · lightheadedness · muscle twitching · myocardial depression (resulting in hypotension and bradycardia) · nausea · numbness of the tongue and perioral region · paraesthesia (including sensations of hot and cold) · peripheral vasodilatation (resulting in hypotension and bradycardia) · restlessness · tinnitus · transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) · tremors · vomiting

Further information

Toxic effects

Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Allergy and cross-sensitivity

Hypersensitivity and cross-sensitivity

Reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, methylpracaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

Pregnancy

Use with caution in early pregnancy.

Breastfeeding

Use with caution.

Hepatic impairment

Use with caution; increased risk of side-effects in severe impairment.

Renal impairment

Use with caution; increased risk of side-effects.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Scandonest plain (Deproco UK Ltd)
Mepivacaine hydrochloride 30 mg per 1 ml Scandonest plain 3% solution for injection 2.2ml cartridges | 50 cartridge [Box] no price available

Lidocaine with tetracaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride, p. 1197, tetracaine p. 1203.

INDICATIONS AND DOSE

Anaesthesia before dermatological procedures and venepuncture

To the skin

Adult: Apply 1 mm layer using a spatula 30 minutes before procedure, then peel off immediately before procedure; max. application area 400 cm², application time of 60 minutes indicated for certain procedures, such as laser-assisted tattoo removal and laser leg vein ablation.

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

Child 3-17 years: Consult expert dental sources

Adult: Consult expert dental sources

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

Pliaglis (Galderma (UK) Ltd)
Lidocaine 70 mg, Tetracaine 70 mg Pliaglis 70mg/g / 70mg/g cream | 15 gram [P] £22.95

Mepivacaine hydrochloride

INDICATIONS AND DOSE

Infiltration anaesthesia and nerve block in dentistry

Child 3-17 years: Consult expert dental sources

Adult: Consult expert dental sources

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

Important safety information

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

CONTRA-INDICATIONS

Application to the middle ear (can cause ototoxicity) · avoid injection into infected tissues · avoid injection into inflamed tissues · complete heart block · preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) · should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Mepivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 1200, adrenaline/epinephrine p. 211.

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**PRILOTEKAL**

Spinal anaesthesia

▶ BY INTRATHecal INJECTION

Adult: Usual dose 40–60 mg (max. per dose 80 mg), dose may need to be reduced in elderly or debilitated patients, or in late pregnancy

### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

### IMPORTANT SAFETY INFORMATION

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

### CONTRA-INDICATIONS

Acquired methaemoglobinaemia • anaemia • application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • congenital methaemoglobinaemia • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • should not be applied to damaged skin

---

### CONTRA-INDICATIONS, FURTHER INFORMATION

> Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

### CAUTIONS

Acute porphyrias p. 930 • cardiovascular disease • debilitated patients (consider dose reduction) • elderly (consider dose reduction) • epilepsy • hypovolaemia • impaired cardiac conduction • impaired respiratory function • myasthenia gravis • severe or untreated hypertension • shock

### INTERACTIONS

> Appendix 1 (prilocaine). Caution with concomitant use of drugs that cause methaemoglobinaemia.

### SIDE-EFFECTS

Arrhythmias • blurred vision • cardiac arrest • convulsions • dizziness • drowsiness • feeling of inebriation • headache • hypertension • lightheadedness • methaemoglobinaemia (with high doses) • muscle twitching • myocardial depression (resulting in hypotension and bradycardia) • nausea • numbness of the tongue and perioral region • paraesthesia (including sensations of hot and cold) • peripheral vasodilatation (resulting in hypotension and bradycardia) • restlessness • tinnitus • transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) • tremors • vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

> Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

Methaemoglobinaemia Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride.

### ALLERGY AND CROSS-SENSITIVITY

> Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

### PREGNANCY

Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinaemia reported).

### BREAST FEEDING

Present in milk but not known to be harmful.

### HEPATIC IMPAIRMENT

Lower doses may be required for intrathecal anaesthesia. Use with caution.

### RENAL IMPAIRMENT

Lower doses may be required for intrathecal anaesthesia. Use with caution.

### NATIONAL FUNDING/ACCESS DECISIONS

  - Felypressin 0.3 unit per 1 ml Prilocaine hydrochloride 30 mg per 1 ml Citanest 3% with Octapressin Dental 0.054units/1.8ml solution for injection self-aspiring cartridges | 100 cartridge (PSt) no price available
  - Citanest 3% with Octapressin Dental 0.0666units/2.2ml solution for injection self-aspiring cartridges | 100 cartridge (PSt) no price available

### Ropivacaine hydrochloride

**INDICATIONS AND DOSE**

**Acute pain, peripheral nerve block**
- **BY REGIONAL ADMINISTRATION**
- Adult: 10–20 mg/hour, dose administered as a continuous infusion or by intermittent injection using a 2 mg/mL (0.2%) solution

**Acute pain, field block**
- **BY REGIONAL ADMINISTRATION**
- Adult: 2–200 mg, dose administered using a 2 mg/mL (0.2%) solution

**Acute pain, lumbar epidural block**
- **BY LUMBAR EPIDURAL**
- Adult: 20–40 mg, followed by 20–30 mg at least every 30 minutes, dose administered using a 2 mg/mL (0.2%) solution

**Acute labour pain**
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 12–20 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Acute postoperative pain**
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: Up to 28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Postoperative pain, thoracic epidural block**
- **BY CONTINUOUS EPIDURAL INFUSION**
- Adult: 12–28 mg/hour, dose administered using a 2 mg/mL (0.2%) solution

**Surgical anaesthesia, field block**
- **BY REGIONAL ADMINISTRATION**
- Adult: 7.5–225 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, major nerve block (brachial plexus block)**
- **BY REGIONAL ADMINISTRATION**
- Adult: 225–300 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, thoracic epidural block (to establish block for postoperative pain)**
- **BY THORACIC EPIDURAL**
- Adult: 38–113 mg, dose administered using a 7.5 mg/mL (0.75%) solution

**Surgical anaesthesia, caesarean section**
- **BY LUMBAR EPIDURAL**
- Adult: 113–150 mg, to be administered in incremental doses using a 7.5 mg/mL (0.75%) solution

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**IMPORTANT SAFETY INFORMATION**
Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS** Application to the middle ear (can cause otoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**
Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS** Acute porphyrias p. 930 - cardiovascular disease - debilitated patients (consider dose reduction) - elderly (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

**INTERACTIONS** → Appendix 1 (ropivacaine).

**SIDE-EFFECTS**
- **Common or very common** Hypertension - pyrexia
- **Uncommon** Hypothermia - syncope
- **Frequency not known** Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, un consciousness, and coma) - tremors - vomiting
SIDE-EFFECTS, FURTHER INFORMATION

- Toxic effects: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

  Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

  The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- ALLERGY AND CROSS-SENSITIVITY
  - Hypersensitivity and cross-sensitivity: Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
  - PREGNANCY: Not known to be harmful. Do not use for paracervical block in obstetrics.
  - BREAST FEEDING: Not known to be harmful.
  - HEPATIC IMPAIRMENT: Use with caution in severe impairment.
  - RENAL IMPAIRMENT: Caution in severe impairment. Increased risk of systemic toxicity in chronic renal failure.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  ELECTROLYTES: May contain Sodium
  - **Ropivacaine hydrochloride (Non-proprietary)**
    - Ropivacaine hydrochloride 2 mg per 1 ml \Ropivacaine 20mg/10ml solution for injection ampoules | 10 ampoule £16.50 (Hospital only)

Tetracaine (Amethocaine)

- INDICATIONS AND DOSE
  - Anaesthesia before venepuncture or venous cannulation
    - TO THE SKIN
      - Child 1 month–4 years: Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
      - Child 5–17 years: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation
    - Adult: Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

- CONTRA-INDICATIONS: Should not be applied to damaged skin

- SIDE-EFFECTS: Local skin reactions
  - The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

- ALLERGY AND CROSS-SENSITIVITY
  - Hypersensitivity and cross-sensitivity: Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- BREAST FEEDING: Not known to be harmful.

    - Tetracaine 40 mg per 1 gram Ametop 4% gel | 1.5 gram £1.08 | 18 gram no price available
# Emergency treatment of poisoning

## Overview

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about any aspect of suspected poisoning.

### Hospital admission

Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin p. 114, iron, paracetamol p. 414, tricyclic antidepressants, and codeine p. 62 (diphenoxylate with atropine, Lomotil®); the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

### Further information

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at [www.toxbasebackup.org](http://www.toxbasebackup.org) (a backup site is available at [www.toxbasebackup.org](http://www.toxbasebackup.org) if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:

Tel: 0344 892 0111

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be obtained from TOXBASE or from the National Poisons Information Service (out of hours).

### General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because even a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

### Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

### Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 914 or a colloid. Vasoconstrictor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea.

Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phenylcyclidine, and cocaine.

### Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis,
or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

**Body temperature**

Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate re-warming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

**Convulsions**

Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 317 or diazepam p. 321 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam oromucosal solution p. 318 [unlicensed use in adults and children under 3 months] can be given by the buccal route or diazepam can be administered as a rectal solution.

**Methaemoglobininaemia**

Drug- or chemical-induced methaemoglobinemia should be treated with methylthioninium chloride p. 1216 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylthioninium chloride reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylthioninium chloride can itself cause methaemoglobinemia.

**Removal and elimination**

**Prevention of absorption**

Given by mouth, charcoal, activated p. 1211 can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

**Active elimination techniques**

Repeated doses of charcoal, activated p. 1211 by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.

**Removal from the gastro-intestinal tract**

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of enesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

**Whole bowel irrigation** (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are involved. Whole bowel irrigation (enterally) has been used in poisoning with certain substances such as lithium and iron. Whole bowel irrigation is potentially hazardous and should be performed only by experienced staff.

**Poison management**

Mainly supportive treatment, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

**Aspirin**

The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is less below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).
Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

Opioids

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone hydrochloride p. 1214 is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. The effects of some opioids, such as buprenorphine, are only partially reversed by naloxone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required.

Norpropoxyphene, a metabolite of dextropropoxyphene, also has cardiotoxic effects which may require treatment with sodium bicarbonate p. 910 or magnesium sulfate p. 924, or both. Arrhythmias may occur for up to 12 hours.

**Paracetamol**

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese patients who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg). Acetylcysteine p. 1215 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service.
Poisons Information Service for advice.
Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine p. 1215 should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

**Acute overdose**
Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour. Patients who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 1211 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Patients at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in patients:
- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the patient is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess
A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, patients who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol. For small adults, this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose.

Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g. carbamazepine p. 291, efavirenz p. 593, nevirapine p. 594, phenobarbital p. 313, phenytoin p. 302, primidone p. 313, rifabutin p. 530, rifampicin p. 535, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Patients with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Acetylcysteine dose and administration**
For paracetamol overdose, acetylcysteine is given in a total dose that is divided into 3 consecutive intravenous infusions over a total of 21 hours. The tables below include the dose of acetylcysteine, for adults and children of body-weight 40 kg and over, in terms of the volume of acetylcysteine Concentrate for Intravenous Infusion required for each of the 3 infusions. The requisite dose of acetylcysteine is added to glucose intravenous infusion 5% p. 915.

Charcoal, activated p. 1211 can be given within 1 hour of
ingesting a significant quantity of a second-generation antipsychotic drug.

**Antidepressants**

**Tricyclic and related antidepressants**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, dystonia, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathy may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam, diazepam, or midazolam oromucosal solution [unlicensed use in adults and children under 3 months] (see Convulsions). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.

**Antimalarials**

Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**Antipsychotics**

**Phenothiazines and related drugs**

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 384 or diazepam p. 321 (emulsion preferred).

**Second-generation antipsychotic drugs**

Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 1211 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

**Benzodiazepines**

Benzodiazepines taken alone cause drowsiness, ataxia, dystarxia, dystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 1213 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in patients with a reduced level of consciousness.

**Beta blockers**

Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions. Acute massive overdose must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate p. 1179 is required to treat bradycardia. Cardiogenic shock unresponsive to atropine sulfate is probably best treated with an intravenous injection of glucagon p. 660 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucagon is not available, intravenous isoprenaline (available from specialist-order manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound calcium depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 919 or calcium gluconate p. 920 is given by injection; atropine is an effective measure of hypotension. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts

Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting; abdominal pain; diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 902, which chelates iron. The serum–iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum–iron measurement.

Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Gastric lavage may be considered if it can be performed within 1 hour of ingesting significant quantities of lithium. Wholebowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

Stimulants

Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 321 or lorazepam p. 317; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine

Cocaine stimulates the central nervous system, causing agitation, delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repetitive doses of theophylline can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques). Ondansetron p. 406 may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride p. 929 and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (see Convulsions). Sedation with diazepam may be necessary in agitated patients.

Provided the patient does not suffer from asthma, a short-acting beta-blocker can be administered intravenously to reverse severe tachycardia, hypokalaemia, and hyperglycaemia.
Emergency treatment of poisoning

Other poisons
Consult either the National Poisons Information Service day and night or TOXBASE, see under the National Poisons Information Service.

Cyanides
Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 1212 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 1212 followed by sodium thiosulfate p. 1212 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 899 (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

Ethylene glycol and methanol
Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

Heavy metals
Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

Noxious gases
Carbon monoxide
Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces. Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and high-flow oxygen administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 217. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning, such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

Sulfur dioxide, chlorine, phosgene, ammonia
All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

CS Spray
CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

Nerve agents
Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime chloride p. 1212 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

Pesticides
Organophosphorus insecticides
Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the skin and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 1179 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished.

Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.
Snake bites and animal stings

Snake bites

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent syncope, angioedema, urticaria, abdominal colic, diarrhoea, anaphylactic symptoms (transient hypotension with regional lymph nodes. Systemic effects include early hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure.Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 211. Indications for European viper snake venom antiserum p. 1216 treatment include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those patients who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the European viper snake venom antiserum is recommended; if symptoms of systemic envenoming persist contact the National Poisons Information Service. Adrenaline/epinephrine injection must be immediately to hand for treatment of anaphylactic reactions to the European viper snake venom antiserum.

European viper snake venom antiserum is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine; self-administered intramuscular adrenaline/epinephrine (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

Marine stings

The severe pain of weeverfish (*Trachinus virena*) and Portuguese man-ō’-war stings can be relieved by immersing the sting area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-ō’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater.

Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs can be used to reduce pain.

Other poisons

Consult either the National Poisons Information Service or TOXBASE.

1 Active elimination from the gastro-intestinal tract

ANTIDOTES AND CHELATORS > INTESTINAL ADSORBENTS

Charcoal, activated

- **INDICATIONS AND DOSE**
  
  Reduction of absorption of poisons in the gastro-intestinal system

  - BY MOUTH
    - Child 1 month–11 years: 1 g/kg (max. per dose 50 g)
    - Child 12–17 years: 50 g
    - Adult: 50 g

  Active elimination of poisons

  - BY MOUTH
    - Child 1 month–11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy
    - Child 12–17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy
    - Adult: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy

  Accelerated elimination of teriflunomide

  - BY MOUTH USING GRANULES
    - Adult: 50 g every 12 hours for 11 days

  Accelerated elimination of leflunomide (washout procedure)

  - BY MOUTH USING GRANULES
    - Adult: 50 g 4 times a day for 11 days

- **UNLICENSED USE** Activated charcoal doses in BNF may differ from those in product literature.

- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) - drowsy patient (risk of aspiration—ensure airway protected · reduced gastrointestinal motility (risk of obstruction)

- **SIDE-EFFECTS** Black stools

- **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.

- **MEDIcINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Granules**

  - Carbomix (Beacon Pharmaceuticals Ltd)
    - Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free | 50 gram £11.90

  **Oral suspension**

  - Actidose-Aqua Advance (Alliance Pharmaceuticals Ltd)
    - Activated charcoal 208 mg per 1 ml Actidose-Aqua Advance 1.04g/5ml oral suspension | 240 ml £12.89

  - Charcodote (Teva UK Ltd)
    - Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free | 250 ml £11.88

Emergency treatment of poisoning
2 Chemical toxicity

2.1 Cyanide toxicity

ANTIDOTES AND CHELATORS

Dicobalt edetate

- **INDICATIONS AND DOSE**
  - Severe poisoning with cyanides
    - **BY INTRAVENOUS INJECTION**
    - Child: Consult the National Poisons Information Service
    - Adult: 300 mg, to be given over 1 minute (or 5 minutes if condition less serious), dose to be followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity

- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- **SIDE-EFFECTS** Anaphylactoid reactions • cardiac abnormalities • facial oedema • hypotension • laryngeal oedema • tachycardia • vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - Solution for injection
    - Dicobalt edetate (Non-proprietary)
      - Dicobalt edetate 15 mg per 1 ml
  - Other drugs used for Organophosphorus toxicity
    - Atropine sulfate, p. 1179

Sodium nitrite

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium thiosulfate)
    - **BY INTRAVENOUS INJECTION**
    - Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
    - Adult: 300 mg, to be given over 5–20 minutes (as sodium nitrite injection 30 mg/mL)

- **DOSE EQUIVALENCE AND CONVERSION**
  - 4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
  - Dose max. of 300 mg equates to 10 mL of a 3% solution.

- **SIDE-EFFECTS** Flushing (due to vasodilatation) • headache (due to vasodilatation)

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Sodium thiosulfate

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium nitrite)
    - **BY INTRAVENOUS INJECTION**
    - Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
    - Adult: 12.5 g, to be given over 10 minutes (as sodium thiosulfate injection 500 mg/mL), dose may be repeated in severe cyanide poisoning if dicobalt edetate not available

- **DOSE EQUIVALENCE AND CONVERSION**
  - 400 mg/kg equates to 0.8 mL/kg of a 50% solution.
  - 12.5 g equates to 25 mL of a 50% solution.

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

2.2 Organophosphorus toxicity

ANTIDOTES AND CHELATORS

Pralidoxime chloride

- **INDICATIONS AND DOSE**
  - Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent
    - **BY INTRAVENOUS INFUSION**
    - Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day
    - Adult: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

- **UNLICENSED USE** Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Poisoning with carbamates • poisoning with organophosphorus compounds without anticholinesterase activity
- **CAUTIONS** Myasthenia gravis
- **SIDE-EFFECTS** Disturbances of vision • dizziness • drowsiness • headache • hyperventilation • muscular weakness • nausea • tachycardia
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.
  - With intravenous use in children For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh
Ambulance Services for Mid West and South East Wales)—see TOXBASE for list of designated centres).

- **EXCEPTIONS TO LEGAL CATEGORY**  Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for injection**
    - Pralidoxime chloride (Non-proprietary)
      - Pralidoxime chloride 1 gram Protopam Chloride 1g powder for solution for injection vials | 6 vial (PO) no price available

### 3 Drug toxicity

#### 3.1 Benzodiazepine toxicity

**ANTIDOTES AND CHELATORS > BENZODIAZEPINE ANTAGONISTS**

**Flumazenil**

- **INDICATIONS AND DOSE**  Reversal of sedative effects of benzodiazepines in anaesthesia and clinical procedures
  - BY INTRAVENOUS INJECTION
    - Adult: 200 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; usual dose 300–600 micrograms; maximum 1 mg per course

  Reversal of sedative effects of benzodiazepines in intensive care
  - BY INTRAVENOUS INJECTION
    - Adult: 300 micrograms, dose to be administered over 15 seconds, then 100 micrograms every 1 minute if required; maximum 2 mg per course

  Reversal of sedative effects of benzodiazepines in intensive care (if drowsiness recurs after injection)
  - INITIALLY BY INTRAVENOUS INFUSION
    - Adult: 100–400 micrograms/hour, adjusted according to response, alternatively (by intravenous injection) 300 micrograms, adjusted according to response

- **IMPORTANT SAFETY INFORMATION**  Flumazenil should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS**  Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

- **CAUTIONS**  Avoid rapid injection following major surgery; avoid rapid injection in high-risk or anxious patients; benzodiazepine dependence (may precipitate withdrawal symptoms); elderly; ensure neuromuscular blockade cleared before giving; head injury (rapid reversal of benzodiazepine sedation may cause convulsions); history of panic disorders (risk of recurrence); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); short-acting (repeat doses may be necessary—benzodiazepine effects may persist for at least 24 hours)

- **SIDE-EFFECTS**
  - Common or very common  Nausea · vomiting
  - Uncommon  Anxiety · fear · palpitation
  - Frequency not known  Agitation · chills · convulsions (particularly in those with epilepsy) · dizziness · flushing · sensory disturbance · sweating · tachycardia · transient hypertension

- **PREGNANCY**  Not known to be harmful.

- **BREAST FEEDING**  Avoid breast-feeding for 24 hours.

- **HEPATIC IMPAIRMENT**  Carefully titrate dose.

- **DIRECTIONS FOR ADMINISTRATION**  For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Flumazenil (Non-proprietary)
    - Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules | 5 ampoule (PO) £65.50–£72.46

#### 3.2 Digoxin toxicity

**ANTIDOTES AND CHELATORS > ANTIBODIES**

**Digoxin-specific antibody**

- **INDICATIONS AND DOSE**  Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary
  - BY INTRAVENOUS INFUSION
    - Child:  Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)
    - Adult:  Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION**
  - In adults  For intravenous infusion (DigiFab®), given intermittently in Sodium chloride 0.9%. Reconstitute with water for injections (4 mL/vial), then dilute with infusion fluid and give over 30 minutes.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - DigiFab (BTG International Ltd)
    - Digoxin-specific antibody fragments 40 mg DigiFab 40mg powder for solution for infusion vials | 1 vial (PO) £750.00 (Hospital only)

#### 3.3 Heparin toxicity

**ANTIDOTES AND CHELATORS**

**Protamine sulfate**

- **INDICATIONS AND DOSE**  Overdosage with intravenous injection of unfractionated heparin
  - BY INTRAVENOUS INJECTION
    - Adult:  Dose to be administered at a rate not exceeding 5 mg/minute, 1 mg neutralises 80–100 units heparin when given within 15 minutes; if longer than 15 minute since heparin, less protamine required (consult product literature for details) as heparin rapidly excreted; maximum 50 mg continued →
Emergency treatment of poisoning

OPIOID RECEPTOR ANTAGONISTS

Opioid toxicity

3.4 Opioid toxicity

OPIOID RECEPTOR ANTAGONISTS

Naloxone hydrochloride

INDICATIONS AND DOSE

Overdosage with opioids

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Child 1 month–11 years: Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates

Child 12–17 years: Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates

Child: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

Adult: Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes

Overdosage with opioids in a non-medical setting

- BY INTRAMUSCULAR INJECTION

Child: 400 micrograms every 2–3 minutes, each dose given in subsequent resuscitation cycles if patient not breathing normally, continue until consciousness regained, breathing normally, medical assistance available, or contents of syringe used up; to be injected into deltoid region or anterolateral thigh

Reversal of postoperative respiratory depression

- INITIALLY BY INTRAVENOUS INJECTION

Child 1 month–11 years: 1 microgram/kg, repeated every 2–3 minutes if required

Child 12–17 years: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

Adult: Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours

PHARMACOKINETICS

Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

Important: Only give by subcutaneous or intramuscular routes if intravenous route is not feasible; intravenous administration has more rapid onset of action.

UNLICENSED USE

Naloxone doses in BNF may differ from those in product literature.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.
3.5 Paracetamol toxicity

**ANTIDOTES AND CHELATORS**

**Acetylcysteine**

- **INDICATIONS AND DOSE**
  - **Paracetamol overdose**
    - **BY INTRAVENOUS INFUSION**
      - Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
      - Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 250 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%.
      - Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose Intravenous Infusion 5%.
      - Adult (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre glucose Intravenous Infusion 5%.

- **CAUTIONS** Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) • atopy • may slightly increase INR • may slightly increase prothrombin time

- **SIDE-EFFECTS** Hypersensitivity-like reactions • slight increase in INR and prothrombin time • rashes

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersensitivity-like reactions: Hypersensitivity-like reactions are managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta, agonist) — contact the National Poisons Information Service if reaction severe.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children: For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/mL with glucose 5% or Sodium Chloride 0.9%.
  - With intravenous use in adults: For intravenous infusion (Minijet®, Naloxone Hydrochloride), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute to a concentration of up to 200 micrograms/mL and administer via an infusion pump.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Naloxone hydrochloride (Non-proprietary)**
  - Naloxone hydrochloride 1 mg per 1 ml Naloxone 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £16.80
  - Naloxone hydrochloride 20 microgram per 1 ml Naloxone 40micrograms/2ml solution for injection ampoules | 10 ampoule £55.00
  - Naloxone hydrochloride 400 microgram per 1 ml Naloxone 400micrograms/1ml solution for injection ampoules | 3 ampoule £17.70 | 10 ampoule £41.00–£53.70
  - Prenoxad (Martindale Pharmaceuticals Ltd)
  - Naloxone hydrochloride 1 mg per 1 ml Prenoxad 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £15.30

**Solution for infusion**

- Electolytes: May contain Sodium

**Acetylcysteine (Non-proprietary)**

- Acetylcysteine 200 mg per 1 ml Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule £21.26–£24.59
- Parvolex (Phoenix Labs Ltd)
  - Acetylcysteine 200 mg per 1 ml Parvolex 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule £22.50

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
4 Methaemoglobinaemia

ANTIDOTES AND CHELATORS

Methylthioninium chloride
(Methylene blue)

- **INDICATIONS AND DOSE**
  - Drug- or chemical-induced methaemoglobinaemia
    - BY SLOW INTRAVENOUS INJECTION
      - Child 3 months–17 years: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course
      - Adult: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

- **CAUTIONS**
  - Children under 3 months (more susceptible to methaemoglobinaemia from high doses of methylthioninium)
  - Chlorate poisoning (reduces efficacy of methylthioninium)
  - G6PD deficiency (seek advice from National Poisons Information Service)
  - Methaemoglobinaemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service)
  - Pulse oximetry may give false estimation of oxygen saturation

- **INTERACTIONS**
  - Appendix 1 (methylthioninium).

- **SIDE-EFFECTS**
  - Abdominal pain
  - Agitation
  - Anxiety
  - Arrhythmia
  - Blue-green discoloration of faeces
  - Blue-green discoloration of skin
  - Confusion
  - Dizziness
  - Dyspnoea
  - Fever
  - Haemolytic anaemia
  - Headache
  - Hyperbilirubinaemia (in infants)
  - Hypertension
  - Hypotension
  - Methaemoglobinaemia
  - Mydriasis
  - Nausea
  - Sweating
  - Tachypnoea
  - Tremor
  - Vomiting

- **PREGNANCY**
  - No information available, but risk to fetus of untreated methaemoglobinaemia likely to be significantly higher than risk of treatment.

- **BREAST FEEDING**
  - Manufacturer advises avoid breastfeeding for up to 6 days after administration—no information available.

- **RENAral IRRAIlMENT**
  - Use with caution in severe impairment; dose reduction may be required.

- **DIRECTIONS FOR ADMINISTRATION**
  - In children For intravenous injection, may be diluted with
    - Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%

  - In adults
    - Initially 2 mg/kg
    - 15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9%
    - Use 5 mL diluent/kg body-weight.

  - In severe cases
    - Initially 20 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

  - Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **MEDICATIONS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:
    - Solution for injection
      - Methylthioninium chloride (Non-proprietary)
        - Methylthioninium chloride 5 mg per 1 mL
        - Methylthioninium chloride Proveblue 50mg/10mL solution for injection ampoules | 5 ampoule £167.36

5 Snake bites

**IMMUNE SERA AND IMMUNOGLOBULINS**

**ANTITOXINS**

European viper snake venom antiserum

- **INDICATIONS AND DOSE**
  - Systemic envenoming from snake bites
  - Marked local envenoming
    - BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
      - Child: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
      - Adult: Initially 10 mL for 1 dose, then 10 mL after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **Severe systemic envenoming from snake bites in patients presenting with clinical features**
  - BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
    - Child: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service
    - Adult: Initially 20 mL for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION**
  - By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kg body-weight).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - To order, email immform@dh.gsi.gov.uk.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- European viper snake venom antiserum (Non-proprietary)
  - European viper snake venom antiserum 100 mg per 1 mL
  - Viper venom antiserum, European (equine) 1g/10mL solution for injection vials | 1 vial £18.34
  - no price available
Appendix 1
Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs), as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

Pharmacodynamic interactions
These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur.

Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice.

In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions
Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function. Serious interactions The symbol • has been placed against interactions that are potentially serious and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.
List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

**Abiraterone**
- Analgesics: abiraterone increases plasma concentration of METHADONE
- Antibacterials: plasma concentration of abiraterone possibly reduced by RIFAMPICIN
- Antiepileptics: plasma concentration of abiraterone possibly reduced by POSPHENOTYNOXOPHYN, PHENOBARBITAL, PHENOTYNOXOPHYN and PRIMIDONE
- Antivirals: abiraterone possibly reduces effects of RIBAVIRIN; plasma concentration of abiraterone reduced by TIPRANIVAR
- Orlistat: absorption of abiraterone possibly reduced by ORLISTAT

**Abiraterone** (continued)
- Calcium-channel Blockers: enhanced hypertensive effect when ACE inhibitors given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: captopril possibly increases plasma concentration of DIGOXIN
- Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with CICLOSPORIN
- Clonidine: enhanced hypertensive effect when ACE inhibitors given with CLONIDINE; antihypertensive effect of captopril possibly delayed by previous treatment with CLONIDINE
- Corticosteroids: hypertensive effect of ACE inhibitors antagonised by CORTICOSTEROIDS
- Cytoxics: increased risk of angular conjunctivitis when ACE inhibitors given with EVEROLIMUS
- Diazoxide: enhanced hypertensive effect when ACE inhibitors given with DIAZOXIDE
- Diuretics: increased risk of severe hyperkalaemia when ACE inhibitors given with EPELENONE and SPIRONOLACTONE—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when ACE inhibitors given with AMILORIDE, POTASSIUM CANRENATE or TRIAMTERENE; enhanced hypertensive effect when ACE inhibitors given with DIURETICS
- Dopaminergics: enhanced hypertensive effect when ACE inhibitors given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: ACE inhibitors reduce excretion of LITHIUM (increased plasma concentration)
- Methydopa: enhanced hypertensive effect when ACE inhibitors given with METHYLDOPA
- Moxisylyte: enhanced hypertensive effect when ACE inhibitors given with MOXISYLYTE
- Moxonidine: enhanced hypertensive effect when ACE inhibitors given with MOXONIDINE
- Muscle Relaxants: enhanced hypertensive effect when ACE inhibitors given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypertensive effect when ACE inhibitors given with NITRATES
- Oestrogens: hypertensive effect of ACE inhibitors antagonised by OESTROGENS
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with POTASSIUM SALTS
- Prostaglandins: enhanced hypertensive effect when ACE inhibitors given with ALPROSTADIL
- Sacubitril: manufacturer of sacubitril advises avoid ACE inhibitors for 36 hours before or after SACUBITRIL
- Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with SODIUM AURITHIOMALATE
- Vasodilator Antihypertensives: enhanced hypertensive effect when ACE inhibitors given with HYDRALAZINE, MINOXIDIL or SODIUM NITRPRUSSIDE
- Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with WASP VENOM EXTRACTS

**Acetabulol** see Beta-blockers

**Acefocenac** see NSAIDs

**Acometacin** see NSAIDs

**ACA**
- Analgesics: abiraterone possibly reduces plasma concentration of METHADONE
- Antibacterials: plasma concentration of abiraterone possibly reduced by RIFAMPICIN
- Antiepileptics: plasma concentration of abiraterone possibly reduced by POSPHENOTYNOXOPHYN, PHENOBARBITAL, PHENOTYNOXOPHYN and PRIMIDONE
- Antivirals: abiraterone possibly reduces effects of RIBAVIRIN; plasma concentration of abiraterone reduced by TIPRANIVAR
- Orlistat: absorption of abiraterone possibly reduced by ORLISTAT

**ACA** (continued)
- Calcium-channel Blockers: enhanced hypertensive effect when ACE inhibitors given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: captopril possibly increases plasma concentration of DIGOXIN
- Ciclosporin: increased risk of hyperkalaemia when ACE inhibitors given with CICLOSPORIN
- Clonidine: enhanced hypertensive effect when ACE inhibitors given with CLONIDINE; antihypertensive effect of captopril possibly delayed by previous treatment with CLONIDINE
- Corticosteroids: hypertensive effect of ACE inhibitors antagonised by CORTICOSTEROIDS
- Cytoxics: increased risk of angular conjunctivitis when ACE inhibitors given with EVEROLIMUS
- Diazoxide: enhanced hypertensive effect when ACE inhibitors given with DIAZOXIDE
- Diuretics: increased risk of severe hyperkalaemia when ACE inhibitors given with EPELENONE and SPIRONOLACTONE—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when ACE inhibitors given with AMILORIDE, POTASSIUM CANRENATE or TRIAMTERENE; enhanced hypertensive effect when ACE inhibitors given with DIURETICS
- Dopaminergics: enhanced hypertensive effect when ACE inhibitors given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: ACE inhibitors reduce excretion of LITHIUM (increased plasma concentration)
- Methydopa: enhanced hypertensive effect when ACE inhibitors given with METHYLDOPA
- Moxisylyte: enhanced hypertensive effect when ACE inhibitors given with MOXISYLYTE
- Moxonidine: enhanced hypertensive effect when ACE inhibitors given with MOXONIDINE
- Muscle Relaxants: enhanced hypertensive effect when ACE inhibitors given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypertensive effect when ACE inhibitors given with NITRATES
- Oestrogens: hypertensive effect of ACE inhibitors antagonised by OESTROGENS
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with POTASSIUM SALTS
- Prostaglandins: enhanced hypertensive effect when ACE inhibitors given with ALPROSTADIL
- Sacubitril: manufacturer of sacubitril advises avoid ACE inhibitors for 36 hours before or after SACUBITRIL
- Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with SODIUM AURITHIOMALATE
- Vasodilator Antihypertensives: enhanced hypertensive effect when ACE inhibitors given with HYDRALAZINE, MINOXIDIL or SODIUM NITRPRUSSIDE
- Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with WASP VENOM EXTRACTS

**Acetabulol** see Beta-blockers

**Acefocenac** see NSAIDs

**Acometacin** see NSAIDs
Adefovir see Coumarins
Aciclovir see Aciclovir
Adalimumab

> NOTE Interactions do not apply to topical adalimumab preparations
  > Aminophylline: adalimumab possibly increases plasma concentration of AMINOPHYLLINE
  > Ciclosporin: increased risk of nephrotoxicity when adalimumab given with CICLOSPORIN
  > Mycophenolate: plasma concentration of adalimumab increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
  > Tacrolimus: possible increased risk of nephrotoxicity when adalimumab given with TACROLIMUS
  > Theophylline: adalimumab possibly increases plasma concentration of THEOPHYLLINE

Acitretin see Retinoids
Aciclovir see Antivirals
Acetazolamide see Diuretics

Adrnergic Neurone Blockers (continued)
» Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIS; hypotensive effect of adrenergic neurone blockers antagonised by TRICYCLICS
» Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by HALOPERIDOL; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of CHLORPROMAZINE; enhanced hypotensive effect when adrenergic neurone blockers given with PHENOTHIAZINES
» Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with ANXIOLYTICS AND HYPNOTICS
» Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with BETA-BLOCKERS
» Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with CALCIUM-CHANNEL BLOCKERS
» Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with CLONIDINE
» Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by CORTICOSTEROIDS
» Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with DIAZoxide
» Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with DIURETICS
» Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with CO-ENZYME Q10, CO-CALCIUM or LEVODOPA
» Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with METHYLDOPA
» Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with MOXISLYTE
» Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with MOXONIDINE
» Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with BACLOFEN or TIZANIDINE
» Nitrites: enhanced hypotensive effect when adrenergic neurone blockers given with NITRATES
» Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by OESTROGENS
» Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by PIZOTifen
» Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with ALPROSTADIL
» Symptomatetics: increased risk of hypertension when guanethidine given with ADRENAline (EPINEPHRINE); hypotensive effect of guanethidine antagonised by DEXAMFETAMINE and Lisdexamfetamine; hypotensive effect of adrenergic neurone blockers antagonised by EPHEDRINE, ISOMETHETANE, METARAMINOL, METHYLPHENIDATE, NORADRENALINE (norepinephrine), OXYMETAZOLINE, PHENYLEPHRINE, Pseudoephedrine and XyloMetazine; avoidance of guanethidine advised by manufacturer of MIOdRINE
» Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with HYDRAZINE, MINOXIDIL or SODIUM NitROPRUSsE

Adsorbents see Kaolin
Afatinib

> Anti-arhythmics: plasma concentration of afatinib possibly increased by AMIODARONE — manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours
» Anti-infectives: plasma concentration of afatinib possibly increased by ERYTHROMYCIN — manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by RifAMPICIN
» Antifungals: plasma concentration of afatinib possibly increased by ITRACONAZOLE and KETOCONAZOLE — manufacturer of afatinib advises separating administration of itraconazole and ketoconazole by 6 to 12 hours
» Anti-psychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
» Antivirals: plasma concentration of afatinib increased by RITONAVIR — manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma

Adrenocortical see Coumarins
Acetazolamide see Diuretics
Aciclovir

NOTE Interactions do not apply to topical aciclovir preparations
» Aminophylline: aciclovir possibly increases plasma concentration of AMINOPHYLLINE
» Ciclosporin: increased risk of nephrotoxicity when aciclovir given with CICLOSPORIN
» Mycophenolate: plasma concentration of aciclovir increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
» Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with TACROLIMUS
» Theophylline: aciclovir possibly increases plasma concentration of THEOPHYLLINE

Aciclovir see Antivirals
Acetazolamide see Diuretics
Adrenaline (epinephrine)

> NOTE Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIS; hypotensive effect of adrenergic neurone blockers antagonised by TRICYCLICS
> Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by HALOPERIDOL; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of CHLORPROMAZINE; enhanced hypotensive effect when adrenergic neurone blockers given with PHENOTHIAZINES
> Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with ANXIOLYTICS AND HYPNOTICS
> Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with BETA-BLOCKERS
> Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with CALCIUM-CHANNEL BLOCKERS
> Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with CLONIDINE
> Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by CORTICOSTEROIDS
> Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with DIAZoxide
> Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with DIURETICS
> Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with CO-ENZYME Q10, CO-CARELDOPA or LEVODOPA
> Methyldopa: enhanced hypotensive effect when adrenergic neurone blockers given with METHYLDOPA
> Moxisylyte: enhanced hypotensive effect when adrenergic neurone blockers given with MOXISLYTE
> Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with MOXONIDINE
> Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with BACLOFEN or TIZANIDINE
> Nitrites: enhanced hypotensive effect when adrenergic neurone blockers given with NITRATES
> Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by OESTROGENS
> Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by PIZOTifen
> Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with ALPROSTADIL
> Symptomatetics: increased risk of hypertension when guanethidine given with ADRENAline (EPINEPHRINE); hypotensive effect of guanethidine antagonised by DEXAMFETAMINE and Lisdexamfetamine; hypotensive effect of adrenergic neurone blockers antagonised by EPHEDRINE, ISOMETHETANE, METARAMINOL, METHYLPHENIDATE, NORADRENALINE (norepinephrine), OXYMETAZOLINE, PHENYLEPHRINE, Pseudoephedrine and XyloMetazine; avoidance of guanethidine advised by manufacturer of MIOdRINE
> Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with HYDRAZINE, MINOXIDIL or SODIUM NitROPRUSsE

Adsorbents see Kaolin
Afatinib

Anti-arhythmics: plasma concentration of afatinib possibly increased by AMIODARONE — manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours
Anti-infectives: plasma concentration of afatinib possibly increased by ERYTHROMYCIN — manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by RifAMPICIN
Antifungals: plasma concentration of afatinib possibly increased by ITRACONAZOLE and KETOCONAZOLE — manufacturer of afatinib advises separating administration of itraconazole and ketoconazole by 6 to 12 hours
Anti-psychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Antivirals: plasma concentration of afatinib increased by RITONAVIR — manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma
Afatinib
Antivirals (continued)
concentration of afatinib possibly increased by SAQUINAVIR — manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours
• Calcium-channel Blockers: plasma concentration of afatinib possibly increased by VERAPAMIL — manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours
• Ciclosporin: plasma concentration of afatinib possibly increased by CICLOSPORIN — manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours
• Tacrolimus: plasma concentration of afatinib possibly increased by TACROLIMUS — manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours

Agalsidase Alfa and Beta
• Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by AMIODARONE (manufacturers of agalsidase alfa and beta advise concomitant use)
• Antibacterials: effects of agalsidase alfa and beta possibly inhibited by CHLOROQUINE and HYDROXYCHLOROQUINE (manufacturers of agalsidase alfa and beta advise concomitant use concomitant use)

Agomelatine
• Antidepressants: manufacturer of agomelatine advises avoid concomitant use with CIPROFLOXACIN
• Antidepressants: metabolism of agomelatine inhibited by FLUOXETINEN (increased plasma concentration)
• Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE and ARTEMIMOL WITH PIPERAQUINE
• Antihistamines: possible increased risk of convulsions when antidepressants given with ATOMOXETINE

Albendazole
• Anthelminitics: plasma concentration of both drugs possibly reduced when albendazole given with LEVAMISOLE
• Antiepileptics: plasma concentration of albendazole reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE — consider increasing albendazole dose when given for systemic infections
• Antivirals: plasma concentration of active metabolite of albendazole reduced by RITONAVIR — consider increasing albendazole dose when given for systemic infections
• Corticosteroids: plasma concentration of active metabolite of albendazole increased by DEXMETHASONE
• Grapefruit Juice: plasma concentration of active metabolite of albendazole increased by GRAPEFRUIT JUICE
• Ulcer-healing Drugs: effects of albendazole possibly enhanced by CIMETIDINE

Albiglutide see Antidiabetics

Alcohol
• ACE Inhibitors: enhanced hypotensive effect when alcohol given with ACE INHIBITORS
• Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with ADRENERGIC NEURONE BLOCKERS
• Alpha-blockers: increased sedative effect when alcohol given with INDOMAMINE; enhanced hypotensive effect when alcohol given with ALPHA-BLOCKERS
• Analgesics: enhanced hypotensive and sedative effects when alcohol given with OPIOID ANALGESICS
• Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
• Anthelminitics: possibility of disulfiram-like reaction when alcohol given with LEVAMISOLE
• Antibacterials: disulfiram-like reaction when alcohol given with METRONIDAZOLE; possibility of disulfiram-like reaction when alcohol given with TINIDAZOLE; increased risk of convulsions when alcohol given with CYCLOSERINE
• Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with COUMARINS or PHENINDIONE
• Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with MAOIS (hypertensive crisis) — if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with SCT; increased sedative effect when alcohol given with MIRTAZAPINE, TRICYCLIC-RELATED ANTIDEPRESSANTS or TRICYCLICS
• Antidiabetics: alcohol enhances hypoglycaemic effect of ANTIDIABETICS; increased risk of lactic acidosis when alcohol given with METFORMIN
• Antiepileptics: alcohol possibly increases CNS side-effects of CARBAMAZEPINE; chronic heavy consumption of alcohol possibly reduces plasma concentration of fosphenytoin and phenytoin; increased sedative effect when alcohol given with PHENOBARBITAL OR PRIMIDONE; increased risk of blurred vision when alcohol given with RETIGABINE
• Antifungals: possibility of disulfiram-like reaction when alcohol given with KETOCONAZOLE; effects of alcohol possibly enhanced by GRISOFULVIN
• Antihistamines: increased sedative effect when alcohol given with ANTIHISTAMINES (possibly less effect with non-sedating antihistamines)
• Antimuscarinics: increased sedative effect when alcohol given with HYOSCINE
• Antipsychotics: increased sedative effect when alcohol given with ANTISYPHYSCHTICS
• Anxiolytics and Hypnotics: increased sedative effect when alcohol given with ANXIOLYTICS AND HYPNOTICS
• Avanafil: possible enhanced hypotensive effect when alcohol given with AVANAFIL
• Beta-blockers: enhanced hypotensive effect when alcohol given with BETA-BLOCKERS
• Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with CALCIUM-CHANNEL BLOCKERS; plasma concentration of alcohol possibly increased by VERAPAMIL
• Clonidine: enhanced hypotensive effect when alcohol given with CLONIDINE
• Cytotoxics: disulfiram-like reaction when alcohol given with PROCARBAZINE; avoidance of alcohol advised by manufacturer of TRABETEDIN
• Dapoxetine: increased sedative effect when alcohol given with DAPOXETINE
• Diazoxide: enhanced hypotensive effect when alcohol given with DIAZOXIDE
• Disulfiram: disulfiram reaction when alcohol given with DISULFIRAM
• Diuretics: enhanced hypotensive effect when alcohol given with DIURETICS
• Dopaminergics: alcohol reduces tolerance to BROMOCRIPINE
• Guanfacine: sedative effects possibly increased when alcohol given with GUANFACINE
• Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of LOMITAPIDE
• Lofexidine: increased sedative effect when alcohol given with LOFEXIDINE
• Methyl dopa: enhanced hypotensive effect when alcohol given with METHYLDOPA
• Metoclopramide: absorption of alcohol possibly increased by METOCLOPRAMIDE
• Moxonidine: enhanced hypotensive effect when alcohol given with MOXONIDINE
• Muscle Relaxants: increased sedative effect when alcohol given with BACLOFEN, METHOCELAMOL OR TIZANIDINE
• Nicorandil: alcohol possibly enhances hypotensive effect of NICORANDIL
• Nitrites: enhanced hypotensive effect when alcohol given with NITRATES
• Paraldehyde: increased sedative effect when alcohol given with PARALDEHYDE
• Retinoids: presence of alcohol causes etretinate to be formed from ACITRETIN (increased risk of teratogenicity in women of child-bearing potential)
• Sympathomimetics: alcohol possibly enhances effects of METHYLPHENIDATE
Interactions | Appendix 1

Alcohol — Alpha-blockers

### Alcohol

(continued)

- Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with **Hydralazine, Minoxidil** or **Sodium Nitroprusside**

### Aldesleukin

- ACE Inhibitors: enhanced hypotensive effect when aldesleukin given with **ACE INHIBITORS**
- Alpha-blockers: enhanced hypotensive effect when aldesleukin given with **ALPHA-BLOCKERS**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when aldesleukin given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antivirals: aldesleukin possibly increases plasma concentration of aliskiren given with **CLONIDINE**

#### ACE Inhibitors

- **Corticosteroids**: manufacturer of aldesleukin advises avoid concomitant use with **CORTICOSTEROIDS**
- **Cytoxics**: manufacturer of aldesleukin advises avoid concomitant use with **CISPLATIN, DACarbazine** and **VINBLASTINE**

#### Calcium-channel Blockers

- **Ciclosporin**: plasma concentration of aliskiren increased by **KETOCONAZOLE**, increased risk of hyperkalaemia when aliskiren given with **ALDOSTERONE ANTAGONISTS** or **POTASSIUM-SPARING DIURETICS**

#### Analgesics

- **Anticoagulants**: aldesleukin possibly increases plasma concentration of **AMINOPHYLLINE**
- **Beta-blockers**: enhanced hypotensive effect when alpha-blockers given with **ACE INHIBITORS**
- Calcium-channel Blockers: enhanced hypotensive effect when aldesleukin given with **CALCIUM-CHANNEL BLOCKERS**
- Clonidine: enhanced hypotensive effect when aldesleukin given with **CLONIDINE**

### Aliskiren

(continued)

- **Diuretics**: aliskiren reduces plasma concentration of **FUROSEMIDE**; increased risk of hyperkalaemia when aliskiren given with **ALDOSTERONE ANTAGONISTS** or **POTASSIUM-SPARING DIURETICS**
- **Grapefruit Juice**: plasma concentration of aliskiren reduced by **GRAPEFRUIT JUICE**—avoid concomitant use
- **Potassium Salts**: increased risk of hyperkalaemia when aliskiren given with **POTASSIUM SALTS**

### Alfentanil

(continued)

- **Antipsychotics**: allopurinol possibly enhances anticoagulant effect of **COUMARINS**
- **Antivirals**: allopurinol possibly increases plasma concentration of **AMOXYCILLIN, AMPICILLIN** or **CD-AMOXICLAV**
- **Anticoagulants**: allopurinol possibly enhances anticoagulant effect of **COUMARINS**

### Allopurinol

- **ACE Inhibitors**: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with **ACE INHIBITORS** especially in renal impairment
- **Aminophylline**: allopurinol possibly increases plasma concentration of **AMINOPHYLLINE**
- **Antibacterials**: increased risk of rash when allopurinol given with **AMOXYCILLIN, AMPICILLIN** or **CD-AMOXICLAV**
- **Anticoagulants**: allopurinol possibly enhances anticoagulant effect of **COUMARINS**

### Aldosterone Antagonists

- **Corticosteroids**: manufacturer of aldesleukin advises avoid concomitant use with **CORTICOSTEROIDS**
- **Cytoxics**: manufacturer of aldesleukin advises avoid concomitant use with **CISPLATIN, DACarbazine** and **VINBLASTINE**

### Almotriptan

- **Diabetes**: aldesleukin possibly increases plasma concentration of **AMOXYCILLIN, AMPICILLIN** or **CD-AMOXICLAV**

### Alpha-blockers

(continued)

- **ACE Inhibitors**: enhanced hypotensive effect when alpha-blockers given with **ACE INHIBITORS**
- **Adrenergic Neurone Blockers**: enhanced hypotensive effect when alpha-blockers given with **ADRENERGIC NEURONE BLOCKERS**
- **Alcohol**: enhanced hypotensive effect when alpha-blockers given with **ALCOHOL**; increased sedative effect when indoramin given with **ALCOHOL**
- **Alpha-blockers**: enhanced hypotensive effect when alpha-blockers given with **ALDESLEUKIN**
- **Anaesthetics**: General: enhanced hypotensive effect when alpha-blockers given with **GENERAL ANAESTHETICS**
- **Alpha-blockers**: enhanced hypotensive effect of alpha-blockers antagonised by **NSAIDS**
- **Angiotensin-II Receptor Antagonists**: enhanced hypotensive effect when alpha-blockers given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- **Antidepressants**: manufacturer of indoramin advises avoid concomitant use with **MAOIS**; enhanced hypotensive effect when alpha-blockers given with **MAOIS**
- **Antifungals**: plasma concentration of alfuzosin possibly increased by **KETOCONAZOLE**; plasma concentration of tamsulosin increased by **KETOCONAZOLE**
- **Antipsychotics**: enhanced hypotensive effect when alpha-blockers given with **ANTIPSYCHOTICS**
- **Antivirals**: plasma concentration of doxazosin and tamsulosin possibly increased by **BOCPEPREVIR**—manufacturer of boceprevir advises avoid concomitant use; plasma concentration of alfuzosin possibly increased by **RITONAVIR**—avoid concomitant use; avoidance of alfuzosin advised by manufacturer of **TELAPREVIR**
Alpha-blockers (continued)

- Axonalytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with ANXIOLYTICS AND HYPNOTICS
- Avasanil: enhanced hypotensive effect when alpha-blockers given with ▶ AVANAFIL—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Beta-blockers: enhanced hypotensive effect when alpha-blockers given with ▶ BETA-BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Calcium-channel Blockers: enhanced hypotensive effect when alpha-blockers given with ▶ CALCIUM-CHANNEL BLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Cardiac Glysidoses: prazosin increases plasma concentration of TAMSULOSIN increased by VERAPAMIL
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with ▶ DOPAMINERGICS
- Diuretics: enhanced hypotensive effect when alpha-blockers given with ▶ DIURETICS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypotensive effect when alpha-blockers given with ▶ DIURETICS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Nitrates: increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
- Sympathomimetics: enhanced hypotensive effect when alpha-blockers given with ▶ SYMPATHOMIMETICS
- Prostaglandins:

Amantadine
- Antimalarial: plasma concentration of amantadine possibly increased by QUININE
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with ▶ ANTIPSYCHOTICS
- Propafenone: increased risk of side-effects when amantadine given with ▶ PROPAFENONE
- Memantine: increased risk of CNS toxicity when amantadine given with ▶ MEMANTINE (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by ▶ MEMANTINE
- Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Tetroxanezine: increased risk of extrapyramidal side-effects when amantadine given with TETRAZEPINE

Ambrisentan
- Antibacterials: plasma concentration of ambrisentan possibly increased by ▶ RIFAMPICIN
- Ciclosporin: plasma concentration of ambrisentan increased by ▶ CICLOSPORIN (see under Ambrisentan, p. 174)

Amikacin
- See Aminoglycosides

Aminodrines
- See Diuretics

Aminoglycosides
- Agalsidase Alfa and Beta: gentamicin possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by INDOMETACIN
- Antibacterials: neomycin reduces absorption of PHENODIMETHYLPHENICILLIN; increased risk of nephrotoxicity when aminoglycosides given with CICLOSPORIN or POLYMYXINS; increased risk of nephrotoxicity and oto toxicity when aminoglycosides given with CAPREOMYCIN or VANCOMYCIN; possible increased risk of nephrotoxicity when aminoglycosides given with CEPHALOSPORINS
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with ▶ COUMARINS or PHENINDIONE
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of ACARBOSE, also severity of gastro-intestinalal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with ▶ AMPHOTERICIN
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with ▶ BISPHOSPHONATES
- Cardiac Glysidoses: gentamicin possibly increases plasma concentration of DIGOXIN; neomycin reduces absorption of DIGOXIN
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ▶ CICLOSPORIN
- Cytotoxics: neomycin possibly reduces absorption of MEOXYREDXATE; neomycin reduces bioavailability of SORAFLIB; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with ▶ PLATINUM COMPOUNDS
- Diuretics: increased risk of otoxicity when aminoglycosides given with ▶ LOOP DIURETICS
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with ▶ MANNITOL
- Muscle Relaxants: aminoglycosides enhance effects of ▶ NON-DEPOLARISING MUSCLE RELAXANTS and ▶ SUXAMETHONIUM
- Parasympathomimetics: aminoglycosides antagonise effects of ▶ NEOSTIGMINE and ▶ PYRIDOSTIGMINE
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with ▶ TACROLIMUS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC
- Vitamins: neomycin possibly reduces absorption of ▶ VITAMIN A

Amphoterin
- Alopurinol: plasma concentration of aminophylline possibly increased by ▶ ALOPURINOL
- Anaesthetics, General: increased risk of convulsions when aminophylline given with ▶ KETAMINE
- Anti-arrrhythmics: aminophylline antagonises anti-arrrhythmic effect of ADENOSINE—manufacturer of adenosine advises
Aminophylline

Anti-arrhythmics (continued)

Avoid aminophylline for 24 hours before adenosine; plasma concentration of aminophylline increased by PROPafenone

- Antibacterials: plasma concentration of aminophylline possibly increased by CLARITHROMYCIN and ROPIVACAIN; plasma concentration of aminophylline increased by ERYTHROMYCIN (also aminophylline may reduce absorption of oral erythromycin); plasma concentration of aminophylline increased by CAPROFLOXACIN and NORFLOXACIN; metabolism of aminophylline accelerated by RIFAMPICIN (reduced plasma concentration); possible increased risk of convulsions when aminophylline given with QUINOLONES

- Antidepressants: plasma concentration of aminophylline possibly increased by FLUCONAZOLE and KETOCONAZOLE

- Antivirals: plasma concentration of aminophylline possibly increased by ACICLOVIR and VALACLOVIR; metabolism of aminophylline accelerated by RITONAVIR (reduced plasma concentration)

- Anti-epileptics: metabolism of aminophylline accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced effect); plasma concentration of both drugs reduced when aminophylline given with FOSFENPYRON and PHENYTOIN

- Antifungals: plasma concentration of aminophylline possibly increased by FLUCONAZOLE and KETOCONAZOLE

- Anticoagulants: avoidance of aminophylline advised by manufacturer of ALENDRONATE, DISOPROPYRAMIDE or DRONERADONE—avoid concomitant use; aminophylline increases plasma concentration of FLECAIN IDE (halve dose of flecainide)

- Anti-arrhythmics: increased risk of ventricular arrhythmias when aminophylline given with PHENYTOIN, ERYTHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when aminophylline given with LEVOFLOXACIN

- Anticoagulants: aminophylline inhibits metabolism of COUMARINS and PHENIDIONE (enhanced anticoagulant effect); aminophylline increases plasma concentration of DABIGATRAN (see under Dabigatran Etxecllate, p. 128)

- Antidepressants: avoidance of aminophylline advised by manufacturer of CITOLOPRAM, ESCITALOPRAM and SULPIRIDE

- Antihistamines: increased risk of ventricular arrhythmias when aminophylline given with CITALOPRAM, MOXIFLOXACIN and PIMOZIDE

- Antimalarials: metabolism of aminophylline increased by PHENINDIONE (reduced plasma concentration); possible increased risk of ventricular arrhythmias when aminophylline given with ARTEMETHER AND LUMEFANTRINE (risk of ventricular arrhythmias); avoidance of aminophylline advised by manufacturer of ARTENIMOL WITH PIPAQUEIN (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when aminophylline given with CHLOROQUINE, HYDOXYCHLOROQUINE, MEfloQUINE or QUININE—avoid concomitant use

- Antimuscarnics: increased risk of ventricular arrhythmias when aminophylline given with TOLTERODINE

- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when aminophylline given with BENPERIDOL—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when aminophylline given with AMISULPIDE, DROPERIDOL, HALOPERIDOL, PHENOTHIAZINES, PIMOZIDE or ZUCLOPENTHIXOL—avoid concomitant use; increased risk of ventricular arrhythmias when aminophylline given with SULPIRE

- Anticoagulants: aminophylline inhibits metabolism of PHENYTOIN and FOSFENPYRON (increased plasma concentration)

- Anti-H1 antihistamines: increased risk of ventricular arrhythmias when aminophylline given with PREDNISOLONE, LITHIUM—avoid concomitant use

- Anticoagulants: increased risk of ventricular arrhythmias when aminophylline given with ARIANTHROMycin and AZITHROMycin

- Anticoagulants: aminophylline increases excretion of LITHIUM (reduced plasma concentration)

- Anticoagulants: plasma concentration of aminophylline increased by LEUKOTRIENe RECEPTOR ANTAGONISTS; plasma concentration of aminophylline increased with ZAFIRUkAST, also plasma concentration of zafirlukast reduced

- Anticoagulants: increased risk of hypokalaemia when aminophylline given with ACETAMiDOPHEN, LOOP DIURETICS and THIAZIDES AND RELATED DIURETICS

- Anticoagulants: increased risk of hypokalaemia when aminophylline given with TELITROMYCIN

- Anticoagulants: aminophylline increases excretion of LITHIUM (reduced plasma concentration)

- Anticoagulants: increased risk of hypokalaemia when aminophylline given with LEUKOTRIENe RECEPTOR ANTAGONISTS

- Anticoagulants: increased risk of hypokalaemia when aminophylline given with EPmEREDINE in children

- Anticoagulants: increased risk of hypokalaemia when aminophylline given with high doses of BETA2 SYMPATHOMIMETICS

- Anticoagulants: ulcer-healing Drugs: metabolism of aminophylline inhibited by CIMETIDE (increased plasma concentration); absorption of aminophylline possibly reduced by SUCRALFAE (give at least 2 hours apart)
Amiodarone

- Antivirals (Continued)
  - INDINAVIR —avoid concomitant use; plasma concentration of amiodarone increased by RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when amiodarone given with 
  - SACHINJUINAVIR —avoid concomitant use; possible increased risk of bradycardia when amiodarone given with 
  - SOFOSBUVIR —see under Amiodarone, p. 99; avoidance of amiodarone advised by manufacturer of TELAPREVI (risk of ventricular arrhythmias)
  - Atorvastatin: increased risk of ventricular arrhythmias when amiodarone given with ATRVOSTAT
  - Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with 
  - BETA-BLOCKERS; increased myocardial depression when anti-arrhythmics given with BETA-BLOCKERS; increased risk of ventricular arrhythmias when amiodarone given with 
  - SOTALOL —avoid concomitant use
  - Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with 
  - DILTAZEM OR VERAPAMIL
  - Cardiolipins: amiodarone increases plasma concentration of DIGOXIN (half life of digitoxin)
  - Ciclosporin: amiodarone possibly increases plasma concentration of CICLOSPORIN
  - Cobimetap: plasma concentration of amiodarone possibly increased by COBIMETAP —manufacturer of cobimetap advises avoid concomitant use
  - Colecine: amiodarone possibly increases risk of COLCHICINE toxicity
  - Cytotoxics: amiodarone possibly increases the plasma concentration of AFABININ —manufacturer of afabinin advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with 
  - BUSUTINIB and 
  - CERITINIB; amiodarone possibly increases the plasma concentration of 
  - IBURITINIB —reduce dose of iburitinib (see under iburitinib, p. 867); avoidance of amiodarone advised by manufacturer of IDELALISIB; possible increased risk of ventricular arrhythmias when amiodarone given with 
  - VANDETINIB —avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with 
  - ARSENIC TRIOXIDE
  - Diuretics: amiodarone increases plasma concentration of 
  - EPLERONE (reduce dose of eplerenone); increased cardiac toxicity with amiodarone if hypokalaemia occurs with 
  - ACETAZOLAMIDE, LOOP DIURETICS OR THIAZIDES AND RELATED DIURETICS
  - Fingolimod: possible increased risk of bradycardia when amiodarone given with 
  - FINGOLIMOD
  - Grapefruit juice: plasma concentration of amiodarone increased by 
  - GRAPEFRUIT JUICE
  - Ibradadine: increased risk of ventricular arrhythmias when amiodarone given with 
  - IYABRADINE
  - Lipid-regulating Drugs: increased risk of myopathy when amiodarone given with 
  - SIMVASTATIN (see under Simvastatin, p. 194); separating administration from amiodarone by 12 hours advised by manufacturer of 
  - LOMITAPIDE
  - Lithium: manufacturer of amiodarone advises avoid concomitant use with 
  - LITHIUM (risk of ventricular arrhythmias)
  - Orlisat: plasma concentration of amiodarone possibly reduced by 
  - ORLISTAT
  - Panobinostat: possible increased risk of ventricular arrhythmias when amiodarone given with 
  - PANOBINOSTAT —avoid concomitant use
  - Pentamidine Isetionate: increased risk of ventricular arrhythmias when amiodarone given with 
  - PENTAMIDINE ISETIONATE —avoid concomitant use
  - Tacrolimus: amiodarone possibly increases plasma concentration of 
  - TACROLIMUS
  - Thyroid Hormones: amiodarone can affect serum concentrations of 
  - THYROID HORMONES —monitor thyroid function closely
  - Ulcer-healing Drugs: plasma concentration of amiodarone increased by 
  - CIMETIDINE

Amisolpride see Antipsychotics
Amiprivitryline see Antidepressants, Tricyclic
Amlodipine see Calcium-channel Blockers
Amodicillin see Penicillins

Amphotericin

NOTE Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics
Antibacterials: increased risk of nephrotoxicity when amphotericin given with 
- AMINOLYSISIDES or POLYMIXINS; possible increased risk of nephrotoxicity when amphotericin given with 
- VANCOCYN
> Antiinflamms: amphotericin reduces renal excretion and increases cellular uptake of FLUCYTOSINE (toxicity possibly increased); effects of amphotericin possibly antagonised by 
- IMIDAZOLES and TRAIZOLES; plasma concentration of amphotericin possibly increased by 
- MICAFUNGIN
> Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with 
- CARDIAC GLYCOSIDES
> Ciclosporin: increased risk of nephrotoxicity when amphotericin given with 
- CICLOSPORIN
> Corticosteroids: increased risk of hypokalaemia when amphotericin given with 
- CORTICOSTEROIDS—avoid concomitant use unless corticosteroids needed to control reactions
> Cytoxics: increased risk of ventricular arrhythmias when amphotericin given with 
- ARSENIC TRIOXIDE
> Diuretics: increased risk of hypokalaemia when amphotericin given with 
- LOOP DIURETICS OR THIAZIDES AND RELATED DIURETICS
> Pentamidine Isetionate: possible increased risk of nephrotoxicity when amphotericin given with 
- PENTAMIDINE ISETIONATE
> Sodium Stibogluconate: possible increased risk of arrhythmias when amphotericin given after 
- SODIUM STIBOGLUCONATE —manufacturer of sodium stibogluconate advises giving 14 days apart
> Tacrolimus: increased risk of nephrotoxicity when amphotericin given with 
- TACROLIMUS

Ampicillin see Penicillins

Anabolic Steroids

- Antiocoagulants: anabolic steroids enhance anticoagulant effect of 
- COUMARINS AND 
- PHENINDINE
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of 
- ANTIDIABETICS

Anasthetics, General

NOTE See also Surgery and Long-term Medication, under 
- General Anaesthesia in BNF
> ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with 
- ACE INHIBITORS
> Adrenergic Neuron Blockers: enhanced hypotensive effect when general anaesthetics given with 
- ADRENERGIC NEURONE BLOCKERS
> Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with 
- ALPHA-BLOCKERS
> Aminophylline: increased risk of convulsions when ketamine given with 
- AMINOPHYLLINE
> Analgesics: metabolism of etomidate inhibited by 
- FENTANYL (consider reducing dose of etomidate); effects of thiopental possibly enhanced by 
- ASPARIN; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by 
- OPIOID ANALGESICS
> Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with 
- ANGIOTENSIN-II RECEPTOR ANTAGONISTS
> Antibacterials: increased risk of hepatotoxicity when isoflurane given with 
- ISONIAZIDE; effects of thiopental enhanced by 
- SULFONAMIDES; hypersensitivity–like reactions can occur when 
- intraavenous VANCOCYN
> Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with 
- TRICYCLICS
> Antipsychotics: enhanced hypotensive effect when general anaesthetics given with 
- ANTIPSYCHOTICS; effects of thiopental enhanced by 
- DROPERIDOL
> Anxiolytics and Hypnotics: increased sedative effect when 
- general anaesthetics given with 
- ANXIOLYTICS AND HYPNOTICS
> Beta-blockers: enhanced hypotensive effect when general anaesthetics given with 
- BETA-BLOCKERS

Amitrazine see See Antiparasitics

Ampicillin see Penicillins

Amphotericin
Angiotensin-II Receptor Antagonists

ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with ACE INHIBITORS.

Adrenergic Neurone Blockers: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ADRENERGIC NEURONE BLOCKERS.

Alcohol: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ALCOHOL.

Aldesleukin: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ALDESLEUKIN.

Aliksiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with ALIXISIREN.

Alpha-blockers: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ALPHA-BLOCKERS.

Anaesthetics, General: enhanced hypertensive effect when angiotensin-II receptor antagonists given with GENERAL ANAESTHETICS.

Antipsychotics: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ANTI PSYCHOTICS.

Antivirals: plasma concentration of candesartan, losartan and valsartan possibly increased by PARITAPREVIN—manufacturer of paritaprevin advises reduce dose of candesartan, losartan and valsartan.

Anxiolytics and Hypnotics: enhanced hypertensive effect when angiotensin-II receptor antagonists given with ANXIOLYTICS AND HYPNOTICS.

Beta-blockers: enhanced hypertensive effect when angiotensin-II receptor antagonists given with BETA-BLOCKERS.

Calcium-channel Blockers: enhanced hypertensive effect when angiotensin-II receptor antagonists given with CALCIUM-CHANNEL BLOCKERS.

Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with CICLOSPORIN.

Clonidine: enhanced hypertensive effect when angiotensin-II receptor antagonists given with CLONIDINE.

Corticosteroids: hypertensive effect of angiotensin-II receptor antagonists antagonised by CORTICOSTEROIDS.

Diazoxide: enhanced hypertensive effect when angiotensin-II receptor antagonists given with DIAZOXIDE.

Diuretics: increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with EPIERENONE and SPIRONOLACTONE—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with AMILORIDE, POTASSIUM CANRENOATE or TRIAMTERENE; enhanced hypertensive effect when angiotensin-II receptor antagonists given with DIURETICS; valsartan reduces plasma concentration of FUROSEMIDE.

Dopaminergics: enhanced hypertensive effect when angiotensin-II receptor antagonists given with MOXISLYTE.

Etanercept: avoid concomitant use of anakinra with ETANERCEPT.

Epleronone and SPIRONOLACTONE—avoid concurrent use or use lowest possible doses of both drugs; increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with AMILORIDE, POTASSIUM CANRENOATE or TRIAMTERENE; enhanced hypertensive effect when angiotensin-II receptor antagonists given with DIURETICS; valsartan reduces plasma concentration of FUROSEMIDE.

Furosemide: enhanced hypertensive effect when angiotensin-II receptor antagonists given with FUROSEMIDE.

Gemfibrozil: enhanced hypertensive effect when angiotensin-II receptor antagonists given with GEMFIBROZIL.

Lithium: improved plasma concentration when angiotensin-II receptor antagonists given with LITHIUM.

Methyldopa: enhanced hypertensive effect when angiotensin-II receptor antagonists given with METHYLDOPA.

Moxisylyte: enhanced hypertensive effect when angiotensin-II receptor antagonists given with MOXISLYTE.

Opioids: enhanced hypertensive effect when angiotensin-II receptor antagonists given with OPIOIDS.

Paracetamol: enhanced hypertensive effect when angiotensin-II receptor antagonists given with PARACETAMOL.

Peprotin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with PEPROTIN.

Potassium Canrenone: enhanced hypertensive effect when angiotensin-II receptor antagonists given with POTASSIUM CANRENOATE.

Potassium Pulitzer: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with POTASSIUM PULVERISE.

Propafenone: enhanced hypertensive effect when angiotensin-II receptor antagonists given with PROPAFENONE.

Quinapril: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with QUINAPRIL.

Ritonavir: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with RITONAVIR.

Rifampicin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with RIFAMPICIN.

Sodium Citrate: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with SODIUM CITRATE.

Spirinolactone: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with SPIRONOLACTONE.

Valproate: enhanced hypertensive effect when angiotensin-II receptor antagonists given with VALPROATE.

Verapamil: enhanced hypertensive effect when angiotensin-II receptor antagonists given with VERAPAMIL.
Angiotensin-II Receptor Antagonists (continued)

- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with Baclofen or Tizanidine.
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with Nitrates.
- Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by Oestrogens.
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with Potassium Salts.
- Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with Hydralazine, Minoxidil or Sodium Nitroprusside.

Antacids

Note: Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.

- ACE Inhibitors: antacids possibly reduce absorption of ACE Inhibitors; antacids reduce absorption of Captopril, Enalapril and Fosinopril.
- Analgesics: antacids possibly reduce absorption of Acemetacin; alkaline urine due to some antacids increases excretion of Aspirin.
- Antihelmintics: sodium bicarbonate reduces excretion of Diethylcarbamazine.
- Antibacterials: antacids reduce absorption of Ceftazidime, Ciprofloxacin, Levofloxacin and Rifampicin; antacids reduce absorption of Azithromycin (give at least 2 hours before or 1 hour after antacids); antacids reduce absorption of Ciprofloxacin and Levofloxacin (give at least 2 hours before or 4 hours after ciprofloxacin and levofloxacin); antacids reduce absorption of Moxifloxacin (give at least 6 hours apart); antacids reduce absorption of Olopatadine (give at least 2 hours apart); avoid concomitant use of antacids with Methenamine; oral magnesium salts (as magnesium trisilicate) reduce absorption of Nitrofurantoin; antacids possibly reduce absorption of Tetracyclines (give at least 2 to 3 hours apart).
- Antiepileptics: antacids reduce absorption of Fosphenytoin, Gabapentin and Phenytoin.
- Antifungals: antacids reduce absorption of Itraconazole and Ketoconazole.
- Antihistamines: antacids reduce absorption of Fexofenadine.
- Antimalarials: antacids reduce absorption of Chloroquine and Hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of Proguanil.
- Antipsychotics: antacids reduce absorption of Phenothiazines and Sulpiride.
- Antivirals: antacids reduce absorption of Atazanavir (give at least 2 hours before or 1 hour after antacids); oral magnesium salts reduce absorption of Dolasetodarin — manufacturer of dolasetodarin advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide reduces absorption of Dolasetodarin — manufacturer of dolasetodarin advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts reduce absorption of Elvitegravir (give at least 4 hours apart); aluminium hydroxide reduces absorption of Elvitegravir (give at least 4 hours apart); separating administration from antacids by 4 hours advised by manufacturer of Ledipasvir; aluminium hydroxide reduces plasma concentration of Raltegravir — manufacturer of raltegravir advises avoid concomitant use; oral magnesium salts reduce plasma concentration of Raltegravir — manufacturer of raltegravir advises avoid concomitant use; manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after Rilpivirine; antacids reduce absorption of Tipranavir (give at least 2 hours apart).
- Bile Acids: antacids possibly reduce absorption of Bile Acids; aluminium hydroxide probably reduces effects of Cholic Acid (manufacturer of cholic acid advises give at least 5 hours apart).

Antacids (continued)

- Bisphosphonates: antacids reduce absorption of Bisphosphonates.
- Cardiac Glycosides: antacids possibly reduce absorption of Digoxin.
- Corticosteroids: antacids reduce absorption of Deflazacort.
- Cytoxins: aluminium hydroxide and oral magnesium salts possibly reduce absorption of Estramustine — manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of Bosutinib; antacids possibly reduce absorption of Dasatinib (give at least 2 hours apart); antacids possibly reduce plasma concentration of Erlotinib — give antacids at least 4 hours before or 2 hours after erlotinib.
- Deferasirox: antacids containing aluminium possibly reduce absorption of Deferasirox (manufacturer of deferasirox advises avoid concomitant use).
- Deferiprone: antacids containing aluminium possibly reduce absorption of Deferiprone (manufacturer of deferiprone advises avoid concomitant use).
- Dipyradomol: antacids possibly reduce absorption of Dipyradomol.
- Erlotinib: antacids reduce absorption of Erlotinib.
- Eltrombopag: antacids reduce absorption of Eltrombopag (give at least 4 hours apart).
- Folates: antacids possibly reduce absorption of Folic Acid (manufacturer of folic acid advises give at least 2 hours apart).
- Iron Salts: oral magnesium salts (as magnesium trisilicate) reduce absorption of Oral IRON SALTS.
- Lipid-regulating Drugs: antacids reduce absorption of Rosuvastatin.
- Lithium: sodium bicarbonate increases excretion of Lithium (reduced plasma concentration).
- Misoprostol: antacids possibly reduce absorption of Misoprostol.
- Mycophenolate: antacids reduce absorption of Mycophenolate.
- Penicillamine: antacids reduce absorption of Penicillamine.
- Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with Polystyrene Sulfonate Resins;
- Risk of metabolic alkalosis when oral magnesium salts given with Polystyrene Sulfonate Resins.
- Riociguat: antacids reduce absorption of Riociguat (give at least 2 hours before or 1 hour after riociguat).
- Symptomatics: aluminium hydroxide possibly increases absorption of Pseudoephedrine.
- Thyroid Hormones: antacids possibly reduce absorption of Levothyroxine.
- Ulcer-healing Drugs: antacids possibly reduce absorption of Lansoprazole.

Antazoline see Antihistamines

Antihelminitics see individual drugs

Anthrax Vaccine see Vaccines

Anti-D Immunoglobulins see Immunoglobulins

Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedaron, Flecaïnide, Lidocaine, and Propafenone

Antibacterials see individual drugs

Antibiotics (cytotoxic) see Bleomycin, Daunorubicin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, Mitoxantrone, and Pixantrone

Anticoagulants see Apixaban, Argatroban, Bivalirudin, Coumarins, Dabigatran, Danaparoid, Edoxaban, Fondaparinux, Heparins, Phenindione, and Rivaroxaban

Antidepressants see Agomelatine; Antidepressants, SSRIs; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Venlafaxine; Vortioxetine

Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine

Antidepressants, SSRIs

Note: see also Dapoxetine

- Alcohol: sedative effects possibly increased when SSRIs given with Alcohol.

- Amoxapine: fluvoxamine increases plasma concentration of Amoxapine (concomitant use should usually be avoided, but where not possible halve amoxapine dose and monitor plasma-amoxapine concentration)
Antidepressants, SSRI (continued)

Antifungals: fluvoxamine inhibits metabolism of *ROPIVACAINE*—avoid prolonged administration of ropivacaine

• Analgesics: Increased risk of bleeding when SSRIs given with *NSAIDS or ASPIRIN*: possible increased serotonergic effects when SSRIs given with *FENTANYL*; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of *METHADONE*; increased risk of CNS toxicity when SSRIs given with *TRAMADOL*

• Anti-arrhythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with *AMIODARONE* (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with *DISOPYRAMIDE* (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with *DRONEDARONE* (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of *FLECAINIDE*; fluoxetine and paroxetine possibly inhibit metabolism of *PROPafenONE*

• Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with *intravenous ERYTHROMYCIN* (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with *MOXIFLOXACIN* (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with *TELITROMYCIN*

• Anticoagulants: SSRIs possibly enhance anticoagulant effect of *COUMARINS*; possible increased risk of bleeding when SSRIs given with *DABIGATRAN*

• Antidepressants: avoidance of fluvoxamine advised by manufacturer of *REboxetine*: possible increased serotonergic effects when SSRIs given with *DULOXETINE*; fluvoxamine inhibits metabolism of *DULOXETINE*—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping *MAOIS*; also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; fluoxetine should not be started until 2 weeks after stopping *MAOIS*; also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; CNS effects of SSRIs increased by *MAOIS* (risk of serious toxicity); increased risk of CNS toxicity when escitalopram given with *MOCLOBEMIDE*, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start *MOCLOBEMIDE* for at least 1 week; after stopping fluoxetine do not start *MOCLOBEMIDE* for 5 weeks; increased serotonergic effects when SSRIs given with *ST JOHN’S WORT*—avoid concomitant use; fluvoxamine inhibits metabolism of *AGOMELATINE* (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with *MIrTAZAPINE*: SSRIs increase plasma concentration of some *TRICYCLICS*; manufacturer of citalopram and escitalopram advises avoid concomitant use with *TRICYCLICS* (risk of ventricular arrhythmias); possible increased risk of convulsions when SSRIs given with *VORtixETINE*; fluoxetine and paroxetine possibly increase plasma concentration of *VORtixETINE* (consider reducing dose of vortioxetine)

• Antiepileptics: SSRIs antagonise anti-epileptic effect of *ANTIEPILEPTICS* (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of *CARBARAZEPINE*; fluoxetine and fluvoxamine increase plasma concentration of *FosphENyTIN*; plasma concentration of sertraline possibly reduced by *FosphENyTIN and PHENyTOIN*, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of paroxetine reduced by *FosphENyTIN, PHENOBARBITAL, PHENyTOIN and ASPIRIN*; fluoxetine increases plasma concentration of *FosphENyTIN* and *PHENyTOIN*

• Antifungals: plasma concentration of paroxetine possibly increased by *TERBINAFINE*

• Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with *MIZOLASTINE* (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by *CYPROMEPATINE*

Antidepressants, SSRI (continued)

• Antimalarials: avoidance of antidepressants advised by manufacturer of *ARTEMETHER WITH LUMEFANTRINE* and *ARTENIMOL WITH PIPERAQUINE*: possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with *ARTENIMOL WITH LUMEFANTRINE*: avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with *ARTENIMOL WITH PIPERAQUINE*: avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with *QUININE*: avoid concomitant use

• Antinociceptive: paroxetine increases plasma concentration of *DARIFENACIN* and *PROCYCLIDINE*

• Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of *DROPERIDOL* (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with *HALOPERIDOL* (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of *CLOzapINE*, *HALOPERIDOL* and *RISPERIDONE*; fluvoxamine possibly increases plasma concentration of *ASENApINE* and *HALOPERIDOL*; paroxetine inhibits metabolism of *PERPHENAZINE* (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of *APRIPipRAZOLE* (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by *ASENApINE*; fluvoxamine, paroxetine and sertraline increase plasma concentration of *CLOzapINE*; citalopram possibly increases plasma concentration of *CLOzapINE* (increased risk of toxicity); fluvoxamine increases plasma concentration of *ASENApINE* and *HALOPERIDOL*; manufacturer of citalopram and escitalopram advises avoid concomitant use with *PHENOTHIAZINES* (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with *PIMOZIDE* (risk of ventricular arrhythmias); SSRIs possibly increase plasma concentration of *PIMOZIDE* (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of *RISPERIDONE* (increased risk of toxicity)

• Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by *DARUNavIR*: plasma concentration of SSRIs possibly increased by *RITONAVIR*; plasma concentration of paroxetine possibly reduced by *RITONAVIR*

• Antiulcerotics and Hypnotics: fluoxetine increases plasma concentration of *ALPRAZOLAM*; fluvoxamine increases plasma concentration of some *BENZODIAZEPINES*; fluvoxamine increases plasma concentration of *MELATONIN*: avoid concomitant use; sedative effects possibly increased when sertraline given with *ZOLPIDEM*

• Atomoxetine: possible increased risk of convulsions when antidepressants given with *ATOMOXETINE*: fluoxetine and paroxetine possibly inhibit metabolism of *ATOMOXETINE*

• Beta-blockers: citalopram and escitalopram increase plasma concentration of *METOPROLOL*; paroxetine possibly increases the plasma concentration of *METOPROLOL*—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of *PROPRANOLOL*; increased risk of ventricular arrhythmias when citalopram given with *SOTALOL*: avoid concomitant use; manufacturer of escitalopram advises avoid concomitant use with *SOTALOL* (risk of ventricular arrhythmias)

• Bupropion: plasma concentration of citalopram possibly increased by *BUPROPION*

• Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of *NIFEDIPINE* (increased plasma concentration)

• Clidipogrel: fluoxetine and fluvoxamine possibly reduce antiplaetelet effect of *CLIDIPOGREL*

• Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with *DAPOXETINE* (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)
Antidepressants, SSRI (continued)

- Dopaminergics: increased risk of CNS toxicity when SSRIs given with **RASAGILINE**; fluvoxamine should not be started until 2 weeks after stopping **RASAGILINE**; fluoxetine should not be started until 2 weeks after stopping **RASAGILINE**, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; avoidance of citalopram and escitalopram advised by manufacturer of **SELEGILINE**; increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with **SELEGILINE** (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when paroxetine given with **SELEGILINE** (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with **SELEGILINE** (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)

- Grapefruit Juice: plasma concentration of sertraline possibly increased by **GRAPEFRUIT JUICE**

- Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of **TAMOXIFEN** to active metabolite (avoid concomitant use)

- **SHTR-receptor Agonists**: increased risk of CNS toxicity when citalopram given with **SHTR-AGONISTS** (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of **FROYOVATRIPTAN**; possible increased serotonergic effects when SSRIs given with **NARATRIPTAN**; CNS toxicity reported when sertraline given with **SUMATRIPTAN**; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with **SUMATRIPTAN**; fluvoxamine possibly inhibits metabolism of **ZOLMITRIPTAN** (reduce dose of zolmitriptan)

- **SHTR-receptor Antagonists**: possible increased serotonergic effects when SSRIs given with **SHTR-ANTAGONISTS**

- Lipid-Regulating Drugs: separating administration from fluoxetine and fluvoxamine by 12 hours advised by manufacturer of **LOMIDIFIDE**

- Lithium: Increased risk of CNS effects when SSRIs given with **LITHIUM** (lithium toxicity reported)

- Methylthioninium: risk of CNS toxicity when SSRIs given with **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

- Metoclopramide: CNS toxicity reported when SSRIs given with **METOCLOPRAMIDE**

- Muscle Relaxants: fluvoxamine increases plasma concentration of **TIZANIDINE** (increased risk of toxicity)—avoid concomitant use

- Parasympathomimetics: paroxetine increases plasma concentration of **GALANTAMINE**

- Pentamidine Isetionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with **PENTAMIDINE ISETONATE** (risk of ventricular arrhythmias)

- Pirenidone: fluvoxamine increases plasma concentration of **PIRFENIDONE**—manufacturer of pirenidone advises avoid concomitant use

- Pomalidomide: fluvoxamine increases plasma concentration of **POMALIDOMIDE**

- Ranolazine: paroxetine increases plasma concentration of **RANOLAZINE**

- Roflumilast: fluvoxamine inhibits the metabolism of **ROFLUMILAST**

- Sympathomimetics: metabolism of SSRIs possibly inhibited by **METHYLPHENIDATE**

- Theophylline: fluvoxamine increases plasma concentration of **THEOPHYLLINE** (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)

- Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with **TICAGRELOR**

- Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by **CIMETIDINE**; fluvoxamine possibly increases plasma concentration of **LANSOPRAZOLE**; plasma concentration of escitalopram increased by **OMEPRAZOLE**

Antidepressants, SSRI (related)

See Duloxetine and Venlafaxine

Antidepressants, Tricyclic

- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**

- Alcohol: increased sedative effect when tricyclics given with **ALCOHOL**

- Alpha₂-adrenergic Stimulants: avoidance of tricyclics advised by manufacturer of **APRACLONIDINE** and **BRIMONIDINE**

- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with **GENERAL ANAESTHETICS**

- Analgesics: increased risk of CNS toxicity when tricyclics given with **TRAMADOL**—side-effects possibly increased when tricyclics given with **NEFOPAM**; sedative effects possibly increased when tricyclics given with **OPIOID ANALGESICS**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with **AMIODARONE**—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with **DISOPYRAMIDE** or **FLECAINIDE**; avoidance of tricyclics advised by manufacturer of **DRONEDARONE** (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with **PROPafenONE**

- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with **MOXIFLOXACIN**—avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics that prolong the QT interval given with **DELAMINOL**; possible increased risk of ventricular arrhythmias when tricyclics given with **TELITHROMYCIN**

- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of **COUMARINS**

- Antidepressants: avoidance of tricyclics advised by manufacturer of **CITALOPRAM** and **ESCITALOPRAM** (risk of ventricular arrhythmias); possible increased serotonergic effects when amitriptyline or clomipramine given with **DULOXETINE**; increased risk of hypertension and CNS excitation when tricyclics given with **MADOS**, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start **MOCLOBEMIDE** for at least 1 week; plasma concentration of some tricyclics increased by **SSRIS**; plasma concentration of amitriptyline reduced by **ST JOHN’S WORT**; possible increased risk of convulsions when tricyclics given with **VORTIXETINE**

- Antiepileptics: tricyclics antagonise anticonvulsant effect of **ANTIEPILEPTICS** (convulsive threshold lowered); metabolism of tricyclics accelerated by **CARBAMAZEPINE** (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by **FOSPHENYTIN** and **PHENOBARBITAL** and **PRIMIDONE** (reduced plasma concentration)

- Antifungals: plasma concentration of amitriptyline and nortriptyline possibly increased by **TUCONAZOLE**; plasma concentration of tricyclics possibly increased by **TERBINAFINE**

- Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with **ANTIHISTAMINES**

- Antimalarials: avoidance of antidepressants advised by manufacturer of **ARTEMETHER WITH LUMEFAUNTRINE** and **ARTENIMOL WITH PIPERAQUINE**

- Antibacterials: risk of antimuscarinic side-effects when tricyclics given with **ANTIMUSCARINICS**

- Antipsychotics: avoidance of tricyclics advised by manufacturer of **DROPERIDOL**, **FLUPHENAZINE**, **HALOPERIDOL**, **SULPIRIDE** and **ZUCLOPENTHIXOL** (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with **CLOZAPINE**; increased risk of antimuscarinic side-effects when tricyclics given with **PHENOTHIAZINES**; possible increased risk of ventricular arrhythmias when tricyclics given with **RISPERIDONE**

- Antivirals: plasma concentration of tricyclics possibly increased by **ZITONAVIR**; increased risk of ventricular...
Antidepressants, Tricyclic

- **Antivirals** (continued)
  - arrhythmias when tricyclics given with ● **SAQUINAVIR**—avoid concomitant use
  - Anxiety and Hypnotics: increased sedative effect when tricyclics given with ● **ANXIOLYTICS AND HYPNOTICS**
  - Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with ● **ATOMOXETINE**; possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
  - Beta-blockers: plasma concentration of imipramine increased by **LABETALOL** and **PROPRANOLOL**; increased risk of ventricular arrhythmias when tricyclics given with ● **SOTALOL**
  - Bupropion: plasma concentration of tricyclics possibly increased by **BUPROPION** (possible increased risk of convulsions)
  - Calcium-channel Blockers: plasma concentration of imipramine increased by **DILTIAZEM** and **VERAPAMIL**; plasma concentration of tricyclics possibly increased by **DILTIAZEM** and **VERAPAMIL**
  - Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with **CANNABIS EXTRACT**
  - Clonidine: tricyclics antagonise hypotensive effect of ● **CLONIDINE**, also increased risk of hypertension on clonidine withdrawal
  - Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with ● **ARSENIC TRIOXIDE**
  - Dapoxetine: possible increased risk of serotoninergic effects when tricyclics given with ● **DAPoxetine** (manufacturer of dapoxetine advises tricyclics should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tricyclics)
  - Disulfiram: metabolism of tricyclics inhibited by **DISULFIRAM** (increased plasma concentration); concomitant amitriptyline reported to increase **DISULFIRAM** reaction with alcohol
  - Diuretics: increased risk of postural hypotension when tricyclics given with **DIURETICS**
  - Dopaminergics: caution with tricyclics advised by manufacturer of **ENTACAPONE**; increased risk of CNS toxicity when tricyclics given with ● **RASAGILINE**; CNS toxicity reported when tricyclics given with ● **SELEGILINE**
  - Histamine: tricyclics theoretically antagonise effects of **HISTAMINE**—manufacturer of histamine advises avoid concomitant use
  - Lithium: risk of toxicity when tricyclics given with **LITHIUM**
  - Methylthionium: risk of CNS toxicity when clomipramine given with ● **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)
  - Moxonidine: tricyclics possibly antagonise hypotensive effect of **MOXONIDINE** (manufacturer of moxonidine advises avoid concomitant use)
  - Muscle Relaxants: tricyclics enhance muscle relaxant effect of **BACLOFEN**
  - Nicorandil: tricyclics possibly enhance hypotensive effect of **NICORANDIL**
  - Nitrates: tricyclics reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)
  - Oestrogens: antidepressant effect of tricyclics antagonised by **OESTROGENS** (but side-effects of tricyclics possibly increased due to increased plasma concentration)
  - Pentamidine isetionate: increased risk of ventricular arrhythmias when tricyclics given with ● **PENTAMIDINE ISETIONATE**
  - Sodium Oxybate: increased risk of side-effects when tricyclics given with **SODIUM OXYBATE**
  - Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with ● **ADRENALINE (EPINEPHRINE)** (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by **METHYLPHENIDATE**; avoidance of tricyclics advised by manufacturer of **MIDDORF**; increased risk of hypertension and arrhythmias when tricyclics given with ● **NORADRENALINE (NOREPINEPHRINE) OR PHENYLEPHRINE**

Antidepressants, Tricyclic (continued)

- Thyroid Hormones: effects of tricyclics possibly enhanced by **THYROID HORMONES**; effects of amitriptyline and imipramine enhanced by **THYROID HORMONES**
- Tricyclic-related Antidepressants: plasma concentration of tricyclics possibly increased by **CIMETIDINE**; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by **CIMETIDINE** (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with ● **ALCOHOL**
- Alpha-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of **APRALONIDINE** and **BRIMONIDINE**
- Antibacterials: plasma concentration of trazodone possibly increased by **CLARITHROMYCIN**
- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of **WARFARIN**
- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping ● **MAIDS**, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start ● **MOLOBEMIDE** for at least 1 week
- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ● **ANTIEPILEPTICS** (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by ● **CARBAMAZEPINE**; plasma concentration of mianserin reduced by ● **FOSSPHENYTOIN** and ● **PHENYTOIN**; metabolism of mianserin accelerated by ● **PHENOBARBITAL** and ● **PRIMIDONE** (reduced plasma concentration)
- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with **ANTIHISTAMINES**
- Antiinflammatories: avoidance of antidepressants advised by manufacturer of ● **ARTEMETHER WITH LUMEFANTRINE** and ● **ARTENIOMIL WITH PIPERAQUINE**
- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with **ANTIMUSCARINICS**
- Antivirals: plasma concentration of trazodone increased by ● **SAQUINAVIR** (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with ● **SAQUINAVIR**—avoid concomitant use; plasma concentration of trazodone possibly increased by **TELAPREVIR**
- Anxiety and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with **ANXIOLYTICS AND HYPNOTICS**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with ● **ATOMOXETINE**
- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with ● **DIAZOXIDE**
- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of **NITRATES** (failure to dissolve under tongue owing to dry mouth)
- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with **HYDRAZINE OR SODIUM NITROPRUSSIDE**

Antidiabetics

**NOTE** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption

**NOTE** Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by **ACE INHIBITORS**
- Alcohol: hypoglycaemic effect of antidiabetics enhanced by **ALCOHOL**; increased risk of lactic acidosis when metformin given with **ALCOHOL**
- Anabolic Steroids: hypoglycaemic effect of antidiabetics possibly enhanced by **ANABOLIC STEROIDS**
Antidiabetics (continued)

- Analgesics: effects of sulfonylureas possibly enhanced by
  - NSAIDS; lidocaine possibly reduces the absorption of paracetamol when given 1 to 4 hours before paracetamol.
- Anti-arrhythmics: hypoglycaemic effect of gliclazide, insulin, and metformin possibly enhanced by digoxin.
- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by neomycin; also severity of gastrointestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of glibenclamide possibly enhanced by norfloxacin; plasma concentration of canagliflozin and nateglinide reduced by rifampicin; effects of sulfonylureas enhanced by clarithromycin; metabolism of tolbutamide accelerated by rifampicin; hypoglycaemic effect of repaglinide possibly enhanced by clarithromycin; effects of sulfonylureas rarely enhanced by sulfonylamides and trimethoprim; hypoglycaemic effect of sulfonylureas possibly enhanced by tetracyclines; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim — manufacturer advises avoid concomitant use.
- Anticoagulants: exenatide possibly enhances anticoagulant effect of warfarin; hypoglycaemic effect of sulfonylureas possibly enhanced by coumarins, also possible changes to anticoagulant effect.
- Antidepressants: hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs; hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs.
- Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with pioglitazone; plasma concentration of dulaglutide increased by sitagliptin.
- Antiepileptics: tolbutamide transiently increases plasma concentration of fosphenytoin and phenoxytoin (possibility of toxicity); plasma concentration of metformin possibly increased by topiramate; plasma concentration of glibenclamide possibly reduced by topiramate.
- Antifungals: plasma concentration of pioglitazone, saxagliptin and tolbutamide increased by sitagliptin; plasma concentration of sulfonylureas increased by flucloxacillin and miconazole; hypoglycaemic effect of gliclazide and glipizide enhanced by miconazole — avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by flucloxacillin and miconazole.
- Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use).
- Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by phenothiazines.
- Antivirals: plasma concentration of metformin increased by dolabetgravir — consider reducing dose of metformin; plasma concentration of tolbutamide possibly increased by ritonavir; plasma concentration of metformin increased by telaprevir (consider reducing dose of metformin).
- Aprepitant: plasma concentration of tolbutamide reduced by aprepitant.
- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers.
- Bosentan: increased risk of hepatotoxicity when glibenclamide given with bosentan — avoid concomitant use.
- Cardiac Glycosides: acarbose possibly reduces plasma concentration of digoxin; canagliflozin and sitagliptin increase plasma concentration of digoxin.
- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin.

Antidiabetics (continued)

- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids.
- Cytotoxics: avoidance of repaglinide advised by manufacturer of lapatinib; plasma concentration of metformin possibly increased by vandetanib (consider reducing dose of metformin).
- Deferasirox: plasma concentration of repaglinide increased by deferasirox.
- Diuretics: canagliflozin possibly enhances diuretic effect of diuretics; dapagliflozin possibly enhances diuretic effect of loop diuretics and thiazides and related diuretics; manufacturer of canagliflozin advises avoid concomitant use with loop diuretics; hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics.
- Fosaprepitant: plasma concentration of tolbutamide reduced by fosaprepitant.
- Hormone Antagonists: requirements for antidiabetics possibly reduced by lanreotide, octreotide and pasireotide.
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide.
- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by colesevelam; absorption of glimepiride reduced by colesevelam — manufacturer of glimepiride advises give at least 4 hours before colesevelam; hypoglycaemic effect of acarbose possibly enhanced by colestyramine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with gemfibrozil; avoid concomitant use; plasma concentration of glibenclamide possibly increased by fluvastatin; manufacturer of canagliflozin advises give at least 1 hour before or 4–6 hours after bile acid sequestrants; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with fibrates; separating administration from linagliptin by 12 hours advised by manufacturer of lomitapide.
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens.
- Orlistat: avoidance of acarbose advised by manufacturer of orlistat.
- Pancreatin: hypoglycaemic effect of acarbose antagonised by pancreatin.
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens.
- Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone.
- Teriflunomide: plasma concentration of repaglinide increased by teriflunomide.
- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone.
- Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by cimetidine.

Anti-epileptics see Carbamazepine, Eslicarbazepine, ethosuximide, fosphenytoin, gabapentin, lactosamide, lamotrigine, levetiracetam, oxcarbazepine, perampanel, Phenobarbital, phenytoin, pregabalin, primidone, retigabine, Rufinamide, sodium valproate, stiripentol, tiagabine, topiramate, valproic acid, vigabatrin, and zonisamide.

Anti-fungals see Amphotericin; Anti-fungals; Imidazole; Anti-fungals; Triazole; caspofungin; flucytosine; griseofulvin; micafungin; itraconazole; lamotrigine, levetiracetam, oxcarbazepine, perampanel, ethosuximide, fosphenytoin, gabapentin, lacosamide, lamotrigine, levetiracetam, oxcarbazepine, perampanel, phenobarbital, phenytoin, pregabalin, primidone, retigabine, rufinamide, sodium valproate, stiripentol, tiagabine, topiramate, valproic acid, vigabatrin, and zonisamide.

Antifungals see Amphotericin; Anti-fungals; Imidazole; Anti-fungals; Triazoles; caspofungin; flucytosine; griseofulvin; micafungin; itraconazole.

Anti-fungals, imidazole

- Alcohol: possibility of disulfiram-like reaction when ketoconazole given with alcohol.
- Aliskiren: ketoconazole increases plasma concentration of aliskiren.
- Alpha-blockers: ketoconazole possibly increases plasma concentration of alfuzosin; ketoconazole increases plasma concentration of tamsulosin.
- Aminophylline: ketoconazole possibly increases plasma concentration of aminophylline.
Interactions

Antifungals, Imidazole

Antimuscarinics: ketoconazole increases metabolism of
- BUPRENORPHINE (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when ketoconazole given with METHADONE — manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of OXYCODONE; manufacturer of ketoconazole advises avoid concomitant use with PARACETAMOL

Antacids: absorption of ketoconazole reduced by ANTACIDS

Antihistamines: ketoconazole increases plasma concentration of PRAZIQUENTAL

Anti-arrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with DISOPYRAMIDE — avoid concomitant use; ketoconazole increases plasma concentration of DRONEDARONE — avoid concomitant use

Antibacterials: manufacturer of ketoconazole advises avoid concomitant use
- CLARITHROMYCIN in severe renal impairment; metabolism of ketoconazole accelerated byrifampicin (reduced plasma concentration), also plasma concentration of rifampicin may be reduced by ketoconazole; ketoconazole increases plasma concentration of BEDAQUILINE — avoid concomitant use if ketoconazole given for more than 14 days; avoidance of ketoconazole advised by manufacturer of FIDAXOMICIN; plasma concentration of ketoconazole possibly reduced byisoniazid; ketoconazole increases the plasma concentration of telithromycin — avoid in severe renal and hepatic impairment

Anticoagulants: ketoconazole increases plasma concentration of
- APIXABAN — manufacturer of apixaban advises avoid concomitant use; ketoconazole enhances anticoagulant effect of coumarins; miconazole (including oral gel and possibly vaginal and topical formulations) greatly enhances the anticoagulant effect of coumarins — avoid concomitant use if possible; ketoconazole increases plasma concentration of dabigatran and rivaroxaban — avoid concomitant use; ketoconazole increases plasma concentration of edoxaban (reduce dose of edoxaban — see under Edoxaban, p. 118)

Antidepressants: avoidance of imidazoles advised by manufacturer of reboxetine; ketoconazole increases plasma concentration of mirtazapine

Antidiabetics: miconazole enhances hypoglycaemic effect of
- GLICLIZIDE and GLIPIZIDE — avoid concomitant use; ketoconazole increases plasma concentration of pioglitazone, saxagliptin and tolbutamide; miconazole increases plasma concentration of sulfonylureas

Antiepileptics: plasma concentration of ketoconazole possibly reduced by CARBAMAZEPINE, also plasma concentration of carbamazepine possibly increased; miconazole possibly increases plasma concentration of carbamazepine; miconazole enhances anticonvulsant effect of fosphenytoin and phenytoin (plasma concentration of fosphenytoin and phenytoin increased); plasma concentration of ketoconazole reduced by fosphenytoin and phenytoin; ketoconazole increases plasma concentration of perampanel

Antifungals: imidazoles possibly antagonise effects of
- GLICLIZIDE and GLIPIZIDE — avoid concomitant use; ketoconazole increases plasma concentration of pioglitazone, saxagliptin and tolbutamide; miconazole increases plasma concentration of sulfonylureas

Antihistamines: avoidance of imidazoles advised by manufacturer of arteether with lumefantrine; avoidance of imidazoles advised by manufacturer of arteminol with piperaquine (possible risk of ventricular arrhythmias); ketoconazole increases plasma concentration of mefloquine

Antimuscarinics: concentration of Darifenacin — avoid concomitant use; manufacturer of fesoterodine advises dose reduction when ketoconazole given with fesoterodine — consult fesoterodine product literature; ketoconazole increases plasma concentration of oxybutynin; ketoconazole increases plasma concentration of solifenacin — see under Solifenacin, p. 713; avoidance of ketoconazole advised by manufacturer of tolterodine

Antipsychotics: ketoconazole inhibits metabolism of
- ARIPIPRAZOLE (reduce dose of aripiprazole); ketoconazole increases plasma concentration of lurasidone — avoid concomitant use; increased risk of ventricular arrhythmias when imidazoles given with pimozide — avoid concomitant use; imidazoles possibly increase plasma concentration of quetiapine — manufacturer of quetiapine advises avoid concomitant use

Antivirals: ketoconazole increases plasma concentration of
- BOCEPREVIR; ketoconazole increases the plasma concentration of daclatasvir — reduce dose of daclatasvir (see under Daclatasvir, p. 577); plasma concentration of both drugs increased when ketoconazole given with sarunavir; plasma concentration of both drugs increased when ketoconazole given with dasabuvir and paritaprevir — avoid concomitant use; plasma concentration of ketoconazole reduced by efavirenz; plasma concentration of ketoconazole increases fosamprenavir (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of indinavir and maraviroc (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by riuvirapine — avoid concomitant use; avoidance of ketoconazole advised by manufacturer of omibitasvir and pimodutar; ketoconazole increases plasma concentration of saquinavir — manufacturer of ketoconazole advises avoid concomitant use; imidazoles possibly increase plasma concentration of saquinavir; plasma concentration of both drugs possibly increased when ketoconazole given with telaprevir (increased risk of ventricular arrhythmias) — reduce dose of ketoconazole

Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of
- ALPRAZOLAM — manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of midazolam (risk of prolonged sedation — avoid concomitant use of oral midazolam); ketoconazole increases plasma concentration of zolpidem

Aprepitant: ketoconazole increases plasma concentration of
- AVAPRALIL — avoid concomitant use

Beta-blockers: ketoconazole possibly increases plasma concentration of nadolol

Bosentan: ketoconazole increases plasma concentration of
- BOSENTAN

Calcium-channel Blockers: ketoconazole inhibits metabolism of
- FELODIPINE (increased plasma concentration) — manufacturer of ketoconazole advises avoid concomitant use; avoidance of ketoconazole advised by manufacturer of lercanidipine; ketoconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)

Cannabis Extract: ketoconazole increases plasma concentration of
- CANNABIS EXTRACT

Ciclosporin: ketoconazole inhibits metabolism of
- CICLOSPORIN (increased plasma concentration); miconazole possibly inhibits metabolism of ciclosporin (increased plasma concentration)

Cilostazol: ketoconazole increases plasma concentration of
- CILOSTAZOL (see under Cilostazol, p. 221)

Cinacalcet: ketoconazole inhibits metabolism of cinacalcet (increased plasma concentration)

Crontaurogels: ketoconazole possibly reduces antiplatelet effect of clopidogrel

Cobicistat: plasma concentration of ketoconazole possibly increased by cobicistat — manufacturer of cobicistat advises reduce dose of ketoconazole

Colchicine: ketoconazole possibly increases risk of colchicine toxicity — suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Corticosteroids: ketoconazole possibly inhibits metabolism of corticosteroids; ketoconazole increases the plasma concentration of inhaled and oral (and possibly also intranasal...
Antifungals, Imidazole

- Corticosteroids (continued) and rectal: Budesonide; ketoconazole increases plasma concentration of active metabolite of Ciclesonide; ketoconazole possibly increases plasma concentration of inhaled fluticasone; ketoconazole inhibits the metabolism of methyprednisolone; ketoconazole increases plasma concentration of inhaled mometasone.
- Cytotoxic: ketoconazole inhibits the metabolism of ifosfamide; possible increased risk of neutropenia when ketoconazole given with Bremtuximab vedotin; ketoconazole possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of ketoconazole by 6 to 12 hours; ketoconazole increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); ketoconazole increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ketoconazole increases plasma concentration of bortezomib, cabozantinib, dabrafenin, etoposide, idelalisib, imatinib, nintedanib and ponatinib; ketoconazole increases plasma concentration of certinib—avoid concomitant use or consider reducing the dose of certinib (see under Certinib, p. 861); ketoconazole increases plasma concentration of crizotinib, lapatinib, nilotinib and regorafenib—avoid concomitant use; ketoconazole possibly increases plasma concentration of dasatinib; ketoconazole inhibits metabolism of erlotinib and sunitinib (increased plasma concentration); ketoconazole increases plasma concentration of everolimus—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of ibrutinib—reduce dose of ibrutinib (see under Ibrutinib, p. 861); ketoconazole increases plasma concentration of pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ketoconazole given with ruxolitinib—consult ruxolitinib product literature; ketoconazole increases plasma concentration of the active metabolite of temsirolimus—avoid concomitant use; avoidance of ketoconazole advised by manufacturer of cabazitaxel; in vitro studies suggest a possible interaction between ketoconazole and docetaxel (consult docetaxel product literature); ketoconazole reduces plasma concentration of irinotecan (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; ketoconazole increases plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use.
- Dapoxetine: ketoconazole increases plasma concentration of dapoxetine—manufacturer of dapoxetine advises avoid concomitant use.
- Diuretics: ketoconazole increases plasma concentration of eplerenone—avoid concomitant use; domperidone: manufacturer of ketoconazole advises avoid concomitant use with domperidone (risk of ventricular arrhythmias).
- Ergot Alkaloids: manufacturer of ketoconazole advises avoid concomitant use with ergot alkaloids; increased risk of ergotism when imidazoles given with ergotamine—avoid concomitant use.
- Fingolimod: ketoconazole increases plasma concentration of fingolimod.
- Fosaprepitant: ketoconazole increases plasma concentration of fosaprepitant.
- Guanfacine: ketoconazole increases plasma concentration of guanfacine (halve dose of guanfacine).
- Hormone Antagonists: manufacturer of ketoconazole advises avoid concomitant use with pasireotide.
- SHT2 receptor Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.
- Ibrutinib: ketoconazole increases plasma concentration of ivabradine—avoid concomitant use.

Antifungals, Imidazole (continued)

Ivacaftor: ketoconazole increases plasma concentration of ivacaftor—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC).
- Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart).
- Lenalidomide: ketoconazole possibly increases plasma concentration of lenalidomide (increased risk of toxicity).
- Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin; possible increased risk of myopathy when ketoconazole given with atorvastatin—manufacturer of ketoconazole advises avoid concomitant use; possible increased risk of myopathy when miconazole given with simvastatin; ketoconazole increases plasma concentration of lobitapide—avoid concomitant use.
- Lumacaftor: plasma concentration of ketoconazole possibly reduced by lumacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC).
- Macitentan: ketoconazole increases plasma concentration of macitentan.
- Mirabegron: when given with ketoconazole avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, p. 715.
- Naloxegol: ketoconazole increases plasma concentration of naloxegol—avoid concomitant use.
- Netupitant: ketoconazole possibly increases plasma concentration of netupitant.
- Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with oestrogens; ketoconazole increases plasma concentration of ethinylestradiol.
- Panobinostat: ketoconazole increases plasma concentration of panobinostat (reduce dose of panobinostat—see under Panobinostat, p. 834).
- Parasympathomimetics: ketoconazole increases plasma concentration of galantamine.
- Progestogens: ketoconazole increases plasma concentration of drospirenone.
- Ranolazine: ketoconazole increases plasma concentration of ranolazine—avoid concomitant use.
- Retinoids: ketoconazole increases plasma concentration of altiretinoin; ketoconazole possibly increases risk of tretinoin toxicity.
- Riociguat: avoidance of ketoconazole advised by manufacturer of riociguat.
- Sildenafil: ketoconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension.
- Sirolimus: ketoconazole increases plasma concentration of sirolimus—avoid concomitant use; miconazole increases plasma concentration of sirolimus.
- Sympathomimetics, Beta: ketoconazole increases plasma concentration of olsalazine (increased plasma concentration).
- Tacrolimus: ketoconazole increases plasma concentration of tacrolimus (consider reducing dose of tacrolimus); miconazole oral gel possibly increases plasma concentration of tacrolimus.
- Tadalafil: ketoconazole increases plasma concentration of tadalafl—avoid concomitant use of tadalafl for pulmonary hypertension.
- Theophylline: ketoconazole possibly increases plasma concentration of theophylline.
- Ticagrelor: ketoconazole increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use.
- Tolvaptan: ketoconazole increases plasma concentration of tolvaptan—manufacturer of ketoconazole advises avoid concomitant use.
- Ulcer-healing Drugs: absorption of ketoconazole reduced by histamine H2-antagonists, proton pump inhibitors and sucralfate.
Antifungals, Imidazole (continued)

- Ulipristal: ketoconazole increases plasma concentration of low-dose ULIPRISTAL—manufacturer of low-dose ulipristal advises avoid concomitant use
- Vardenafil: ketoconazole increases plasma concentration of VARDENAFIL—avoid concomitant use
- Vitamins: miconazole possibly reduces effects of ALFACALCIDIOL, CALCITRIOL, COLECALCIFEROL, DIHYDROXYCHOLESTEROL, ERGOCALCIFEROL, PARICALCITOL and VITAMIN D; ketoconazole possibly increases plasma concentration of PARICALCITOL

Antifungals, Polyene see Amphotericin

Antifungals, Triazole

NOTE In general, fluconazole interactions relate to multiple-drug treatment.

- Aliskiren: itraconazole increases plasma concentration of ALISKIREN—avoid concomitant use
- Aminophylline: fluconazole possibly increases plasma concentration of AMINOPHYLLINE
- Analgesics: fluconazole increases plasma concentration of CELECOXIB (halve dose of celecoxib); voriconazole increases plasma concentration of DICLOFENAC, IBUPROFEN and OXYCODONE; fluconazole increases plasma concentration of FLURBIPROFEN, IBUPROFEN and METHADONE; fluconazole increases plasma concentration of PARECOXIB (reduce dose of parecoxib); voriconazole increases plasma concentration of ALFENTANIL and METHADONE (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of ALFENTANIL (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of ALFENTANIL; triazoles possibly increase plasma concentration of ▶ FENTANYL; itraconazole possibly increases plasma concentration of ▶ METHADONE (increased risk of ventricular arrhythmias); itraconazole increases plasma concentration of OXYCODONE

Antacids: absorption of itraconazole reduced by ANTACIDS
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with ▶ DISOPYRAMIDE; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of ▶ DRONERADONE
- Antibacterials: plasma concentration of itraconazole increased by CLARITHROMYCIN; manufacturer of fluconazole advises avoid concomitant use with ERYTHROMYCIN; triazoles possibly increase plasma concentration of ▶ RIFABUTIN (increased risk of uveitis—reduce rifabutin dose); plasma concentration of isavucnozole possibly reduced by ▶ RIFABUTIN—avoid concomitant use; posaconazole increases plasma concentration of ▶ RIFABUTIN (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of ▶ RIFABUTIN, also rifabutin reduces plasma concentration of voriconazole (increased risk of uveitis and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of ▶ RIFABUTIN (increased risk of uveitis—reduce rifabutin dose); plasma concentration of itraconazole reduced by ▶ RIFABUTIN and ▶ RIFAMPICIN—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of isavucnozole and voriconazole reduced by ▶ RIFAMPICIN—avoid concomitant use; plasma concentration of posaconazole reduced by ▶ RIFAMPICIN; metabolism of fluconazole accelerated by ▶ RIFAMPICIN (reduced plasma concentration); fluconazole possibly increases plasma concentration of BEDAQUILINE—avoid concomitant use if fluconazole given for more than 14 days
- Anticoagulants: avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of APIXABAN; fluconazole, itraconazole and voriconazole enhance anticoagulant effect of ▶ COUMARINS; avoidance of itraconazole advised by manufacturer of DABIGATRAN and RIVAROXABAN; avoidance of posaconazole and voriconazole advised by manufacturer of RIVAROXABAN
- Antidepressants: avoidance of triazoles advised by manufacturer of ▶ REBOXETINE; fluconazole possibly increases plasma concentration of AMITRIPYLILINE and NORTRIPTYLILINE; plasma concentration of voriconazole reduced by ▶ ST JOHN’S WORT—avoid concomitant use; plasma concentration of isavucnozole possibly reduced by ▶ ST JOHN’S WORT—avoid concomitant use

Antifungals, Triazole (continued)

- Anti-diabetics: isavucnozole increases plasma concentration of METFORMIN; posaconazole possibly enhances hypoglycaemic effect of GLIPIZIDE; fluconazole possibly enhances hypoglycaemic effect of NATEGILINIDE; itraconazole possibly enhances hypoglycaemic effect of NATEGILINIDE; Voriconazole increases plasma concentration of SULFONYLUREAS; voriconazole possibly increases plasma concentration of SULFONYLUREAS
- Antiepileptics: plasma concentration of itraconazole and posaconazole possibly reduced by ▶ CARBAMAZEPINE; plasma concentration of isavucnozole and voriconazole possibly reduced by ▶ CARBAMAZEPINE—avoid concomitant use; fluconazole possibly increases plasma concentration of CARBAMAZEPINE; plasma concentration of isavucnozole possibly reduced by ▶ FOSPHENYTOIN; PHENOBARBITAL; ▶ PHENYOIN and ▶ PRIMIDONE—avoid concomitant use; plasma concentration of itraconazole reduced by ▶ FOSPHENYTOIN and ▶ PHENYOIN (consider reducing dose of fosphenytoin and phenytoin); voriconazole increases plasma concentration of ▶ FOSPHENYTOIN and ▶ PHENYOIN; plasma concentration of itraconazole possibly reduced by ▶ PHENOBARBITAL and ▶ PRIMIDONE—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ▶ PRIMIDONE
- Antifungals: plasma concentration of isavucnozole increased by ▶ KETOCONAZOLE—avoid concomitant use; triazoles possibly antagonise effects of AMPHOTERICIN; monitoring for increased voriconazole side effects advised by manufacturer of FLUCONAZOLE if voriconazole given after fluconazole; plasma concentration of itraconazole increased by MICAFUNGIN (consider reducing dose of itraconazole); plasma concentration of fluconazole increased by TERBINAFINE
- Antihistamines: itraconazole inhibits metabolism of ▶ MIZOLASTINE—avoid concomitant use
- Anti-malarials: avoidance of triazoles advised by manufacturer of ▶ ARTEMETHER WITH LUMEFANTRINE; avoidance of triazoles advised by manufacturer of ▶ ARTENIOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarnics: avoidance of itraconazole advised by manufacturer of ▶ DARIFENACIN and TOLERODINE; manufacturer of fesoterodine advises dose reduction of ▶ DARIFENACIN—avoid concomitant use; itraconazole given with ▶ FESOTERODINE—consult fesoterodine product literature; itraconazole possibly increases plasma concentration of ▶ SOLifenacin—see under Solifenacin, p. 715
- Antipsychotics: itraconazole possibly increases plasma concentration of ▶ HALOPERIDOL; itraconazole possibly increases plasma concentration of ▶ ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of ▶ ARIPIPRAZOLE; ▶ IBUPROFEN and ▶ RIFAMICIN; metabolism of fluconazole accelerated by ▶ FOSPHENYTOIN; ▶ PHENOBARBITAL, ▶ PHENYOIN and ▶ PRIMIDONE—avoid concomitant use; plasma concentration of itraconazole and posaconazole possibly reduced by ▶ PRIMIDONE; itraconazole possibly increases plasma concentration of ▶ QUetiapine—manufacturer of quetiapine advises avoid concomitant use; itraconazole possibly increases side-effects of ▶ RISPERIDONE
- Antivirals: plasma concentration of voriconazole increased or decreased by ▶ ATAZANAVIR and plasma concentration of atazanavir also reduced; posaconazole increases plasma concentration of ▶ ATAZANAVIR; itraconazole, posaconazole and voriconazole possibly increase the plasma concentration of ▶ DAclatasvir—reduce dose of daclatasvir (see under Dacatasvir, p. 577); plasma concentration of voriconazole possibly affected by ▶ DARUNAVIR; plasma concentration of both drugs possibly increased when itraconazole and posaconazole
Interactions

**Antifungals, Triazole**

- **Antivirals (continued)**
  - given with **DASABUVIR**—avoid concomitant use; plasma concentration of itraconazole and posaconazole reduced by **EFAVIREN**; plasma concentration of voriconazole reduced by **EFAVIREN**; plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); manufacturer of isavuconazole advises avoid concomitant use with **EFAVIREN** and **ETRAVIRINE**; plasma concentration of posaconazole possibly reduced by **FOSAMPREN**; plasma concentration of both drugs may increase when itraconazole given with **FOSAMPREN**; isavuconazole reduces plasma concentration of **INDINAVI**; itraconazole increases plasma concentration of **INDINAVI** (consider reducing dose of indinavir); plasma concentration of itraconazole increased by **LOPINAVI** (also plasma concentration of Lopinavir reduced); fluconazole increases plasma concentration of **NEVIRAPINE, RITONAVI** and **TIPRANA**; plasma concentration of itraconazole possibly reduced by **NEVIRAPINE**—consider increasing dose of itraconazole; plasma concentration of both drugs possibly increased when itraconazole and posaconazole given with **PARITAPRE**—avoid concomitant use; plasma concentration of isavuconazole increased by **RITONAVI** (also plasma concentration of ritonavir reduced) avoid concomitant use of high-dose ritonavir; combination of itraconazole with **RITONAVI** may increase plasma concentration of either drug (or both); plasma concentration of voriconazole reduced by **RITONAVI**—avoid concomitant use; triazoles possibly increase plasma concentration of **SAQUINAVI**; fluconazole, itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **SIMPEPRE**—manufacturer of simprevir advises avoid concomitant use; plasma concentration of voriconazole possibly affected by **TELAPRE** (possible increased risk of ventricular arrhythmias); plasma concentration of posaconazole possibly increased by **TELAPRE** (increased risk of ventricular arrhythmias); plasma concentration of itraconazole possibly increased by **TELAPRE**; fluconazole increases plasma concentration of **ZIDOVUDI** (increased risk of toxicity)
  - Amiodolys and Hypnotics: itraconazole increases plasma concentration of **ALPAZOLAM**; fluconazole and voriconazole increase plasma concentration of **DIAZEPAM** (risk of prolonged sedation); isavuconazole increases plasma concentration of **MIDAZOLAM**; fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of **MIDAZOLAM** (risk of prolonged sedation); itraconazole increases plasma concentration of **BUSPIRONE** (reduce dose of buspirone)
  - Avanafil: itraconazole and voriconazole possibly increase plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use; fluconazole possibly increases plasma concentration of **AVANAFIL**—see under Avanafil, p. 744
  - Bosentan: fluconazole possibly increases plasma concentration of **BOSENTAN**—avoid concomitant use; itraconazole possibly increases plasma concentration of **BOSENTAN**
  - Calcium-channel Blockers: negative inotropic effect possibly increased when itraconazole given with **CALCIUM-CHANNEL BLOCKERS**; itraconazole inhibits metabolism of **FELODIPINE** (increased plasma concentration); avoidance of itraconazole advised by manufacturer of **LERCANDIPIN**; itraconazole possibly inhibits metabolism of **HYDRODROPYRIDINES** (increased plasma concentration)
  - Cardiac Glicosides: isavuconazole and itraconazole increase plasma concentration of **DIGOXIN**
  - Cilostazol: isavuconazole increases plasma concentration of **CILOSTAZOL**; fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of **CILOSTAZOL** (increased plasma concentration)
  - Docetaxel: itraconazole possibly increases plasma concentration of **EPLERENONE** (reduce dose of eplerenone); itraconazole increases plasma concentration of **EPLERENONE**—avoid
  - Eplerenone: manufacturer of eplerenone advises dose reduction when fluconazole given with **DAPOXETINE** (see under Dapoxetine, p. 751); avoidance of itraconazole advised by manufacturer of **DAPOXETINE** (increased risk of toxicity)
  - **Diuretics**: fluconazole increases plasma concentration of **FLUTICASONE** (inhaled) increases risk of **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
  - Corticosteroids: itraconazole possibly inhibits metabolism of **CORTICOSTEROIDS** and **METHYLPREDNISOLON**; itraconazole increases the plasma concentration of **CORTICOSTEROIDS** and **METHYLPREDNISOLON**; itraconazole increases plasma concentration of **HILOFLUCI**
  - Cytoxics: itraconazole inhibits metabolism of **BUSULFAN** (increased risk of toxicity); fluconazole possibly increase side-effects of **CYCLOPHOSPHAMIDE**; itraconazole possibly increases the plasma concentration of **CABOZANTIN**; itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **CEBITIBI**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); itraconazole and voriconazole possibly increase plasma concentration of **CRZITIBI**—manufacturer of crizotinib advises avoid concomitant use; avoidance of itraconazole advised by manufacturer of **LAPATIBI**; avoidance of itraconazole and voriconazole advised by manufacturer of **NILOTIBI**; itraconazole and voriconazole possibly increase plasma concentration of **EVEROLI**—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of **GESITIBI**—reduce dose of efavirenz (also plasma concentration of lopinavir reduced); itraconazole and voriconazole possibly increase plasma concentration of **IBRUTINIB**—reduce dose of ibrutinib (see under ibrutinib, p. 867); avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of **DAZATIBI** and **TEMSELIMUS** (plasma concentration of dasatinib and temsirolimus possibly increased); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of **EVEROLI**—manufacturer of everolimus advises avoid concomitant use; itraconazole increases plasma concentration of **FOSAMP**—reduce dose of pazopanib; itraconazole and voriconazole possibly increase plasma concentration of **PONATIB**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when fluconazole, itraconazole, posaconazole and voriconazole given with **RUXOLITINIB**—consult ruxolitinib product literature; itraconazole and voriconazole possibly increase plasma concentration of **CABAZITAXEL**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; itraconazole and voriconazole possibly increase plasma concentration of **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of toxicity when itraconazole given with **IRINOTECAN**—avoid concomitant use; fluconazole possibly increases plasma concentration of **IRINOTECAN**; itraconazole and voriconazole possibly increase plasma concentration of **IRINOTECAN**—reduce dose of irinotecan; itraconazole and voriconazole possibly increase plasma concentration of **ITAL */**
Antifungals, Triazole
● Diuretics (continued) concomitant use; plasma concentration of fluconazole increased by HYDROCHLOROTHIAZIDE
● Dopemidine: possible increased risk of ventricular arrhythmias when itraconazole or voriconazole given with • DOPERIDONE—avoid concomitant use
● Ergot Alkaloids: increased risk of ergotism when voriconazole given with • ERGOMETRINE—avoid concomitant use; manufacturer of itraconazole advises avoid concomitant use with • ERGOTAMINE (increased risk of ergotism); increased risk of ergotism when triazoles given with • ERGOTAMINE—avoid concomitant use
● Guanafacine: fluconazole, itraconazole and posaconazole possibly increase the plasma concentration of • GUANAFACINE (halve dose of guanafacine)
● 5HT1-receptor Agonists: itraconazole increases plasma concentration of • ELERTRIPTAN (risk of toxicity)—avoid concomitant use
● Ivabradine: fluconazole increases plasma concentration of IVABRADINE—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of • IVABRADINE—avoid concomitant use
● Ivacaftor: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • IVACAFTOR—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC); fluconazole increases plasma concentration of • IVACAFTOR—reduce dose of ivacaftor (see under Ivacaftor, p. 275)
● Lenalidomide: itraconazole possibly increases plasma concentration of • LENALIDOMIDE (increased risk of toxicity)
● Leukotriene Receptor Antagonists: fluconazole increases plasma concentration of ZAFIRILUKAST
● Lipid-regulating Drugs: isavuconazole increases plasma concentration of ATORVASTATIN; increased risk of myopathy when itraconazole, posaconazole or voriconazole given with • ATORVASTATIN; possible increased risk of myopathy when fluconazole given with • ATORVASTATIN or • SIMVASTATIN; fluconazole increases plasma concentration of FLUVASTATIN—possible increased risk of myopathy; itraconazole increases plasma concentration of • ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with • SIMVASTATIN (avoid concomitant use); increased risk of myopathy when voriconazole given with • SIMVASTATIN; avoidance of triazoles advised by manufacturer of • LOMITAPIDE (plasma concentration of lomitapide possibly increased).
● Lumacaftor: plasma concentration of posaconazole and voriconazole possibly reduced by • LUMACAFTOR—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC); plasma concentration of itraconazole reduced by • LUMACAFTOR—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC)
● Mirabegron: when given with itraconazole avoid or reduce dose of • MIRABEGRON in hepatic or renal impairment—see Mirabegron, p. 715
● Mycophenolate: isavuconazole increases plasma concentration of MYCOPHENOLATE
● Naloxegol: itraconazole possibly increases plasma concentration of • NALOXEGOL—avoid concomitant use
● Oestrogens: plasma concentration of voriconazole increased by OESTROGENS
● Panobinostat: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • PANOBINOSTAT (reduce dose of panobinostat—see under Panobinostat, p. 834)
● Progestogens: plasma concentration of voriconazole possibly increased by • PROGESTOGENS
● Ranolazine: itraconazole, posaconazole and voriconazole possibly increase plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
● Retinoids: fluconazole and voriconazole possibly increase risk of • TRETINOIN toxicity

Antifungals, Triazole (continued)
● Riociguat: avoidance of itraconazole and voriconazole advised by manufacturer of • RIOCIUGAT
● Sildenafil: itraconazole increases plasma concentration of SILDENAFIL—reduce initial dose of sildenafil
● Sirolimus: isavuconazole increases plasma concentration of SIROLIMUS; fluconazole and posaconazole possibly increase plasma concentration of SIROLIMUS; itraconazole and voriconazole increase plasma concentration of • SIROLIMUS—avoid concomitant use
● Tacrolimus: isavuconazole increases plasma concentration of TACROLIMUS; fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of • TACROLIMUS (consider reducing dose of tacrolimus)
● Tadalafil: itraconazole possibly increases plasma concentration of TADALAFIL
● Theophylline: fluconazole possibly increases plasma concentration of • THEOPHYLLINE
● Ulcer-healing Drugs: plasma concentration of posaconazole reduced by • CIMETIDINE and • ESOMEPRAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of posaconazole possibly reduced by • FAMOTIDINE, • LANSOPRAZOLE, • NIZATIDINE, • OMEPRAZOLE, • PANTOPRAZOLE, • RABEPRAZOLE and • RANITIDINE—manufacturer of posaconazole suspension advises avoid concomitant use; voriconazole possibly increases plasma concentration of ESOMEPRAZOLE; voriconazole increases plasma concentration of OMEPRAZOLE (consider reducing dose of omeprazole); absorption of itraconazole reduced by • HISTAMINE H 2-ANTAGONISTS and • PROTON PUMP INHIBITORS
● Ulipristal: avoidance of itraconazole advised by manufacturer of • ULRIPRISTAL
● Vardenafil: itraconazole possibly increases plasma concentration of • VARDENAFIL—avoid concomitant use

Antihistamines
NOTE Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including nasal and ocular preparations).
● Alcohol: increased sedative effect when antihistamines given with • ALCOHOL (possibly less effect with non-sedating antihistamines)
● Analgesics: sedative effects possibly increased when sedating antihistamines given with • OPIOID ANALGESICS
● Antacids: absorption of fexofenadine reduced by • ANTACIDS
● Anti-arrhythmics: increased risk of ventricular arrhythmias when mizolastine given with • AMIODARONE, • DISOPYRAMIDE or • FLECAINIDE—avoid concomitant use; manufacturer of mizolastine advises avoid concomitant use with • PROPafenONE (possible risk of ventricular arrhythmias)
● Antibacterials: manufacturer of loratadine advises plasma concentration possibly increased by • ERYTHROMYCIN; metabolism of mizolastine inhibited by • ERYTHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with • MOXIFLOXACIN—avoid concomitant use; effects of fexofenadine possibly reduced by • RIFAMPICIN; metabolism of mizolastine possibly inhibited by • MACROLIDES (avoid concomitant use)
● Antidepressants: avoidance of mizolastine advised by manufacturer of • CITOPRAM and • ESICITALOPRAM (risk of ventricular arrhythmias); increased antimuscarinic and sedative effects when antihistamines given with • MAOIS or • TRICYCLICS; manufacturer of promethazine advises avoid for 2 weeks after stopping • MAOIS; manufacturer of hydroxyzine advises avoid concomitant use with • MAOIS; cyproheptadine possibly antagonises antidepressant effect of • SSRIS; possible increased antimuscarinic and sedative effects when antihistamines given with • TRICYCLIC-RELATED ANTIDEPRESSANTS
● Antidiabetics: thrombocyte count depressed when ketotifen given with • METFORMIN (manufacturer of ketotifen advises avoid concomitant use)
● Antifungals: metabolism of mizolastine inhibited by • ITRAConazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by • MIDAZOLES (avoid concomitant use)
Antihistamines — Antipsychotics

Antihistamines (continued)
- Antimalarial: avoidance of mizolastine advised by manufacturer of ARTENIL with PIPIRAQUAINE (possible risk of ventricular arrhythmias)
- Antimuscarinics: increased risk of antimuscarinic side-effects when antimuscarinics given with ANTUSARCINICS
- Antivirals: plasma concentration of chlorphenamine possibly increased by LOPINAVIR; plasma concentration of non-sedating antihistamines possibly increased by RITONAVIR; increased risk of ventricular arrhythmias when mizolastine given with SAQUINAVIR — avoid concomitant use
- Anxiolytics and Hypnotics: increased sedative effect when antimuscarinics given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with SOTALOL — avoid concomitant use
- Betahistine: antihistamines theoretically antagonise effect of BETAHISTINE
- Cytotoxic: possible increased risk of ventricular arrhythmias when mizolastine given with VANDETANIB — avoid concomitant use
- Grapefruit Juice: plasma concentration of bilastine reduced by GRAPEFRUIT JUICE
- Histamine: antihistamines theoretically antagonise effects of HISTAMINE — manufacturer of histamine advises avoid concomitant use
- Symptomimetics: avoidance of antihistamines advised by manufacturer of MIDODRINE
- Ulcer-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by Cimetidine; plasma concentration of hydroxyzine increased by Cimetidine
- Ulipristal: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ULIPRISTAL

Antihistamines, Non-sedating see Antihistamines

Antihistamines, Sedating see Antihistamines

Antimalarials see Artemether with Lumefantrine, Artennirol with Piperaquine, Chloroquine, Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine

Antimetabolites see Capecitabine, Cladribine, Cytarabine, Decitabine, Fludarabine, Fluorouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, Tegafur, and Tioguanine

Antimuscarinics
NOTE Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation.
- Alcohol: increased sedative effect when hyoscine given with ALCOHOL
- Analgesics: possible increased risk of antimuscarinic side-effects when antimuscarinics given with CODEINE; increased risk of antimuscarinic side-effects when antimuscarinics given with NEFOPAM
- Anti-arhythmics: increased risk of ventricular arrhythmias when tolterodine given with AMIODARONE, DISOPYRAMIDE or FLECAINIDE; increased risk of antimuscarinic side-effects when antimuscarinics given with DISOPYRAMIDE
- Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with CLARITHROMYCIN and TELITHROMYCIN — consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with CLARITHROMYCIN and ERYTHROMYCIN; plasma concentration of active metabolite of fesoterodine reduced by RIFAMPICIN — avoid concomitant use

Antidepressants: plasma concentration of darifenacin and procyclidine increased by PAROXETINE; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIS or TRICYCLICS; plasma concentration of active metabolite of fesoterodine possibly reduced by ST JOHN’S WORT — manufacturer of fesoterodine advises avoid concomitant use; possible increased antimuscarinic side-effects when antimuscarinics given with TRICYCLIC-RELATED ANTIDEPRESSANTS

Antimuscarinics (continued)
- Antiepileptics: plasma concentration of active metabolite of fesoterodine possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PHENYTOIN — manufacturer of fesoterodine advises avoid concomitant use
- Antifungals: antimuscarinics reduce absorption of KETOCONAZOLE; manufacturer of fesoterodine advises dose reduction when fesoterodine given with IRACONAZOLE and KETOCONAZOLE — consult fesoterodine product literature; plasma concentration of darifenacin increased by KETOCONAZOLE — avoid concomitant use; plasma concentration of solifenacin increased by KETOCONAZOLE — see under Solifenacin, p. 715; plasma concentration of oxybutynin increased by KETOCONAZOLE; manufacturer of tolterodine advises avoid concomitant use with IRACONAZOLE and KETOCONAZOLE; manufacturer of darifenacin advises avoid concomitant use with IRACONAZOLE; plasma concentration of solifenacin possibly increased by IRACONAZOLE — see under Solifenacin, p. 713
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with ANTIHISTAMINES
- Antipsychotics: antimuscarinics possibly reduce effects of HALOPERIDOL; increased risk of antimuscarinic side-effects when antimuscarinics given with CLOZAPINE; antimuscarinics reduce plasma concentration of PHENOTHIAZINES, but risk of antimuscarinic side-effects increased
- Antivirals: manufacturer of darifenacin advises avoid concomitant use with ATAZANAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR; manufacturer of fesoterodine advises dose reduction when fesoterodine given with ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR; plasma concentration of solifenacin possibly increased by RITONAVIR — see under Solifenacin, p. 713
- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with SOTALOL
- Calcium-channel Blockers: plasma concentration of solifenacin increased by VERA PATIL; manufacturer of darifenacin advises avoid concomitant use with VEPAMIL
- Cardiac Glycosides: darifenacin possibly increases plasma concentration of DIGOXIN
- Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with CICLOSPORIN
- Dopaminergics: antimuscarinics possibly reduce absorption of DOBUTAMINE and LEVODOPA; increased risk of antimuscarinic side-effects when antimuscarinics given with CLOZAPINE; antimuscarinics reduce plasma concentration of PHENOTHIAZINES, but risk of antimuscarinic side-effects increased
- Memantine: effects of antimuscarinics possibly enhanced by MEMANTINE
- Metoclopramide: antimuscarinics antagonise effects of METOCLOPRAMIDE on gastro-intestinal activity
- Nitrites: antimuscarinics possibly reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Parasympathomimetics: antimuscarinics antagonise effects of PARASYMPATHOMIMETICS

Antipsychotics
NOTE Increased risk of toxicity with myelosuppressive drugs
NOTE Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis
- ACE Inhibitors: enhanced hypertensive effect when antipsychotics given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypertensive effect when phenothiazines given with ADRENERGIC NEURONE BLOCKERS; higher doses of chlorpromazine antagonise hypertensive effect of ADRENERGIC NEURONE BLOCKERS; haloperidol antagonises hypertensive effect of ADRENERGIC NEURONE BLOCKERS
- Adsorbents: absorption of phenothiazines possibly reduced by KAOLIN
- Alcohol: increased sedative effect when antipsychotics given with ALCOHOL
Antipsychotics (continued)

- Alpha-blockers: enhanced hypotensive effect when antipsychotics given with ALPHA-BLOCKERS
  - Anaesthetics, General: droperidol enhances effects of THIOPENTAL; enhanced hypotensive effect when antipsychotics given with GENERAL ANAESTHETICS
  - Analgesics: possible severe drowsiness when haloperidol given with ACETAMIN or INDOMETACIN; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with METHADONE; increased risk of ventricular arrhythmias when amisulpride given with METHADONE—avoid concomitant use; increased risk of convulsions when antipsychotics given with TRAMADOL; enhanced hypotensive and sedative effects when antipsychotics given with OPIOID ANALGESICS
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
  - Antacids: absorption of phenothiazines and sulpiride reduced by ANTACIDS
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with ANTI-ARRHYTHMICS that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with AMIODARONE—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with AMIODARONE or DISOPYRAMIDE; increased risk of ventricular arrhythmias when benperidol given with AMIODARONE—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with DISOPYRAMIDE; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with DISOPYRAMIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with DISOPYRAMIDE—avoid concomitant use; avoidance of phenothiazines advised by manufacturer of DRONEDARONE (risk of ventricular arrhythmias); increased risk of arrhythmias when amisulpride given with FLECAINIDE; possible increased risk of ventricular arrhythmias when pimozide given with FLECAINIDE; plasma concentration of lurasidone possibly increased by CLARITHROMYCIN and TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with CLARITHROMYCIN, MOXIFLOXACIN or TELITHROMYCIN—avoid concomitant use; plasma concentration of quetiapine possibly increased by CLARITHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of lurasidone possibly increased by CLARITHROMYCIN and TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with CLARITHROMYCIN, MOXIFLOXACIN or TELITHROMYCIN—avoid concomitant use; plasma concentration of quetiapine possibly increased by CLARITHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of lurasidone possibly increased by CLARITHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of lurasidone possibly increased by ERYTHROMYCIN—avoid concomitant use; plasma concentration of quetiapine possibly increased by ERYTHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias with sulpiride given with parenteral ERYTHROMYCIN; increased risk of ventricular arrhythmias when zuclopenthixol given with parenteral ERYTHROMYCIN—avoid concomitant use; plasma concentration of clozapine increased by CIPROFLOXACIN; plasma concentration of olanzapine possibly increased by CIPROFLOXACIN; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with MOXIFLOXACIN—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by RIFAMPICIN and RIFABUTIN—avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone reduced by RIFAMPICIN—avoid concomitant use; plasma concentration of clozapine possibly reduced by RIFAMPICIN; metabolism of haloperidol accelerated by

Antipsychotics

- Antibacterials (continued)
  - RIFAMPICIN (reduced plasma concentration); avoid concomitant use of clozapine with RIFAMPICIN; CHLORAMPHENICOL or SULFONAMIDES (increased risk of agranulocytosis); increased risk of ventricular arrhythmias when droperidol, haloperidol or pimozide given with DELAMANID; increased risk of ventricular arrhythmias when phenothiazines that prolong the QT interval given with DELAMANID; manufacturer of droperidol advises avoid concomitant use with MACROLIDES (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when chlorpromazine given with TELITHROMYCIN; plasma concentration of quetiapine possibly increased by TELITHROMYCIN

- Antidepressants: plasma concentration of clozapine possibly increased by CITALOPRAM (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of CITALOPRAM (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of ESCITALOPRAM (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly increased by FLUOXETINE and PAROXETINE (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine, haloperidol and risperidone increased by FLUOXETINE; manufacturer of droperidol advises avoid concomitant use with FLUOXETINE, FLUOXAMINE, SERTRALINE and TRICYCLICS (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by FLUOXAMINE; plasma concentration of clozapine and olanzapine increased by FLUOXAMINE; asenapine possibly increases plasma concentration of PAROXETINE; plasma concentration of clozapine increased by PAROXETINE and SERTRALINE; plasma concentration of risperidone possibly increased by PAROXETINE (increased risk of toxicity); metabolism of perphenazine inhibited by PAROXETINE (reduce dose of perphenazine); plasma concentration of haloperidol increased by VENLAFAXINE; clozapine possibly increases CNS effects of MAOI; plasma concentration of pimozide possibly increased by SSRIS (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of lurasidone possibly reduced by ST JOHN’S WORT—avoid concomitant use; plasma concentration of aripiprazole possibly reduced by ST JOHN’S WORT (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); possible increased risk of ventricular arrhythmias when risperidone given with TRICYCLICS; possible increased antimuscarinic side-effects when clozapine given with TRICYCLICS; manufacturer of fluphenazine, haloperidol, sulpiride and zuclopenthixol advises avoid concomitant use with TRICYCLICS (risk of ventricular arrhythmias); increased risk of antimuscarinic side-effects when phenothiazines given with TRICYCLICS; possible increased risk of convulsions when butyrophenones, phenothiazines or thioxanthenes given with VORTOXETINE

- Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of SULFONLUREAS

- Antiepileptics: antipsychotics antagonise anticonvulsant effect of ANTIPELICUTICS (convulsive threshold lowered); plasma concentration of lurasidone possibly reduced by CARBAMAZEPINE, PEPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—avoid concomitant use; metabolism of haloperidol, olanzapine, quetiapine and risperidone accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of clozapine accelerated by CARBAMAZEPINE (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; plasma concentration of aripiprazole reduced by CARBAMAZEPINE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paliperidone reduced by CARBAMAZEPINE; plasma concentration of haloperidol reduced by CARBAMAZEPINE, PEPHENYTOIN and PHENYTOIN; chlorpromazine possibly increases or decreases
Antipsychotics

Antiepileptics (continued)

plasma concentration of *FOSPHENYTOIN* and *PHENYTOIN*; metabolism of clozapine and quetiapine accelerated by *FOSPHENYTOIN* (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by *FOSPHENYTOIN*; *PHENOBARBITAL*, *PHENYTOIN* and *PRIMIDONE* (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of clozapine possibly reduced by *PHENOBARBITAL* and *PRIMIDONE*; metabolism of haloperidol accelerated by *PHENOBARBITAL* and *PRIMIDONE* (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with *PHENOBARBITAL* and *PRIMIDONE*; metabolism of clozapine and quetiapine inhibited by *PHENYTOIN*; possible increased plasma concentration; increased risk of side-effects including neutropenia when olanzapine given with *SODIUM VALPROATE* and *VALPROIC ACID*; plasma concentration of clozapine possibly increased or decreased by *SODIUM VALPROATE* and *VALPROIC ACID*.

Antifungals: plasma concentration of lurasidone increased by *KETOCONAZOLE*—avoid concomitant use; metabolism of aripiprazole possibly increased by *KETOCONAZOLE* (reduce dose of aripiprazole); plasma concentration of lurasidone possibly increased by *FLUCONAZOLE* (see under Lurasidone, p. 373); plasma concentration of lurasidone possibly increased by *ITRACONAZOLE*, *POSaconazole* and *VORICONAZOLE*—avoid concomitant use; plasma concentration of aripiprazole possibly increased by *ITRACONAZOLE* (reduce dose of aripiprazole—consult aripiprazole product literature); side-effects of risperidone possibly increased by *ITRACONAZOLE*; plasma concentration of haloperidol possibly increased by *ITRACONAZOLE*; increased risk of ventricular arrhythmias when pimozide given with *IMIDAZOLEs* or *TRIAZOLEs*—avoid concomitant use; plasma concentration of quetiapine possibly increased by *IMIDAZOLEs* and *TRIAZOLEs*—manufacturer of quetiapine advises avoid concomitant use.

Antimalarials: avoidance of antipsychotics advised by manufacturer of *ARTEMETHER WITH LUMEFANTRINE*; avoidance of droperidol, haloperidol, phenothiazines and pimozide advised by manufacturer of *ARTENIMOL WITH PIPERAQUINE* (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when droperidol given with *CHLOROQUINE*, *HYDROXYCHLOROQUINE* or *QUININE*—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with *MEFLOQUINE* or *QUININE*—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when risperidone given with *MEFLOQUINE*; increased risk of ventricular arrhythmias when pimozide given with *MEFLOQUINE*; possible increased risk of ventricular arrhythmias when risperidone given with *QUININE*.

Antimuscarnics: increased risk of antimuscarnic side-effects when clozapine given with *ANTIMUSCARNICS*; plasma concentration of phenothiazines reduced by *ANTIMUSCARNICS*, but risk of antimuscarnic side-effects increased; effects of haloperidol possibly reduced by *ANTIMUSCARNICS*.

Antipsychotics: increased risk of ventricular arrhythmias when phenothiazine or sulphuride given with *DROPERIDOL*—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazine that prolong the QT interval given with *DROPERIDOL*—avoid concomitant use; avoid concomitant use of clozapine with depot formulation of *FLUPENTIXOL*, *FLUPHENAZINE*, *HALOPERIDOL*, *RISPERIDONE* or *ZUCLOPENTHIXOL* as cannot be withdrawn quickly if neutropenia occurs; increased risk of ventricular arrhythmias when sulphuride given with *HALOPERIDOL*; chlorpromazine possibly increases plasma concentration of *HALOPERIDOL*; increased risk of ventricular arrhythmias when droperidol given with *HALOPERIDOL*—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with *PHENOTHIAZINES*—avoid concomitant use; lurasidone possibly increases plasma concentration of *HALOPERIDOL*; increased risk of ventricular arrhythmias when droperidol given with *HALOPERIDOL*—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with *PHENOTHIAZINES*—avoid concomitant use; lurasidone possibly increases plasma concentration of...
Antipsychotics

- COBICISTAT (continued)
  - COBICISTAT — manufacturer of cobicistat advises avoid concomitant use

- Cytotoxics: avoid concomitant use of clozapine with
  - CYTOTOXICS (increased risk of agranulocytosis); possible increased risk of ventricular arrhythmias when haloperidol given with • BOSUTINIB and • CERITINIB; avoidance of pimozide advised by manufacturer of CERITINIB, IDELALISIB and • LAPATINIB; possible increased risk of ventricular arrhythmias when droperidol given with • BOSUTINIB and • CERITINIB; caution with pimozide advised by manufacturer of • CRIZOTINIB; avoidance of quetiapine advised by manufacturer of IDELALISIB; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol given with • VANDETANIB — avoid concomitant use; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with • ARSENIC TRIXIOIDE; increased risk of ventricular arrhythmias when haloperidol given with • ARSENIC TRIXIOIDE

- Deferasirox: avoidance of clozapine advised by manufacturer of DEFERASIROX

- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with DESFERRIOXAMINE; avoidance of prochloperazine advised by manufacturer of DESFERRIOXAMINE

- Diazoxide: enhanced hypotensive effect when phenothiazines given with • DIAZOXIDE

- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by • DIURETICS; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by • DIURETICS (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with • DIURETICS

- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with • AMANTADINE; antipsychotics antagonise effects of • APOMORPHINE, • CO-BENELDOPA, • CO-CARELDOPA, • LEVODOPA and • PERGOLIDE; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of • BROMOCRIPTINE and • CABERGOLINE; manufacturer of amisulpride advises avoid concomitant use of • CO-BENELDOPA, • CO-CARELDOPA and • LEVODOPA (antagonism of effect); avoidance of antipsychotics advised by manufacturer of • PRAMIPEXOLE, • ROPINIROLE and • ROTIGOTINE (antagonism of effect)

- Ergot Alkaloids: lurasidone possibly increases plasma concentration of • ERGOT ALKALOIDS (increased risk of toxicity)

- Fosaprepitant: avoidance of pimozide advised by manufacturer of • FOSAPREPTANT

- Grapefruit Juice: manufacturer of lurasidone and pimozide advises avoid concomitant use with • GRAPEFRUIT JUICE; plasma concentration of quetiapine possibly increased by • GRAPEFRUIT JUICE — manufacturer of quetiapine advises avoid concomitant use

- Guanfacine: sedative effects possibly increased when antipsychotics given with • GUANFACINE

- Histamine: antipsychotics theoretically antagonise effects of • HISTAMINE — manufacturer of histamine advises avoid concomitant use

- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with • TAMOXIFEN (risk of ventricular arrhythmias)

- Ivabradine: increased risk of ventricular arrhythmias when pimozide given with • IVABRADINE

- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol given with • LITHIUM; possible risk of toxicity when olanzapine given with • LITHIUM; extrapyramidal side-effects of quetiapine possibly increased by • LITHIUM; increased risk of extrapyramidal side-effects when sulpiride given with • LITHIUM

- Memantine: effects of antipsychotics possibly reduced by • MEMANTINE

- Methyldopa: enhanced hypotensive effect when antipsychotics given with • METHYLDOPA (also increased risk of extrapyramidal effects)

Antipsychotics (continued)

- Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with • METOCLOPRAMIDE

- Moxonidine: enhanced hypotensive effect when phenothiazines given with • MOXONIDINE

- Muscle Relaxants: promazine possibly enhances effects of • SUXAMETHONIUM

- Nitrates: enhanced hypotensive effect when phenothiazines given with • NITRATES

- Panobinostat: possible increased risk of ventricular arrhythmias when pimozide given with • PANOBINOSTAT — avoid concomitant use

- Penicillamine: increased risk of haematological toxicity when clozapine given with • PENICILLAMINE — manufacturer of penicillamine advises avoid concomitant use

- Pentamidine isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with • PENTAMIDINE ISETIONATE — avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with • PENTAMIDINE ISETIONATE

- Sodium Benzoate: haloperidol possibly reduces effects of • SODIUM BENZOATE

- Sodium Oxybate: antipsychotics possibly enhance effects of • SODIUM OXYBATE

- Sodium Phenylbutyrate: haloperidol possibly reduces effects of • SODIUM PHENYL BUTYRATE

- Sympathomimetics: antipsychotics antagonise hypertensive effect of • SYMPATHOMIMETICS; antipsychotic effects of chlorpromazine possibly antagonised by • DEXAMFETAMINE; chlorpromazine possibly reduces effects of • Lisdexamfetamine; side-effects of risperidone possibly increased by • METHYLPHENIDATE

- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with • TACROLIMUS (risk of ventricular arrhythmias)

- Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with • TETRABENAZINE

- Uterus-Healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by • CIMETIDINE; plasma concentration of clozapine possibly reduced by • OMEPRAZOLE; absorption of sulpiride reduced by • SUCRALFATE

- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with HYDRAZALINE, MINOXIDIL or • SODIUM NITROPRUSSIDE

Antivirals see individual drugs

Anxiolytics and Hypnotics

- ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with • ACE INHIBITORS

- Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with • ADRENERGIC NEURONE BLOCKERS

- Alcohol: increased sedative effect when anxiolytics and hypnotics given with • ALCOHOL

- Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with • ALPHA-BLOCKERS

- Aminophylline: effects of benzodiazepines possibly reduced by • AMINOPHYLLINE

- Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with • GENERAL ANAESTHETICS

- Analgesics: metabolism of midazolam possibly inhibited by • FENTANYL; increased sedative effect when anxiolytics and hypnotics given with • OPIOID ANALGESICS

- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with • ANGIOTENSIN-II RECEPTOR ANTAGONISTS

- Antibacterials: metabolism of midazolam inhibited by • CLARITHROMYCIN, • ERYTHROMYCIN and • TELITROMYCIN (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by • ERYTHROMYCIN (reduce dose of buspirone); metabolism of zopiclone inhibited by • ERYTHROMYCIN; manufacturer of zolpidem advises avoid concomitant use with • CIPROFLOXACIN; metabolism of benzodiazepines possibly accelerated by • RIFAMPICIN (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by • RIFAMPICIN (reduced plasma concentration); metabolism of buspirone possibly
Antivirals: plasma concentration of alprazolam increased by
FLUOXETINE; plasma concentration of metronidazole possibly increased by
SODIUM VALPROATE; plasma concentration of midazolam possibly increased by
fOSAPREPITANT (risk of prolonged sedation); plasma concentration of buspirone increased by
RITONAVIR and
FELAPREVIR (risk of prolonged sedation—avoid concomitant use of oral midazolam); increased risk of

Antihistamines: plasma concentration of midazolam increased by
FLOXICETINE; plasma concentration of lorazepam possibly increased by
SODIUM VALPROATE; plasma concentration of buspirone increased by
RITONAVIR (risk of prolonged sedation and respiratory depression—avoid concomitant use); plasma concentration of antivirals and hypnotics possibly increased by
RITONAVIR; plasma concentration of buspirone increased by
RITONAVIR (increased risk of toxicity); plasma concentration of midazolam increased by
SAQUINAVIR (risk of prolonged sedation—avoid concomitant use of oral midazolam); plasma concentration of oral midazolam increased by
SIMEPREVIR

Anxiolytics and Hypnotics — Anxiolytics and Hypnotics
Anxiolytics and Hypnotics (continued)

- Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine; sedative effects possibly increased when benzodiazepines given with moxonidine
- Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine
- Netupitant: plasma concentration of midazolam increased by
- Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrates
- Oestrogens: plasma concentration of melatonin increased by oestrogens; plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by oestrogens; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by oestrogens
- Progestogens: plasma concentration of chlordiazepoxide, diazepam and nitrazepam possibly increased by progestogens; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by progestogens
- Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use)
- Theophylline: effects of benzodiazepines possibly reduced by theophylline
- Uler-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration)
- Vasodilator Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with hydralazine, minoxidil or sodium nitroprusside

Apixaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins)
- Antibacterials: manufacturer of apixaban advises avoid concomitant use with clarithromycin and telithromycin; plasma concentration of apixaban possibly reduced by rifampicin — manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- Anticoagulants: increased risk of haemorrhage when apixaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with dabigatran, edoxaban and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of apixaban possibly reduced by st john’s Wort — manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism
- Antiepileptics: plasma concentration of apixaban possibly reduced by carbamazepine — manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; plasma concentration of apixaban possibly reduced by fosphenytoin, phenobarbital, phenytoin and primidone
- Antifungals: plasma concentration of apixaban increased by daptomycin (alternative contraception recommended)
- Antihypertensives: enhanced hypotensive effect when anxiolytics and hypnotics given with hydralazine, minoxidil or sodium nitroprusside
- Antipsychotics: manufacturer of apixaban advises avoid concomitant use with maid, tricyclic-related antidepressants and tricyclics
- Sympathomimetics: manufacturer of apixaban advises avoid concomitant use with sympathomimetics

Apopemiphene

- Antipsychotics: effects of apomorphine antagonised by antipsychotics
- Domperidone: possible increased risk of ventricular arrhythmias when apomorphine given with domperidone
- Dopaminergics: effects of apomorphine possibly enhanced by entacapone
- SHT-receptor Antagonists: possible increased hypotensive effect when apomorphine given with ondansetron — avoid concomitant use
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methylpoda: antiparkinsonian effect of dopaminergics antagonised by methylpoda

Apreamiplatin

- Antibacterials: plasma concentration of apremilast reduced by rifampicin
- Anticoagulants: apremilast possibly reduces anticoagulant effect of warfarin
- Antidepressants: manufacturer of apremilast advises avoid concomitant use with st john’s Wort
- Antidiabetics: apremilast reduces plasma concentration of tolbutamide
- Antiepileptics: plasma concentration of apremilast possibly reduced by carbamazepine, fosphenytoin, phenobarbital and phenytoin
- Antifungals: plasma concentration of apremilast increased by ketoconazole
- Antipsychotics: manufacturer of apremilast advises avoid concomitant use with pimozide
- Antivirals: plasma concentration of apremilast possibly increased by ritonavir
- Anxiolytics and Hypnotics: apremilast increases plasma concentration of midazolam (risk of prolonged sedation)
- Apanafil: apremilast possibly increases plasma concentration of apanafil — see under Apanafil, p. 744
- Calcium-channel Blockers: plasma concentration of both drugs may increase when apanafil given with diltiazem
- Corticosteroids: apremilast inhibits metabolism of dexamethasone and methylprednisolone (reduce dose of dexamethasone and methylprednisolone)
- Cytotoxics: apremilast possibly increases plasma concentration of bosutinib — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; apremilast possibly increases the plasma concentration of ibritinib — reduce dose of ibritinib (see under Ibrutinib, p. 867)
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when apanafil given with dapoxetine (see under Dapoxetine, p. 751)
- Guanfacine: apremilast possibly increases plasma concentration of guanfacine (halve dose of guanfacine)
- Oestrogens: apremilast possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended)
- Progestogens: apremilast possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended)

Argatroban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid...
Argatroban

- Analgesics (continued)
  - concomitant use, including low-dose heparins; increased risk of haemorrhage when anticoagulants given with RETOROLAC (avoid concomitant use, including low-dose heparins)
  - Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DABIGATRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Aripiprazole see Antipsychotics

Arsenic Trioxide

- Anti-arrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with AMIODARONE or DISOPYRAMIDE
- Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with ANTIPSYCHOTICS that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with HALOPERIDOL; avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
- Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with AMITRIPTYLINE or CLOMIPRAMINE
- Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with PENTAMIDINE ISETIONATE
- Antipsychotics: increased risk of ventricular arrhythmias when arsenic trioxide given with ANALGESICS
- Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with SOTALOL
- Antivirals: increased risk of ventricular arrhythmias when arsenic trioxide given with AZT, ATTIVILOX, CERVICALIX, ERTIVAX, GLOBEX, INHERION, IVACATIN, LOPINAVIR, Ritonavir, SANCIVAX and TIPRANAVIR; avoidance of antimalarials given with ATAZANAVIR, FOSAMPRENACIV, INIDINAVIR, LOPINAVIR, Ritonavir, SANCIVAX and TIPRANAVIR; avoidance of antimalarials given with BOCREPRAVIR; plasma concentration of lumefantrine increased when artemether with lumefantrine given with DARUNAVIR; plasma concentration of arteether with lumefantrine reduced by EFAVIRENZ and ETARVIRINE
- Antipsychotics: manufacturer of antiprescribed with lumefantrine avoids concomitant use with BENZODIAZEPINES
- Antivirals: manufacturer of antiprescribed with lumefantrine advises caution with ATAZANAVIR, FOSAMPRENACIV, INIDINAVIR, LOPINAVIR, Ritonavir, SANCIVAX and TIPRANAVIR; avoidance of antimalarials given with ATAZANAVIR, FOSAMPRENACIV, INIDINAVIR, LOPINAVIR, Ritonavir, SANCIVAX and TIPRANAVIR; avoidance of antimalarials given with BOCREPRAVIR; plasma concentration of lumefantrine increased when artemether with lumefantrine given with DARUNAVIR; plasma concentration of arteether with lumefantrine reduced by EFAVIRENZ and ETARVIRINE
- Beta-blockers: manufacturer of antiprescribed with lumefantrine advises avoid concomitant use with METOPROLOL and SOTALOL

Artemether with Lumefantrine (continued)

- Cytotoxics: possible increased risk of ventricular arrhythmias when arteether with lumefantrine given with VANDENABR—avoid concomitant use
- Grapefruit Juice: plasma concentration of arteether with lumefantrine possibly increased by GRAPEFRUIT JUICE
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Penicillamine: increased risk of haematological toxicity when antimalarials given with PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use
- Ulcer-healing Drugs: manufacturer of arteether with lumefantrine advises avoid concomitant use with CIMETIDINE—Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Artemisinin with Piperaquine

NOTE Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 5 months after treatment has been stopped

- Analgesics: manufacturer of arteether with piperaquine advises avoid concomitant use with METHADONE (possible risk of ventricular arrhythmias)
- Antiprescribed with arteether with piperaquine advises avoid concomitant use with AMIODARONE and DISOPYRAMIDE (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of arteether with piperaquine advises avoid concomitant use with MACROLIDES and MOXIFLOXACIN (possible risk of ventricular arrhythmias)
- Antifungals: manufacturer of arteether with piperaquine advises avoid concomitant use with PENTAMIDINE ISETIONATE (possible risk of ventricular arrhythmias)
- Antipsychotics: manufacturer of arteether with piperaquine advises avoid concomitant use with ANTIPSYCHOTICS
- Antidepressants: manufacturer of arteether with piperaquine advises avoid concomitant use with ANTIPSYCHOTICS
- Antidiabetics: manufacturer of arteether with piperaquine advises avoid concomitant use with ANTIPSYCHOTICS (possible risk of ventricular arrhythmias)
- Antivirals: manufacturer of arteether with piperaquine advises avoid concomitant use with ANTIHISTAMINES
- Antihistamines: manufacturer of arteether with piperaquine advises avoid concomitant use with ANTIHISTAMINES (possible risk of ventricular arrhythmias)
- Antimalarials: avoidance of antimalarials advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE
- Antipsychotics: manufacturer of arteether with piperaquine advises avoid concomitant use with PROPRIDIO
- Beta-blockers: manufacturer of arteether with piperaquine advises avoid concomitant use with SAQUINAVIR (possible risk of ventricular arrhythmias)
- Antitussives: manufacturer of arteether with piperaquine advises avoid concomitant use with SOTALOL (possible risk of ventricular arrhythmias)
- Cytotoxics: manufacturer of arteether with piperaquine advises avoid concomitant use with VASCULAR DILATORS and ARTERIO-SOLVING (possible risk of ventricular arrhythmias)
- Cimetidine: manufacturer of arteether with piperaquine advises avoid concomitant use with VASCULAR DILATORS and ARTERIO-SOLVING (possible risk of ventricular arrhythmias)
- Grapefruit Juice: manufacturer of arteether with piperaquine advises avoid concomitant use with GRAPEFRUIT JUICE
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Penicillamine: increased risk of haematological toxicity when antimalarials given with PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use
- Pentamidine isetionate: manufacturer of arteether with piperaquine advises avoid concomitant use with PENTAMIDINE ISETIONATE (possible risk of ventricular arrhythmias)
Arteminol with Piperaquine — Atazanavir

**Arteminol with Piperaquine** (continued)

- Vaccines: antimalarials inactivate oral Typhoid Vaccine — see under Typhoid Vaccine in BNF or BNFC.

**Ascorbic acid** see Vitamins

**Asenapine** see Antipsychotics

**Aspirin**

- Adsorpts: absorption of aspirin possibly reduced by kaolin
- Analgesics: generic: aspirin possibly enhances effects of thiopental

- Analgesics: avoid concomitant use of aspirin with:
  - **NSAIDS** (increased side-effects); antiplatelet effect of aspirin possibly reduced by ibuprofen
  - Antacids: excretion of aspirin increased by alkaline urine due to similar 

- Anticoagulants: increased risk of bleeding when aspirin given with:
  - comarin or phenindione (due to antiplatelet effect); increased risk of bleeding when high-dose aspirin given with:
  - edoxaban (avoid concomitant use); aspirin enhances anticoagulant effect of:
  - heparins

- Antidepressants: increased risk of bleeding when aspirin given with:
  - **SSRIs** or venlafaxine

- Antiepileptics: aspirin enhances effects of fosphenytoin, phenytoin, sodium valproate and valproic acid

- Clopidogrel: increased risk of bleeding when aspirin given with clopidogrel

- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate

- Cytotoxics: aspirin reduces excretion of:
  - methotrexate (increased risk of toxicity); aspirin possibly reduces renal excretion of pemetrexed — consult product literature

- Diuretics: aspirin antagonises diuretic effect of:
  - spiranolactone; increased risk of toxicity when high-dose aspirin given with:
  - acetazolamide; possible increased risk of toxicity when high-dose aspirin given with:
  - loop diuretics (also possible reduced effect of loop diuretics)

- Ilprost: increased risk of bleeding when aspirin given with iloprost

- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of:
  - zafirlukast

- Metoclopramide: rate of absorption of aspirin increased by:
  - metoclopramide (enhanced effect)

- Nicorandil: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with:
  - nicorandil

- Sulfipyrazone: aspirin antagonises effects of:
  - sulfipyrazone

**Atazanavir**

- Analgesics: atazanavir increases plasma concentration of:
  - buprenorphine

- Antacids: absorption of atazanavir reduced by:
  - antacids (give at least 2 hours before or 1 hour after antacids)

- Anti-arrhythmics: atazanavir possibly increases plasma concentration of:
  - amiodarone and lidocaine

- Antibacterials: plasma concentration of both drugs increased when atazanavir given with:
  - clarithromycin; atazanavir increases plasma concentration of:
  - rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by:
  - rifampicin — avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of:
  - telithromycin

- Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of:
  - warfarin; avoidance of atazanavir advised by manufacturer of:
  - apixaban and rivaroxaban

- Antidepressants: plasma concentration of atazanavir reduced by:
  - St John's wort — avoid concomitant use

- Antifungals: plasma concentration of atazanavir increased by:
  - posaconazole; atazanavir increases or decreases the plasma concentration of:
  - voriconazole and plasma concentration of atazanavir also reduced

- Antimalarials: caution with atazanavir advised by manufacturer of:
  - arteether with lumefantrine; atazanavir possibly increases plasma concentration of:
  - quinine (increased risk of toxicity)

- Antimuscarinics: avoidance of atazanavir advised by manufacturer of:
  - darifenacin; manufacturer of fosoterodine advises dose reduction when atazanavir given with:
  - fosoterodine — consult fosoterodine product literature

**Atazanavir** (continued)

- Antipsychotics: atazanavir possibly increases plasma concentration of:
  - aripiprazole (reduce dose of aripiprazole — consult aripiprazole product literature)
  - atazanavir possibly increases plasma concentration of:
  - pimozide — avoid concomitant use; atazanavir possibly increases plasma concentration of:
  - quetiapine — manufacturer of quetiapine advises avoid concomitant use

- Antivirals: plasma concentration of atazanavir reduced by:
  - boceprevir; atazanavir increases the plasma concentration of:
  - daclatasvir — reduce dose of daclatasvir (see under Daclatasvir, p. 577); absorption of atazanavir reduced by:
  - didanosine tablets (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with:
  - efavirenz (plasma concentration of atazanavir reduced); atazanavir boosted with ritonavir increases plasma concentration of:
  - elvitegravir (reduce dose of elvitegravir); avoid concomitant use of atazanavir with:
  - indinavir; atazanavir increases plasma concentration of:
  - maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by:
  - nevirapine — avoid concomitant use; atazanavir increases plasma concentration of:
  - paritaprevir; increased risk of venricular arrhythmias when atazanavir given with:
  - saquinavir — avoid concomitant use; atazanavir possibly reduces plasma concentration of:
  - telaprevir, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by:
  - tenofovir; also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of:
  - tipranavir (also plasma concentration of atazanavir reduced)

- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of:
  - midazolam — avoid concomitant use of oral midazolam

- Calcium-channel Blockers: atazanavir increases plasma concentration of:
  - diltiazem (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of:
  - verapamil

- Ciclosporin: atazanavir possibly increases plasma concentration of:
  - ciclosporin

- Colchicine: atazanavir possibly increases risk of:
  - colchicine toxicity — suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

- Cytotoxics: atazanavir possibly increases plasma concentration of:
  - axitinib (reduce dose of axitinib — consult axitinib product literature); atazanavir possibly increases the plasma concentration of:
  - bosutinib — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of:
  - crizotinib and everolimus — manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases the plasma concentration of:
  - ibritinib — reduce dose of ibritinib (see under ibritinib, p. 867); atazanavir possibly increases plasma concentration of:
  - pazopanib (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of:
  - cabazitaxel; atazanavir possibly inhibits metabolism of:
  - irinotecan (increased risk of toxicity)

- Dapoxetine: avoidance of atazanavir advised by manufacturer of:
  - dapoxetine (increased risk of toxicity)

- Ergot Alkaloids: atazanavir possibly increases plasma concentration of:
  - ergot alkaloids — avoid concomitant use

- Guanfacine: atazanavir possibly increases plasma concentration of:
  - guanfacine (halve dose of guanfacine)

- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with:
  - atorvastatin or pravastatin; atazanavir increases plasma concentration of:
  - rosuvastatin — adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with:
  - simvastatin (avoid concomitant use)

- Oestrogens: atazanavir increases plasma concentration of:
  - ethinylestradiol

- Orlistat: absorption of atazanavir possibly reduced by:
  - orlistat

- Progestogens: atazanavir increases plasma concentration of:
  - norethisterone
Atazanavir (continued)
- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine — manufacturer of ranolazine advises avoid concomitant use
- Simvastatin: atazanavir possibly increases plasma concentration of simvastatin — manufacturer of simvastatin advises avoid concomitant use
- Atorvastatin: atazanavir possibly increases plasma concentration of atorvastatin — manufacturer of atorvastatin advises avoid concomitant use
- Atomoxetine: plasma concentration of atomoxetine possibly reduced by atazanavir; increased risk of ventricular arrhythmias when atomoxetine given with atazanavir — when patient is stable on the alpha blocker initiate atazanavir at the lowest possible dose
- Rifampicin: plasma concentration of rifampicin possibly increased by atazanavir — avoid concomitant use; plasma concentration of atazanavir possibly reduced by rifampicin — manufacturer of atazanavir advises adjust concomitant use; plasma concentration of atazanavir reduced by disopyramide and antipyschotics — see under atazanavir product literature; plasma concentration of atazanavir reduced by propoxyphene and proton pump inhibitors — avoid or adjust dose of both drugs (consult product literature)

Atezolozole
- See Beta-blockers

Atomoxetine
- Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with methadone — possible increased risk of convulsions when atomoxetine given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atomoxetine given with amiadaron or disopyramide
- Antidepressants: increased risk of ventricular arrhythmias when atomoxetine given with paroxetine — erythromycin; increased risk of ventricular arrhythmias when atomoxetine given with moxifloxacin
- Antidiabetics: metabolism of atomoxetine possibly inhibited by fluoxetine and paroxetine — possible increased risk of convulsions when atomoxetine given with antidepressants; atomoxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with tricyclics
- Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with melfloquine
- Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with antipsychotics that prolong the QT interval
- Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with sotalol
- Bupropion: possible increased risk of convulsions when atomoxetine given with bupropion
- Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by diuretics
- Sympathomimetics, beta-2: increased risk of cardiovascular side-effects when atomoxetine given with paroxetine sulbutamol

Atorvastatin
- See Statins

Atovaquone
- Antioxidants: manufacturer of atovaquone avoids anti oxidant use with rifabutin (plasma concentration of both drugs reduced); plasma concentration of atovaquone reduced by rifampicin (and concentration of rifampicin increased) — avoid concomitant use; plasma concentration of atovaquone reduced by tetrycycline
- Antivirals: plasma concentration of atovaquone reduced by efavirenz — avoid concomitant use; atovaquone possibly reduces plasma concentration of indinavir; plasma concentration of atovaquone possibly reduced by ritonavir — manufacturer of atovaquone advises avoid concomitant use; atovaquone increases plasma concentration of zidovudine (increased risk of toxicity)
- Cytotoxics: atovaquone possibly increases plasma concentration of etoposide
- Histamine: avoidance of atovaquone advised by manufacturer of histamine
- Metoclopramide: plasma concentration of atovaquone reduced by metoclopramide — avoid concomitant use

Atracurium see Muscle Relaxants

Atropine see Antimuscarinics

Avanafil
- ACE inhibitors: avanafil possibly enhances hypotensive effect of enalapril
- Alcohol: possible enhanced hypotensive effect when avanafil given with alcohol
- Alpha-blockers: increased hypotensive effect when avanafil given with alpha-blockers — when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Antibacterials: plasma concentration of avanafil possibly increased by clarithromycin and telithromycin — manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by erythromycin — see under avanafil, p. 744; plasma concentration of avanafil possibly increased by rifampicin — manufacturer of avanafil advises avoid concomitant use
- Antiepileptics: plasma concentration of avanafil possibly reduced by carbamazepine, phenobarbital and primidone — manufacturer of avanafil advises avoid concomitant use
- Antifungals: plasma concentration of avanafil increased by ketoconazole — avoid concomitant use; plasma concentration of avanafil possibly increased by fluconazole — see under avanafil, p. 744; plasma concentration of avanafil possibly increased by itraconazole and voriconazole — manufacturer of avanafil advises avoid concomitant use
- Antivirals: plasma concentration of avanafil possibly reduced by efavirenz — manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil increased by fosamprenavir — see under avanafil, p. 744; plasma concentration of avanafil possibly increased by indinavir and saquinavir — manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil significantly increased by ritonavir — avoid concomitant use
- Aprepitant: plasma concentration of avanafil possibly increased by aprepitant — see under avanafil, p. 744
- Bosentan: plasma concentration of avanafil possibly reduced by bosentan — manufacturer of avanafil advises avoid concomitant use
- Calcium-channel blockers: plasma concentration of avanafil possibly increased by diltaizem and verapamil — see under avanafil, p. 744
- Cobicistat: plasma concentration of avanafil possibly increased by cobicistat — avoid concomitant use
- Fosaprepitant: plasma concentration of avanafil possibly increased by fosaprepitant
- Grapefruit juice: plasma concentration of avanafil possibly increased by grapefruit juice — manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
- Nicorandil: avanafil significantly enhances hypotensive effect of nicorandil — avoid concomitant use
- Nitrates: avanafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)
- Riociguat: possible enhanced hypotensive effect when avanafil given with riociguat — avoid concomitant use

Axitinib
- Antibacterials: plasma concentration of axitinib possibly increased by clarithromycin, erythromycin and telithromycin (reduce dose of axitinib — consult axitinib product literature); plasma concentration of axitinib decreased by rifabutin (increase dose of axitinib — consult axitinib product literature); plasma concentration of axitinib decreased by rifampicin (increase dose of axitinib — consult axitinib product literature)
- Antiepileptics: plasma concentration of axitinib possibly reduced by st john’s wort — consider increasing dose of axitinib
- Antifungals: plasma concentration of axitinib possibly decreased by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone (increase dose of axitinib — consult axitinib product literature)
- Antifungals: plasma concentration of axitinib increased by ketoconazole (reduce dose of axitinib — consult axitinib product literature); plasma concentration of axitinib possibly
Axitinib

Antifungals (continued)
increased by ITRACONAZOLE (reduce dose of axitinib—consult axitinib product literature)

Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)

Antivirals: plasma concentration of axitinib possibly increased by AZATANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR (reduce dose of axitinib—consult axitinib product literature)

Corticosteroids: plasma concentration of axitinib possibly decreased by DEXAMETHASONE (increase dose of axitinib—consult axitinib product literature)

Grapefruit Juice: plasma concentration of axitinib possibly increased by GRAPEFRUIT JUICE

Azathioprine

ACE Inhibitors: increased risk of anaemia or leucopenia when azathioprine given with CAPTOPRIL especially in renal impairment; increased risk of anaemia when azathioprine given with ENALAPRIL especially in renal impairment

Allopurinol: enhanced effects and increased toxicity of azathioprine when given with ALLOPURINOL (reduce dose of azathioprine to one quarter of usual dose)

Anaesthetics: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with INDOMETACIN

Antibacterials: increased risk of haematological toxicity when azathioprine given with SULFAMETHOXAZOLE (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with TRIMETHOPRIM (also with co-trimoxazole)

Anticoagulants: azathioprine possibly reduces anticoagulant effect of ACENOCOUMAROL; azathioprine reduces anticoagulant effect of WARFARIN

Antivirals: myelosuppressive effects of azathioprine possibly enhanced by RIBAVIRIN

Febuxostat: avoidance of azathioprine advised by manufacturer of FEBOXOSTAT

Ulcer-healing Drugs: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with CIMETIDINE

Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Azelastine see Antihistamines

Azilsartan see Angiotensin II Receptor Antagonists

Azithromycin see Macrolides

Aztrenam

Anticoagulants: aztrenam possibly enhances anticoagulant effect of CLOMANS

Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Baclofen see Muscle Relaxants

Bambuterol see Sympathomimetics, Beta2

Basiliximab

Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)

Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

BCG Vaccine see Vaccines

Beclometasone see Corticosteroids

Bedaquiline

Antibacterials: plasma concentration of bedaquiline possibly increased by CIPROFLOXACIN, CLARITHROMYCIN and ERTHROMYCIN—avoid concomitant use if ciprofloxacin, clarithromycin and erythromycin given for more than 14 days; manufacturer of bedaquiline advises avoid concomitant use with MOXIFLOXACIN; plasma concentration of bedaquiline possibly reduced by RIFABUTIN—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline reduced by Rifampicin—manufacturer of bedaquiline advises avoid concomitant use; possible increased risk of ventricular arrhythmias when bedaquiline given with CLOFAZILINE

Antidepressants: plasma concentration of bedaquiline possibly reduced by ST JOHN’S WORT—manufacturer of bedaquiline advises avoid concomitant use

Bedaquiline (continued)

Antiepileptics: plasma concentration of bedaquiline possibly reduced by CARBAMAZEPINE, FOSPHENYTIOIN and PHENYTOIN—manufacturer of bedaquiline advises avoid concomitant use

Antifungals: plasma concentration of bedaquiline increased by KETOCONAZOLE—avoid concomitant use if ketoconazole given for more than 14 days; plasma concentration of bedaquiline possibly increased by FLUCONAZOLE—avoid concomitant use if fluconazole given for more than 14 days

Antivirals: plasma concentration of bedaquiline possibly reduced by EFAVIRENZ and ETRAVIRINE—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline possibly increased by RITONAVIR—manufacturer of ritonavir advises avoid concomitant use

Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Bee Venom Extracts

ACE Inhibitors: possible severe anaphylactoid reaction when bee venom extracts given with ACE INHIBITORS

Belimumab

Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)

Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Bendamustine

Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)

Bendroflumethiazide see Diuretics

Benperidol see Antipsychotics

Benzodiazepines see Anxiolytics and Hypnotics

Benztropine see Penicillins

Beta-blockers

NOTE Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind

ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE INHIBITORS

Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with ADRENERGIC NEURONE BLOCKERS

Alcohol: enhanced hypotensive effect when beta-blockers given with ALCOHOL

Aldesleukin: enhanced hypotensive effect when beta-blockers given with ALDESLEUKIN

Alpha-blockers: enhanced hypotensive effect when beta-blockers given with ALPHABLOCKERS, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with GENERAL ANAESTHETICS

Anaesthetics, Local: propranolol increases risk of BUPIVACAINE toxicity

Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDS; plasma concentration of esmolol possibly increased by MORPHINE

Angiotensin II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with ANGIOΤENSIN-II RECEPTOR ANTAGONISTS

Anti-arrhythmics: increased myocardial depression when beta-blockers given with ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when sotalol given with AMIODARONE, DISOPYRAMIDE or DRONERADONE—avoid concomitant use; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with AMIODARONE; plasma concentration of metoprolol and propranolol possibly increased by DRONERADONE; increased risk of LIDOCAINE toxicity; propranolol increases risk of LIDOCAINE toxicity; plasma concentration of metoprolol and propranolol increased by PROPafenone

Antibacterials: increased risk of ventricular arrhythmias when sotalol given with MOXIFLOXACIN—avoid concomitant use;
Beta-blockers
- Antibacterial: possible increased risk of ventricular arrhythmias when sotalol given with • BOSUTINIB and • CEDIRINIB; possible increased risk of bradycardia when beta-blockers given with • CRIZOTINIB; possible increased risk of ventricular arrhythmias when sotalol given with • VANDETANIB—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with • ARSENIC TRIOXIDE
- Diazoxide: enhanced hypotensive effect when beta-blockers given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when beta-blockers given with • DIURETICS; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by • LOOP DIURETICS or • THIAZIDES AND RELATED DIURETICS
- Dopamine: enhanced hypotensive effect when beta-blockers given with • CO-BENEDOLPA, • CO-CARELDPRA and • LEVODOPRA
- Ergot Alkaloids: increased peripheral vasconstriction when beta-blockers given with ERGOT ALKALOIDS
- Fingolimod: possible increased risk of bradycardia when beta-blockers given with • FINGOLIMOD
- Hormone Antagonists: possible increased risk of bradycardia when corticosteroids or metoprolol, propranolol or sotalol given with • PASIREOTIDE
- 5HT1-receptor Agonists: propranolol increases plasma concentration of • RIZATRIPTAN (manufacturer of rizatRIPTAN advises halve dose and avoid within 2 hours of propranolol)
- Ibradine: increased risk of ventricular arrhythmias when sotalol given with • IVAABRIDE 
- Methylp: enhanced hypotensive effect when beta-blockers given with • METHYLDOPA
- Mirabegron: plasma concentration of metoprolol increased by • MIRABEGRON
- Moxylyte: possible severe postural hypotension when betablockers given with • MOXYLYTE
- Moxonidine: enhanced hypotensive effect when beta-blockers given with • MOKONIDINA
- Muscle Relaxants: propranolol enhances effects of • MUSCLE RELAXANTS; enhanced hypotensive effect when beta-blockers given with • BACLOFEN; possible enhanced hypotensive effect and bradycardia when beta-blockers given with • TIZANIDINA
- Nitrates: enhanced hypotensive effect when beta-blockers given with • NITRATES
- Oestrogens: hypotensive effect of beta-blockers antagonised by • OESTROGENS
- Panobinostat: possible increased risk of ventricular arrhythmias when sotalol given with • PANOBINOSTAT—avoid concomitant use
- Parasympathomimetics: propranolol antagonises effects of • NEOSTIGMIN and • PYRIDOSTIGNMIN; increased risk of arrhythmias when beta-blockers given with • PILOCARPINA
- Prostaglandins: enhanced hypotensive effect when beta-blockers given with • ALPROSTADIL
- Ranolazine: avoidance of sotalol advised by manufacturer of • RANOLAZINA
- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with • ADRENALINA (EPINEFIRINA), also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with • DOBUTAMINA; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with • NORDRENALINA (NOREPINEFIRINA)
- Thyroid Hormone: metabolism of propranolol accelerated by • LEVOTHYROXINA
- Ulcer-healing Drug: plasma concentration of labetalol, metoprolol and propranolol increased by • CETIDINA; plasma concentration of oral timolol possibly increased by • CETIDINA
- Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with • HYDRAZIN, • MINOXIDOL or • SODIUM NITROPRUSSIDE
Betahistine
- Antihistamines: effect of betahistine theoretically antagonised by • ANTIHISTAMINES
Betamethasone see Corticosteroids
Betaxolol see Beta-blockers
Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: avoidance of bevacizumab advised by manufacturer of Panitumumab
- Vaccines: risk of generalised infections when monoclonal antibodies given with live Vaccines—avoid concomitant use

Bevacizumab

- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bevacizumab increased by
  - GEMFIBrozil—avoid concomitant use

Bezafibrate see Fibrates

Bicalutamide

- Anticoagulants: bicalutamide possibly enhances anticoagulant effect of COUMARINS
- Lipid-regulating Drugs: separating administration from bicalutamide by 12 hours advised by manufacturer of LOMITAPIDE

Biguanides see Antidiabetics

Bilastine see Antihistamines

Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestymamine

Bile Acids

- Antacids: absorption of bile acids possibly reduced by
  - ANTACIDS; effects of cholic acid probably reduced by ALUMINIUM HYDROXIDE (manufacturer of cholic acid advises give at least 5 hours apart)
- Antiepileptics: manufacturer of cholic acid advises avoid concomitant use with
  - PHENOBARBITAL
- Ciclosporin: manufacturer of cholic acid advises avoid concomitant use with
  - CICLOSPORIN; ursodeoxycholic acid increases absorption of
  - CICLOSPORIN
- Lipid-regulating Drugs: effects of cholic acid probably reduced by
  - COLESEVELAM, COLESTIPOL and COLESTYRAMINE (manufacturer of cholic acid advises give at least 5 hours apart); absorption of bile acids possibly reduced by
  - COLESTIPOL and COLESTYRAMINE

Bisoprolol see Beta-blockers

Bisphosphonates

- Antacids: absorption of bisphosphonates reduced by
  - ANTACIDS
- Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with
  - AMINOGLYCOSIDES
- Calcium Salts: absorption of bisphosphonates reduced by
  - CALCIUM SALTS
- Cytotoxics: sodium clodronate increases plasma concentration of
  - ESTRAMUSTINE
- Iron Salts: absorption of bisphosphonates reduced by oral IRON SALTS

Bivalirudin

- Analgesics: increased risk of haemorrhage when anticoagulants given with
  - intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with a KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - APIXaban, DABIGATран, EDoxaban and RIVARoxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Cardiac Glicosides: bleomycin possibly reduces absorption of
  - DIGOxin tablets
- Cytotoxics: increased risk of pulmonary toxicity when bleomycin given with
  - BRENTUXIMAB VEDOTIN—avoid concomitant use; increased pulmonary toxicity when bleomycin given with
  - CISPlatin
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live Vaccines—avoid concomitant use

Boceprevir

- Alpha-blockers; boceprevir possibly increases plasma concentration of
  - DOXAZOSIN and TAMsulosIN—manufacturer of boceprevir advises avoid concomitant use

Boceprevir (continued)

- Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with
  - BUPRENORPHINE; boceprevir possibly affects plasma concentration of METHADONE
- Antibacterials: manufacturer of boceprevir advises avoid concomitant use with
  - RifAMPICIN (plasma concentration of boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by manufacturer of APiXaban
- Antiepileptics: manufacturer of boceprevir advises avoid concomitant use with
  - CARBAMAZEPINE, FOsPHENytoIN, PHENOBARBITAL, PHENytoIN and PRIMIDONE (plasma concentration of boceprevir possibly reduced)
- Antifungals: plasma concentration of boceprevir increased by
  - KETOCONAZOLE
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with
  - ARTEMether with LUMEFanTriNE
- Antipsychotics: boceprevir possibly increases plasma concentration of
  - LURASIDONE—avoid concomitant use; manufacturer of boceprevir advises avoid concomitant use with
  - PIMOZIDE; boceprevir possibly increases plasma concentration of
  - QUETiapINE—manufacturer ofquetiapine advises avoid concomitant use
- Antivirals: boceprevir reduces plasma concentration of
  - ATRAzANAVIR; boceprevir possibly increases the plasma concentration of
  - DAclATARISVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 577); avoid concomitant use of boceprevir with
  - DARUNAVIR; effects of both drugs possibly reduced when boceprevir given with
  - ETARIVIRINE; avoidance of boceprevir advised by manufacturer of
  - FOSAMPReNAVIR, NEVIRAPINE and TIPRANAvIR; manufacturers advise avoid concomitant use of boceprevir with
  - LOPINAVIR; boceprevir increases plasma concentration of
  - MARAVIroC (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with
  - RITONAVIR
- Anxiolytics and Hypnotics: boceprevir increases plasma concentration of oral
  - MIDAzoLAM—manufacturer of boceprevir advises avoid concomitant use
- Cardiac Glicosides: boceprevir possibly increases side-effects of
  - DIGOxin
- Ciclosporin: boceprevir increases plasma concentration of
  - CICLOSPORIN
- Cilostazol: boceprevir possibly increases plasma concentration of
  - CILOSTAZOL (see under Cilostazol, p. 221)
- Cocistat: avoidance of boceprevir advised by manufacturer of COBICISTAT
- Cytotoxics: boceprevir possibly increases the plasma concentration of
  - BOSUTiniB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with
  - DASATiNIB, ERLoTINiB, GEFTiNIB, IMATiNIB, LAPATiNIB, NILOTiNIB, PzAPANiB, SORAFEniB and SUNiTINIB; manufacturer of ruxolitinib advises dose reduction when boceprevir given with
  - RUXoLITINiB—consult ruxolitinib product literature; boceprevir possibly increases plasma concentration of
  - OLAPARiB (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
- Domperidone: possible increased risk of ventricular arrhythmias when boceprevir given with
  - DOMPERIDONE—avoid concomitant use
- Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with
  - ERGOT ALKALOiDS
- Guanfacine: boceprevir possibly increases plasma concentration of
  - GUANFACiNE (halve dose of guanfacine)
- Lipid-regulating Drugs: boceprevir increases plasma concentration of
  - ATORvASTATIN (reduce dose of atorvastatin); boceprevir increases plasma concentration of
  - PRaVASTATiN; manufacturers advise avoid concomitant use of boceprevir with
  - SIMVASTATIN
- Progestogens: boceprevir increases plasma concentration of
  - DROSPiRENOne (increased risk of toxicity)
- Siromus: boceprevir increases plasma concentration of
  - SIROlUMiS (increased risk of toxicity—reduce sirolimus dose)
- Tacrolimus: boceprevir increases plasma concentration of
  - TACROLiMUS (reduce dose of tacrolimus)
Bosentan

- Antiarrhythmics: plasma concentration of bosentan reduced by • Rifampicin — manufacturer of bosutinib advises avoid concomitant use
- Antidepressants: plasma concentration of bosentan possibly reduced by • ST JOHN’S WORT — manufacturer of bosutinib advises avoid concomitant use
- Anti-epileptics: plasma concentration of bosentan possibly reduced by • Carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone — manufacturer of bosutinib advises avoid concomitant use

Bosutinib

- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with • Methadone
- Antacids: manufacturer of bosutinib advises separating administration with antacids by about 12 hours
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with • Amiodarone and • Disopyramide — plasma concentration of bosutinib possibly increased by • Dronedarone — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antifungals: plasma concentration of bosutinib possibly increased by • Ciprofloxacin, clarithromycin, erythromycin and • Telithromycin — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of ventricular arrhythmias when bosutinib given with • Moxifloxacin — plasma concentration of bosutinib possibly reduced by • Rifabutin —

Bosutinib (continued)

- Antidepressants (continued): manufacturer of bosutinib advises avoid concomitant use; plasma concentration of bosutinib reduced by • Rifampicin — manufacturer of bosutinib advises avoid concomitant use
- Antipsychotics: plasma concentration of bosutinib possibly reduced by • ST JOHN’S WORT — manufacturer of bosutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of bosutinib possibly reduced by • Carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone — manufacturer of bosutinib advises avoid concomitant use

Antifungals: plasma concentration of bosutinib increased by

- Bosentan — increased by • Rifampicin

- Cytotoxics:
  - Cobicistat: manufacturer of bosutinib advises separating administration with bosentan by about 24 hours
  - Avoidance of bosentan advised by manufacturer of bosutinib
  - Plasma concentration of bosutinib possibly increased by • Flucanazole, • Itraconazole, • Posaconazole and • Voriconazole — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with • Haloperidol; avoid concomitant use of cytotoxics with • Clozapine (increased risk of agranulocytosis)

- Antivirals: plasma concentration of bosutinib possibly increased by • Atazanavir, • Boceprevir, • Darunavir, • Fosamprenavir, • Indinavir, • ritonavir, • Saquinavir and • Telaprevir — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by • Efavirenz and • Etiravirine — manufacturer of bosutinib advises avoid concomitant use

- Aprepitant: plasma concentration of bosutinib possibly increased by • Aprepitant — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with • Sotalol

- Bosentan: plasma concentration of bosutinib possibly reduced by • Bosentan — manufacturer of bosutinib advises avoid concomitant use

- Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by • Diltiazem and • Verapamil — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Cytotoxics: plasma concentration of bosutinib possibly increased by • Matinib — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Darunavir:
  - Manufacturer of bosutinib advises avoid concomitant use with • Domperidone — (risk of ventricular arrhythmias)

- Fosaprepitant: plasma concentration of bosutinib possibly increased by • Fosaprepitant — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Grapefruit juice; plasma concentration of bosutinib possibly increased by • Grapefruit juice — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Haloperidol; manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib

- Modafinil: plasma concentration of bosutinib possibly reduced by • Modafinil — manufacturer of bosutinib advises avoid concomitant use

- Ulcer-healing Drugs: plasma concentration of bosutinib reduced by • Lansoprazole

Brentuximab vedotin

- Antibacterials: effects of brentuximab vedotin possibly reduced by • Rifampicin

- Antifungals: possible increased risk of neutropenia when brentuximab vedotin given with • Ketoconazole

- Antipsychotics: avoid concomitant use of cytotoxics with • Clozapine (increased risk of agranulocytosis)

- Cytotoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with • Bleomycin — avoid concomitant use

- Vaccines: risk of generalised infections when monoclonal antibodies given with live • Vaccines — avoid concomitant use
Brimonidine

Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIS, TRICYCLIC-RELATED ANTIDEPRESSANTS and TRICYCLICS

Brinzolamide see Diuretics

Brivaracetam

Antibacterials: plasma concentration of brivaracetam reduced by

- Rifampicin

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)

Antiepileptics: plasma concentration of brivaracetam reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; plasma concentration of brivaracetam reduced by FOSPHENYTONE, PHENOBARBITAL, PHENOTYPIN and PRIMIDONE

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by Mefloquine

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by Antipsychotics (convulsive threshold lowered)

- Oralstat: possible increased risk of convulsions when antiepileptics given with Oralstat

Bromocriptine

- Alcohol: tolerance of bromocriptine reduced by Alcohol

- Antibacterials: plasma concentration of bromocriptine increased by ERYTHROMYCIN (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by MACROLIDES (increased risk of toxicity)

- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of bromocriptine antagonised by Antipsychotics

- Domperidone: hypoprolactinaemic effect of bromocriptine possibly antagonised by Domperidone

- Antineurotransmitter: bromocriptine concentration of bromocriptine increased by OCTREOTIDE

- Memantine: effects of dopaminergics possibly enhanced by Memantine

- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by Methylodopa

- Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by Metoclopramide

- Symptomimetics: risk of toxicity when bromocriptine given with Symptomimetics

Buclozine see Antihistamines

Budesonide see Corticosteroids

Bumetanide see Diuretics

Butapacaine

- Anti-arhythmic: increased myocardial depression when butapacaine given with Anti-arhythmic

- Beta-blockers: increased risk of butapacaine toxicity when given with Propranolol

Buprenorphine see Opioid Analgesics

Buproprion

- Antidepressants: buproprion possibly increases plasma concentration of Citalopram; manufacturer of buproprion advises avoid for 2 weeks after stopping MAOIS; manufacturer of buproprion advises avoid concomitant use with MOLOBEMIDE; buproprion possibly increases plasma concentration of TRICYCLICS (possible increased risk of convulsions); buproprion increases plasma concentration of Vortioxetine (consider reducing dose of vortioxetine)

- Antiepileptics: plasma concentration of buproprion reduced by Carbamazepine, fosphenytoin and phenytoin; metabolism of buproprion inhibited by Sodium Valproate and valproic acid

- Antivirals: metabolism of buproprion accelerated by Efavirenz (reduced plasma concentration); plasma concentration of buproprion reduced by Ritonavir

- Atomoxetine: possible increased risk of convulsions when bupropion given with Atomoxetine

- Dopaminergics: increased risk of side-effects when bupropion given with Amantadine, Co-beneldopa, Co-careldopa or levodopa

- Hormone Antagonists: bupropion possibly inhibits metabolism of Tamoxifen to active metabolite (avoid concomitant use)

Buproprion (continued)

- Methylthioninium: possible risk of CNS toxicity when buproprion given with Methylthioninium — avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Buspirone see Anxiolytics and Hypnotics

Busulfan

- Analgesics: metabolism of intravenous busulfan possibly inhibited by Paracetamol (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol)

- Antibacterials: plasma concentration of busulfan increased by Metronidazole (increased risk of toxicity)

- Antiepileptics: plasma concentration of busulfan possibly reduced by Fosphenytoin and Phenytoin

- Antifungals: metabolism of busulfan inhibited by Itraconazole (increased risk of toxicity)

- Antipsychotics: avoid concomitant use of cytoxics with Clozapine (increased risk of agranulocytosis)

- Cytotoxics: increased risk of hepatotoxicity when busulfan given with Thioguanine

Busulfan

Antipsychotics see Antipsychotics

Cabazitaxel

- Antidepressants: plasma concentration of cabazitaxel possibly increased by Clarithromycin and Telithromycin — manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises concomitant use with Rifabutin; plasma concentration of cabazitaxel reduced by Rifampicin — manufacturer of cabazitaxel advises avoid concomitant use

- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with St John’s Wort

- Antipsychotics: manufacturer of cabazitaxel advises avoid concomitant use with Carbamazepine, fosphenytoin, Phenobarbital, Phenotyphin and Primidone

- Antifungals: manufacturer of cabazitaxel advises avoid concomitant use with Ketoconazole; plasma concentration of cabazitaxel possibly increased by Itraconazole and Voriconazole — manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

- Antipsychotics: avoid concomitant use of cytoxics with Clozapine (increased risk of agranulocytosis)

- Antivirals: manufacturer of cabazitaxel advises avoid concomitant use with Atazanavir; plasma concentration of cabazitaxel possibly increased by Indinavir, Ritonavir and Saquinavir — manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel

Cabelergone

- Antibacterials: plasma concentration of cabergolone increased by Erythromycin (increased risk of toxicity); plasma concentration of cabergolone possibly increased by MACROLIDES (increased risk of toxicity)

- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of cabergolone antagonised by Antipsychotics

- Domperidone: hypoprolactinaemic effect of cabergolone antagonised by Domperidone

- Memantine: effects of dopaminergics possibly enhanced by Memantine

- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by Methylodopa

- Metoclopramide: hypoprolactinaemic effect of cabergolone antagonised by Metoclopramide

Caboantinib

- Antibacterials: plasma concentration of caboantinib possibly increased by Clarithromycin and Erythromycin; plasma concentration of caboantinib reduced by Rifampicin — avoid concomitant use

- Antidepressants: plasma concentration of caboantinib possibly reduced by St John’s Wort — manufacturer of caboantinib advises avoid concomitant use

- Antiepileptics: plasma concentration of caboantinib possibly reduced by Carbamazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone — avoid concomitant use
Calcitriol see Vitamins

Calcium Salts

NOTE see also Antacids
• Antiarthritics: calcium salts reduce absorption of ciprofloxacin (give at least 2 hours before or 4 hours after ciprofloxacin); calcium salts possibly reduce absorption of tetracyclines (give at least 2 to 3 hours apart)
• Antivirals: calcium salts reduce absorption of dolutegravir — manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; separating administration from calcium salts by 4 hours advised by manufacturer of ledipasvir; manufacturer of rifapentine advises give calcium salts 2 hours before or 4 hours after rifapentine.
• Bisphosphonates: calcium salts reduce absorption of bisphosphonates.
• Cardiac Glysosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with cardiac glycosides.
• Corticosteroids: absorption of calcium salts reduced by corticosteroids.
• Cytotoxics: calcium salts reduce absorption of estramustine (manufacturer of estramustine advises avoid concomitant administration).
• Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics.
• Etrombopag: calcium salts possibly reduce absorption of etrombopag (give at least 4 hours apart).
• Fluorides: calcium salts reduce absorption of fluorides.
• Iron Salts: calcium salts reduce absorption of oral iron salts.
• Thyroid Hormones: calcium salts reduce absorption of levothyroxine.
• Zinc: calcium salts reduce absorption of zinc.

Calcium-channel Blockers

NOTE Dihydropyridine calcium-channel blockers include amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, and nimodipine.
• ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE inhibitors.
• Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers.
• Alcohol: enhanced hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol.
• Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with aldesleukin.
• Aminophylline: enhanced hypotensive effect when calcium-channel blockers given with aminophylline; verapamil increases plasma concentration of aminophylline.
• Alpha-blockers: enhanced hypotensive effect when calcium-channel blockers given with alpha-blockers; also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
• Aminophylline: calcium-channel blockers possibly increase plasma concentration of aminophylline; enhanced hypotensive effect when calcium-channel blockers given with amiodarone; increased risk of myocardial depression and asystole when verapamil given with disopyramide or flecainide; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with dronedarone; nifedipine increases plasma concentration of dronedarone.
• Antiarrhythmics: metabolism of calcium-channel blockers possibly inhibited by clarithromycin, erythromycin, telithromycin, and risedronate; metabolism of lercanidipine possibly inhibited by risedronate; effects of dihydropyridines, nicardipine and nimodipine possibly accelerated by rifampicin; increased risk of agranulocytosis; plasma concentration of cabozantinib possibly reduced; effects of dihydropyridines, nicardipine and nimodipine possibly accelerated by rifampicin; increased risk of agranulocytosis; increased risk of bradycardia and myocardial depression when diltiazem and verapamil given with rifampicin; avoidance of verapamil by manufacturer of fidaxomycin; anticoagulants: verapamil possibly increases plasma concentration of dabigatran (see under dabigatran etexilate, p. 128); verapamil increases plasma concentration of edoxaban.
• Antidepressants: metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of mirtazapine; enhanced hypotensive effect when calcium-channel blockers given with mirtazapine; plasma concentration of nifedipine reduced by st john’s wort; plasma concentration of amiodarone and nifedipine possibly reduced by st john’s wort; plasma concentration of verapamil significantly reduced by st john’s wort; diltiazem and verapamil possibly increase plasma concentration of tricyclics.
• Antidiabetics: glucose tolerance occasionally impaired when nifedipine given with insulins.
• Antiepileptics: effects of dihydropyridines, nicardipine and nifedipine probably reduced by carbamazepine; diltiazem and verapamil enhance effects of carbamazepine; manufacturer of nimodipine advises avoid concomitant use with carbamazepine, fosphenytoin and phenytoin (plasma concentration of nimodipine possibly reduced); effects of felodipine and isradipine reduced by carbamazepine; effects of felodipine and verapamil reduced by phenytoin; manufacturer of nimodipine advises avoid concomitant use with fosphenytoin; phenobarbital, phenytoin and primidone; diltiazem increases plasma concentration of fosphenytoin and phenytoin but also effect of diltiazem reduced; effects of calcium-channel blockers probably reduced by phenobarbital and primidone; manufacturer of nimodipine advises avoid concomitant use with phenobarbital and primidone (plasma concentration of nimodipine reduced); effects of felodipine and verapamil reduced by phenytoin.
Calcium-channel Blockers (continued)
- Antifungals: metabolism of dihydropyridines possibly inhibited by ITRACANAZOLE and KETOCONAZOLE (increased plasma concentration); metabolism of felodipine is inhibited by KETOCONAZOLE (increased plasma concentration). Manufacturer of ketoconazole advises avoid concomitant use; manufacturer of lercanidipine advises avoid concomitant use with ITRACANAZOLE and KETOCONAZOLE; negative inotropic effect possibly increased when calcium-channel blockers given with ITRACANAZOLE and KETOCONAZOLE; metabolism of felodipine inhibited by ITRACANAZOLE (increased plasma concentration); plasma concentration of nifedipine increased by MICAFUNIC.
- Antimalarials: possible increased risk of bradycardia when calcium-channel blockers given with MELOQUIN.
- Antimuscarinics: enhancement of antimuscarinic effect by guanfacine.

Calcium-channel Blockers (continued)
- Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by CORTICOSTEROIDS; diltiazem increases plasma concentration of METHYLPRERIDINOLS.
- Cytotoxics: verapamil possibly increases plasma concentration of OXORUBICIN; verapamil possibly increases the plasma concentration of AFAFINIB—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with CRIZOTINIB; plasma concentration of both drugs may increase when verapamil given with EVEROLMULUS (consider reducing the dose of everolimus); diltiazem and verapamil possibly increase the plasma concentration of IBRUTINIB—reduce dose of ibritinib (see under Ibrutinib, p. 867); diltiazem and verapamil possibly increase plasma concentration of OLAPARIB (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); nifedipine possibly inhibits metabolism of VINCIRINE.
- Diphteroids: manufacturer of daphneontilde advises dose reduction when diltiazem and verapamil given with DAPTOXIN (see under Dapoxetine, p. 751).
- Dose: enhanced hypotensive effect when calcium-channel blockers given with DIAZODE.
- Dihydropyridine: diltiazem and verapamil increase plasma concentration of EPLERENONE (reduce dose of eplerenone); enhanced hypotensive effect when calcium-channel blockers given with DURETICS.
- Dopamine: enhanced hypotensive effect when calcium-channel blockers given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA.
- Fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with FINGOLIMOD.
- Fosaprepitant: plasma concentration of both drugs may increase when diltiazem given with FOSAPREPTANT.
- Grapefruit: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by GRAPEFRUIT JUICE.
- Guanfacine: diltiazem and verapamil possibly increase the plasma concentration of GUANFACINE (halve dose of guanfacine).
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of DUTASTERIDE; possible increased risk of bradycardia when diltiazem or verapamil given with PASIREOTID.
- Ibradine: diltiazem and verapamil increase plasma concentration of IVABRADINE—avoid concomitant use.
- Lenalidomide: verapamil possibly increases plasma concentration of LENALIDOMIDE (increased risk of toxicity).
- Lipid-regulating Drugs: diltiazem increases plasma concentration of ATORVASTATIN—possible increased risk of myopathy; plasma concentration of verapamil increased by ATORVASTATIN, also possible increased risk of myopathy (consider reducing dose of atorvastatin); possible increased risk of myopathy when amiodipine and diltiazem given with SIMVASTATIN (see under Simvastatin, p. 194); increased risk of myopathy when verapamil given with SIMVASTATIN (see under Simvastatin, p. 194); avoidance of diltiazem and verapamil advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased); separating administration from amiodipine and lacidipine by 12 hours advised by manufacturer of LOMITAPIDE.
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with LITHIUM without increased plasma concentration of lithium.
- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and PARENTERAL MAGNESIUM in pre-eclampsia.
- Methyldopa: enhanced hypotensive effect when calcium-channel blockers given with METHYLDOPA.
Calcium-channel Blockers (continued)

- Moxisylyte: enhanced hyotensive effect when calcium-channel blockers with MOXISYLYTE
- Moxonidine: enhanced hyotensive effect when calcium-channel blockers with MOXONIDINE
- Muscle Relaxants: verapamil enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; enhanced hyotensive effect when calcium-channel blockers given with BACLOFEN or TIZANIDINE; manufacturer of verapamil advises avoid concomitant use of intravenous DANTROLENE; possible increased risk of ventricular arrhythmias when diltiazem given with intravenous DANTROLENE—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS
- Naloxegol: diltiazem increases plasma concentration of NALOXEGOL (reduce dose of naloxegol—see under Naloxegol, p. 61); verapamil possibly increases plasma concentration of NALOXEGOL (reduce dose of naloxegol—see under Naloxegol, p. 61)
- Nitrates: enhanced hyotensive effect when calcium-channel blockers with NITRATES
- Oestrogens: hyotensive effect of calcium-channel blockers antagonised by OESTROGENS
- Prostaglandins: enhanced hyotensive effect when calcium-channel blockers given with ALPROSTADIL
- Ranolazine: diltiazem and verapamil increase plasma concentration of RANOLAZINE (consider reducing dose of ranolazine)
- Sildenafil: diltiazem enhances hyotensive effect when amiodipine given with SILDENAFIL
  - Sirolimus: diltiazem increases plasma concentration of SIROLIMUS; plasma concentration of both drugs increased when verapamil given with a SIROLIMUS; nicardipine possibly increases plasma concentration of SIROLIMUS
- Sulfinpyrazone: plasma concentration of verapamil reduced by SULFINPYRAZONE
  - Tacrolimus; diltiazem, nicardipine and nifedipine increase plasma concentration of TACROLIMUS; felodipine and verapamil possibly increase plasma concentration of TACROLIMUS
  - Theophylline: calcium-channel blockers possibly increase plasma concentration of THYMEFOLINE (enhanced effect); diltiazem increases plasma concentration of THYMEFOLINE; verapamil increases plasma concentration of THYMEFOLINE (enhanced effect)
  - Ticagrelor: diltiazem increases plasma concentration of TICAGRELOR
  - Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by CIMETIDINE (increased plasma concentration); plasma concentration of isradipine increased by CIMETIDINE (halve dose of isradipine)
  - Ulipristal: avoidance of verapamil advised by manufacturer of low-dose ULIPRISTAL
  - Vardenafil: enhanced hyotensive effect when nifedipine given with VARDENAFIL
  - Vasodilator Antihypertensives: enhanced hyotensive effect when calcium-channel blockers given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Calcium-channel Blockers (dihydropyridines) see Calcium-channel Blockers

Canagliflozin see Antidiabetics

Canakinumab
- Antipsychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Candesartan see Angiotensin-II Receptor Antagonists

Cannabis Extract
- Antibacterials: plasma concentration of cannabis extract reduced by Rifampicin—manufacturer of cannabis extract advises avoid concomitant use
- Antidepressants: plasma concentration of cannabis extract possibly reduced by ST JOHN’S WORT—manufacturer of cannabis extract advises avoid concomitant use; possible

Cannabis Extract (continued)
- increased risk of hypertension and tachycardia when cannabis extract given with TRICYCLES
- Antiepileptics: plasma concentration of cannabis extract possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of cannabis extract advises avoid concomitant use
- Antifungals: plasma concentration of cannabis extract increased by KETOCONAZOLE

Capecitabine
- Allopurinol: manufacturer of capecitabine advises avoid concomitant use with ALLOPURINOL
- Antibacterial: metabolism of capecitabine inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: capecitabine enhances anticoagulant effect of COUMARINS
- Antiepileptics: capecitabine possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: capecitabine possibly increases plasma concentration of ERLOTINIB
- Filgrastim: neutropenia possibly exacerbated when capecitabine given with FILGRASTIM
- Folates: toxicity of capecitabine increased by FOLIC ACID—avoid concomitant use
- Lipogfilgrastim: neutropenia possibly exacerbated when capecitabine given with LIPOGFILGRASM
- Ppegfilgrastim: neutropenia possibly exacerbated when capecitabine given with PEGFILGRASM
- Ulcer-healing Drugs: metabolism of capecitabine inhibited by CIMETIDINE (increased plasma concentration)

Capreomycin
- Antibacterials: increased risk of nephrotoxicity when capreomycin given with COLISTIMETHATE SODIUM or POLYMIXINS; increased risk of nephrotoxicity and ototoxicity when capreomycin given with AMINGGLYCOSIDES or VANCOMYCIN
- Cytoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with PLATINUM COMPOUNDS
- Vaccines: antibacterials inactive ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Captopril see ACE Inhibitors

Carbamazepine
- Alcohol: CNS side-effects of carbamazepine possibly increased by ALCOHOL
- Aminophylline: carbamazepine accelerates metabolism of AMINOPHYLLINE (reduced effect)
- Analgesics: effects of carbamazepine enhanced by DEXTROPROPXYPHENYE; carbamazepine possibly accelerates metabolism of FENTANYL (reduced effect); carbamazepine reduces plasma concentration of METHADONE; carbamazepine reduces effects of TRAMADOL; carbamazepine possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Anthelmintics: carbamazepine reduces plasma concentration of ALBINDAZOLE and PRAZIQUENTAL—consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of DRONERADONE—avoid concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by CLARITHROMYCIN (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ERYTHROMYCIN; plasma concentration of carbamazepine reduced by RIFABUTIN; carbamazepine accelerates metabolism of DOXYCYCLINE (reduced effect); carbamazepine possibly reduces plasma concentration of BEDAQUELINE—manufacturer of bedaquiline advises avoid concomitant use; avoidance of carbamazepine advised by manufacturer of DELAMANID; plasma concentration of carbamazepine increased by ISOXAZID (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces
Antiepileptics: carbamazepine possibly reduces plasma concentration of antiepileptics—manufacturer of axitinib advises avoid concomitant use for treatment of deep-vein thrombosis or pulmonary embolism; carbamazepine accelerates thrombolysis mechanism of COUMARINS (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of EDOXABAN; carbamazepine possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.

Antidepressants: carbamazepine possibly reduces plasma concentration of tricyclics (reduced plasma concentration and reduced effect); carbamazepine possibly reduces plasma concentration of vortioxetine—consider increasing dose of vortioxetine; carbamazepine possibly reduces plasma concentration of ETHOSUXIMIDE and RETIGABINE; plasma concentration of both drugs often reduced when carbamazepine given with fosphenytoin or phenytoin, also plasma concentration of an active metabolite of oxcarbazepine may be increased; carbamazepine often reduces plasma concentration of lamotrigin, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with levetiracetam; plasma concentration of carbamazepine sometimes reduced by oxcarbazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of perampanel (see under Perampanel, p. 301); carbamazepine possibly increases plasma concentration of phenobarbital and primidone; plasma concentration of both drugs possibly reduced when carbamazepine given with rifampicin; plasma concentration of tiagabine and zonisamide; carbamazepine often reduces plasma concentration of topiramate.

Antifungals: plasma concentration of carbamazepine possibly increased by ketoconazole, also plasma concentration of ketoconazole possibly reduced; plasma concentration of carbamazepine possibly increased by fluconazole and miconazole; carbamazepine possibly reduces plasma concentration of isavuconazole and voriconazole—avoid concomitant use; carbamazepine possibly reduces plasma concentration ofitraconazole and posaconazole; carbamazepine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin.

Antimalarias: avoidance of carbamazepine advised by manufacturer of artequinoxil with piperaquine; antiviral effect of antiepileptics antagonised by mefloquine.

Antimuscarnics: carbamazepine possibly reduces plasma concentration of active metabolite of fesoterodine—manufacturer of fesoterodine advises avoid concomitant use.

Antipsychotics: antipsychotic effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); carbamazepine accelerates metabolism of haloperidol, olanzapine, quetiapine and risperidone (reduced plasma concentration); carbamazepine reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine possibly reduces plasma concentration of luradione—avoid concomitant use; carbamazepine reduces plasma concentration of paliperidone.

Antivirals: avoidance of carbamazepine advised by manufacturer of boceprevir and rilpivirine (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of darunavir, fosamprenavir, lopinavir, saquinavir and tipranavir, and carbamazepine reduces plasma concentration of dasabuvir, omibasvir and paritaprevir—avoid concomitant use; carbamazepine reduces the plasma concentration of dolastatin (see under Dolastatin, p. 592); plasma concentration of both drugs reduced when carbamazepine given with efavirenz; avoidance of carbamazepine advised by manufacturer of elvitegravir, etravirine, ledipasvir, sofosbuvir and telaprevir; carbamazepine possibly reduces plasma concentration of indinavir, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of nevirapine, plasma concentration of carbamazepine possibly increased by ritonavir.

Anxiolytics and Hypnotics: carbamazepine often reduces plasma concentration of clonazepam; carbamazepine reduces plasma concentration of midazolam.

Apremilast: carbamazepine possibly reduces plasma concentration of apremilast—avoid concomitant use.

Aprepitant: carbamazepine possibly reduces plasma concentration of aprepitant.

Avanafl: carbamazepine possibly reduces plasma concentration of avanafl—manufacturer of avanafl advises avoid concomitant use.

Bupropion: carbamazepine reduces plasma concentration of bupropion.

Calcium-channel Blockers: carbamazepine reduces effects of felodipine and isradipine; carbamazepine probably reduces effects of dihydropyridines, nicardipine and nifedipine; avoidance of carbamazepine advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by dilizium and verapamil.

Cannabis Extract: carbamazepine possibly reduces plasma concentration of cannabis extract—manufacturer of cannabis extract advises avoid concomitant use.

Ciclosporin: carbamazepine accelerates metabolism of ciclosporin.

Clopidogrel: carbamazepine possibly reduces antiplatelet effect of clopidogrel.

Cobicistat: carbamazepine possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use.

Corticosteroids: carbamazepine accelerates metabolism of corticosteroids (reduced effect).

Cytotoxics: carbamazepine possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of bortezomib, bosutinib, crizotinib, ibritinib, idelalisib and ponatinib advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of cabozantinib and ceritinib—avoid concomitant use; avoidance of...
Carbamazepine
- Cytotoxics (continued)
  carbamazepine advised by manufacturer of
  CABAZITAXEL, DABRAFENIB, GEPITINIB, OLAPARIB and VEMURAFENIB;
  avoidance of carbamazepine advised by manufacturer of
  DASATINIB, VANDETANIB and VISMODEGIB (plasma concentration of dasatinib, vandetanib and vismodegib possibly reduced);
  carbamazepine reduces plasma concentration of IMATINIB and LAPATINIB—avoid concomitant use;
  carbamazepine possibly reduces plasma concentration of ERIFULIN; carbamazepine reduces plasma concentration of IRINOTECAN and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with PROCARBAZINE.
- Diuretics: carbamazepine reduces plasma concentration of
  EPLERENONE—avoid concomitant use; increased risk of hyponatraemia when carbamazepine given with DIURETICS; plasma concentration of carbamazepine increased by
  ACETAZOLAMIDE.
- Fingolimod: carbamazepine reduces plasma concentration of
  FINGOLIMOD.
- Fosaprepitant: carbamazepine possibly reduces plasma concentration of
  FOSAPREPIANT.
- Guanfacine: carbamazepine possibly reduces plasma concentration of
  GUANFACINE—increased dose of guanfacine.
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of
  ABRITERONE—manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by
  DANAZOL (increased risk of toxicity); carbamazepine possibly accelerates metabolism of
toremifene (reduced plasma concentration).
- SH3 receptor Antagonists: carbamazepine accelerates metabolism of
  ONDANSETRON (reduced effect).
- Ixacator: carbamazepine possibly reduces plasma concentration of
  IXACAFOR—manufacturer of ixacator advises avoid concomitant use.
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of
  SIMVASTATIN—consider increasing dose of simvastatin.
- Lithium: neurotoxicity may occur when carbamazepine given with
  LITHIUM without increased plasma concentration of lithium.
- Lumacaftor: plasma concentration of carbamazepine possibly reduced by
  LUMACAFTOR—manufacturer of lumacaftor advises avoid concomitant use.
- Macitentan: avoidance of carbamazepine advised by manufacturer of
  MACITENTAN.
- Muscle Relaxants: carbamazepine antagonises muscle relaxing effect of
  NON-DEPOLARISING MUSCLE RELAXANTS (accelerated recovery from neuromuscular blockade).
- Naloxegol: carbamazepine possibly reduces plasma concentration of
  NALOXEGOL—avoid concomitant use.
- Oestrogens: carbamazepine accelerates metabolism of
  OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC).
- Orlistat: possible increased risk of convulsions when
  antiepileptics given with
  ORLISTAT.
- Panobinostat: avoidance of carbamazepine advised by manufacturer of
  PANOBINOSTAT.
- Progestogens: carbamazepine accelerates metabolism of
  PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC).
- Retinoids: plasma concentration of carbamazepine possibly reduced by
  ISOTRETINOIN.
- Rol氟米酯: carbamazepine possibly inhibits effects of
  ROFLUMILAST (manufacturer of rolfluimilast advises avoid concomitant use).
- Theophylline: carbamazepine accelerates metabolism of
  THEOPHYLLINE (reduced effect).

Carbamazepine (continued)
- Thyroid Hormones: carbamazepine accelerates metabolism of
  THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism).
- Tilibone: carbamazepine accelerates metabolism of
  TIBOLONE (reduced plasma concentration).
- Ticagrelor: carbamazepine possibly reduces plasma concentration of
  TICAGRELOR.
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by
  CIMETIDINE (increased plasma concentration).
- Ulipristal: avoidance of carbamazepine advised by manufacturer of
  ULIPRISTAL (contraceptive effect of ulipristal possibly reduced).
- Vitamins: carbamazepine possibly increases requirements for
  ALFACALCIDOL, CALCIUM, COLECALCIFEROL, DIIHYDROACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D.

Carbapenems see Ertapenem, Imipenem with Cilastatin, and Meropenem.

Carbamazepine
- Anticoagulants: carbamazepine possibly increases anticoagulant effect of
  COUMARDIN.
- Carboplatin see Platinum Compounds.
- Carboprost see Prostaglandins.
- Cardiac Glysides
  - ACE Inhibitors: plasma concentration of digoxin possibly increased by
    Captopril.
  - Alpha-blockers: plasma concentration of digoxin increased by
    PRAZOSIN.
  - Aminosalicylates: absorption of digoxin possibly reduced by
    SULFASALAZINE.
  - Analgesics: plasma concentration of cardiac glycosides possibly increased by
    NSAIDS, also possible exacerbation of heart failure and reduction of renal function.
  - Antacids: absorption of digoxin possibly reduced by
    ANTACIDS.
  - Anti-arrhythmics: plasma concentration of digoxin increased by
    AMIODARONE, DRONEDARONE and PROPafenone (halve dose of digoxin).
  - Antibacterials: plasma concentration of digoxin possibly increased by
    GENTAMICIN, TELITHROMYCIN and TRIMETHOPRIM; absorption of digoxin reduced by
    NEOMYCIN; plasma concentration of digoxin possibly reduced by
    RIFAMPICIN; plasma concentration of digoxin increased by
    MACROLIDES (increased risk of toxicity).
  - Antidepressants: plasma concentration of digoxin reduced by
    ST JOHN’S WORT—avoid concomitant use.
  - Antidiabetics: plasma concentration of digoxin possibly reduced by
    ACARBOSE; plasma concentration of digoxin increased by
    CANAGLIFLOZIN and SITAGLITRIPTIN.
  - Anti-epileptics: plasma concentration of digoxin possibly reduced by
    FOSPHENYTOIN and PHENYTOIN.
  - Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with
    AMPHOTERICIN; plasma concentration of digoxin increased by
    ISAVONICAZOLE and
    ITRACONAZOLE.
  - Antimalarials: plasma concentration of digoxin possibly increased by
    CHLOROQUINE and HYDROXYCHLOROQUINE; possible increased risk of bradycardia when digoxin given with
    MEfloQUINE; plasma concentration of digoxin increased by
    QUININE.
  - Antimuscarinics: plasma concentration of digoxin possibly increased by
    DARIFENACIN.
  - Antivirals: side-effects of digoxin possibly increased by
    BOCEPREVIR; plasma concentration of digoxin increased by
    DACLATASVIR, ETARAVIRINE, SIMPREVIR and TELAPREVIR; plasma concentration of digoxin possibly increased by
    PARITAPREVIR (consider reducing dose of digoxin); plasma concentration of digoxin possibly increased by
    RITONAVIR.
  - Anxiolytics and Hypnotics: plasma concentration of digoxin increased by
    ALPRAZOLAM (increased risk of toxicity).
  - Beta-blockers: increased risk of AV block and bradycardia when
    cardiac glycosides given with
    BETABLOCKERS.
  - Calcium Salts: arrhythmias can be precipitated when
    cardiac glycosides given with large intravenous doses of
    CALCIUM SALTS.
Ca**rdiac Glycosides** (continued)

- Calcium-channel Blockers: plasma concentration of digoxin increased by [Diltiazem](#), [Lercanidipine](#) and [Nimodipine](#); plasma concentration of digoxin possibly increased by [Nifedipine](#); plasma concentration of digoxin increased by [Verapamil](#), also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by [Ciclosporin](#) (increased risk of toxicity)
- Ciclosporin: plasma concentration of digoxin possibly increased by [Ciclosporin](#) (increased risk of toxicity)
- Ciclosporin: plasma concentration of digoxin possibly increased by [Ciclosporin](#) (increased risk of toxicity)
- Ciclosporin: plasma concentration of digoxin possibly increased by [Ciclosporin](#) (increased risk of toxicity)
- Colchicine: possible increased risk of myopathy when digoxin given with [Colchicine](#)
- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with [Corticosteroids](#)
- Cytoxics: absorption of digoxin **tablets** possibly reduced by [Bleomycin](#), [Carmustine](#), [Cyclophosphamide](#), [Cytarabine](#), [Doxorubicin](#), [Melphalan](#), [Methotrexate](#), [Procarbazine](#) and [Vincristine](#) ; possible increased risk of bradycardia when digoxin given with [Cytotoxins](#); manufacturer of digoxin advises give [Ibrutinib](#) at least 6 hours before or after Ibrutinib; plasma concentration of digoxin increased by [Vandetanib](#) — possible increased risk of bradycardia
- Diuretics: plasma concentration of digoxin possibly increased by [Potassium Canrenoate](#); plasma concentration of digoxin increased by [Spironolactone](#) ; increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with [Acetazolamide](#), [Loop Diuretics](#) or [Thiazides and Related Diuretics](#)
- Icacinac: plasma concentration of digoxin possibly increased by [Ivacaftor](#)
- Lenalidomide: plasma concentration of digoxin possibly increased by [Lenalidomide](#)
- Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by [Colistin](#) and [Col Streptomycin](#); plasma concentration of digoxin possibly increased by [Aторвастатин](#)
- Mirabegron: plasma concentration of digoxin increased by [Mirabegron](#) — reduced initial dose of digoxin
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with [Suxamethonium](#); possible increased risk of bradycardia when cardiac glycosides given with [Tizanidine](#)
- Penicillamine: plasma concentration of digoxin possibly reduced by [Penicillamine](#)
- Ranolazine: plasma concentration of digoxin increased by [Ranolazine](#)
- Sympathomimetics: avoidance of digoxin advised by manufacturer of [Midodrine](#)
- Sympathomimetics, Beta: plasma concentration of digoxin possibly reduced by [Salbutamol](#)
- Ticagrelor: plasma concentration of digoxin increased by [Ticagrelor](#)
- Tolvaptan: plasma concentration of digoxin increased by [Tolvaptan](#) (increased risk of toxicity)
- Ulcer-healing Drugs: plasma concentration of digoxin possibly increased by [Proton Pump Inhibitors](#); absorption of cardiac glycosides possibly reduced by [Sucralfate](#)
- Ulipristal: manufacturer of ulipristal advises give digoxin at least 1.5 hours before or after [Ulipristal](#)

**Carmustine**

- Antipsychotics: avoid concomitant use of cytoxics with [Clozapine](#) (increased risk of agranulocytosis)
- Cardiac Glycosides: cardustine possibly reduces absorption of [Digoxin](#) tablets
- Ulcer-healing Drugs: myelosuppressive effects of cardustine possibly enhanced by [Cimetidine](#)

**Carpe**tolol see Beta-blockers

**Carvedilol** see Beta-blockers

**Cephalosporins**

- Antimicrobial: plasma concentration of cephalosporin initially increased and then reduced by [Rifampicin](#) (consider increasing dose of cephalosporin)
- Antiepileptics: plasma concentration of cephalosporin possibly reduced by [Carbamazepine](#), [Fosphenytoin](#) and [Phenytoin](#) — consider increasing dose of cephalosporin
- Antivirals: plasma concentration of cephalosporin possibly reduced by [Efavirenz](#) and [Nevirapine](#) — consider increasing dose of cephalosporin

**Caspofungin** (continued)

- Ciclosporin: plasma concentration of caspofungin increased by [Ciclosporin](#) (manufacturer of caspofungin recommends monitoring liver enzymes)
- Corticosteroids: plasma concentration of caspofungin possibly reduced by [Dexamethasone](#) — consider increasing dose of caspofungin
- Tacrolimus: caspofungin reduces plasma concentration of [Tacrolimus](#)

**Catumaxomab**

- Antipsychotics: avoid concomitant use of cytoxics with [Clozapine](#) (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live [Vaccines](#) — avoid concomitant use

**Cefadroxil** see Cephalosporins

**Cefalexin** see Cephalosporins

**Cefixime** see Cephalosporins

**Cefotaxime** see Cephalosporins

**Ceftriaxone** see Cephalosporins

**Cefuroxime** see Cephalosporins

**Celecoxib** see NSAIDs

**Celiprolol** see Beta-blockers

**Cephalosporins**

- Antacids: absorption of cefalor reduced by [Antacids](#)
- Antibacterials: possible increased risk of nephrotoxicity when cephalosporins given with [Aminoglycosides](#)
- Anticoagulants: cephalosporins possibly enhance anticoagulant effect of [Coumarins](#)
- Teriflunomide: plasma concentration of cefalor increased by [Teriflunomide](#)
- Vaccines: antibacterials inactivate [Oral Typhoid Vaccine](#) — see under Typhoid Vaccine in BNF or NBFC

**Ceritinib**

- Analgesics: manufacturer of ceritinib advises avoid concomitant use with [Alfentanil](#) and [Fentanyl](#); possible increased risk of ventricular arrhythmias when ceritinib given with [Methadone](#) and [Disopyramide](#)
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when ceritinib given with [Amiodarone](#) and [Disopyramide](#)
- Antibacterials: possible increased risk of ventricular arrhythmias when ceritinib given with [Clarithromycin](#) and [Moxifloxacin](#); plasma concentration of ceritinib possibly reduced by [Rifabutin](#) — avoid concomitant use; plasma concentration of ceritinib reduced by [Rifampicin](#) — avoid concomitant use; plasma concentration of ceritinib possibly increased by [Telithromycin](#) — avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861)
- Anticoagulants: manufacturer of ceritinib advises avoid concomitant use with [Warfarin](#)
- Antidepressants: plasma concentration of ceritinib possibly reduced by [St John’s Wort](#) — avoid concomitant use
- Antiepileptics: plasma concentration of ceritinib possibly reduced by [Carbamazepine](#), [Fosphenytoin](#), [Phenobarbital](#), [Phenytoin](#) and [Primidone](#) — avoid concomitant use
- Antifungals: plasma concentration of ceritinib increased by [Ketoconazole](#) — avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); plasma concentration of ceritinib possibly increased by [Itraconazole](#), [Posaconazole](#) and [Voriconazole](#) — avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861)
- Antimalarials: possible increased risk of ventricular arrhythmias when ceritinib given with [Chloroquine](#)
- Antipsychotics: possible increased risk of ventricular arrhythmias when ceritinib given with [Droperidol](#) and [Haloperidol](#) — avoid concomitant use of cytoxics with...
Ceritinib
- Antipsychotics (continued)
  - **CLOzapine** (increased risk of agranulocytosis); manufacturer of ceritinib advises avoid concomitant use with PIMOZIDE
- Antivirals: plasma concentration of ceritinib possibly increased by **RITONAVIR** and **SAQUINAVIR**—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 86)
  - Ciclosporin: manufacturer of ceritinib advises avoid concomitant use with CICLOSPORIN
- Domperidone; possible increased risk of ventricular arrhythmias when ceritinib given with **DOMPERIDONE**
- Ergot Alkaloids: manufacturer of ceritinib advises avoid concomitant use with ERGOTAMINE
  - Grapefruit Juice: manufacturer of ceritinib advises avoid concomitant use with GRAPEFRUIT JUICE
  - Sirolimus: manufacturer of ceritinib advises avoid concomitant use with SIROLIMUS
  - Tacrolimus: manufacturer of ceritinib advises avoid concomitant use with TACROLIMUS
Cetilizumab pegol
- Abatacept: avoid concomitant use of cetilizumab pegol with **ABATACEPT**
- Anakinra: avoid concomitant use of cetilizumab pegol with **ANAKINRA**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use

Chloroquine (continued)
- Agalsidase Alfa and Beta: chloroquine possibly inhibits effects of AGALSIDASE ALFA AND ALFA (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
  - Antacids: absorb proton of chloroquine reduced by **ANTACIDS**
  - Anthelmintics: chloroquine reduces plasma concentration of **PRAZIQUANTEL**—consider increasing praziquantel dose when given for systemic infections
  - Antiarhythmics: increased risk of ventricular arrhythmias when chloroquine given with **AMIODARONE**—avoid concomitant use
  - Antibacterials: increased risk of ventricular arrhythmias when chloroquine given with **MOXIFLOXACIN**—avoid concomitant use
  - Antidepressants: possible increased risk of ventricular arrhythmias when chloroquine given with **DROPERIDOL**—avoid concomitant use

Chloramphenicol
- Antibacterials: metabolism of chloramphenicol accelerated by **RIFAMPICIN** (reduced plasma concentration)
  - Anticoagulants: chloramphenicol enhances anticoagulant effect of **COUMARINS**
  - Antidiabetics: chloramphenicol enhances effects of **SULFINPYRINE**
  - Anti-epileptics: chloramphenicol increases plasma concentration of **FOSPHENYTOIN** and **PHENOTIN** (increased risk of toxicity); metabolism of chloramphenicol possibly accelerated by **PHENOBARBITAL** and **PRIMIDONE** (reduced plasma concentration)
  - Antipsychotics: avoid concomitant use of chloramphenicol with **CLOzapine** (increased risk of agranulocytosis)
  - Ciclosporin: chloramphenicol possibly increases plasma concentration of **CICLOSPORIN**
  - Clopidogrel: chloramphenicol possibly reduces antiplatelet effect of **CLOPIDOGREL**
  - Guanfacine: when given with chloramphenicol manufacturer of GUANFACINE advises halve dose
  - Hydroxocobalamin: chloramphenicol reduces response to HYDROXOCOBALAMIN
  - Iron Salts: chloramphenicol possibly inhibits effects of **IRON SALTS**
  - Tacrolimus: chloramphenicol possibly increases plasma concentration of **TACROLIMUS**
  - Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Chlordiazepoxide see Anxiolytics and Hypnotics

Chlorpropionate
- Antibacterials: chlorpropionate possibly inhibits effects of **SULFONAMIDES** (manufacturer of chlorpropionate advises avoid concomitant use)

Chloroquine
- Adsorbents: absorption of chloroquine reduced by KAOLIN

Chloroplacine
- Antabuse: chloroplacine possibly inhibits effects of **NAPHTHOLS** (manufacturer of chloroplacine advises avoid concomitant use)
Ciclosporin

- Antibacterials: concentration of ciclosporin possibly reduced by:
  - SULFAZIDINE; increased risk of nephrotoxicity when ciclosporin given with:
  - AMINOLGICOSIDES, POLYMYXINS, QUINOLONES, SULFONAMIDES or VANCOMYCIN; plasma concentration of ciclosporin possibly increased by:
  - CHLORAMPHENICOL and TETRITHROMYCIN; increased risk of myopathy when ciclosporin given with:
  - DAPTOMYCIN (preferably avoid concomitant use); avoidance of ciclosporin advised by manufacturer of FIDAXOMICIN; metabolism of ciclosporin possibly inhibited by:
  - MACROLIDES; increased plasma concentration; ciclosporin increases plasma concentration of:
  - RIFAMICIN; increased risk of nephrotoxicity when ciclosporin given with:
  - TRIMETHOPRIM, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Anticoagulants: ciclosporin possibly increases plasma concentration of:
  - DABIGATRAN — manufacturer of dabigatran advises avoid concomitant use; ciclosporin increases plasma concentration of:
  - EDOXABAN (reduce dose of edoxaban — see under Edoxaban, p. 118)
- Antidepressants: plasma concentration of ciclosporin reduced by:
  - ST JOHN'S WORT — avoid concomitant use
- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of REPAGLITINIDE
- Antiepileptics: metabolism of ciclosporin accelerated by:
  - CARBAMAZEPINE, FOSPHENYTIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by:
  - DXCABAZEPINE
- Antiinflamnals: metabolism of ciclosporin inhibited by:
  - FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE, POSaconazole and VORICONAZOLE (increased plasma concentration); metabolism of ciclosporin possibly inhibited by:
  - MICANOZOLE (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with:
  - AMPHOTERICIN; plasma concentration of ciclosporin increased by:
  - ISAVONAZOLE; ciclosporin increases plasma concentration of:
  - CASPOFUNGIN (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by:
  - GRISOFULVIN and TERBINAFINE; ciclosporin concentration of ciclosporin possibly increased by:
  - MICAFUNGIN
- Antimalarials: plasma concentration of ciclosporin increased by:
  - CHLOROQUINE and HYDROXYCHLOROQUINE (increased risk of toxicity)
- Antimuscarnics: avoidance of ciclosporin advised by manufacturer of:
  - DARIFENACIN
- Antibacterials: increased risk of nephrotoxicity when ciclosporin given with:
  - ACICLOVIR or VALACLOVIR; plasma concentration of ciclosporin possibly increased by:
  - ATAZANAVIR and RITONAVIR; plasma concentration of ciclosporin increased by:
  - BOCEPREVIR, FOSAMPRENARVIR and INIDINAVIR; plasma concentration of ciclosporin possibly reduced by:
  - EFAVIRENZ; plasma concentration of both drugs increased when ciclosporin given with:
  - SACAQINAVIR; plasma concentration of both drugs increased when ciclosporin given with:
  - TELAPREVIR (reduce dose of ciclosporin)
- Beta-blockers: plasma concentration of ciclosporin increased by:
  - CARVEDIOL
- Bile Acids: avoidance of ciclosporin advised by manufacturer of:
  - CHOLIC ACID; absorption of ciclosporin increased by:
  - URSODEOXYCHOLIC ACID
- Bosentan: ciclosporin increases plasma concentration of:
  - BOSENTAN (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with:
  - LERCANDIPINE may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by:
  - DILTIAZEM, NICARDIPINE and VERAPAMIL; ciclosporin possibly increases plasma concentration of:
  - NIFEDIPINE (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of:
  - DIGOXIN (increased risk of toxicity)

Ciclosporin (continued)

- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with:
  - COLCHICINE — suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose:
  - METHYLPREDNISOLONE (risk of convulsions); ciclosporin increases plasma concentration of:
  - PRENISOLONE
- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with:
  - MELPHALAN; increased risk of neurotoxicity when ciclosporin given with:
  - DOXORUBICIN; ciclosporin increases plasma concentration of:
  - EPIRUBICIN and IDARUBICIN; ciclosporin reduces excretion of:
  - MITOXANTRONE (increased plasma concentration); risk of toxicity when ciclosporin given with:
  - METHOTREXATE; ciclosporin possibly increases the plasma concentration of:
  - AFATINIB — manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; avoidance of ciclosporin advised by manufacturer of:
  - CERITINIB; caution with ciclosporin advised by manufacturer of:
  - CRIZOTINIB; ciclosporin increases plasma concentration of:
  - EVEROLIMUS (consider reducing the dose of everolimus — consult everolimus product literature); plasma concentration of ciclosporin possibly increased by:
  - IMATINIB; in vitro studies suggest a possible interaction between ciclosporin and:
  - DOXETAXEL (consult doxetaxel product literature); ciclosporin possibly increases plasma concentration of:
  - ETOPOSIDE (increased risk of toxicity)
- Dexamethasone: increased risk of immunosuppression with ciclosporin advised by manufacturer of:
  - DEXRAXOZANE
- Diuretics: plasma concentration of ciclosporin possibly increased by:
  - ACETAZOLAMIDE; increased risk of hyperkalaemia when ciclosporin given with:
  - ALDOSTERONE ANTAGONISTS or POTASSIUM-SPARING DIURETICS; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with:
  - THIAZIDES AND RELATED DIURETICS
- Grapefruit Juice: plasma concentration of ciclosporin increased by:
  - GRAPEFRUIT JUICE (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by:
  - GALANZOL (increased plasma concentration); plasma concentration of ciclosporin reduced by:
  - LAMOTRIGINE and OXCARBAZEPINE; increased risk of nephrotoxicity when ciclosporin given with:
  - PASIREOTIDE
- Lenalidomide: ciclosporin possibly increases plasma concentration of:
  - LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by:
  - COLESSELAM; increased risk of renal impairment when ciclosporin given with:
  - BEZAFIBRATE or FENOFLIBRATE; increased risk of myopathy when ciclosporin given with:
  - ATORVASTATIN (see under Atorvastatin, p. 191); increased risk of myopathy when ciclosporin given with:
  - FLUVASTATIN or PRAVASTATIN; increased risk of myopathy when ciclosporin given with:
  - ROSUVASTATIN or SIMVASTATIN (avoid concomitant use); plasma concentration of both drugs may increase when ciclosporin given with:
  - EZETIMIBE; separating administration from ciclosporin by 12 hours advised by manufacturer of:
  - LOMITAPIDE
- Lumacaftor: avoidance of ciclosporin advised by manufacturer of:
  - LUMACTAUR
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with:
  - MANNITOL
- Metoclopimamide: plasma concentration of ciclosporin increased by:
  - METOCLOPRAMIDE
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of:
  - MIFAMURTIDE
- Modafinil: plasma concentration of ciclosporin reduced by:
  - MODAFINIL
- Oestrogens: plasma concentration of ciclosporin possibly increased by:
  - OESTROGENS
- Orlistat: absorption of ciclosporin possibly reduced by:
  - ORLISTAT
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with:
  - POTASSIUM SALTS
- Progestogens: plasma concentration of ciclosporin possibly increased by:
  - PROGESTOGENS
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with:
  - RANOLAZINE

Interactions

Appendix 1

BNF 73

Ciclosporin — Ciclosporin 1257
Clonidine (continued)

- Adrenergic Neurone Blockers: enhanced hypotensive effect when clonidine given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when clonidine given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when clonidine given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when clonidine given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when clonidine given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of clonidine antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when clonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIS; hypotensive effect of clonidine possibly antagonised by MIRTAZAPINE; hypotensive effect of clonidine antagonised by TRICYCLICS, also increased risk of hypertension on clonidine withdrawal
- Antipsychotics: enhanced hypotensive effect when clonidine given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when clonidine given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with BETA-BLOCKERS (withdraw beta-blockers several days before slowly withdrawing clonidine)
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with CALCIUM-CHANNEL BLOCKERS
- Corticosteroids: hypotensive effect of clonidine antagonised by CORTICOSTEROIDS
- Cytoxics: possible increased risk of bradycardia when clonidine given with CRIZOTINIB
- Diazoxide: enhanced hypotensive effect when clonidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when clonidine given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when clonidine given with DOPAMINE
- Oestrogens: hypotensive effect of clonidine antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when clonidine given with ALPROSTADIL
- Sympathomimetcs: possible risk of hypertension when clonidine given with ADRENALINE (EPINEPHRINE) or NORADEXALINE (NOREPINEPHRINE); serious adverse events reported with concomitant use of clonidine and METHYLPHENIDATE (causality not established)
- Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSIDE

Clopidogrel

- Analgesics: increased risk of bleeding when clopidogrel given with NSAIDS or ASPIRIN
- Antibacterials: antiplatelet effect of clopidogrel possibly reduced by CHLORAMPHENICOL, CIPROFLOXACIN and ERYTHROMYCIN
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with WARFARIN; antiplatelet action of clopidogrel enhances anticoagulant effect of COUMARINS and PHENINDIONE; increased risk of bleeding when clopidogrel given with HEPARINS

Clindamycin

- Adverse effects: Clindamycin increases plasma concentration of SIROLIMUS
- Sulfonpyrazone: plasma concentration of clindamycin possibly reduced by SULFONPYRAZONE
- Tacrolimus: plasma concentration of clindamycin increased by TACROLIMUS (increased risk of nephrotoxicity)—avoid concomitant use
- Ticagrelor: clopidogrel increases plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of clindamycin possibly increased by Cimetidine; plasma concentration of clindamycin possibly affected by Omeprazole
- Vitamins: plasma concentration of clindamycin possibly affected by VITAMIN E

Clonazepam

- Anxiolytics and Hypnotics
- Antidepressants, SSRI
- Antihistamines
- Histamine: avoid concomitant use of clonidine with Antiplatelet action of clopidogrel possibly reduced by CHLORAMPHENICOL, CIPROFLOXACIN and ERYTHROMYCIN
Clozapine see Co-amoxiclav

▶ Memantine:

▶ Iron Salts:

▶ Diuretics:

▶ Clonidine:

▶ Calcium-channel Blockers:

▶ Anxiolytics and Hypnotics:

▶ Antimuscarinics:

▶ Antidepressants:

▶ Alpha-blockers:

▶ Adrenergic Neurone Blockers:

▶ Ulcer-healing Drugs: clopidogrel

ANTAGONISTS after stopping MAOIs; increased risk of side-effects when co-given with beneldopa when given with

enhanced hypotensive effect when co-beneldopa given with

increased risk of side-effects when co-beneldopa given with

absorption of co-beneldopa possibly reduced

risk of hypertensive crisis when co-beneldopa given with

ISONIAZID

Antidepressants: risk of hypertensive crisis when co-beneldopa given with MAOIs; increased risk of side-effects when co-beneldopa given with moclobemide

Antiepileptics: effects of co-beneldopa possibly reduced by fosphenytoin and phenytoin

Antimuscarinics: absorption of co-beneldopa possibly reduced by antimuscarinics

Antipsychotics: effects of co-beneldopa antagonised by antipsychotics; avoidance of co-beneldopa advised by manufacturer of amisulpride (agonist of effect)

Anxiolytics and Hypnotics: effects of co-beneldopa possibly antagonised by benzodiazepines

Beta-blockers: enhanced hypotensive effect when co-beneldopa given with beta-blockers

Bupropion: increased risk of side-effects when co-beneldopa given with bupropion

Calcium-channel Blockers: enhanced hypotensive effect when co-beneldopa given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when co-beneldopa given with clonidine

Diazoxide: enhanced hypotensive effect when co-beneldopa given with diazoxide

Diuretics: enhanced hypotensive effect when co-beneldopa given with diuretics

Dopaminergics: enhanced effects and increased toxicity of co-beneldopa when given with selegiline (reduce dose of co-beneldopa)

Iron Salts: absorption of co-beneldopa possibly reduced by oral iron salts

Mecamylamine: effects of dopaminergics possibly enhanced by mecamylamine

Methyldopa: enhanced hypotensive effect when co-beneldopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa

Clopidogrel (continued) All interactions are described below. 

Clopidogrel (continued) Antidepressants: antplatelet effect of clopidogrel possibly reduced by fluoxetine, fluvoxamine and moclobemide

Antiepileptics: antplatelet effect of clopidogrel possibly reduced by carbamazepine and oxcarbazepine

Antifungals: antplatelet effect of clopidogrel possibly reduced by fluconazole, itraconazole, ketoconazole and voriconazole

Antivirals: antplatelet effect of clopidogrel possibly reduced by etravirine

Dipyriramole: increased risk of bleeding when clopidogrel given with dipyriramole

Iloprost: increased risk of bleeding when clopidogrel given with iloprost

Lipid-regulating Drugs: clopidogrel increases plasma concentration of rosuvastatin — adjust dose of rosuvastatin (consult product literature)

Prasugrel: possible increased risk of bleeding when clopidogrel given with prasugrel

Ulcer-healing Drugs: clopidogrel increases plasma concentration of omeprazole and esomeprazole

Clotrimazole see Antifungals, imidazole

Clozapine see Antipsychotics

Co-amoxiclav see Penicillins

Co-beneldopa ▶ ACE Inhibitors: enhanced hypotensive effect when co-beneldopa given with ACE INHIBITORS

Adrenergic Neurone Blockers: enhanced hypotensive effect when co-beneldopa given with adrenergic neurone blockers

Alpha-blockers: enhanced hypotensive effect when co-beneldopa given with alpha-blockers

Anaesthetics, General: increased risk of arrhythmias when co-beneldopa given with volatile liquid general anaesthetics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when co-beneldopa given with angiotensin-II receptor antagonists

Redbloodcell: effects of co-beneldopa possibly reduced by isoniazid

Antidepressants: risk of hypertensive crisis when co-beneldopa given with madopar, avoid co-beneldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-beneldopa given with moclobemide

Antiepileptics: effects of co-beneldopa possibly reduced by fosphenytoin and phenytoin

Pharmacokinetic Interactions: absorption of co-beneldopa possibly reduced by antimuscarinics

Antipsychotics: effects of co-beneldopa antagonised by antipsychotics; avoidance of co-beneldopa advised by manufacturer of amisulpride (agonist of effect)

Anxiolytics and Hypnotics: effects of co-beneldopa possibly antagonised by benzodiazepines

Beta-blockers: enhanced hypotensive effect when co-beneldopa given with beta-blockers

Bupropion: increased risk of side-effects when co-beneldopa given with bupropion

Calcium-channel Blockers: enhanced hypotensive effect when co-beneldopa given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when co-beneldopa given with clonidine

Diazoxide: enhanced hypotensive effect when co-beneldopa given with diazoxide

Diuretics: enhanced hypotensive effect when co-beneldopa given with diuretics

Dopaminergics: enhanced effects and increased toxicity of co-beneldopa when given with selegiline (reduce dose of co-beneldopa)

Iron Salts: absorption of co-beneldopa possibly reduced by oral iron salts

Mecamylamine: effects of dopaminergics possibly enhanced by mecamylamine

Methyldopa: enhanced hypotensive effect when co-beneldopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa

Co-beneldopa (continued) ▶ Moxonidine: enhanced hypotensive effect when co-beneldopa given with moxonidine

Muscle Relaxants: possible agitation, confusion and hallucinations when co-beneldopa given with baclofen

Nitrates: enhanced hypotensive effect when co-beneldopa given with nitrates

Vasodilator Antihypertensives: enhanced hypotensive effect when co-beneldopa given with hydralazine, minoxidil or sodium nitroprusside

Cobicistat • Alpha-blockers: cobicistat possibly increases plasma concentration of alfuzosin — manufacturer of cobicistat advises avoid concomitant use

Anti-arrhythmics: cobicistat possibly increases plasma concentration of amiodarone — manufacturer of cobicistat advises avoid concomitant use

Antiinfectives: cobicistat possibly increases plasma concentration of rifabutin (adjust dose — consult product literature); plasma concentration of cobicistat possibly reduced by rifampicin — manufacturer of cobicistat advises avoid concomitant use

Anticoagulants: avoidance of cobicistat advised by manufacturer of apixaban; cobicistat possibly enhances anticoagulant effect of rivaroxaban — avoid concomitant use

Antidepressants: plasma concentration of cobicistat possibly reduced by st john’s wort — manufacturer of cobicistat advises avoid concomitant use

Antiepileptics: plasma concentration of cobicistat possibly reduced by carbamazepine, fosphenytoin, phenobarbital and primidone — manufacturer of cobicistat advises avoid concomitant use

Antifungals: cobicistat possibly increases plasma concentration of itraconazole and ketoconazole — manufacturer of cobicistat advises reduce dose of itraconazole and ketoconazole

Antipsychotics: cobicistat possibly increases plasma concentration of lurasidone — avoid concomitant use; cobicistat possibly increases plasma concentration of pimozide — manufacturer of cobicistat advises avoid concomitant use

Antivirals: manufacturer of cobicistat advises avoid concomitant use with boceprevir and ritonavir; cobicistat possibly increases the plasma concentration of daclatasvir — reduce dose of daclatasvir (see under daclatasvir, p. 577); avoidance of cobicistat advised by manufacturer of dasabuvir, nevirapine, ombitasvir and paritaprevir; cobicistat possibly increases plasma concentration of maraviroc (reduce dose of maraviroc); cobicistat possibly increases plasma concentration of simprevir — manufacturer of simprevir advises avoid concomitant use; plasma concentration of both drugs reduced when cobicistat given with tipranavir (avoid concomitant use)

Anxiolytics and Hypnotics: manufacturer of cobicistat advises avoid concomitant use with oral midazolam

Avanafil: cobicistat possibly increases plasma concentration of avanafil — avoid concomitant use

Boventan: manufacturer of cobicistat advises avoid concomitant use with boventan

Cardiac Glycosides: cobicistat possibly increases plasma concentration of digoxin — reduce initial dose of digoxin

Cytotoxics: cobicistat possibly increases the plasma concentration of ibritinib — reduce dose of ibritinib (see under ibritinib, p. 867); cobicistat possibly increases plasma concentration of olaparib (avoid concomitant use or reduce dose of olaparib — see under olaparib, p. 881)

Dorperidone: possible increased risk of venricular arrhythmias when cobicistat given with domperidone — avoid concomitant use

Ergot Alkaloids: cobicistat possibly increases plasma concentration of ergot alkaloids — manufacturer of cobicistat advises avoid concomitant use

Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of atorvastatin — manufacturer of cobicistat
Cobicistat

- Lipid-regulating Drugs: co-careldopa given with Cobicistat increases plasma concentration of NORGESTIMATE.
- Sildenafil: co-careldopa given with Cobicistat increases plasma concentration of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature.
- Sympathomimetics, Beta2: manufacturer of cobicistat avoids concomitant use with SALMETEROL.
- Tadalafil: manufacturer of cobicistat advises avoid concomitant use with antidepressants, anticoagulants, anticonvulsants, calcium channel blockers, combination products, cyclosporin, dopamine agonists, dopamine antagonists, dopaminergics, fluoxetine, interferon beta, ketoconazole, lurasidone, milnacipran, moclobemide, nortriptyline, paroxetine, quetiapine, TCAs.
- Vardenafil: manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature).
- Vardenafil: manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature).
- Alpha-blockers: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Alpha-blockers: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Beta-blockers: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Beta-blockers: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Clonidine: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Diazoxide: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Diuretics: enhanced hypertensive effect when co-careldopa given with Cobicistat advised.
- Dopaminergics: enhanced effects and increased toxicity of co-careldopa when given with Cobicistat advised.
- Iron Salts: absorption of co-careldopa possibly reduced by oral IRON SALTS.
- Memantine: effects of dopamineergics possibly enhanced by Memantine.
- Methyldopa: enhanced hypertensive effect when co-careldopa given with Methyldopa; antiparkinsonian effect of dopamineergics antagonised by Methyldopa.
- Muscle Relaxants: possible agitation, confusion and hallucinations when co-careldopa given with Baclofen.

Colestipol

- Antidiabetics: canagliflozin and dapagliflozin (give at least 4 hours apart).
- Calcium channel blockers: possible increased risk of myopathy when given with Fosphenytoin and Phenytoin.
- Antiepileptics: effects of co-careldopa possibly reduced by Phenytoin.
- Antidepressants: risk of hypertensive crisis when co-careldopa given with MAOIs, avoid co-careldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-careldopa given with moclobemide.
- Antipsychotics: effects of co-careldopa possibly antagonised by Benzodiazepines.
- Beta-blockers: enhanced hypertensive effect when co-careldopa given with Beta-blockers.
- Bupropion: increased risk of side-effects when co-careldopa given with Bupropion.
- Calcium channel blockers: enhanced hypertensive effect when co-careldopa given with Calcium-channel blockers.
- Cholecalciferol see Vitamins.
- Colesevelam

- Antidiabetics: colesevelam reduces absorption of Glimepiride and Glipizide; colesevelam reduces absorption of Glimepiride—manufacturer of glimepiride advises given at least 4 hours before colchicine; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before Canagliflozin.
- Antiepileptics: colesevelam possibly reduces absorption of Fosphenytoin and Phenytoin.
- Bile Acids: colesevelam probabaly reduces effects of Cholic Acid (manufacturer of cholic acid advises give at least 5 hours apart).
- Calcium channel blockers: possible increased risk of myopathy when given with Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of Lomitapide (give at least 4 hours apart).
- Colesevelam

- Other drugs should be taken at least 4 hours before or after colesevelam to reduce possible interference with absorption.

Colestipol

- Note other drugs should be taken at least 1 hour before or 4–6 hours after colesevelam to reduce possible interference with absorption.
- Antidiabetics: colesevelam reduces absorption of Cholic Acid (manufacturer of cholic acid advises give at least 5 hours apart).
- Bile Acids: colesevelam possibly reduces absorption of Bile Acids; colesevelam probably reduces effects of Cholic Acid (manufacturer of cholic acid advises give at least 5 hours apart).
Colestipol — Corticosteroids 1261

Corticosteroids (continued)
- Anthelmintics: dexamethasone increases plasma concentration of active metabolite of ALBENDAZOLE; continuous use of dexamethasone possibly reduces plasma concentration of ALBENDAZOLE.
- Anticholinergics: plasma concentration of methylprednisolone possibly increased by CLARITHROMYCIN; metabolism of corticosteroids possibly inhibited by ERYTHROMYCIN; metabolism of methylprednisolone inhibited by ERYTHROMYCIN; corticosteroids possibly reduce plasma concentration of ISONIAZID; metabolism of corticosteroids accelerated by rifampicin (reduced effect).
- Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of coumarins (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of phenindione.
- Antiangiotics: corticosteroids antagonise hypoglycaemic effect of antidiabetics.
- Antiepileptics: metabolism of corticosteroids accelerated by gabapentin, lamotrigine, phenytoin, primidone (reduced effect).
- Antifungals: metabolism of corticosteroids possibly inhibited by itraconazole and ketoconazole; plasma concentration of active metabolite of ciclosporine increased by ketoconazole; plasma concentration of intranasal mometasone increased by ketoconazole; plasma concentration of intranasal and oral (and possibly also intranasal and rectal) budesonide increased by itraconazole and ketoconazole; plasma concentration of fluticasone increased by itraconazole; metabolism of methylprednisolone inhibited by ketoconazole; increased risk of hypokalaemia when corticosteroids given with amphotericin — avoid unless drug concomitant use unless corticosteroids needed to control reactions; plasma concentration of intranasal fluticasone increased by itraconazole; metabolism of methylprednisolone possibly inhibited by itraconazole; dexamethasone possibly reduces plasma concentration of caspofungin — consider increasing dose of caspofungin.
- Antivirals: dexamethasone possibly reduces plasma concentration of daclatasvir and simprevir — manufacturer of daclatasvir and simprevir advises avoid concomitant use; dexamethasone possibly reduces plasma concentration of indinavir, lopinavir, saquinavir and telaprevir; avoidance of dexamethasone (except when given as a single dose) advised by manufacturer of rilpivirine; plasma concentration of budesonide (including intranasal, intranasal, and rectal budesonide) possibly increased by ritonavir — increased risk of adrenal suppression; plasma concentration of corticosteroids possibly increased by ritonavir — increased risk of adrenal suppression; plasma concentration of triamcinolone injection increased by ritonavir — increased risk of adrenal suppression; plasma concentration of intranasal and intranasal fluticasone increased by ritonavir — increased risk of adrenal suppression; plasma concentration of intranasal and intranasal budesonide and fluticasone possibly increased by telaprevir.
- Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by aprepitant (reduce dose of dexamethasone and methylprednisolone).
- Beta-blockers: corticosteroids antagonise hypotensive effect of beta-blockers.
- Calcium salts: corticosteroids reduce absorption of calcium salts.
- Calcium-channel blockers: corticosteroids antagonise hypotensive effect of calcium-channel blockers; plasma concentration of methylprednisolone increased by diltiazem.
- Cardiac glycosides: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides.
- Ciclosporin: high-dose methylprednisolone increases plasma concentration of ciclosporin (risk of convulsions); plasma concentration of prednisolone increased by ciclosporin.
- Clonidine: corticosteroids antagonise hypotensive effect of clonidine.
- Cytotoxics: possible increased risk of hepatotoxicity when dexamethasone given with high-dose methotrexate; dexamethasone possibly decreases plasma concentration of...
Corticosteroids — Coumarins

Corticosteroids
Cytoxics (continued)
AXITINIB (increase dose of axitinib—consult axitinib product literature); dexamethasone possibly reduces plasma concentration of CABOZANTINIB—manufacturer of cabozantinib advises avoid concomitant use
• Diazoxide; corticosteroids antagonise hypothensive effect of DIAZoxide
• Diuretics: corticosteroids antagonise diuretic effect of DIURETICS; increased risk of hypokalaemia when corticosteroids given with ACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS
• Fosaprepitant: metabolism of dexamethasone and methylprednisolone inhibited by FOSAPREPITANT (reduce dose of dexamethasone and methylprednisolone)
• Grapefruit Juice: plasma concentration of oral budesonide increased by GRAPEFRUIT JUICE—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
• Histamine: avoidance of corticosteroids advised by manufacturer of HISTAMINE
• Methylprednisolone: corticosteroids antagonise hypothensive effect of METHYLPREDNISOLONE
• Mifepristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after MIFEPRISTONE
• Moxonidine: corticosteroids antagonise hypothensive effect of MOXONIDINE
• Muscle Relaxants: corticosteroids possibly antagonise effects of PANCURONIUM and VEкрыRONIUM
• Netupitant: plasma concentration of dexamethasone increased by NETUPITANT (halve dose of dexamethasone)
• Niconardil: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NICORANDIL
• Nitrates: corticosteroids antagonise hypothensive effect of NITRATES
• Oestrogens: plasma concentration of corticosteroids increased by oral contraceptive containing OESTROGENS
• Panobinostat: dexamethasone reduces plasma concentration of PANOBINOSTAT
• Sodium Benzoate: corticosteroids possibly reduce effects of SODIUM BENZOATE
• Sodium Phenylbutyrate: corticosteroids possibly reduce effects of SODIUM PHENYL BUTYRATE
• Somatropin: corticosteroids may inhibit growth-promoting effect of SOMATROPIN
• Symptomimetics: metabolism of dexamethasone accelerated by EPHEDRINE; possible risk of hypertension when corticosteroids given with MIDODRINE
• Symptomimetics, Beta₂: increased risk of hypokalaemia when corticosteroids given with high doses of BETA₂ SYMPTOMIMETICS
• Theophylline: increased risk of hypokalaemia when corticosteroids given with THEOPHYLLINE
• Vaccines: high doses of corticosteroids impair immune response to VACCINES—avoid concomitant use with live vaccines
• Vasodilator Antihypertensives: corticosteroids antagonise hypothensive effect of HYDRALAZINE, MINOXIDIL and SODIUM NITROPRUSSIDE

Co-trimoxazole see Trimethoprim and Sulfamethoxazole

Coumarins
NOTE Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
• Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of ALCOHOL
• Allopurinol: anticoagulant effect of coumarins possibly enhanced by ALLOPURINOL
• Anabolic Steroids: anticoagulant effect of coumarins enhanced by ANABOLIC STEROIDS

Coumarins (continued)
• Analgesics: anticoagulant effect of coumarins possibly enhanced by NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ETOROLAC (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by TRAMADOL; increased risk of bleeding when coumarins given with ASPIRIN (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of PARACETAMOL

Antihelminths: anticoagulant effect of coumarins possibly enhanced by IVERMECTIN; anticoagulant effect of warfarin possibly enhanced by LEVAMISOLE
• Anti-arrhythmics: metabolism of coumarins inhibited by AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of warfarin may be enhanced or reduced by DISOPYRAMIDE; anticoagulant effect of coumarins possibly enhanced by DRONEDARONE; anticoagulant effect of coumarins enhanced by PROPafenONE

Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with NEOMYCIN (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by AZITHROMYCIN, AZTREONAM, CEPHALOSPORINS, CIPROFLOXACIN, LEVOFLOXACIN, TETRACYCLINES, TIGECYCLINE and TRIMETHOPRIM; anticoagulant effect of coumarins enhanced by CHLORAMPHENICOL, CLARITHROMYCIN, ERYTHROMYCIN, METRONIDAZOLE, NALIDIXIC ACID, NORFLOXACIN, OFLOXACIN and SULFONAMIDES; plasma concentration of warfarin possibly increased by ORITAVANCIN; an interaction between coumarins and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of coumarins accelerated by RIFAMYCINS (reduced anticoagulant effect); anticoagulant effect of warfarin possibly reduced by RIFAXIMIN

Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DABIGATRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
• Antidepressants: anticoagulant effect of warfarin possibly enhanced by VENLAFAXINE; anticoagulant effect of warfarin may be enhanced or reduced by TRAZODONE; anticoagulant effect of coumarins possibly enhanced by SSRI'S; anticoagulant effect of coumarins reduced by ST JOHN’S WORT (avoid concomitant use); anticoagulant effect of warfarin enhanced by MIRTAZAPINE; anticoagulant effect of coumarins may be enhanced or reduced by TRICYCLICS

Antidiabetics: anticoagulant effect of warfarin possibly enhanced by EXENATIDE; coumarins possibly enhance hypoglycaemic effect of SULFONYLUREAS, also possible changes to anticoagulant effect
• Antiepileptics: metabolism of coumarins accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced anticoagulant effect); plasma concentration of warfarin reduced by ESICARBAZEPINE; metabolism of coumarins accelerated by FOSPHENOTIN and PHENOTIN (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by SODIUM VALPROATE and VALPROIC ACID

Antifungals: anticoagulant effect of coumarins enhanced by FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE; anticoagulant effect of coumarins greatly enhanced by MICANAZOLE (including oral gel and possibly vaginal and topical formulations)—avoid concomitant use if possible; anticoagulant effect of coumarins reduced by GRISEOFULVIN
• Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by PROGUANIL; plasma concentration of both drugs increased when warfarin given with QUININE
• Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by ATAZANAVIR, NEVIRAPINE and RITONAVIR; plasma concentration of both drugs increased when warfarin given with
Interactions | Appendix 1

**Cumarins**
- Antivirals (continued)
  - concentration of cumarins possibly affected by EFAVIREN,
  - anticoagulant effect of cumarins may be enhanced or reduced by FOSAMPRENAVIR
  - anticoagulant effect of cumarins possibly enhanced by RITONAVIR
  - anticoagulant effect of warfarin possibly enhanced by SAQUINAVIR
  - plasma concentration of warfarin possibly affected by TELAPRE
  - Anxiolytics and Hypnotics: anticoagulant effect of cumarins may transiently be enhanced by CHLORAL
  - Aprepitant: anticoagulant effect of warfarin possibly reduced by APREPI
  - Azathioprine: anticoagulant effect of acenocoumarol possibly enhanced by AZATHIOPRINE
  - anticoagulant effect of warfarin reduced by AZATHIOPRINE
  - Bosentan: monitoring anticoagulant effect of cumarins recommended by manufacturer of BOSENTAN
  - Carbimazole: anticoagulant effect of cumarins possibly enhanced by CARBIMAZOLE
  - Clopidogrel: anticoagulant effect of cumarins enhanced due to antiplatelet action of CLOPIDOGREL
  - Enteral Feeds: anticoagulant effect of cumarins may be enhanced or reduced by CORTICOSTEROIDS (high-dose corticosteroids enhance anticoagulant effect)
  - Cranberry Juice: anticoagulant effect of cumarins possibly enhanced by CRANBERRY JUICE
  - Cytoxotics: anticoagulant effect of cumarins possibly enhanced by ETOPOSIDE, IFOSFAMIDE and SORAFENIB
  - anticoagulant effect of cumarins enhanced by CAPECITABINE, FLUPROURACIL and TEGAFUR: anticoagulant effect of warfarin possibly enhanced by GEPITINIB, GEMCITABINE and VEMURAFENIB: anticoagulant effect of cumarins possibly reduced by MERCAPTOPURINE and MITOTANE: avoidance of warfarin advised by manufacturer of CERITINIB: plasma concentration of warfarin reduced by DABRAFENIB: increased risk of bleeding when cuminars given with ERLOTINIB: avoidance of warfarin advised by manufacturer of IBRUTINIB: replacement of warfarin with a heparin advised by manufacturer of IMATINIB (possibility of enhanced warfarin effect): increased risk of bleeding when warfarin given with REGORAFENIB
  - Dipryidamole: anticoagulant effect of cumarins enhanced due to antiplatelet action of DIPYRIDAMOLE
  - Disulfiram: anticoagulant effect of cumarins enhanced by DISULFIRAM
  - Dopaminergics: anticoagulant effect of warfarin enhanced by ENTACONE
  - Enteral Feeds: anticoagulant effect of cumarins antagonised by vitamin K (present in some ENTERAL FEEDS)
  - Fosaprepitant: anticoagulant effect of warfarin possibly reduced by FOSAPREPI
  - Glucosamine: anticoagulant effect of warfarin enhanced by GLUCOSAMINE (avoid concomitant use)
  - Hormone Antagonists: anticoagulant effect of cumarins possibly enhanced by BICALUTAMIDE and TROPEMIFENE
  - metabolism of cumarins inhibited by DANAZOL (enhanced anticoagulant effect): plasma concentration of cumarins possibly reduced by ENZALUTAMIDE: anticoagulant effect of cumarins enhanced by FLUTAMIDE and TAMOXIFEN
  - Ilprost: anticoagulant effect of cumarins possibly enhanced by ILPROST
  - Lactulose: anticoagulant effect of cumarins possibly enhanced by LACTULOSE
  - Leflunomide: anticoagulant effect of warfarin possibly enhanced by LEFLUNOMIDE
  - Levoketiene Receptor Antagonists: anticoagulant effect of warfarin enhanced by ZAFIRLUKAST
  - Levocarnitine: anticoagulant effect of cumarins possibly enhanced by LEVOCAR
  - Lipid-regulating Drugs: anticoagulant effect of cumarins may be enhanced or reduced by COLESTYRAMINE: anticoagulant effect of warfarin may be transiently reduced by ATORVASTATIN: anticoagulant effect of cumarins enhanced by FIBRATES and FLUVASTATIN: anticoagulant effect of cumarins possibly enhanced by EZETIMIBE

**Cumarins**
- Lipid-regulating Drugs (continued)
  - RosuVASTATIN: anticoagulant effect of cumarins can be enhanced by SIMVASTATIN: anticoagulant effect of warfarin possibly enhanced by LOMITAPIDE
  - Memantine: anticoagulant effect of warfarin possibly enhanced by MEMANTINE
  - Oestrogens: anticoagulant effect of cumarins may be enhanced or reduced by OESTROGENS
  - Orlstat: monitoring anticoagulant effect of cumarins recommended by manufacturer of ORLISTAT
  - Prasugrel: possible increased risk of bleeding when cumarins given with PRASUGREL
  - Protogestogens: anticoagulant effect of cumarins may be enhanced or reduced by PROGESTOGENS
  - Raloxifene: anticoagulant effect of cumarins antagonised by RALOXIFENE
  - Retinooids: anticoagulant effect of cumarins possibly reduced by ACITRETIN
  - Sulfipyrazone: anticoagulant effect of cumarins enhanced by SULFINDPAZONE
  - Sympathomimetics: anticoagulant effect of cumarins possibly enhanced by METHYLPHENIDATE
  - Testolactone: anticoagulant effect of cumarins enhanced by TESTOLACTONE
  - Testosterone: anticoagulant effect of cumarins enhanced by TESTOSTERONE
  - Thyroid Hormones: anticoagulant effect of cumarins enhanced by THYROID HORMONES
  - Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by UBIDECARENONE
  - Ulcer-healing Drugs: metabolism of cumarins inhibited by CIMITIDINE (enhanced anticoagulant effect): anticoagulant effect of cumarins possibly enhanced by ESOMEPRAZOLE and OMEPRAZOLE: anticoagulant effect of cumarins might be enhanced by PANTOPRAZOLE: absorption of cumarins possibly reduced by SUCRALFATE (reduced anticoagulant effect)
  - Vaccines: anticoagulant effect of warfarin possibly enhanced by INFLUENZA VACCINE
  - Vitamins: anticoagulant effect of cumarins possibly enhanced by VITAMIN E: anticoagulant effect of cumarins antagonised by VITAMIN K

**Cranberry Juice**
- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of CUMARINS—avoid concomitant use

**Crizotinib**
- Analogics: manufacturer of crizotinib advises caution with ALFENTANIL and FENTANYL
- Antibacterials: plasma concentration of crizotinib possibly increased by CLARITHROMYCIN and TLTHROMYCIN—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by RIFAPUTIN—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by RIFAMPICIN—manufacturer of crizotinib advises avoid concomitant use
- Antidepressants: plasma concentration of crizotinib possibly reduced by ST JOHN’S WORT—manufacturer of crizotinib advises avoid concomitant use
- Antiepileptics: plasma concentration of crizotinib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of crizotinib advises avoid concomitant use
- Antifungals: plasma concentration of crizotinib increased by KETOCONAZOLE—avoid concomitant use; plasma concentration of crizotinib possibly increased by ITRACONAZOLE and VORICONAZOLE—manufacturer of crizotinib advises avoid concomitant use
- Antimalarials: possible increased risk of bradycardia when crizotinib given with MEFLOQUINE
- Antipsychotics: avoid concomitant use of cytoxics with CLOZAPINE (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with PIMOZIDE
- Antivirals: plasma concentration of crizotinib possibly increased by ATAZANAVIR, INDINAVIR, RITONAVIR and
Crizotinib

- Antivirals (continued)
  - SAQUINAVIR — manufacturer of crizotinib advises avoid concomitant use
  - Antioxidants and Hypnotics: crizotinib increases plasma concentration of ▶ MIAZOLAM
  - Beta-blockers: possible increased risk of bradycardia when crizotinib given with ▶ BETA-BLOCKERS
  - Calcium-channel Blockers: possible increased risk of bradycardia when crizotinib given with ▶ DILTIAZEM or ▶ VERAPAMIL
  - Cardiac Glycosides: possible increased risk of bradycardia when crizotinib given with ▶ DIGOXIN
  - Ciclosporin: manufacturer of crizotinib advises caution with ▶ CICLOSPORIN
  - Clonidine: possible increased risk of bradycardia when crizotinib given with ▶ CLONIDINE
  - Cycloheximide: crizotinib possibly increases the plasma concentration of ▶ IBRUTINIB — reduce dose of ibritunib (see under Ibrutinib, p. 867)
  - Ergot Alkaloids: manufacturer of crizotinib advises caution with ▶ ERGOT ALKALOIDS
  - Grapefruit Juice: plasma concentration of crizotinib possibly increased by ▶ GRAPEFRUIT JUICE — manufacturer of crizotinib advises avoid concomitant use
  - Guanfacine: crizotinib possibly increases plasma concentration of ▶ GUANFACINE (halve dose of guanfacine)
  - Oestrogens: manufacturer of crizotinib advises contraceptive effect of ▶ OESTROGENS possibly reduced
  - Parasympathomimetics: possible increased risk of bradycardia when crizotinib given with ▶ PILOCARPINE
  - Progestogens: manufacturer of crizotinib advises contraceptive effect of ▶ PROGESTOGENS possibly reduced
  - Sirolimus: manufacturer of crizotinib advises caution with ▶ SIROLIMUS
  - Tacrolimus: manufacturer of crizotinib advises caution with ▶ TACROLIMUS

Cyclophosphamide

- Antifungals: side-effects of cyclophosphamide possibly increased by ▶ FLUCONAZOLE and ▶ ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytoxotics with ▶ CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: cyclophosphamide possibly reduces absorption of ▶ DIGOXIN tablets
- Cyclophosphamide: increased toxicity when high-dose cyclophosphamide given with ▶ PENTOSTATIN — avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of ▶ SUXAMETHONIUM

Cycloserine

- Alcohol: increased risk of convulsions when cycloserine given with ▶ ALCOHOL
- Antibacterials: increased risk of CNS toxicity when cycloserine given with ▶ ISONIAZID
- Vaccines: antibacterials inactivate ▶ ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF or BNFC

Cyproheptadine see Antihistamines

Cytarabine

- Antifungals: cytarabine possibly reduces plasma concentration of ▶ FLUCYTOSINE
- Antipsychotics: avoid concomitant use of cytoxotics with ▶ CLOZAPINE (increased risk of agranulocytosis)
- Cardiac Glycosides: cytarabine possibly reduces absorption of ▶ DIGOXIN tablets
- Cyclophosphamide: intracellular concentration of cytarabine increased by ▶ FLUIDARABINE

Cytotoxics see individual drugs

Dabigatran (continued)

- Anti-arrhythmics: plasma concentration of dabigatran increased by ▶ AMIODARONE (see under Dabigatran Etxetilale, p. 128); plasma concentration of dabigatran increased by ▶ DRONERADONE — avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when dabigatran given with ▶ CLARITHROMYCIN; plasma concentration of dabigatran reduced by ▶ RIFAMPICIN — manufacturer of dabigatran advises avoid concomitant use
- Antiaggregants: increased risk of haemorrhage when dabigatran given with other ▶ ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with ▶ APIXABAN, ▶ RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: possible increased risk of bleeding when dabigatran given with ▶ SSRI-RELATED ANTIDEPRESSANTS or ▶ SSRIS; plasma concentration of dabigatran possibly reduced by ▶ ST JOHN’S WORT — manufacturer of dabigatran advises avoid concomitant use
- Antiepileptics: plasma concentration of dabigatran possibly reduced by ▶ CARBAMAZEPINE, ▶ PHOSPHENYTOIN and ▶ PHENOTYIN — manufacturer of dabigatran advises avoid concomitant use
- Antifungals: plasma concentration of dabigatran increased by ▶ KETOCONAZOLE — avoid concomitant use; manufacturer of dabigatran advises avoid concomitant use with ▶ ITRACONAZOLE
- Antivirals: manufacturers advise avoid concomitant use of dabigatran with ▶ DARUNAVIR; plasma concentration of dabigatran possibly increased by ▶ RILPIVIRINE and ▶ TELAPREVIR
- Calcium-channel Blockers: plasma concentration of dabigatran possibly increased by ▶ VERAPAMIL (see under Dabigatran Etxetilale, p. 128)
- Ciclosporin: manufacturer of dabigatran advises avoid concomitant use
- Netupitant: caution with dabigatran advised by manufacturer of ▶ NETUPITANT
- Sulfipyrazone: possible increased risk of bleeding when dabigatran given with ▶ SULFONYLURIA

Dabrafenib

- Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with ▶ RIFAMPICIN
- Anticoagulants: dabrafenib reduces plasma concentration of ▶ WARFARIN
- Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with ▶ ST JOHN’S WORT
- Antiepileptics: manufacturer of dabrafenib advises avoid concomitant use with ▶ CARBAMAZEPINE, ▶ PHOSPHENYTOIN, ▶ PHENOBARBITAL, ▶ PHENOTYIN and ▶ PRIMIDONE
- Antifungals: plasma concentration of dabrafenib increased by ▶ KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytoxotics with ▶ CLOZAPINE (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of dabrafenib increased by ▶ Gemfibrozil
- Oestrogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing ▶ OESTROGENS possibly reduced (alternative contraceptive recommended)
- Progestogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing ▶ PROGESTOGENS possibly reduced (alternative contraceptive recommended)
- Ulcer-healing Drugs: manufacturer of dabrafenib advises avoid concomitant use with ▶ PROTON PUMP INHIBITORS (plasma concentration of dabrafenib possibly reduced)
Dacarbazine

- Aldesleukin: avoidance of dacarbazine advised by manufacturer of ALDELEUKIN
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)

Dacarbazin

- Anti-arhythmic: possible increased risk of atrial fibrillation when dacarbazin (with fosforbivin) given with AMIODARONE — see under Amiodarone, p. 99
- Antibacterials: plasma concentration of dacarbazin possibly increased by CLARITHROMYCIN and TELOTHROMYCIN — reduce dose of dacarbazin (see under Dacarbazin, p. 577); plasma concentration of dacarbazin possibly reduced by Rifabutin — manufacturer of dacarbazin advises avoid concomitant use; plasma concentration of dacarbazin reduced by Rifampicin — avoid concomitant use
- Antidepressants: plasma concentration of dacarbazin possibly reduced by ST. JOHN'S WORT — manufacturer of dacarbazin advises avoid concomitant use
- Antiepileptics: plasma concentration of dacarbazin possibly reduced by Carbamazepine, Phosphenytoin, Oxcarbazepine, Phenytoin and Primidone — manufacturer of dacarbazin advises avoid concomitant use
- Antifungals: plasma concentration of dacarbazin increased by Ketoconazole — reduce dose of dacarbazin (see under Dacarbazin, p. 577); plasma concentration of dacarbazin possibly increased by Itraconazole, Posaconazole and Voriconazole — reduce dose of dacarbazin (see under Dacarbazin, p. 577)
- Antivirals: plasma concentration of dacarbazin increased by Atazanavir and Teleprrevir — reduce dose of dacarbazin (see under Dacarbazin, p. 577); plasma concentration of dacarbazin possibly increased by Boceprrevir — reduce dose of dacarbazin (see under Dacarbazin, p. 577); manufacturer of dacarbazin advises avoid concomitant use with Darunavir (plasma concentration of dacarbazin possibly increased); plasma concentration of dacarbazin reduced by Efavirenz — increase dose of dacarbazin (see under Dacarbazin, p. 577); manufacturer of dacarbazin advises avoid concomitant use with Etiravirine and Nevirapine (plasma concentration of dacarbazin possibly reduced)
- Cardiac Glycosides: dacarbazin increases plasma concentration of Digoxin
- Cobicitstat: plasma concentration of dacarbazin possibly increased by Cobicitstat — reduce dose of dacarbazin (see under Dacarbazin, p. 577)
- Corticosteroids: plasma concentration of dacarbazin possibly reduced by Dexamethasone — manufacturer of dacarbazin advises avoid concomitant use
- Lipid-regulating Drugs: dacarbazin increases plasma concentration of Rosuvastatin

Dactinomycin

- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: increased risk of haematotoxicity when dactinomycin given with Vincristine
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with Live VACCINES — avoid concomitant use
- Vitamins: dactinomycin possibly reduces effects of Alfalfacidd, Calcitriol, Colecalciferol, Dihydropotachysterol, Ergocaliferol, Paricalcit and Vitamin D

Dairy Products

- Antibacterials: dairy products reduce absorption of Ciprofloxacin; dairy products reduce absorption of Tetracyclines (except doxycycline and minocycline)
- Cytotoxics: dairy products possibly reduce plasma concentration of Mercaptopurine — manufacturer of mercaptopurine advises give at least 1 hour before or 3 hours after dairy products
- Eliptrombapag: dairy products possibly reduce absorption of Eliptrombapag (give at least 4 hours apart)

Dalteparin see Heparins

Danaparoid

- Analgesics: increased risk of haemorrhage when anticoagulants given with Intravenous Diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with Ketorolac (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with Apixaban, Dabigatran, Edoxaban and Rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Danazol

- Anticoagulants: danazol inhibits metabolism of COUMARINS (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of Carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of Ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with Simvastatin — avoid concomitant use
- Tacrolimus: danazol possibly increases plasma concentration of Tacrolimus

Dantrolene see Muscle Relaxants

Dapagliflozin see Antidiabetics

Dapoxetine

- Alcohol: increased sedative effect when dapoxetine given with Alcohol
- Analgesics: possible increased risk of serotoninergic effects when dapoxetine given with Tramadol (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Clarithromycin and Erythromycin (see under Dapoxetine, p. 751); manufacturer of dapoxetine advises avoid concomitant use with Telithromycin (increased risk of toxicity)
- Antidepressants: possible increased risk of serotoninergic effects when dapoxetine given with SSRIs, St John's Wort, Duloxetine, Tricyclines and Venlafaxine (manufacturer of dapoxetine advises SSRIs, St John's wort, duloxetine, tricyclines and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)
- Anticoagulants: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Clarithromycin and Erythromycin (see under Dapoxetine, p. 751); manufacturer of dapoxetine advises dose reduction when dapoxetine given with Flucanazole (see under Dapoxetine, p. 751); manufacturer of dapoxetine advises avoid concomitant use with Itraconazole (increased risk of toxicity)
- Antivirals: manufacturer of dapoxetine advises avoid concomitant use with Atazanavir, Ritonavir and Saquinavir (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with Fosamprenavir (see under Dapoxetine, p. 751)
- Appriant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Appriant (see under Dapoxetine, p. 751)
- Calcium-channel Blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Dilatiazem and Verapamil (see under Dapoxetine, p. 751)
- 5HT-Receptor Agonists: possible increased risk of serotoninergic effects when dapoxetine given with 5HT, Agonists (manufacturer of dapoxetine advises 5HT, agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping 5HT1 agonists)
- Lithium: possible increased risk of serotoninergic effects when dapoxetine given with Lithium (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping
Dapoxetine
- Lithium (continued)
  stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with SILDENAFIL
- Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with TADALAFIL
- Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with VARDENAFIL

Dapsone
- Antibacterials: plasma concentration of dapsone reduced by RIFAMYCINS; plasma concentration of both drugs may increase when dapsone given with TRIMETHOPRIM
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with SAQUINAVIR—avoid concomitant use
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Daptomycin
- Ciclosporin: increased risk of myopathy when daptomycin given with CICLOSPORIN (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with FIBRATES or STATINS (preferably avoid concomitant use)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Darifenacin see Antimuscarinics

Darunavir
- Anti-arrhythmics: darunavir possibly increases plasma concentration of LIDOCAINE—avoid concomitant use
- Antibacterials: darunavir increases plasma concentration of DAPSONE; plasma concentration of darunavir significantly reduced by DAUCAMBIN—avoid concomitant use
- Anticoagulants: avoidance of darunavir advised by manufacturer of ARIXIBAN and RIVAROXABAN; manufacturers advise avoid concomitant use of darunavir with BABIGATAN
- Antidepressants: darunavir possibly reduces plasma concentration of PAROXETINE and SERTRALINE; plasma concentration of darunavir reduced by ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of darunavir possibly reduced by CARBAMAZEPINE, FOSPHENTOIN, PHENOBARTAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of both drugs increased when darunavir given with KETOCONAZOLE; darunavir possibly affects plasma concentration of VORICONAZOLE
- Antimalarials: plasma concentration of lumefantrine increased when darunavir given with ARTEMETHER with LUMEFANTRINE; darunavir possibly increases plasma concentration of QUININE (increased risk of toxicity)
- Antipsychotics: darunavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); darunavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of darunavir with BOCEPREVIR or TELAPREVIR; avoidance of darunavir advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly increased); manufacturer of darunavir advises take DIDANOSONE 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by EFAVIRENZ (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with INDINAVIR; plasma concentration of darunavir reduced by LOPINAVIR and SAQUINAVIR—avoid concomitant use; darunavir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); darunavir increases plasma concentration of PARITAPREVIR and plasma concentration of darunavir decreased; increased risk of rash when darunavir given with Raltegravir; plasma concentration of both drugs increased when darunavir given with SIMPREVIR—manufacturer of simprevir advises avoid concomitant use

Darunavir (continued)
- Cytotoxics: darunavir possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of EVEROLIMUS—manufacturer of everolimus advises avoid concomitant use; darunavir possibly increases the plasma concentration of IBRUTINIB—reduce dose of ibritunib (see under Ibrutinib, p. 867)
- Ergot Alkaloids: increased risk of ergotism when darunavir given with ERGOT ALKALOIDS—manufacturer of darunavir advises avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when darunavir given with ATORVASTATIN; darunavir possibly increases plasma concentration of PRAVASTATIN (use lowest possible dose of pravastatin); darunavir increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); avoidance of darunavir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of darunavir possibly reduced by ORLISTAT
- Ranolazine: darunavir possibly increases plasma concentration of RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use

Dasabuvir
- Antibacterials: manufacturer of dasabuvir advises avoid concomitant use with CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of dasabuvir possibly reduced by RIFAMPICIN—avoid concomitant use
- Antidepressants: plasma concentration of dasabuvir possibly reduced by ST JOHN’S WORT—manufacturer of dasabuvir advises avoid concomitant use
- Antiepileptics: plasma concentration of dasabuvir reduced by CARBAMAZEPINE—avoid concomitant use; plasma concentration of dasabuvir possibly reduced by FOSPHENTOIN, PHENOBARTAL, PHENYTOIN and PRIMIDONE—avoid concomitant use
- Antifungals: plasma concentration of both drugs increased when dasabuvir given with KETOCONAZOLE—avoid concomitant use; plasma concentration of both drugs possibly increased when dasabuvir given with TRICARAZOLE and POSACONAZOLE—avoid concomitant use
- Antivirals: manufacturer of dasabuvir advises avoid concomitant use with EFAVIRENZ, ETRAVIRINE and NEVIRAPINE
- Cobicitat: manufacturer of dasabuvir advises avoid concomitant use with COBICISTAT
- Cytotoxics: manufacturer of dasabuvir advises avoid concomitant use with MITOTANE
- Diuretics: dasabuvir increases plasma concentration of FUROSEMIDE (reduce dose of furosemide)
- Hormone Antagonists: manufacturer of dasabuvir advises avoid concomitant use with ENZALUTAMIDE
- Lipid-regulating Drugs: manufacturer of dasabuvir advises avoid concomitant use with ATORVASTATIN, GEMFIBROZIL and SIMVASTATIN; dasabuvir increases plasma concentration of ROSUVASTATIN (reduce dose of rosuvastatin—see under Rosuvastatin, p. 195)
- Oestrogens: manufacturer of dasabuvir advises avoid concomitant use of ETHINYLESTRADIAL—use alternative form of contraception

Dasatinib
- Antacids: absorption of dasatinib possibly reduced by ANTACIDS (give at least 2 hours apart)
- Antibacterials: manufacturer of dasatinib advises avoid concomitant use with CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (plasma concentration of dasatinib possibly increased); metabolism of dasatinib accelerated by RIFAMPICIN (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: manufacturer of dasatinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENTOIN, PHENOBARTAL, PHENYTOIN and PRIMIDONE (plasma concentration of dasatinib possibly reduced)
- Antifungals: plasma concentration of dasatinib possibly increased by KETOCONAZOLE; manufacturer of dasatinib
Dasatinib
Antifungals (continued)
advise avoid concomitant use with ITRACONAZOLE (plasma concentration of dasatinib possibly increased)
• Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
• Antivirals: avoidance of dasatinib advised by manufacturer of BOCPREVIR; manufacturer of dasatinib advises avoid concomitant use with RITONAVIR (plasma concentration of dasatinib possibly increased)
• Grapefruit Juice: manufacturer of dasatinib advises avoid concomitant use with GRAPEFRUIT JUICE (plasma concentration of dasatinib possibly increased)
• Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of SIMVASTATIN
• Ulcer-healing Drugs: plasma concentration of dasatinib reduced by • FAMOTIDINE and • OMEPRAZOLE—consider using an antacid as an alternative; manufacturer of dasatinib advises avoid concomitant use with • HISTAMINE H2-ANTAGONISTS and • PROTON PUMP INHIBITORS—consider using an antacid as an alternative
Daunorubicin
• Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
• Cytoxotics: possible increased risk of cardiotoxicity when daunorubicin given with • TRASTUZUMAB—avoid concomitant use for up to 28 weeks after stopping trastuzumab
• Vaccines: risk of generalised infections when cytotoxic antibiotics given with live • VACCINES—avoid concomitant use
Decitabine
• Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
Deferasirox
• Antipsychotics: deferasirox increases plasma concentration of AMINOPHYLLINE (consider reducing dose of aminophylline)
• Antacids: absorption of deferasirox possibly reduced by ANTACIDS containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
• Antibacterials: plasma concentration of deferasirox reduced by RIFAMPICIN
• Antidiabetics: deferasirox increases plasma concentration of REPAGLINIDE
• Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with CLOZAPINE
• Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of MIDAZOLAM
• Muscle Relaxants: manufacturer of deferasirox advises avoid concomitant use with TIZANIDINE
• Theophylline: deferasirox increases plasma concentration of THEOPHYLLINE (consider reducing dose of theophylline)
Deferiprone
• Antacids: absorption of deferiprone possibly reduced by ANTACIDS containing aluminium (manufacturer of deferiprone advises avoid concomitant use)
Deflazacort see Corticosteroids
Delamandin
• Analgesics: increased risk of ventricular arrhythmias when delamandin given with • METHADONE
• Anti-arrhythmics: increased risk of ventricular arrhythmias when delamandin given with • AMIODARONE or • DISOPYRAMIDE
• Antibacterials: possible increased risk of ventricular arrhythmias when delamandin given with • CLARITHROMYCIN and •ERYTHROMYCIN; increased risk of ventricular arrhythmias when delamandin given with • MOXIFLOXACIN; plasma concentration of delamandin reduced by • RIFAMPICIN; delamandin increases plasma concentration of ETHAMBUTOL
• Antidepressants: possible increased risk of ventricular arrhythmias when delamandin given with • TRICYCLICS that prolong the QT interval
• Antiepileptics: manufacturer of delamandin advises avoid concomitant use with CARBAMAZEPINE
• Antipsychotics: increased risk of ventricular arrhythmias when delamandin given with • DROPERIDOL, • HALOPERIDOL or • PIMOZIDE; increased risk of ventricular arrhythmias when delamandin given with • PHENOTHIAZINES that prolong the QT interval
Delamanid (continued)
• Antivirals: plasma concentration of delamanid increased by LOPINAVIR and RITONAVIR; increased risk of ventricular arrhythmias when delamanid given with • SAQUINAVIR
• Beta-blockers: increased risk of ventricular arrhythmias when delamanid given with • SOTALOL
• Cytoxotics: increased risk of ventricular arrhythmias when delamanid given with • ARSENIC TRIOXIDE or • VINFLUNINE; possible increased risk of ventricular arrhythmias when delamanid given with • VINBLASTINE, • VINCristINE, • VindesINE and • VINoreBINE
• Domperidone: possible increased risk of ventricular arrhythmias when delamanid given with • DOMPERIDONE
• Pentamidine isetionate: increased risk of ventricular arrhythmias when delamanid given with • PENTAMIDINE ISETIONATE
• Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC
Demeclocycline see Tetracyclines
Desferroxamine
• Antipsychotics: avoidance of desferroxamine advised by manufacturer of LEVOMEPROMAZINE; manufacturer of desferroxamine advises avoid concomitant use with PROCHLORPERAZINE
Desflurane see Anaesthetics, General
Desloratadine see Antihistamines
Desmopressin
• Analgesics: effects of desmopressin enhanced by INDOMETACIN
• Loperamide: plasma concentration of oral desmopressin increased by LOPERAMIDE
Desogestrel see Progestogens
Dexamethasone see Corticosteroids
Dexamfetamine see Sympathomimetics
Dexibuprofen see NSAIDs
Dextroketoprofen see NSAIDs
Dexrazoxane
• Antiepileptics: dexrazoxane possibly reduces absorption of • FOSPHENYTOIN and • PHENYTOIN
• Ciclosporin: manufacturer of dexrazoxane advises increased risk of immunosuppression with CICLOSPORIN
• Tacrolimus: manufacturer of dexrazoxane advises increased risk of immunosuppression with TACROLIMUS
• Vaccines: risk of generalised infections when dexrazoxane given with live • VACCINES—avoid concomitant use
Dextromethorphan see Opioid Analgesics
Dextropropoxyphene see Opioid Analgesics
Diamorphine see Opioid Analgesics
Diazepam see Anxiolytics and Hypnotics
Diazoxide
• ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE INHIBITORS
• Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with ADRENERGIC NEURONE BLOCKERS
• Alcohol: enhanced hypotensive effect when diazoxide given with ALCOHOL
• Aldesleukin: enhanced hypotensive effect when diazoxide given with ALDESLEUKIN
• Alpha-blockers: enhanced hypotensive effect when diazoxide given with ALPHA-BLOCKERS
• Anaesthetics, General: enhanced hypotensive effect when diazoxide given with GENERAL ANAESTHETICS
• Analgesics: hypotensive effect of diazoxide antagonised by NSAIDS
• Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
• Antidepressants: enhanced hypotensive effect when diazoxide given with MAOIS or TRICYCLIC-RELATED ANTIDEPRESSANTS
• Antidiabetics: diazoxide antagonises hypoglycaemic effect of ANTIDIABETICS
• Antiepileptics: diazoxide reduces plasma concentration of FOSPHENYTOIN and PHENYTOIN, also effect of diazoxide may be reduced
• Antipsychotics: enhanced hypotensive effect when diazoxide given with PHENOTHIAZINES
Diazoxide – Disopyramide

Diazoxide (continued)

» Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with ANXIOLYTICS AND HYPNOTICS
» Beta-blockers: enhanced hypotensive effect when diazoxide given with BETA-BLOCKERS
» Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with CALCIUM-CHANNEL BLOCKERS
» Clonidine: enhanced hypotensive effect when diazoxide given with CLONIDINE
» Corticosteroids: hypotensive effect of diazoxide antagonised by CORTICOSTEROIDS
» Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with DIURETICS
» Dopaminergics: enhanced hypotensive effect when diazoxide given with BACLOFEN or TIZANIDINE
» Methyldopa: enhanced hypotensive effect when diazoxide given with METHYLOPA
» Moxisylyte: enhanced hypotensive effect when diazoxide given with MOXISYLYTE
» Moxonidine: enhanced hypotensive effect when diazoxide given with MOXONIDINE
» Muscle Relaxants: enhanced hypotensive effect when diazoxide given with BACLOFEN or TIZANIDINE
» Nitrates: enhanced hypotensive effect when diazoxide given with NITRATES
» Prostaglandins: enhanced hypotensive effect when diazoxide given with ALPROSTADIL
» Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Diclofenac see NSAIDs
Dicyclomine see Antimuscarinics
Didanosine

NOTE Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart

Allopurinol: plasma concentration of didanosine increased by

Allopurinol (risk of toxicity)—avoid concomitant use

Analgesics: plasma concentration of didanosine possibly reduced by METHADONE

Antibacterials: didanosine tablets reduce absorption of CIPROFLOXACIN (give at least 2 hours before or 4 hours after ciprofloxacin); manufacturer of levofloxacin advises give didanosine tablets at least 2 hours before or after LEVOFLOXACIN; manufacturer of moxifloxacin advises give didanosine tablets at least 6 hours before or after MOXIFLOXACIN

Antihistamines: plasma concentration of didanosine possibly reduced by GANCICLOVIR and VALGANCICLOVIR; didanosine tablets reduce absorption of INDINAVIR (give at least 1 hour apart); increased risk of side-effects when didanosine given with RIBAVIRIN—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after RILPIVIRINE; manufacturer of ritonavir advises didanosine and RITONAVIR should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with STAVUDINE; plasma concentration of didanosine increased by TENOFIRVIR (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by TIPRANAVIR—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart

Cytotoxics: increased risk of toxicity when didanosine given with HYDROXYCARBAMIDE—avoid concomitant use

Orlistat: absorption of didanosine possibly reduced by ORLISTAT

Dienogest see Progestogens
Diethylcarbamazine

» Antacids: excretion of diethylcarbamazine reduced by SODIUM BICARBONATE

Digoxin see Cardiac Glycosides
Dihydrocodeine see Opioid Analgesics
Dihydrotachysterol see Vitamins

Diltiazem see Calcium-channel Blockers
Dimethyl sulfoxide

» Analgesics: avoid concomitant use of dimethyl sulfoxide with SULINDAC

Disoprostone see Prostaglandins
Diphenoxylate see Opioid Analgesics
Diptheria Vaccines see Vaccines
Dipipanone see Opioid Analgesics
Dipyridamole

» Antiarrhythmics: absorption of dipyridamole possibly reduced by ANTAGONISTS

» Anti-arrhythmics: dipyridamole enhances and extends effect of AMIODARONE (important risk of toxicity)—reduce dose of amiodarone, see p. 101

» Antiarrhythmics: antiplatelet action of dipyridamole enhances anticoagulant effect of COUMARINS and PHENINDIONE; dipyridamole enhances anticoagulant effect of HEPARINS

» Clopidogrel: increased risk of bleeding when dipyridamole given with CLOPIDOGREL

» Cytotoxics: dipyridamole possibly reduces effects of FLUDARABINE

Disopyramide

» Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVAUCINE, LEVOBUPIVAUCINE, PRILOCaine or ROFIVAUCINE

» Antiarrhythmics: increased myocardial depression when anti-arrhythmics given with other ANTI-ARRHYTHMICS; increased risk of ventricular arrhythmias when disopyramide given with AMIODARONE or DRONEDARONE—avoid concomitant use

» Antiarrhythmics: plasma concentration of disopyramide possibly increased by AZITHROMYCIN (increased risk of toxicity); plasma concentration of disopyramide possibly increased by CLARITHROMYCIN (increased risk of ventricular arrhythmias); plasma concentration of disopyramide disopyramide increased by ERYTHROMYCIN (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with DELAMANID; metabolism of disopyramide accelerated by RIFAMYCINS (reduced plasma concentration); possible increased risk of ventricular arrhythmias when disopyramide given with TELITHROMYCIN

» Antiarrhythmic: disopyramide may enhance or reduce anticoagulant effect of WARFARIN

» Antidepressants: avoidance of disopyramide advised by manufacturer of CITALOPRAM and ESCITALOPRAM (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with TRICYCLICS

» Antiarrhythmic: disopyramide possibly enhances hypoglycaemic effect of GLICLAZIDE, INSULIN and METFORMIN

» Antiarrhythmics: plasma concentration of disopyramide reduced by FOSPHENYTOIN and PHENOTIN; metabolism of disopyramide accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)

» Antiarrhythmics: increased risk of ventricular arrhythmias when disopyramide given with KETOCONAZOLE—avoid concomitant use; avoidance of disopyramide advised by manufacturer of ITRACONAZOLE

» Antiarrhythmics: increased risk of ventricular arrhythmias when disopyramide given with MIZOLASTINE—avoid concomitant use

» Antiarrhythmic: avoidance of disopyramide advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE (risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of ARTEMETHER WITH PIPERAQUINE (possible risk of ventricular arrhythmias)

» Antiarrhythmics: increased risk of antimuscarinic side-effects when disopyramide given with ANTIMUSCARINICS; increased risk of ventricular arrhythmias when disopyramide given with TOLERODINE

» Antiarrhythmics: increased risk of ventricular arrhythmias when disopyramide given with AMISULPRIDE, DROPERIDOL, PIMOZIDE or ZUCLOPENTHIXOL—avoid concomitant use; possible increased...
Disopyramide

● Antipsychotics (continued)
  
  risk of ventricular arrhythmias when disopyramide given with
  • HALDOPERIDOL—avoid concomitant use; increased risk of
  ventricular arrhythmias when disopyramide given with
  • PHENOTHIAZINES or • SULPIRIDE
  • Antivirals: plasma concentration of disopyramide possibly
  increased by • RITONAVIR (increased risk of toxicity); increased risk of
  ventricular arrhythmias when disopyramide given with
  • SAQUINAVIR—avoid concomitant use; avoidance of
  disopyramide advised by manufacturer of • TELAPREVIR (risk of
  ventricular arrhythmias)
  • Atomoxetine: increased risk of ventricular arrhythmias
  when disopyramide given with • ATOMOXETINE
  • Beta-blockers: increased myocardial depression when anti-
  arrhythmics given with • BETA-BLOCKERS; increased risk of
  ventricular arrhythmias when disopyramide given with
  • SOTALOL—avoid concomitant use
  • Calcium-channel Blockers: increased risk of myocardial
  depression and astystole when disopyramide given with
  • VERAPAMIL
  • Cytotoxics: possible increased risk of ventricular arrhythmias
  when disopyramide given with • DOXORUBICIN and • CEPHALOSPORINS;
  possible increased risk of ventricular arrhythmias when
  disopyramide given with • VANDENATIN—avoid concomitant use;
  increased risk of ventricular arrhythmias when disopyramide given with •
  ARSENIC TRIOXIDE
  • Diuretics: increased cardiac toxicity with disopyramide if
  hypokalaemia occurs with • ACETAZOLAMIDE, • LOOP DIURETICS
  or • THIAZIDES AND RELATED DIURETICS
  • Fingolimod: possible increased risk of bradycardia when
  disopyramide given with • FINGOLIMOD
  • Ivabradine: increased risk of ventricular arrhythmias when
  disopyramide given with • IVABRADINE
  • Nitrates: disopyramide reduces effects of sublingual tablets of
  NITRATES (failure to dissolve under tongue owing to dry
  mouth)
  • Panobinostat: possible increased risk of ventricular
  arrhythmias when disopyramide given with • PANOBINOSTAT—
  avoid concomitant use
  • Pentamidine isetionate: possible increased risk of ventricular
  arrhythmias when disopyramide given with • PENTAMIDINE
  ISETIONATE
  • Ranolazine: avoidance of disopyramide advised by
  manufacturer of • RANOLAZINE
  • Sildenafil: manufacturer of disopyramide advises avoid
  concomitant use with • SILDENAFIL (risk of ventricular
  arrhythmias)
  • Tadalafil: manufacturer of disopyramide advises avoid
  concomitant use with • TADALAFIL (risk of ventricular
  arrhythmias)
  • Vardenafil: manufacturer of disopyramide advises avoid
  concomitant use with • VARDENAFIL (risk of ventricular
  arrhythmias)

Disulfiram

● Alcohol: disulfiram reaction when disulfiram given with
  • ALCOHOL
  • Aminophylline: disulfiram inhibits metabolism of
  • AMINOPHYLLINE (increased risk of toxicity)
  • Antibacterials: psychotic reaction reported when disulfiram
  given with • METRONIDAZOLE; CNS effects of disulfiram possibly
  increased by • ISONIAZID
  • Anticoagulants: disulfiram enhances anticoagulant effect of
  • COUMARINS
  • Antidepressants: increased disulfiram reaction with alcohol
  reported with concomitant • AMITRIPTYLINE; disulfiram inhibits
  metabolism of • TRICYCLES (increased plasma concentration)
  • Antiepileptics: disulfiram inhibits metabolism of
  • FOSPHENYTOIN and • PHENYTOIN (increased risk of toxicity)
  • Anxiolytics and Hypnotics: disulfiram increases risk of
  • TEMAZEPAM toxicity; disulfiram inhibits metabolism of
  • BENZODIAZEPINES (increased sedative effects)
  • Paraldehyde: risk of toxicity when disulfiram given with
  • PARALDEHYDE
  • Theophylline: disulfiram inhibits metabolism of • THEOPHYLLINE
  (increased risk of toxicity)

Diuretics

NOTE Since systemic absorption may follow topical application
of brinzolamide to the eye, the possibility of interactions
should be borne in mind

NOTE Since systemic absorption may follow topical application
of dorzolamide to the eye, the possibility of interactions
should be borne in mind

● ACE Inhibitors: enhanced hypotensive effect when diuretics
  given with • ACE INHIBITORS; increased risk of severe
  hyperkalaemia when eplerenone and spironolactone given with
  • ACE INHIBITORS—avoid concurrent use or use lowest
  possible doses of both drugs; increased risk of severe
  hyperkalaemia when amiloride, potassium canrenoate or
  triamterene given with • ACE INHIBITORS
  • Adrenergic Neurone Blockers: enhanced hypotensive effect
  when diuretics given with • ADREnergic NeURONE BLOCKERS
  • Alcohol: enhanced hypotensive effect when diuretics given
  with • ALCOHOL
  • Aldesleukin: enhanced hypotensive effect when diuretics given
  with • ALDESLEUKIN
  • Aliksiren: increased risk of hyperkalaemia when aldosterone
  antagonists or potassium-sparing diuretics given with
  • ALSKIREN; plasma concentration of furosemide reduced by
  • ALSKIREN
  • Alfopurinol: increased risk of hypersensitivity when thiazides
  and related diuretics given with • ALLOPURINOL especially in
  renal impairment
  • Alpha-blockers: enhanced hypotensive effect when diuretics
  given with • ALPHA-BLOCKERS, also increased risk of first-dose
  hypotension with post-synaptic alpha-blockers such as
  prazosin
  • Aminophylline: increased risk of hypokalaemia when
  acetazolamide, loop diuretics or thiazide diuretics given with
  • AMINOPHYLLINE
  • Anaesthetics, General: enhanced hypotensive effect when
  diuretics given with • GENERAL ANAESTHETICS
  • Analgesics: possible increased risk of hyperkalaemia when
  aldosterone antagonists or potassium-sparing diuretics given with
  • KSADs; diuretics increase risk of nephrotoxicity of
  • NSAID S, also antagonism of diuretic effect; diuretic effect
  of potassium canrenoate possibly antagonised by • NSAID S;
  furosemide possibly increases the excretion of • ACEMETACIN;
  effects of diuretics antagonised by • INDOMETACIN and
  • KETOROLAC; increased risk of hyperkalaemia when aldosterone
  antagonists or potassium-sparing diuretics given with
  • INDOMETACIN; occasional reports of reduced renal function
  when triamterene given with • INDOMETACIN—avoid
  concomitant use; diuretic effect of spironolactone
  antagonised by • ASPRIN; increased risk of toxicity when
  acetazolamide given with high-dose • ASPRIN; possible
  increased risk of toxicity when loop diuretics given with high-
  • ASPRIN (also possible reduced effect of loop diuretics)
  • Angiotensin-II Receptor Antagonists: enhanced hypotensive
  effect when diuretics given with • ANGIOTENSIN-II RECEPTOR
  ANTAGONISTS; increased risk of severe hyperkalaemia when
  eplerenone and spironolactone given with • ANGIOTENSIN-II
  RECEPTOR ANTAGONISTS—avoid concurrent use or use lowest
  possible doses of both drugs; increased risk of severe
  hyperkalaemia when amiloride, potassium canrenoate or
  triamterene given with • ANGIOTENSIN-II RECEPTOR
  ANTAGONISTS; plasma concentration of furosemide reduced by
  • VALSARTAN
  • Anti-arrhythmics: plasma concentration of eplerenone
  increased by • AMIODARONE (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or
  thiazides and related diuretics increases cardiac toxicity with
  • AMIODARONE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac
toxicity with • DISOPYRAMIDE; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with • FLECAINIDE;
hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of
• LIDOCAINE
• Antibacterials: plasma concentration of eplerenone increased by • CLARITHROMYCIN and • TELITHROMYCIN—avoid
Diuretics
- Antibacterials (continued) concomitant use; plasma concentration of eplerenone increased by ERYTHROMYCIN (reduce dose of eplerenone); plasma concentration of eplerenone reduced by RIFAMPICIN, avoid concomitant use; avoidance of diuretics advised by manufacturer of LYMECTYLIN; increased risk of toxicity when loop diuretics given with AMINOGLYCOSIDES, POLYMIXINS or VANCOMYCIN; acetazolamide antagonises effects of METHENAMINE; possible increased risk of hyperkalaemia when spironolactone given with TRIMETHOPRIM; increased risk of hyperkalaemia when eplerenone given with TRIMETHOPRIM.
- Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with ATOMOXETINE; enhanced hypotensive effect when diuretics given with MAOI; plasma concentration of eplerenone reduced by ST JOHN'S WORT—avoid concomitant use; increased risk of postural hypotension when diuretics given with TRICYCLICS.
- Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of ANTIDIABETICS; avoidance of loop diuretics advised by manufacturer of CANAGLIFLOZIN; diuretic effect of diuretics possibly enhanced by DAPAGLIFLOZIN; diuretic effect of loop diuretics and thiazides and related diuretics possibly enhanced by DAPAGLIFLOZIN.
- Antiparkinsonists: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with REBOXETINE; enhanced hypotensive effect when diuretics given with MAOI; plasma concentration of eplerenone reduced by CICLOSPORIN—avoid concomitant use; increased risk of hyperkalaemia when acetazolamide increases risk of ventricular arrhythmias with FRANKENSOHN; spironolactone increases plasma concentration of eplerenone given with CICLOSPORIN.
- Anticonvulsants: increased risk of hyperkalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with CORTICOSTEROIDS; increased risk of hyperkalaemia when methotrexate acts synergistically with CORTICOSTEROIDS; increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with CORTICOSTEROIDS; acetazolamide possibly increases plasma concentration of CORTICOSTEROIDS.
- Antihistamines: increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with PLATINUM COMPOUNDS.
- Antihypertensives: loop diuretics and thiazides and related diuretics antagonise hypotensive effect of BETA BLOCKERS; enhanced hypotensive effect when diuretics given with CICLOSPORIN; hypokalaemia caused by diuretics antagonises effect of CICLOSPORIN; increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with CICLOSPORIN; acetazolamide possibly increases plasma concentration of CICLOSPORIN.
- Cytotoxics: enhanced hypotensive effect when diuretics given with METHOTREXATE; hypokalaemia caused by diuretics antagonised by CYTOTOXICS; increased risk of nephrotoxicity and ototoxicity when diuretics given with CYTOTOXICS.
- Diuretics: increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with ACETAZOLAMIDE; reduced diuretic effect of diuretics enhanced hypotensive and hyperglycaemic effects when diuretics given with DASABUVIR, OMBITASVIR or RITONAVIR.
- Hormone Antagonists: increased risk of hyperkalaemia when thiazides and related diuretics given with CORTICOSTEROIDS; acetazolamide increases plasma concentration of DASABUVIR, OMBITASVIR and RITONAVIR, reduce dose of diuretic with CORTICOSTEROIDS; avoidance of spironolactone advised by manufacturer of MITOTANE—antagonism of effect; increased risk of nephrotoxicity and ototoxicity when diuretics given with MITOTANE.
- Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by COLESTIPOL and COLESTYRAMINE give at least 2 hours apart.
- Lithium: aldosterone antagonists and potassium-sparing diuretics reduce increase of LITHIUM (increased plasma concentration and risk of toxicity); loop diuretics and thiazides and related diuretics reduce increase of LITHIUM (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; acetazolamide increases the excretion of LITHIUM.
- Methyldopa: enhanced hypotensive effect when diuretics given with METHYLDOPA.
- Moxisylyte: enhanced hypotensive effect when diuretics given with MOXISYLYTE.
- Moxonidine: enhanced hypotensive effect when diuretics given with MOXONIDINE.
- Muscle Relaxants: enhanced hypotensive effect when diuretics given with BACLOFEN or TIZANIDINE.
- Nitrates: enhanced hypotensive effect when diuretics given with NITRATES.
- Oestrogens: diuretic effect of diuretics antagonised by OESTROGENS.
- Potassium Salts: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with POTASSIUM SALTS.
- Progestogens: risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with DROSPIRENONE (monitor serum potassium during first cycle).
- Prostaglandins: enhanced hypotensive effect when diuretics given with ALPROSTADIL.
- Sacubitril: plasma concentration of furosemide reduced by SACUBITRIL.
- Sympathomimetics, Beta2: increased risk of hyperkalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of BETA2 SYMPATHOMIMETICS.
Diuretics (continued)

- Tacrolimus: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with
  - TACROLIMUS
- Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with THEOPHYLLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with HYDRAZONE, MINOXIDIL or SODIUM NITROPRUSSIDE
- Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with ALFACALCICOL, CALCIOTRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Diuretics, Loop | see Diuretics
Diuretics, Potassium-sparing | see Diuretics
Diuretics, Thiazide and related | see Diuretics
Doxatexel

- Antibacterials: plasma concentration of docetaxel possibly increased by
  - CLARITHROMYCIN and
  - TELITHROMYCIN
- Antivirals: reduced plasma concentration of docetaxel when given with
  - VACCAZOLE (consult docetaxel product literature); plasma concentration of docetaxel possibly increased by
  - IRACONAZOLE and
  - VORICONAZOLE
- Antidepressants: manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Antibacterials: plasma concentration of docetaxel possibly increased by
  - PHENYTOIN
  - FOSPHENYTOIN
- Antifungals: in vitro studies suggest a possible interaction between docetaxel and NETUPITAN; plasma concentration of docetaxel increased by
  - SORAFENIB
- Netupitant: plasma concentration of docetaxel increased by NETUPITAN

Dolutesgravir

- Antacids: absorption of dolutesgravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS—manufacturer of dolutesgravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts
- Antivirals: plasma concentration of dolutesgravir reduced by
  - RIFAMPICIN (see under Dolutesgravir, p. 592)
- Antidepressants: plasma concentration of dolutesgravir possibly reduced by
  - ST JOHN’S WORT (see under Dolutesgravir, p. 592)
- Antidiabetics: dolutesgravir increases the plasma concentration of METFORMIN—consider reducing dose of metformin
- Antiepileptics: plasma concentration of dolutesgravir reduced by
  - CARBAMAZEPINE (see under Dolutesgravir, p. 592); plasma concentration of dolutesgravir possibly reduced by
  - OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and
  - PRIMIDONE (see under Dolutesgravir, p. 592)
- Antivirals: plasma concentration of dolutesgravir reduced by
  - EFAVIRENZ, ETIRAVIRINE and
  - TIPRANAVIR (see under Dolutesgravir, p. 592)
- Calcium Salts: absorption of dolutesgravir reduced by
  - CALCIUM SALTS—manufacturer of dolutesgravir advises give at least 2 hours before or 6 hours after calcium salts
- Iron Salts: absorption of dolutesgravir reduced by
  - ORAL IRON SALTS—manufacturer of dolutesgravir advises give at least 2 hours before or 6 hours after oral iron salts

Domperidone

- Analgesics: effects of domperidone on gastro-intestinal activity antagonised by OPIOID ANALGESICS
- Antibacterials: possible increased risk of ventricular arrhythmias when domperidone given with
  - CLARITHROMYCIN or
  - TELITHROMYCIN
- Antivirals: reduced plasma concentration of domperidone when given with
  - VORICONAZOLE (risk of ventricular arrhythmias; possible increased risk of ventricular arrhythmias when domperidone given with
  - ITROCONAZOLE or
  - CICLOSPORIN
- Antidepressants: possible increased risk of ventricular arrhythmias when domperidone given with
  - ARTEMOMIL WITH PIPAQUAINE
- Antifungals: avoid concomitant use of domperidone with
  - ORAL RIFAMPICIN
- Cytotoxics: possible increased risk of ventricular arrhythmias when domperidone given with
  - DOXORUBICIN
- Diuretics: possible increased risk of ventricular arrhythmias when domperidone given with
  - DOXORUBICIN
- Theophylline: possible increased risk of ventricular arrhythmias when domperidone given with
  - THEOPHYLLINE
- Doxapram given with
  - VORICONAZOLE—avoid concomitant use
  - CICLOSPORIN
  - PHENYTOIN
  - FOSPHENYTOIN
  - PRIMIDONE, RASAGILINE, ROTIGOTINE, SELEGILINE, and TOLCAPONE

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxycycline see Tetracyclines

Diuretics (continued)

- Tacrolimus: increased risk of hyperkalaemia when aldosterone antagonists or potassium-sparing diuretics given with
  - TACROLIMUS
- Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with THEOPHYLLINE
- Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with HYDRAZONE, MINOXIDIL or SODIUM NITROPRUSSIDE
- Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with ALFACALCICOL, CALCIOTRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Diuretics, Loop | see Diuretics
Diuretics, Potassium-sparing | see Diuretics
Diuretics, Thiazide and related | see Diuretics
Dobutamine see Sympathomimetics

Dolutesgravel

- Antidepressants: possible increased risk of ventricular arrhythmias when domperidone given with
  - DOXAPRAM
  - THEOPHYLLINE
- Cytotoxics: possible increased risk of ventricular arrhythmias when domperidone given with
  - APOMORPHINE
  - VORICONAZOLE

Dopamine see Sympathomimetics

Dopaminergics see Amantadine, Apomorphine, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Ropinirole, Rotigotine, Selegiline, and Tolcapone

Dopexamine see Sympathomimetics

Dorzolamidene see Diuretics

Dosulepine see Antidepressants, Tricyclic

Doxapram

- Aminophylline: increased CNS stimulation when doxapram given with
  - AMINOPHYLLINE
    - Anaesthetics, General: increased risk of arrhythmias when doxapram given with
      - VOLATILE LIQUID GENERAL ANAESTHETICS
        - (avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics)
    - Antidepressants: effects of doxapram enhanced by
      - MAOIS
    - Sympathomimetics: increased risk of hypertension when doxapram given with
      - SYMPATHOMIMETICS
    - Theophylline: increased CNS stimulation when doxapram given with
      - THEOPHYLLINE

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxorubicin

- Antipsychotics: avoid concomitant use of cytoxotics with
  - CLOzapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of doxorubicin reduced by
  - RIFAMPICIN (see under Doxorubicin, p. 592)
- Antidepressants: plasma concentration of doxorubicin possibly increased by
  - ST JOHN’S WORT (see under Doxorubicin, p. 592)
- Antidiabetics: doxorubicin possibly increases the plasma concentration of METFORMIN—consider reducing dose of metformin
- Antiepileptics: plasma concentration of doxorubicin reduced by
  - CARBAMAZEPINE (see under Doxorubicin, p. 592); plasma concentration of doxorubicin possibly reduced by
  - EFFENBARTAL, PHENOBARBITAL, PHENYTOIN and
  - PRIMIDONE (see under Doxorubicin, p. 592)
- Antibacterials: plasma concentration of doxorubicin reduced by
  - EFVIRENZ, ETIVIRINE and
  - TIPRANAVIR (see under Dolutesgravir, p. 592)
- Calcium Salts: absorption of doxorubicin reduced by
  - CALCIUM SALTS—manufacturer of doxorubicin advises give at least 2 hours before or 6 hours after calcium salts
- Iron Salts: absorption of doxorubicin reduced by
  - ORAL IRON SALTS—manufacturer of doxorubicin advises give at least 2 hours before or 6 hours after oral iron salts
- Antituberculous agents: plasma concentration of doxorubicin possibly increased by
  - VORICONAZOLE—avoid concomitant use
- Cardiac Glycosides: doxorubicin possibly reduces absorption of
  - DIGOXIN TABLETS
- Cytotoxics: possible increased risk of cardiotoxicity when doxorubicin given with
  - CICLOSPORIN
- Antivirals: doxorubicin possibly reduces absorption of
  - VACCAZOLE
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with
  - VACCINES—avoid concomitant use
Dronedarone

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE or ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other 
  - Anti-ARRHYTHMICS; increased risk of ventricular arrhythmias when dronedarone given with 
  - AMIODARONE or 
  - DISOPYRAMIDE—avoid concomitant use
- Antibacterials: manufacturer of dronedarone advises avoid concomitant use with 
  - CLRTHROMYCIN (risk of ventricular arrhythmias); plasma concentration of dronedarone increased by 
  - ERYTHROMYCIN (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by 
  - Rifampicin—avoid concomitant use; avoidance of dronedarone advised by manufacturer of 
  - FIDAXOMICIN; increased risk of ventricular arrhythmias when dronedarone given with 
  - Telithromycin—avoid concomitant use
- Anticoagulants: dronedarone possibly enhances anticoagulant effect of 
  - Coumarins and 
  - Phenindione; dronedarone increases plasma concentration of 
  - Dabigatran—avoid concomitant use; dronedarone increases plasma concentration of 
  - Edoxaban (reduce dose of edoxaban—see under Edoxaban, p. 118); avoidance of dronedarone advised by manufacturer of 
  - Rivaroxaban
- Antidepressants: avoidance of dronedarone advised by 
  - Citalopram and 
  - Escitalopram (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by 
  - St John's Wort—avoid concomitant use; manufacturer of dronedarone advises concomitant use with 
  - Tricyclics (risk of ventricular arrhythmias)
- Antiepileptics: plasma concentration of dronedarone possibly reduced by 
  - Carbamazepine, 
  - Fosphenytoin, 
  - Phenobarbital, 
  - Phenytoin and 
  - Primidone—avoid concomitant use
- Antifungals: plasma concentration of dronedarone increased by 
  - Ketoconazole—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with 
  - Itraconazole, 
  - Posaconazole and 
  - Voriconazole
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with 
  - Antipsychotics that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with 
  - Phenothiazines (risk of ventricular arrhythmias)
- Antivirals: manufacturer of dronedarone advises avoid concomitant use with 
  - Ritonavir; increased risk of ventricular arrhythmias when dronedarone given with 
  - Saquinavir—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with 
  - Beta-blockers; dronedarone possibly increases plasma concentration of 
  - Metoprolol and 
  - Propranolol; increased risk of ventricular arrhythmias when dronedarone given with 
  - Sotalol—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of dronedarone increased by 
  - Nifedipine; increased risk of bradyarrhythmia and myocardial depression when dronedarone given with 
  - Diltiazem and 
  - Verapamil
- Cardiac Glycosides: dronedarone increases plasma concentration of 
  - Digoxin (halve dose of digoxin)
- Cytotoxics: dronedarone possibly increases the plasma concentration of 
  - Bosutinib; manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; dronedarone possibly increases the plasma concentration of 
  - Ibrutinib—reduce dose of ibrutinib (see under ibrutinib, p. 867)
- Fingolimod: possible increased risk of bradyarrhythmia when dronedarone given with 
  - Fingolimod
- Grapefruit Juice: plasma concentration of dronedarone increased by 
  - Grapefruit Juice—avoid concomitant use
- Lipid-regulating Drugs: dronedarone possibly increases plasma concentration of 
  - Atorvastatin; dronedarone increases plasma concentration of 
  - Rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when dronedarone given with 
  - Simvastatin; avoidance of 

Droperidol see Antipsychotics

Drospirenone see Progestogens

Dulaglutide see Antidiabetics

Duloxetine

- Analgesics: possible increased serotonergic effects when SSRI-related antidepressants given with 
  - Fentanyl; possible increased serotonergic effects when duloxetine given with 
  - Pethidine or Tramadol
- Antibacterials: metabolism of duloxetine inhibited by 
  - Ciprofloxacin—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSRI-related antidepressants given with 
  - Dabigatran
- Antidepressants: metabolism of duloxetine inhibited by 
  - Fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with 
  - St John's Wort, 
  - Amitriptyline, 
  - Clopidogrel, 
  - Moclobemide or 
  - Venlafaxine; duloxetine should not be started until 2 weeks after stopping 
  - MAOI, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRI-related antidepressants do not start 
  - Moclobemide for at least 1 week; possible increased risk of convulsions when SSRI-related antidepressants given with 
  - Vortioxetine
- Antimalarials: avoidance of antidepressants advised by manufacturer of 
  - Arteether with Lumefantrine and 
  - Artemether with Piperaquine
- Atomoxetine: possible increased risk of convulsions when antidepressants given with 
  - Atomoxetine
- Dapoxetine: possible increased risk of serotonin effects when duloxetine given with 
  - Dapoxetine (manufacturer of dapoxetine advises duloxetine should not be started until 
  - 1 week after stopping dapoxetine, avoid dapoxetine for 
  - 2 weeks after stopping duloxetine)
- 5HT, receptor Agonists: possible increased serotonergic effects when duloxetine given with 
  - 5HT agonists
- 5HT2-receptor Agonists: possible increased serotonergic effects when SSRI-related antidepressants given with 
  - 5HT antagonists
- Methyldopa: risk of CNS toxicity when SSRI-related antidepressants given with 
  - Methyldopa—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 
  - 4 hours after administration)

Doxarubin

- Calcium-channel Blockers: plasma concentration of doxarubin increased by 
  - Diltiazem and 
  - Verapamil

Drospirenone see Progestogens

Edoxaban

- Analgesics: increased risk of bleeding when edoxaban given with 
  - NSAIDs (manufacturer of edoxaban advises avoid long-term NSAIDs); increased risk of haemorrhage when 
  - Anticoagulants given with 
  - Ibrutinib; increased risk of haemorrhage when edoxaban given with 
  - Dronedarone (reduce dose of edoxaban—see under Edoxaban, p. 118)
- Antibacterials: plasma concentration of edoxaban given by 
  - Erythromycin (reduce dose of edoxaban—see under 
  - Edoxaban, p. 118); plasma concentration of edoxaban reduced by 
  - Rifampicin—avoid concomitant use
- Anti-arrhythmics: plasma concentration of edoxaban increased by 
  - Dronedarone (reduce dose of edoxaban—see under Edoxaban, p. 118)
- Anticoagulants: possible increased risk of haemorrhage when edoxaban given with 
  - Anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of 
  - Haemorrhage when other anticoagulants given with
Eloxaban

- Anticoagulants (continued)
  - **APIXABAN**, **DABIGATRAN** and **RIVAROXABAN** (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
  - Antidepressants: plasma concentration of eloxaban possibly reduced by **ST JOHN’S WORT**
  - Antiplateletics: plasma concentration of eloxaban possibly reduced by **CARBAMAZEPINE**, **FOSPHENOTHION**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
  - Antifungals: plasma concentration of eloxaban increased by **KETOCONAZOLE** (reduce dose of eloxaban—see under Eloxaban, p. 118)
  - Calcium-channel blockers: plasma concentration of eloxaban increased by **VERAPAMIL**
  - Ciclosporin: plasma concentration of eloxaban increased by **CICLOSPORIN** (reduce dose of eloxaban—see under Eloxaban, p. 118)

Efavirenz

- Analgesics: efavirenz reduces plasma concentration of METHADONE
- Antibacterials: efavirenz reduces plasma concentration of CLARITHROMYCIN, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of **rifabutin**—increase dose of rifabutin; plasma concentration of efavirenz reduced by **rifampicin**—increase dose of efavirenz; efavirenz possibly reduces plasma concentration of **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use
- Anticoagulants: efavirenz possibly affects plasma concentration of **COUMARINS**
- Antidepressants: plasma concentration of efavirenz reduced by **ST JOHN’S WORT**—avoid concomitant use
- Antiplateletics: plasma concentration of both drugs reduced when efavirenz given with **CARBAMAZEPINE**
- Antifungals: efavirenz reduces plasma concentration of **ITRACONAZOLE**, **KETOCONAZOLE** and **POSACONAZOLE**; avoidance of efavirenz advised by manufacturer of **ISAVUCONAZOLE**; efavirenz reduces plasma concentration of **voriconazole**, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of **CASPofungin**—consider increasing dose of caspofungin
- Antimalarials: efavirenz reduces plasma concentration of **ARTEMETHER WITH LUMEFANTRINE**; efavirenz possibly affects plasma concentration of **PROGUANIL**
- Antipsychotics: efavirenz possibly reduces plasma concentration of **Aripiprazole** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of **PIMOZIDE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of **ATAZANAVIR** (plasma concentration of atazanavir reduced); efavirenz reduces the plasma concentration of **DACLATASVIR**—increase dose of daclatasvir (see under Daclatasvir, p. 577); efavirenz reduces plasma concentration of **BARUNAVIR** (adjust dose—consult product literature); avoidance of efavirenz advised by manufacturer of **DASABUVIR, ELVIGETRAVIR, OMITBASVIR and PARITAPREVI**; efavirenz reduces the plasma concentration of **DOLTEGRAVIR** (see under Doltegravir, p. 592); efavirenz possibly reduces plasma concentration of **ETRIVARINE**—avoid concomitant use; efavirenz reduces plasma concentration of **INDINAVIR and SIMprevir**; efavirenz reduces plasma concentration of **Lopinavir**—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of **MARAVIRIC**—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by **NEVIRAPINE**—avoid concomitant use; toxicity of efavirenz increased by **RITONAVIR**, monitor liver function tests—manufacturer of Atiripla® advises avoid concomitant use with high-dose ritonavir; efavirenz significantly reduces plasma concentration of **SAQUINAVIR**; efavirenz reduces plasma concentration of **TELAPREVI**—increase dose of telaprevir

Efavirenz (continued)

- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with **midazolam**—avoid concomitant use
- Atovaquone: efavirenz reduces plasma concentration of **Atovaquone**—avoid concomitant use
- Avanafil: efavirenz possibly reduces plasma concentration of **Avanafil**—manufacturer of avanafil advises avoid concomitant use
- Bupropion: efavirenz accelerates metabolism of **Bupropion** (reduced plasma concentration)
- Calcium-channel blockers: efavirenz reduces plasma concentration of **Diltiazem**
- Ciclosporin: efavirenz possibly reduces plasma concentration of **Ciclosporin**
- Cytotoxics: efavirenz possibly reduces plasma concentration of **bosutinib**—manufacturer of bosutinib advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with **ergot alkaloids**—avoid concomitant use
- Grapefruit Juice: plasma concentration of efavirenz possibly increased by **grapefruit juice**
- Guanfacine: efavirenz possibly reduces plasma concentration of **guanfacine**—increase dose of guanfacine
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of **atorvastatin, pravastatin and simvastatin**
- Orlistat: absorption of efavirenz possibly reduced by **orlistat**
- Progestogens: efavirenz possibly reduces contraceptive effect of **progestogen**
- Tacrolimus: efavirenz possibly affects plasma concentration of **Tacrolimus**

Eletriptan see 5HT₁-receptor agonists (under HT)

Eltrombopag

- Antacids: absorption of eltrombopag reduced by **antacids** (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by **lopinavir**
- Calcium Salts: absorption of eltrombopag possibly reduced by **calcium salts** (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by **dairy products** (give at least 4 hours apart)
- Iron Salts: absorption of eltrombopag possibly reduced by **oral iron salts** (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature)
- Selenium: absorption of eltrombopag possibly reduced by **selenium** (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by **zinc** (give at least 4 hours apart)

Eltegravir

- Antacids: absorption of eltegravir reduced by **aluminium hydroxide and oral magnesium salts** (give at least 4 hours apart)
- Antibacterials: plasma concentration of eltegravir reduced by **rifabutin** also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of eltegravir advises avoid concomitant use with **rifampicin**
- Antidepressants: manufacturer of eltegravir advises avoid concomitant use with **st john’s wort**
- Antiplateletics: manufacturer of eltegravir advises avoid concomitant use with **carbamazepine, fosphenothion**, **phenobarbital, phenytoin and primidone**
- Antivirals: plasma concentration of eltegravir increased by **atazanavir** and **lopinavir** boosted with ritonavir (reduce dose of eltegravir); manufacturer of eltegravir advises avoid concomitant use with **efavirenz and nevirapine**
- Bosentan: manufacturer of eltegravir advises avoid concomitant use with **bosentan**
- Orlistat: absorption of eltegravir possibly reduced by **orlistat**
- Progestogens: eltegravir increases plasma concentration of **noregestimate**

Empagliflozin see Antidiabetics
Emtricitabine

- Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine
- Orlistat: absorption of emtricitabine possibly reduced by
  - Orlistat

Enalapril see ACE Inhibitors

Enfuvidate
- Orlistat: absorption of enfuvirtide possibly reduced by
  - Orlistat

Enoxaparin see Heparins

Enoximine see Phosphodiesterase Inhibitors

Entacapone
- Anticoagulants: entacapone enhances anticoagulant effect of
  - Warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective MADIS
- Dopaminergics: entacapone possibly enhances effects of apomorphine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10 mg selegiline if used concomitantly
- Iron salts: absorption of entacapone reduced by oral iron salts
- Memantine: effects of dopaminergics possibly enhanced by
  - Memantine
- Methyldopa: entacapone possibly enhances effects of methyldopa; antiparkinsonian effect of dopaminergics antagonised by
  - Methyldopa
- Sympathomimetics: entacapone possibly enhances effects of
  - Adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine)

Enteral Feeds
- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of
  - Coumarins and
  - Phenindione
- Antiepileptics: enteral feeds possibly reduce absorption of
  - Fosphenytoin and phenytoin

Enzalutamide
- Anticoagulants: enzalutamide possibly reduces plasma concentration of
  - Coumarins
- Antivirals: avoidance of enzalutamide advised by manufacturer of dasabuvir, omibitasvir and paritaprevir
- Anxiolytics and Hypnotics: enzalutamide reduces plasma concentration of
  - Midazolam
- Lipid-regulating Drugs: plasma concentration of enzalutamide increased by
  - Gemfibrozil—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- Ulcer-healing Drugs: enzalutamide reduces plasma concentration of
  - Omeprazole

Ephedrine see Sympathomimetics

Epinephrine

**NOTE** Epinephrine interactions as for adrenaline, see under sympathomimetics

Epirubicin
- Antipsychotics: avoid concomitant use of cytotoxic with
  - Clozapine (increased risk of agranulocytosis)
  - Ciclosporin: plasma concentration of epirubicin increased by
  - Ciclosporin
- Cytotoxic: possible increased risk of cardiotoxicity when epirubicin given with
  - Trastuzumab—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by
  - Cimetidine
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live
  - Vaccines—avoid concomitant use

Eplerenone see Diuretics

Eprosartan see Angiotensin-II Receptor Antagonists

Eptifibatide
- Iloprost: increased risk of bleeding when eptifibatide given with
  - Iloprost

Ergocalciferol see Vitamins

Ergometrine see Ergot Alkaloids

Ergot Alkaloids
- Antibacterials: increased risk of ergotism when ergot alkaloids given with
  - Clarithromycin, erythromycin or telithromycin—avoid concomitant use; increased risk of ergotism when ergotamine given with
  - Tetracyclines

Ergot Alkaloids (continued)
- Antidepressants: possible risk of hypertension when ergotamine given with
  - Redoxetine
- Antifungals: avoidance of ergot alkaloids advised by manufacturer of
  - Ketoconazole; avoidance of ergotamine advised by manufacturer of
  - Itraconazole (increased risk of ergotism); increased risk of ergotism when ergometrine given with
  - Voriconazole—avoid concomitant use; increased risk of ergotism when ergotamine given with
  - Imitazoles or triazoles—avoid concomitant use
- Antipsychotics: plasma concentration of ergot alkaloids possibly increased by
  - Lurasidone (increased risk of toxicity)
- Antivirals: plasma concentration of ergot alkaloids possibly increased by
  - Atazanavir—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of
  - Boceprevir and Telaprevir; increased risk of ergotism when ergot alkaloids given with
  - Darunavir—manufacturer of darunavir advises avoid concomitant use; increased risk of ergotism when ergot alkaloids given with
  - Efavirenz or ritonavir—avoid concomitant use; increased risk of ergotism when ergometrine given with
  - Indinavir—avoid concomitant use
- Beta-blockers: increased peripheral vasodilatation when ergot alkaloids given with
  - Beta-blockers
- Cobicistat: plasma concentration of ergot alkaloids possibly increased by
  - Cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Cytotoxics: avoidance of ergotamine advised by manufacturer of
  - Ceritinib and ideализis; caution with ergot alkaloids advised by manufacturer of
  - Crizotinib
- 5HT-receptor Agonists: increased risk of vasospasm when ergotamine given with
  - Almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine); increased risk of vasospasm when ergotamine given with
  - Eletriptan
- Frovatriptan or naratriptan, avoid ergotamine given for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)
- Sympathomimetics: increased risk of ergotism when ergot alkaloids given with
  - Sympathomimetics
- Ticagrelor: plasma concentration of ergot alkaloids possibly increased by
  - Ticagrelor
- Ulcer-healing Drugs: increased risk of ergotism when ergotamine given with
  - Cimetidine—avoid concomitant use

Ergotamine see Ergot Alkaloids

Eribulin
- Antibacterials: plasma concentration of eribulin possibly reduced by
  - Rifampicin
- Antidepressants: plasma concentration of eribulin possibly reduced by
  - St John’s Wort
- Antiepileptics: plasma concentration of eribulin possibly reduced by
  - Carbamazepine, fosphenytoin and phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with
  - Clozapine (increased risk of agranulocytosis)

Erlotinib
- Analgesics: increased risk of bleeding when erlotinib given with
  - NSAIDs
- Antacids: plasma concentration of erlotinib possibly reduced by
  - Antacids—give antacids at least 4 hours before or 2 hours after erlotinib
- Antibacterials: plasma concentration of erlotinib increased by
  - Ciprofloxacin; metabolism of erlotinib accelerated by
  - Rifampicin (reduced plasma concentration)
- Anticoagulants: increased risk of bleeding when erlotinib given with
  - Coumarins
- Antifungals: metabolism of erlotinib inhibited by
  - Ketoconazole (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytotoxics with
  - Clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of erlotinib advised by manufacturer of
  - Boceprevir
Erlotinib (continued)

- Cytotoxics: plasma concentration of erlotinib possibly increased by **CAPECTABINE**
- Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with **OMEPRAZOLE**, **RAMOTIDINE**, **NIZATIDINE**, **RANTOPRAZOLE**, and **RABEPRAZOLE**; plasma concentration of erlotinib reduced by **RANITIDINE**—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by **OMEPRAZOLE**—manufacturer of erlotinib advises avoid concomitant use

Ertapenem

- Antiepileptics: carbamazepine reduces plasma concentration of **SODIUM VALPROATE** and **VALPROIC ACID**—avoid concomitant use
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Esinicarbazepine

- Anticoagulants: esinibcarbazepine reduces plasma concentration of **WARFARIN**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of esinibcarbazepine possibly reduced by **CARBAMAZEPINE** but risk of side-effects increased; plasma concentration of esinibcarbazepine reduced by **FOSPHENYTOIN** and **PHENYTOIN**, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of esinibcarbazepine advises avoid concomitant use with **OXCARBAZEPINE**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Lipid-regulating Drugs: esinibcarbazepine reduces plasma concentration of **ROSIUVASTATIN**; esinibcarbazepine reduces plasma concentration of **SIMVASTATIN**—consider increasing dose of simvastatin
- Oestrogens: esinibcarbazepine accelerates metabolism of **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **ORLISTAT**
- Progestogens: esinibcarbazepine accelerates metabolism of **PROGESTONES** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)

Esmolol see Beta-blockers

Esomeprazole see Proton Pump Inhibitors

Estradiol see Oestrogens

Estramustine

- Antacids: absorption of estramustine possibly reduced by **ALUMINIUM HYDROXIDE** and **ORAL MAGNESIUM SALTS**—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by **SODIUM CLORONATE**
- Calcium Salts: absorption of estramustine reduced by **CALCIUM SALTS** (manufacturer of estramustine advises avoid concomitant administration)

Estrone see Oestrogens

Estrone see Oestrogens

Etenacept (continued)

- Anakinra: avoid concomitant use of etanercept with **ANAKINRA**
- Vaccines: risk of generalised infections when etanercept given with live **VACCINES**—avoid concomitant use

Ethambutol

- Antibacterials: plasma concentration of ethambutol increased by **DELAMANID**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

Ethinylenestraldiol see Oestrogens

Ethosuximide

- Antibacterials: metabolism of ethosuximide inhibited by **ISONIAZID** (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by **CARBAMAZEPINE**, **PHENOBARBITAL** and **PRIMIDONE**; plasma concentration of ethosuximide possibly reduced by **FOSPHENYTOIN** and **PHENYTOIN**, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of ethosuximide advises avoid concomitant use with **OMEPRAZOLE**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **ORLISTAT**

Etodolac see NSAIDs

Etomidine see Anaesthetics, General

Etonogestrel see Progestogens

Etoposide

- Anticoagulants: etoposide possibly enhances anticoagulant effect of **COUMARINS**
- Antidepressants: plasma concentration of etoposide possibly reduced by **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Antifungals: plasma concentration of etoposide increased by **KETOCONAZOLE**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (increased risk of agranulocytosis)
- Atovaquone: plasma concentration of etoposide possibly increased by **ATOVQUONE**
- Ciclosporin: plasma concentration of etoposide possibly increased by **CICLOSPORIN** (increased risk of toxicity)
- Netupitant: plasma concentration of etoposide increased by **NETUPITANT**

Etoricoxib see NSAIDs

Etravirine

- Antibacterials: etravirine reduces plasma concentration of **CLARITHROMYCIN** (but concentration of an active metabolite increased), also plasma concentration of etravirine increased; plasma concentration of both drugs reduced when etravirine given with **RIFABUTIN**; manufacturer of etravirine advises avoid concomitant use with **RIFAMPICIN**; etravirine possibly reduces plasma concentration of **BEDAQUILINE**—manufacturer of bedaquiline advises avoid concomitant use
- Antidepressants: manufacturer of etravirine advises avoid concomitant use with **ST JOHN’S WORT**
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Antifungals: avoidance of etravirine advised by manufacturer of **SAUVICONAZOLE**
- Antimalarials: etravirine reduces plasma concentration of **ARTEMETHER WITH LUMEFANTRINE**
- Antivirals: effects of both drugs possibly reduced when etravirine given with **DECOLOPIVIR**; avoidance of etravirine advised by manufacturer of **DACLATASVIR** (plasma concentration of daclatasvir possibly reduced); avoidance of
Etravirine

- **Antivirals (continued)**
  - etravirine advised by manufacturer of DASABUVIR,OMBITASVIR,PARITAPREVIRandsIMEPREVIR; etravirine reduces the plasma concentration of DOLUTEGRAVIR (see under Dolutegravir, p. 592); plasma concentration of etravirine possibly reduced by EVEROLIMUS—avoid concomitant use; etravirine increases plasma concentration of FOSAMPRENAVIR (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of INDINAVIR—avoid concomitant use; etravirine possibly reduces plasma concentration of MARAVIROC; plasma concentration of etravirine reduced by TIPRANAVIR, also plasma concentration of tipranavir increased (avoid concomitant use)
  - Cardiovascular Drugs: etravirine increases plasma concentration of DIGOXIN
  - CLOPIDOGREL—avoid concomitant use with ORLISTAT
  - Cytotoxics: etravirine possibly reduces plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid concomitant use
  - Guanfacine: etravirine possibly reduces plasma concentration of GUANAFACINE—increase dose of guanfacine
  - Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of ATORVASTATIN
  - Orlistat: absorption of etravirine possibly reduced by ORLISTAT
  - Sildenafil: etravirine reduces plasma concentration of SILDENAFIL

Evelocumab

- Antipsychotics: avoid concomitant use of CYCLOSPORIN—manufacturer of cyclosporin advises avoid concomitant use
- Antifungals: plasma concentration of everolimus increased by KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of everolimus possibly increased by ITRACONAZOLE, POSACONAZOLE and VORICONAZOLE—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by AZATANAVIR, DARUNAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with VERAPAMIL (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by CICLOSPORIN (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by IMATINIB (consider reducing the dose of everolimus—consult everolimus product literature)
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with GRAPEFRUIT JUICE
- Lumacaftor: avoidance of everolimus advised by manufacturer of LUMACAFTOR

Exemestane

- Antibacterials: plasma concentration of exemestane possibly reduced by RIFAMPICIN

Exenatide see Antidiabetics

Ezetimibe

- Anticoagulants: ezetimibe possibly enhances anticoagulant effect of COUMARINS
- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with CICLOSPORIN
- Lipid-regulating Drugs: ezetimibe increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis and gallbladder disease when ezetimibe given with FIBRATES—discontinue if suspected

Famotidine see Histamine H₂-antagonists

Faramipridine

- Ulcer-healing Drugs: manufacturer of fampridine advises avoid concomitant use with CIMETIDINE

Fexofenadine see Antihistamines

Fibrates

- Antibacterials: increased risk of myopathy when fibrates given with DAPTOMYCIN (preferably avoid concomitant use)
- Anticoagulants: fibrates enhance anticoagulant effect of COUMARINS and PHENINDONE
- Antidiabetics: fibrates may improve glucose tolerance and have an additive effect with INSULIN or SULFONYLUREAS; gemfibrozil possibly enhances hypoglycaemic effect of NATEGLINIDE; increased risk of severe hypoglycaemia when gemfibrozil given with REPAGLINIDE—avoid concomitant use
- Antivirals: avoidance of gemfibrozil advised by manufacturer of DASABUVIR; gemfibrozil increases plasma concentration of PARITAPREVIR—manufacturer of paritaprevir advises avoid concomitant use
- Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with CICLOSPORIN
- Clofibrate: possible increased risk of myopathy when fibrates given with COLCHICINE
- Cytotoxics: gemfibrozil increases plasma concentration of DABRAFENIB; gemfibrozil increases plasma concentration of BEXAROTENE—avoid concomitant use
- Hormone Antagonists: gemfibrozil increases plasma concentration of ENZALUTAMIDE—manufacturer of enzalutamide advises avoid concomitant use or halve dose of enzalutamide
- Leukotriene Receptor Antagonists: gemfibrozil increases plasma concentration of MONTELUKAST
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with ATORVASTATIN, FLUVASTATIN or PRAVASTATIN (preferably avoid concomitant use); increased risk of myopathy when fibrates given with ROSUVASTATIN (see under Rosuvastatin, p. 193); possible increased risk of myopathy when bezafibrate given with SIMVASTATIN (see under Simvastatin, p. 194); possible increased risk of myopathy when ciprofibrate given with SIMVASTATIN (see under Simvastatin, p. 194); increased risk of myopathy when gemfibrozil given with SIMVASTATIN (avoid concomitant use); increased risk of cholelithiasis and gallbladder disease when fibrates given with EZETIMIBE—discontinue if suspected; increased risk of myopathy when fibrates given with STATINS; reduce maximum dose of fenofibrate when given with STATINS—see under Fenofibrate, p. 188
Fidaxomicin
- Anti-arrhythmics: manufacturer of fidaxomicin advises avoid concomitant use with AMIODARONE and DRONEDARONE
- Antibacterials: manufacturer of fidaxomicin advises avoid concomitant use with CLARITHROMYCIN and ERITHROMYCIN
- Antifungals: manufacturer of fidaxomicin advises avoid concomitant use with KETOCONAZOLE
- Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with VERAPAMIL
- Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with CICLOSPORIN
- Vaccines: antibacterials manufacturer of fidaxomicin advises avoid concomitant use with UNDER Typhoid Vaccine in BNF or BNFC

Filgrastim
- Cytotoxics: neutropenia possibly exacerbated when filgrastim given with CAPECITABINE, FLUOROURACIL or TEGAFUR

Fingolimod
- Anti-arrhythmics: possible increased risk of bradycardia when fingolimod given with AMIODARONE, DISOPYRAMIDE or DRONEDARONE
- Antidepressants: plasma concentration of fingolimod possibly reduced by ST JOHN’S WORT—manufacturer of fingolimod advises avoid concomitant use
- Antiepileptics: plasma concentration of fingolimod reduced by CARBAMAZEPINE
- Antifungals: plasma concentration of fingolimod increased by KETOCONAZOLE
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with BETA-BLOCKERS
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with DILTIAZEM or VERAPAMIL

Flavoxate see Antimuscarinics

Flecainide
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAIN or PONVACAINE
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other ANTI-ARRHYTHMIACS; plasma concentration of flecainide increased by AMIODARONE (halve dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by FLUOXETINE; increased risk of ventricular arrhythmias when flecainide given with TRICYCLICS
- Antihistamines: increased risk of ventricular arrhythmias when flecainide given with MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of ARTEMETHER with LUMEFAANTRINE (risk of ventricular arrhythmias); plasma concentration of flecainide increased by QUININE
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with TOLERODINE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ANTI PSYCHOTICS that prolong the QT interval; increased risk of arrhythmias when flecainide given with CLOzapine
- Antivirals: plasma concentration of flecainide possibly increased by FOSAMPRENAVIR, INIDINAVIR, LOPINAVIR and RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with SAQUINAVIR—avoid concomitant use; caution with flecainide advised by manufacturer of TELAPREvir (risk of ventricular arrhythmias)
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with BETA-BLOCKERS; increased myocardial depression when anti-arrhythmics given with BETA-BLOCKERS
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with VERAPAMIL
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with ACETAZOLAMIDE, LOOP DIURETICS or THIADIZIDES AND RELATED DIURETICS
- Ulcer-healing Drugs: metabolism of flecainide inhibited by CIMETIDINE (increased plasma concentration)

FlucloraXin see Penicillins

Fluconazole see Antifungals, Triazole

Flucytosine
- Anti-arrhythmics: renal excretion of flucytosine decreased and cellular uptake increased by AMPHOTERICIN (toxicity possibly increased)
- Cytotoxics: plasma concentration of flucytosine possibly reduced by CYTARABINE

Fludarabine
- Antipsychotics: avoid concomitant use of cytotoxics with AMONAPINE (increased risk of agranulocytosis)
- Cytotoxics: fludarabine increases intracellular concentration of CYTARABINE; increased pulmonary toxicity when fludarabine given with PENTOSTATIN (unacceptably high incidence of fatalities)
- Dipyridamole: effects of fludarabine possibly reduced by Dipyridamol

Fludrocortisone see Corticosteroids

Fluorides
- Calcium Salts: absorption of fluorides reduced by CALCIUM SALTS

Fluorouracil
- Antibacterials: metabolism of fluorouracil inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: fluorouracil enhances anticoagulant effect of COUMARINs
- Antiepileptics: fluorouracil possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with AMIODARONE (increased risk of agranulocytosis)
- Cytotoxics: avoidance of fluorouracil advised by manufacturer of PANITUMUMAB
- Filgrastim: neutropenia possibly exacerbated when fluorouracil given with FILGRASTIM
- Folates: toxicity of fluorouracil increased by FOLIC ACID—avoid concomitant use
- Lipogfilgrastim: neutropenia possibly exacerbated when fluorouracil given with LIPEGFILGRASTIM
- Pegfilgrastim: neutropenia possibly exacerbated when fluorouracil given with PEGFILGRASTIM
- Temoparin: increased skin photosensitivity when topical fluorouracil used with TEMOPORFIN
- Ulcer-healing Drugs: metabolism of fluorouracil inhibited by CIMETIDINE (increased plasma concentration)

Fluoxetine see Antidepressants, SSRI

Flupentixol see Antipsychotics

Fluphenazine see Antipsychotics

Flurazepam see Anxiolytics and Hypnotics

Flurbiprofen see NSAIDs

Flutamide
- Anticoagulants: flutamide enhances anticoagulant effect of COUMARINS

Fluticasone see Corticosteroids

Fluvastatin see Statins

Fluvoxamine see Antidepressants, SSRI

Folates
- Aminosalicylates: absorption of folic acid possibly reduced by SULFASALAZINE
- Antacids: absorption of folic acid possibly reduced by ANTACIDS (manufacturer of folic acid advises give at least 2 hours apart)
- Antiepileptics: folates possibly reduce plasma concentration of FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Cytotoxics: folic acid increases toxicity of CAPECITABINE, FLUOROURACIL and TEGAFUR—avoid concomitant use; avoidance of folates advised by manufacturer of RALTITREXED; avoidance of folic acid advised by manufacturer of PANITUMUMAB

Folic Acid see Folates

Folinic Acid see Folates

Fondaparinux
- Analgesics: increased risk of haemorrhage when anticoagulants given with INTRavenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DABIGATRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except
Fosamprenavir

- Cytotoxics: fosamprenavir reduces plasma concentration of methadone
- Antiarhythmics: fosamprenavir possibly increases plasma concentration of - amiodarone, - flecainide and
- Propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of - lidocaine—avoid concomitant use
- Antibacterials: fosamprenavir increases plasma concentration of - rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by - rifampicin—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of telithromycin
- Anticoagulants: avoidance of fosamprenavir advised by manufacturer of apixaban and rivaroxaban; fosamprenavir may enhance or reduce anticoagulant effect of coumarins
- Antidepressants: plasma concentration of fosamprenavir reduced by - st john’s wort—avoid concomitant use
- Antiepileptics: plasma concentration of fosamprenavir possibly reduced by - carbamazepine, phenobarbital and primidone
- Antifungals: fosamprenavir increases plasma concentration of ketoconazole (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with itraconazole; fosamprenavir possibly reduces plasma concentration of posaconazole
- Antimalarials: caution with fosamprenavir advised by manufacturer of artemether with lumefantrine; fosamprenavir possibly increases plasma concentration of - quinine (increased risk of toxicity)
- Antimuscarinics: avoidance of fosamprenavir advised by manufacturer of darifenac and tolterodine
- Antipsychotics: fosamprenavir possibly increases plasma concentration of - aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); fosamprenavir increases plasma concentration of - pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of - quetiapine—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturer of fosamprenavir advises avoid concomitant use with - boceprevir and - telaprevir; fosamprenavir reduces plasma concentration of - dolutegravir; plasma concentration of fosamprenavir increased by - etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by - lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir reduced by - maraviroc—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by - nevirapine—avoid unboosted fosamprenavir; manufacturer of fosamprenavir advises avoid concomitant use of fosamprenavir with - telaprevir; plasma concentration of fosamprenavir reduced by - tipranavir
- Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of - midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Avanafil: fosamprenavir possibly increases plasma concentration of - avanafil—see under Avanafil, p. 744
- Cicleson: fosamprenavir increases plasma concentration of - ciclosporin
- Cytotoxics: fosamprenavir possibly increases the plasma concentration of - bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosamprenavir possibly increases the plasma concentration of - ibrutinib—reduce dose of ibrutinib (see under ibrutinib, p. 867)

Fosamprenavir (continued)

- Dapoxetine: manufacturer of dapoxetine advises dose reduction when fosamprenavir given with dapoxetine (see under Dapoxetine, p. 751)
- Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with - ergotamine—avoid concomitant use
- Guanfacine: fosamprenavir possibly increases plasma concentration of guanfacine (halve dose of guanfacine)
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with - rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with simvastatin—avoid concomitant use; avoidance of fosamprenavir advised by manufacturer of - lomitapide (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of fosamprenavir possibly reduced by - orlistat
- Ranolazine: fosamprenavir possibly increases plasma concentration of - ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil
- Tacrolimus: fosamprenavir increases plasma concentration of - tacrolimus
- Tadalafil: fosamprenavir possibly increases plasma concentration of - tadalafl
- Vardenafil: fosamprenavir possibly increases plasma concentration of - vardenafl

Fosaprepitant

- Antibacterials: plasma concentration of fosaprepitant possibly increased by - clarithromycin and telithromycin; plasma concentration of fosaprepitant reduced by rifampicin
- Anticoagulants: fosaprepitant possibly reduces anticoagulant effect of warfarin
- Antidepressants: manufacturer of fosaprepitant advises avoid concomitant use with - st john’s wort
- Antidiabetics: fosaprepitant reduces plasma concentration of tolbutamide
- Antiepileptics: plasma concentration of fosaprepitant possibly reduced by - carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone
- Antifungals: plasma concentration of fosaprepitant increased by ketoconazole
- Antipsychotics: manufacturer of fosaprepitant advises avoid concomitant use with - pimozide
- Antivirals: plasma concentration of fosaprepitant possibly increased by - ritonavir
- Anxiolytics and Hypnotics: fosaprepitant increases plasma concentration of midazolam (risk of prolonged sedation)
- Avanafil: fosaprepitant possibly increases plasma concentration of avanafil
- Calcium-channel blockers: plasma concentration of both drugs may increase when fosaprepitant given with diltiazem
- Corticosteroids: fosaprepitant inhibits metabolism of dexamethasone and methylprednisolone
- Cytotoxics: fosaprepitant possibly increases the plasma concentration of - bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; fosaprepitant possibly increases plasma concentration of - ibrutinib
- Guanfacine: fosaprepitant possibly increases plasma concentration of guanfacine (halve dose of guanfacine)
- Lipid-regulating Drugs: separating administration from fosaprepitant by 12 hours advised by manufacturer of lomitapide
- Oestrogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing - oestrogens (alternative contraception recommended)
- Progestogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing - progestogens (alternative contraception recommended)
Fosphenytoin

- Metoclopramide: plasma concentration of fosphenytoin reduced by METOCLOPRAMIDE.
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC.

Other interactions

- Alcohol: plasma concentration of fosphenytoin possibly reduced by chronic heavy consumption of ALCOHOL.
- Aminophylline: plasma concentration of both drugs reduced when fosphenytoin given with AMINOPHYLLINE.
- Analgesics: excretion of fosphenytoin possibly reduced by ACETAMINOPHEN (increased risk of toxicity); fosphenytoin possibly accelerates metabolism of FENTANYL (reduced effect); fosphenytoin accelerates metabolism of METHADONE (reduced effect and risk of withdrawal effects); fosphenytoin possibly increases risk of PETIDINE toxicity; effects of fosphenytoin enhanced by ASPIRIN; fosphenytoin possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Antibacterials: fosphenytoin reduces plasma concentration of ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of fosphenytoin possibly reduced by LEVAMISOLE.
- Anti-arrhythmics: metabolism of fosphenytoin inhibited by AMIODARONE (increased plasma concentration); fosphenytoin reduces plasma concentration of DISOPYRAMIDE; fosphenytoin possibly reduces plasma concentration of DROPERIDOL—avoid concomitant use.
- Anticholinergics: fosphenytoin reduces plasma concentration of CLARITHROMYCIN (increased plasma concentration); metabolism of fosphenytoin possibly inhibited by METRONIDAZOLE (increased plasma concentration); plasma concentration of fosphenytoin increased or decreased by CIPROFLOXACIN; fosphenytoin accelerates metabolism of DOXYCYCLINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of TELITHROMYCIN (avoid during and for 2 weeks after fosphenytoin); plasma concentration of fosphenytoin increased by TRIMETHOPRIM (also increased antifolate effect).
- Anticoagulants: fosphenytoin reduces plasma concentration of APIXABAN and EDOXABAN; fosphenytoin accelerates metabolism of COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); fosphenytoin possibly reduces plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of thrombosis.
- Antidepressants: plasma concentration of fosphenytoin increased by FLUOXETINE and FLUVAXOMIDE; fosphenytoin reduces plasma concentration of MIANSERIN, MIRTAZAPINE and PARoxetine; plasma concentration of fosphenytoin possibly increased by SERTRALINE, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered); plasma concentration of fosphenytoin possibly reduced by ST JOHN’S WORT—avoid concomitant use; fosphenytoin possibly reduces plasma concentration of TRICYCLICS; fosphenytoin possibly reduces plasma concentration of VORITOXINE—consider increasing dose of vortioxetine.

Antidiabetics: plasma concentration of fosphenytoin transiently increased by TOBITAMIDE (possibility of toxicity).

Antiepileptics: fosphenytoin reduces plasma concentration of BRIVARACETAM, LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of both drugs often reduced when fosphenytoin given with CARBAMAZEPINE, also plasma concentration of fosphenytoin may be increased; fosphenytoin reduces plasma concentration of ESICARBAZEPINE, also plasma concentration of fosphenytoin increased; plasma concentration of fosphenytoin possibly increased by ETHOSUXIMIDE, also plasma concentration of ethosuximide possibly reduced; plasma concentration of fosphenytoin increased by OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; fosphenytoin reduces plasma concentration of PERAMpanel (see under Perampanel, p. 301); fosphenytoin often increases plasma concentration of PHENOBARBITAL and PRIMIDONE, plasma concentration of fosphenytoin often reduced but may be increased; fosphenytoin possibly reduces plasma concentration of TEGICABINE; fosphenytoin possibly reduces plasma concentration of RUFINAMIDE, also plasma concentration of fosphenytoin possibly increased; plasma concentration of fosphenytoin increased or possibly reduced when given with SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of fosphenytoin increased by STIRIPENTOL; plasma concentration of fosphenytoin increased by TOPIRAMATE (also plasma concentration of topiramate reduced); plasma concentration of fosphenytoin reduced by VIGABATRIN.

Antifungals: fosphenytoin reduces plasma concentration of KETOCONAZOLE and POSaconazole; anticonvulsant effect of fosphenytoin enhanced by MICONAZOLE (plasma concentration of fosphenytoin increased); plasma concentration of fosphenytoin increased by FLUCONAZOLE (consider reducing dose of fosphenytoin); fosphenytoin possibly reduces plasma concentration of ISAVUCONAZOLE—avoid concomitant use; fosphenytoin reduces plasma concentration of ITRACONAZOLE—avoid concomitant use; plasma concentration of fosphenytoin increased by VORICONAZOLE, also fosphenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for fosphenytoin toxicity); fosphenytoin possibly reduces plasma concentration of CASPOFUNGIN—consider increasing dose of caspofungin.

Antimalarials: avoidance of fosphenytoin advised by manufacturer of ARTEMESAN WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by MELODquine; anticonvulsant effect of fosphenytoin antagonised by PYRIMETHAMINE, also increased antifolate effect.

Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); fosphenytoin reduces plasma concentration of HALOPERIDOL; plasma concentration of fosphenytoin possibly increased or decreased by CHLORPROMAZINE; fosphenytoin possibly reduces plasma concentration of Aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); fosphenytoin accelerates metabolism of CLOZAPINE and QUETIPRINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of Lurasidone—avoid concomitant use.

Antivirals: fosphenytoin possibly reduces plasma concentration of ABACAVIR, DARIUNAVIR, LOPINAVIR and SAQUINAVIR; avoidance of fosphenytoin advised by manufacturer of BOCCEPREVIR and RILPIVIRINE (plasma concentration of bocceprevir and rilpivirine possibly reduced); fosphenytoin possibly reduces plasma concentration of DALATASVIR and SIMPREVIR—manufacturer of dalatasvir and simprevir advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of DASABUVIR, OMBITASVIR and PARITAPREVIR—avoid concomitant use;
Fosphenytoin

- Diuretics (continued)

- Antivirals (continued)

- Caffeine citrate: fosphenytoin reduces plasma concentration of caffeine citrate.

- Calcium-channel Blockers: fosphenytoin possibly reduces plasma concentration of felodipine.

- Cytotoxic: fosphenytoin possibly reduces plasma concentration of cyclophosphamide.

- Diuretics: fosphenytoin possibly reduces plasma concentration of furosemide; increased risk of osteomalacia when fosphenytoin given with carbonic anhydrase inhibitors.

- Dopaminergics: fosphenytoin possibly reduces plasma concentration of levodopa, pramipexole.

- Enteral Feeds: absorption of fosphenytoin possibly reduced by enteral feeds.

- Folates: plasma concentration of fosphenytoin possibly reduced by folates.

- Fosaprepitant: fosphenytoin possibly reduces plasma concentration of fosaprepitant.

- Hormone Antagonists: fosphenytoin possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; fosphenytoin possibly accelerates metabolism of toremifene.

- 5HT₂-receptor Antagonists: fosphenytoin accelerates metabolism of ondansetron (reduced effect).

- Icafvor: fosphenytoin possibly reduces plasma concentration of icafvor—manufacturer of icafvor advises avoid concomitant use.

- Leflunomide: when fosphenytoin given with leflunomide, reduced plasma concentration of fosphenytoin.

- Therapeutic: fosphenytoin possibly reduced by therapeutic.

- Ticagrelor: plasma concentration of ticagrelor possibly reduced by ticagrelor.

- Tibolone: fosphenytoin accelerates metabolism of tibolone.

- Ticagrelor: fosphenytoin possibly reduces plasma concentration of ticagrelor.

- Thrombolytics: fosphenytoin possibly reduces plasma concentration of thrombolytics.

- Thromboembolic agents: fosphenytoin possibly reduces plasma concentration of thromboembolic agents.

- Tranquilizers: fosphenytoin possibly reduces plasma concentration of tranquilizers.

- Vemurafenib: fosphenytoin possibly reduces plasma concentration of vemurafenib.

- X-ray contrast media: fosphenytoin possibly reduces plasma concentration of x-ray contrast media.

Fosphenytoin

- Of fosphenytoin possibly increased by acetazolamide; fosphenytoin antagonises effects of furosemide; increased risk of osteomalacia when fosphenytoin given with carbonic anhydrase inhibitors.

- Dopaminergics: fosphenytoin possibly reduces plasma concentration of levodopa, pramipexole.

- Theophylline: plasma concentration of both drugs reduced when fosphenytoin given with theophylline.

- Thyroid Hormones: fosphenytoin accelerates metabolism of thyroid hormones (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin possibly increased.

- Tropolone: fosphenytoin accelerates metabolism of tropolone.

- Ticagrelor: fosphenytoin possibly reduces plasma concentration of ticagrelor.
Fosphenytoin – Grapefruit Juice

Fosphenytoin (continued)
- Ulcer-healing Drugs; metabolism of fosphenytoin inhibited by:
  - Cimetidine (increased plasma concentration); effects of fosphenytoin enhanced by: esomeprazole; effects of fosphenytoin possibly enhanced by omeprazole; absorption of fosphenytoin reduced by: sucralfate
- Ulipristal; avoidance of fosphenytoin advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)
  - Vaccines; effects of fosphenytoin enhanced by influenza vaccine
- Vitamins: fosphenytoin possibly increases requirements for alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D

Frovatriptan see 5HT1-receptor Agonists (under HT)
Furosemide see Diuretics
Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with:
  - Ritonavir—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with saquinavir
- Lipid-regulating Drugs; risk of myopathy and rhabdomyolysis when fusidic acid given with:
  - Statins—avoid concomitant use and for 7 days after last fusidic acid dose
- Sugammadex: fusidic acid possibly reduces response to sugammadex
- Vaccines; antibiotics inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF or BNFC

Gabapentin
- Analgesics; bioavailability of gabapentin increased by morphine
- Antacids: absorption of gabapentin reduced by:
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by:
  - MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by:
  - SSRI and tricyclics (convulsive threshold lowered)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by:
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by:
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Galantamine see Parasympathomimetics
Ganciclovir
\textbf{Note} Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antibacterials; increased risk of convulsions when ganciclovir given with:
  - Mipemid with cilastatin
- Antivirals: ganciclovir possibly increases plasma concentration of didanosine; profound myelosuppression when ganciclovir given with:
  - Zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- Mycophenolate: plasma concentration of ganciclovir possibly increased by:
  - Mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gefitinib
- Antibacterials: plasma concentration of gefitinib reduced by:
  - Rifampicin—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of:
  - Warfarin
- Antidepressants: manufacturer of gefitinib advises avoid antiepileptic use with:
  - St John’s Wort
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with:
  - Carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone
- Antifungals: plasma concentration of gefitinib increased by:
  - Itraconazole
- Antipsychotics: avoid concomitant use of cytotoxics with:
  - Clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of boceprevir

Gefitinib (continued)
- Ulcer-healing Drugs; plasma concentration of gefitinib reduced by:
  - Ranitidine

Gemcitabine
- Anticoagulants; gemcitabine possibly enhances anticoagulant effect of:
  - Warfarin
- Antipsychotics: avoid concomitant use of cytotoxics with:
  - Clozapine (increased risk of agranulocytosis)

Gemeprost see Prostaglandins
Gemfibrozil see Fibrates
Gentamicin see Aminoglycosides
Gestodene see Progestogens
Glibenclamide see Antidiabetics
Gliclazide see Antidiabetics
Glimepiride see Antidiabetics
Glipizide see Antidiabetics
Glucosamine
- Anticoagulants; glucosamine enhances anticoagulant effect of:
  - Warfarin (avoid concomitant use)

Glyceryl Trinitrate see Nitrates
Glycopyrronium see Antimuscarinics
Gold
\textbf{Note} see Sodium Aurothiomalate

Golimumab
- Abatacept: avoid concomitant use of golimumab with:
  - ABATACEPT
- Anakinra: avoid concomitant use of golimumab with:
  - ANAKINRA
- Antipsychotics: avoid concomitant use of cytotoxics with:
  - Clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use

Granisetron see 5HT3-receptor Antagonists (under HT)

Grapefruit Juice
- Alikiren: grapefruit juice reduces plasma concentration of:
  - Alikiren—avoid concomitant use
- Anthelmintics: grapefruit juice increases plasma concentration of active metabolite of:
  - Albendazole; grapefruit juice increases plasma concentration of:
  - Praziquantel
- Anti-arrhythmics: grapefruit juice increases plasma concentration of:
  - Amiodarone; grapefruit juice increases plasma concentration of:
  - Dronedarone—avoid concomitant use
- Antidepressants: grapefruit juice possibly increases plasma concentration of:
  - Sertraline
- Antihistamines: grapefruit juice reduces plasma concentration of:
  - Bilastine
- Antimalarials: grapefruit juice possibly increases plasma concentration of:
  - Artemether with lumefantrine; avoidance of grapefruit juice advised by manufacturer of:
  - Artensim with piperaquine
- Antipsychotics; avoidance of grapefruit juice advised by manufacturer of:
  - Lurasidone and pimozide; grapefruit juice possibly increases plasma concentration of:
  - Quetiapine—manufacturer of quetiapine advises avoid concomitant use
  - Antivirals: grapefruit juice possibly increases plasma concentration of:
  - Efavirenz
- Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of:
  - Oral midazolam; grapefruit juice increases plasma concentration of:
  - Buspirone
- Avanafil: grapefruit juice possibly increases plasma concentration of:
  - Avanafil—manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
  - Calcium-channel Blockers: grapefruit juice possibly increases plasma concentration of:
  - Amiodarone; grapefruit juice increases plasma concentration of:
  - Felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimoipidine and verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of:
  - Ciclosporin (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of:
  - Colchicine toxicity
- Corticosteroids: grapefruit juice increases plasma concentration of:
  - Oral budesonide—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
Grapefruit Juice (continued)

- Cytotoxics: grapefruit juice possibly increases plasma concentration of Axitinib, Cabozantinib and Ponatinib; grapefruit juice possibly increases the plasma concentration of Bosutinib—manufacturer of bosutinib advises avoidance or consider reducing dose of bosutinib; avoidance of grapefruit juice advised by manufacturer of Ceritinib, Everolimus, Ibrutinib, Lapatinib, Nilotinib, Olaparib and Pazopanib; grapefruit juice possibly increases plasma concentration of Crizotinib and Vinflunine—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of Dasatinib (plasma concentration of dasatinib possibly increased)
- Guanfacine: avoidance of grapefruit juice advised by manufacturer of Guanfacine
- Ibradine: grapefruit juice increases plasma concentration of Ibradine
- Iveracftor: grapefruit juice possibly increases plasma concentration of Iveracftor—manufacturer of ivacafort advises avoid concomitant use
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of Atorvastatin; grapefruit juice increases plasma concentration of Atorvastatin—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of Lomitapide
- Naloxegol: grapefruit juice possibly increases plasma concentration of Naloxegol—avoid concomitant use
- Panobinostat: avoidance of grapefruit juice advised by manufacturer of Panobinostat
- Pirfenidone: avoidance of grapefruit juice advised by manufacturer of Pirfenidone
- Ranolazine: grapefruit juice possibly increases plasma concentration of Ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of Sildenafil
- Sirolimus: grapefruit juice increases plasma concentration of Sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of Tacrolimus
- Tadalafil: grapefruit juice possibly increases plasma concentration of Tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of Tolvaptan—avoid concomitant use
- Ulipristal: avoidance of grapefruit juice advised by manufacturer of Low-dose Ulipristal
- Vardenafil: grapefruit juice possibly increases plasma concentration of Vardenafil—avoid concomitant use

Grisofulvin

- Alcohol: griseofulvin possibly enhances effects of Alcohol
- Anticoagulants: griseofulvin reduces anticoagulant effect of Coumarins
- Antiepileptics: absorption of griseofulvin reduced by Phenobarbital and Primidone (reduced effect)
- Ciclosporin: griseofulvin possibly reduces plasma concentration of Ciclosporin
- Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with Oestrogens
- Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with Progestogens

Guanetidine see Adrenergic Neurone Blockers

Guanfacine

- Alcohol: sedative effects possibly increased when guanfacine given with Alcohol
- Antibacterials: plasma concentration of guanfacine possibly increased by Clarithromycin, Erythromycin and Telithromycin (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by Rifabutin—increase dose of guanfacine; plasma concentration of guanfacine reduced by Rifampicin—increase dose of guanfacine; manufacturer of guanfacine advises halve dose when given with Chloramphenicol
- Antidepressants: plasma concentration of guanfacine possibly reduced by St John’s Wort—increase dose of guanfacine

Guanfacine (continued)

- Antiepileptics: plasma concentration of guanfacine possibly reduced by Carbamazepine, Oxcarbazepine, Phenytoin and Primidone—increase dose of guanfacine; guanfacine increases plasma concentration of Sodium Valproate and Valproic Acid
- Antifungals: plasma concentration of guanfacine increased by Ketoconazole (halve dose of guanfacine); plasma concentration of guanfacine possibly increased by Fluconazole, Itraconazole and Posaconazole (halve dose of guanfacine)
- Antipsychotics: sedative effects possibly increased when guanfacine given with Antipsychotics
- Antivirals: plasma concentration of guanfacine possibly increased by Azithromycin, Becepruvir, Fosamprenavir, Indinavir, Ritonavir, Saquinavir and Telaprevir (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by Efavirenz, Etravirine and Nevirapine—increases dose of guanfacine
- Anxiolytics and Hypnotics: sedative effects possibly increased when guanfacine given with Anxiolytics and Hypnotics
- Aprepitant: plasma concentration of guanfacine possibly increased by Aprepitant (halve dose of guanfacine)
- Bosentan: plasma concentration of guanfacine possibly reduced by Bosentan—increases dose of guanfacine
- Calcium-channel Blockers: plasma concentration of guanfacine possibly increased by Dilatazem and Verapamil (halve dose of guanfacine)
- Cytotoxics: plasma concentration of guanfacine possibly increased by Crizotinib and Imatinib (halve dose of guanfacine)
- Fosaprepitant: plasma concentration of guanfacine possibly increased by Fosaprepitant (halve dose of guanfacine)
- Grapefruit Juice: manufacturer of guanfacine advises avoid concomitant use with Grapefruit Juice
- Modafinil: plasma concentration of guanfacine possibly reduced by Modafinil—increases dose of guanfacine

Haemophilus Vaccine see Vaccines

Haloperidol see Antipsychotics

Heparin see Heparins

Heparins

- ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors
- Aliskiren: increased risk of hyperkalaemia when heparins given with Aliskiren
- Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants given with Intravenous Diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with Ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by Aspirin
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with Angiotensin-II Receptor Antagonists
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with Arixiban, Darbigantran, Edoxaban and Rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Clodigrel: increased risk of bleeding when heparins given with Clopidogrel
- Dipyriramole: anticoagulant effect of heparins enhanced by Dipyriramole
- Iloprost: anticoagulant effect of heparins possibly enhanced by Iloprost
- Nitrates: anticoagulant effect of heparins reduced by infusion of Glyceryl Trinitrate

Hepatitis Vaccines see Vaccines

Histamine

- Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by Tricyclics—manufacturer of histamine advises avoid concomitant use
Histamine — Histamine H2-antagonists

Histamine H2-antagonists
- Antivirals (continued)
  - ATAZANAVIR (adjust doses of both drugs—consult atazanavir product literature); famotidine reduces plasma concentration of LEDIPASVIR; famotidine increases plasma concentration of Raltegravir; avoidance of histamine H2-antagonists for 12 hours before or 4 hours after RILPIVIRINE advised by manufacturer of rilpivirine—consult product literature; cimetidine possibly increases plasma concentration of SAQUINAVIR
- Anxiolytics and Hypnotics: cimetidine inhibits metabolism of BENZODIAZEPINES, CLOMETHIAZOLE and ZALEPLON (increased plasma concentration); cimetidine increases plasma concentration of MELATONIN
- Azathioprine: manufacturer of azathioprine advises possible increased risk of myelosuppression when cimetidine given with AZATHIOPRINE
- Beta-blockers: cimetidine increases plasma concentration of LABELTALOL, METOPROLOL and PROPRANOL; cimetidine possibly increases plasma concentration of oral TIMOLOL
- Caffeine citrate: cimetidine increases plasma concentration of CAFFEINE CITRATE
- Calcium—Channel Blockers: cimetidine possibly inhibits metabolism of CALCIUM—CHANNEL BLOCKERS (increased plasma concentration); cimetidine increases plasma concentration of ISRADINE (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of CYCLOSPORIN
- Clopidogrel: cimetidine possibly reduces antplatelet effect of CLOPIDOGREL
- Cytotoxics: cimetidine possibly enhances myelosuppressive effects of CARMUSTINE and COMUSTINE; cimetidine reduces plasma concentration of DOXORUBICIN; cimetidine increases plasma concentration of EPIRUBICIN; cimetidine inhibits metabolism of CAPECITABINE, FLUOROURACIL and TEGAFUR (increased plasma concentration); avoidance of histamine H2-antagonists advised by manufacturer of DASATINIB—consider using an antacid as an alternative; famotidine reduces plasma concentration of DASATINIB—consider using an antacid as an alternative; avoidance of cimetidine, famotidine and nizatidine advised by manufacturer of ERLOTINI; ranitidine reduces plasma concentration of ERLOTINIB—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of GEFITINIB; histamine H2-antagonists possibly reduce absorption of LAPATINIB; histamine H2-antagonists possibly reduce absorption of PAZOPANIB—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H2-antagonists
- Dopaminergics: cimetidine reduces excretion of PRAMIPEXOLE (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with ergotamine—avoid concomitant use
- Fampridine: avoidance of cimetidine advised by manufacturer of FAMPRIDINE
- Histamine: histamine H2—antagonists theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by OCTREOTIDE
- S5H receptor Agonists: cimetidine inhibits metabolism of ZOLMITRIPTAN (reduce dose of zolmitriptan)
- Lipid—Regulating Drugs: separating administration from cimetidine and ranitidine by 12 hours advised by manufacturer of LOMTAPID
- Roflumilast: cimetidine inhibits the metabolism of ROFLUMILAST
- Sildenafil: cimetidine increases plasma concentration of SILDENAFIL—consider reducing dose of sildenafil for erectile dysfunction
- Symptomiotics: cimetidine possibly inhibits metabolism of DOBUTAMINE
- Theophylline: cimetidine inhibits metabolism of THEOPHYLLINE (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of LEVOThYRoxINE
Harmotropine see Antimuscarinics
Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

5HT3-receptor Agonists

Antidepressants: increased risk of CNS toxicity when SHT1 agonists given with • CITALOPRAM (manufacturer of citalopram advises avoid concomitant use; increased risk of CNS toxicity when sumatriptan given with • CITALOPRAM, • ESICITALOPRAM, • LUMOZIRAXINE, • PAROXETINE; metabolism of frovatriptan inhibited by FLUVAXOMINE; metabolism of zolmitriptan possibly inhibited by FLUVAXOMINE (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with SERTRALINE; possible increased serotoninergic effects when SHT1 agonists given with • DULOXETINE, • VENLAFAXINE or VORTEXETINE; risk of CNS toxicity when rizatRIPTAN or sumatriptan given with • MAOIS (avoid rizatRIPTAN or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when zolmitriptan given with • MAOIS or • MOCLOBEMIDE (reduce dose of zolmitriptan); risk of CNS toxicity when rizatRIPTAN or sumatriptan given with • MOCLOBEMIDE (avoid rizatRIPTAN or sumatriptan for 2 weeks after moclobemide); possible increased serotoninergic effects when naratriptAN given with • SSRI S; increased serotoninergic effects when SHT1 agonists given with • ST JOHN’S WORT—avoid concomitant use

Antifungals: plasma concentration of eletriptan increased by • ITRACONAZOLE and • KETOCONAZOLE (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptAN increased by KETOCONAZOLE (increased risk of toxicity)

Antivirals: plasma concentration of eletriptan increased by • INDAVIR and • RITONAVIR (risk of toxicity)—avoid concomitant use

Beta-blockers: plasma concentration of rizatRIPTAN increased by PROPRANOLOL (manufacturer of rizatRIPTAN advises halve dose and avoid within 2 hours of propranolol)

Dopamine: possible increased risk of serotoninergic effects when SHT1 agonists given with • DAPOXETINE (manufacturer of dapoxetine advises SHT1 agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT1 agonists)

Dopaminergics: avoidance of SHT1 agonists advised by manufacturer of SELEGILINE

Ergot Alkaloids: increased risk of vasospasm when eletriptAN, frovatriptAN or naratriptAN given with • ERGOTAMINE (avoid ergotamine for 24 hours after eletriptAN, frovatriptAN or naratriptAN, avoid eletriptAN, frovatriptAN or naratriptAN for 24 hours after ergotamine); increased risk of vasospasm when almotriptAN, rizatRIPTAN, sumatriptAN or zolmitriptAN given with • ERGOTAMINE (avoid ergotamine for 6 hours after almotriptAN, rizatRIPTAN, sumatriptAN or zolmitriptAN, avoid almotriptAN, rizatRIPTAN, sumatriptAN or zolmitriptAN for 24 hours after ergotamine)

Lithium: possible risk of toxicity when sumatriptAN given with LITHIUM

Ulcer-healing Drugs: metabolism of zolmitriptAN inhibited by CIMETIDINE (reduce dose of zolmitriptAN)

Harmotropine see Antimuscarinics
Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Lanreotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

5HT3-receptor Antagonists

Analgesics: ondansetron possibly antagonises effects of TRAMADOL

Antibacterials: metabolism of ondansetron accelerated by • RIFAMPICIN (reduced effect)

Antidepressants: possible increased serotoninergic effects when SHT1 antagonists given with • SSRI-RELATED ANTIDEPRESSANTS or SSRI S

Antiepileptics: metabolism of ondansetron accelerated by • CARBAMAZEPINE, • FOSPHENYTINU and • PHENYTINU (reduced effect)

Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with • VANDETANIN—avoid concomitant use

Dopaminergics: possible increased hypertensive effect when ondansetron given with • APOMORPHINE—avoid concomitant use

SHT3-receptor Antagonists (continued)

Panobinostat: possible increased risk of ventricular arrhythmias when granisetron and ondansetron given with • PANOBINOSTAT

Hydroxychloroquine see Vaccines
Hydralazine see Vasodilator Antihypertensives
Hydrochlothiazide see Diuretics
Hydrocortison see Corticosteroids
Hydroflumethiazide see Diuretics
Hydromorphone see Opioid Analgesics
Hydrotalcit see Antacids
Hydroxocobalamin

Antibacterial: response to hydroxocobalaminst reduced by CHLORAMPHENICOL

Hydroxyuric Acid

Antipsychotics: avoid concomitant use of cytoxotics with • CLOZAPINE (increased risk of agranulocytosis)

Antivirals: increased risk of toxicity when hydroxyuric acid given with • DIDANOSINE and • STAVUDINE—avoid concomitant use

Vaccines: risk of generalised infections when hydroxyuric acid given with live • VACCINES—avoid concomitant use

Hydroxychloroquine

Adsorbents: absorption of hydroxychloroquine reduced by • KAOLIN • Agalsidase Alfa and Beta: hydroxychloroquine possibly inhibits effects of AGALSIDASE ALFA AND BETA (manufacturers of agalsidase alfa and beta advise avoid concomitant use) • Antacids: absorption of hydroxychloroquine reduced by • ANTACIDS • Anti-arrhythmics: increased risk of ventricular arrhythmias when hydroxychloroquine given with • AMIODARONE—avoid concomitant use • Antimalarials: avoidance of antimalarials advised by manufacturer of • ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when hydroxychloroquine given with • MELOQUINE • Antipsychotics: increased risk of ventricular arrhythmias when hydroxychloroquine given with • DROPERIDOL—avoid concomitant use • Cardiac Glycosides: hydroxychloroquine possibly increases plasma concentration of • DIGOXIN • Ciclosporin: hydroxychloroquine increases plasma concentration of • CICLOSPORIN (increased risk of toxicity) • Cytotoxics: possible increased risk of ventricular arrhythmias when hydroxychloroquine given with • BOSUTINIB • Histamine: avoidance of antimalarials advised by manufacturer of • HISTAMINE • Lanthanum: absorption of hydroxychloroquine possibly reduced by • LANTHANUM (give at least 2 hours apart) • Laronidase: hydroxychloroquine possibly inhibits effects of • LARONIDASE (manufacturer of laronidase advises avoid concomitant use) • Parasympathomimetics: hydroxychloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of • NEOSTIGMINE and • PYRIDOSTIGMINE • Penicillamine: increased risk of haematological toxicity when antimalarials given with • PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use • Ulcer-healing Drugs: metabolism of hydroxychloroquine inhibited by • CIMETIDINE (increased plasma concentration)

Vaccines; antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Hydroxyurea see Antimalarial Agents
Hydantoin Acid see Bisphosphonates
Ibrutinib

Antirrhinum: plasma concentration of ibrutinib possibly increased by • AMIODARONE and • DROPERIDOL—reduce dose of ibrutinib (see under ibrutinib, p. 867)

Antibacterials: plasma concentration of ibrutinib possibly increased by • CIPROFLOXACIN, • CLARITHROMYCIN,
Idelalisib

- Antipsychotics (continued) of idelalisib avoids concomitant use with PIMOZIDE and QUETIAPINE
- Anti-infectives; manufacturer of idelalisib advises avoid concomitant use with oral MIDAZOLAM
- Ergot Alkaloids: manufacturer of idelalisib advises avoid concomitant use with ERGOTAMINE
- Lipid-regulating Drugs: manufacturer of idelalisib avoids concomitant use with SIMVASTATIN
- Sildenafil: manufacturer of idelalisib avoids concomitant use with sildenafil for pulmonary arterial hypertension
- Sympathomimetics, Beta2; manufacturer of idelalisib avoids concomitant use with SALMETEROL

Ibosfamide

- Anticoagulants: ibosfamide possibly enhances anticoagulant effect of COUMARINS
- Antifungals: metabolism of ibosfamide inhibited by ketoconazole
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: ibosfamide possibly enhances anticoagulant effect of clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: plasma concentration of ibosfamide possibly increased by FOSAMPRENIVAR and SQUINAPIN—reduce dose of ibosfamide (see under Ibrutinib, p. 867)
- Aprepitant: plasma concentration of ibosfamide possibly increased by APREPITANT—reduce dose of ibosfamide (see under Ibrutinib, p. 867)
- Calcium-channel Blockers: plasma concentration of ibosfamide possibly increased by DILTIAZEM and VERAPAMIL—reduce dose of ibosfamide (see under Ibrutinib, p. 867)
- Cardiac Glycosides: manufacturer of ibosfamide advises give DIGOXIN at least 6 hours before or after ibosfamide
- Ciclosporin: manufacturer of imatinib advises avoid concomitant use with tacrolimus (increased risk of agranulocytosis)
- Cytotoxics: plasma concentration of imatinib increased by imatinib—reduce dose of imatinib (see under Ibrutinib, p. 867)
- Fosaprepitant: plasma concentration of ibosfamide possibly increased by FOSAMPRENIVAR
- Illoprost

- Analgesics: increased risk of bleeding when illoprost given with NSAIDS of ASPIRIN
- Anticoagulants: illoprost possibly enhances anticoagulant effect of COUMARINS and HEPARINS; increased risk of bleeding when illoprost given with phenindione
- Clopidogrel: increased risk of bleeding when illoprost given with clopidogrel
- Ephedrines: increased risk of bleeding when illoprost given with ephedrine
- Tirosiban: increased risk of bleeding when illoprost given with tirosiban

Imatinib

- Anticoagulants: manufacturer of imatinib advises caution with warfarin (possibility of enhanced warfarin effect)
- Anti-infectives; plasma concentration of imatinib reduced by ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of imatinib reduced by COUMARINS and HEPARINS
- Antituberculosis: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect)
- Antidepressants: plasma concentration of imatinib possibly increased by imatinib increases plasma concentration of imatinib possibly increased by COUMARINS and HEPARINS
- Anti-infectives; manufacturer of imatinib advises concomitant use with ritonavir—avoid concomitant use
- Antineoplastic Agents: plasma concentration of imatinib possibly increased by PARACETAMOL
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antidepressants: plasma concentration of imatinib increased by imatinib possibly increases plasma concentration of imatinib possibly increased by GEMCITABINE and IMATINIB—reduce dose of imatinib (see under Ibrutinib, p. 867)
- Antiepileptics: plasma concentration of imatinib possibly increased by CLOZAPINE and IMATINIB—reduce dose of imatinib (see under Ibrutinib, p. 867)
- Grapefruit Juice: manufacturer of ibosfamide advises avoid concomitant use with GRAPEFRUIT JUICE
- Vitamins: manufacturer of ibosfamide advises avoid concomitant use with VITAMIN E

Ibuprofen see NSAIDs

Idarubicin

- Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
- Ciclosporin: plasma concentration of idarubicin increased by CYCLOSPORIN
- Cytotoxics: possible increased risk of cardiotoxicity when idarubicin given with TRASTUZUMAB—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live VACCINES—avoid concomitant use

Idevralisib

- Alpha-blockers: manufacturer of idelalisib advises avoid concomitant use with alfuzosin
- Anti-arhythmic drugs: manufacturer of idelalisib advises avoid concomitant use with amiodarone
- Antibacterials: plasma concentration of idelalisib reduced by rifampicin (avoid concomitant use)
- Antidepressants; plasma concentration of idelalisib possibly reduced by ST JOHN’S WORT—manufacturer of idelalisib advises avoid concomitant use
- Antiepileptics: plasma concentration of idelalisib possibly reduced by CARBAMAZEPINE, FOSPHENTOIN and PHENYTOIN—manufacturer of idelalisib advises avoid concomitant use
- Antifungals: plasma concentration of idelalisib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis); manufacturer
Imipenem with Cilastatin

- Antiepileptics: carbamepenes reduce plasma concentration of • SODIUM VALPROATE and • VALPROIC ACID—avoid concomitant use
- Antivirals: increased risk of convulsions when imipenem with cilastatin given with • GANCICLOVIR or • VALGANICLOVIR
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Imipramine see Antidepressants, Tricyclic

Immunoglobulins
- Vaccines: anti-d immunoglobulins and normal immunoglobulin might impair immune response to • BCG VACCINE—give BCG vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to • MMR VACCINE—give MMR vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to live • INFLUENZA VACCINE—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to oral • POLIOMYELITIS VACCINE—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to oral • ROTA VIRUS VACCINE—give live oral rotavirus vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to oral • SMALLPOX VACCINE—give smallpox vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to • VARICELLA-ZOSTER VACCINE—give live varicella-zoster vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to • YELLOW FEVER VACCINE—give live yellow fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin

Indacaterol see Sympathomimetics, Beta2

Indapamide see Diuretics

Indinavir
- Aldesleukin: plasma concentration of indinavir possibly increased by • ALDESLEUKIN
- Anti-arrhythmics: indinavir possibly increases plasma concentration of • AMIODARONE—avoid concomitant use; indinavir possibly increases plasma concentration of • FLECAINIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of • RIFABUTIN, also plasma concentration of indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); metabolism of indinavir accelerated by • RIFAMPICIN (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of • TELITHROMYCIN
- Anticoagulants: avoidance of indinavir advised by manufacturer of • APIXABAN and • RIVAROXABAN
- Antidepressants: plasma concentration of indinavir reduced by • ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of indinavir possibly reduced by • CARBAMAZEPINE, • PHOSPHENTOIN and • PHENYTOIN, also plasma concentration of carbamazepine, fosphenytoin and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by • PHENOBARBITAL and • PRIMIDONE
- Antifungals: plasma concentration of indinavir increased by • ITRACONAZOLE and • KETOCONAZOLE (consider reducing dose

Indinavir
- Antifungals (continued) of indinavir); plasma concentration of indinavir reduced by • ISAVUCONAZOLE
- Antimalarials: caution with indinavir advised by manufacturer of • ARTESATE WITH LUMEFANTRINE; indinavir possibly increases plasma concentration of • QUININE (increased risk of toxicity)
- Antimycobacterials: avoidance of indinavir advised by manufacturer of • DARIFENACIN and • TOLERTODINE; manufacturer of fesoterodine advises dose reduction when indinavir given with • FESOTERODINE—consult fesoterodine product literature
- Antipsychotics: indinavir possibly increases plasma concentration of • ARIPIPRAZOLE (reduce dose of aripiprazole product literature); indinavir possibly increases plasma concentration of • LURASIDONE—avoid concomitant use; indinavir possibly increases plasma concentration of • QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: avoid concomitant use of indinavir with • ATAZANAVIR; plasma concentration of indinavir possibly reduced when indinavir given with • DARUNAVIR; absorption of indinavir reduced by • DIDANOSINE tablets (give at least 1 hour apart); plasma concentration of indinavir reduced by • EFAVIRENZ and • NEVIRAPINE; plasma concentration of indinavir possibly reduced by • ETRAVIRINE—avoid concomitant use; indinavir increases plasma concentration of • MARAVIROC (consider reducing dose of maraviroc); avoidance of indinavir advised by manufacturer of • PARTAPREVIR; plasma concentration of indinavir increased by • RITONAVIR; indinavir increases plasma concentration of • POZANAVIR
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with • ALPRAZOLAM—avoid concomitant use; indinavir possibly increases plasma concentration of • MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Atovalaxone: plasma concentration of indinavir possibly reduced by • ATOVAXONE
- Avana: indinavir possibly increases plasma concentration of • AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Bosentan: plasma concentration of indinavir possibly reduced by • BOSENTAN
- Ciclosporin: indinavir increases plasma concentration of • CICLOSPORIN
- Colchicine: indinavir possibly increases risk of • COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of indinavir possibly reduced by • DEXAMETHASONE
- Cytotoxics: indinavir possibly increases plasma concentration of • AXITINIB (reduce dose of axitinib—consult axitinib product literature); indinavir possibly increases the plasma concentration of • BOSUTINIB and • CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; indinavir possibly increases plasma concentration of • CRIZOTINIB and • EVEROLIMUS—manufacturer of crizotinib and everolimus advises avoid concomitant use; indinavir possibly increases the plasma concentration of • INIBITINIB—reduce dose of inibitinib (see under Inibitinib, p. 867); indinavir possibly increases plasma concentration of • PAZOPANIB (reduce dose of pazopanib); indinavir possibly increases plasma concentration of • PONITINIB—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when indinavir given with • RUOXITINIB—consult ruxolitinib product literature; indinavir possibly increases plasma concentration of • DEXRoxelaxone—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
- Ergot Alkaloids: increased risk of ergotism when indinavir given with • ERGOMETRINE or • ERGOTAMINE—avoid concomitant use
- Guanfacine: indinavir possibly increases plasma concentration of • GUANFACINE (halve dose of guanfacine)
Indinavir  
- 5HT1-receptor Agonists: indinavir increases plasma concentration of \textit{Eledriptan} (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with \textit{Atrvostatin}; possible increased risk of myopathy when indinavir given with \textit{Rosuvastatin}—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with
- \textit{Simvastatin} (avoid concomitant use); avoidance of indinavir advised by manufacturer of \textit{Lomitapide} (plasma concentration of lomitapide possibly increased)
- \textit{Naloxegol}: indinavir possibly increases plasma concentration of \textit{Naloxegol}—avoid concomitant use
- \textit{Orlistat}: absorption of indinavir possibly reduced by \textit{Orlistat}
- \textit{Ranolazime}: indinavir possibly increases plasma concentration of \textit{Ranolazime}—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: indinavir increases plasma concentration of \textit{Sildenafil}—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of \textit{Tadalafil}
- Vardenafil: indinavir increases plasma concentration of \textit{Vardenafil}—avoid concomitant use

Indomethacin see NSAIDs
Indoramin see \textit{Alpha-blockers}

Infliximab
- \textit{Abatacept}: avoid concomitant use of infliximab with \textit{Abatacept}
- \textit{Anakina}: avoid concomitant use of infliximab with \textit{Anakinra}
- \textit{Antipsychotics}: avoid concomitant use of cytoxics with \textit{Clozapine} (increased risk of agranulocytosis)
- \textit{Vaccines}: risk of generalised infections when monoclonal antibodies given with live \textit{Vaccines}—avoid concomitant use

Influenza Vaccine see \textit{Vaccines}
Insulin see \textit{Antidiabetics}
Interferon Alpha see \textit{Interferons}
Interferon Gamma see \textit{Interferons}

- Aminophylline: interferon alfa and peginterferon alfa inhibit metabolism of \textit{Aminophylline} (consider reducing dose of aminophylline)
- \textit{Antivirals}: caution with peginterferon alfa advised by manufacturer of \textit{Adefovir}; increased risk of peripheral neuropathy when interferon alfa and peginterferon alfa given with \textit{Telbivudine}
- \textit{Theophylline}: interferon alfa and peginterferon alfa inhibit metabolism of \textit{Theophylline} (consider reducing dose of theophylline)
- \textit{Vaccines}: manufacturer of interferon gamma advises avoid concomitant use with \textit{Vaccines}

Ipriflavone
- \textit{Antipsychotics}: avoid concomitant use of cytoxics with \textit{Clozapine} (increased risk of agranulocytosis)
- \textit{Cytotoxic}: manufacturer of ipilimumab advises avoid concomitant use with \textit{Vemurafenib}
- \textit{Vaccines}: risk of generalised infections when monoclonal antibodies given with live \textit{Vaccines}—avoid concomitant use

Ipratropium
- Antipsychotics: avoid concomitant use of cytoxics with \textit{Clozapine} (increased risk of agranulocytosis)
- \textit{Antivirals}: metabolism of irinotecan possibly inhibited by \textit{Atazanavir} (increased risk of toxicity)

Irinotecan  
- Cytotoxics: avoidance of irinotecan advised by manufacturer of \textit{Panitumumab}; plasma concentration of active metabolite of irinotecan increased by \textit{Lapatinib}—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by \textit{Regorafenib}; plasma concentration of irinotecan possibly increased by \textit{Sorafenib}

Iron Salts
- \textit{Antacids}: absorption of oral iron salts reduced by \textit{Oral Magnesium Salts} (as magnesium trisilicate)
- \textit{Antibacterials}: oral iron salts reduce absorption of \textit{Ciprofloxacin} (give at least 2 hours before or 4 hours after ciprofloxacin); oral iron salts reduce absorption of \textit{Levofloxacin, Norfloxacin} and \textit{Ofloxacin} (give at least 2 hours apart); oral iron salts reduce absorption of \textit{MoXifloxacin} (give at least 6 hours apart); effects of iron salts possibly inhibited by \textit{Chloramphenicol}; oral iron salts reduce absorption of tetracyclines, also absorption of oral iron salts reduced by \textit{Tetracyclines} (give at least 2 to 3 hours apart)
- \textit{Antivirals}: oral iron salts reduce absorption of \textit{Dolutegravir}—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts
- \textit{Bisphosphonates}: oral iron salts reduce absorption of \textit{Bisphosphonates}

- Calcium Salts: absorption of oral iron salts reduced by \textit{Calcium Salts}
- \textit{Dopaminergics}: oral iron salts possibly reduce absorption of \textit{Co-BeNeldopa, Co-Careldopa} and \textit{Levodopa}; oral iron salts reduce absorption of \textit{Entacapone}
- Eltrombopag: oral iron salts possibly reduce absorption of \textit{Eltrombopag} (give at least 4 hours apart)
- \textit{Methyldopa}: oral iron salts antagonise hypotensive effect of \textit{Methyldopa}
- \textit{Mycofenolate}: oral iron salts reduce absorption of \textit{Mycofenolate}
- \textit{Penicillamine}: oral iron salts reduce absorption of \textit{Penicillamine}
- \textit{Thyroid Hormones}: oral iron salts reduce absorption of \textit{Liothyronine, Levothyroxine} (give at least 2 hours apart)
- \textit{Trientine}: absorption of oral iron salts reduced by \textit{Trientine}
- \textit{Zinc}: oral iron salts reduce absorption of \textit{Zinc}, also absorption of oral iron salts reduced by zinc

Isavuconazole see Antifungals, Imidazole
Isocarboxazid see MAOIs
Isosflurane see Anaesthetics, General
Isomethptene see \textit{Symptomimetics}
Isoniazid
- Aminophylline: isoniazid possibly increases plasma concentration of \textit{Aminophylline}
- \textit{Anaesthetics, General}: increased risk of hepatotoxicity when isoniazid given with \textit{Isosflurane}
- \textit{Analgesics}: avoidance of isoniazid advised by manufacturer of \textit{Pethidine}

Iron Salts
- \textit{Antacids}: absorption of oral iron salts reduced by \textit{Oral Magnesium Salts} (as magnesium trisilicate)
- \textit{Antibacterials}: oral iron salts reduce absorption of \textit{Ciprofloxacin} (give at least 2 hours before or 4 hours after ciprofloxacin); oral iron salts reduce absorption of \textit{Levofloxacin, Norfloxacin} and \textit{Ofloxacin} (give at least 2 hours apart); oral iron salts reduce absorption of \textit{MoXifloxacin} (give at least 6 hours apart); effects of iron salts possibly inhibited by \textit{Chloramphenicol}; oral iron salts reduce absorption of tetracyclines, also absorption of oral iron salts reduced by \textit{Tetracyclines} (give at least 2 to 3 hours apart)
- \textit{Antivirals}: oral iron salts reduce absorption of \textit{Dolutegravir}—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts
- \textit{Bisphosphonates}: oral iron salts reduce absorption of \textit{Bisphosphonates}

- Calcium Salts: absorption of oral iron salts reduced by \textit{Calcium Salts}
- \textit{Dopaminergics}: oral iron salts possibly reduce absorption of \textit{Co-BeNeldopa, Co-Careldopa} and \textit{Levodopa}; oral iron salts reduce absorption of \textit{Entacapone}
- Eltrombopag: oral iron salts possibly reduce absorption of \textit{Eltrombopag} (give at least 4 hours apart)
- \textit{Methyldopa}: oral iron salts antagonise hypotensive effect of \textit{Methyldopa}
- \textit{Mycofenolate}: oral iron salts reduce absorption of \textit{Mycofenolate}
- \textit{Penicillamine}: oral iron salts reduce absorption of \textit{Penicillamine}
- \textit{Thyroid Hormones}: oral iron salts reduce absorption of \textit{Liothyronine, Levothyroxine} (give at least 2 hours apart)
- \textit{Trientine}: absorption of oral iron salts reduced by \textit{Trientine}
- \textit{Zinc}: oral iron salts reduce absorption of \textit{Zinc}, also absorption of oral iron salts reduced by zinc

Isavuconazole see Antifungals, Imidazole
Isocarboxazid see MAOIs
Isosflurane see Anaesthetics, General
Isomethptene see \textit{Symptomimetics}
Isoniazid
- Aminophylline: isoniazid possibly increases plasma concentration of \textit{Aminophylline}
- \textit{Anaesthetics, General}: increased risk of hepatotoxicity when isoniazid given with \textit{Isosflurane}
- \textit{Analgesics}: avoidance of isoniazid advised by manufacturer of \textit{Pethidine}

Antacids: absorption of isoniazid reduced by \textit{Antacids}
- \textit{Antibacterials}: increased risk of hepatotoxicity when isoniazid given with \textit{Rifampicin}; increased risk of CNS toxicity when isoniazid given with \textit{Cycloserine}
- \textit{Antiepileptics}: isoniazid increases plasma concentration of \textit{Carbamazepine} (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of \textit{Ethosuximide} (increased plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of \textit{Fosphenytoin} and \textit{Phenytoin} (increased risk of toxicity)
- \textit{Antifungals}: isoniazid possibly reduces plasma concentration of \textit{Ketoconazole}
- \textit{Anxiolytics and Hypnotics}: isoniazid inhibits the metabolism of \textit{Diazepam}
- \textit{Corticosteroids}: plasma concentration of isoniazid possibly reduced by \textit{Corticosteroids}
- \textit{Disulfiram}: isoniazid possibly increases CNS effects of \textit{Disulfiram}
- \textit{Dopaminergics}: isoniazid possibly reduces effects of \textit{Co-BeNeldopa, Co-Careldopa} and \textit{Levodopa}
- \textit{Lipid-regulating Drugs}: separating administration from isoniazid by 12 hours advised by manufacturer of \textit{Lomitapide}
Isoniazid — Lamotrigine

Isoniazid (continued)

- Theophylline: isoniazid possibly increases plasma concentration of theophylline.
- Vaccines: antibacterials inactivate oral typhoid vaccine — see under Typhoid Vaccine in BNF or BNFC.

Itraconazole see Antifungals, Triazole

- Anti-arrrhythmics: increased risk of ventricular arrhythmias when ivabradine given with amiodarone or disopyramide.
- Antibacterials: plasma concentration of ivabradine possibly increased by clarithromycin and telithromycin — avoid concomitant use; increased risk of ventricular arrhythmias when ivabradine given with erthyromycin — avoid concomitant use.
- Antidepressants: plasma concentration of ivabradine reduced by St John’s Wort — avoid concomitant use.
- Antifungals: plasma concentration of ivabradine increased by ketoconazole — avoid concomitant use.
- Antivirals: plasma concentration of ivabradine possibly increased by ritonavir — avoid concomitant use.
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with sotalol.
- Calcium-channel Blockers: plasma concentration of ivabradine increased by diltiazem and verapamil — avoid concomitant use.
- Grapefruit Juice: plasma concentration of ivabradine increased by grapefruit juice.
- Pentamidine isetionate: increased risk of ventricular arrhythmias when ivabradine given with pentamidine isetionate.

Ivacaftor (continued)

- Grapefruit Juice: plasma concentration of ivacaftor possibly increased by grapefruit juice — manufacturer of ivacaftor advises avoid concomitant use.
- Lipid-regulating Drugs: separating administration from ivacaftor by 12 hours advised by manufacturer of lovatatin.
- Ivermectin
- Anthelmints: plasma concentration of ivermectin possibly increased by levamisole.
- Anticoagulants: ivermectin possibly enhances anticoagulant effect of coumarins.

Japanese Encephalitis Vaccine see Vaccines

- Kaolin
- Analgesics: kaolin possibly reduces absorption of aspirin.
- Antibacterials: kaolin possibly reduces absorption of tetracyclines.
- Antimalarials: kaolin reduces absorption of chloroquine and hydroxychloroquine.
- Antipsychotics: kaolin possibly reduces absorption of phenothiazines.

Ketamine see Anaesthetics, General

Ketoconazole see Antifungals, Imidazole

Ketoprofen see NSAIDs

Ketorolac see NSAIDs

Ketotifen see Antihistamines

Labeletal see Beta-blockers

Lacidipine see Calcium-channel Blockers

Lacosamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered).
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by Mefloquine.
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered).
- Oralstat: possible increased risk of convulsions when antiepileptics given with orlistat.

Lactulose
- Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins.

Lamivudine
- Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole) — avoid concomitant use of high-dose co-trimoxazole.
- Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine.
- Cytoxics: manufacturer of lamivudine advises avoid concomitant use with cladribine.
- Oralstat: absorption of lamivudine possibly reduced by orlistat.

Lamotrigine
- Antidepressants: plasma concentration of lamotrigine reduced by rifampicin.
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered).
- Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by fosphenytoin, phenobarbital, phenytoin and primidone; plasma concentration of lamotrigine increased by sodium valproate and valproic acid (increased risk of toxicity — reduce lamotrigine dose).
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by Mefloquine.
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered).
- Antivirals: plasma concentration of lamotrigine possibly reduced by ritonavir.

Ivermectin
- Anthelmints: plasma concentration of ivermectin possibly increased by levamisole.
- Anticoagulants: ivermectin possibly enhances anticoagulant effect of coumarins.
**Lamotrigine** (continued)
- Oestrogens: plasma concentration of lamotrigine reduced by **OESTROGENS**—consider increasing dose of lamotrigine
- Orlistat: possible increased risk of convulsions when antipsychotics given with **ORLISTAT**
- Progestogens: plasma concentration of lamotrigine possibly increased by **DESOGESTREL**

**Lanreotide**
- Antidiabetics: lanreotide possibly reduces requirements for **ANTI DIABETICS**
- Ciclosporin: lanreotide reduces plasma concentration of **CICLOSPORIN**

**Lansoprazole** see Proton Pump Inhibitors

**Lanthanum**
- Antibacterials: lanthanum possibly reduces absorption of **ANTIBACTERIALS**
- Antacids: (give at least 2 hours before or 4 hours after lanthanum)
- Antifungals: lanthanum possibly reduces absorption of **ANTIFUNGALS** and **HYDROxychlOROQUINE** (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of **ANTIMALARIALS**
- Thyroid Hormones: lanthanum reduces absorption of **LEVOTHYROXINE** (give at least 2 hours apart)

**Lapatinib**
- Antibacterials: manufacturer of lapatinib advises avoid concomitant use with **RIFABUTIN, RIFAMPICIN** and **PHENYTOIN**
- Antidepressants: manufacturer of lapatinib advises avoid concomitant use with **ST JOHN’S WORT**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with **PIMOZIDE**
- Antivirals: avoidance of lapatinib advised by manufacturer of **BOCeprevir**; manufacturer of lapatinib advises avoid concomitant use with **RITONAVIR** and **SAQUINAVIR**
- Cytotoxics: lapatinib increases plasma concentration of **AZAteparAZOLE**—increased risk of neutropenia when lapatinib given with **DOCETAXEL;** increased risk of neutropenia when lapatinib given with **PLACITAXEL;** lapatinib increases plasma concentration of active metabolite of **IRINOTECAN**—consider reducing dose of irinotecan
- Calcium-channel Blockers: absorption of lapatinib possibly reduced by **HISTamine H2-ANTAGONISTS** and **PROTON PUMP INHIBITORS**

**Laronidase**
- Antihistamines: increased risk of agranulocytosis; manufacturer of laronidase advises avoid concomitant use
- Heparin: manufacturer of laronidase advises avoid concomitant use

**Ledipasvir** (continued)
- Antivirals: plasma concentration of both drugs increased when ledipasvir given with **SIMEPREVIR**—manufacturer of ledipasvir advises avoid concomitant use
- Calcium Salts: manufacturer of ledipasvir advises separating administration from **CALCIUM SALTS** by 4 hours
- Lipid-regulating Drugs: possible increased risk of myopathy when ledipasvir given with **ATORVASTATIN, FLUVASTATIN** and **SIMVASTATIN**—manufacturer of ledipasvir advises consider reducing dose of atorvastatin, fluvastatin and simvastatin; manufacturer of ledipasvir advises avoid concomitant use with **ROsvASTATIN**
- Ulcer-healing Drugs: plasma concentration of ledipasvir reduced by **FAMOTIDINE** and **OMEPRAZOLE**; manufacturer of ledipasvir advises do not take **PROTON PUMP INHIBITORS** before ledipasvir

**Leflunomide**

**Lipid-regulating Drugs**
- **Antibacterials**: plasma concentration of both drugs increased when ledipasvir given with **SIMEPREVIR**—manufacturer of ledipasvir advises avoid concomitant use
- Anticoagulants: leflunomide possibly enhances anticoagulant effect of **WARFARIN**
- Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of **TOLButAMIDE**
- Antiepileptics: leflunomide possibly increases plasma concentration of **FOSPHENyTOIN and PHENyTOIN**
- Cytotoxics: risk of toxicity when leflunomide given with **METHotreXATE**
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by **COLESTRAMINE** (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: risk of generalised infections when leflunomide given with live **VACCINES**—avoid concomitant use

**Lenalidomide**
- Antibacterials: plasma concentration of lenalidomide possibly increased by **CLARITHRomyCIN** (increased risk of toxicity)
- Antifungals: plasma concentration of lenalidomide possibly increased by **itraCOnazole** and **KETOCONAZOLE** (increased risk of toxicity)
- Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by **VERAPAMIL** (increased risk of toxicity)
- Cardiovascular: lenalidomide possibly increases plasma concentration of **DIGoxin**
- Ciclosporin: plasma concentration of lenalidomide possibly increased by **CICLOSPORIN** (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis)

**Lercanidipine** see Calcium-channel Blockers

**Leukotriene Receptor Analogists**
- Aminophylline: zafirlukast possibly increases plasma concentration of **AMINOPHYLLINE**, also plasma concentration of zafirlukast reduced
- Analgesics: plasma concentration of zafirlukast increased by **ASPIRIN**
- Antibacterials: plasma concentration of zafirlukast reduced by **ERYthROMYCIN**
- Anticoagulants: zafirlukast enhances anticoagulant effect of **WARFARIN**
- Antiepileptics: plasma concentration of montelukast reduced by **PHENOBARBITAL** and **PRIMIDONE**
- Antifungals: plasma concentration of zafirlukast increased by **FLUCONAZOLE**
- Lipid-regulating Drugs: plasma concentration of montelukast increased by **GEMFIBROZIL**
- Theophylline: zafirlukast possibly increases plasma concentration of **THEOPHYLLINE**, also plasma concentration of zafirlukast reduced

**Levamisole**
- Alcohol: possibility of disulfiram-like reaction when levamisole given with **ALCOHOL**
- Anthelmintics: plasma concentration of both drugs possibly reduced when levamisole given with **ALBENDAZOLE**; levamisole possibly increases plasma concentration of **IVERmECTIN**
Levamisole (continued)

- Anticoagulants: levamisole possibly enhances anticoagulant effect of warfarin
- Antiepileptics: levamisole possibly increases plasma concentration of fosphenytoin and phenytoin

Levetiracetam

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRI and tricyclics (convulsive threshold lowered)
- Antiepileptics: levetiracetam possibly increases risk of carbamazepine toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by mefloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Antituberculars: levamisole possibly increases plasma concentration of
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Levobunolol

- Anti-arrhythmics: reduced plasma concentration of lidocaine possibly increased by antiepileptics given with
- Antihistamines, beta-blockers: possible increased risk of side-effects when levodopa given with

Levodopa (continued)

- ACE inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with volatile liquid general anaesthetics
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with angiotensin-II receptor antagonists
- ANTIHISTAMINES: effects of levodopa possibly reduced by isoniazid
- Antidepressants: risk of hypertensive crisis when levodopa given with MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with moclobemide
- Antiepileptics: effects of levodopa possibly reduced by fosphenytoin and phenytoin
- Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics
- Antipsychotics: effects of levodopa antagonised by antipsychotics; avoidance of levodopa advised by manufacturer of amisulpride (antagonism of effect)
- Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by benzodiazepines
- Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers
- Bupropion: increased risk of side-effects when levodopa given with bupropion
- Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when levodopa given with clonidine
- Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide
- Diuretics: enhanced hypotensive effect when levodopa given with diuretics
- Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)
- Iron Salts: absorption of levodopa possibly reduced by oral iron salts
- Memantine: effects of dopaminergics possibly enhanced by memantine

Levodopa (continued)

- Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen
- Nitrates: enhanced hypotensive effect when levodopa given with nitrates
- Vasodilator Anti-hypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside

Levofloxacin see Quinolones

Levofolic Acid see Folicates

Levozepromazine see Antipsychotics

Levonorgestrel see Progestogens

Levosimendan

- Nitrates: possible severe postural hypotension when levosimendan given with isosorbide mononitrate

Levotyroxine see Thyroid Hormones

Lidocaine

- ACE Inhibitors
- Adrenergic Neurone Blockers
- Alpha-blockers
- Anaesthetics, General
- Angiotensin-II Receptor Antagonists
- Antiarrhythmics that prolong the QT interval
- Antidepressants
- Antipsychotics that prolong the QT interval
- Antivirals: plasma concentration of lidocaine possibly increased by atazanavir and lopinavir; plasma concentration of lidothane possibly increased by darunavir and fosamprenavir—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with saquinavir—avoid concomitant use; caution with intravenous lidocaine advised by manufacturer of telaprevir
- Beta blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; possible increased risk of lidothane toxicity when given with nalidixic acid; increased risk of lidothane toxicity when given with propafenone
- Diuretics: action of lidothane antagonised by hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics
- Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidothane given with suxamethonium
- Ulcer-healing Drugs: plasma concentration of lidothane increased by cimetidine (increased risk of toxicity)

Linagliptin see Antidiabetics

Linezolid see MAOIs

Liothyronine see Thyroid Hormones

Lipefoglifastim

- Cytotoxics: neutropenia possibly exacerbated when lipoglifastim given with capецептин, флуроруракил or tegafur

Lipid-regulating Drugs see Colesevelam, Colestipol, Colestyremin, Ezetimibe, Fibrate, Lomitapide, Nicotinic Acid, and Statins

Liraglutide see Antidiabetics

Lisdexametanfate see Sympathomimetics

Lisinopril see ACE Inhibitors

Lithium

- ACE inhibitors: excretion of lithium reduced by ACE inhibitors (increased plasma concentration)
- Aminophylline: excretion of lithium increased by aminophylline (reduced plasma concentration)
- Analgesics: excretion of lithium reduced by NSAIDs (increased risk of toxicity); excretion of lithium reduced by ketorolac (increased risk of toxicity)—avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by angiotensin-II receptor antagonists (increased plasma concentration)
Lithium (continued)

- Antacids: excretion of lithium increased by sodium bicarbonate (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of amiodarone (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with metronidazole
- Antidepressants: possible increased serotoninergic effects when lithium given with venlafaxine; increased risk of CNS effects when lithium given with SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics
- Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine, fosphenytoin or phenytoin without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by topiramate
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupentixol, haloperidol, phenothiazines, risperidone or zuclopenthixol; possible risk of toxicity when lithium given with quetiapine; increased risk of extrapyramidal side-effects when lithium given with sulpiride
- Anxiolytics and Hypnotics: increased risk of neurotoxicity when lithium given with clonazepam
- Calcium-channel Blockers: neurotoxicity may occur when lithium given with Diltiazem or Verapamil; without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lithium given with arsenic trioxide
- Dopamine: possible increased risk of serotoninergic effects when lithium given with dapoxetine (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
- Diuretics: excretion of lithium increased by acetazolamide; excretion of lithium reduced by aldosterone antagonists and potassium-sparing diuretics (increased plasma concentration and risk of toxicity); excretion of lithium reduced by loop diuretics and thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides
- 5HT1-receptor Agonists: possible risk of toxicity when lithium given with sumatriptan
- Methyl/dopa: neurotoxicity may occur when lithium given with methyl/dopa without increased plasma concentration of lithium
- Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesis caused by lithium possibly aggravated by baclofen
- Parasympathomimetics: lithium antagonises effects of neostigmine
- Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration)
- Lixisenatide see Antidiabetics
- Loperamime see Antidiarrheics, Tricyclic
- Lofexidine
- Alcohol: increased sedative effect when lofexidine given with alcohol
- Anxiolytics and Hypnotics: increased sedative effect when lofexidine given with anxiolytics and hypnotics

Lomitapide (continued)

- Anticoagulants: lomitapide possibly enhances anticoagulant effect of warfarin
- Antidepressants: manufacturer of lomitapide advises separating administration from fluoxetine and fluvoxamine by 12 hours
- Antidiabetics: manufacturer of lomitapide advises separating administration from linagliptin by 12 hours
- Antifungals: plasma concentration of lomitapide increased by ketoconazole—avoid concomitant use; manufacturer of lomitapide advises avoid concomitant use with triazoles (plasma concentration of lomitapide possibly increased)
- Antivirals: manufacturer of lomitapide advises avoid concomitant use with dapavinavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir, telaprevir and tipranavir (plasma concentration of lomitapide possibly increased)
- Anxiolytics and Hypnotics: manufacturer of lomitapide advises separating administration from alprazolam by 12 hours
- Calcium-channel Blockers: manufacturer of lomitapide advises avoiding concomitant use with amlopidine and lacidipine by 12 hours; manufacturer of lomitapide advises avoid concomitant use with diltiazem and verapamil (plasma concentration of lomitapide possibly increased)
- Ciclosporin: manufacturer of lomitapide advises separating administration from ciclosporin by 12 hours
- Clofazimine: manufacturer of lomitapide advises separating administration from ciclosporin by 12 hours
- Cytotoxics: manufacturer of lomitapide advises separating administration from lapatinib, nilotinib and pazopanib by 12 hours
- Fosaprepitant: manufacturer of lomitapide advises separating administration from fosaprepitant by 12 hours
- Grapefruit Juice: manufacturer of lomitapide advises avoid concomitant use with grapefruit juice
- Hormone Antagonists: manufacturer of lomitapide advises separating administration from aminoglutethimide, bicalutamide and ketoconazole by 12 hours; increased risk of ventricular arrhythmias
- Lipid-regulating Drugs: lomitapide increases plasma concentration of atorvastatin—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; lomitapide increases plasma concentration of simvastatin (see under Simvastatin, p. 194); absorption of lomitapide possibly reduced by bile acid sequestrants (give at least 4 hours apart)
- Oestrogens: manufacturer of lomitapide advises separating administration from oestrogens by 12 hours
- Ranolazine: manufacturer of lomitapide advises separating administration from ranolazine by 12 hours
- Tacrolimus: manufacturer of lomitapide advises separating administration from tacrolimus by 12 hours
- Tiaclopidine: manufacturer of lomitapide advises separating administration from ticlopidine by 12 hours
- Ulcer-healing Drugs: manufacturer of lomitapide advises separating administration from cimetidine and ranitidine by 12 hours

Lomustine

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Ulcer-healing Drugs: myelosuppressive effects of lomustine possibly enhanced by cimetidine

Loperamide

- Desmopressin: loperamide increases plasma concentration of oral desmopressin

Lopinavir

Note in combination with ritonavir as Kaletra® (ritonavir is noted to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir
- Anti-arrhythmics: lopinavir possibly increases plasma concentration of flecainide (increased risk of ventricular arrhythmias—avoid concomitant use); lopinavir possibly increases plasma concentration of lidocaine
Lopinavir — Macrolides

Lopinavir (continued)

- Antibacterials: plasma concentration of lopinavir reduced by
  - **RIFAMPICIN**—avoid concomitant use; lopinavir increases plasma concentration of **DELAMANID**; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of **SIMEPATIDE**
  - **TELITHROMYCIN**
- Anticoagulants: avoidance of lopinavir advised by manufacturer of **APIXABAN**; manufacturers advise avoid concomitant use of lopinavir with **RIVAROXABAN**
- Antidepressants: plasma concentration of lopinavir reduced by
  - **ST JOHN’S WORT**—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by **CARBAMAZEPINE, FOSPHENYTIOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE**
- Antifungals: lopinavir increases plasma concentration of **ISAVICONAZOLE** (also plasma concentration of lopinavir reduced)
- Antihistamines: lopinavir possibly increases plasma concentration of **CHLORPHENAMINE**
- Antimalarials: caution with lopinavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**
- Antimuscarinics: avoidance of lopinavir advised by manufacturer of **DARIFENACIN and TOLTERODINE**
- Antipsychotics: lopinavir possibly increases plasma concentration of **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: manufacturers advise avoid concomitant use of lopinavir with **BOCDEPREVIR** and **TELAPREVIR**; lopinavir reduces plasma concentration of **DARUNAVIR**—avoid concomitant use; plasma concentration of lopinavir reduced by **EFAVIRENZ**—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of **ELVITEGRAVIR** (reduce dose of elvitegravir); lopinavir reduces plasma concentration of **FOSAMPRENAVIR**, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of **MARAVIROC** (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by **NEVIRAPINE**—consider increasing dose of lopinavir; lopinavir increases plasma concentration of **PARITAPREVIR**—manufacturer of paritaprevir advises avoid concomitant use; increased risk of ventricular arrhythmias when lopinavir given with **SAQUINAVIR**—avoid concomitant use; lopinavir increases plasma concentration of **TENOFIVIR**; plasma concentration of lopinavir reduced by **TIPRANAVIR**
  - Bosentan: lopinavir increases plasma concentration of **BOSENTAN** (consider reducing dose of bosentan)
  - Corticosteroids: plasma concentration of lopinavir possibly reduced by **DEKAMETHASONE**
- Cytoxotics: manufacturer of ruxolitinib advises dose reduction when lopinavir given with **RUXOLITINIB**—consult ruxolitinib product literature
- Eltrombopag: lopinavir possibly reduces plasma concentration of **ELTROMBOPAG**
- Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with **ATORVASTATIN**; lopinavir increases plasma concentration of **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with **SIMVASTATIN**—avoid concomitant use; avoidance of lopinavir advised by manufacturer of **LOMITAPIDE** (plasma concentration of lomitapide possibly increased)
- Orlistat: absorption of lopinavir possibly reduced by **ORLISTAT**
- Ranolazine: lopinavir possibly increases plasma concentration of **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: lopinavir possibly increases plasma concentration of **SIROLIMUS**
- Sympathomimetics, Beta₂: manufacturer of lopinavir advises avoid concomitant use with **SALMETEROL**
- Loprazolam see Anxiolytics and Hypnotics
- Loradatine see Antihistamines
- Lorazepam see Anxiolytics and Hypnotics
- Lormetazepam see Anxiolytics and Hypnotics
- Losartan see Angiotensin-II Receptor Antagonists
- Lumacaftor
  - Antibacterials: lumacaftor possibly reduces plasma concentration of **CLARITHROMYCIN** and **TELITHROMYCIN**—reduce dose of lumacaftor with ivacox (see under Lumacaftor with Ivacoxar in BNF or BNFC); lumacaftor possibly reduces plasma concentration of **RIFABUTIN**—avoid concomitant use
  - Antidepressants: manufacturer of lumacaftor advises avoid concomitant use with **ST JOHN’S WORT**
- Antiepileptics: lumacaftor possibly reduces plasma concentration of **CARBAMAZEPINE, FOSPHENYTIOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE**—manufacturer of lumacaftor advises avoid concomitant use
- Antifungals: lumacaftor possibly reduces plasma concentration of **KETOCONAZOLE, POSACONAZOLE** and **VORICONAZOLE**—reduce dose of lumacaftor with ivacoxar (see under Lumacaftor with Ivacoxar in BNF or BNFC); lumacaftor reduces plasma concentration of **ITRAZOPAN**—reduce dose of lumacaftor with Ivacoxar (see under Lumacaftor with Ivacoxar in BNF or BNFC)
- Anxiolytics and Hypnotics: lumacaftor possibly reduces plasma concentration of **MIDAZOLAM**—manufacturer of lumacaftor advises avoid concomitant use
- Ciclosporin: manufacturer of lumacaftor advises avoid concomitant use with **CICLOSPORIN**
- Cytoxotics: manufacturer of lopinavir advises avoid concomitant use with **EVEROLIMUS**
- Oestrogens: lumacaftor possibly causes contraceptive failure of hormonal contraceptives containing **ETHINYLESTRADIOL** (alternative contraception recommended)
- Progestogens: lumacaftor possibly causes contraceptive failure of hormonal contraceptives containing **PROGESTOGENS** (alternative contraception recommended)
- Sirolimus: manufacturer of lumacaftor advises avoid concomitant use with **SIROLIMUS**
- Tacrolimus: manufacturer of lumacaftor advises avoid concomitant use with **TACROLIMUS**
- Lupasidentone see Antipsychotics
- Lymecycline see Tetracyclines
- Macitentan
  - Antibacterials: plasma concentration of macitentan reduced by **RIFAMPICIN**—avoid concomitant use
  - Antidepressants: manufacturer of macitentan advises avoid concomitant use with **ST JOHN’S WORT**
  - Antiepileptics: manufacturer of macitentan advises avoid concomitant use with **CARBAMAZEPINE, FOSPHENYTIOIN and PHENOBARBITAL**
  - Antifungals: plasma concentration of macitentan increased by **KETOCONAZOLE**

Macrogols

Note Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides

Note See also Telithromycin

Note Interactions do not apply to small amounts of erythromycin used topically

- Aminophylline: clarithromycin possibly increases plasma concentration of **AMINOPHYLLINE**; erythromycin increases plasma concentration of **AMINOPHYLLINE** (also aminophylline may reduce absorption of oral erythromycin)
- Analgesics: erythromycin increases plasma concentration of **ALFENTANIL**; clarithromycin possibly increases plasma concentration of **FENTANYL**
- Antacids: absorption of azithromycin reduced by **ANTACIDS** (give at least 2 hours before or 1 hour after antacids)
- Anti-arrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with **AMIODARONE**—avoid concomitant use; clarithromycin possibly increases plasma concentration of **DISOPYRAMIDE** (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of **DISOPYRAMIDE** (increased risk of toxicity); erythromycin increases plasma concentration of **DISOPYRAMIDE** (increased risk of toxicity); avoidance of
Macrolides

- Antipsychotics (continued)
  clarithromycin advised by manufacturer of ▶ DRONEDARONE (risk of ventricular arrhythmias); erythromycin increases plasma concentration of ▶ DRONEDARONE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Anticholinergics: increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ MOXIFLOXACIN—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with ▶ RIFABUTIN; clarithromycin increases plasma concentration of ▶ RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of ▶ RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of ▶ BEDAQUILINE—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias when clarithromycin and erythromycin given with ▶ DELAMANID; avoidance of clarithromycin and erythromycin advised by manufacturer of FIDAXOMICIN; plasma concentration of clarithromycin reduced by ▶ RIFAMYCINS
- Anticoagulants: avoidance of clarithromycin advised by manufacturer of parenteral erythromycin; clarithromycin possibly enhances anticoagulant effect of ▶ CUMARINS; clarithromycin and erythromycin enhance anticoagulant effect of ▶ CUMARINS; possible increased risk of bleeding when clarithromycin given with ▶ DABIGATRAN; erythromycin increases plasma concentration of ▶ EDOXABAN (reduce dose of edoxaban—see under Edoxaban, p. 118)
- Antidepressants: avoidance of macrolides advised by manufacturer of ▶ REBOXETINE; avoidance of intravenous erythromycin advised by manufacturer of ▶ CITALOPRAM and ▶ ESCITALOPRAM (risk of ventricular arrhythmias); avoidance of erythromycin advised by manufacturer of ▶ VENLAFAXINE (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of ▶ TRAZODONE
- Anti-diabetics: clarithromycin enhances effects of ▶ REPAGLINIDE
- Antiepileptics: erythromycin increases plasma concentration of ▶ CARBAMAZEPINE; clarithromycin increases plasma concentration of ▶ CARBAMAZEPINE (consider reducing dose of carbamazeptine); clarithromycin inhibits metabolism of ▶ FOSPHENOTYDIN and ▶ PHENOTYDIN (increased plasma concentration); erythromycin possibly inhibits metabolism of ▶ SODIUM VALPROATE and ▶ VALPROIC ACID (increased plasma concentration)
- Antifungals: avoidance of concomitant clarithromycin in severe renal impairment advised by manufacturer of ▶ KETOCONAZOLE; avoidance of erythromycin advised by manufacturer of ▶ FLUCONAZOLE; clarithromycin increases plasma concentration of ▶ ITRACONAZOLE
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of ▶ LORATADINE; macrolides possibly inhibit metabolism of ▶ MIZOLASTINE (avoid concomitant use); erythromycin inhibits metabolism of ▶ MIZOLASTINE—avoid concomitant use
- Antimalarials: avoidance of macrolides advised by manufacturer of ▶ ARTENIOLIM WITH PIPERPAQUINE (possible risk of ventricular arrhythmias)
- Antimuscarnics: erythromycin possibly increases plasma concentration of ▶ DARIFENACIN; manufacturer of fosoterodine advises dose reduction when clarithromycin given with ▶ FOSOTERODINE—consult fosoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ TOLTERODINE
- Antipsychotics: avoidance of macrolides advised by manufacturer of ▶ DROPERIDOL (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ ZUCLOPENTHIXOL—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ▶ AMISULPRIDE—avoid concomitant use; erythromycin possibly increases plasma concentration of ▶ CLOZAPINE (possible increased risk of convulsions); clarithromycin possibly increases plasma concentration of ▶ LURASIDONE—avoid concomitant use;

Macrolides

- Antipsychotics (continued)
  clarithromycin possibly increases the plasma concentration of ▶ LURASIDONE (see under Lurasidone, p. 573); possible increased risk of ventricular arrhythmias when erythromycin given with ▶ ZIPROZIDE—avoid concomitant use; increased risk of ventricular arrhythmias when clarithromycin given with ▶ ZIPROZIDE—avoid concomitant use; erythromycin increases plasma concentration of ▶ QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use; clarithromycin possibly increases plasma concentration of ▶ QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ SULPIRIDE
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with ▶ ATAZANAVIR; clarithromycin possibly increases the plasma concentration of ▶ DACLATASVIR—reduce dose of daclatasvir (see under Daclatasvir, p. 577); avoidance of clarithromycin advised by manufacturer of ▶ DASABUVIR and ▶ PARITAPREVIR; plasma concentration of clarithromycin reduced by ▶ Efavirenz, also plasma concentration of active metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ▶ Efavirenz and ▶ NEVIRAPINE (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of ▶ MARAVIROC (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ RILPIVIRINE (plasma concentration of rilpivirine possibly increased); plasma concentration of azithromycin and erythromycin possibly increased by ▶ RITONAVIR; plasma concentration of clarithromycin increased by ▶ RITONAVIR (reduce dose of clarithromycin in renal impairment); plasma concentration of both drugs possibly increased when clarithromycin given with ▶ SAQUINAVIR and ▶ TELAPREVI (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when erythromycin given with ▶ SAQUINAVIR—avoid concomitant use; clarithromycin possibly increases plasma concentration of ▶ SIMPREVIR—manufacturer of simprevir advises avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with ▶ SIMPREVIR—manufacturer of simprevir advises avoid concomitant use; plasma concentration of both drugs possibly increased when erythromycin given with ▶ TELAPREVI (increased risk of ventricular arrhythmias); plasma concentration of clarithromycin increased by ▶ TIPRANAVIR (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of ▶ ZIDOVUDINE (give at least 2 hours apart)
- Anxiolytics and Hypnotics: clarithromycin and erythromycin inhibit metabolism of ▶ MIDAZOLAM (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of ▶ BUSPIRONE (reduce dose of buspironone); erythromycin inhibits the metabolism of ▶ ZOPICLONE
  ▶ Aprepitant: clarithromycin possibly increases plasma concentration of ▶ APREPIANT
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ ATOMOXETINE
- Avanafil: clarithromycin possibly increases plasma concentration of ▶ AVANAFIL—manufacturer of avanafil advises avoid concomitant use; erythromycin increases plasma concentration of ▶ AVANAFIL—see under Avanafil, p. 744
- Calcium-channel blockers: clarithromycin and erythromycin possibly inhibit metabolism of ▶ CALCIUM-CHANNEL BLOCKERS (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of ▶ LERCANIDIPINE
- Cardiac Glycosides: macrolides increase plasma concentration of ▶ DIGOXIN (increased risk of toxicity)
- Ciclosporin: macrolides possibly inhibit metabolism of ▶ CICLOSPORIN (increased plasma concentration); azithromycin increases plasma concentration of ▶ CICLOSPORIN; clarithromycin and erythromycin inhibit metabolism of ▶ CICLOSPORIN (increased plasma concentration)
**Macrolides**

- Gliostazol: clarithromycin possibly increases plasma concentration of **CILOSTAZOL** (see under Cilostazol, p. 221); erythromycin increases plasma concentration of **CILOSTAZOL** (see under Cilostazol, p. 221)
- Clopidogrel: erythromycin possibly reduces antiplatelet effect of **CLOPIDOGREL**
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of **COLCHICINE** toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: erythromycin possibly inhibits metabolism of **CORTICOSTEROIDS**; erythromycin inhibits the metabolism of **METHYLPRERIDNOSLONE**; clarithromycin possibly increases plasma concentration of **METHYLPRERIDNOSLONE**
- Cytotoxic: erythromycin possibly increases the plasma concentration of **AFATINIB**—manufacturer of afatinib advises separating administration of erthyromycin by 6 to 12 hours; clarithromycin and erythromycin possibly increase plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of **BOSUTINIB**—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin and erythromycin possibly increase plasma concentration of **CABOZANTINIB**; possible increased risk of ventricular arrhythmias when clarithromycin given with **CERITINIB**; clarithromycin possibly increases plasma concentration of **CRIZOTINIB** and **EVEROLIMUS**—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of clarithromycin and erythromycin advised by manufacturer of **DASATINIB** (plasma concentration of dasatinib possibly increased); erythromycin increases plasma concentration of **EVEROLIMUS** (consider reducing the dose of everolimus—consult everolimus product literature); clarithromycin and erythromycin possibly increase the plasma concentration of **IBRUTINIB**—reduce dose of ibrutinib (see under ibrutinib, p. 867); avoidance of clarithromycin advised by manufacturer of **NILITINIB**; clarithromycin possibly increases plasma concentration of **PAZOPANIB** (reduce dose of pazopanib); clarithromycin possibly increases plasma concentration of **PONATINIB**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 875); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with **RUXOLITINIB**—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when parenteral erythromycin given with **VANDENATIB**—avoid concomitant use; clarithromycin possibly increases the plasma concentration of **CABAZITAXEL**—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; clarithromycin possibly increases plasma concentration of **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of ventricular arrhythmias when erythromycin given with **ARESINIC TRIOXIDE**; clarithromycin and erythromycin possibly increase plasma concentration of **OLAPARIB** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881); erythromycin increases toxicity of **VINBLASTINE**—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with **VINORELBINE**
- Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with **DAPOXETINE** (see under Dapoxetine, p. 751)
- Diuretics: clarithromycin increases plasma concentration of **EPLERENONE**—avoid concomitant use; erythromycin increases plasma concentration of **EPLERENONE** (reduce dose of eplerenone)
- Domeridone: possible increased risk of ventricular arrhythmias when clarithromycin given with **DOMPERIDONE**—avoid concomitant use; erythromycin increases plasma concentration of **DOMPERIDONE** (increased risk of ventricular arrhythmias—avoid concomitant use)
- Dopaminergics: macrolides possibly increase plasma concentration of **BROMOCRIPTINE** and **CABERGOLINE** (increased risk of toxicity); erythromycin increases plasma concentration of **BROMOCRIPTINE** and **CABERGOLINE** (increased risk of toxicity)
- Dose of bosutinib; clarithromycin and erythromycin possibly increase the plasma concentration of **GUANAFACINE** (halve dose of guanfacine)
- 5HT2-receptor Agonists: clarithromycin and erythromycin increase plasma concentration of **ELIPTRIPTAN** (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of **IVABRADINE**—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with **IVABRADINE**—avoid concomitant use
- Ivacaftor: clarithromycin possibly increases plasma concentration of **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC); erythromycin possibly increases plasma concentration of **IVACAFTOR**—reduce dose of ivacaftor (see under Ivacaftor, p. 275)
- Lenalidomide: clarithromycin possibly increases plasma concentration of **LENALIDOMIDE** (increased risk of toxicity)
- Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of **ZAFIRILUKAST**
- Lipid-regulating Drugs: possible increased risk of myopathy when azithromycin or erythromycin given with **ATORVASTATIN**; clarithromycin increases plasma concentration of **ATORVASTATIN** and **PRAVASTATIN**; erythromycin increases plasma concentration of **PRAVASTATIN**; erythromycin reduces plasma concentration of **ROSUVASTATIN**; possible increased risk of myopathy when azithromycin given with **SIMVASTATIN**; increased risk of myopathy when clarithromycin or erythromycin given with **SIMVASTATIN** (avoid concomitant use); separating administration from azithromycin by 12 hours advised by manufacturer of **LOMITAPIDIE**; avoidance of clarithromycin and erythromycin advised by manufacturer of **LOMITAPIDIE** (plasma concentration of lomitapide possibly increased)
- Lumacaftor: plasma concentration of clarithromycin possibly reduced by **LUMACAFTOR**—reduce dose of lumacaftor with ivacaftor (see under Lumacaftor with Ivacaftor in BNF or BNFC)
- Mirabegron: when given with clarithromycin avoid or reduce dose of **MIRABEGRON** in hepatic or renal impairment—see Mirabegron, p. 715
- Naloxegol: clarithromycin possibly increases plasma concentration of **NALOXEGOL**—avoid concomitant use
- Netupitant: plasma concentration of erythromycin increased by **NETUPITANT**
- Oestrogens: erythromycin increases plasma concentration of **ESTRADIOL**
- Panobinostat: increased risk of ventricular arrhythmias when clarithromycin given with **PANOBINOSTAT**—avoid concomitant use
- Parasympathomimetics: erythromycin increases plasma concentration of **GALANTAMINE**
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with **PENTAMIDINE ISETIONATE**
- Progestogens: erythromycin increases plasma concentration of **DIENOGEST**
- Ranolazine: clarithromycin possibly increases plasma concentration of **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases the plasma concentration of **SILDENAFIL**—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; erythromycin increases plasma concentration of **SILDENAFIL**—reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension
- Sirolimus: clarithromycin increases plasma concentration of **SIROLIMUS**—avoid concomitant use; plasma concentration of
Macrolides

- Sirolimus (continued)
  - both drugs increased when erythromycin given with
    - sIROLimus
  - Tacrolimus: clarithromycin and erythromycin increase plasma concentration of tacrolimus
  - Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil

- Theophylline: clarithromycin possibly increases plasma concentration of theophylline; erythromycin increases plasma concentration of theophylline (also theophylline may reduce absorption of oral erythromycin)
  - Ticagrelor: clarithromycin possibly increases plasma concentration of ticagrelor — manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of ticagrelor

- Ucer-healing Drugs: plasma concentration of erthyromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole

- Ulipristal: avoidance of clarithromycin advised by manufacturer of low-dose ulipristal; erythromycin increases plasma concentration of low-dose ulipristal — manufacturer of low-dose ulipristal advises avoid concomitant use

- Vaccines; antibacterials inactivate oral typhoid vaccine — see under typhoid vaccine in BNF or BNFC

- Vardenafil: clarithromycin possibly increases plasma concentration of vardenafil (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil)

Magnesium (parenteral)

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and nifedipine in pre-eclampsia

- Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium

Magnesium Salts (oral)

- see Antacids

Mannitol

- Antibacterials: avoidance of mannitol advised by manufacturer of tobramycin

- Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with ciclosporin

MAOIs

NOTE For interactions of reversible MAO-A inhibitors (RIMAs) see moclobemide, and for interactions of MAO-B inhibitors see rasagiline and selegiline

NOTE Tedizolid is a reversible, non-selective MAO inhibitor and an antibacterial

NOTE Linezolid is a reversible, non-selective MAO inhibitor and an antibacterial

- ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ACE inhibitors

- Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with adrenergic neurone blockers

- Alcohol: MAOIs interact with tyramine found in some beverages containing alcohol and some dealkoholised beverages (hypertensive crisis) — if no tyramine, enhanced hypotensive effect

- Alpha-2-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine

- Alpha-blockers: avoidance of MAOIs advised by manufacturer of indoramin; enhanced hypotensive effect when MAOIs given with alpha-blockers

- Analgesics: possible increased serotonergic effects when MAOIs given with fentanyl; CNS excitation or depression (hypertension or hypotension) when MAOIs given with paroxetine — avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when MAOIs given with tramadol — some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs

- Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of angiotensin-II receptor antagonists

- Antibacterials: plasma concentration of linezolid reduced by therapeutic failure of linezolid

- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start citalopram, escitalopram, fluvoxamine, paroxetine or sertraline for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start duloxetine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with venlafaxine (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertension and CNS excitation when MAOIs given with other MAOIs (avoid for at least previous 5 days before stopping MAOIs and then start at a reduced dose); after stopping MAOIs do not start moclobemide for at least 1 week; MAOIs increase CNS effects of SSRIS (risk of serious toxicity); after stopping MAOIs do not start mirtazapine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with tricyclics, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); avoidance of linezolid advised by manufacturer of vortioxetine; increased risk of hypertension and CNS excitation when MAOIs given with vortioxetine (vortioxetine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 2 weeks after stopping vortioxetine)

- Antidiabetics: MAOIs possibly enhance hypoglycaemiac effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulfonylureas

- Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of carbamazepine, also antagonism of anticonvulsant effect

- Antihistamines: avoidance of MAOIs advised by manufacturer of hydroxyzine; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of promethazine; increased antimuscarinic and sedative effects when MAOIs given with antihistamines

- Antimalarials: avoidance of antidepressants advised by manufacturer of artepime with lumefantrine and artemether with lumefantrine

- ArtemiNol with piperaquene

- Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics

- Antipsychotics: CNS effects of MAOIs possibly increased by clozapine

- Anxiolytics and Hypnotics: manufacturer of tranylcypromine advises avoid buspirone for 14 days after stopping tranylcypromine; avoidance of MAOIs advised by manufacturer of buspirone

- Atomoxetine: after stopping MAOIs do not start atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

- Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers

- Buspirone: avoidance of buspirone for 2 weeks after stopping MAOIs advised by manufacturer of buspirone

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of bupropion

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of bupropion
MAOIs (continued)
- Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when MAOIs given with CLONIDINE
- Dapoxetine: increased risk of serotoninergic effects when MAOIs given with DAPOXETINE (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)
- Diazoxide: enhanced hypotensive effect when MAOIs given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when MAOIs given with DIURETICS
- Dopaminergics: risk of hypertensive crisis when MAOIs given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA, avoid co-beneldopa, co-careldopa or levdopa for at least 2 weeks after stopping MAOIs; avoid concomitant use of non-selective MAOIs with ENTACAPONE; risk of hypertensive crisis when MAOIs given with RASAGILINE, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with SELEGINILE — manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with TOLCAPONE
- Doxapram: MAOIs enhance effects of DOXAPRAM
- Histamine: avoidance of MAOIs advised by manufacturer of HISTAMINE
- SHT-receptor Agonists: risk of CNS toxicity when MAOIs given with RIZATRIPTAN or SUMATRIPTAN (avoid rizatRIPTAN or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when MAOIs given with ZOMITRIPTAN (reduce dose of zolmitriptan)
- Methyldopa: avoidance of MAOIs advised by manufacturer of METHYLDOPA
- Moxonidine: enhanced hypotensive effect when MAOIs given with MOXONIDINE
- Muscle Relaxants: phenelzine enhances effects of SUXAMETHONIUM
- Nicorandil: enhanced hypotensive effect when MAOIs given with NICORANDIL
- Nitrates: enhanced hypotensive effect when MAOIs given with NITRATES
- Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of PHOLCODINE
- Sympathomimetics: risk of hypertensive crisis when MAOIs given with ADRENALINE (EPINEPHRINE), DOBUTAMINE, DOPAMINE, NORADRENALINE (NOREPINEPHRINE) or XYLEMETHAZOLINE; risk of hypertensive crisis when MAOIs given with DEXAMFETAMINE, EPHEDRINE, ISOMETHEPHENE, LISDEXAMFETAMINE, METARAMINOL, METHYLPHENIDATE, PHENYLEPHRINE or PSEUDEPHEDRINE, avoid dexamfetamine, ephedrine, isomethephene, lisdexamfetamine, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of MIOODRINE; risk of hypertensive crisis when MAOIs given with OXYMETHAZOLINE, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs
- Tetrabenazine: risk of CNS toxicity when MAOIs given with TETRABENAZINE (avoid tetrabenazine for 2 weeks after MAOIs) Vaccines: antibacterials including linezolid and tedizolid inactivate ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF or BNFC
- Vasodilator Antihypertensives: enhanced hypotensive effect when MAOIs given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

MAOIs, reversible see Moclobemide

Maraviroc (continued)
- Antifungals: plasma concentration of maraviroc increased by KETOCONAZOLE (consider reducing dose of maraviroc)
- Antivirals: plasma concentration of maraviroc increased by ATVAZANAVIR, BOCEPREVIR, DARUNAVIR, INDINAVIR, LOPINAVIR, SAQUINAVIR and TELAPREVIR (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by EFAVIRENZ — consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by ETROVIRINE; maraviroc reduces plasma concentration of FOSAMPRENAVIR — avoid concomitant use; plasma concentration of maraviroc increased by COBICISTAT (reduce dose of maraviroc)
- Orlistat: absorption of maraviroc possibly reduced by ORLSTAT

Mebendazole
- Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by CIMETIDINE (increased plasma concentration)

Medroxyprogesterone see Progestogens

Mefenamic Acid see NSAIDs

Mefloquine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with AMIODARONE — avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with MOXIFLOXACIN — avoid concomitant use; plasma concentration of mefloquine reduced by RIFAMPICIN — avoid concomitant use
- Antidepressants: possible increased risk of convulsions when mefloquine given with VORTICOTINE
- Antiepileptics: mefloquine antagonises anticonvulsant effect of ANTIEPILEPTICS
- Antifungals: plasma concentration of mefloquine increased by KETOCONAZOLE
- Antimalarials: avoidance of antimalarials advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when mefloquine given with CHLOROQUINE or HYDROXYCHLOROQUINE; increased risk of convulsions when mefloquine given with QUININE (but should not prevent the use of intravenous quinine in severe cases)
- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with HALOPERIDOL — avoid concomitant use; avoidance of mefloquine advised by manufacturer of AMISULPRIDE; increased risk of ventricular arrhythmias when mefloquine given with PIMOZIDE — avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with RISPERIDONE
- Antivirals: mefloquine possibly reduces plasma concentration of RITONAVIR
- Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with ATOMOXETINE
- Beta-blockers: increased risk of bradycardia when mefloquine given with BETA-BLOCKERS
- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with CALCIUM-CHANNEL BLOCKERS
- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with DIGOXIN
- Cytotoxics: possible increased risk of bradycardia when mefloquine given with CRIZOTINIB
- Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE
- Ibavradine: increased risk of ventricular arrhythmias when mefloquine given with IBRAVADINE
- Penicillamine: increased risk of haematological toxicity when antimalarials given with PENICILLAMINE — manufacturer of penicillamine advises avoid concomitant use
- Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF or BNFC

Megestrol see Progestogens

Melatonin see Anxiolytics and Hypnotics

Meloxicam see NSAIDs
Methenamine
- Antibacterials: increased risk of methenamine toxicity when given with **NALIDIXIC ACID**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: methenamine possibly reduces absorption of **DIGOXIN** tablets
- Ciclosporin: increased risk of nephrotoxicity when methenalan given with **CICLOSPORIN**

Memantine
- Anaesthetics, General: increased risk of CNS toxicity when memantine given with **AMANTADINE**
- Analgesics: increased risk of CNS toxicity when memantine given with **DEXTROMETHORPHAN**
- Anticoagulants: memantine possibly enhances anticoagulant effect of **WARFARIN**
- Antimuscarinics: memantine possibly enhances effects of **ANTIMUSCARINICS**
- Antipsychotics: dopamine possibly reduces effects of **DOPAMINERGICS** and **SELEGILINE**
- Muscle Relaxants: memantine possibly modifies effects of **BACLOFEN** and **DANTROLENE**

Meningococcal Vaccines see Vaccines

Mepacrine
- Antimalarials: mepacrine increases plasma concentration of **PRIMAQUINE** (increased risk of toxicity)
- **Meprobamate** see Anxiolytics and Hypnotics
- **Meptazinol** see Opioid Analgesics

Merpenturine
- Allopurinol: enhanced effects and increased toxicity of merpenturine when given with **ALLOPURINOL** (reduce dose of merpenturine to one quarter of usual dose)
- Antibacterials: increased risk of haematological toxicity when merpenturine given with **SULFAMETHOXAZOLE** (as co- trimoxazole); increased risk of haematological toxicity when merpenturine given with **TRIMETHOPRIM** (also with co- trimoxazole)
- Anticoagulants: merpenturine possibly reduces anticoagulant effect of **COUMARINS**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOZAPINE** (increased risk of agranulocytosis)
- **Dairy Products**: plasma concentration of merpenturine possibly reduced by **Dairy Products**—manufacturer of merpenturine advises avoid concomitant use after dairy products
- **Febuxostat**: avoidance of merpenturine advised by manufacturer of **FEBUXOSTAT**

Meroopen
- Antiepileptics: carbapenems reduce plasma concentration of **SODIUM VALPROATE** and **VALPROIC ACID**—avoid concomitant use
- Vaccines: antibacterials inactive **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

Mestranol see Oestrogens

Metaraminol see Sympathomimetics

Metformin see Antidiabetics

Methadone see Opioid Analgesics

Methenamine
- Antacids: avoid concomitant use of methenamine with **ANTACIDS**
- Antibacterials: increased risk of crystalluria when methenamine given with **SULFONAMIDES**
- Diuretics: effects of methenamine antagonised by **ACEINHIBITORS**
- Potassium Salts: avoid concomitant use of methenamine with **POTASSIUM CITRATE**
- Sodium Citrate: avoid concomitant use of methenamine with **SODIUM CITRATE**
- Vaccines: antibacterials inactive **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC

Methocarbamol see Muscle Relaxants

Methotrexate
- Aminophylline: methotrexate possibly increases plasma concentration of **AMINOPHYLLINE**
- Anaesthetics, General: antifolate effect of methotrexate increased by **NITROUS OXIDE**—avoid concomitant use
- Analgesics: excretion of methotrexate possibly reduced by **NSAIDS** (increased risk of toxicity); excretion of methotrexate reduced by **ASPIRIN**, **DICLOFENAC**, **IBUPROFEN**
- Antimicrobials: methotrexate possibly reduced by **INDOMETACIN**, **KETOPROFEN**, **MELOXICAM** and **NALIDIXIC ACID** (increased risk of toxicity)
- Antibacterials: absorption of methotrexate possibly reduced by **NEOMYCIN**; excretion of methotrexate possibly reduced by **CIPROFLOXACIN** (increased risk of toxicity); increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when methotrexate given with **SULFAMETHOXAZOLE** (as co-trimoxazole); increased risk of methotrexate toxicity when given with **DOXYCYCLINE**, **SULFONAMIDES** or **TETRACYCLINE**; excretion of methotrexate reduced by **PENICILLINS** (increased risk of toxicity); increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when methotrexate given with **TRIMETHOPRIM** (also with co-trimoxazole)
- Antiepileptics: antifolate effect of methotrexate increased by **FOSPHENYTOIN** and **PHENYTOIN**; plasma concentration of methotrexate possibly increased by **LEVETIRACETAM**
- Antimalarials: antifolate effect of methotrexate increased by **PYRIMETHAMINE**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOZAPINE** (increased risk of agranulocytosis)
- Cardiac Glycosides: methotrexate possibly reduces absorption of **DIGOXIN** tablets
- Ciclosporin: risk of toxicity when methotrexate given with **CICLOSPORIN**
- Corticosteroids: possible increased risk of hepatotoxicity when **high-dose** methotrexate given with **BEMETASONE**
- Cytotoxics: increased pulmonary toxicity when methotrexate given with **CISPLATIN**
- Diuretics: excretion of methotrexate increased by alkaline urine due to **ACETAZOLAMIDE**
- Leflunomide: risk of toxicity when methotrexate given with **LEFLUNOMIDE**
- Retinoids: plasma concentration of methotrexate increased by **ACITRETIN** (also increased risk of hepatotoxicity)—avoid concomitant use
- Theophylline: methotrexate possibly increases plasma concentration of **THEOPHyllINE**
- Ulcer-healing Drugs: excretion of methotrexate possibly reduced by **PROTON PUMP INHIBITORS** (increased risk of toxicity)

Methyldopa
- ACE Inhibitors: enhanced hypotensive effect when methyldopa given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with **ADRENERGIC NEURONE BLOCKERS**
- Alcohol: enhanced hypotensive effect when methyldopa given with **ALCOHOL**
- Aldesleukin: enhanced hypotensive effect when methyldopa given with **ALDESLEUKIN**
- Alpha-blockers: enhanced hypotensive effect when methyldopa given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when methyldopa given with **GENERAL ANAESTHETICS**
- Analgesics: hypotensive effect of methyldopa antagonised by **NSAIDS**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antidepressants: manufacturer of methyldopa advises avoid concomitant use with **MAOIS**
- Antipsychotics: enhanced hypotensive effect when methyldopa given with **ANTIPSYCHOTICS** (also increased risk of extrapyramidal effects)
- Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with **ANXIOLYTICS AND HYPNOTICS**
- Beta-blockers: enhanced hypotensive effect when methyldopa given with **BETA-BLOCKERS**
Methyldopa (continued)
- Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when methyldopa given with CLONIDINE
- Corticosteroids: hypotensive effect of methyldopa antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when methyldopa given with DIAZoxide
- Diuretics: enhanced hypotensive effect when methyldopa given with DIURETICS
- Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics; increased risk of extrapyramidal side-effects when methyldopa given with AMANTADINE; enhanced hypotensive effect when methyldopa given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA; effects of methyldopa possibly enhanced by ENTACAPONE
- Iron Salts: hypotensive effect of methyldopa antagonised by oral IRON SALTS
  - Lithium: neurotoxicity may occur when methyldopa given with LITHIUM without increased plasma concentration of lithium with MOXISYLVE, MOXONIDINE
  - Moxonidine: enhanced hypotensive effect when methyldopa given with MOXONIDINE
  - Muscle Relaxants: enhanced hypotensive effect when methyldopa given with BACLOFEN or TIZANIDINE
  - Nitrates: enhanced hypotensive effect when methyldopa given with NITRATES
  - Oestrogens: hypotensive effect of methyldopa antagonised by OESTROGENS
  - Prostaglandins: enhanced hypotensive effect when methyldopa given with ALPROSTADIL
  - Sympathomimetics, Beta-2: acute hypotension reported when methyldopa given with infusion of SALBUTAMOL
  - Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE
- Methylphenidate see Sympathomimetics
- Methyleneprisalolone see Corticosteroids
- Methyldopa
- Antidepressants: risk of CNS toxicity when methyldophium given with SSRI-RELATED ANTIDEPRESSANTS, SSRI-RELATED ANTIDEPRESSANTS and CLOMIPRAMINE—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldophium and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methyldophium given with MIRTAPATINE—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldophium and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methyldophium given with BUSPIRONE—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldophium and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methyldophium given with BUPROPION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldophium and observe patient for up to 4 hours after administration)
- Metoclopramide
- Alcohol: metoclopramide possibly increases absorption of ALCOHOL
- Anaesthetics, General: metoclopramide enhances effects of THIOPENTAL
- Analgesics: metoclopramide increases rate of absorption of ASPIRIN (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by OPIOID ANALGESICS; metoclopramide increases rate of absorption of PARACETAMOL
- Antibacterials: metoclopramide reduces plasma concentration of FOSFOMYCIN
- Antidepressants: CNS toxicity reported when metoclopramide given with SSRIS
- Antimuscarinics: effects of metoclopramide on gastro-intestinal activity antagonised by ANTIMUSCARINICS

Methyldopa — Minoxidil

Metoclopramide
- Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with ANTIPSYCHOTICS
- Atovaquone: metoclopramide reduces plasma concentration of ATOVAQUONE—avoid concomitant use
- Cilostazol: metoclopramide increases plasma concentration of CICLOSPORIN
- Dopaminergics: metoclopramide antagonises hypoprolactinaemic effects of BROMOCRIPTINE and CABERGOLINE; metoclopramide antagonises antiparkinsonian effect of PERGOLIDE; avoidance of metoclopramide advised by manufacturer of ROPINIROLE and ROTIGOTINE (antagonism of effect)
- Muscle Relaxants: metoclopramide enhances effects of SUXAMETHONIUM
- Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with TETRABENAZINE

Metolazo see Diuretics

Metoprolol see Beta-blockers

Methyldopa — Minoxidil

Metronidazole
- Cytotoxics: metronidazole increases plasma concentration of CICLOSPORIN
- Lithium: increased risk of lithium toxicity
- Mycophenolate: metronidazole possibly reduces bioavailability of MYCOPHENOLATE
- Ulcer-healing Drugs: metabolism of metronidazole inhibited by CIMETIDINE (increased plasma concentration)
- Vaccines: antibacterials inactive ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Mianserin see Antidepressants, Tricyclic (related)

Micafungin
- Antifungals: micafungin possibly increases plasma concentration of AMPHOTERICIN; micafungin increases plasma concentration of ITRACONAZOLE (consider reducing dose of itraconazole)
- Calcium-channel Blockers: micafungin increases plasma concentration of NIFEDIPINE
- Cilostazol: micafungin possibly increases plasma concentration of CICLOSPORINE
- Sirolimus: micafungin increases plasma concentration of SIROLIMUS

Miconazole see Antifungals. Imidazole

Midazolam see Antiepileptics: benzodiazepines

Midodrine see Sympathomimetics

Mifamurtide
- Antibacterials: mifamurtide possibly reduces bioavailability of MICAFUNGIN
- Cyclosporin: mifamurtide possibly reduces bioavailability of MYCOPHENOLATE
- Vaccines: antibacterials inactive ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Mifamurtide — Minoxidil

Mifepristone
- Corticosteroids: mifepristone may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

Milrinone see Phosphodiesterase Inhibitors

Minocycline see Tetracyclines

Minoxidil see Vasodilator Antihypertensives
Mirabegron

- Antimicrobials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with clarithromycin — see Mirabegron, p. 715
- Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given withitraconazole and ketoconazole — see Mirabegron, p. 715
- Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with ritonavir — see Mirabegron, p. 715
- Beta-blockers: mirabegron increases plasma concentration of metoprolol
- Cardiac Glycosides: mirabegron increases plasma concentration of digoxin — reduce initial dose of digoxin

Miratapine

- Alcohol: increased sedative effect when mirtapapine given with alcohol
- Analgesics: possible increased sedative effects when mirtapapine given with tramadol
- Anticoagulants: mirtapapine enhances anticoagulant effect of warfarin

Moxisylyte

- Antidepressants: possible increased serotonergic effects when mirtapapine given with atomoxetine
- Antimalarials: increased plasma concentration of mirtapapine given with carbamazepine, fosphenytoin and phenytoin
- Antifungals: plasma concentration of mirtapapine increased by ketoconazole
- Antimalarial: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and artemether with piperaquine
- Anxiety and Hypnotics: increased sedative effect when mirtapapine given with anxiolytics and hypnotics
- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Clonidine: mirtapapine possibly antagonises hypothensive effect of clonidine
- Methylthioninium: possible risk of CNS toxicity when mirtapapine given with methylthioninium — avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
- Ulcer-healing Drugs: plasma concentration of mirtapapine increased by cimetidine

Missoprostol

- Antacids: absorption of missoprostol possibly reduced by antacids

Mitomycin

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when cytoxic antibiotics given with live vaccines — avoid concomitant use

Mitotane

- Anticoagulants: mitotane possibly reduces anticoagulant effect of coumarins
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Antivirals: avoidance of mitotane advised by manufacturer of dasabuvir, ombitasvir and paritaprevir
- Diuretics: manufacturer of mitotane advises avoid concomitant use of spironolactone (agonist of action of spironolactone)

Moxifloxacin

- Antidepressants: possible increased serotonergic effects when mirtapapine given with clozapine (increased risk of agranulocytosis)
- Ciclosporin: excretion of moxifloxacin reduced by ciclosporin (increased plasma concentration)
- Vaccines: risk of generalised infections when cytoxic antibiotics given with live vaccines — avoid concomitant use

Mivacurium

- Antihistamines

MMR Vaccine

- Vaccines

Moxisylyte

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with alpha-blockers
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
- Beta-blockers: possible severe postural hypotension when moxisylyte given with beta-blockers
Moxisylyte — Muscle Relaxants

**Muscle Relaxants**

- ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with ADRENERGIC NEURONE BLOCKERS
  - Alcohol: increased sedative effect when baclofen, methycarbalol or tizanidine given with ALCOHOL
  - Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with ALPHA-BLOCKERS
    - Anaesthetics, General: effects of atracurium enhanced by KETAMINE; increased risk of myocardial depression and bradycardia when suxamethonium given with PROPOL; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VOLATILE LIQUID GENERAL ANAESTHETICS
    - Analgesics: excretion of baclofen possibly reduced by NSAIDS (increased risk of toxicity); excretion of baclofen reduced by IBUPROFEN (increased risk of toxicity); increased sedative effect when baclofen given with FENTANYL or MORPHINE
    - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
      - Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with LIDOCAINE
        - Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by PIPERACILLIN; plasma concentration of tizanidine increased by CIPROFLOXACIN (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by NORFLOXACIN (increased risk of toxicity); plasma concentration of tizanidine possibly reduced by BIFAMPICIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by AMINOGYCOSIDES; effects of non-depolarising muscle relaxants and suxamethonium enhanced by CLINDAMYCIN; effects of non-depolarising muscle relaxants and suxamethonium enhanced by POLYMIXINS; effects of suxamethonium enhanced by VANCOMYCIN
      - Antidepressants: plasma concentration of tizanidine increased by FLUOXAMINE (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by PHENELZINE; muscle relaxant effect of baclofen enhanced by TRICYCLICS
        - Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by CARBAMAZEPINE (accelerated recovery from neuromuscular blockade); effects of non-depolarising muscle relaxants reduced by long-term use of FOSPHENYTOIN and PHENYTOIN (but effects of non-depolarising muscle relaxants might be increased by acute use of fosphenytoin and phenytoin)
        - Antimalarials: effects of suxamethonium possibly enhanced by QUININE
        - Antipsychotics: effects of suxamethonium possibly enhanced by PROMAZINE
        - Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with ANXIOLYTICS AND HYPNOTICS
          - Beta-blockers: enhanced hypotensive effect when baclofen given with BETA-BLOCKERS; possible enhanced hypotensive effect and bradycardia when tizanidine given with BETA-BLOCKERS; effects of muscle relaxants enhanced by PRопANOLOL
          - Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with CALCIUM-CHANNEL BLOCKERS; effects of non-depolarising muscle relaxants possibly enhanced by CALCIUM-CHANNEL BLOCKERS; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with DILTIAZEM;—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by VERAPAMIL; avoidance of intravenous dantrolene advised by manufacturer of VERAPAMIL
          - Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with CARDIAC GLYCOSIDES; risk of ventricular arrhythmias when suxamethonium given with CARDIAC GLYCOSIDES

**Moxisylyte**

- Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when moxonidine given with CLONIDINE
- Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS
- Dopaminergic: enhanced hypotensive effect when moxonidine given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Methyldopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when moxonidine given with MOXISYLYTE
- Muscle Relaxants: enhanced hypotensive effect when moxonidine given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when moxonidine given with NITRATES
- Oestrogens: hypotensive effect of moxonidine antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when moxonidine given with ALPROSTADIL
- Vasodilator Anti-hypertensives: enhanced hypotensive effect when moxonidine given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

**Moxonidine**

- ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS
  - Alcohol: enhanced hypotensive effect when moxonidine given with ALCOHOL
  - Aldesleukin: enhanced hypotensive effect when moxonidine given with ALDESELEUKIN
  - Alpha-blockers: enhanced hypotensive effect when moxonidine given with ALPHA-BLOCKERS
  - Anaesthetics, General: enhanced hypotensive effect when moxonidine given with GENERAL ANAESTHETICS
  - Analgesics: hypotensive effect of moxonidine antagonised by NSAIDS
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
  - Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIS; hypotensive effect of moxonidine possibly antagonised by TRICYCLICS (manufacturer of moxonidine advises avoid concomitant use)
  - Antipsychotics: enhanced hypotensive effect when moxonidine given with PHENOTHIAZINES
  - Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with ANXIOLYTICS AND HYPNOTICS; sedative effects possibly increased when moxonidine given with BENZODIAZEPINES
  - Beta-blockers: enhanced hypotensive effect when moxonidine given with BETA-BLOCKERS
  - Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS
  - Clonidine: enhanced hypotensive effect when moxonidine given with CLONIDINE
  - Corticosteroids: hypotensive effect of moxonidine antagonised by CORTICOSTEROIDS
  - Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE
  - Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS
  - Dopaminergic: enhanced hypotensive effect when moxonidine given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
  - Methyldopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA
  - Moxisylyte: enhanced hypotensive effect when moxonidine given with MOXISYLYTE
  - Muscle Relaxants: enhanced hypotensive effect when moxonidine given with BACLOFEN or TIZANIDINE
  - Nitrates: enhanced hypotensive effect when moxonidine given with NITRATES
  - Oestrogens: hypotensive effect of moxonidine antagonised by OESTROGENS
  - Prostaglandins: enhanced hypotensive effect when moxonidine given with ALPROSTADIL
  - Vasodilator Anti-hypertensives: enhanced hypotensive effect when moxonidine given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE
Muscle Relaxants — Nevirapine

Muscle Relaxants (continued)

- Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with
  CLONIDINE
- Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by
  CORTICOSTEROIDS
- Cytototics: enhanced hypotensive effect when baclofen or tizanidine given with
  DIURETICS
- Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with
  CO-BENELDOPA, CO-CARELDOPA or LEVODOPA
- Lithium: effects of muscle relaxants enhanced by LITHIUM; baclofen possibly aggravates hyperkinesis caused by LITHIUM
- Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by PARENTERAL MAGNESIUM
- Memantine: effects of baclofen and dantrolene possibly modified by MEMANTINE
- Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with METHYLDOPA
- Metoclopramide: effects of suxamethonium enhanced by METOCLOPRAMIDE
- Minoxidil: enhanced hypotensive effect when baclofen or tizanidine given with
  MINOXIDINE
- Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with NITRATES
- Oestrogens: plasma concentration of tizanidine possibly increased by
  OESTROGENS (increased risk of toxicity)
- Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by DONEPEZIL; effects of suxamethonium possibly enhanced by DONEPEZIL; effects of suxamethonium enhanced by
  GALANTAMINE, NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE; effects of non-depolarising muscle relaxants antagonised by NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE
- Progestogens: plasma concentration of tizanidine possibly increased by
  PROGESTOGENS (increased risk of toxicity)
- Symptomimetics, Beta: effects of suxamethonium enhanced by BAMBUTEROL
- Vasodilators, Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with HYDRAZALINE; enhanced hypotensive effect when baclofen or tizanidine given with MINOXIDIL; enhanced hypotensive effect when baclofen or tizanidine given with SODIUM NITROPRUSSIDE

Muscle Relaxants, depolarising see Muscle Relaxants

Muscle Relaxants, non-depolarising see Muscle Relaxants

Mycophenolate

- Antacids: absorption of mycophenolate reduced by ANTACIDS
  ● Antibacterials: bioavailability of mycophenolate possibly reduced by
    METRONIDAZOLE and NORFLOXACIN; plasma concentration of mycophenolate possibly reduced by CO-AMOXICLAV; plasma concentration of active metabolite of mycofenolate reduced by ● Rifampicin
- Antifungals: plasma concentration of mycofenolate increased by
  ISAVUCONAZOLE
- Antivirals: mycofenolate increases plasma concentration of
  ACICLOVIR and VALaciclovir, also plasma concentration of inactive metabolite of mycofenolate increased; mycofenolate possibly increases plasma concentration of GANCICLOVIR and VALGANCICLOVIR, also plasma concentration of inactive metabolite of mycofenolate possibly increased
- Iron Salts: absorption of mycofenolate reduced by oral IRON SALTS
- Lipid-regulating Drugs: absorption of mycofenolate reduced by
  COLESTYRAMINE
- Sevelamer: plasma concentration of mycofenolate possibly reduced by SEVELAMER

Nabumetone see NSAIDs

Nadolol see Beta-blockers

Nalidixic Acid see Quinolones

Nalmsene

● Analgesics: manufacturer of nalmefene advises avoid concomitant use with ● OPIOID ANALGESICS

Naloxegol

● Antibacterials: plasma concentration of naloxegol possibly increased by ● CLARITHROMYCIN and ● TELITHROMYCIN —avoid concomitant use; plasma concentration of naloxegol reduced by ● Rifampicin —avoid concomitant use
- Antidepressants: plasma concentration of naloxegol possibly reduced by ● ST JOHN’S Wort —avoid concomitant use
- Antiepileptics: plasma concentration of naloxegol possibly increased by CARBAMAZEPINE —avoid concomitant use
- Antifungals: plasma concentration of naloxegol increased by KETOCONAZOLE —avoid concomitant use; plasma concentration of naloxegol possibly increased by ITRACONAZOLE —avoid concomitant use
- Antivirals: plasma concentration of naloxegol possibly increased by INDINAVIR, RITONAVIR and SAQUINAVIR —avoid concomitant use
  ● Calcium-channel Blockers: plasma concentration of naloxegol increased by DILTIAZEM (reduce dose of naloxegol —see under Naloxegol, p. 61); plasma concentration of naloxegol possibly increased by VERAPAMIL (reduce dose of naloxegol —see under Naloxegol, p. 61)
- Grapefruit Juice: plasma concentration of naloxegol possibly increased by GRAPEFRUIT JUICE —avoid concomitant use

Nandrolone see Anabolic Steroids

Naproxen see NSAIDs

Naratipran see SHT-receptor Agonists (under HT)

Natalizumab

- Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES —avoid concomitant use

Nateglinide see Antidiabetics

Nebivolol see Beta-blockers

Nefopam

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with ● MAOIS; side-effects possibly increased when nefopam given with TRICYCLICS
- Antimuscariotics: increased risk of antimuscarinic side-effects when nefopam given with ANTIMUSCARINICS

Neomycin see Aminoglycosides

Neostigmine see Parasympathomimetics

Netupitant

- Analgesics: manufacturer of netupitant advises caution with MORPHINE
- Antibacterials: netupitant increases plasma concentration of ERYTHROMYCIN; plasma concentration of netupitant reduced by ● Rifampicin —avoid concomitant use
- Anticoagulants: manufacturer of netupitant advises caution with DABIGATRAN
- Antiepileptics: manufacturer of netupitant advises caution with ZIDOVUDINE
- Anxiolytics and Hypnotics: netupitant increases plasma concentration of MIDAZOLAM
- Colchicine: manufacturer of netupitant advises caution with
  COLCHICINE
- Corticosteroids: netupitant increases plasma concentration of DEXAMETHASONE (halve dose of dexamethasone)
- Cytotoxics: netupitant increases plasma concentration of
  DOCEtaxel and ETOPOSIDE

Nevirapine

- Analgesics: nevirapine possibly reduces plasma concentration of METHADONE
- Antibacterials: nevirapine reduces plasma concentration of CLARITHROMYCIN (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of RIFABUTIN; plasma concentration of nevirapine reduced by ● Rifampicin —avoid concomitant use
Nevirapine — Nitrates

Nevirapine (continued)

- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of - WARFARIN

- Antidepressants: plasma concentration of nevirapine reduced by - ST JOHN'S WORT—avoid concomitant use

- Antiarrythmics: plasma concentration of nevirapine reduced by - CARBAMAZEPINE

- Antifungals: nevirapine reduces plasma concentration of - KETOCONAZOLE—avoid concomitant use; plasma concentration of nevirapine increased by - FLUCONAZOLE; nevirapine possibly reduces plasma concentration of - CASPOFUNGIN and - ITRACONAZOLE—consider increasing dose of caspofungin and itraconazole

- Antipsychotics: nevirapine possibly reduces plasma concentration of - ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature)

- Antivirals: nevirapine possibly reduces plasma concentration of - ATAZANAVIR and - ETRAVIRINE—avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with - BOCEPREVIR and - RILPİVİRİNE; avoidance of nevirapine advised by manufacturer of - DACLATASVİR (plasma concentration of daclatasvir possibly reduced); avoidance of nevirapine advised by manufacturer of - DASABUVİR, - ELİVİTREATİV, - OMBİTASVİR and - PARİTADEVİR; nevirapine possibly reduces the plasma concentration of - DOLİTREAVİR (see under Dolitreavir, p. 592); nevirapine reduces plasma concentration of - FOSAMPRENAVİR—avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of - INDİNAVİR; nevirapine possibly reduces plasma concentration of - LOPİNAVİR and - TELİPADEVİR—consider increasing dose of lopinavir and telaprevir; nevirapine possibly reduces plasma concentration of - SİMEPRENAVİR—manufacturer of simeprevir advises avoid concomitant use; increased risk of granulocytopenia when nevirapine given with - ZİDOUDİNE

- Dacabazine: manufacturer of nevirapine advises avoid concomitant use with - COBİCİSTAT

- Cytotoxics: avoidance of nevirapine advised by manufacturer of - OLAŞİRİBI

- Guanfacine: nevirapine possibly reduces plasma concentration of - GÜANFACİNE—increase dose of guanfacine

- Oestrogens: nevirapine accelerates metabolism of - OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)

- Orlistat: absorption of nevirapine possibly reduced by - ORLİSTAT

- Progestogens: nevirapine accelerates metabolism of - PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)

Nicolardil (continued)

- Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicorandil given with - HYDRAZİNE, - MINOXİDİL or - SODİUM NİTROPRİSSİDE

Nicotine

- Anti-arrhythmics: nicotine possibly enhances effects of - ADENOSİNE

Nicotinic Acid

- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with - STATİNS (applies to lipid regulating doses of nicotinic acid)

Nifedipine see Calcium-channel Blockers

Nilotinib

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with - CLARİTHROMİCYİN and - TELİTHROMİCYİN; plasma concentration of nilotinib reduced by - RİFİMPİCİN—avoid concomitant use

- Antifungals: plasma concentration of nilotinib increased by - KETOCONAZOLE—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with - ITRACONAZOLE and - VİRİKONAZOLE

- Antipsychotics: avoid concomitant use of cytotoxics with - CLOZAPİNE (increased risk of agranulocytosis)

- Antivirals: avoidance of nilotinib advised by manufacturer of - BOCEPREVİR; plasma concentration of nilotinib possibly increased by - RİTONAVİR—manufacturer of nilotinib advises avoid concomitant use

- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of - MIDAZOLAM

- Grapefruit juice: manufacturer of nilotinib advises avoid concomitant use with - GRAPEFRUIT JUİCE

- Lipid-regulating Drugs: separating administration from nilotinib by 12 hours advised by manufacturer of - LOMİTAİDE

Nimodipine see Calcium-channel Blockers

Nintedanib

- Antibacterials: plasma concentration of nintedanib reduced by - RİFİMPİCİN—avoid concomitant use

- Antifungals: plasma concentration of nintedanib increased by - KETOCONAZOLE

- Antipsychotics: avoid concomitant use of cytotoxics with - CLOZAPİNE (increased risk of agranulocytosis)

Nitrates

- ACE Inhibitors: enhanced hypotensive effect when nitrates given with - ACE INHİBITORS

- Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with - ADRENERGİC NEURON BLOCKERS

- Alcohol: enhanced hypotensive effect when nitrates given with - ALCOHOL

- Aldesleukin: enhanced hypotensive effect when nitrates given with - ALDESLEUKİN

- Alpha-blockers: enhanced hypotensive effect when nitrates given with - ALPHA-BLOCKERS

- Anaesthetics, General: enhanced hypotensive effect when nitrates given with - GENERAL ANAESTHETİCS

- Analgesics: hypotensive effect of nitrates antagonised by - NSAİDS

- Angiotensin II Receptor Antagonists: enhanced hypotensive effect when nitrates given with - ANGIOTENSİNS-II RECEPTOR ANTAGONİSTS

- Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by - DISİPRİMAİDE (failure to dissolve under tongue owing to dry mouth)

- Anticoagulants: infusion of glycyl trinitrate reduces anticoagulant effect of - HEPARİNS

- Antidepressants: enhanced hypotensive effect when nitrates given with - MAOİS; effects of sublingual tablets of nitrates possibly reduced by - TRİCYCLİC-RELATED ANİTDİPESİnts (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by - TRİCYCLİCS (failure to dissolve under tongue owing to dry mouth)

- Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by - ANİTDİPESİnts (failure to dissolve under tongue owing to dry mouth)

- Antipsychotics: enhanced hypotensive effect when nitrates given with - PHENOTHİAZİNES

</table>

**NSAIDs**

**NOTE** See also Aspirin. Interactions do not generally apply to topical NSAIDs

- Ace inhibitors: increased risk of renal impairment when NSAIDs given with **ACE INHIBITORS**, also hypotensive effect antagonised
- Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of **ADRENERGIC NEURONE BLOCKERS**
- Aliskiren: NSAIDs possibly antagonise hypotensive effect of **ALISKIREN**
- Alpha-blockers: NSAIDs antagonise hypotensive effect of **ALPHA-BLOCKERS**
- Analgesics: avoid concomitant use of NSAIDs with **NSAIDS** or **ASPIND** (increased side-effects); avoid concomitant use of NSAIDs with **KETOROLAC** (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of **ASPIND**
- Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**, also hypotensive effect antagonised
- Antacids: absorption of acemetacin possibly reduced by **ANTACIDS**
- Antibacterials: indometacin possibly increases plasma concentration of **AMIKACIN** and **GENTAMICIN** in neonates; plasma concentration of celecoxib, diclofenac and etoricoxib reduced by **RIFAMPICIN**; possible increased risk of convulsions when NSAIDs given with **QUINOLONES**
- Anticoagulants: increased risk of haemorrhage when **intravenous** diclofenac given with **ANTICOAGULANTS** (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with **ANTICOAGULANTS** (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of **COUMARINS** and **PHENINDIONE**; possible increased risk of bleeding when NSAIDs given with **DABIGATRAN** or **HEPARINS**; increased risk of bleeding when NSAIDs given with **EDOXABAN** (manufacturer of edoxaban advises avoid long-term NSAIDs)
- Antidepressants: increased risk of bleeding when **NSAIDS** given with **SSRIS** or **VENLAFAXINE**
- Antidiabetics: NSAIDs possibly enhance effects of **SULFONYLUREAS**
- Antiepileptics: acemetacin possibly reduces excretion of **FOSPHENTOIN** and **PHENTOIN** (increased risk of toxicity)
- Antiinfungals: plasma concentration of parecoxib increased by **FLUCONAZOLE** (reduce dose of parecoxib); plasma concentration of celecoxib increased by **FLUCONAZOLE** (halve dose of celecoxib); plasma concentration of flurbiprofen and ibuprofen increased by **FLUCONAZOLE**; plasma concentration of diclofenac and ibuprofen increased by **VORICONAZOLE**
- Antipsychotics: possible severe drowsiness when acemetacin or indometacin given with **HALOPERIDOL**
- Antivirals: plasma concentration of NSAIDs possibly increased by **RITONAVIR**; plasma concentration of piroxicam increased by **RITONAVIR** (risk of toxicity)—avoid concomitant use; increased risk of haematological toxicity when NSAIDs given with **ZIDOVUDINE**
- Azathioprine: manufacturer of azathioprine advises possible increased risk of myelosuppression when indometacin given with **AZATHIOPRINE**
- Beta-blockers: NSAIDs antagonise hypotensive effect of **BETA-BLOCKERS**
- Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of **CALCIUM-CHANNEL BLOCKERS**
- Cardiac Glycosides: NSAIDs possibly increase plasma concentration of **CARDIAC GLYCOSIDES**, also possible exacerbation of heart failure and reduction of renal function
- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with **CICLOSPORIN**; plasma concentration of diclofenac increased by **CICLOSPORIN** (halve dose of diclofenac)
- Clopidogrel: increased risk of bleeding when **NSAIDS** given with **CLOPIDOGREL**
- Corticosteroids: increased risk of gastrointestinal bleeding and ulceration when NSAIDs given with **CORTICOSTEROIDS**
- Cytotoxics: NSAIDs probably reduce excretion of **METHOTREXATE** (increased risk of toxicity); diclofenac,
NSAIDs

- Ibuprofen, indomethacin, ketoprofen, meloxicam and naproxen reduce excretion of metotrexate (increased risk of toxicity); NSAIDs possibly reduce renal excretion of pemetrexed (consult product literature; increased risk of bleeding when NSAIDs given with erlotinib; avoidance of mefenamic acid advised by manufacturer of regorafenib.
- Desmopressin: indomethacin enhances effects of desmopressin.
- Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide.
- Dimethyl sulfoxide: avoid concomitant use of sulindac with dimethyl sulfoxide.
- Diuretics: NSAIDs possibly antagonise diuretic effect of potassium-sparing diuretics; risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; excetration of acetaminophen possibly increased by furosemide; occasional reports of reduced renal function when indometacin given with triamterene—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with aldosterone antagonists or potassium-sparing diuretics; possible increased risk of hyperkalaemia when NSAIDs given with aldosterone antagonists or potassium-sparing diuretics.
- Iloprost: increased risk of bleeding when NSAIDs given with iloprost.
- Lipid-regulating Drugs: excretion of meloxicam increased by colestyramine.
- Lithium: NSAIDs reduce excretion of lithium (increased risk of toxicity); ketorolac reduces excretion of lithium (increased risk of toxicity)—avoid concomitant use.
- Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa.
- Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of mifamurtide.
- Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine.
- Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity).
- Nicardipine: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with nicardipine.
- Nitrates: NSAIDs antagonise hypotensive effect of nitrates.
- Oestrogens: etoricoxib increases plasma concentration of ethinylestradiol.
- Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with penicillamine.
- Pentoxifylline: possible increased risk of bleeding when NSAIDs given with pentoxifylline; increased risk of bleeding when ketorolac given with pentoxifylline (avoid concomitant use).
- Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel.
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with tacrolimus.
- Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside.

Obinutuzumab

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use.

Ocreotide

- Antiadibiotics: ocreotide possibly reduces requirements for antiadibiotics.
- Ciclosporin: ocreotide reduces plasma concentration of ciclosporin.
- Dopaminergics: ocreotide increases plasma concentration of bromocriptine.
- Uler-healing Drugs: ocreotide possibly delays absorption of cimetidine.

Oestrogens

- ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors.

Oestrogens (continued)

- Aminophylline: oestrogens increase plasma concentration of aminophylline (consider reducing dose of aminophylline).
- Analgesics: plasma concentration of ethinylestradiol increased by etoricoxib.
- Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists.
- Antibacterials: plasma concentration of estradiol increased by erythromycin; metabolism of oestrogens accelerated by rifampicin (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC).
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of coumarins; oestrogens antagonise anticoagulant effect of phenindione.
- Antidepressants: contraceptive effect of oestrogens reduced by st John's wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration).
- Antiadibetics: oestrogens antagonise hypoglycaemic effect of antiadibetics.
- Antiepileptics: metabolism of oestrogens accelerated by carbamazepine; eslicarbazepine, fosphenytoin, oxcarbazepine; phenobarbital, phenytoin, primidone; rufinamide and topiramate (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC); oestrogens reduce plasma concentration of lamotrigine—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of sodium valproate and valproic acid.
- Antifungals: plasma concentration of ethinylestradiol increased by ketoconazole; oestrogens increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure of hormonal contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine.
- Antivirals: plasma concentration of ethinylestradiol increased by atazanavir; avoidance of ethinylestradiol advised by manufacturer of dasabuvir, omibitasvir and paritaprevir—use alternative form of contraception; metabolism of oestrogens accelerated by nevirapine and ritonavir (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC); plasma concentration of ethinylestradiol possibly reduced by telaprevir—manufacturer of telaprevir advises additional contraceptive precautions.
- Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of chloridiazepoxide, clidazep and nitrazepam; oestrogens possibly reduce plasma concentration of lorazepam, oxazepam and temazepam; oestrogens increase plasma concentration of melatonin.
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with aprepitant (alternative contraception recommended).
- Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers.
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosentan (alternative contraception recommended).
- Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers.
- Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin.
- Clonidine: oestrogens antagonise hypotensive effect of clonidine.
- Cobicistat: metabolism of oestrogens accelerated by cobicistat (reduced contraceptive effect with combined oral
**Oligocyclines** (continued) concomitantly with other anticonvulsants; the anticonvulsant effect of one is possibly increased by the other.

**Olfatunumah**

- Antipyretics: concomitant use of antipyretics with 
  - **COBICISTAT** (reduced plasma concentration of 
  - **COBICISTAT** (alternative anticonvulsant recommended)

**Olopatadine**

- Progesterone: plasma concentration of olaparib possibly reduced by 
  - **COBICISTAT** (alternative anticonvulsant recommended)

**Oogestrogens**

- **Holocort**: treatment of allergic rhinitis; the anticonvulsant effect of one is possibly increased by the other.

**Olaparib**

- Antifungals: plasma concentration of olaparib possibly reduced by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)

**Omeprazol**

- Antifungals: plasma concentration of olaparib possibly reduced by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)

**Omeprazol**

- Antifungals: plasma concentration of olaparib possibly increased by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)

**Omeprazol**

- Antifungals: plasma concentration of olaparib possibly increased by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)

**Omeprazol**

- Antifungals: plasma concentration of olaparib possibly increased by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)

**Omeprazol**

- Antifungals: plasma concentration of olaparib possibly increased by 
  - **CLOzapine** (increased risk of agranulocytosis)

**Omeprazol**

- Antivirals: plasma concentration of olaparib possibly increased by 
  - **BOCEPREVIR**
  - **RTONAVIR** and **TELAPREVIR** (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
A1

Opioid Analgesics

Antifungals:

Antibacterials:

Analgesics

Accelerated by alfentanil, codeine, fentanyl, methadone and morphine; metabolic pathway for increased risk of ventricular arrhythmias when methadone given with delamanid; manufacturer of pethidine advises avoid concomitant use with isoniazid; possible increased risk of ventricular arrhythmias when methadone given with telithromycin; metabolism of oxycodone inhibited by telithromycin.

Anticoagulants: tramadol enhances anticoagulant effect of coumarins.

Antidepressants: plasma concentration of methadone possibly increased by fluoxetine, fluvoxamine, paroxetine and sertraline; possible increased serotonergic effects when pethidine or tramadol given with duloxetine; possible increased serotonergic effects when tramadol given with mirtazapine, venlafaxine or vortioxetine; possible increased serotonergic effects when fentanyl given with MAOIs, SSRI-related antidepressants or SSRIs; possible CNS excitation or depression (hypertension or hypotension) when opioid analgesics with maois; possible CNS excitation or depression (hypertension or hypotension) when tramadol given with maois; possible CNS excitation or depression (hypertension or hypotension) when methadone given with maois, ssris or tricyclics; plasma concentration of methadone possibly reduced by st john’s wort; sedative effects possibly increased when opioid analgesics given with tricyclics.

Antiepileptics: dextropropoxyphene enhances effects of carbamazepine; effects of tramadol reduced by carbamazepine; plasma concentration of methadone reduced by carbamazepine, phenobarbital and primidone; metabolism of fentanyl possibly accelerated by carbamazepine, fosphenytoin and phenytoin (reduced effect); metabolism of methadone accelerated by fosphenytoin and phenytoin (reduced effect and risk of withdrawal effects); possible increased risk of pethidine toxicity when given with fosphenytoin and phenytoin; morphine increases bioavailability of gabapentin.

Antifungals: metabolism of buprenorphine inhibited by ketoconazole, fluconazole and voriconazole; metabolism of alfentanil inhibited by fluconazole; risk of prolonged or delayed respiratory depression; plasma concentration of methadone increased by fluconazole; metabolism of alfentanil possibly inhibited by itraconazole; plasma concentration of methadone possibly increased by itraconazole (increased risk of ventricular arrhythmias); plasma concentration of alfentanil and methadone increased by voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by triazoles.

Antihistamines: sedative effects possibly increased when opioid analgesics given with sedating antihistamines.

Opioid Analgesics (continued)

Antimarial: avoidance of methadone advised by manufacturer of artemirol with piperaquine (possible risk of ventricular arrhythmias).

Antimuscarinics: possible increased risk of antimuscarinic side-effects when codeine given with antimuscarinics.

Antipsyhotics: enhanced hypnotic and sedative effects when opioid analgesics with antipsyhotics; increased risk of ventricular arrhythmias when methadone given with antipsyhotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsyhotics; increased risk of ventricular arrhythmias when methadone given with amisulpride—avoid concomitant use.

Antivirals: plasma concentration of methadone possibly reduced by abacavir, nevirapine and rilpivirine; plasma concentration of buprenorphine increased by atazanavir; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with boceprevir; plasma concentration of methadone possibly affected by boceprevir; methadone possibly reduces plasma concentration of didanosine; plasma concentration of methadone reduced by efavirenz, fosamprenavir and ritonavir; plasma concentration of dextropropoxyphene increased by ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; plasma concentration of alfentanil and fentanyl increased by ritonavir; plasma concentration of pethidine reduced by ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); plasma concentration of morphine possibly reduced by ritonavir; increased risk of ventricular arrhythmias when methadone given with ritonavir; possible increased risk of prolonged sedation when tramadol given with ritonavir.

Anxiolytics and Hypnotics: increased sedative effect when opioid analgesics given with anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of midazolam.

Antihistaminics: increased risk of ventricular arrhythmias when methadone given with atenolol; possible increased risk of convulsions when tramadol given with atenolol; beta-blockers: morphine possibly increases plasma concentration of esmolol.

Calcium-channel Blockers: metabolism of alfentanil inhibited by diltiazem (risk of prolonged or delayed respiratory depression).

Cytotoxics: possible increased risk of ventricular arrhythmias when methadone given with bosutinib and ceritinib; avoidance of alfentanil and fentanyl advised by manufacturer of ceritinib; caution with alfentanil and fentanyl advised by manufacturer of crizotinib; possible increased risk of ventricular arrhythmias when methadone given with vanetanib—avoid concomitant use.

Dapoxetine: possible increased risk of serotoninergic effects when tramadold given with dapoxetine (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol).

Domperidone: opioid analgesics antagonise effects of domperidone on gastro-intestinal activity.

Dopaminergic: risk of CNS toxicity when pethidine given with rasagiline (avoid pethidine for 2 weeks after rasagiline); avoid concomitant use of dextromethorphan with rasagiline.

Hyperpyrexia and CNS toxicity reported when pethidine given with selegiline (avoid selegiline; possible increased risk of ventricular arrhythmias; plasma concentration of alfentanil and methadone increased by voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by triazoles.

Hormone Antagonists: plasma concentration of dextromethorphan increased by abiraterone.

SERT inhibitors: effects of tramadol possibly antagonised by ondansetron.

Memantine: increased risk of CNS toxicity when dextromethorphan given with memantine (manufacturer of memantine advises avoid concomitant use).

1306 Opioid Analgesics — Opioid Analgesics BNF 73
Opioid Analgesics (continued)

- Metoclopramide: opioid analgesics antagonise effects of METOCLOPRAMIDE on gastrointestinal activity
- Muscle Relaxants: increased sedative effect when fentanyl or morphine given with BACLOFEN
- Nalmefene: avoidance of opioid analgesics advised by manufacturer of NALMEFENE
- Netuptatin: caution with morphine advised by manufacturer of NETUPITATIN
- Panobinostat: avoidance of dextromethorphan advised by manufacturer of PANOBINOSTAT; possible increased risk of ventricular arrhythmias when methadone given with PANOBINOSTAT—avoid concomitant use
- Sodium Oxybate: opioid analgesics enhance effects of SODIUM OXYBATE (avoid concomitant use)
- Ulcer-healing Drugs: metabolism of opioid analgesics inhibited by CIMETIDINE (increased plasma concentration)

Oritavancin

- Anticoagulants: oritavancin possibly increases plasma concentration of WARFARIN
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Orlistat

- Anti-arhythmics: orlistat possibly reduces plasma concentration of AMIODARONE
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of COUMARINS
- Antidiabetics: manufacturer of orlistat advises avoid concomitant use with ACCARBOSAN
- Antiepileptics: possible increased risk of convulsions when orlistat given with ANTIEPILEPTICS
- Antivirals: orlistat possibly reduces absorption of ABACAVIR, ATAZANAVIR, DARUNAVIR, DIDANOSINE, EFAVIRENZ, ELVITEGRAVIR, EMTRICITABINE, ENFUVIRTIDE, ETATIRINE, FOSAMPRENRAVIR, INDINAVIR, LAMIVUDINE, LOPINAVIR, MARAVIROC, NEVIRAPINE, RALTEGRAVIR, RILPVIRINE, RITONAVIR, SQUAUVINAVIR, STAVUDINE, TENOFOVIR, TIPRANAVIR and ZIDOVUDINE
- Ciclosporin: orlistat possibly reduces absorption of CICLOSPORIN
- Thyroid Hormones: possible increased risk of hypothyroidism when orlistat given with LEVOTHYROXINE

Orphenadrine see Antimuscarinics

Oxaliplatin see Platinum Compounds

Oxandrolone see Anabolic Steroids

Oxazepam see Anxiolytics and Hypnotics

Oxcarbazepine

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRI and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of CARBAMAZEPINE (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of ESLICARBAZEPINE; oxcarbazepine increases plasma concentration of FOSPHENTOIN, PHENOBARBITAL, PHENTYOIN and PRIMIDONE, also plasma concentration of an active metabolite of oxcarbazepine reduced; oxcarbazepine reduces plasma concentration of PERAMPANEL, also plasma concentration of oxcarbazepine increased (see under Perampanel, p. 301); plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by SODIUM VALPROATE and VALPROIC ACID
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Antivirals: oxcarbazepine possibly reduces plasma concentration of DAJALATASVIR and SIMEPREVIR—manufacturer of daclatasvir and simprevir advises avoid concomitant use; oxcarbazepine possibly reduces the plasma concentration of DULOTEGRAVIR (see under Dolutegavir, oxcarbazepine possibly reduces plasma concentration of CICLOSPORIN
- Clopidogrel: oxcarbazepine possibly reduces antiplatelet effect of CLOPIDOGREL
- Cytotoxics: oxcarbazepine reduces plasma concentration of IMATINIB—avoid concomitant use
- Guanfacine: oxcarbazepine possibly reduces plasma concentration of GUANFACINE—increase dose of guanfacine
- Oestrogens: oxcarbazepine accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT
- Progestogens: oxcarbazepine accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- Oxbreitol see Beta-blockers

Oxbutymin see Antimuscarinics

Oxycodone see Opioid Analgesics

Oxymetazoline see Sympathomimetics

Oxytetracycline see Tetracyclines

Oxytocin

- Anaesthetics: General: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with VOLATILE LIQUID GENERAL ANAESTHETICS
- Prostaglandins: uterotonic effect of oxytocin potentiated by PROSTAGLANDINS
- Sympathomimetics: risk of hypertension when oxytocin given with vasconstrictor SYMPATHOMIMETICS (due to enhanced vasopressor effect)

Palitaxel

- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by RITONAVIR
- Cytotoxics: increased risk of neutropenia when paclitaxel given with LAPATINIB

Paliperidone see Antipsychotics

Palonosetron see 5HT3-receptor Antagonists (under HT)

Pamidronate Disodium see Bisphosphonates

Pancreatin

- Antidiabetics: pancreatin antagonises hypoglycaemic effect of ACARBOSE

Pancuronium see Muscle Relaxants

Panitumumab

- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: manufacturer of panitumumab advises avoid concomitant use with BEVACIZUMAB, FLUOROURACIL, IRINOTECAN and OXALIPLATIN
- Folates: manufacturer of panitumumab advises avoid concomitant use with FOLIC ACID
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Panobinostat

- Antipsychotics: manufacturer of panobinostat advises avoid concomitant use with DEXTROMETHORPHAN; possible increased risk of ventricular arrhythmias when panobinostat given with METHADONE—avoid concomitant use
- Anti-arhythmics: possible increased risk of ventricular arrhythmias when panobinostat given with AMIODARONE or DISOPYRAMIDE—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when panobinostat given with CLARITHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when panobinostat given with MOXIFLOXACIN—
Panobinostat
- Antibacterials (continued)
  avoid concomitant use; manufacturer of panobinostat advises avoid concomitant use with • Rifabutin and • Rifampicin
  plasma concentration of panobinostat possibly increased by • Telithromycin (reduce dose of panobinostat—see under Panobinostat, p. 834)
- Antidepressants: manufacturer of panobinostat advises avoid concomitant use with • St John’s Wort
- Antiepileptics: manufacturer of panobinostat advises avoid concomitant use with • Carbamazepine, • fosphenytoin, • Phenobarbital, • phenytoin and • Primidone
- Antifungals: plasma concentration of panobinostat increased by • Ketoconazole (reduce dose of panobinostat—see under Panobinostat, p. 834); plasma concentration of panobinostat possibly increased by • Itraconazole, • Posaconazole and • Voriconazole (reduce dose of panobinostat—see under Panobinostat, p. 834)
- Antimalarials: possible increased risk of ventricular arrhythmias when panobinostat given with • Chloroquine—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when panobinostat given with • Pimozide—avoid concomitant use
- Antivirals: plasma concentration of panobinostat possibly increased by • Ritonavir and • Saquinavir (reduce dose of panobinostat—see under Panobinostat, p. 834)
- Beta-blockers: possible increased risk of ventricular arrhythmias when panobinostat given with • Sotalol—avoid concomitant use
- Corticosteroids: plasma concentration of panobinostat reduced by • Dexamethasone
- Grapefruit Juice: manufacturer of panobinostat advises avoid concomitant use with • Grapefruit Juice
- SHT₂-receptor Antagonists: possible increased risk of ventricular arrhythmias when panobinostat given with • Granisetron and • Ondansetron
Panotrazole see Proton Pump Inhibitors
Paracetamol
- Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of • Coumarins
- Antidiabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after • Lixisenatide
- Antiepileptics: metabolism of paracetamol possibly accelerated by • Carbamazepine, • fosphenytoin, • Phenobarbital, • Phenytoin and • Primidone (also isolated reports of hepatotoxicity)
- Antifungals: avoidance of paracetamol advised by manufacturer of • Ketoconazole
- Cytoxics: paracetamol possibly inhibits metabolism of • intravenous Busulfan (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of • Imatinib
- Lipid-regulating Drugs: absorption of paracetamol reduced by • Colestyramine
- Metoclopramide: rate of absorption of paracetamol increased by • Metoclopramide
Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with • Alcohol
- Disulfiram: risk of toxicity when paraldehyde given with • Disulfiram
Parasymphathomimetics
- Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by • Propafenone
- Antibacterials: plasma concentration of galantamine increased by • Erythromycin; effects of neostigmine and pyridostigmine antagonised by • Aminoglycosides; effects of neostigmine and pyridostigmine antagonised by • Clindamycin; effects of neostigmine and pyridostigmine antagonised by • Polymyxins
- Antidepressants: plasma concentration of galantamine increased by • Paroxetine
- Antifungals: plasma concentration of galantamine increased by • Ketoconazole
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for • Chloroquine to
Pazopanib
- Antibacterials: plasma concentration of pazopanib possibly increased by clarithromycin and telithromycin (reduce dose of pazopanib); plasma concentration of pazopanib possibly reduced by rifampicin.
- Antifungals: plasma concentration of pazopanib increased by ketoconazole (reduce dose of pazopanib); plasma concentration of pazopanib possibly increased byitraconazole and voriconazole (reduce dose of pazopanib).
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Antivirals: plasma concentration of pazopanib possibly increased by atazanavir, indinavir and ritonavir (reduce dose of pazopanib); avoidance of pazopanib advised by manufacturer of boceprevir; increased risk of ventricular arrhythmias when pazopanib given with saquinavir—avoid concomitant use.
- Cytotoxics: plasma concentration of pazopanib increased by lapatinib.
- Grapefruit Juice: manufacturer of pazopanib advises avoid concomitant use with grapefruit juice.
- Lipid-regulating Drugs: separating administration from pazopanib by 12 hours advised by manufacturer of lomitapide.
- Ulcer-healing Drugs: absorption of pazopanib possibly reduced by histamine H2-antagonists—manufacturer of pazopanib advises give at least 2 hours before or 10 hours after histamine H2-antagonists; absorption of pazopanib possibly reduced by proton pump inhibitors—manufacturer of pazopanib advises give at the same time as proton pump inhibitors.

Pegfilgrastim
- Cytotoxics: neutropenia possibly exacerbated when pegfilgrastim given with capetitabine, fluorouracil or tegafur.

 Peginterferon Alfa see Interferons

Pembrolizumab
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use.

Pemetrexed
- Analgesics: renal excretion of pemetrexed possibly reduced by NSAIDs and aspirin—consult product literature.
- Antimalarials: antagonise effect of pemetrexed increased by pyrimethamine.
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).

Penicillamine
- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs.
- Antacids: absorption of penicillamine reduced by antacids.
- Antimalarials: increased risk of haematological toxicity when penicillamine given with antimalarials—manufacturer of penicillamine advises avoid concomitant use.
- Antipsychotics: increased risk of haematological toxicity when penicillamine given with clozapine—manufacturer of penicillamine advises avoid concomitant use.
- Cardiac Glycosides: penicillamine possibly reduces plasma concentration of digoxin.
- Iron Salts: absorption of penicillamine reduced by oral iron salts.

Penicillamine (continued)
- Sodium Aurothiomalate: increased risk of haematological toxicity when penicillamine given with sodium aurothiomalate—see under Penicillamine, p. 964.
- Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc.

Penicillins
- Allopurinol: increased risk of rash when amoxicillin, ampicillin or co-amoxiclav given with allopurinol.
- Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin; effects of penicillins possibly antagonised by tetracyclines.
- Anticoagulants: an interaction between broad-spectrum penicillins and coumarins and phenindione has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered.
- Antiepileptics: manufacturer of pivmecillinam advises avoid concomitant use with sodium valproate and valproic acid.
- Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity).
- Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and suxamethonium.
- Mycophenolate: co-amoxiclav possibly reduces plasma concentration of mycophenolate.
- Sulfinpyrazone: excretion of penicillins reduced by sulfinpyrazone.
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF or BNFC.

Pentamidine isetionate
- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with amiodarone—avoid concomitant use; possible increased risk of ventricular arrhythmias when pentamidine isetionate given with disopyramide.
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with parenteral erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with moxifloxacin—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with delamanid; possible increased risk of ventricular arrhythmias when parenteral pentamidine isetionate given with telithromycin.
- Antidepressants: avoidance of pentamidine isetionate advised by manufacturer of citalopram and escitalopram (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when pentamidine isetionate given with tricyclics.
- Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with amphotericin.
- Antimalarials: avoidance of pentamidine isetionate advised by manufacturer of arteminol with piperacillin (possible risk of ventricular arrhythmias).
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with phenothiazines.
- Antivirals: increased risk of hypocalcaemia when parenteral pentamidine isetionate given with foscarin; increased risk of ventricular arrhythmias when pentamidine isetionate given with saquinavir—avoid concomitant use.
- Cytotoxics: possible increased risk of ventricular arrhythmias when pentamidine isetionate given with vanetanib—avoid concomitant use.
- Ibavradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with ibavradine.

Pentazocine see Opioid Analgesics

Pentostatin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Cytotoxics: increased toxicity when pentostatin given with high-dose cyclophosphamide—avoid concomitant use; increased pulmonary toxicity when pentostatin given with fluorouracil (unacceptably high incidence of fatalities).
Phenindione (continued)

- Anti-arrhythmics: metabolism of phenindione inhibited by
  - AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by
  \* DRONEDARONE (enhanced anticoagulant effect)
- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with
  - NEOMYCIN (given for local action on gut); anticoagulant effect of phenindione possibly enhanced by
  - LEVOFLOXACIN and TETRACYCLINES; an interaction between phenindione and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by
  \* SULFONAMIDES
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with
  - APIXABAN, \* DABIGATRAN,
  - EDOXABAN and \* RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticoagulant effect of phenindione possibly enhanced by
  \* RITONAVIR
- Clopidogrel: anticoagulant effect of phenindione enhanced due to antiplatelet action of
  \* CLOPIDOGREL
- Corticosteroids: anticoagulant effect of phenindione may be enhanced or reduced by
  \* CORTICOSTEROIDS
- Cytoxics: avoidance of phenindione advised by manufacturer of
  \* IBRUTINIB
- Dipyrindamole: anticoagulant effect of phenindione enhanced due to antiplatelet action of
  \* DIPYRIDAMOLE
- Enteral Feeds: anticoagulant effect of phenindione antagonised by vitamin K (present in some \* ENTERAL FEEDS)
- Iloprost: increased risk of bleeding when phenindione given with
  - ILOPROST
- Lipid-regulating Drugs: anticoagulant effect of phenindione may be enhanced or reduced by
  - COLESTYRAMINE;
  - anticoagulant effect of phenindione possibly enhanced by
  - ROSUVASTATIN;
  - anticoagulant effect of phenindione enhanced by
  - FIBRATES
- Oestrogens: anticoagulant effect of phenindione antagonised by
  \* OESTROGENS
- Prasugrel: possible increased risk of bleeding when phenindione given with
  - PRASUGREL
- Progestogens: anticoagulant effect of phenindione antagonised by
  - PROGESTOGENS
- Testolactone: anticoagulant effect of phenindione enhanced by
  - TESTOLACTONE
- Testosterone: anticoagulant effect of phenindione enhanced by
  - TESTOSTERONE
- Thyroid Hormones: anticoagulant effect of phenindione enhanced by
  - THYROID HORMONES
- Vitamins: anticoagulant effect of phenindione antagonised by
  - VITAMIN K

Phenobarbital

- Alcohol: increased sedative effect when phenobarbital given with
  - ALCOHOL
- Aminophylline: phenobarbital accelerates metabolism of
  - AMINOPHYLLINE (reduced effect)
- Analgesics: phenobarbital reduces plasma concentration of
  - METHADONE; phenobarbital possibly accelerates metabolism of
  - PARACETAMOL (also isolated reports of hepatotoxicity)
- Anthelmintics: phenobarbital reduces plasma concentration of
  - ALBENDAZOLE and \* PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: phenobarbital accelerates metabolism of
  - DISOPRIMIDE (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of
  - DRONEDARONE—avoid concomitant use; phenobarbital possibly accelerates metabolism of
  - PROPAFENONE
- Antibacterials: phenobarbital accelerates metabolism of
  - METRONIDAZOLE (reduced effect); phenobarbital possibly reduces plasma concentration of
  - RIFAMPICIN; phenobarbital accelerates metabolism of
  - DISOPRIMIDE (reduced plasma concentration); phenobarbital possibly accelerates metabolism of
  - CHLORAMPHENICOL (reduced plasma concentration); phenobarbital reduces plasma concentration
Phenobarbital
- Antibacterials (continued)
  - Telithromycin (avoid during and for 2 weeks after phenobarbital)
- Anticoagulants: phenobarbital possibly reduces plasma concentration of apixaban and edoxaban; phenobarbital accelerates metabolism of coumarins (reduced anticoagulant effect); phenobarbital possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: phenobarbital possibly reduces plasma concentration of reboxetine; phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of mianserin (reduced plasma concentration); antidepressant effect of antiepileptics possibly antagonised by maoi and tricyclic-related antidepressants (convulsive threshold lowered); antidepressant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); plasma concentration of phenobarbital possibly reduced by st john's wort—avoid concomitant use; phenobarbital possibly accelerates metabolism of tricyclics (reduced plasma concentration)
- Antiepileptics: phenobarbital reduces plasma concentration of brivaracetam, lamotrigine, tiagabine and zonisamide; plasma concentration of phenobarbital possibly increased by carbamazepine; phenobarbital possibly reduces plasma concentration of ethosuximide, rufinamide and topiramate; plasma concentration of phenobarbital often increased by fosphenytoin and phenytoin, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; plasma concentration of phenobarbital increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital increased by sodium valproate and valproic acid (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of phenobarbital increased by stiripentol
- Antifungals: phenobarbital possibly reduces plasma concentration of isavuconazole and voriconazole—avoid concomitant use; phenobarbital possibly reduces plasma concentration of itraconazole and posaconazole; phenobarbital reduces absorption of griseofulvin (reduced effect)
- Antiinfectials: avoidance of phenobarbital advised by manufacturer of artemisinin with piperaquine; anticonvulsant effect of antiepileptics antagonised by mefloquine
- Antimucosinics: phenobarbital possibly reduces plasma concentration of active metabolite of fosoterodine—manufacturer of fosoterodine advises avoid concomitant use
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenobarbital possibly reduces plasma concentration of clozapine; phenobarbital possibly reduces plasma concentration of lurasidone—avoid concomitant use
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir, indinavir, lopinavir and saquinavir; avoidance of phenobarbital advised by manufacturer of boceprevir and rilpivirine (plasma concentration of boceprevir and rilpivirine possibly reduced); phenobarbital possibly reduces plasma concentration of daclatasvir and simeprevir—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of dasabuvir, ombitasvir and paritaprevir—avoid concomitant use; phenobarbital possibly reduces the plasma concentration of dolutegravir (see under dolutegravir, p. 592); avoidance of phenobarbital advised by manufacturer of elvitegravir, etravirine, ledipasvir, sofosbuvir and telaprevir

Phenobarbital (continued)
- Anxiolytics and Hypnotics: increased sedative effect when phenobarbital given with anxiolytics and hypnotics; phenobarbital often reduces plasma concentration of clozapine
- Apremilast: phenobarbital possibly reduces plasma concentration of apremilast—avoid concomitant use
- Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant
- Avanafil: phenobarbital possibly reduces plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: phenobarbital possibly reduces plasma concentration of propranolol
- Bile Acids: avoidance of phenobarbital advised by manufacturer of cholic acid
- Caffeine citrate: effects of phenobarbital possibly antagonised by caffeïne citrate
- Calcium-channel Blockers: phenobarbital probably reduces effects of calcium-channel blockers; avoidance of phenobarbital advised by manufacturer of nimodipine (plasma concentration of nimodipine reduced)
- Cannabis Extract: phenobarbital possibly reduces plasma concentration of cannabis extract—manufacturer of cannabis extract advises avoid concomitant use
- Ciclosporin: phenobarbital accelerates metabolism of ciclosporin
- Cobimetinib: phenobarbital possibly reduces plasma concentration of cobimetinib—manufacturer of cobimetinib advises avoid concomitant use
- Corticosteroids: phenobarbital accelerates metabolism of corticosteroids (reduced effect)
- Cytotoxics: phenobarbital possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); phenobarbital possibly reduces plasma concentration of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of cabozantinib and ceritinib—avoid concomitant use; avoidance of phenobarbital advised by manufacturer of cabazitaxel, dabrafenib, gefitinib and olaparib; avoidance of phenobarbital advised by manufacturer of dasatinib and vandetanib (plasma concentration of dasatinib and vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenobarbital given with procarbazine
- Diuretics: phenobarbital reduces plasma concentration of eplerenone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors
- Folates: plasma concentration of phenobarbital possibly reduced by folates
- Fosaprepitant: phenobarbital possibly reduces plasma concentration of fosaprepitant
- Guanfacine: phenobarbital possibly reduces plasma concentration of guanfacine
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of toremifene (reduced plasma concentration)
- Ircavatof: phenobarbital possibly reduces plasma concentration of iravatof—manufacturer of iravatof advises avoid concomitant use
- Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast
- Lumeacof: plasma concentration of phenobarbital possibly reduced by lumeacof—manufacturer of lumeacof advises avoid concomitant use
- Oestrogens: phenobarbital accelerates metabolism of oestrogens (reduced contraceptive effect with combined
Phenobarbital

- Progestogens: phenobarbital accelerates metabolism of progestogens (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- Roflumilast: phenobarbital possibly inhibits effects of roflumilast (manufacturer of roflumilast advises avoid concomitant use)
- Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of sodium oxybate

Phenytoin

- Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of alcohol
- Aminophylline: plasma concentration of both drugs reduced when phenytoin given with aminophylline
- Analgesics: excretion of phenytoin possibly reduced by acetaminophen (increased risk of toxicity); phenytoin possibly accelerates metabolism of fenoprofen (reduced effect); phenytoin accelerates metabolism of methadone (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of pethidine toxicity; effects of phenytoin enhanced by aspirin; phenytoin possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity)
- Antacids: absorption of phenytoin reduced by antacids
- Antihelminths: phenytoin reduces plasma concentration of albendazole and praziquantel—consider increasing albendazole and praziquantel dose when given for systemic infections; plasma concentration of phenytoin possibly increased by levamisole
- Anti-arrhythmics: metabolism of phenytoin inhibited by amiodarone (increased plasma concentration); phenytoin reduces plasma concentration of disopyramide; phenytoin possibly reduces plasma concentration of dronedarone—avoid concomitant use
- Antibacterials: metabolism of phenytoin inhibited by clarithromycin (increased plasma concentration); metabolism of phenytoin possibly inhibited by metronidazole (increased plasma concentration); plasma concentration of phenytoin increased or decreased by ciprofloxacin; phenytoin accelerates metabolism of doxycycline (reduced plasma concentration); phenytoin possibly reduces plasma concentration of bedaquiline—manufacturer of bedaquiline advises avoid concomitant use;
Phenytoin

- Antifungals (continued)
  concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin

- Antimalarials: avoidance of phenytoin advised by manufacturer of arteninol with piperaquine; anticonvulsant effect of antipilippines antagonised by méfloquine; anticonvulsant effect of phenytoin antagonised by pyrimethamine, also increased antifolate effect

- Antimuscarnics: phenytoin possibly reduces plasma concentration of active metabolite of fosoterodine—manufacturer of fosoterodine advises avoid concomitant use

- Antipsychotics: anticonvulsant effect of antipilippines antagonised by antipsychotics (convulsive threshold lowered); phenytoin reduces plasma concentration of haloperidol; plasma concentration of phenytoin possibly increased or decreased by chlorpromazine; phenytoin possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin accelerates metabolism of clozapine and quetiapine (reduced plasma concentration); phenytoin possibly reduces plasma concentration of lurasidone—avoid concomitant use

- Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of boceprevir and rilpivirine (plasma concentration of boceprevir and rilpivirine possibly reduced); phenytoin possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); phenytoin possibly reduces plasma concentration of dapsuburiv and omibitasvir and paritaprevir—avoid concomitant use; phenytoin possibly reduces the plasma concentration of dolugreatriv (see under Dolugreatriv, p. 592); avoidance of phenytoin advised by manufacturer of elvitegravir, etravirine, ledipasvir, sofosbuvir and telaprevir; phenytoin possibly reduces plasma concentration of indinavir; also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of ritonavir; also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine

- Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of clonazepam; plasma concentration of phenytoin increased or decreased by diazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines

- Apremilast: phenytoin possibly reduces plasma concentration of apremilast—avoid concomitant use

- Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant

- Buspropan: phenytoin reduces plasma concentration of buproprion

- Caffeine citrate: phenytoin reduces plasma concentration of caffeine citrate

- Calcium-channel Blockers: phenytoin reduces effects of felodipine and verapamil; avoidance of phenytoin advised by manufacturer of isradipine; avoidance of phenytoin advised by manufacturer of nimodipine (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by diltiazem but also effect of diltiazem reduced

- Cannabin Extract: phenytoin possibly reduces plasma concentration of cannabis extract—manufacturer of cannabis extract advises avoid concomitant use

- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of digoxin

- Ciclosporin: phenytoin accelerates metabolism of ciclosporin (reduced plasma concentration)

- Cobicistat: phenytoin possibly reduces plasma concentration of cobicistat—manufacturer of cobicistat advises avoid concomitant use

- Corticosteroids: phenytoin accelerates metabolism of corticosteroids (reduced effect)

- Cytotoxics: phenytoin possibly reduces plasma concentration of doxorubicin, etoposide and oxaliplatin; metabolism of phenytoin possibly inhibited by capetitabine, fluorouracil and tegafur (increased risk of toxicity); phenytoin increases antifolate effect of methotrexate; plasma concentration of phenytoin possibly reduced by cisplatin; phenytoin possibly decreases plasma concentration of axitinib (increase dose of axitinib—consult axitinib product literature); phenytoin possibly reduces plasma concentration of cabazitaxel, dabrafenib, gefitinib, lapatinib, olaparib and vemurafenib; avoidance of phenytoin advised by manufacturer of dasatinib and vismodegib (plasma concentration of dasatinib and vismodegib possibly reduced); phenytoin reduces plasma concentration of imatinib—avoid concomitant use; phenytoin possibly reduces plasma concentration of irinotecan and its active metabolite; manufacturer of procrazone advises possible increased risk of hypersensitivity reactions when phenytoin given with procrazone

- Dexamethasone: absorption of phenytoin possibly reduced by dexamethasone

- Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced

- Disulfiram: metabolism of phenytoin inhibited by disulfiram (increased risk of toxicity)

- Diuretics: phenytoin reduces plasma concentration of eplerenone—avoid concomitant use; plasma concentration of phenytoin possibly increased by acetazolamide; phenytoin antagonises effects of furosemide; increased risk of osteomalacia when phenytoin given with carbonic anhydrase inhibitors

- Dopaminergics: phenytoin possibly reduces effects of co-beneldopa, co-careldopa and levodopa

- Enteral Feeds: absorption of phenytoin possibly reduced by enteral feeds

- Folic acids: plasma concentration of phenytoin possibly reduced by folates

- Fosaprepitant: phenytoin possibly reduces plasma concentration of fosaprepitant

- Guanfacine: phenytoin possibly reduces plasma concentration of guanfacine—increased dose of guanfacine

- Hormone Antagonists: phenytoin possibly reduces plasma concentration of abiraterone—manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of toremifene

- HIs1-receptor Antagonists: phenytoin accelerates metabolism of ondansetron (reduced effect)

- Ibravafon: phenytoin possibly reduces plasma concentration of ibravafon—manufacturer of ibravafon advises avoid concomitant use

- Leflunomide: plasma concentration of phenytoin possibly increased by leflunomide

- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by colesevelam; combination of phenytoin with fluvastatin may increase plasma concentration of either drug (or both)

- Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium

- Lumacaftor: plasma concentration of phenytoin possibly reduced by lumacaftor—manufacturer of lumacaftor advises avoid concomitant use

- Macitentan: avoidance of phenytoin advised by manufacturer of macitentan

- Modafinil: plasma concentration of phenytoin possibly increased by modafinil

- Muscle Relaxants: long-term use of phenytoin reduces effects of non-depolarising muscle relaxants (but acute use of
Phenotin
- Muscle Relaxants (continued)
  phenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: phenytoin accelerates metabolism of
  - OESTROGENS (reduced conjugative effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Panobinostat: avoidance of phenytoin advised by manufacturer of • PANOBINOSTAT
- Progestogens: phenytoin accelerates metabolism of
  - PROGESTOGENS (reduced conjugative effect with combined oral contraceptives, progestogen—only oral contraceptives, contraceptive patches, vaginal rings, eutogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- Roflumilast: phenytoin possibly inhibits effects of • ROFLUMILAST (manufacturer of roflumilast advises avoid for concomitant use)
- Sulfinpyrazone: plasma concentration of phenytoin increased by • SULFINPYRAZONE
- Sympathomimetics: plasma concentration of phenytoin increased by • METHYLPHENIDATE
- Tacrolimus: phenytoin reduces plasma concentration of TACROLIMUS, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with • THEOPHYLLINE
- Thyroid Hormones: phenytoin accelerates metabolism of
  - THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Tibolone: phenytoin accelerates metabolism of TIBOLONE
- Ticagrelor: phenytoin possibly reduces plasma concentration of • TICAGRELOR
- Ulcer-healing Drugs: metabolism of phenytoin inhibited by
  - CIMETIDINE (increased plasma concentration); effects of phenytoin enhanced by • ESOMEPRAZOLE; effects of phenytoin possibly enhanced by • OMEPRAZOLE; absorption of phenytoin reduced by • Sucralfate
- Ulipristal: avoidance of phenytoin advised by manufacturer of • ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of phenytoin enhanced by • INFLUENZA VACCINE
- Vitamin D: phenytoin possibly increases requirements for • D3HYDROTACHYSTEROL, • DIHYDROTACHYSTEROL, • CALCITRIOL
- Phosphodiesterase Type-3 Inhibitors
- Pholcodine
  - Antidepressants: manufacturer of pholcodine advises avoid for 2 weeks after stopping MAOIs
- Phosphodiesterase Type-3 Inhibitors
  • ANAGRELIDE, avoidance of exonoxime and milrinone advised by manufacturer of • ANAGRELIDE
- Pilocarpine see Parasympathomimetics
- Pimozone see Antipsychotics
- Pindolol see Beta-blockers
- Pioglitazone see Antidiabetics
- Piperacillin see Penicillins
- Piperazine see Arsenicals with Piperazine
- Pirfenidone
  - Antibacterials: plasma concentration of pirfenidone increased by • CIPROFLOXACIN—see under Pirfenidone, p. 279
  - Antidepressants: plasma concentration of pirfenidone increased by • FLUOXAMINE—manufacturer of pirfenidone advises avoid concomitant use
  - Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with • GRAPEFRUIT JUICE
- Piroxicam see NSAIDs
- Pivmecillinam see Penicillins
- Pixantrone
  - Antipsychotics: avoid concomitant use of cytoxotics with • CLOZAPINE (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when cytoxotic antibiotics given with live • VACCINES—avoid concomitant use

Pizotifen
- Adrenergic Neurone Blockers: pizotifen antagonises hypnotic effect of • ADRENERGIC NEURONE BLOCKERS

Platinum Compounds
- Aldesleukin: avoidance of cisplatin advised by manufacturer of • ALDESLEUKIN
- Antibacterials: increased risk of nephrotoxicity and possibly of ototoxicity when platinum compounds given with
  • AMIONOGLYCOSES or • POLYMIXINS; increased risk of nephrotoxicity and ototoxicity when platinum compounds given with • CAPREOMYCIN; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with • VANCOMYCIN
- Antiepileptics: cisplatin possibly reduces plasma concentration of • FOSPHENYTOIN and • PHENYTOIN
- Antipsychotics: avoid concomitant use of cytoxotics with • CLOZAPINE (increased risk of agranulocytosis)
- Cytoxotics: increased risk of ototoxicity when cisplatin given with • IFOSFAМИNE; increased pulmonary toxicity when cisplatin given with • BLEOMYCIN and • METHOTREXATE; avoidance of oxaliplatin advised by manufacturer of • PANITUMUMAB
- Diuretics: increased risk of nephrotoxicity and ototoxicity when platinum compounds given with • DIURETICS

Pneumococcal Vaccine see Vaccines
Polymyxins
- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with • AMIONOGLYCOSES; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with • CAPREOMYCIN; increased risk of nephrotoxicity when polymyxins given with • VANCOMYCIN; increased risk of nephrotoxicity and ototoxicity when colistimethate sodium given with • VANCOMYCIN
- Antifungals: increased risk of nephrotoxicity when polymyxins given with • AMPHOTERICIN
- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with • CICLOSPORIN
- Cytoxotics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with • PLATINUM COMPOUNDS
- Diuretics: increased risk of ototoxicity when polymyxins given with • LOOP DIURETICS
- Muscle Relaxants: polymyxins enhance effects of • NON-DEPOLARISING MUSCLE RELAXANTS and • SUXAMETHONIUM
- Parasympathomimetics: polymyxins antagonise effects of • NEOGUSTINE and • PYRIDOSTIGMINE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Polyoxin
- Antacids: risk of intestinal obstruction when polyoxin sulphate given with • ALUMINIUM HYDROXIDE; risk of metabolic alkalosis when polyoxin sulphate given with • ORAL MAGESISIUM SALTS
- Thyroid Hormones: polyoxin sulphate reduces absorption of • LEVOTHYROXINE

Pomalidomide
- Antidepressants: plasma concentration of pomalidomide increased by • FLUOXAMINE

Ponatinib
- Antibacterials: plasma concentration of ponatinib possibly increased by • CITALIROMYCIN and • TELITROMYCIN—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); plasma concentration of ponatinib possibly reduced by • RIFABUTIN—manufacturer of ponatinib advises avoid concomitant use; plasma concentration of ponatinib reduced by • RIFAMPICIN—manufacturer of ponatinib advises avoid concomitant use
- Antidepressants: plasma concentration of ponatinib possibly reduced by • ST JOHN'S WORT—manufacturer of ponatinib advises avoid concomitant use
- Antiepileptics: plasma concentration of ponatinib possibly reduced by • CARBAMAZEPINE, • FOSPHENYTOIN, • PHENOBARBITAL, • PHENYTOIN and • PRIMIDONE—manufacturer of ponatinib advises avoid concomitant use
Ponatinib (continued)

- Antifungals: plasma concentration of ponatinib increased by **ketoconazole**; plasma concentration of ponatinib possibly increased by **itraconazole** and **voriconazole**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 875)
- Antipsychotics: avoid concomitant use with **clozapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of ponatinib possibly increased by **indinavir**, **ritonavir** and **saquinavir**—consider reducing initial dose of ponatinib (see under Ponatinib, p. 875)
- Grapefruit Juice: plasma concentration of ponatinib possibly increased by **grapefruit juice**

Prazosin see Alpha-blockers
Prednisolone see Corticosteroids
Prednison see Corticosteroids
Pregabalin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TCA REL ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **TCA REL ANTIDEPRESSANTS** (convulsive threshold lowered)
- Antimalarias: anticonvulsant effect of antiepileptics antagonised by **TCA REL ANTIDEPRESSANTS** (convulsive threshold lowered)
- Orlstat: possible increased risk of convulsions when antiepileptics given with **orlistat**

Prilosec
- Anti-arrhythmics: increased myocardial depression when prilosec given with **anti-arrhythmics**
- Antibacterials: increased risk of methaemoglobinemia when prilosec given with **sulfonamides**

Primaquine
- Antimalarias: avoidance of antimalaria advised by manufacturer of **artemether with lumefantrine**
- Histamine: avoidance of antimalaria advised by manufacturer of **histamine**
- Mepacrine: plasma concentration of primaquine increased by **mepacrine** (increased risk of toxicity)
- Penicillamine: increased risk of haematological toxicity when antimalarias given with **penicillamine**—manufacturer of penicillamine advises avoid concomitant use
- Vaccines: antimalarias inactivate **oral typhoid vaccine**—see under Typhoid Vaccine in BNF or BNFC

Primidone
- Alcohol: increased sedative effect when primidone given with **alcohol**
- Aminophylline: primidone accelerates metabolism of **aminophylline** (reduced effect)
- Analgesics: primidone reduces plasma concentration of **methadone**; primidone possibly accelerates metabolism of **paracetamol** (also isolated reports of hepatotoxicity)
- Antihelmintics: primidone reduces plasma concentration of **albendazole** and **praziquantel**—consider increasing albendazole and praziquantel dose when given for systemic infections
- Anti-arrhythmics: primidone accelerates metabolism of **disopyramide** (reduced plasma concentration); primidone possibly reduces plasma concentration of **dronedarone**—avoid concomitant use; primidone possibly accelerates metabolism of **propafenone**
- Antibacterials: primidone accelerates metabolism of **metronidazole** (reduced effect); primidone possibly reduces plasma concentration of **rifampicin**; primidone accelerates metabolism of **doxycycline** (reduced plasma concentration); primidone possibly accelerates metabolism of **chloramphenicol** (reduced plasma concentration); primidone reduces plasma concentration of **telithromycin** (avoid during and for 2 weeks after primidone)
- Anticoagulants: primidone possibly reduces plasma concentration of **apixaban** and **edoxaban**; primidone accelerates metabolism of **coumarins** (reduced anticoagulant effect); primidone possibly reduces plasma concentration of **rivaroxaban**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: primidone possibly reduces plasma concentration of **reboxetine**; primidone reduces plasma concentration of **paroxetine**; primidone accelerates metabolism of **mianserin** (reduced plasma concentration); anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TCA REL ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIs** and **TCA REL ANTIDEPRESSANTS** (convulsive threshold lowered); plasma concentration of
Primidone

- **Antidepressants (continued)**
  - Primidone possibly reduced by: 
    - ST JOHN’S WORT—avoid concomitant use; primidone possibly accelerates metabolism of 
    - **TRICYCLES** (reduced plasma concentration)
  - Antiepileptics: primidone reduces plasma concentration of 
    - BIVARACETAM, LAMOTRIGINE, TIAGABINE and ZONISAMIDE; 
      - Plasma concentration of primidone possibly increased by 
      - CARBARAZEPINE; primidone possibly reduces plasma concentration of 
      - ETHOSUXIMIDE, RUFINAMIDE and TOPIRAMATE; 
      - Plasma concentration of primidone often increased by 
      - FOSPHENYTIN and PHENYTIN, plasma concentration of fosphenytin and phenytin often reduced but may be increased; 
      - Plasma concentration of primidone increased by 
      - OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of 
      - Primidone increased by 
      - SODIUM VALPROATE and VALPROIC ACID (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of primidone increased by 
      - **STIRIPENTOL**
  - Antiinflammatories: use; primidone possibly reduces plasma concentration of 
    - **ISAVUCONAZOLE** and **VORICONAZOLE**—avoid concomitant use; primidone possibly reduces plasma concentration of 
    - **ITRACONAZOLE** and **PIROXONAZOLE**; primidone reduces absorption of 
    - **GRISOFULVIN** (reduced effect)
  - Antimalarials: avoidance of primidone advised by manufacturer of 
    - ARTEMINOL WITH PIPERQUINE; anticonvulsant effect of antiepileptics antagonised by 
    - **MELOQUINE**
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by 
    - **ANTIPSYCHOTICS** (convulsive threshold lowered); primidone accelerates metabolism of 
    - **HALOPERIDOL** (reduced plasma concentration); plasma concentration of both drugs reduced when primidone given with 
    - **CHLORPROMAZINE**; primidone possibly reduces plasma concentration of 
    - **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); primidone possibly reduces plasma concentration of 
    - **CLOZAPINE**; primidone possibly reduces plasma concentration of 
    - **LURASIDONE**—avoid concomitant use
  - Antivirals: primidone possibly reduces plasma concentration of 
    - **ABACAVIR**, **DARUNAVIR**, **FOSAPREVIR**, **INDINAVIR**, 
      - **LORINAVIR** and **SAQUINAVIR**; avoidance of primidone advised by manufacturer of 
      - **BOCEPREVIR** and **RILPIVIRINE** (plasma concentration of boceprevir and rilpivirine possibly reduced); 
      - Primidone possibly reduces plasma concentration of 
      - **DACLATASVIR** and **SIMEPREVIR**—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; primidone possibly reduces plasma concentration of 
      - **DASABUVIR**; primidone possibly reduces plasma concentration of 
      - **OMBITASVIR** and **PARITAPREVIR**—avoid concomitant use; primidone possibly reduces the plasma concentration of 
      - **DOLUTEGRAVIR** (see under Dolutegravir, p. 592); avoidance of 
      - Primidone advised by manufacturer of 
      - **ELVITEGRAVIR**, **ETRARIVINE**, **LEDIPASVIR**, **SOFOSBUVIR** and **TELAPREVIR**
    - Anxiolytics and Hypnotics: increased sedative effect when primidone given with 
      - **ANXIOLYTICS AND HYPNOTICS**; primidone often reduces plasma concentration of 
      - **CLONAZEPAM**; 
      - Aprepitant: primidone possibly reduces plasma concentration of 
      - **APREPIANT**
    - Avasanil: primidone possibly reduces plasma concentration of 
      - **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
    - Beta-blockers: primidone possibly reduces plasma concentration of 
      - **PROPRANOLOL**
    - Caffeine citrate: effects of primidone possibly antagonised by 
      - **CAFFEINE CITRATE**
    - Calcium-channel Blockers: primidone probably reduces effects of 
      - **CALCIUM-CHANNEL BLOCKERS**; avoidance of primidone advised by manufacturer of 
      - **ISRADIPE**: avoidance of primidone advised by manufacturer of 
      - **NIMODIPINE** (plasma concentration of nimodipine reduced)
    - Cannabis Extract: primidone possibly reduces plasma concentration of 
      - **CANNABIS EXTRACT**—manufacturer of cannabis extract advises avoid concomitant use
    - Ciclosporin: primidone accelerates metabolism of 
      - **CICLOSPORIN** (reduced plasma concentration)

Primidone (continued)

- Cobicitab: primidone possibly reduces plasma concentration of 
  - **COBICISTAT**—manufacturer of cobicitab advises avoid concomitant use
- Corticosteroids: primidone accelerates metabolism of 
  - **CORTICOSTEROIDS** (reduced effect)
- Cytoxics: primidone possibly decreases plasma concentration of 
  - **AXITINIB** (increase dose of axitinib—consult axitinib product literature); primidone possibly reduces plasma concentration of 
  - **BETRIZOMIB**, **BOSUTINIB**, **CRIZOTINIB** and **PONATINIB**—manufacturer of betrizaemb, bosutinib, crizotinib and ponatinib advises avoid concomitant use; primidone possibly reduces plasma concentration of 
  - **CABOZANTINIB** and 
    - **CERITINIB**—avoid concomitant use; avoidance of primidone advised by manufacturer of 
    - **CABAZITAXEL**, **DABRAFENIB** and **GEPITINIB**; avoidance of primidone advised by manufacturer of 
    - **DASATINIB** and **VANDETANIB** (plasma concentration of dasatinib and vandetanib possibly reduced); primidone possibly reduces plasma concentration of 
    - **ETOPOSIDE**; primidone reduces plasma concentration of 
    - **IRINOTECAN** and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when primidone given with 
    - **PROCARBAZINE**
  - Diuretics: primidone reduces plasma concentration of 
    - EPLERENONE—avoid concomitant use; increased risk of osteomalacia when primidone given with 
    - **CARBONIC ANHYDRASE INHIBITORS**
  - Folates: plasma concentration of primidone possibly reduced by 
    - **FOLATES**
  - Fosaprepitant: primidone possibly reduces plasma concentration of 
    - **FOSAPREPIANT**
  - Guanfacine: primidone possibly reduces plasma concentration of 
    - **GUANFACINE**—increase dose of guanfacine
  - Hormone Antagonists: primidone possibly reduces plasma concentration of 
    - **ABIRATERONE**—manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of 
    - **TOREMIFENE** (reduced plasma concentration)
  - Ivacafar: primidone possibly reduces plasma concentration of 
    - **IVACAFOR**—manufacturer of ivacafrad advises avoid concomitant use
  - Leukotriene Receptor Antagonists: primidone reduces plasma concentration of 
    - **MONTELUKAST**
  - Lumacaftor: plasma concentration of primidone possibly reduced by 
    - **LUMACAFOR**—manufacturer of lumacafrad advises avoid concomitant use
  - Oestrogens: primidone accelerates metabolism of 
    - **ESTROGENS** (reduced oral contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
  - Orlistat: possible increased risk of convulsions when 
    - Antiepileptics given with 
    - **ORLISTAT**
  - Panobinostat: avoidance of primidone advised by manufacturer of 
    - **PANOBINOSTAT**
  - Progestogens: primidone accelerates metabolism of 
    - **PROGESTOGENS** (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
  - Ponatinib: primidone possibly inhibits effects of 
    - **ROFULIMILAST** (manufacturer of rofufilumast advises avoid concomitant use)
  - Sodium Oxibate: avoidance of primidone advised by manufacturer of 
    - **SODIUM OXIBATE**
  - Sympathomimetics: plasma concentration of primidone possibly increased by 
    - **MEPHENIDATE**
  - Tacrolimus: primidone reduces plasma concentration of 
    - **TACROLIMUS**
  - Theophylline: primidone accelerates metabolism of 
    - **THEOPHYLLINE** (reduced effect)
  - Thyroid Hormones: primidone accelerates metabolism of 
    - **THYROID HORMONES** (may increase requirements for thyroid hormones in hypothyroidism)
  - Ticagrelor: primidone possibly reduces plasma concentration of 
    - **TICAGRELOR**
Progestogens (continued)

Progestogens

Anticholinergics: plasma concentration of norgestrel increased by CILOSPORIN; plasma concentration of norgestrel increased by CILOSPORIN, probenicid, and PHENOBARBITAL. 

Antihistamines: isolated reports that propafenone given with antihistamines may enhance anticoagulant effect of WARFARIN. 

Antimalarials: inactivate artemether with lumefantrine; increased antifolate effect when propafenone given with pyrimethamine. 

Anticoagulants: reduced effect when propafenone given with anticoagulants. 

Antidepressants: increased risk of haematological toxicity when antimalarials given with antimalarials prior to the first cycle. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines.

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antimalarials given with antihistamines. 

Antihistamines: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Antimalarials: avoid concomitant use of antimalarials with propafenone. 

Antidepressants: isolated reports that propafenone may enhance anticoagulant effect of warfarin. 

Anticoagulants: increased risk of haematological toxicity when antimalarials given with antihistamines. 

Antidiabetics: increased myocardial depression when antmalari
Propafenone (continued)

- Antihistamines: avoidance of propafenone advised by manufacturer of MIZOLASTINE (possible risk of ventricular arrhythmias).
- Anticoagulants: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with.
- ANTIPSYCHOTICS that prolong the QT interval.
- Antivirals: plasma concentration of propafenone possibly increased by POSAMPRINAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by RITONAVIR (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with SAQUINAVIR—avoid concomitant use; caution with propafenone advised by manufacturer of TELEPREVIR (risk of ventricular arrhythmias).
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with. BETA-BLOCKERS; propafenone increases plasma concentration of METOPROLOL and PROPRANOLOL.

- Cardiac Glycosides: propafenone increases plasma concentration of DIGOXIN (half-life of digoxin).
- Ciclosporin: propafenone possibly increases plasma concentration of CICLOSPORIN.
- Parasympathomimetics: propafenone possibly antagonises effects of NEOSTIGMINE and PYRIDOSTIGMINE.
- Theophylline: propafenone increases plasma concentration of THEOPHYLLINE.
- Ulcer-healing Drugs: plasma concentration of propafenone increased by CIMETIDINE.

Propradiol see Antiarrhythmics
Propofol see Anaesthetics, General
Proporanolol see Beta-blockers
Prostaglandins
- ACE Inhibitors: enhanced hypotensive effect when alprostadil given with ACE INHIBITORS.
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with ADRENERGIC NEURONE Blockers.
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with ALPHA-BLOCKERS.
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
- Beta-blockers: enhanced hypotensive effect when alprostadil given with BETA-BLOCKERS.
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with CALCIUM-CHANNEL BLOCKERS.
- Clonidine: enhanced hypotensive effect when alprostadil given with CLONIDINE.
- Diazoxide: enhanced hypotensive effect when alprostadil given with DIAZOXIDE.
- Diuretics: enhanced hypotensive effect when alprostadil given with DIURETICS.
- Methyldopa: enhanced hypotensive effect when alprostadil given with METHYLDOPA.
- Moxonidine: enhanced hypotensive effect when alprostadil given with MOXONIDINE.
- Nitrates: enhanced hypotensive effect when alprostadil given with NITRATES.
- Oxycin: prostaglandins potentiate uterotic effect of OXYCIN.
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE.

Protein Kinase Inhibitors see individual drugs

Proton Pump Inhibitors

- Antacids: absorption of lansoprazole possibly reduced by ANTACIDS.
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with CLARITHROMYCIN.
- Anticoagulants: esomeprazole and omeprazole possibly enhance anticoagulant effect of COUMARINS; pantoprazole might enhance the anticoagulant effect of COUMARINS.
- Antidepressants: omeprazole increases plasma concentration of ESCITALOPRAM; plasma concentration of lansoprazole possibly increased by FLUVOXAMINE; plasma concentration of omeprazole possibly reduced by ST JOHN’S WORT.
- Antiarrhythmics: esomeprazole possibly increases plasma concentration of ITRACONAZOLE and KETOCONAZOLE; esomeprazole reduces plasma concentration of POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by VORICONAZOLE; plasma concentration of omeprazole increased by VORICONAZOLE (consider reducing dose of omeprazole).
- Antipsychotics: omeprazole possibly reduces plasma concentration of CLOzapine.
- Antibacterials: plasma concentration of both drugs increased when omeprazole given with CLARITHROMYCIN.
- Anticoagulants: esomeprazole and omeprazole possibly enhance anticoagulant effect of COUMARINS; pantoprazole might enhance the anticoagulant effect of COUMARINS.
- Antidepressants: omeprazole increases plasma concentration of ESCITALOPRAM; plasma concentration of lansoprazole possibly increased by FLUVOXAMINE; plasma concentration of omeprazole possibly reduced by ST JOHN’S WORT.
- Antiarrhythmics: esomeprazole possibly increases plasma concentration of ITRACONAZOLE and KETOCONAZOLE; esomeprazole reduces plasma concentration of POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of POSACONAZOLE—manufacturer of posaconazole suspension advises avoid concomitant use; plasma concentration of esomeprazole possibly increased by VORICONAZOLE; plasma concentration of omeprazole increased by VORICONAZOLE (consider reducing dose of omeprazole).
- Antipsychotics: omeprazole possibly reduces plasma concentration of CLOzapine.
Pyrazinamide

> Sulfinpyrazone: pyrazinamide antagonises effects of SULFINPYRAZONE.

> Vaccines; antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC.

Pyridostigmine see Parasympathomimetics

Pyridoxine see Vitamins

Pyrimethamine

> Antibacterials: increased antifolate effect when pyrimethamine given with SULFONAMIDES or TRIMETHOPRIM.

> Antiepileptics: pyrimethamine antagonises anticonvulsant effect of FOSPHENYTOIN and PHENYTOIN, also increased antifolate effect.

> Antimalarials: avoidance of antimalarials advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; increased antifolate effect when pyrimethamine given with PROGUANIL.

> Antivirals: increased antifolate effect when pyrimethamine given with ZIDOVUDINE.

> Cytotoxics: pyrimethamine increases antifolate effect of METHOTREXATE and PEMETREXED.

> Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE.

> Penicillamine: increased risk of haematological toxicity when antimalarials given with PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use.

> Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC.

Quetiapine see Antipsychotics

Quinagolide

> Memantine: effects of dopaminergics possibly enhanced by MEMANTINE.

> Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA.

Quinapril see ACE Inhibitors

Quinoline

> Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with AMIODARONE—avoid concomitant use; quinine increases plasma concentration of AMIODARONE.

> Antibacterials: increased risk of ventricular arrhythmias when quinine given with MOXIFLOXACIN—avoid concomitant use; plasma concentration of quinine reduced by sulfamethoxazole.

> Antivirals: increased antifolate effect when quinidine given with SUXAMETHONIUM.

Quinine (continued)

> Penicillamine: increased risk of haematological toxicity when antimalarials given with PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use.

> Ulcer-healing Drugs: metabolism of quinine inhibited by CITOMIDINE (increased plasma concentration).

> Vaccines: antimalarials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC.

Quinolones

> Aminophylline: possible increased risk of convulsions when quinolones given with AMINOPHYLLINE; ciprofloxacin and norfloxacin increase plasma concentration of AMINOPHYLLINE.

> Analgesics: possible increased risk of convulsions when quinolones given with NSAIDS.

> Antacids: absorption of moxifloxacin reduced by ANTACIDS (give at least 6 hours apart); absorption of ciprofloxacin and levofloxacin reduced by ANTACIDS (give at least 2 hours before or 4 hours after ciprofloxacin and levofloxacin); absorption of norfloxacin reduced by ANTACIDS; absorption of ofloxacin reduced by ANTACIDS (give at least 2 hours apart).

> Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with AMIODARONE; avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with DISOPYRAMIDE—avoid concomitant use.

> Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with parenteral ERYTHROMYCIN—avoid concomitant use; avoidance of moxifloxacin advised by manufacturer of BEDAQUILINE; ciprofloxacin possibly increases plasma concentration of BEDAQUILINE—avoid concomitant use if ciprofloxacin given for more than 14 days; increased risk of ventricular arrhythmias when moxifloxacin given with DELAMANID; effects of nalidixic acid possibly antagonised by NITROFURANTOIN; increased possible risk of ventricular arrhythmias when moxifloxacin given with TELITHROMYCIN.

> Anticoagulants: nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of COUMARINS; ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of COUMARINS; levofloxacin possibly enhances anticoagulant effect of PHENINDIONE.

> Antidepressants: avoidance of moxifloxacin advised by manufacturer of CITOLOPRAM, ESCITALOPRAM and VENLAFAXINE (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of DULOXETINE—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of AGOMELATINE; increased risk of ventricular arrhythmias when moxifloxacin given with TRICYCLICS—avoid concomitant use.

> Antidiabetics: norfloxacin possibly enhances effects of GLIBENCLAMIDE.

> Antiepileptics: ciprofloxacin increases or decreases plasma concentration of FOSPHENYTOIN and PHENYTOIN.

> Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with MIZOLASTINE—avoid concomitant use.

> Antimalarials: avoidance of quinolones advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; avoidance of moxifloxacin advised by manufacturer of ARTEMIDIL WITH PIPERAQUINE (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when moxifloxacin given with CHLOROQUINE, HYDROXYCHLOROQUINE, MEFLOQUINE or QUININE—avoid concomitant use.

> Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with BENPERIDOL—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin given with DROPERIDOL, HALOPERIDOL, PHENOTHIAZINES, PIMOZIDE or ZUCLOPENTHIXOL—avoid concomitant use; ciprofloxacin increases plasma concentration of CLOZAPINE; ciprofloxacin possibly increases plasma concentration of OLANzapine.

> Antivirals: manufacturer of moxifloxacin advises give DIDanosine tablets at least 6 hours before or after moxifloxacin; manufacturer of norfloxacin advises give DIDanosine tablets at least 2 hours before or after norfloxacin; manufacturer of levofloxacin advises give DIDanosine tablets at least 2 hours before or after levofloxacin; absorption of ciprofloxacin reduced by DIDanosine tablets (give at least......
Quinolones

Antivirals (continued)
2 hours before or 4 hours after ciprofloxacin); increased risk of ventricular arrhythmias when moxifloxacin given with
- SAQUINAVIR—avoid concomitant use
- Amoxicillin and clavulanic acid: avoidance of ciprofloxacin advised by manufacturer of ZOLIDEPID
- Atorvastatin: increased risk of ventricular arrhythmias when moxifloxacin given with● ATOMOXETINE
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with● SOTALOL—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by CALCIUM SALTS (give at least 2 hours before or 4 hours after ciprofloxacin)
- Ciclosporin: increased risk of nephrotoxicity when quinolones given with● CICLOSPORIN
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of● CLOPIDODGER
- Cytotoxics: nalidixic acid increases risk of MELPHALAN toxicity; ciprofloxacin possibly reduces excretion of METHOTREXATE (increased risk of toxicity); possible increased risk of ventricular arrhythmias when moxifloxacin given with● BOSUTINIB and● CERTINIB; ciprofloxacin possibly increases the plasma concentration of● BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of ERLOTINIB; ciprofloxacin possibly increases the plasma concentration of● IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, p. 867); possible increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with● ARSENIC TRIOXIDE; ciprofloxacin possibly increases plasma concentration of● OLAPARIB (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
- Dairy Products: absorption of ciprofloxacin reduced by DAIRY PRODUCTS (give at least 2 hours apart); absorption of norfloxacin reduced by DAIRY PRODUCTS
- Dapomimetics: ciprofloxacin increases plasma concentration of● RASAGILINE; ciprofloxacin inhibits metabolism of● RANOLAZINE (increased plasma concentration)
- SH2-receptor Agonists: quinolones possibly inhibit metabolism of● ZOLMITRIPTAN (reduce dose of zolmitriptan)
- Iron Salts: absorption of moxifloxacin reduced by oral IRON SALTS (give at least 6 hours apart); absorption of ciprofloxacin reduced by oral IRON SALTS (give at least 2 hours before or 4 hours after ciprofloxacin); absorption of levofloxacin, norfloxacin and ofloxacin reduced by oral IRON SALTS (give at least 2 hours apart)
- Lanthanum: absorption of quinolones possibly reduced by● LANTHANUM (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: norfloxacin possibly increases plasma concentration of● TIZANIDINE (increased risk of toxicity); ciprofloxacin increases plasma concentration of● TIZANIDINE (increased risk of toxicity)—avoid concomitant use
- Mycophenolate: norfloxacin possibly reduces bioavailability of● MYCOPHENOLATE
- Panobinostat: possible increased risk of ventricular arrhythmias when moxifloxacin given with● PANOBINOSTAT—avoid concomitant use
- Pentamidine ietionate: increased risk of ventricular arrhythmias when moxifloxacin given with● PENTAMIDINE ISETONATE—avoid concomitant use
- Perifedone: ciprofloxacin increases plasma concentration of● PERIFEDONE—see under Perifedone, p. 279
- Sevelamer: absorption of ciprofloxacin reduced by● SEVELAMER (give at least 2 hours before or 4 hours after ciprofloxacin)
- Strontium Ranelate: absorption of quinolones reduced by● STRONTIUM RANELATE (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with● THEOPHYLLINE; ciprofloxacin and norfloxacin increase plasma concentration of● THEOPHYLLINE
- Ulcer-healing Drugs: absorption of levofloxacin, norfloxacin and ofloxacin reduced by● SUCRALFATE (give at least 2 hours

Quinolones

Ulcer-healing Drugs (continued)
- absorption of ciprofloxacin reduced by● SUCRALFATE (give at least 2 hours before or 4 hours after ciprofloxacin); absorption of moxifloxacin reduced by● SUCRALFATE (give at least 6 hours apart)
- Vaccines: antibacterials inactivate● ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC
- Zinc: absorption of moxifloxacin reduced by● ZINC (give at least 6 hours apart); absorption of ciprofloxacin, levofloxacin, norfloxacin and ofloxacin reduced by● ZINC (give at least 2 hours apart)

Rabeprazole see Proton Pump Inhibitors

Rabies Vaccine see Vaccines

Raloxifene

- Anticoagulants: raloxifene antagonises anticoagulant effect of● COUMARINS
- Lipid-regulating Drugs: absorption of raloxifene reduced by● COLESTYRAMINE (manufacturer of raloxifene advises avoid concomitant administration)

Raltitrexed

- Antipsychotics: avoid concomitant use of cytotoxics with● CLOzapine (increased risk of agranulocytosis)
- Folates: manufacturer of raltitrexed advises avoid concomitant use with● FOLATES

Ramipril see ACE Inhibitors

Ramucirumab

- Antibacterials: plasma concentration of raltegravir reduced by● ALUMINIUM HYDROXIDE and● ORAL MAGNESIUM SALTS—manufacturer of raltegravir advises avoid concomitant use
- Antivirals: plasma concentration of raltegravir reduced by● RIFAPICIN—consider increasing dose of raltegravir
- Antivirals: increased risk of rash when raltegravir given with● DARUNAVIR; avoidance of raltegravir advised by manufacturer of● FOSAMPRENAVIR
- Oralstat: absorption of raltegravir possibly reduced by● ORALSTAT
- Ulcer-healing Drugs: plasma concentration of raltegravir increased by● FAMOTIDINE and● OMEPRAZOLE

Raltitrexed

- Antipsychotics: avoid concomitant use of cytotoxics with● CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live● VACCINES—avoid concomitant use

Ranitidine see Histamine H2-antagonists

Ranolazine

- Anti-arrhythmics: manufacturer of ranolazine advises avoid concomitant use with● DISOPYRAMIDE
- Antibacterials: plasma concentration of ranolazine possibly increased by● CLARITHROMYCIN and● TELITHROMYCIN—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by● RIFAPICIN—manufacturer of ranolazine advises avoid concomitant use
- Antidepressants: plasma concentration of ranolazine increased by● PAROXETINE
- Antifungals: plasma concentration of ranolazine increased by● KETOCONAZOLE—avoid concomitant use; plasma concentration of ranolazine possibly increased by● ITRACONAZOLE,● POSaconazole and● voriconazole—manufacturer of ranolazine advises avoid concomitant use
- Antivirals: plasma concentration of ranolazine possibly increased by● ATAZANAVIR,● DARUNAVIR,● FOSAMPRENAVIR,● INIDINAVIR,● LOPINAVIR,● RITONAVIR,● SAQUINAVIR and● TIPRANAVIR—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with● SOTALOL
- Calcium-channel Blockers: plasma concentration of ranolazine increased by● Diltiliazem and● VERAPAMIL (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of● DIGOXIN
- Ciclosporin: plasma concentration of both drugs may increase when ranolazine given with● CICLOSPORIN

Corrections:
Ranolazine (continued)

- Grapefruit Juice: plasma concentration of ranolazine possibly increased by grapefruit juice—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of simvastatin (see under simvastatin, p. 194); separating administration from ranolazine by 12 hours advised by manufacturer of lomitapide
- Tacrolimus: ranolazine increases plasma concentration of tacrolimus

Rasagiline

**NOTE** Rasagiline is a MAO-B inhibitor

- Analgesics: avoid concomitant use of rasagiline with dextromethorphan; risk of CNS toxicity when rasagiline given with pethidine (avoid pethidine for 2 weeks after rasagiline)
- Antibacterials: plasma concentration of rasagiline increased by ciprofloxacin
- Antidepressants: after stopping rasagiline do not start fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; after stopping rasagiline do not start fluvoxamine for 2 weeks; risk of hypertensive crisis when rasagiline given with MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRIs or tricyclics; risk of CNS excitation and hypertention when rasagiline given with vortioxetine
- Dopaminergics: plasma concentration of rasagiline possibly reduced by entacapone
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methyl dopa: antiparkinsonian effect of dopaminergics antagonised by methyl dopa
- Symptomhmetics: avoid concomitant use of rasagiline with sympathomimetics

Reboxetine

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with macrolides
- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with fluvoxamine; increased risk of hypertention and CNS excitation when reboxetine given with MAOIs (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)
- Antiepileptics: plasma concentration of reboxetine possibly reduced by carbamazepine, phenobarbital and primidone
- Antifungals: manufacturer of reboxetine advises avoid concomitant use with imidazoles and triazoles
- Antimalarials: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and artemiinol with piperaquine
- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics and thiazides and related diuretics
- Ergot alkaloids: possible risk of hypertention when reboxetine given with ergotamine

Regorafenib

- Analgesics: manufacturer of regorafenib advises avoid concomitant use with mefenamic acid
- Antibacterials: plasma concentration of regorafenib reduced by rifampicin—manufacturer of regorafenib advises avoid concomitant use
- Anticoagulants: increased risk of bleeding when regorafenib given with warfarin
- Antifungals: plasma concentration of regorafenib increased by ketoconazole—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Cytotoxics: regorafenib increases plasma concentration of irinotecan

Remifentanil see Opioid Analgesics

Repaglinide see Antidiabetics

Retigabine

- Alcohol: increased risk of blurred vision when retigabine given with alcohol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of retigabine possibly reduced by carbamazepine, fosphenytoin and phenytoin
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by mephaquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered)
- Orlstat: possible increased risk of convulsions when antiepileptics given with orlistat

Retinoids

- Alcohol: etretinate formed from acitretin in presence of alcohol (increased risk of teratogenicity in women of child-bearing potential)
- Antibacterials: possible increased risk of benign intracranial hypertension when retinoids given with tetracyclines (avoid concomitant use)
- Anticoagulants: acitretin possibly reduces anticoagulant effect of coumarins
- Antiepileptics: isotretinoin possibly reduces plasma concentration of carbamazepine
- Antifungals: plasma concentration of alitretinoin increased by ketoconazole; possible increased risk of retinoid toxicity when given with fluconazole, ketoconazole and voriconazole
- Cytotoxics: acitretin increases plasma concentration of methotrexate (also increased risk of hepatotoxicity)—avoid concomitant use
- Lipid-regulating Drugs: alitretinoin reduces plasma concentration of simvastatin
- Vitamins: risk of hypervitaminosis A when retinoids given with vitamin A—avoid concomitant use

Ribavirin

- Antivirals: effects of ribavirin possibly reduced by abacavir, increased risk of side-effects when ribavirin given with didanosine—avoid concomitant use; increased risk of toxicity when ribavirin given with stavudine; increased risk of anaemia when ribavirin given with zidovudine—avoid concomitant use
- Azathioprine: ribavirin possibly enhances myelosuppressive effects of azathioprine

Rifabutin see Rifamycins

Rifampicin see Rifamycins

Rifamycins

**NOTE** Interactions do not apply to rifaximin

- ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of imidapril (reduced antihypertensive effect)
- Alfiskiren: rifampicin reduces plasma concentration of aliskiren
- Ambrisentan: rifampicin possibly increases plasma concentration of ambrisentan
- Aminophylline: rifampicin accelerates metabolism of aminophylline (reduced plasma concentration)
- Analgesics: rifampicin reduces plasma concentration of celecoxib, diclofenac and etoricoxib; rifampicin accelerates metabolism of alfentanil, codeine, fentanyl, methadone and morphine (reduced effect); rifampicin possibly accelerates metabolism of oxycodone
- Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of losartan and its active metabolite
- Antacids: absorption of rifampicin reduced by antacids
- Antihelminetics: rifampicin reduces plasma concentration of praziquantel—avoid concomitant use
- Anti-arrhythmics: rifampicins accelerate metabolism of disopyramide (reduced plasma concentration); rifampicin reduces plasma concentration of brendaron—avoid concomitant use; rifampicin accelerates metabolism of propafenone (reduced effect)
Rifamycins

Rifamycins (continued)
- Antimicrobials: increased risk of side-effects including neutropenia when rifabutin given with azithromycin; rifampicin reduces plasma concentration of clarithromycin and dапsone; plasma concentration of rifabutin increased by clarithromycin (increase risk of toxicity—reduce rifabutin dose); plasma concentration of rifabutin possibly increased by erythromycin (increased risk of toxicity—reduce rifabutin dose); rifampicin possibly reduces plasma concentration of tinidazole and trimethoprime; rifampicin reduces plasma concentration of doxycycline—consider increasing dose of doxycycline; rifampicin reduces plasma concentration of bedaquiline—manufacturer of bedaquiline advises avoid concomitant use; rifabutin possibly reduces plasma concentration of bedaquiline—manufacturer of bedaquiline advises avoid concomitant use; rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); rifampicin reduces plasma concentration of delamanid; increased risk of hepatotoxicity when rifampicin given with isoniazid; rifampicin reduces plasma concentration of telithromycin (avoid during and for 2 weeks after rifampicin).
- Anticoagulants: rifampicin possibly reduces plasma concentration of apixaban—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; rifampicins accelerate metabolism of coumarins (reduced anticoagulant effect); rifampicin reduces plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of edoxaban; rifampicin reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.
- Antidepressants: rifampicin reduces plasma concentration of linezolid (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of vortioxetine—consider increasing dose of vortioxetine.
- Antidiabetics: rifampicins accelerate metabolism of tolbutamide (reduced effect); rifampicin reduces plasma concentration of canagliflozin and nateglinide; rifampicin possibly reduces effects of linagliptin; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifampicins possibly accelerate metabolism of sulfonyleureas (reduced effect).
- Antiepileptics: rifampicin reduces plasma concentration of brivaracetam and lamotrigine; rifabutin reduces plasma concentration of carbamazepine; rifampicins accelerate metabolism of fosphenytoin and phenytoin (reduced plasma concentration); plasma concentration of rifampicin possibly reduced by phenobarbital and primidone.
- Antifungals: rifampicin accelerates metabolism of ketoconazole (reduced plasma concentration, also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of rifabutin increased by fluconazole (increased risk of uveitis—reduce rifabutin dose); rifampicin accelerates metabolism of fluconazole (reduced plasma concentration); rifabutin possibly reduces plasma concentration of isavuconazole—avoid concomitant use; rifampicin reduces plasma concentration of isavuconazole and voriconazole—avoid concomitant use; rifabutin and rifampicin reduce plasma concentration of itraconazole—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by posaconazole (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of posaconazole and terbinafine; plasma concentration of rifabutin increased by voriconazole, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for signs of toxicity); rifampicin initially increases and then reduces plasma concentration of caspofungin (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by triazoles (increased risk of uveitis—reduce rifabutin dose).
- Antihistamines: rifampicin possibly reduces effects of fexofenadine.

Rifamycins (continued)
- Antimalarials: avoidance of rifampicin advised by manufacturer of artenandin with piperaquine; rifampicin reduces plasma concentration of mefloquine—avoid concomitant use; rifampicin reduces plasma concentration of quinidine.
- Antimycobacterials: rifampicin reduces plasma concentration of active metabolite of fosfonidine—avoid concomitant use.
- Antipsychotics: rifampicin accelerates metabolism of haloperidol (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of clozapine; rifampicin reduces plasma concentration of lurasidone—avoid concomitant use.
- Antivirals: rifampicin possibly reduces plasma concentration of abacavir; rifampicin reduces plasma concentration of atazanavir, daplatasvir, lopinavir, nevirapine and rilpivirine—avoid concomitant use; plasma concentration of rifabutin increased by atazanavir, darunavir, fosamprenavir and tipranavir (reduce dose of rifabutin); avoidance of rifampicin advised by manufacturer of boceprevir (plasma concentration of boceprevir possibly reduced); rifabutin possibly reduces plasma concentration of daclatasvir and simprevir—manufacturer of daclatasvir and simprevir advises avoid concomitant use; rifampicin significantly reduces plasma concentration of darunavir, fosamprenavir and telaprevir—avoid concomitant use; rifampicin possibly reduces plasma concentration of dasabuvir, omibitasvir, paritaprevir and tipranavir—avoid concomitant use; rifampicin reduces the plasma concentration of dolutegravir (see under Dolutegravir, p. 592); rifampicin reduces plasma concentration of efavirenz—increase dose of efavirenz; plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; avoidance of rifampicin advised by manufacturer of elvitegravir, etravirine, ledipasvir, sofosbuvir and zidovudine; rifabutin reduces plasma concentration of elvitegravir also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; plasma concentration of both drugs reduced when rifabutin given with etravirine; plasma concentration of rifabutin increased by indinavir, also plasma concentration of indinavir decreased (reduce dose of rifabutin and increase dose of indinavir); rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); avoidance of rifampicin advised by manufacturer of ledipasvir, sofosbuvir and telaprevir; rifampicin reduces plasma concentration of maraviroc and raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of ritonavir possibly increased by nevirapine—rifabutin decreases plasma concentration of rilpivirine (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rifabutin increased by ritonavir (increased risk of toxicity—reduce rifabutin dose); rifampicin reduces plasma concentration of ritonavir; rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of ritonavir possibly increased by saquinavir (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; rifampicin reduces plasma concentration of simprevir—manufacturer of simprevir advises avoid concomitant use.
- Anxiolytics and Hypnotics: rifampicin accelerates metabolism of diazepam and zaleplon (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of butorphanol; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.
- Apremilast: rifampicin reduces plasma concentration of apremilast.
- Aprepiant: rifampicin reduces plasma concentration of aprepitant.
Cytotoxics:

- Bosentan:
- Avanafil:
- Atovaquone:
- Rifamycins

Rifamycins (continued)

- Atovaquone: avoidance of concomitant rifabutin advised by manufacturer of ATOVUQUONE (plasma concentration of both drugs reduced); rifampicin reduces plasma concentration of ATOVUQUONE (and concentration of rifampicin increased)—avoid concomitant use
- Avanafil: rifampicin possibly reduces plasma concentration of AVANAFIL—manufacturer of avanafil advises avoid concomitant use
- Beta-blockers: rifampicin accelerates metabolism of BISOPROLOL and PROPRANOLOL (plasma concentration significantly reduced); rifampicin reduces plasma concentration of CARVEDILOL, CELIPROLOL and METOPROLOL; rifampicin possibly reduces plasma concentration of oral TIMOLOL
- Bosentan: rifampicin reduces plasma concentration of BOSENTAN—avoid concomitant use
- Calcium-channel blockers: rifampicin possibly reduces plasma concentration of FELODIPINE; rifampicin possibly accelerates metabolism of ISRADIPINE and NICARDIPINE (possible significantly reduced plasma concentration); rifampicin accelerates metabolism of DILTIAZEM, NIFEDIPINE, NIMODIPINE and VERAPAMIL (plasma concentration significantly reduced)
- Cannabis Extract: rifampicin reduces plasma concentration of CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Ciclosporin: rifampicin accelerates metabolism of CICLOSPORIN (reduced plasma concentration)
- Cocisistat: rifabutin reduces plasma concentration of COCISTAT (adjust dose—consult product literature); rifampicin possibly reduces plasma concentration of COCISTAT—manufacturer of cocistat advises avoid concomitant use
- Corticosteroids: rifamycins accelerate metabolism of CORTICOSTEROIDS (reduced effect)
- Diuretics: rifampicin possibly reduces effects of BRENTOXIMAVEDOTIN; rifampicin reduces plasma concentration of AFATINIB, RUXOLITINIB, SORAFENIB and TRABECTEDIN; rifabutin possibly reduces plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); rifampicin reduces plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); rifabutin possibly reduces plasma concentration of BORTezOMIB, BOsUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bosutinib, crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of BOSUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bosutinib, crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bosutinib, crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BOsUTINIB, CRIZOTINIB, PONATINIB, REGORAFENIB and VANDETANIB—manufacturer of bortezomib, bosutinib, cabazitaxel, crizotinib, ponatinib, regorafenib and vandetanib advises avoid concomitant use; rifampicin reduces plasma concentration of BORTezOMIB, BOsUTINIB, CRIZOTINIB and PONATINIB—manufacturer of bosutinib, crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of CRIZOTINIB and PONATINIB—manufacturer of crizotinib and ponatinib advises avoid concomitant use; rifampicin reduces plasma concentration of ERLOTINIB and SUNITINIB (reduced plasma concentration); rifampicin reduces plasma concentration of EVEROLIMUS (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature); avoidance of rifabutin advised by manufacturer of CABAZITAXEL, LAPATINIB, OLAPARIB and VEMURAFENIB; rifampicin accelerates metabolism of DASATINIB (reduced plasma concentration—avoid concomitant use); rifampicin accelerates metabolism of ERLOTINIB and SUNITINIB (reduced plasma concentration); rifampicin reduces plasma concentration of EVerOLIMUS (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature); avoidance of rifabutin advised by manufacturer of CABAZITAXEL, LAPATINIB, OLAPARIB and VEMURAFENIB; rifampicin possibly reduces plasma concentration of ERIBULIN and PAZOPANIB; rifampicin reduces plasma concentration of active metabolite of TEMSIROLIMUS—avoid concomitant use; rifampicin possibly reduces plasma concentration of VINFLUNINE—manufacturer of vinflunine advises avoid concomitant use; avoidance of rifampicin advised by manufacturer of VISMODEGIB (plasma concentration of vismodegib possibly reduced)

Rifamycins (continued)

- Deferasirox: rifampicin reduces plasma concentration of DEFERASIROX
- Diuretics: rifampicin reduces plasma concentration of EPLERENONE—avoid concomitant use
- Fosaprepitant: rifampicin reduces plasma concentration of FOSAPREPITAN
- Guanfacine: rifabutin possibly reduces plasma concentration of GUANFACINE—increase dose of guanfacine; rifampicin reduces plasma concentration of GUANFACINE—increase dose of guanfacine
- Hormone Antagonists: rifampicin reduces plasma concentration of ABRIRERONE—manufacturer of abiraterone advises avoid concomitant use; rifabutin possibly reduces plasma concentration of ABRIRERONE—manufacturer of abiraterone advises avoid concomitant use; rifampicin possibly reduces plasma concentration of EXEMESTANE; rifampicin accelerates metabolism of TAMOXIFEN (reduced plasma concentration)
- HST1-receptor Antagonists: rifampicin accelerates metabolism of ONDANSETRON (reduced effect)
- Icavafor: rifabutin possibly reduces plasma concentration of IVACAFOR—manufacturer of icavafor advises avoid concomitant use; rifampicin reduces plasma concentration of IVACAFOR—manufacturer of icavafor advises avoid concomitant use
- Lefunomide: rifampicin possibly reduces plasma concentration of active metabolite of LEFLUNOMIDE
- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of ATOVASTATIN and SIMVASTATIN; rifampicin accelerates metabolism of FLUVASTATIN (reduced effect)
- Lumacaftor: plasma concentration of rifabutin possibly reduced by LUMACAFOR—avoid concomitant use
- Macitentan: rifampicin reduces plasma concentration of MACITENANT—avoid concomitant use
- Muscle Relaxants: rifampicin possibly reduces plasma concentration of TIZANIDINE
- Mycophenolate: rifampicin reduces plasma concentration of active metabolite of MYCOPHENOLATE
- Naloxegol: rifampicin reduces plasma concentration of NALOXEGOL—avoid concomitant use
- Netupitant: rifampicin reduces plasma concentration of NETUPITANT—avoid concomitant use
- Oestrogens: rifamycins accelerate metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Panobinostat: avoidance of rifabutin and rifampicin advised by manufacturer of PANOBINOSTAT
- Progestogens: rifamycins accelerate metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- Ranolazine: rifampicin reduces plasma concentration of RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Roflumilast: rifampicin inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of SIROLIMUS—avoid concomitant use
- Tacrolimus: rifabutin possibly reduces plasma concentration of TACROLIMUS; rifampicin reduces plasma concentration of TACROLIMUS
- Tadalafil: rifampicin reduces plasma concentration of TADALAFIL—manufacturer of tadalafil advises avoid concomitant use
- Teriflunomide: rifampicin reduces plasma concentration of TERIFLUNOMIDE
- Theophylline: rifampicin accelerates metabolism of THEOPHYLLINE (reduced plasma concentration)
- Thyroid Hormones: rifampicin accelerates metabolism of LEVOTHYROIDINE (may increase requirements for levothyroxine in hypothyroidism)
- Tibolone: rifampicin accelerates metabolism of TIBOLONE (reduced plasma concentration)
Rifaximin

- Ticagrelor: rifampicin reduces plasma concentration of ticagrelor; avoid concomitant use
- Tolovaptan: rifampicin reduces plasma concentration of tolvaptan
- Ulcer-healing Drugs: rifampicin accelerates metabolism of cimetidine (reduced plasma concentration)
- Ulipristal: avoidance of rifampicin advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF or BNFC

Rifaximin

Note: Rifaximin interactions do not apply to rifaximin.
- Anticoagulants: rifaximin possibly reduces anticoagulant effect of warfarin
- Ciclosporin: plasma concentration of rifaximin increased by ciclosporin
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNF or BNFC

Rilpivirine

- Antacids: manufacturer of rilpivirine advises give antacids 2 hours before or 4 hours after rilpivirine
- Antimonials: manufacturer of rilpivirine advises avoid concomitant use with carbarsazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin
- Dabigatran: rilpivirine possibly increases plasma concentration of dabigatran
- Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with St John’s Wort (plasma concentration of rilpivirine possibly reduced)
- Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with carbamazepine, fosphenytoin, oxcarsazepine, phenobarbital, phenytoin
- Primidone: rilpivirine product literature
- Antivirals: manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after rilpivirine; avoidance of rilpivirine advised by manufacturer of nevirapine
- Calcium: manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after rilpivirine
- Corticosteroids: manufacturer of rilpivirine advises avoid concomitant use with dexamethasone (except when given as a single dose)
- Orlistat: absorption of rilpivirine possibly reduced by orlistat
- Ulcer-healing Drugs: manufacturer of rilpivirine advises avoid concomitant use with esomeprazole, lansoprazole, pantoprazole and rabeprazole (plasma concentration of rilpivirine possibly reduced); plasma concentration of rilpivirine reduced by omeprazole—avoid concomitant use; manufacturer of rilpivirine advises avoid histamine H2-antagonists for 12 hours before or 4 hours after rilpivirine—consult product literature

Riociguat

- Antacids: absorption of riociguat reduced by antacids (give at least 2 hours before or 1 hour after riociguat)
- Antifungals: manufacturer of riociguat advises avoid concomitant use with itraconazole, ketoconazole and voriconazole
- Antivirals: manufacturer of riociguat advises avoid concomitant use with riociguat
- Avanafil: possible enhanced hypotensive effect when riociguat given with avanafil—avoid concomitant use
- Bosentan: plasma concentration of riociguat reduced by bosentan
- Nicorandil: possible enhanced hypotensive effect when riociguat given with nicorandil—avoid concomitant use
- Nitrates: possible enhanced hypotensive effect when riociguat given with nitrates—avoid concomitant use
- Sildenafil: enhanced hypotensive effect when riociguat given with sildenafil—avoid concomitant use
- Tadalafil: possible enhanced hypotensive effect when riociguat given with tadalafil—avoid concomitant use
- Vardenafil: possible enhanced hypotensive effect when riociguat given with vardenafil—avoid concomitant use
- Risedronate sodium: see Bisphosphonates
- Risperidone: see Antipsychotics

Ritonavir

- Alpha-blockers: ritonavir possibly increases plasma concentration of alfuzosin—avoid concomitant use
- Aminophylline: ritonavir accelerates metabolism of aminophylline (reduced plasma concentration)
- Analgesics: ritonavir possibly increases plasma concentration of nsaids and buproprionphine; ritonavir increases plasma concentration of dextropropoxyphene and piroxicam (risk of toxicity)—avoid concomitant use; ritonavir increases plasma concentration of alfenatal and fentanyl; ritonavir reduces plasma concentration of methadone; ritonavir possibly reduces plasma concentration of morphine; ritonavir reduces plasma concentration of methadone; ritonavir possibly reduces plasma concentration of morphine; ritonavir possibly reduces plasma concentration of pethidine; but increases plasma concentration of toxic metabolite of pethidine (avoid concomitant use)
- Anthelminetics: ritonavir possibly reduces plasma concentration of active metabolite of albendazole—consider increasing albendazole dose when given for systemic infections
- Antiarrhythmics: ritonavir increases plasma concentration of amiodarone and propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of disopyramide (increased risk of toxicity); avoidance of ritonavir advised by manufacturer of dronedarone; ritonavir possibly increases plasma concentration of flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: ritonavir possibly increases plasma concentration of azithromycin and erythromycin; ritonavir increases plasma concentration of clarithromycin (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of rifabutin (increased risk of toxicity); ritonavir possibly increases plasma concentration of rilpivirine reduced by rilpamipine; ritonavir possibly increases plasma concentration of bedaquiline—manufacturer of ritonavir advises avoid concomitant use; ritonavir increases plasma concentration of delamanid; plasma concentration of both drugs increased when ritonavir given with fusidic acid—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of telithromycin
- Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of warfarin; avoidance of ritonavir advised by manufacturer of apixaban; ritonavir possibly enhances anticoagulant effect of coumarins and phenindione; ritonavir increases plasma concentration of rivaroxaban—avoid concomitant use
- Antidepressants: ritonavir possibly reduces plasma concentration of paroxetine; ritonavir increases plasma concentration of trazodone (increased risk of toxicity); ritonavir possibly increases plasma concentration of SSRIs and tricyclics; plasma concentration of ritonavir reduced by St John’s Wort—avoid concomitant use
- Antidiabetics: ritonavir possibly increases plasma concentration of tolbutamide
- Antiepileptics: ritonavir possibly increases plasma concentration of carbamazepine; plasma concentration of ritonavir possibly reduced by fosphenytoin and phenytoin; also plasma concentration of fosphenytoin and phenytoin possibly affected; ritonavir possibly reduces plasma concentration of lamotrigine, sodium valproate and valproic acid
- Antifungals: ritonavir increases plasma concentration of ketoconazole (reduce dose of ketoconazole); plasma concentration of ritonavir increased by fluconazole; ritonavir increases plasma concentration of isavuconazole (also plasma concentration of ritonavir reduced)—avoid concomitant use of high-dose ritonavir; combination of
Ritonavir

- Antifungals (continued)
  - Ritonavir with ITRACONAZOLE may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of Voriconazole—avoid concomitant use
- Antiarrhythmics: ritonavir possibly increases plasma concentration of NON-SEDATING ANTIHISTAMINES
- Antiarrhythmials: caution with ritonavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; plasma concentration of ritonavir possibly reduced by MEFLOQUINE; ritonavir increases plasma concentration of QUININE (increased risk of toxicity)
- Antiarrhythmics: avoidance of ritonavir advised by manufacturer of DARIFENACIN and TOLERTODINE; manufacturer of fesoterodine advises dose reduction when ritonavir given with FESOTERODINE—consult fesoterodine product literature; ritonavir possibly increases plasma concentration of SOLIFENACIN—see under Solifenacin, p. 713
- Antipsychotics: ritonavir possibly increases plasma concentration of ANTI PSYCHOTICS; ritonavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with CLOzapine (increased risk of toxicity); ritonavir possibly increases plasma concentration of LURASIDONE—avoid concomitant use; ritonavir reduces plasma concentration of OLANZAPINE—consider increasing dose of olanzapine; ritonavir increases plasma concentration of PIMOZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antiarrhythmics: plasma concentration of both drugs reduced when ritonavir given with BOPEPREVIR; manufacturer of ritonavir advises ritonavir and DIDANOSINE should be taken 2.5 hours apart; ritonavir increases the toxicity of EFAVirenz, monitor liver function tests—manufacturer of Atripla® advises avoid concomitant use with high-dose ritonavir; ritonavir increases plasma concentration of INDINAVIR, MARAVIROC and SAQUINAVIR; ritonavir increases plasma concentration of SIMEPREVIR—manufacturer of simeprevir advises avoid concomitant use
- Antivirals: ritonavir possibly increases plasma concentration of ANTI HEPATITIS V/HIV ANTIVIRALS; ritonavir possibly increases plasma concentration of ALPRAZOLAM, DIAZEPAM, FLURAZEPAM and ZOLPIDEM (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of MIDAZOLAM (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of BUSPIRONE (increased risk of toxicity)
- Aprepitant: ritonavir possibly increases plasma concentration of APREPITANT
- Atovaquone: ritonavir possibly reduces plasma concentration of ATOV AQUONE—manufacturer of atovaquone advises avoid concomitant use
- Avanafil: ritonavir significantly increases plasma concentration of AVANAFIL—avoid concomitant use
- Bosentan: ritonavir increases plasma concentration of BOSENTAN (consider reducing dose of bosentan)
- Bupropion: ritonavir reduces plasma concentration of BUPROPION
- Calcium-channel blockers: ritonavir possibly increases plasma concentration of CALCIUM-CHANNEL BLOCKERS; ritonavir increases plasma concentration of AMLODIPINE (reduce dose of amlopridine); avoidance of ritonavir advised by manufacturer of LERCANIDIPINE
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of DIGOXIN
- Ciclosporin: ritonavir possibly increases plasma concentration of CICLOSPORIN
- Cilostazol: ritonavir possibly increases plasma concentration of CILOSTAZOL (see under Cilostazol, p. 221)
- Cobimetinib: avoidance of ritonavir advised by manufacturer of COBICISTAT

Ritonavir (continued)

- Colchicine: ritonavir possibly increases risk of COLCHICINE toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ritonavir possibly increases plasma concentration of CORTICOSTEROIDS—increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of Budesonide (including inhaled, intranasal, and rectal budesonide)—increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal Fluticasone—increased risk of adrenal suppression; ritonavir reduces plasma concentration of TRIAMCINOLONE injection—increased risk of adrenal suppression
- Cytotoxics: ritonavir increases the plasma concentration of AFINATIN—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of Axitinin (reduce dose of axitinib—consult axitinib product literature); ritonavir possibly increases the plasma concentration of Bosutinib and CABAZITAXEL—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of Cabozantinib and Vinblastine; ritonavir possibly increases plasma concentration of Cetirinin—avoid concomitant use or consider reducing the dose of cetirinin (see under Cetirinin, p. 861); ritonavir possibly increases plasma concentration of Crizotinib, Everolimus, Nilotinib and Vinflunine—manufacturer of crizotinib, everolimus, nilotinib and vinflunine advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of Dasatinib (plasma concentration of dasatinib possibly increased); ritonavir possibly increases the plasma concentration of Brutinib—reduce dose of lbrutinib (see under Ibrutinib, p. 867); avoidance of ritonavir advised by manufacturer of Lapatinib; ritonavir possibly increases plasma concentration of Pazopanib (reduce dose of pazopanib); ritonavir possibly increases plasma concentration of Ponatinib—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when ritonavir given with RUXOLITINIB—consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of Docetaxel—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; ritonavir increases plasma concentration of Paclitaxel; ritonavir possibly increases plasma concentration of Olaparib (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
- Daopetine: avoidance of ritonavir advised by manufacturer of DOPOXETINE (increased risk of toxicity)
- Diuretics: ritonavir increases plasma concentration of Eplerenone—avoid concomitant use
- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with Domperidone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when ritonavir given with Ergot Alkaloids—avoid concomitant use
- Fosaprepitant: ritonavir possibly increases plasma concentration of Fosaprepitant
- Ganciclovir: ritonavir possibly increases plasma concentration of Ganciclovir (half-life of ganciclovir)
- H1-receptor Agonists: ritonavir increases plasma concentration of Eletriptan (risk of toxicity)—avoid concomitant use
- Ibrud: ritonavir possibly increases plasma concentration of Ibrud
- Lipid-regulating Drugs: ritonavir possibly increases plasma concentration of Atorvastatin (use lowest possible dose of atorvastatin); possible increased risk of myopathy when ritonavir given with Rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with Simvastatin (avoid concomitant use); avoidance of ritonavir advised by manufacturer of Lomitapide (plasma concentration of lomitapide possibly increased)

Interactions | Appendix 1
Ritonavir (continued)

- Mirabegron: when given with ritonavir avoid or reduce dose of Mirabegron in hepatic or renal impairment—see Mirabegron, p. 715
- Haloxegol: ritonavir possibly increases plasma concentration of Haloxegol—avoid concomitant use
- Oestrogens: ritonavir accelerates metabolism of Oestrogens (reduced concomitant effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlisstat: absorption of rimonavir possibly reduced by Orlisstat
- Panobinostat: ritonavir possibly increases plasma concentration of Panobinostat (reduce dose of panobinostat—see under Panobinostat, p. 834)
- Ranolazine: rimonavir possibly increases plasma concentration of Ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Riociguat: avoidance of rimonavir advised by manufacturer of Riociguat
- Sildenafil: ritonavir significantly increases plasma concentration of Sildenafil—avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction (consult sildenafil product literature)
- Symathomimetics: rimonavir possibly increases plasma concentration of Dexamfetamine
- Symathomimetics, Beta2: manufacturer of rimonavir advises avoid concomitant use with Salbutamol
- Tacrolimus: rimonavir possibly increases plasma concentration of Tacrolimus
- Tadalafil: rimonavir increases plasma concentration of Tadalafil—avoid concomitant use of tadalafil for pulmonary hypertension
- Theophylline: rimonavir accelerates metabolism of Theophylline (reduced plasma concentration)
- Ticagrelor: rimonavir possibly increases plasma concentration of Ticagrelor—manufacturer of ticagrelor advises avoid concomitant use
- Ulipristal: avoidance of rimonavir advised by manufacturer of Ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vardenafil: rimonavir increases plasma concentration of Vardenafil—avoid concomitant use

Rituximab

- Antipsychotics: avoid concomitant use of cytotoxics with Rituximab
- Clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monocular antibodies given with live Vaccines—avoid concomitant use

Rivaroxaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with Ketorolac (avoid concomitant use, including low-dose heparins)
- Anti-arhythmics: manufacturer of rivaroxaban advises avoid concomitant use with Dronedarone
- Anticoagulants: plasma concentration of rivaroxaban reduced by Rifampicin—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Anticoagulants: increased risk of haemorrhage when rivaroxaban given with other Anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with Apixaban, Darapladin and Edoxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of rivaroxaban possibly reduced by St John’s Wort—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antiepileptics: plasma concentration of rivaroxaban possibly reduced by Carbamazepine, Phenytoin, Phenobarbital, Phenytoin and Primidone—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antifungals: plasma concentration of rivaroxaban increased by Fosamprenavir, Saquinavir and Tipranavir; manufacturers advise concomitant use of rivaroxaban with Lopinavir; plasma concentration of rivaroxaban increased by Ritonavir—avoid concomitant use
- Antibacterials: effects of rivaroxaban possibly inhibited by Ciprofloxacin (manufacturer of rivaroxaban advises avoid concomitant use)
- Antidepressants: metabolism of rivaroxaban inhibited by Fluvoxamine
- Antiepileptics: effects of rivaroxaban possibly inhibited by Carbamazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone (manufacturer of rivaroxaban advises avoid concomitant use)
- Theophylline: manufacturer of rivaroxaban advises avoid concomitant use with Theophylline
- Ulcer-healing Drugs: metabolism of rivaroxaban inhibited by Cimetidine

Roflumilast

- Aminophylline: manufacturer of roflumilast advises avoid concomitant use with Aminophylline
- Antibacterials: effects of roflumilast inhibited by Ciprofloxacin (manufacturer of roflumilast advises avoid concomitant use)
- Antidepressants: metabolism of roflumilast by Fluvoxamine
- Antiepileptics: effects of roflumilast possibly inhibited by Carbamazepine, Fosphenytoin, Phenobarbital, Phenytoin and Primidone (manufacturer of rivaroxaban advises avoid concomitant use)
- Theophylline: manufacturer of rivaroxaban advises avoid concomitant use with Theophylline
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by Cimetidine

Ropinirole

- Antipsychotics: metabolism of ropinirole inhibited by Ciprofloxacin (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of Antipsychotics (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by Memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by Methyldopa
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of Metoclopramide (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by Oestrogens

Ropivacaine

- Anti-arhythmics: increased myocardial depression when ropivacaine given with Anti-arhythmics
- Antidepressants: metabolism of ropivacaine inhibited by Fluvoxamine—avoid prolonged administration of ropivacaine

Rousuvastatin: see Statins

Rotavirus Vaccine: see Vaccines

Rotigotine

- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of Antipsychotics (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by Memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by Methyldopa
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of Metoclopramide (antagonism of effect)

Rufinamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and Tricyclic-related Antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and Tricyclics (convulsive threshold lowered)
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with Carbamazepine; plasma concentration of rufinamide possibly reduced by Fosphenytoin and Phenytoin, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of rufinamide possibly reduced by Phenobarbital and Primidone; plasma concentration of rufinamide possibly increased by Sodium Valproate and Valproic Acid (reduce dose of rufinamide)
Rufinamide (continued)

- Antimalarials: anticonvulsant effect of antiepileptics antagonised by • MEfloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTiPSYCHOTICS (convulsive threshold lowered)
- Oestrogens: rufinamide accelerates metabolism of • OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Oralistat: possible increased risk of convulsions when antiepileptics given with • ORLISTAT
- Progestogens: rufinamide accelerates metabolism of • PROGESTOGENs (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)

Ruxolitinib

- Antibacterials: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with • CLARITHROMYCIN and • TELITHROMYCIN—consult ruxolitinib product literature; plasma concentration of ruxolitinib reduced by • RIFAMPICIN
- Antifungals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with • FLUCONAZOLE, • ITRACONAZOLE, • KETOCONAZOLE, • POSaconazole and • voriconazole—consult ruxolitinib product literature
- Antipsychotics: avoid concomitant use of cytotoxics with • clozapine (increased risk of agranulocytosis)
- Antivirals: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with • boceprevir, • indinavir, • lopinavir, • ritonavir, • saquinavir and • telaprevir—consult ruxolitinib product literature

Sacubitril

- ACE Inhibitors: manufacturer of sacubitril advises avoid • ACE INHIBITORS for 36 hours before or after sacubitril
- Diuretics: sacubitril reduces plasma concentration of • Furosemide
- Lipid-regulating Drugs: sacubitril increases plasma concentration of • atorvastatin

St John’s Wort

- Aminophylline: St John’s wort possibly reduces plasma concentration of • aminophylline
- Analgesics: St John’s wort possibly reduces plasma concentration of • Methadone
- Anti-arrhythmics: St John’s wort possibly reduces plasma concentration of • Dronedarone—avoid concomitant use
- Antibacterials: St John’s wort possibly reduces plasma concentration of • Bedaquiline—manufacturer of bedaquiline advises avoid concomitant use; St John’s wort reduces plasma concentration of • Telithromycin (avoid during and for 2 weeks after St John’s wort)
- Anticoagulants: St John’s wort possibly reduces plasma concentration of • Apixaban—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; St John’s wort reduces anticoagulant effect of • edaravone (avoid concomitant use); St John’s wort possibly reduces plasma concentration of • dabigatran—manufacturer of dabigatran advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of • edoxaban; St John’s wort possibly reduces plasma concentration of • rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: possible increased serotoninergic effects when St John’s wort given with • duloxetine, • venlafaxine or • Vortioxetine; St John’s wort reduces plasma concentration of • Amitriptyline; increased serotoninergic effects when St John’s wort given with • SSRIs—avoid concomitant use
- Antiepileptics: St John’s wort possibly reduces plasma concentration of • carbamazepine; St John’s wort possibly reduces plasma concentration of • fosphenytoin, • phenobarbital, • phenytoin and • primidone—avoid concomitant use
- Antifungals: St John’s wort possibly reduces plasma concentration of • isavuconazole—avoid concomitant use;

St John’s Wort (continued)

- Antifungals (continued)
  - St John’s wort reduces plasma concentration of • voriconazole—avoid concomitant use
- Antimalarials: avoidance of antidepressants advised by manufacturer of • arteether with lumefantrine and • artemisinol with piperaquine
- Antimuscarnicinas: St John’s wort possibly reduces plasma concentration of active metabolite of • fesoterodine—manufacturer of fesoterodine advises avoid concomitant use
- Antipsychotics: St John’s wort possibly reduces plasma concentration of • aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); St John’s wort possibly reduces plasma concentration of • lurasidone—avoid concomitant use
- Antivirals: St John’s wort reduces plasma concentration of • atazanavir, • darunavir, • efavirenz, • fosamprenavir, • indinavir, • lopinavir, • nevirapine, • ritonavir and • saquinavir—avoid concomitant use; St John’s wort possibly reduces plasma concentration of • dalatafazin, • dasabuvir, • ombitasvir, • paritaprevir and • simprevir—manufacturer of dalatafazin, dasabuvir, ombitasvir, paritaprevir and simprevir advises avoid concomitant use; St John’s wort possibly reduces the plasma concentration of • dolugetavir (see under Dolugetavir, p. 592); avoidance of St John’s wort advised by manufacturer of • elvitegravir, • etravirine, • ledipasvir, • sofosbuvir and • telaprevir; St John’s wort possibly reduces plasma concentration of • maraviroc and • tirapavir—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of • rilpivirine (plasma concentration of rilpivirine possibly reduced)
- Anxiolytics and Hypnotics: St John’s wort possibly reduces plasma concentration of oral midazolam
- Apremilast: St John’s wort possibly reduces plasma concentration of • apremilast—avoid concomitant use
- Aprepitant: avoidance of St John’s wort advised by manufacturer of • aprepitant
- Atomoxetine: possible increased risk of convulsions when antidepressants given with • atomoxetine
- Calcium-channel Blockers: St John’s wort possibly reduces plasma concentration of • amiodopine and • felodipine; St John’s wort reduces plasma concentration of • nifedipine; St John’s wort significantly reduces plasma concentration of • verapamil
- Cannabis Extract: St John’s wort possibly reduces plasma concentration of • cannabis extract—manufacturer of cannabis extract advises avoid concomitant use
- Cardiac Glicoses: St John’s wort reduces plasma concentration of • digoxin—avoid concomitant use
- Ciclosporin: St John’s wort reduces plasma concentration of • ciclosporin—avoid concomitant use
- Cobicitab: St John’s wort possibly reduces plasma concentration of • cobicitab—manufacturer of cobicitab advises avoid concomitant use
- Cytotoxic: St John’s wort possibly reduces plasma concentration of • axitinib—consider increasing dose of axitinib; St John’s wort possibly reduces plasma concentration of • bortezomib, • bosutinib, • cabozantinib, • crizotinib, • everolimus, • ibritinib, •idelalisib, • ponatinib and • vinflunine—manufacturer of bortezomib, bosutinib, cabozantinib, crizotinib, everolimus, ibritinib, idelalisib, ponatinib and vinflunine advises avoid concomitant use; St John’s wort possibly reduces plasma concentration of • ceritinib—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of • cabazitaxel, • dabrafenib, • gefitinib, • lapatinib, • olaparib and • vemurafenib; St John’s wort reduces plasma concentration of • matinib—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of • vandetanib and • vismodegib (plasma concentration of vandetanib and vismodegib possibly reduced); St John’s wort possibly reduces plasma concentration of • eribulin; St John’s wort accelerates metabolism of • irinotecan (reduced plasma concentration—avoid concomitant use)
St John's Wort – Saquinavir

Interactions

Dapoxetine: possible increased risk of serotonergic effects when St John's Wort is given with dapoxetine (manufacturer of dapoxetine advises St John's Wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John's Wort)

Diuretics: St John's Wort reduces plasma concentration of eplerenone — avoid concomitant use

Fingolimod: St John's Wort possibly reduces plasma concentration of fingolimod — manufacturer of fingolimod advises avoid concomitant use

Fosaprepitant: avoidance of St John's Wort advised by manufacturer of fosaprepitant

Panobinostat:
Naloxegol:
Macitentan:
SHT; receptor Agonists: increased serotonergic effects when St John's Wort is given with SHT, agonists — avoid concomitant use

Ivabradine: St John's Wort reduces plasma concentration of ivabradine — avoid concomitant use

Ivacaftor: manufacturer of ivacaftor advises avoid concomitant use

Lipid-regulating Drugs: St John's Wort reduces plasma concentration of simvastatin

Lumacaftor: avoidance of St John's Wort advised by manufacturer of lumacaftor

Macitentan: avoidance of St John's Wort advised by manufacturer of macitentan

Naloxegol: St John's Wort possibly reduces plasma concentration of naloxegol — avoid concomitant use

Oestrogens: St John's Wort reduces contraceptive effect of oestrogens

Panobinostat: avoidance of St John's Wort advised by manufacturer of panobinostat

Progestogens: St John's Wort reduces contraceptive effect of progestogens — avoid concomitant use

Tacrolimus: St John's Wort reduces plasma concentration of tacrolimus — avoid concomitant use

Theophylline: St John's Wort possibly reduces plasma concentration of theophylline

Ulcerc-healing Drugs: St John's Wort possibly reduces plasma concentration of omeprazole

Ulipristal: avoidance of St John's Wort advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Salmeterol
Salbutamol
Saquinavir

Analgesics: increased risk of ventricular arrhythmias when saquinavir is given with alfentanil, fentanyl, of methadone — avoid concomitant use

Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir is given with amiodarone, disopyramide, dofetilide, flecainide, lidocaine or propafenone — avoid concomitant use

Antibacterials: plasma concentration of both drugs possibly increased when saquinavir is given with clarithromycin (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir is given with dapsone, erythromycin or moxifloxacin — avoid concomitant use; saquinavir increases plasma concentration of rifabutin (also plasma concentration of saquinavir reduced) — reduced rifabutin dose; plasma concentration of saquinavir significantly reduced by rifampicin, also risk of hepatotoxicity — avoid concomitant use; increased risk of ventricular arrhythmias when saquinavir is given with delamanid; plasma concentration of both drugs may increase when saquinavir is given with fusidic acid; avoidance of saquinavir advised by manufacturer of telithromycin (risk of ventricular arrhythmias)

Anticoagulants: saquinavir possibly enhances anticoagulant effect of warfarin — avoid of saquinavir advised by manufacturer of apixaban and rivaroxaban

Antidepressants: increased risk of ventricular arrhythmias when saquinavir is given with trazodone or tricyclics — avoid concomitant use; plasma concentration of saquinavir reduced by St John's Wort — avoid concomitant use

Antiepileptics: plasma concentration of saquinavir possibly reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone

Antifungals: plasma concentration of saquinavir increased by ketoconazole — manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of saquinavir possibly increased by imidazoles and triazoles

Antihistamines: increased risk of ventricular arrhythmias when saquinavir with mizolastine — avoid concomitant use

Antimalaria: caution with saquinavir advised by manufacturer of arteether with lumefantrine; avoidance of saquinavir advised by manufacturer of arteminol with piperaquine (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir is given with quinine — avoid concomitant use

Antimuscarinics: avoidance of saquinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advices dose reduction when saquinavir given with fesoterodine — consult fesoterodine product literature

Antipsychotics: increased risk of ventricular arrhythmias when saquinavir is given with clozapine, haloperidol or phenothiazines — avoid concomitant use; saquinavir possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole — consult aripiprazole product literature); saquinavir possibly increases plasma concentration of luraside — avoid concomitant use; saquinavir possibly increases plasma concentration of pimozone (increased risk of ventricular arrhythmias — avoid concomitant use); saquinavir possibly increases plasma concentration of quetiapine — manufacturer of quetiapine advises avoid concomitant use

Antivirals: increased risk of ventricular arrhythmias when saquinavir is given with atazanavir or lopinavir — avoid concomitant use; saquinavir reduces plasma concentration of darunavir — avoid concomitant use; plasma concentration of saquinavir significantly reduced by efavirenz; plasma concentration of saquinavir increased by indinavir and ritonavir; saquinavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); avoidance of saquinavir advised by manufacturer of paritaprevir; plasma concentration of saquinavir reduced by ritonavir

Antioxidics and Hypnotics: saquinavir increases plasma concentration of midazolam (risk of prolonged sedation — avoid concomitant use of oral midazolam)

Avanafil: saquinavir possibly increases plasma concentration of avanafil — manufacturer of avanafil advises avoid concomitant use

Beta-blockers: increased risk of ventricular arrhythmias when saquinavir is given with sotalol — avoid concomitant use

Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ciclosporin

Corticosteroids: plasma concentration of saquinavir possibly reduced by dexamethasone

Cytotoxics: saquinavir possibly increases the plasma concentration of afatinib — manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of afatinib (reduce dose of afatinib — consult afatinib product literature); saquinavir possibly increases the plasma concentration of bosutinib and cabazitaxel — manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly increases plasma concentration of ceritinib — avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); saquinavir possibly increases plasma concentration of crizotinib and everolimus — manufacturer of crizotinib and everolimus advises avoid concomitant use; saquinavir possibly increases...
**Saxagliptin**

- **Cytopotitics** (continued): the plasma concentration of • IBRUTINIB—reduce dose of ibritinib (see under ibritinib, p. 867); avoidance of saxagliptin advised by manufacturer of • LAPATINIB; increased risk of ventricular arrhythmias when saxagliptin given with • RANITIDINE—avoid concomitant use; saxagliptin possibly increases plasma concentration of • DOXOTAXEL—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose by 50%.

- Dapoxetine: avoidance of saxagliptin advised by manufacturer of • DAPoxetine (increased risk of toxicity).

- Diuretics: saxagliptin increases plasma concentration of • EPLERENONE (reduce dose of eplerenone).

- Domperidone: possible increased risk of ventricular arrhythmias when saxagliptin given with • DOMPERIDON—avoid concomitant use.

- Ergot Alkaloids: increased risk of ergotism when saxagliptin given with • ERGOTAMINE—avoid concomitant use.

- Guanfacine: saxagliptin possibly increases plasma concentration of • GUANFACINE (halve dose of guanfacine).

- Lipid-regulating Drugs: possible increased risk of myopathy when saxagliptin given with • SIMVASTATIN (avoid concomitant use); avoidance of saxagliptin advised by manufacturer of • LOMITAPIDE (plasma concentration of lomitapide possibly increased).

- Naloxegol: saxagliptin possibly increases plasma concentration of • NALOXEGOL—avoid concomitant use.

- Orlitast: absorption of saxagliptin possibly reduced by • ORLISTAT.

- Panobinostat: saxagliptin possibly increases plasma concentration of • PANOBINOSTAT (reduce dose of panobinostat—see under Panobinostat, p. 854).

- Pentamidine Isetionate: increased risk of ventricular arrhythmias when saxagliptin given with • PENTAMIDINE ISETIONATE—avoid concomitant use.

- Ranolazine: saxagliptin possibly increases plasma concentration of • RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use.

- Sildenafil: increased risk of ventricular arrhythmias when saxagliptin given with • SILDENAFIL—avoid concomitant use.

- Tacrolimus: saxagliptin increases plasma concentration of • Tacrolimus (consider reducing dose of tacrolimus).

- Tadalafil: increased risk of ventricular arrhythmias when saxagliptin given with • TADALAFIL—avoid concomitant use.

- Ulcer-healing Drugs: plasma concentration of saxagliptin possibly increased by • Cimetidine; plasma concentration of saxagliptin possibly increased by • ESOMEPRAZOLE, • Lansoprazole, • Pantoprazole and • Rabeprazole—manufacturer of saxagliptin advises avoid concomitant use; plasma concentration of saxagliptin increased by • OMEPRAZOLE—manufacturer of saxagliptin advises avoid concomitant use.

- Vardenafil: increased risk of ventricular arrhythmias when saxagliptin given with • VARDENAFIL—avoid concomitant use.

**Selegiline**

- **Antidepressants:** manufacturer of selegiline advises avoid concomitant use with • CITALOPRAM and • ESICITALOPRAM; increased risk of hypertension and CNS excitation when selegiline given with • FLUOXETINE (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with • FLUOXAMINE, • SERTRALINE or • VENLAFAXINE (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with • MAOIS—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with • MOLOBEMIDE; CNS toxicity reported when selegiline given with • TRICYCLICS; risk of CNS excitation and hypertension when selegiline given with • VORTIXETINE.

- **Dopaminergics:** selegiline enhances effects and increases toxicity of • CO-BENEDOPA, • CO-CARELDOPA or • LEVODOPA (reduce dose of co-benedopa, co-carel dopa or levodopa); max. dose of 10 mg selegiline advised by manufacturer of • ENTACAPONE if used concomitantly.

- 5HT-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with 5HT, AGONISTS.

- Memantine: effects of dopaminergics and selegiline possibly enhanced by • MEMARTINE.

- Methylidopa: antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA.

- Oestrogens: plasma concentration of selegiline increased by • OESTROGENS—manufacturer of selegiline advises avoid concomitant use.

- Progestogens: plasma concentration of selegiline increased by • PROGESTOGENS—manufacturer of selegiline advises avoid concomitant use.

- **Sympathomimetics:** manufacturer of selegiline advises avoid concomitant use with • SYMPATHOMIMETICS; risk of hypertensive crisis when selegiline given with • DOPAMINE.

**Selenium**

- Eltrombopag: selenium possibly reduces absorption of • ELTROMBOPAG (give at least 4 hours apart).

- Vitamins: absorption of selenium possibly reduced by • ASCORBIC ACID (give at least 4 hours apart).

**Sertraline**

- **Antidepressants,** SSRIs.

- **Sevelamer**

- **Antibacterials:** sevelamer reduces absorption of • CIPROFLOXACIN (at least 2 hours before or 4 hours after ciprofloxacin).

- Ciclosporin: sevelamer possibly reduces plasma concentration of • CICLOSPORIN.

- Mycophenolate: sevelamer possibly reduces plasma concentration of • MYCOPHENOLATE.

- Tacrolimus: sevelamer possibly reduces plasma concentration of • TACROLIMUS.

- Thyroid Hormones: sevelamer possibly reduces absorption of • LEVOTHYROXINE.

- Vitamins: sevelamer reduces absorption of • CALCITRIOL (give at least 1 hour before or 3 hours after sevelamer).

**Sevoflurane**

- **Anaesthetics,** General.

- **Sildenafil**

- **Alpha-blockers:** enhanced hypotensive effect when sildenafil given with • ALPHA-BLOCKERS (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose.

- **Anti-arrhythmics:** avoidance of sildenafil advised by manufacturer of • DISOPYRAMIDE (risk of ventricular arrhythmias).

- **Antibacterials:** plasma concentration of sildenafil increased by • CLARITHROMYCIN—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; plasma concentration of sildenafil increased by • ERITHROMYCIN—reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension; plasma
Sildenafil

- **Antibacterials** (continued): concentration of sildenafil possibly increased by **TELITHROMYCIN**—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension.
- **Antifungals**: plasma concentration of sildenafil increased by **KETOCONAZOLE**—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension; plasma concentration of sildenafil increased by **ITRACONAZOLE**—reduce initial dose of sildenafil.
- **Antivirals**: plasma concentration of sildenafil increased by **ETRAVIRINE**; plasma concentration of sildenafil possibly increased by **fosamprenavir**; plasma concentration of sildenafil possibly increased by **INDINAVIR**—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by **RITONAVIR**—avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction (consult sildenafil product literature); increased risk of ventricular arrhythmias when sildenafil given with **SAQUINAVIR**—avoid concomitant use; avoidance of sildenafil advised by manufacturer of **TELAPREvir**; avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of **TIRPAVENIR**.
- **Basal Hypertensive Agents**: plasma concentration of sildenafil reduced by **BOSENTAN**, also plasma concentration of bosentan increased.
- **Calcium-channel Blockers**: enhanced hypotensive effect when sildenafil given with **AMLODINE**.
- **Cobicistat**: plasma concentration of sildenafil possibly increased by **Cobicistat**—manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction—consult cobicistat product literature.
- **Cytotoxics**: avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of **IDEALISIB**.
- **Dapoxetine**: avoidance of sildenafil advised by manufacturer of **DAPOXETINE**.
- **Grapefruit Juice**: plasma concentration of sildenafil possibly increased by **GRAPFruit JUICE**.
- **Niacinamide**: sildenafil significantly enhances hypotensive effect of **NICTARDIN** (avoid concomitant use).
- **Nitrates**: sildenafil significantly enhances hypotensive effect of **NITRATES** (avoid concomitant use).
- **Riociguat**: enhanced hypotensive effect when sildenafil given with **RIOCIgUAT**—avoid concomitant use.
- **Ulcer-Healing Drugs**: plasma concentration of sildenafil increased by **CIMETIDINE**—consider reducing dose of sildenafil for erectile dysfunction.

Silmiximab

- **Antipsychotics**: avoid concomitant use of cytotoxics with **CLOZAPINE** (increased risk of agranulocytosis).
- **Vaccines**: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use.

Simeprevir

- **Anti-arrhythmics**: possible increased risk of bradycardia when simeprevir (with sofosbuvir) given with **AMIODARONE**—see under Amiodarone, p. 99.
- **Antibacterials**: plasma concentration of simeprevir possibly increased by **CLAIRITHROMYCIN** and **TELITHROMYCIN**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs increased when simeprevir given with **ERYTHROMYCIN**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by **RIFABUTIN**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by **RIFAMPICIN**—manufacturer of simeprevir advises avoid concomitant use.
- **Antidepressants**: plasma concentration of simeprevir possibly reduced by **ST JOHN’S WORT**—manufacturer of simeprevir advises avoid concomitant use.
- **Antiepileptics**: plasma concentration of simeprevir possibly reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **OXCARBAZEPINE**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**—manufacturer of simeprevir advises avoid concomitant use.
- **Antifungals**: manufacturer of simeprevir advises avoid concomitant use with **KETOCONAZOLE**; plasma concentration of simeprevir possibly increased by **FLUCONAZOLE**.
- **Antivirals**: plasma concentration of simeprevir possibly increased by **ITRACONAZOLE**, **POSACONAZOLE** and **VORICONAZOLE**—manufacturer of simeprevir advises avoid concomitant use.
- **Antiwars**: plasma concentration of both drugs increased when simeprevir given with **DARUNAVIR**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir reduced by **ETRAVIRINE**; plasma concentration of both drugs increased when simeprevir given with **LEDIPASVIR**—manufacturer of ledipasvir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by **NEVIRAPINE**—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir increased by **RITONAVIR**—manufacturer of simeprevir advises avoid concomitant use.
- **Anxiolytics and Hypnotics**: simeprevir increases plasma concentration of **ORAL MIDAZOLAM**.
- **Cardiac Glycosides**: simeprevir increases plasma concentration of **DIGOXIN**.
- **Cobicistat**: plasma concentration of simeprevir possibly increased by **Cobicistat**—manufacturer of simeprevir advises avoid concomitant use.
- **Corticosteroids**: plasma concentration of simeprevir possibly reduced by **Dexamethasone**—manufacturer of simeprevir advises avoid concomitant use.
- **Lipid-regulating Drugs**: simeprevir increases plasma concentration of **ATORVASTATIN**, **ROSUVASTATIN** and **SIMVASTATIN** (consider reducing dose of atorvastatin, rosuvastatin and simvastatin).

Simvastatin see Statins

Siroliimus

- **Anti-arrhythmics**: caution with sirolimus advised by manufacturer of **DRONEDARONE**.
- **Antibacterials**: plasma concentration of sirolimus increased by **CLAIRITHROMYCIN** and **TELITHROMYCIN**—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with **ERYTHROMYCIN**; plasma concentration of sirolimus reduced by **RIFABUTIN** and **RIFAMPICIN**—avoid concomitant use.
- **Antifungals**: plasma concentration of sirolimus increased by **ITRACONAZOLE**, **KETOCONAZOLE** and **VORICONAZOLE**—avoid concomitant use; plasma concentration of sirolimus possibly increased by **ISAVUCONAZOLE**, **MICAFUNGIN** and **MICONAZOLE**; plasma concentration of sirolimus possibly increased by **FLUCONAZOLE** and **POSACONAZOLE**.
- **Antiwars**: plasma concentration of sirolimus possibly increased by **BOCEPREVIR** (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with **TELAPREvir**—reduce dose of sirolimus.
- **Calcium-channel Blockers**: plasma concentration of sirolimus possibly increased by **MICARDIPINE**; plasma concentration of sirolimus increased by **DILTIAZEM**; plasma concentration of both drugs increased when sirolimus given with **VERAPAMIL**.
- **Ciclosporin**: plasma concentration of sirolimus increased by **CICLOSPORIN**.
- **Cytotoxics**: avoidance of sirolimus advised by manufacturer of **CERITINIB**—with caution with sirolimus advised by manufacturer of **CRIZOTINIB**.
- **Grapefruit Juice**: plasma concentration of sirolimus increased by **Grapefruit juice**—avoid concomitant use.
- **Lumacaftor**: avoidance of sirolimus advised by manufacturer of **LUMACAFTOR**.

Sitagliptin see Antidiabetics

Smallpox Vaccine see Vaccines

Sodium Aurothiomalate

- **ACE Inhibitors**: flushing and hypotension reported when sodium aurothiomalate given with **ACE INHIBITORS**.
- **Penicillamine**: increased risk of haematological toxicity when sodium aurothiomalate given with **PENICILLAMINE**—see under Penicillamine, p. 964).
Sodium Benzoate
- Antiepileptics: effects of sodium benzoate possibly reduced by SODIUM VALPROATE and VALPROIC ACID
- Antipsychotics: effects of sodium benzoate possibly reduced by HALOPERIDOL
- Corticosteroids: effects of sodium benzoate possibly reduced by CORTICOSTEROIDS

Sodium Citrate
- Antibacterials: avoid concomitant use of sodium citrate with METHENAMINE
- Ulcer-healing Drugs: avoidance of sodium citrate advised by manufacturer of SUCRALFATE

Sodium Clodronate see Bisphosphonates

Sodium Desferalate see Iron salts

Sodium Nitroprusside see Vasodilator Antihypertensives

Sodium Oxybate
- Analgesics: effects of sodium oxybate enhanced by OPIOID ANALGESICS (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxybate given with TRICYCLICS
- Antiepileptics: manufacturer of sodium oxybate advises giving 14 days apart
- Anticoagulants: increased risk of side-effects when sodium oxybate given with RUFINAMIDE
- Antihypnotics and Hypnotics: plasma concentration of sodium oxybate possibly reduced by BENZODIAZEPINES (avoid concomitant use)
- Antimicrobials: effects of sodium oxybate possibly reduced by SODIUM PHENYLBUTYRATE
- Antipsychotics: effects of sodium oxybate possibly enhanced by VALPROIC ACID

Sodium Phenytoin
- Antiepileptics: effects of sodium phenytoin possibly reduced by SODIUM VALPROATE and VALPROIC ACID
- Antipsychotics: effects of sodium phenytoin possibly reduced by HALOPERIDOL
- Corticosteroids: effects of sodium phenytoin possibly reduced by CORTICOSTEROIDS

Sodium Stibogluconate
- Antifungals: possible increased risk of arrhythmias when sodium stibogluconate given before AMPHOTERICIN—manufacturer of sodium stibogluconate advises giving 14 days apart

Sodium Valproate
- Analgesics: effects of sodium valproate enhanced by ASPIRIN
- Antibacterials: metabolism of sodium valproate possibly inhibited by ERYTHROMYCIN (increased plasma concentration); avoidance of sodium valproate advised by manufacturer of PIPEMICILLIN; plasma concentration of sodium valproate reduced by CARBABENEMES—avoid concomitant use
- Anticoagulants: sodium valproate possibly enhances anticoagulant effect of COUMARINS
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of sodium valproate reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; sodium valproate possibly increases plasma concentration of ETHOSUXIMIDE; sodium valproate increases or possibly decreases plasma concentration of FOSPHENYTOIN and PHTHYDON, also plasma concentration of sodium valproate reduced; sodium valproate increases plasma concentration of LAMOTRIGINE (increased risk of toxicity—reduce lamotrigine dose); sodium valproate sometimes reduces plasma concentration of an active metabolite of OXCARBAZEPINE; sodium valproate increases plasma concentration of PHENOBARBITAL and PRIMIDONE (also plasma concentration of sodium valproate reduced); sodium valproate possibly increases plasma concentration of RUFINAMIDE (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when sodium valproate given with TOPRIMATE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MEFLOQUINE

Sodium Valproate (continued)
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by CLOZAPINE, RITONAVIR, OLANZAPINE
- Antivirals: plasma concentration of sodium valproate possibly reduced by RITONAVIR; sodium valproate possibly increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
- Antioxidants and Hypnotics: plasma concentration of sodium valproate possibly increased by CLOBAZAM; increased risk of side-effects when sodium valproate given with LAMOTRIGINE, PHENYTOIN and PRIMIDONE

Sodium Benzoate—Statins

Sofosbuvir
- Anti-arrhythmics: possible increased risk of bradycardia when sofosbuvir given with AMIODARONE—see under Amiodarone, p. 99
- Antibacterials: manufacturer of sofosbuvir advises avoid concomitant use with RIFABUTIN and RIFAMPICIN
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with ST JOHN’S WORT
- Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with CARBAMAZEPINE, OXCARBAZEPINE, PHENOBARBITAL and PRIMIDONE
- Anticoagulants: sodium valproate possibly reduces effects of SODIUM OXYBATE
- Antipsychotics: increased risk of toxicity when sofosbuvir given with OLANZAPINE

Solifenacin see Antimuscarinics

Somatropin
- Corticosteroids: growth-promoting effect of somatropin may be inhibited by CORTICOSTEROIDS
- Oestrogens: increased doses of somatropin may be needed when given with OESTROGENS (when used as oral replacement therapy)

Sorafenib
- Anti-arrhythmics: bioavailability of sorafenib reduced by NEOMYCIN; plasma concentration of sorafenib reduced by RIFAMPICIN
- Anticoagulants: sorafenib possibly enhances anticoagulant effect of COUMARINS
- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Antivirals: avoidance of sorafenib advised by manufacturer of ZIDOVUDINE
- Anticoagulants: sorafenib possibly reduces plasma concentration of IRINOTECAN
- Anticoagulants: sorafenib possibly reduces plasma concentration of DOXETAXEL and DOROXUBICIN; sorafenib possibly increases plasma concentration of IRINOTECAN

Sotalol see Beta-blockers

Spiroponolactone see Diuretics

Statin
- Antacids: absorption of rosuvastatin reduced by ANTAGONISTS
- Antiarhythmics: increased risk of myopathy when simvastatin given with AMIODARONE (see under Simvastatin, p. 194); increased risk of myopathy when simvastatin given with DRONEDARONE; plasma concentration of atorvastatin
Antivirals:• Antiepileptics: • Antidiabetics:

Possible increased risk of myopathy when atorvastatin or simvastatin given with: • AZITHROMYCIN; plasma concentration of atorvastatin and pravastatin increased by • CLARITHROMYCIN; increased risk of myopathy when simvastatin given with • CLARITHROMYCIN, • ERYTHROMYCIN or • TELITHROMYCIN (avoid concomitant use); plasma concentration of rosuvastatin reduced by • ERYTHROMYCIN or • KETOCONAZOLE; increased risk of myopathy when atorvastatin given with • ERYTHROMYCIN; plasma concentration of pravastatin increased by • AZITHROMYCIN; plasma concentration of atorvastatin and simvastatin possibly reduced by • RIFAMPICIN; metabolism of fluvastatin accelerated by • RIFAMPICIN (reduced effect); increased risk of myopathy when statins given with • DAPTOMYCIN (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when statins given with • FUSIDIC ACID—avoid concomitant use and for 7 days after last fusidic acid dose; increased risk of myopathy when atorvastatin given with • TELITHROMYCIN (avoid concomitant use); possible increased risk of myopathy when pravastatin given with • TELITHROMYCIN

Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of • WARFARIN; simvastatin can enhance the anticoagulant effect of • COUMARINS; fluvastatin enhances anticoagulant effect of • COUMARINS; rosuvastatin possibly enhances anticoagulant effect of • COUMARINS and • PHENINDIONE

Antidepressants: plasma concentration of simvastatin reduced by • ST JOHN’S WORT

Antidiabetics: fluvastatin possibly increases plasma concentration of • GLIBENCLAMIDE

Antiepileptics: plasma concentration of simvastatin reduced by • CARBAMAZEPINE and • ESICLABAZEPINE—consider increasing dose of simvastatin; plasma concentration of rosuvastatin reduced by • ESICLABAZEPINE; combination of fluvastatin with • FOSAMPRENAVIR or • PHENYTOIN may increase plasma concentration of either drug (or both)

Antifungals: possible increased risk of myopathy when atorvastatin given with • KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when simvastatin given with • ITRACONAZOLE, • KETOCONAZOLE or • POSACONAZOLE (avoid concomitant use); possible increased risk of myopathy when simvastatin given with • FLUCONAZOLE or • MICONAZOLE; possible increased risk of myopathy when atorvastatin given with • FLUCONAZOLE or • IMIDAZOLES; possible concentration of simvastatin increased by • FLUCONAZOLE—possibly increased risk of myopathy; plasma concentration of atorvastatin increased by • ISAUCONAZOLE; plasma concentration of rosuvastatin increased by • ITRACONAZOLE—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with • ITRACONAZOLE, • POSACONAZOLE or • VORICONAZOLE; increased risk of myopathy when simvastatin given with • VORICONAZOLE

Antivirals: increased risk of myopathy when atorvastatin or pravastatin given with • ATAZANAVIR; plasma concentration of rosuvastatin increased by • ATAZANAVIR, • DARUNAVIR, • LOPINAVIR and • TIPRANAVIR—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when simvastatin given with • ATAZANAVIR, • INDINAVIR, • RITONAVIR or • SAQUINAVIR (avoid concomitant use); plasma concentration of atorvastatin increased by • BOCEPREVIR (reduce dose of atorvastatin); manufacturers advise avoid atorvastatin use of simvastatin with • BOCEPREVIR and • TELAPREVIR; plasma concentration of pravastatin possibly increased by • BOCEPREVIR; plasma concentration of rosuvastatin increased by • DACLATASVIR; plasma concentration of pravastatin possibly increased by • DARUNAVIR (use lowest possible dose of pravastatin); possible increased risk of myopathy when atorvastatin given with • DARUNAVIR, • FOSAMPRENAVIR, • INDINAVIR, • LOPINAVIR or • SAQUINAVIR; avoidance of atorvastatin and simvastatin advised by • ETRAVIRINE; possible increased risk of myopathy when rosuvastatin given with • FOSAMPRENAVIR, • INDINAVIR, • RITONAVIR and • SAQUINAVIR—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with • FOSAMPRENAVIR or • LOPINAVIR—avoid concomitant use; avoidance of rosuvastatin advised by manufacturer of • LEDIPASVIR; possible increased risk of myopathy when atorvastatin, fluvastatin and simvastatin given with • LEDIPASVIR—manufacturer of ledipasvir advises consider reducing dose of atorvastatin, fluvastatin and simvastatin; avoidance of atorvastatin and simvastatin advised by manufacturer of • OMBITASVIR; avoidance of atorvastatin, fluvastatin and simvastatin advised by manufacturer of • PARITAPREVIR; plasma concentration of pravastatin increased by • PARITAPREVIR (reduce dose of pravastatin); plasma concentration of atorvastatin possibly increased by • RITONAVIR (use lowest dose of atorvastatin); plasma concentration of atorvastatin, rosuvastatin and simvastatin increased by • SIMEPREVIR (consider reducing dose of atorvastatin, rosuvastatin and simvastatin); avoidance of atorvastatin advised by manufacturer of • TELAPREVIR; plasma concentration of simvastatin possibly increased by • TIPRANAVIR—avoid concomitant use; increased risk of myopathy when atorvastatin given with • TIPRANAVIR (see under Atorvastatin, p. 191)

Anxiolytics and Hypnotics: atorvastatin increases plasma concentration of • INTRAVENOUS MIDAZOLAM

Bosentan: plasma concentration of simvastatin reduced by • BOSENTAN

Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with • AMLODIPINE and • DILTIAZEM— • DILTIAZEM (see under Simvastatin, p. 194); plasma concentration of atorvastatin increased by • DILTIAZEM—possibly increased risk of myopathy; increased risk of myopathy when simvastatin given with • VERAPAMIL (see under Simvastatin, p. 194); atorvastatin increases plasma concentration of • VERAPAMIL, also possible increased risk of myopathy (consider reducing dose of atorvastatin)

Cardiac Glycosides: atorvastatin possibly increases plasma concentration of • DIGOXIN

Ciclosporin: increased risk of myopathy when rosuvastatin or simvastatin given with • CICLOSPORIN (avoid concomitant use); increased risk of myopathy when simvastatin given with • CICLOSPORIN (see under Atorvastatin, p. 191); increased risk of myopathy when fluvastatin or pravastatin given with • CICLOSPORIN

Clodigrel: plasma concentration of rosuvastatin increased by • CLOPIDOGREL—adjust dose of rosuvastatin (consult product literature)

Cobicistat: plasma concentration of atorvastatin possibly increased by • Cobicistat—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of • Cobicistat

Colchicine: possible increased risk of myopathy when statins given with • COLCHICINE

Cytotoxics: plasma concentration of simvastatin possibly increased by • DASATINIB; avoidance of simvastatin advised by manufacturer of • IDELALISIB; plasma concentration of simvastatin increased by • IMATINIB

Elotrombopag: plasma concentration of rosuvastatin increased by • ELTROMBOPAG—adjust dose of rosuvastatin (consult product literature)

Grapefruit juice: plasma concentration of atorvastatin possibly increased by • GRAPEFRUIT JUICE; plasma concentration of simvastatin increased by • GRAPEFRUIT JUICE—avoid concomitant use
Statins (continued)
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with a DANAZOL—avoid concomitant use
- Enzyme-regulating Drugs: possible increased risk of myopathy when simvastatin given with b BEZAFIBRATE (see under Simvastatin, p. 194); possible increased risk of myopathy when simvastatin given with c CIPIROBIZOL (see under Simvastatin, p. 194); when given with statins reduce maximum dose of FENOFIBRATE—see under Fenofibrate, p. 188; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with d GEMFIBROZIL (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with e GEMFIBROZIL (avoid concomitant use); plasma concentration of rosuvastatin increased by f EZEZIMIBE—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when rosuvastatin given with g FIBRATES (see under Rosuvastatin, p. 195); increased risk of myopathy when statins given with h FIBRATES; plasma concentration of atorvastatin increased by i LOMITAPIDE—manufacturer of lomitapide advises reduce dose of atorvastatin by half or separate administration by 12 hours; plasma concentration of simvastatin increased by j LOMITAPIDE (see under Simvastatin, p. 194); increased risk of myopathy when statins given with k NICOTINIC ACID (applies to lipid regulating doses of nicotinic acid)
- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ETHINYLESTRADEOLOL
- Progestogens: atorvastatin increases plasma concentration of NORETHISTERONE; rosuvastatin increases plasma concentration of active metabolite of NORGESTIMATE; rosuvastatin increases plasma concentration of NORGESTREL
- Ranolazine: plasma concentration of simvastatin increased by l RANOLAZINE (see under Simvastatin, p. 194)
- Retinoids: plasma concentration of simvastatin reduced by m ALITRETININOX
- Sacubitril: plasma concentration of atorvastatin increased by n SUCUBITRIL
- Teriflunomide: plasma concentration of rosuvastatin increased by o TERIFLUNOMIDE (consider reducing dose of rosuvastatin)
- Ticagrelor: plasma concentration of simvastatin increased by p TICARAGRELOR (increased risk of toxicity)

Stavudine
- Antivirals: increased risk of side-effects when stavudine given with a DIDANOSINE; increased risk of toxicity when stavudine given with b RIBAVIRIN; effects of stavudine possibly inhibited by c ZIDOVUDINE (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by d DOXORUBICIN; increased risk of toxicity when stavudine given with e HYDROXYCARBAMIDE—avoid concomitant use
- Orlstat: absorption of stavudine possibly reduced by f ORLISTAT

Stiripentol
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by a MAOIS and b TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by c SSRIS and d TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: stiripentol increases plasma concentration of e CARBAMAZEPINE, f FOSPHENYTIN, g PHENOBARBITAL, h PHENYTOIN and i PRIMIDONE
- Antimalariais: anticonvulsant effect of antiepileptics antagonised by j MEFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by k ANTIPSYCHOTICS (convulsive threshold lowered)
- Anxiolytics and Hypnotics: stiripentol increases plasma concentration of l CLOBAZAM
- Orlstat: possible increased risk of convulsions when antiepileptics given with m ORLISTAT

Streptomycin see Aminoglycosides

Strontium Ranelate
- Antibacterials: strontium ranelate reduces absorption of a QUINOLONES and b TETRACYCLINES (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate
- Aminophylline: sucralfate possibly reduces absorption of a AMINOPHYLLINE (give at least 2 hours apart)
- Antibacterials: sucralfate reduces absorption of b CIPROFLOXACIN (give at least 2 hours before or 4 hours after ciprofloxacin); sucralfate reduces absorption of c LEVOFLOXACIN, d NORFLOXACIN and e OFLOXACIN (give at least 2 hours apart); sucralfate reduces absorption of f MOXIFLOXACIN (give at least 6 hours apart); sucralfate reduces absorption of g TETRACYCLINES
- Anticoagulants: sucralfate possibly reduces absorption of h COUMARINS (reduced anticoagulant effect)
- Antiepileptics: sucralfate reduces absorption of i FOSPHENYTIN and j PHENYTOIN
- Antifungals: sucralfate reduces absorption of k KETOCONAZOLE
- Antipsychotics: sucralfate reduces absorption of l SULPIRIDE
- Cardiac Glycosides: sucralfate possibly reduces absorption of m CARDIAC GLYCOSIDES
- Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with n POTASSIUM CITRATE
- Sodium Citrate: manufacturer of sucralfate advises avoid concomitant use with o SODIUM CITRATE
- Theophylline: sucralfate possibly reduces absorption of p THEOPHYLLINE (give at least 2 hours apart)
- Thyroid Hormones: sucralfate reduces absorption of q LEVOTHYROXINE
- Ulcer-healing Drugs: sucralfate possibly reduces absorption of r Lansoprazole

Sucroferric Oxyhydroxide see Iron Salts

Sugammadex
- Antibacterials: response to sugammadex possibly reduced by s FUSIDIC ACID
- Prostaglandins: sugammadex possibly reduces plasma concentration of t PROGESTOGENS—manufacturer of sugammadex advises additional contraceptive precautions

Sulfadiazine see Sulfonamides

Sulfadoxine see Sulfonamides

Sulfamethoxazole see Sulfonamides

Sulfasalazine
- Cardiac Glycosides: sulfasalazine possibly reduces absorption of u DIGOXIN
- Folates: sulfasalazine possibly reduces absorption of v FOLIC ACID

Sulfapyrazine
- Aminophylline: sulfapyrazine reduces plasma concentration of w AMINOPHYLLINE
- Analgesics: effects of sulfapyrazine antagonised by x ASPIRIN
- Antibacterials: sulfapyrazine reduces excretion of y NITROFURANTOIN (increased risk of toxicity); sulfapyrazine reduces excretion of z PENCILLINS; effects of sulfapyrazine antagonised by a PYRAZINAMIDE
- Anticoagulants: increased risk of bleeding when sulfapyrazine given with b APIXABAN; sulfapyrazine enhances anticoagulant effect of c COUMARINS; possible increased risk of bleeding when sulfapyrazine given with d DABIGATRAN
- Antidiabetics: sulfapyrazine enhances effects of e SULFONYLUREAS
- Antiepileptics: sulfapyrazine increases plasma concentration of f FOSPHENYTIN and g PHENYTOIN
- Calcium-channel Blockers: sulfapyrazine reduces plasma concentration of h VERAPAMIL
- Ciclosporin: sulfapyrazine reduces plasma concentration of i CICLOSPORIN
- Theophylline: sulfapyrazine reduces plasma concentration of j THEOPHYLLINE

Sulfonamides
- Anaesthetics, General: sulfonamides enhance effects of k THIOPENTAL
- Anaesthetics, Local: effects of sulfonamides possibly inhibited by l CHLOROPROCAINE (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinemia when sulfonamides given with m PRilocaine
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with AMIODARONE—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
**Sulfonamides** (continued)
- Antibacterials: increased risk of crystalluria when sulfonamides given with ▶ METHENAMINE
- Anticoagulants: sulfonamides enhance anticoagulant effect of ▶ COUMARINS; sulfonamides possibly inhibit metabolism of
  ▶ PHENINDIONE
- Antidiabetics: sulfonamides rarely enhance the effects of
  ▶ SULFONYLUREAS
- Antiepileptics: sulfonamides possibly increase plasma concentration of ▶ FOSPHENYTOIN and ▶ PHENYTOIN
- Antimalarials: increased antifolate effect when sulfonamides given with ▶ PYRIMETHAMINE
- Antiparkinsonian: avoid concomitant use of sulfonamides with ▶ CLOzapine (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ▶ AZATHIOPRINE
- Cilostazol: increased risk of necrotising enterocolitis when sulfonamides given with ▶ CILOSTAZOLE; sulfadiazine possibly reduces plasma concentration of ▶ CILOSTAZOLE
- Cytoxics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with ▶ MERCAPTOPURINE; sulfonamides increase risk of METHOTREXATE toxicity; increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when sulfamethoxazole (as co-trimoxazole) given with ▶ METHOTREXATE
- Potassium Aminobenzoate: effects of sulfonamides inhibited by ▶ POTASSIUM AMINOBENZOATE
- Tacrolimus: possible increased risk of nephrotoxicity when sulfamethoxazole given with ▶ TACROLIMUS
- Vaccines: antibacterials inactivate ▶ ORAL TYPHOID VACCINE — see under Typhoid Vaccine in BNF or BNFC

**Sulfonamides** see Antidiabetics

**Sulindac** see NSAIDs

**Sulpiride** see Antipsychotics

**Sumatriptan** see 5HT₁-receptor Agonists (under HT)

**Sunitinib**
- Antibacterials: metabolism of sunitinib accelerated by ▶ RIFAMPICIN (reduced plasma concentration).
- Anthraquinones: metabolism of sunitinib inhibited by ▶ KETOCONAZOLE (increased plasma concentration).
- Antipsychotics: avoid concomitant use of cytoxotics with ▶ CLOzapine (increased risk of agranulocytosis)
- Antivirals: avoidance of sunitinib advised by manufacturer of ▶ BOCEPREVIR

**Suxamethonium** see Muscle Relaxants

**Sympathomimetics**
- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypertensive effect of ▶ ADRENERGIC NEURONE BLOCKERS; manufacturer of midodrine advises avoid concomitant use with ▶ GUANETHIDINE; dexametammin and lisdexametammin antagonise hypertensive effect of ▶ GUANETHIDINE; increased risk of hypertensive crisis when adrenaline (epinephrine) given with ▶ GUANETHIDINE
- Alcohol: effects of methylphenidate possibly enhanced by ▶ ALCOHOL
- Alpha-adrrenoreceptor Stimulants: avoidance of sympathomimetics advised by manufacturer of ▶ APRACLONIDINE
- Alpha-blockers: effects of midodrine possibly antagonised by ▶ ALPHA-BLOCKERS; avoid concomitant use of adrenaline (epinephrine) or dopamine with ▶ TOLAZOLINE
- Aminophylline: avoidance of aminophylline in children advised by manufacturer of ▶ AMINOPHYLLINE
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of ▶ ISOFLURANE (risk of ventricular arrhythmias); increased risk of hypertension when methylphenylidate given with ▶ VOLATILE LIQUID GENERAL ANAESTHETICS; increased risk of arrhythmias when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with ▶ VOLATILE LIQUID GENERAL ANAESTHETICS.
- Antacids: absorption of pseudoephedrine possibly increased by ▶ ALUMINIUM HYDROXIDE

**Sympathomimetics** (continued)
- Anticoagulants: methylphenidate possibly enhances anticoagulant effect of ▶ COUMARINS
- Antidepressants: risk of hypertensive crisis when dexametammin, ephedrine, isometheptene, lisdexametammin, metaraminol, methylphenidate, phenylephrine or pseudoephedrine given with ▶ MAOIS, avoid dexametammin, ephedrine, isometheptene, lisdexametammin, metaraminol, methylphenidate, phenylephrine or pseudoephedrine for at least 2 weeks after stopping MAOIs; manufacturer of midodrine advises avoid concomitant use with ▶ MAOIS and ▶ TRICYCLICS; risk of hypertensive crisis when adrenaline (epinephrine), dobutamine, dopamine, noradrenaline (norepinephrine) or xylometazoline given with ▶ MAOIS; risk of hypertensive crisis when oxymetazoline given with ▶ MAOIS, some manufacturers advise avoid oxymetazoline for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when sympathomimetics given with ▶ MOCLOBEMIDE; methylphenidate possibly inhibits metabolism of ▶ SSRS and ▶ TRICYCLICS; increased risk of hypertension and arrhythmias when noradrenaline (norepinephrine) or phenylephrine given with ▶ TRICYCLICS; increased risk of hypertension and arrhythmias when adrenaline (epinephrine) given with ▶ TRICYCLICS (but local anaesthetics with adrenaline appear to be safe)
- Antiepileptics: methylphenidate increases plasma concentration of ▶ FOSPHENYTOIN and ▶ PHENYTOIN; methylphenidate possibly increases plasma concentration of ▶ PHENOBARBITAL and ▶ PRIMIDONE
- Antihistamines: manufacturer of midodrine advises avoid concomitant use with ▶ ANTIHISTAMINES
- Antipsychotics: hypertensive effect of sympathomimetics antagonised by ▶ ANTIPSYCHOTICS; effects of lisdexametamine possibly reduced by ▶ CHLORPROMAZINE; dexametamine possibly antagonises antipsychotic effects of ▶ CHLORPROMAZINE; methylphenidate possibly increases side-effects increased by ▶ RISPERIDONE
- Antivirals: plasma concentration of dexametammin possibly increased by ▶ RITONAVIR
- Beta-blockers: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective ▶ BETA-BLOCKERS, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective ▶ BETA-BLOCKERS; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective ▶ BETA-BLOCKERS
- Cardiac Glycosides: manufacturer of midodrine advises avoid concomitant use with ▶ DIGOXIN
- Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with ▶ CLONIDINE; serious adverse events reported with concomitant use of methylphenidate and ▶ CLONIDINE (causality not established)
- Corticosteroids: possible risk of hypertension when midodrine given with ▶ CORTICOSTEROIDS; ephedrine accelerates metabolism of ▶ DXAMETAMIN.
- Dopaminergics: risk of toxicity when isometheptene given with ▶ BROMOCRIPTINE; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by ▶ ENTACAPONE; avoid concomitant use of sympathomimetics with ▶ RASAGILINE; risk of hypertensive crisis when dopamine given with ▶ SELEGILINE; avoidance of sympathomimetics advised by manufacturer of ▶ SELEGILINE
- Ergot Alkaloids: increased risk of ergotism when sympathomimetics given with ▶ ERGOTALKALOIDS
- Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with ▶ OXYTOCIN (due to enhanced vasopressor effect)
- Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by ▶ DOPEXAMINE; dexamphetamine possibly enhances effects of ▶ NORADRENLINE (NOREPINEPHRINE)
Sympathomimetics (continued)
- Theophylline: avoidance of ephedrine in children advised by manufacturer of THEOPHYLLINE
- Thyroid Hormones: manufacturer of midodrine advises avoid concomitant use with THYROID HORMONES
- Uter-healing Drugs: metabolism of dobutamine possibly inhibited by CIMETIDINE

Sympathomimetics, Beta2
- Aminophylline: increased risk of hypokalaemia when high doses of beta2-sympathomimetics given with AMINOPHYLLINE
- Antifungals: plasma concentration of olopatadine increased by KETOCONAZOLE; metabolism of salmeterol inhibited by KETOCONAZOLE (increased plasma concentration)
- Antivirals: increased risk of nephrotoxicity when tacrolimus given with ACICLOVIR, GANCICLOVIR, VALCICLOVIR or VALGANCICLOVIR; plasma concentration of tacrolimus possibly increased by ATAZANAVIR and RITONAVIR; plasma concentration of tacrolimus increased by BOCEPREVIR (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by EFAVIRENZ; plasma concentration of tacrolimus increased by FOSAMPRENAVIR; plasma concentration of tacrolimus increased by SAQUINAVIR (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with TELAPREVI (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by FELODIPINE and VERAPAMIL; plasma concentration of tacrolimus increased by DILTIAZEM, NICARDIPINE and NIFEDIPINE
- Ciclosporin: tacrolimus increases plasma concentration of CICLOSPORIN (increased plasma concentration)
- Cytotoxics: increased risk of nephrotoxicity—avoid concomitant use
- Cytotoxics: tacrolimus possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; avoidance of tacrolimus advised by manufacturer of IMATINIB; caution with tacrolimus advised by manufacturer of CRIZOTINIB; plasma concentration of tacrolimus increased by IMATINIB
- Dексазозан: increased risk of immunosuppression with tacrolimus advised by manufacturer of DEXRAZOXANE
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with ALDOSTERONE ANTAGONISTS or POTASSIUM-SPARING DIURETICS
- Grapefruit Juice: plasma concentration of tacrolimus increased by GRAPEFRUIT JUICE
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by DANAziel
- Lipid-regulating Drugs: separating administration from tacrolimus by 12 hours advised by manufacturer of LOMITAPIDE
- Lumacaftor: avoidance of tacrolimus advised by manufacturer of LUMACAFTOR
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of MIFAMURTIDE
- Oestroprogestins: plasma concentration of tacrolimus possibly increased by ETHINYLESTRADIOL
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with POTASSIUM SALTS
- Ranolazine: plasma concentration of tacrolimus increased by RANOLAZINE
- Sevelamer: plasma concentration of tacrolimus possibly reduced by SEVELAMER
- Uter-healing Drugs: plasma concentration of tacrolimus possibly increased by OMPEZRAZOLE

Tacrolimus
- Antifungals (continued): nephrotoxicity when tacrolimus given with AMPHOTERICIN; plasma concentration of tacrolimus increased by ISAVICONAZOLE; plasma concentration of tacrolimus reduced by CASPOFUNGIN and DROPERIDOL (risk of ventricular arrhythmias)
- Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with ACICLOVIR, GANCICLOVIR, VALCICLOVIR or VALGANCICLOVIR; plasma concentration of tacrolimus possibly increased by ATAZANAVIR and RITONAVIR; plasma concentration of tacrolimus increased by BOCEPREVIR (reduce dose of tacrolimus); plasma concentration of tacrolimus possibly affected by EFAVIRENZ; plasma concentration of tacrolimus increased by FOSAMPRENAVIR; plasma concentration of tacrolimus increased by SAQUINAVIR (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with TELAPREVI (reduce dose of tacrolimus)
- Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by FELODIPINE and VERAPAMIL; plasma concentration of tacrolimus increased by DILTIAZEM, NICARDIPINE and NIFEDIPINE
- Cytotoxics: increased risk of nephrotoxicity—avoid concomitant use
- Cytotoxics: tacrolimus possibly increases the plasma concentration of AFATINIB—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; avoidance of tacrolimus advised by manufacturer of IMATINIB; caution with tacrolimus advised by manufacturer of CRIZOTINIB; plasma concentration of tacrolimus increased by IMATINIB
- Dексазозан: increased risk of immunosuppression with tacrolimus advised by manufacturer of DEXRAZOXANE
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with ALDOSTERONE ANTAGONISTS or POTASSIUM-SPARING DIURETICS
- Grapefruit Juice: plasma concentration of tacrolimus increased by GRAPEFRUIT JUICE
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by DANAziel
- Lipid-regulating Drugs: separating administration from tacrolimus by 12 hours advised by manufacturer of LOMITAPIDE
- Lumacaftor: avoidance of tacrolimus advised by manufacturer of LUMACAFTOR
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of MIFAMURTIDE
- Oestroprogestins: plasma concentration of tacrolimus possibly increased by ETHINYLESTRADIOL
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with POTASSIUM SALTS
- Ranolazine: plasma concentration of tacrolimus increased by RANOLAZINE
- Sevelamer: plasma concentration of tacrolimus possibly reduced by SEVELAMER
- Uter-healing Drugs: plasma concentration of tacrolimus possibly increased by OMPEZRAZOLE

Tadalafil
- Alpha-blockers: enhanced hypotensive effect when tadalafil given with DOXAZOSIN—manufacturer of tadalafil avoids avoid concomitant use; enhanced hypotensive effect when tadalafil given with ALPHA-BLOCKERS—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose
- Anti-arhythmic/s: avoidance of tadalafil advised by manufacturer of DISOPYRAMIDE (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of tadalafil possibly increased by CLARITHROMYCIN and ERITHROMYCIN; plasma concentration of tadalafil reduced by Rifampicin; possible increased risk of nephrotoxicity when tacrolimus given with SULFAMETHOXAZOLE, TRIMETHOPRIM or VANCOMYCIN; increased risk of nephrotoxicity when tacrolimus given with AMINOLYCOSIDES; plasma concentration of tacrolimus possibly increased by CHLORAMPHENICOL and TELITHROMYCIN
- Anticoagulants: tadalafil possibly increases plasma concentration of DABIGATRAN—manufacturer of dabigatran advises avoid concomitant use
- Antidepressants: plasma concentration of tadalafil reduced by ST JOHN'S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of tacrolimus reduced by FOSPHENYTOIN and PHENYTOIN, also plasma concentration of phenytoin possibly increased; plasma concentration of tacrolimus reduced by PHENOBARBITAL and PRIMIDONE
- Antifungals: plasma concentration of tacrolimus increased by FLUCONAZOLE, ITRACONAZOLE, KETOCONAZOLE, POSaconazole and VORICONAZOLE (consider reducing dose of tacrolimus); plasma concentration of tacrolimus possibly increased by MICONAZOLE oral gel; increased risk of
Tegafur
- Antiarrhythmics: metabolism of tegafur inhibited by
  - PENTOXIFYLBAN
- Anticoagulants: metabolism of tegafur inhibited by
  - RIFAMPICIN
- Antibacterials: plasma concentration of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - RIFABUTIN
- Antiepileptics: manufacturer of telaprevir advises avoid concomitant use with
  - CARBAMAZEPINE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE
- Antifungals: plasma concentration of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - KETOCONAZOLE
- Antioxidants: plasma concentration of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - THEOPHYLLINE
- Antiparkinsonians: metabolism of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - L-DOPA
- Antipsychotics: plasma concentration of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - LITHUANIAN, PHENOTIPIR
- Antiulcer: manufacturer of telaprevir advises caution with
  - TACAMIPRIDE (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with
  - ORAL TYPHOID VACCINE
- Anxiolytics and Hypnotics: plasma concentration of tegafur possibly increased when telaprevir given (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with
  - LORAZEPAM
- Beta-blockers: manufacturer of telaprevir advises caution with
  - CARBAMAZEPINE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE
- Beta-blockers: manufacturer of telaprevir advises caution with
  - LIRICA
- Beta-blockers: manufacturer of telaprevir advises caution with
  - TRAMadol
- Calcium-channel Blockers: manufacturer of telaprevir advises caution with
  - KETONORBNIC DILATE
- Calcium-channel Blockers: manufacturer of telaprevir advises caution with
  - LIVMOC
- Calcium-channel Blockers: manufacturer of telaprevir advises caution with
  - AMIODARONE, DISOPYRAMIDE (risk of ventricular arrhythmias); manufacturer of telaprevir
Telaprevir (continued)

- Colchicine: telaprevir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: telaprevir possibly increases plasma concentration of inhaled and intranasal budesonide and fluticasone; plasma concentration of telaprevir possibly reduced by dexamethasone
- Cytotoxics: telaprevir possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with ruxolitinib—consult ruxolitinib product literature; telaprevir possibly increases plasma concentration of olaparib (avoid concomitant use or reduce dose of olaparib—see under Olaparib, p. 881)
- Domperidone: possible increased risk of ventricular arrhythmias when telaprevir given with domperidone—avoid concomitant use
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with ergot alkaloids
- Guanfacine: telaprevir possibly increases plasma concentration of guanfacine (half-life of guanfacine)
- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with atorvastatin; manufacturers advise avoid concomitant use of telaprevir with simvastatin; avoidance of telaprevir advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Oestrogens: telaprevir possibly reduces plasma concentration of ethinylestradiol—manufacturer of telaprevir advises additional contraceptive precautions
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with sildenafil
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with sirolimus (reduce dose of sirolimus)
- Pimozide: possible increased risk of ventricular arrhythmias when telaprevir given with pimozide—avoid concomitant use; telaprevir possibly increases plasma concentration of quetiapine
- Antivirals: manufacturer of telaprevir advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, ritonavir and tipranavir in severe renal and hepatic impairment; telaprevir possibly increases the plasma concentration of darunavir—reduce dose of darunavir (see under Darunavir, p. 577); avoidance of telaprevir advised by manufacturer of darunavir and ritonavir; telaprevir possibly increases plasma concentration of maraviroc (consider reducing dose of maraviroc); manufacturer of telaprevir advises avoid concomitant use with saquinavir (risk of ventricular arrhythmias); telaprevir possibly increases plasma concentration of simprevir—manufacturer of simprevir advises avoid concomitant use; plasma concentration of elotuzumab possibly increased when telaprevir given with elotuzumab (increased risk of ventricular arrhythmias)
- Anxiolytics and Hypnotics: telaprevir possibly increases metabolism of midazolam (increased plasma concentration with increased sedation)
- Aprepitant: telaprevir possibly increases plasma concentration of aprepitant
- Avanafil: telaprevir possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use
- Calcium-channel Blockers: telaprevir possibly increases plasma concentration of nifedipine.
- Ciclosporin: telaprevir possibly increases plasma concentration of ciclosporin
- Colchicine: telaprevir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: telaprevir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); telaprevir possibly increases the plasma concentration of bosutinib and cabazitaxel—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; telaprevir possibly increases plasma concentration of ceritinib—avoid concomitant use or consider reducing the dose of ceritinib (see under Ceritinib, p. 861); telaprevir possibly increases plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of telaprevir by manufacturer of crizotinib and everolimus advised; telaprevir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); telaprevir possibly increases plasma concentration of ponatinib—consider reducing initial dose of ponatinib (see under Ponatinib, p. 873); manufacturer of ruxolitinib advises dose reduction when telaprevir given with ruxolitinib—consult ruxolitinib product literature; telaprevir possibly increases plasma concentration of telithromycin (continued)

Telithromycin (continued)

- Antidepressants: possible increased risk of ventricular arrhythmias when telithromycin given with citalopram and tricyclics; plasma concentration of telithromycin reduced by st john’s wort (avoid during and for 2 weeks after st john’s wort)
- Antiepileptics: plasma concentration of telithromycin reduced by carbamazepine, fosphenytoin, omeprazole and phenobarbital
Telithromycin
Cytotoxics (continued)
increases plasma concentration of docetaxel — manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; temsirolimus possibly increases plasma concentration of olaparib (avoid concomitant use or reduce dose of olaparib — see under Olaparib, p. 881)
Dapoxetine: avoidance of telithromycin advised by manufacturer of dapoxetine (increased risk of toxicity)
Diuretics: telithromycin increases plasma concentration of eplerenone — avoid concomitant use
Domeridone: possible increased risk of ventricular arrhythmias when telithromycin given with damperidone — avoid concomitant use
Ergot Alkaloids: increased risk of ergotism when telithromycin given with ergot alkaloids — avoid concomitant use
Fosaprepitant: telithromycin possibly increases plasma concentration of fosaprepitant
Guanfacine: telithromycin possibly increases plasma concentration of guanfacine (halve dose of guanfacine)
Ivabradine: telithromycin possibly increases plasma concentration of ivabradine — avoid concomitant use
Ivacaftor: telithromycin possibly decreases plasma concentration of ivacaftor (see under Ivacaftor in BNF or BNFC, and Lumacaftor with Ivacaftor in BNF or BNFC)
Lipid-regulating Drugs: telithromycin possibly increases plasma concentration of panobinostat
Lumacaftor: telithromycin increases plasma concentration of lumacaftor (plasma concentration of lomitapide possibly increased)
Panobinostat: telithromycin possibly increases plasma concentration of panobinostat (reduce dose of panobinostat — see under Panobinostat, p. 834)
Pentamidine i setionate: possible increased risk of ventricular arrhythmias when telithromycin given with pentamidine i setionate
Pentamidine i setionate
Ranolazine: telithromycin possibly increases plasma concentration of ranolazine — manufacturer of ranolazine advises avoid concomitant use
Sildenafil: telithromycin possibly increases plasma concentration of sildenafil — consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension
Sirolimus: telithromycin increases plasma concentration of sirolimus — avoid concomitant use
Tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus
Ulipristal: avoidance of telithromycin advised by manufacturer of low-dose ulipristal
Vaccines: antibacterials inactivate oral typhoid vaccine — see under Typhoid Vaccine in BNF or BNFC
Temsirolimus (continued)
Antibacterials: plasma concentration of active metabolite of temsirolimus reduced by rifampicin — avoid concomitant use
Antifungals: plasma concentration of active metabolite of temsirolimus increased by ketoconazole — avoid concomitant use; manufacturer of temsirolimus advises avoid concomitant use with iraconazole (plasma concentration of temsirolimus possibly increased)
Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Tenovir
Antivirals: manufacturer of tenovir advises avoid concomitant use with adebovir; tenovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased; tenofovir increases plasma concentration of didanosine (increased risk of toxicity) — avoid concomitant use; plasma concentration of tenofovir increased by lopinavir and telaprevir
Orosiata: absorption of tenofovir possibly reduced by orlistat
Terbinafine
Antibacterials: plasma concentration of terbinafine reduced by rifampicin
Antidepressants: terbinafine possibly increases plasma concentration of paroxetine and tricyclics
Antifungals: terbinafine increases plasma concentration of fluconazole
Ciclosporin: terbinafine possibly reduces plasma concentration of ciclosporin
Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with oestrogens (when used for contraception)
Progestogens: occasional reports of breakthrough bleeding when terbinafine given with progestogens (when used for contraception)
Ulcer-healing Drugs: plasma concentration of terbinafine increased by cinetidine
Terbutaline see Sympathomimetics, Beta2
Teriflunomide
Antibacterials: teriflunomide increases plasma concentration of cefaclor; plasma concentration of teriflunomide reduced by rifampicin
Antidiabetics: teriflunomide increases plasma concentration of repaglinide
Lipid-regulating Drugs: the effect of teriflunomide is significantly decreased by colestyramine (enhanced elimination) — avoid unless drug elimination desired; teriflunomide increases plasma concentration of rosuvastatin (consider reducing dose of rosuvastatin)
Oestrogens: teriflunomide increases plasma concentration of ethinylestadiol
Progestogens: teriflunomide increases plasma concentration of levonorgestrel
Vaccines: risk of generalised infections when teriflunomide given with live vaccines — avoid concomitant use
Testolactone
Anticoagulants: testolactone enhances anticoagulant effect of coumarins and phenindione
Testosterone
Anticoagulants: testosterone enhances anticoagulant effect of coumarins and phenindione
Antidiabetics: testosterone possibly enhances hypoglycaemic effect of antidiabetics
Tetrabenazine
Antidepressants: risk of CNS toxicity when tetrabenazine given with maois (avoid tetrabenazine for 2 weeks after MAOIs)
Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with antipsychotics
Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with amantadine
Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide
Tetracosactide see Corticosteroids
Tetracyclines see Tetracyclines
Theophylline

ACE Inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate)

Adsorbents: absorption of tetracyclines possibly reduced by kaolin

Antacids: absorption of tetracyclines possibly reduced by antacids (give at least 2 to 3 hours apart)

Antibacterials: plasma concentration of doxycycline reduced by rifampicin — consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of penicillins

Anticoagulants: tetracyclines possibly enhance anticoagulant effect of coumarins and phenindione

Antidiabetics: tetracyclines possibly increased risk of ergotism when tetracyclines given with ergotamine

Iron Salts: absorption of tetracyclines possibly reduced by calcium salts (give at least 2 to 3 hours apart)

Cytotoxics: doxycycline or tetracycline increase risk of hypokalaemia when theophylline given with doxycycline or tetracycline increase risk of hypokalaemia when theophylline given with rifampicin (increased risk of toxicity)

Calcium-channel Blockers: plasma concentration of theophylline possibly increased by calcium-channel blockers (enhanced effect)

Calcium-channel Blockers: plasma concentration of theophylline increased by ritonavir (reduced plasma concentration)

Caffeine and Hypnotics: theophylline possibly reduces effects of benzodiazepines

Antivirals: plasma concentration of theophylline possibly increased by aciclovir and valaciclovir; metabolism of theophylline accelerated by ritonavir (reduced plasma concentration)

Antiarrhythmics: serum concentrations of thyroid hormones can be affected by amiodarone — monitor thyroid function closely

Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)

Antidepressants: plasma concentration of theophylline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by St John’s Wort

Ulcer-healing Drugs: plasma concentration of theophylline possibly increased by fosphenytoin and phenytoin

Dairy Products: metabolism of theophylline accelerated by carbamazepine, phenobarbital and primidone (reduced plasma concentration)

Atovaquone: tetracycline reduces plasma concentration of atovaquone

Calcium Salts: absorption of tetracyclines possibly reduced by calcium salts (give at least 2 to 3 hours apart)

Caffeine and Hypnotics: theophylline possibly reduces effects of benzodiazepines

Anticoagulants: tetracyclines possibly enhance anticoagulant effect of coumarins and phenindione

Antidiabetics: tetracyclines possibly increased risk of ergotism when tetracyclines given with ergotamine

Iron Salts: absorption of tetracyclines reduced by oral iron salts, also absorption of oral iron salts reduced by tetracyclines (give at least 2 to 3 hours apart)

Lipid-regulating Drugs: absorption of tetracyclines possibly reduced by colestipol and colesteryramine

Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with retinoids (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by Strontium Ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and Tripotassium Dicitrato Bismuthate

Vaccines: antibiotics inactivate oral typhoid vaccine — see Oral Typhoid Vaccine in BNF or BNFC

Zinc: absorption of tetracyclines possibly reduced by zinc (give at least 2 to 3 hours apart)

Theophylline

Allopurinol: plasma concentration of theophylline possibly increased by allopurinol

Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine

Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine — manufacturer of adenosine advises avoid concomitant use for 24 hours before adenosine; plasma concentration of theophylline increased by propafenone

Antibacterials: plasma concentration of theophylline possibly increased by clarithromycin and isoniazid; plasma concentration of theophylline increased by erythromycin (also theophylline may reduce absorption of oral erythromycin); plasma concentration of theophylline increased by ciprofloxacin and norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with quinolones

Antidepressants: plasma concentration of tetracycline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve tetracycline dose and monitor plasma-tetracycline concentration); plasma concentration of tetracycline possibly reduced by St John’s Wort

Antiepileptics: metabolism of theophylline accelerated by carbamazepine, phenobarbital and primidone (reduced effect)

Antidiabetics: absorption of levothyroxine possibly reduced by antacids

Antivirals: plasma concentration of theophylline possibly increased by aciclovir and valaciclovir; metabolism of theophylline accelerated by ritonavir (reduced plasma concentration)

Anticoagulants: tetracyclines possibly enhance anticoagulant effect of coumarins and phenindione

Anticholinergics: serum concentrations of thyroid hormones can be affected by amiodarone — monitor thyroid function closely

Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)

Anticoagulants: thyroid hormones enhance anticoagulant effect of coumarins and phenindione
Thyroid Hormones (continued)

- Antidepressants: thyroid hormones enhance effects of AMITRIPTYLINE and IMPRIPRAMINE; thyroid hormones possibly enhance effects of TRICYCLICS
- Antiepileptics: metabolism of thyroid hormones accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMODONE (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by FOSPHENYTIOIN and PHENYTOIN (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin and phenytoin possibly increased
- Beta-blockers: levothyroxine accelerates metabolism of PROPRAVOLOL
- Calcium Salts: absorption of levothyroxine reduced by CALCIUM SALTS
- Cytotoxics: plasma concentration of levothyroxine possibly reduced by IMATINIB
- Iron Salts: absorption of levothyroxine reduced by oral IRON SALTS (give at least 2 hours apart)
- Lanthanum: absorption of levothyroxine reduced by LANTHANUM (give at least 2 hours apart)
- Lipid-regulating Drugs: absorption of levothyroxine reduced by COLESEVELAM; absorption of thyroid hormones reduced by COLESTIPOL and COLESTYRAMINE
- Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by OESTROGENS
- Orlistat: possible increased risk of hypothyroidism when levothyroxine given with ORLISTAT
- Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by POLYSTYRENE SULFONATE RESINS
- Sevelamer: absorption of levothyroxine possibly reduced by SEVELAMER
- Sympathomimetics: avoidance of thyroid hormones advised by manufacturer of MIDODRINE
- Ulcer-healing Drugs: absorption of levothyroxine reduced by CIMETIDINE and SUCCINATE

Tiagabine

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of tiagabine reduced by CARBAMAZEPINE, FOSPHENYTIOIN, PHENOBARBITAL, PHENYTOIN and PRIMODONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MELFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT

Tiaprofenic Acid see NSAIDs

Tibilone

- Antibacterials: metabolism of tibolone accelerated by RIFAMPICIN (reduced plasma concentration)
- Antiepileptics: metabolism of tibolone accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of tibolone accelerated by FOSPHENYTIOIN and PHENYTOIN

Ticagrelor (continued)

- Antivirals: plasma concentration of ticagrelor possibly increased by ATAZANAVIR and RITONAVIR—manufacturer of ticagrelor advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of ticagrelor increased by DILTIAZEM
- Cardiac Glycosides: ticagrelor increases plasma concentration of DIGOXIN
- Ciclosporin: plasma concentration of ticagrelor increased by CICLOSPORIN
- Ergot Alkaloids: ticagrelor possibly increases plasma concentration of ERGOT ALKALOIDS
- Lipid-regulating Drugs: ticagrelor increases plasma concentration of SIMVASTATIN (increased risk of toxicity); separating administration from ticagrelor by 12 hours advised by manufacturer of LOMITAPIDE

Ticarcillin see Penicillins

Tick-borne Encephalitis Vaccine see Vaccines

Tigecycline

- Anticoagulants: tigecycline possibly enhances anticoagulant effect of COUMARINS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Timolol see Beta-blockers

Tinidazole

- Alcohol: possibility of disulfiram-like reaction when tinidazole given with ALCOHOL
- Antibacterials: plasma concentration of tinidazole possibly reduced by RIFAMPICIN
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF or BNFC

Tinzaparin see Heparins

Tioguanine

- Antipsychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: increased risk of hepatotoxicity when tioguanine given with BUSULFAN

Tiotropium see Antimuscarinics

Tipranavir

- Analgesics: plasma concentration of tipranavir possibly reduced by BUPRENORPHINE
- Antacids: absorption of tipranavir reduced by ANTACIDS (give at least 2 hours apart)
- Antibacterials: tipranavir increases plasma concentration of CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of RIFABUTIN (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by RIFAMPICIN—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of TELITHROMYCIN
- Anticoagulants: avoidance of tipranavir advised by manufacturer of APIXABAN and RIVAROXABAN
- Antidepressants: plasma concentration of tipranavir possibly reduced by ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of tipranavir possibly reduced by CARBAMAZEPINE
- Antifungals: plasma concentration of tipranavir increased by FLUCONAZOLE
- Antimalarials: caution with tipranavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; tipranavir possibly increases plasma concentration of QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of tipranavir advised by manufacturer of DARIFENACIN
- Antipsychotics: tipranavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use
- Antivirals: tipranavir reduces plasma concentration of ABACAVIR, FOSAMPRENAVIR, LOPINAVIR, SAQUINAVIR and ZIDOVUDINE; plasma concentration of tipranavir increased by ATAZANAVIR (also plasma concentration of atazanavir
Tipranavir

- Antivirals (continued); manufacturer of tipranavir advises avoid concomitant use with BOCEPREVIR and TELAPREVIR; tipranavir reduces plasma concentration of DIDANOSINE—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of DOLUTEGRAVIR (see under Dolutegravir, p. 992); tipranavir reduces plasma concentration of ETARIVINE, also plasma concentration of tipranavir increased (avoid concomitant use); avoidance of tipranavir advised by manufacturer of PARTAPREVIR
- Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with METHOPROLOL, for heart failure
- Bosentan manufacturer of tipranavir advises avoid concomitant use with BOSENTAN
- Cobicistat: plasma concentration of both drugs reduced when tipranavir given with COBICISTAT (avoid concomitant use)
- Lipid-regulating Drugs: Tolvaptan increases plasma concentration of KETOCONAZOLE—plasma concentration of tolvaptan increased by 12 hours advised by manufacturer of Tolvaptan by 12 hours advised by manufacturer of Tolvaptan; tipranavir possibly increases plasma concentration of Tolvaptan; tipranavir increases plasma concentration of GLIBENCLAMIDE
- Antidepressants: anticovulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticovulsant effect of antiepileptics antagonised by SSRI and TRICYCLICS (convulsive threshold lowered)
- Antidiabetics: tipranavir possibly increases plasma concentration of METFORMIN; tipranavir possibly reduces plasma concentration of GLIBENCLAMIDE
- Antiepileptics: plasma concentration of tipranavir often reduced by CARBAMAZEPINE; tipranavir increases plasma concentration of PHENOBARBITAL and PRIMIDONE; hyperammonaemia and CNS toxicity reported when tipranavir given with SODIUM VALPROATE and VALPROIC ACID
- Antimalarials: anticovulsant effect of antiepileptics antagonised by MEfloQUINE
- Antipsychotics: anticovulsant effect of antiepileptics antagonised by ANTISYPHOTICS (convulsive threshold lowered)
- Diuretics: plasma concentration of tipranavir possibly increased by HYDROCHLOROTHIAZIDE
- Lithium: tipranavir possibly affects plasma concentration of LITHIUM
- Oestrogens: tipranavir accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF or BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT
- Progestogens: tipranavir accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, eutestrogel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF or BNFC)
- Antiepileptics: metabolism of toremifene possibly accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of toremifene possibly accelerated by FOSPHENITOIN and PHENYTOIN; metabolism of toremifene accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Cytotoxics: possible increased risk of ventricular arrhythmias when toremifene given with VANDETANIB—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with THIAZIDES AND RELATED DIURETICS

Tolcapone

- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOPA
- Tolfenamic Acid
- Tolterodine see Antimuscarinics
- Tolbutamide see Antidiabetics
- Tolcapone
- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOPA
- Tolfenamic Acid
- Tolterodine see Antimuscarinics
- Tolbutamide see Antidiabetics
- Tolcapone
- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOPA
- Tolfenamic Acid
- Tolterodine see Antimuscarinics
- Tolbutamide see Antidiabetics
- Tolcapone
- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOPA
- Tolfenamic Acid
- Tolterodine see Antimuscarinics
- Tolbutamide see Antidiabetics
- Tolcapone
- Antidepressants: avoid concomitant use of tolcapone with MAOIs
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLODOPA
Tretinoin see Retinoids
Triamcinolone see Corticosteroids
Triamterene see Diuretics
Trimesterine for oral
Typhoid Vaccine (parenteral) see Vaccines
Typhoid Vaccine (oral) see Vaccines
Tripotassium Dicitratobismuthate
Tripotassium Dicitratobismuthate see Antimuscarnics
Triphénylédyl see Antipsychotiques
Trimipramine see Antidepressants, Tricyclic

Ulipristal
[continued]
• Increased by ERYTHROMYCIN—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with rifampicin (concomitant effect of ulipristal possibly reduced)
• Anticoagulants: manufacturer of ulipristal advises give DABIGATRAN at least 1.5 hours before or after ulipristal
• Antidepressants: manufacturer of ulipristal advises avoid concomitant use with ST JOHN’S WORT (concomitant effect of ulipristal possibly reduced)
• Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone (concomitant effect of ulipristal possibly reduced)
• Antifungals: plasma concentration of low-dose ulipristal increased by ketoconazole—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with itraconazole
• Antihistamines: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ulipristal
• Antivirals: manufacturer of ulipristal advises avoid concomitant use with ritonavir (concomitant effect of ulipristal possibly reduced)
• Calcium-channel blockers: manufacturer of low-dose ulipristal advises avoid concomitant use with verapamil
• Carboxyhemoglobin: manufacturer of low-dose ulipristal advises avoid concomitant use with grapefruit juice
• Progestogens: ulipristal possibly reduces contraceptive effect of progestogens

Umclidinium see Antimuscarnics
Ursodeoxycholic Acid see Bile Acids

Ustekinumab
• Antipsychotics: avoid concomitant use of cytoxan with clozapine (increased risk of agranulocytosis)
• Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use

Vaccines
• Abacavir: risk of generalised infections when live vaccines given with abacavir—avoid concomitant use
• Aminophylline: influenza vaccine possibly increases plasma concentration of aminophylline
• Anakinra: risk of generalised infections when live vaccines given with anakinra—avoid concomitant use
• Antibacterials: oral typhoid vaccine inactivated by antibacterials—see under Typhoid Vaccine in BNF or BNFC
• Anticoagulants: immunoglobulin possibly enhances anticoagulant effect of warfarin
• Antidepressants: oral typhoid vaccine inactivated by antibacterials including linezolid and tedizolid—see under Typhoid Vaccine in BNF or BNFC
• Antiepileptics: influenza vaccine enhances effects of fosphenytoin and phenytoin
• Antimalarials: oral typhoid vaccine inactivated by antimalarials—see under Typhoid Vaccine in BNF or BNFC
• Azathioprine: risk of generalised infections when live vaccines given with azathioprine—avoid concomitant use
• Corticosteroids: immune response to vaccines impaired by high doses of corticosteroids—avoid concomitant use with live vaccines
• Cytotoxics: risk of generalised infections when live vaccines given with cytotoxic antibiotics, hydroxy carbamidene, monoclonal antibodies or trabectedine—avoid concomitant use
• Dexrazoxane: risk of generalised infections when live vaccines given with dexrazoxane—avoid concomitant use
• Etanercept: risk of generalised infections when live vaccines given with etanercept—avoid concomitant use
• Immunglobulins: impaired immune response to BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine might occur with anti-D immunoglobulins—give BCG vaccine, MMR vaccine, oral typhoid vaccine, rotavirus vaccine, smallpox vaccine, varicella-zoster vaccine and yellow fever vaccine as a separate injection.

Ulipristal
• Increased by erythromycin—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with rifampicin (concomitant effect of ulipristal possibly reduced)
• Anticoagulants: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ulipristal
• Antidepressants: manufacturer of ulipristal advises avoid concomitant use with St John’s Wort (concomitant effect of ulipristal possibly reduced)
• Antiepileptics: manufacturer of ulipristal advises avoid concomitant use with carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone (concomitant effect of ulipristal possibly reduced)
• Antifungals: plasma concentration of low-dose ulipristal increased by ketoconazole—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with itraconazole
• Antihistamines: manufacturer of ulipristal advises give fexofenadine at least 1.5 hours before or after ulipristal
• Antivirals: manufacturer of ulipristal advises avoid concomitant use with ritonavir (concomitant effect of ulipristal possibly reduced)
• Calcium-channel blockers: manufacturer of low-dose ulipristal advises avoid concomitant use with verapamil
• Carboxyhemoglobin: manufacturer of low-dose ulipristal advises avoid concomitant use with grapefruit juice
• Progestogens: ulipristal possibly reduces contraceptive effect of progestogens
Interactions

**Antiepileptics**: (continued)
- fever vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins; impaired immune response to live influenza vaccine might occur with **ANTI-D IMMUNOGLOBULINS** and **NORMAL IMMUNOGLOBULIN**—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to oral poliomyelitis vaccine might occur with **ANTI-D IMMUNOGLOBULINS** and **NORMAL IMMUNOGLOBULIN**—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to oral poliomyelitis vaccine might occur with **ANTI-D IMMUNOGLOBULINS** and **NORMAL IMMUNOGLOBULIN**—give live influenza vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; impaired immune response to oral poliomyelitis vaccine might occur with **ANTI-D IMMUNOGLOBULINS** and **NORMAL IMMUNOGLOBULIN**—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after normal immunoglobulin
- Interferons: avoidance of vaccines advised by manufacturer of **INTERFERON GAMMA**
  - Leflunomide: risk of generalised infections when live vaccines given with **LEFLUNOMIDE**—avoid concomitant use
  - Teriflunomide: risk of generalised infections when live vaccines given with **TERIFLUNOMIDE**—avoid concomitant use
- Theophylline: influenza vaccine possibly increases plasma concentration of **THEOPHYLLINE**

**Valaciclovir**
- Aminophylline: valaciclovir possibly increases plasma concentration of **AMINOPHYLLINE**
- Ciclosporin: increased risk of nephrotoxicity when valaciclovir given with **CICLOSPORIN**
- Mycophenolate: plasma concentration of valaciclovir increased by **MYCOPHENOLATE**, also plasma concentration of inactive metabolite of mycophenolate increased
- Tacrolimus: possible increased risk of nephrotoxicity when valaciclovir given with **TACROLIMUS**
- Theophylline: valaciclovir possibly increases plasma concentration of **THEOPHYLLINE**

**Valganciclovir**
- Antibacterials: increased risk of convulsions when valganciclovir given with **IMIPENEM WITH CILASTATIN**
- Antivirals: valganciclovir possibly increases plasma concentration of **DIDANOSINE**; profound myelosuppression when valganciclovir given with **ZIDOVUDINE** (if possible avoid concomitant administration, particularly during initial valganciclovir therapy)
- Mycophenolate: plasma concentration of valganciclovir possibly increased by **MYCOPHENOLATE**, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when valganciclovir given with **TACROLIMUS**

**Valproic Acid**
- Analgesics: effects of valproic acid enhanced by **ASPIRIN**
- Antibacterials: metabolism of valproic acid possibly inhibited by **ERYTHROMYCIN** (increased plasma concentration); avoidance of valproic acid advised by manufacturer of **PIMECILLINAM**; plasma concentration of valproic acid reduced by **CARBAPENEMS**—avoid concomitant use
- Anticoagulants: valproic acid possibly enhances anticoagulant effect of **COUMARINS**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of valproic acid reduced by **CARBAMAZEPINE**, also plasma concentration of active metabolite of carbamazepine increased; valproic acid possibly increases plasma concentration of **ETHOSUXIMIDE**; valproic acid increases or possibly decreases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**, also plasma concentration of valproic acid reduced; valproic acid increases plasma concentration of **LAMOTRIGINE** (increased risk of toxicity—

**Valproic Acid**
- Antiepileptics (continued)
  - reduce lamotrigin dose); valproic acid sometimes reduces plasma concentration of an active metabolite of **OXCARBAZEPINE**; valproic acid increases plasma concentration of **PHENOBARBITAL** and **PRIMIDONE** (also plasma concentration of valproic acid reduced); valproic acid possibly increases plasma concentration of **RUFINAMIDE** (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproic acid given with **TOPIRAMATE**
  - Antiinflammarials: anticonvulsant effect of antiepileptics antagonised by **MEFLOQUINE**
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered); valproic acid possibly increases or decreases plasma concentration of **CLOzapine**; increased risk of side-effects including neuropenia when valproic acid given with **OLANzapine**
  - Antivirals: plasma concentration of valproic acid possibly reduced by **RITONAVIR**; valproic acid possibly increases plasma concentration of **ZIDOVUDINE** (increased risk of toxicity)
  - Antiflammatories and Hypnotics: plasma concentration of valproic acid possibly increased by **CLOBazam**; increased risk of side-effects when valproic acid given with **CLONAZAPeM**; valproic acid possibly increases plasma concentration of **DIAZAPeM** and **LORAZAPeM**
  - Bupropion: valproic acid inhibits the metabolism of **BUPROpION**
  - Cytotoxics: valproic acid increases plasma concentration of **TemozoloMIDE**
  - Guanfacine: plasma concentration of valproic acid increased by **GUANfACINE**
  - Lipid-regulating Drugs: absorption of valproic acid possibly reduced by **COLESTYRAMINE**
  - Netupitant: caution with valproic acid advised by manufacturer of **NETUPITAN**
  - Oestrogens: plasma concentration of valproic acid possibly reduced by **ETHINYLESTRADIOL**
  - Orlistat: possible increased risk of convulsions when antiepileptics given with **ORLISTAT**
  - Sodium Benzoate: valproic acid possibly reduces effects of **SODIUM BENZOATE**
  - Sodium Oxybate: valproic acid increases the plasma concentration of **SODIUM OXYBATE** (see under Sodium Oxybate, p. 455)
  - Sodium Phenylbutyrate: valproic acid possibly reduces effects of **SODIUM PHENYLButyRATE**
  - Ultra-healing Drugs: metabolism of valproic acid inhibited by **CIMETIDINE** (increased plasma concentration)

**Valsartan** see Angiotensin-Ⅱ Receptor Antagonists

**Vancomycin**
- Anaesthetics, General: hypersensitivity-like reactions can occur when **intravenous** vancomycin given with **GENERAL ANAESThETICS**
- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with **AMINOGlyCOSIDES**, **CAPREOMYcin** or **COlSITMethate sODIum**; increased risk of nephrotoxicity when vancomycin given with **POLYMYXINS**
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with **AMPHOTERICIN**
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with **CICLOSPORIN**
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with **CISPLATIN**
- Diuretics: increased risk of ototoxicity when vancomycin given with **LODIP Diuretics**
- Lipid-regulating Drugs: effects of **oral** vancomycin antagonised by **COLESTYRAMINE**
- Muscle Relaxants: vancomycin enhances effects of **SUXAMETHONIUM**
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with **TACROLIMUS**
- Vaccines: antibacterials inactivate **ORAL TYPhOID VACCINE**—see under Typhoid Vaccine in BNF or BNFC
Vardenafil

- Analgesics: possible increased risk of ventricular arrhythmias when vardenafil given with METHADONE—avoid concomitant use
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vardenafil given with AMIODARONE or DISOPYRAMIDE—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when vardenafil given with parenteral ERYTHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vardenafil given with MOXIFLOXACIN—avoid concomitant use; plasma concentration of vardenafil reduced by Rifampicin—manufacturer of vardenafil advises avoid concomitant use; Antidepressant: manufacturer of vardenafil advises avoid concomitant use with ST JOHN’S WORT (plasma concentration of vardenafil possibly reduced)
- Anti-diabetics: vardenafil possibly increases plasma concentration of METFORMIN (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vardenafil advises avoid concomitant use with CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (plasma concentration of vardenafil possibly reduced)
- Antihistamines: possible increased risk of ventricular arrhythmias when vardenafil given with MIZOLASTINE—avoid concomitant use
- Antimalarials: possible increased risk of ventricular arrhythmias when vardenafil given with ARTEMETHER WITH LUMEFANTRINE—avoid concomitant use
- Anti-pyretics: increased risk of ventricular arrhythmias when vardenafil given with AMISULPRIDE, CHLORPROMAZINE, HALOPERIDOL, PIMOZIDE, SULPIRIDE or ZUCLOPENTHIXOL—avoid concomitant use; avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
- Beta-blockers: possible increased risk of ventricular arrhythmias when vardenafil given with SOTALOL—avoid concomitant use
- Cardiac Glycosides: vardenafil increases plasma concentration of DIGOXIN—possible increased risk of bradycardia
- Cytotoxics: possible increased risk of ventricular arrhythmias when vardenafil given with ARSECNI TRIOXIDE—avoid concomitant use
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vardenafil given with TOREMIFENE—avoid concomitant use
- SHT-receptor Antagonists: increased risk of ventricular arrhythmias when vardenafil given with ONDANSETRON—avoid concomitant use
- Pentamidine isetionate: possible increased risk of ventricular arrhythmias when vardenafil given with PENTAMIDINE ISETIONATE—avoid concomitant use

Vardenafil (continued)

- Antivirals: caution with vardenafil advised by manufacturer of TIPRANAVIR
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with NIFEDIPINE
- Cobicistat: plasma concentration of vardenafil possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
- Dopoxetine: avoidance of vardenafil advised by manufacturer of DAPoxetine
- Grapefruit Juice: plasma concentration of vardenafil possibly increased when vardenafil given with GRAPFRUIT JUICE—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with NICORANDIL—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with NITRATES—avoid concomitant use
- Riociguat: possible enhanced hypotensive effect when vardenafil given with RIoCIGUAT—avoid concomitant use

Varicella-zoster Vaccine see Vaccines

Vasodilator Antihypertensives

- ACE inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALPHA-BLOCKERS
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with PHENOTHIAZINES
- Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CALCIUM-CHANNEL BLOCKERS
- Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CLONIDINE
- Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by CORTICOSTEROIDS
- Dihydropyridines: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with DIAZODE
- Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CO- BENELDPA; enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with CO-CARELDOPA
- Methylpapaverine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with METHYLPAVERINE
- Nonsteroidal Anti-Inflammatory Drugs: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with COBENEDYMPHEN
- Vasodilator Antihypertensives: See Vasodilator Antihypertensives

1344 Vandetanib – Vasodilator Antihypertensives
Venlafaxine (continued)
- Beta-blockers: manufacturer of venlafaxine advises avoid concomitant use with **SOTALOL** (risk of ventricular arrhythmias)
- Dopamine: possible increased risk of serotonergic effects when venlafaxine given with **DAPoxetine** (manufacturer of dapoxetine advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine)
- Dopaminergics: caution with venlafaxine advised by manufacturer of **ENTACAPONE**; increased risk of hypertension and CNS excitation when venlafaxine given with **SELEGININE** (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
- SH3-receptor Agonists: possible increased serotonergic effects when venlafaxine given with **SHT, AGONISTS**
- SH3-receptor Antagonists: possible increased serotonergic effects when SSRI-related antidepressants given with **SHT3 ANTAGONISTS**
- Lithium: possible increased serotonergic effects when venlafaxine given with **LITHIUM**
- Methylthioninium: risk of CNS toxicity when SSRI-related antidepressants given with **METHYLTHIONIUM**—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Verapamil see Calcium-channel Blockers

Vigabatrin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TRICYCLIC-RELATED ANTI DEPRESSANTS** (convulsive threshold lowered): anticonvulsant effect of antiepileptics antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: vigabatrin reduces plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with **ORLISTAT**

Vilanterol see Sympathomimetics, Beta2

Vildaglaptin see Antidiabetics

Vinblastine
- Aldesleukin: avoidance of vinblastine advised by manufacturer of **ALDESLEUKIN**
- Antibacterials: toxicity of vinblastine increased by **ERYTHROMYCIN**—avoid concomitant use; possible increased risk of ventricular arrhythmias when vinblastine given with **DELAMANID**
- Antifungals: possible increased risk of vinblastine toxicity when given with **ITRACONAZOLE**; metabolism of vinblastine possibly inhibited by **POSACONAZOLE** (increased risk of neurotoxicity)
- Antimalarials: avoidance of vinblastine advised by manufacturer of **ARTEMINOL WITH PIPERAQUINE**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by **RITONAVIR**

Vincristine
- Antibacterials: possible increased risk of ventricular arrhythmias when vincristine given with **DELAMANID**
- Antifungals: increased risk of vincristine toxicity when given with **ITRACONAZOLE**; metabolism of vincristine possibly inhibited by **POSACONAZOLE** (increased risk of neurotoxicity)
- Antimalarials: avoidance of vincristine advised by manufacturer of **ARTEMINOL WITH PIPERAQUINE**
- Antipsychotics: avoid concomitant use of cytoxotics with **CLOzapine** (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by **NIFEDIPINE**
- Cardiac Glycosides: vincristine possibly reduces absorption of **DIGOXIN** tablets
**Vincristine** (continued)
- Cytotoxics: increased risk of hepatotoxicity when vincristine given with **DACTINOMYCIN**

**Vindesine**
- Antibacterials: possible increased risk of ventricular arrhythmias when vindesine given with **DELAMANID**
- Antifungals: possible increased risk of vindesine toxicity when given with **ITRACONAZOLE**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis)

**Vinflunine**
- Antibacterials: plasma concentration of vinflunine possibly reduced by **RIFAMPICIN** — manufacturer of vinflunine advises avoid concomitant use; increased risk of ventricular arrhythmias when vinflunine given with **DELAMANID**
- Antidopaminergics: plasma concentration of vinflunine possibly reduced by **ST JOHN’S WORT** — manufacturer of vinflunine advises avoid concomitant use
- Antifungals: plasma concentration of vinflunine possibly increased by **KETOCONAZOLE** — manufacturer of vinflunine advises avoid concomitant use
- Antivirals: plasma concentration of vinflunine possibly increased by **Grapefruit Juice** — manufacturer of vinflunine advises avoid concomitant use

**Vinorelbine**
- Antibacterials: possible increased risk of neutropenia when vinorelbine given with **CLARITHROMYCIN**; possible increased risk of ventricular arrhythmias when vinorelbine given with **DELAMANID**
- Antidopaminergics: avoidance of vinorelbine advised by manufacturer of **ARTEMIMOL WITH PIPERAQUINE**
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinorelbine possibly increased by **RITONAVIR** — manufacturer of vinflunine advises avoid concomitant use
- Antifungals: plasma concentration of vinorelbine possibly increased by **GRAPeFRUIT JUICE** — manufacturer of vinflunine advises avoid concomitant use

**Vismodegib**
- Antibacterials: manufacturer of vismodegib advises avoid concomitant use with **RIFAMPICIN** (plasma concentration of vismodegib possibly reduced)
- Antidopaminergics: manufacturer of vismodegib advises avoid concomitant use with **ST JOHN’S WORT** (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with **CARBAMAZEPINE**, **FOSPHENYToin** and **PHENYTOIN** (plasma concentration of vismodegib possibly reduced)
- Antipsychotics: avoid concomitant use of cytotoxics with **CLOzapine** (increased risk of agranulocytosis)

**Vitamin A** see Vitamins

**Vitamin D** see Vitamins

**Vitamin E** see Vitamins

**Vitamin K (Phytonadione)** see Vitamins

**Vitamins**
- Anticoagulants: vitamin E possibly enhances anticoagulant effect of **COUMARINS**; vitamin K antagonises anticoagulant effect of **COUMARINS** and **PHENINDION**
- Antiepileptics: alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with **CARBAMAZEPINE**; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with **PHOSPHENYToin**; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with **PHENOBARBITAL**; alfacalcidol, calcitriol, colecalciferol,

**Vitamins**
- Antiepileptics (continued)
  - dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with **PHENYTOIN**; alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D requirements possibly increased when given with **PRIMIDONE**
  - Antifungals: plasma concentration of paricalcitol possibly increased by **KETOCONAZOLE**; effects of alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by **MICONAZOLE**
  - Antivirals: increased risk of bleeding when high doses of vitamin E given with **TIPRANAVIR**
  - Cisplatin: vitamin E possibly affects plasma concentration of **CICLOSPORIN**
  - Cytotoxics: effects of alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol and vitamin D possibly reduced by **DACTINOMYCIN**; avoidance of vitamin E advised by manufacturer of **IBRUTINIB**
  - Diuretics: increased risk of hypercalcaemia when alfacalcidol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalcitol or vitamin D given with **THIAZIDES AND RELATED DIURETICS**
  - Dopaminergics: pyridoxine reduces effects of **LEVODOPA** when given without dopa-decarboxylase inhibitor
  - Lipid-regulating Drugs: absorption of calcitriol possibly reduced by **COLESTYRAMINE** (give at least 1 hour before or 4 to 6 hours after colestatramine)
  - Retinoids: risk of hypervitaminosis A when vitamin A given with **RETINoIDS** — avoid concomitant use
  - Selenium: ascorbic acid possibly reduces absorption of **SELENIum** (give at least 4 hours apart)
  - Sevelamer: absorption of calcitriol reduced by **SEVELAMER** (give at least 1 hour before or 3 hours after sevelamer)

**Voriconazole** see Antifungals, Triazole

**Vortioxetine**
- Analgesics: possible increased serotonergic effects when vortioxetine given with **TRAMADOL**
- Antibacterials: plasma concentration of vortioxetine reduced by **RIFAMPICIN** — consider increasing dose of vortioxetine
- Antidepressants: plasma concentration of vortioxetine possibly increased by **FLUOXETINE** and **PAROXETINE** (consider reducing dose of vortioxetine); increased risk of hypertension and CNS excitation when vortioxetine given with **MAOIS** (vortioxetine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 2 weeks after stopping vortioxetine); manufacturer of vortioxetine advises avoid concomitant use with **LINEZOLID** and **MOLOBEMIDE**; possible increased risk of convulsions when vortioxetine given with **SSRI-RELATED ANTIdePRESSANTS**, **SSRIS** or **TRICYCLICS**; possible increased serotonergic effects when vortioxetine given with **ST JOHN’S WORT**
- Antiepileptics: plasma concentration of vortioxetine possibly reduced by **CARBAMAZEPINE**, **FOSPHENYToin** and **PHENYTOIN** — consider increasing dose of vortioxetine
- Antimalarials: avoidance of antidepressants advised by manufacturer of **ARTEMETHER WITH LUMEFANTRIN** and **ARTEMIMOL WITH PIPERAQUINE**; possible increased risk of convulsions when vortioxetine given with **MefLOQUINE**
- Antipsychotics: possible increased risk of convulsions when vortioxetine given with **BUTYROPHENONES**, **PHENOThIAZinEs** and **THIOXANTHENES**
- Atomoxetine: possible increased risk of convulsions when antidepressants given with **ATOMOXETINE**
- Bupropion: plasma concentration of vortioxetine increased by **BUPROPION** (consider reducing dose of vortioxetine)
- Dopaminergics: risk of CNS excitation and hypertension when vortioxetine given with **RASAGLINiNE** or **SELEGLiNINE**
- 5HT2-receptor Agonists: possible increased serotonergic effects when vortioxetine given with **5HT, AGONiSTS**

**Warfarin** see Coumarins

**Wasp Venom Extracts**
- ACE Inhibitors: possible severe anaphylactoid reaction when wasp venom extracts given with **ACE inhibitors**

**Xipamide** see Diuretics

**Xylometazoline** see Sympathomimetics
Yellow Fever Vaccine  see Vaccines
Zafirlukast  see Leukotriene Receptor Antagonists
Zaleplon  see Anxiolytics and Hypnotics

Zidovudine

- **NOTE** Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature
- Analgesics: increased risk of haematological toxicity when zidovudine given with **NSAIDs**; plasma concentration of zidovudine possibly increased by **METHADONE**
- Antibacterials: absorption of zidovudine reduced by **CLARITHROMYCIN** tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with **RIFAMPICIN**
- Antiepileptics: zidovudine increases or decreases plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN**; plasma concentration of zidovudine possibly increased by **SODIUM VALPROATE** and **VALPROIC ACID** (increased risk of toxicity)
- Antifungals: plasma concentration of zidovudine increased by **FLUCONAZOLE** (increased risk of toxicity)
- Antimalarials: increased risk of haematological toxicity when zidovudine given with **PYRIMETHAMINE**
- Antivirals: profound myelosuppression when zidovudine given with **GANCICLOVIR** or **VALGANCICLOVIR** (if possible avoid concomitant administration, particularly during initial ganciclovir or valganciclovir therapy); increased risk of granulocytopenia when zidovudine given with **NEVIRAPINE**; increased risk of anaemia when zidovudine given with **RIBAVIRIN**—avoid concomitant use; zidovudine possibly inhibits effects of **STAVUDINE** (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by **TIPRANAVIR**
- Atovaquone: plasma concentration of zidovudine increased by **ATOVAQUONE** (increased risk of toxicity)
- Efavirenz: caution with zidovudine advised by manufacturer of **NETUPITANT**
- Orlistat: absorption of zidovudine possibly reduced by **ORLISTAT**

Zinc

- Antibacterials: zinc reduces absorption of **CIPROFLOXACIN**, **LEVOFLOXACIN**, **NORFLOXACIN** and **OFLOXACIN** (give at least 2 hours apart); zinc reduces absorption of **MOXIFLOXACIN** (give at least 6 hours apart); zinc possibly reduces absorption of **TETRACYCLINES** (give at least 2 to 3 hours apart)
- Calcium Salts: absorption of zinc reduced by **CALCIUM SALTS**
- Eltrombopag: zinc possibly reduces absorption of **ELTROMBOPAG** (give at least 4 hours apart)
- Iron Salts: absorption of zinc reduced by oral **IRON SALTS**, also absorption of oral iron salts reduced by zinc
- Penicillamine: absorption of zinc reduced by **PENICILLAMINE**, also absorption of penicillamine reduced by zinc
- Trientine: absorption of zinc reduced by **TRIENTINE**, also absorption of trientine reduced by zinc

Zoledronic Acid  see Bisphosphonates
Zolmitriptan  see 5HT₁-receptor Agonists (under HT)
Zolpidem  see Anxiolytics and Hypnotics
Zonisamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIs** and **TRICYCLIC-RELATED ANTIDEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by **SSRIS** and **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: plasma concentration of zonisamide reduced by **CARBAMAZEPINE**, **FOSPHENYTOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **MEFLOQUINE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Diuretics: manufacturer of zonisamide advises avoid concomitant use with **CARBONIC ANHYDRASE INHIBITORS** in children
- Orlistat: possible increased risk of convulsions when antiepileptics given with **ORLISTAT**

Zopiclone  see Anxiolytics and Hypnotics

Zuclopenthixol  see Antipsychotics
In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee's advice and endorsed 'ACBS' will normally not be investigated.

Information

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note

Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements

For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as 'clinically lactose-free' or 'lactose-free' by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer's product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin. The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be consulted for more detailed information. Feeds containing medium chain triglycerides (MCT) should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values

Nutritional values of products vary with flavour and pack size—consult product literature.

Other conditions for which ACBS products can be prescribed

This is a list of clinical conditions for which the ACBS has approved toilet preparations.

BIRTHMARKS

Dermatitis

Eczema and Pruritus

Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)

Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

Disinfectants (antiseptics)

May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for
the treatment of patients, but not for general hygenic purposes.

**Dry mouth (xerostomia)**
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome. *AS Saliva Orthana®; Biotène Oralbalance®; BioXtra®; Glandosane®; Saliveze®.*

**Photodermatoses (skin protection in)**
*Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50*

**Standard ACBS indications:** Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula

Specialised formulas for specific clinical conditions:

- **Kindergen**
  - Energy: 421 kJ (101 kcal)
  - Protein: 1.5 g whey protein
  - Carbohydrate: 11.8 g (sugars 1.2 g)
  - Fat: 5.3 g (LCT 93 %)
  - Fibre: Nil
  - Special Characteristics: Electrolytes/100 mL: Na⁺ 2 mmol K⁺ 0.6 mmol Ca²⁺ 2.8 mmol P⁺ 3 mmol Low Vitamin A
  - ACBS Indications: Enteral feed or nutritional supplement for children with chronic renal failure receiving peritoneal rapid overnight dialysis.
  - Presentation & Flavour: Kindergen powder: 400 gram = £29.47

- **Modulen IBD**
  - Energy: 420 kJ (100 kcal)
  - Protein: 3.6 g casein
  - Carbohydrate: 11 g (sugars 3.98 g)
  - Fat: 4.7 g
  - Fibre: Nil
  - Special Characteristics: Gluten-free Residual lactose
  - ACBS Indications: Crohn’s disease active phase, and in remission if malnourished
  - Presentation & Flavour: Modulen IBD powder: 400 gram = £15.06

- **ProSure**
  - Energy: 536 kJ (127 kcal)
  - Protein: 6.65 g cows’ milk
  - Carbohydrate: 18.3 g (sugars 2.95 g)
  - Fat: 2.56 g
  - Fibre: 2.07 g
  - Special Characteristics: Gluten-free Residual lactose Contains fish oil
  - ACBS Indications: Nutritional supplement for patients with pancreatic cancer. Not suitable for child under 1 year; use with caution in child 1-4 years.
  - Presentation & Flavour: ProSure liquid: 220 ml = £3.34; 240 ml = £3.34

- **Renamil**
  - Energy: 2003 kJ (477 kcal)
  - Protein: 4.6 g cows’ milk
  - Carbohydrate: 70.8 g
  - Fat: 19.3 g
  - Fibre: Nil
  - Special Characteristics: Contains lactose Gluten-free Electrolytes/100 g: Na⁺ 1.04 mmol K⁺ 0.13 mmol Ca²⁺ 10.22 mmol P⁺ 1.06 mmol Contains no vitamin A or vitamin D
  - ACBS Indications: Enteral feed or nutritional supplement for adults and children over 1 year with chronic renal failure.
  - Presentation & Flavour: Renamil powder: 1000 gram = £25.40

- **Renapro**
  - Energy: 1580 kJ (372 kcal)
  - Protein: 90 g whey protein
  - Carbohydrate: 800 mg
  - Fat: 1 g
  - Fibre: Nil
  - Special Characteristics: Gluten-free Residual lactose Electrolytes/100 g: Na⁺ 23 mmol K⁺ 2 mmol Ca²⁺ 4.99 mmol P⁺ 4.84 mmol
  - ACBS Indications: Nutritional supplement for biochemically proven hypoproteinaemia and patients undergoing dialysis. Not suitable for child under 1 year.
  - Presentation & Flavour: Renapro powder: 600 gram = £69.60

- **Renastart**
  - Energy: 414 kJ (99 kcal)
  - Protein: 1.5 g cows’ milk soya
  - Carbohydrate: 12.5 g (sugars 1.3 g)
  - Fat: 4.8 g
  - Fibre: Nil
  - Special Characteristics: Contains lactose Electrolytes/100 mL: Na⁺ 2.1 mmol K⁺ 0.6 mmol Ca²⁺ 0.6 mmol P⁺ 0.6 mmol
  - ACBS Indications: Dietary management of renal failure in child from birth to 10 years.
  - Presentation & Flavour: Renastart powder: 400 gram = £26.37
### Table 4 Feed supplements

#### High-energy supplements

**High-energy supplements: carbohydrate**

Flavoured carbohydrate supplements are not suitable for child under 1 year; liquid supplements should be diluted before use in child under 5 years.

Feed additives

Special additives for conditions of intolerance

Colief®
- For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature.

Colief 50,000 units/g infant drops (Forum Health Products Ltd)
7 ml (ACBS) • NHS indicative price = £8.40

Fructose
- (Laevulose) For proven glucose/galactose intolerance

Glucose
- (Dextrose monohydrate) For use as an energy supplement in sucrose-isomaltase deficiency

VSL#3®
- Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature.

POWDER, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose.

VSL#3 Probiotic Food Supplement oral powder 4.4g sachets (Ferring Pharmaceuticals Ltd)
30 sachet (ACBS) • NHS indicative price = £34.36

Feed thickeners and pre-thickened drinks

Carobel, Instant®
- For thickening feeds in the treatment of vomiting.

POWDER, carob seed flour.

Instant Carobel powder (Cow & Gate Ltd)
135 gram (ACBS) • NHS indicative price = £2.84

Multi-thick®
- For thickening of liquids and foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive. POWDER, modified maize starch, gluten- and lactose-free.

POWDER, carbohydrate content varies with consistency (3 consistencies available), see product literature.

Multi-thick powder (Abbott Laboratories Ltd)
250 gram (ACBS) • NHS indicative price = £4.83

Nutilis® Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

POWDER, maltodextrin, xanthan gum, guar gum, gluten- and lactose-free.

Nutilis Clear powder (Nutricia Ltd)
72 gram (ACBS) • NHS indicative price = £11.04 | 175 gram (ACBS) • NHS indicative price = £8.46

Nutilis® Powder
- For thickening of foods in dysphagia. Not suitable for children under 3 years.

POWDER, carbohydrate 86 g, energy 1520 kJ (358 kcal)/100 g, modified maize starch, gluten- and lactose-free.

Nutilis powder (Nutricia Ltd)
240 gram (ACBS) • NHS indicative price = £6.60 | 300 gram (ACBS) • NHS indicative price = £5.01

Resource® Thickened Drink
- For dysphagia. Not suitable for children under 1 year.

LIQUID, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 376 kJ (89 kcal)/100 mL. Gluten- and lactose-free.

Resource Thickened Drink custard apple (Nestle Health Science)
114 ml (ACBS) • NHS indicative price = £0.73

Resource Thickened Drink custard orange (Nestle Health Science)
114 ml (ACBS) • NHS indicative price = £0.73

Resource Thickened Drink syrup apple (Nestle Health Science)
114 ml (ACBS) • NHS indicative price = £0.73

Resource Thickened Drink syrup orange (Nestle Health Science)
114 ml (ACBS) • NHS indicative price = £0.73

Resource® Thickened Clear
- For thickening of liquids or foods in dysphagia. Not suitable for children under 3 years.

POWDER, maltodextrin, xanthan gum, gluten- and lactose-free.

Resource Thickened Clear powder (Nestle Health Science)
28.8 gram (ACBS) • NHS indicative price = £5.28 | 125 gram (ACBS) • NHS indicative price = £8.46

Resource® Thickened Clear
- For thickening of foods in dysphagia. Not suitable for children under 1 year.

POWDER, modified maize starch. Gluten- and lactose-free.

Resource Thickened Clear powder (Nestle Health Science)
227 gram (ACBS) • NHS indicative price = £4.66 | 337.5 gram (ACBS) • NHS indicative price = £17.86

SLO Drinks®
- Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years.

POWDER, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature.

SLO Drink 1 oral powder lemon (SLO Drinks Ltd)
25 cup (ACBS) • NHS indicative price = £7.50

SLO Drink 1 oral powder orange (SLO Drinks Ltd)
25 cup (ACBS) • NHS indicative price = £7.50

SLO Drink 1 oral powder hot chocolate (SLO Drinks Ltd)
25 cup (ACBS) • NHS indicative price = £7.50

124 gram (ACBS) • NHS indicative price = £6.36
Nutritional supplements for metabolic diseases

Glutaric aciduria (type 1)

**GA Gel®**
- Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years.
  - GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**GA Anamix® Infant**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria.
  - POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Anamix products are generally intended for use in children 1–8 years.

**GAI Maxamaid**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria.
  - POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

**XLYS, TRY Glutaridon®**
- Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements.
  - POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

**Glycogen storage disease**

**Corn flour and corn starch**
- For glycogen storage disease

**Glycosade®**
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years.
  - POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

**Glycosade oral powder 60g sachets** (Vitaflor International Ltd)
- 30 sachet (ACBS) • NHS indicative price = £111.65

**Homocystinuria or hypermethioninaemia**

**HCU Anamix® Infant**
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years.
  - POWDER, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**HCU Anamix Infant powder** (Nutricia Ltd)
- 400 gram (ACBS) • NHS indicative price = £39.45

**HCU cooler® 15**
- A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria.
  - LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 393 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.

**HCU orange cooler 15 liquid** (Vitaflor International Ltd)
- 150 ml (ACBS) • NHS indicative price = £11.21

**HCU Express® 15**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.5 kcal)/25 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.

**HCU express 15 oral powder 25g sachets** (Vitalfo International Ltd) 30 sachet (ACBS) - NHS indicative price = £329.89

**HCU Express® 20**
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria.
- POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.

**HCU express 20 oral powder 34g sachets** (Vitalfo International Ltd) 30 sachet (ACBS) - NHS indicative price = £426.21

**HCU gel®**
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria.
- POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.

**HCU gel oral powder 24g sachets** (Vitalfo International Ltd) 30 sachet (ACBS) - NHS indicative price = £212.38

**HCU Lophlex® LQ 20**
- Nutritional supplement for the dietary management of homocystinuria in children over 5 years.
- LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**HCU Lophlex LQ 20 liquid** (Nutricia Ltd) 125 mL (ACBS) - NHS indicative price = £16.27

**HCU LV®**
- Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years.
- POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8 g sachet, with vitamins, minerals, and trace elements.

**HCU-LV oral powder 27.8g sachets tropical** (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £50.10

**HCU-LV oral powder 27.8g sachets unflavoured** (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £50.10

**XMET Homidon®**
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids, except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**XMET Homidon powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £188.69

**HCU Maxamaid®**
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria.
- POWDER, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**HCU Maxamaid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £159.66

**Hyperlysinaemia**

**HYPER LYS Anamix® Infant**
- Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 15.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kcal (69 kcal)/100 mL.

**HYPER LYS Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £29.45

**HYPER LYS Maxamaid®**
- Nutritional supplement for the dietary management of hyperlysinaemia.
- POWDER, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**HYPER LYS Maxamaid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £99.61

**Isovaleric acidemia**

**IVA Anamix® infant**
- Nutritional supplement for the dietary management of proven isovaleric acidemia or other proven disorders of leucine metabolism in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kcal (69 kcal)/100 mL.

**IVA Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £39.45

**IVA Maxamaid®**
- Nutritional supplement for the dietary management of isovaleric acidemia.
- POWDER, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**IVA Maxamaid powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £99.61

**Maple syrup urine disease**

**MSUD Aid III®**
- Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids.
- POWDER, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**MSUD Aid 111 powder** (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £188.69
**Nutritional supplement for the dietary management of maple syrup urine disease in children from birth to 3 years.**

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 15.1 g, carbohydrate 49.9 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MSUD Anamix Infant Powder** (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £39.45

**MSUD Anamix Infant**

Nutritional supplement for the dietary management of proven maple syrup urine disease in children 1–10 years.

**Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.

**MSUD Anamix Infant Powder liquid** (Nutricia Ltd)

125 ml (ACBS) • NHS indicative price = £9.15

**MSUD cooler 15**

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years. **Liquid**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 595 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements.

**MSUD orange cooler 15 Liquid** (Vitafluo International Ltd)

130 ml (ACBS) • NHS indicative price = £11.21

**MSUD red cooler 15 Liquid** (Vitafluo International Ltd)

130 ml (ACBS) • NHS indicative price = £11.21

**MSUD express 15**

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults. **Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1570.

**MSUD express 15 Oral Powder 25g Sachet** (Vitafluo International Ltd)

30 sachet (ACBS) • NHS indicative price = £329.89

**MSUD express 20**

Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults. **Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1570.

**MSUD express 20 Oral Powder 34g Sachets** (Vitafluo International Ltd)

30 sachet (ACBS) • NHS indicative price = £426.21

**MSUD Gel**

Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years. **Powder**, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 10 g, carbohydrate 10.5 g, fat less than 100 mg, energy 539 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1570.

**MSUD gel 24g Sachets** (Vitafluo International Ltd)

30 sachet (ACBS) • NHS indicative price = £214.88

**MSUD Lophex LQ 20**

Nutritional supplement for the dietary management of maple syrup urine disease in children over 5 years. **Liquid**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

**MSUD Lophex LQ 20 Liquid** (Nutricia Ltd)

125 ml (ACBS) • NHS indicative price = £16.27

**MSUD Maxamaid**

Nutritional supplement for the dietary management of maple syrup urine disease. **Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**MSUD Maxamaid Powder** (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £99.61

**MSUD Maxaxum**

Nutritional supplement for the dietary management of maple syrup urine disease. **Powder**, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxaxum products are generally intended for use in children over 8 years.

**MSUD Maxaxum Powder Orange** (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £159.66

**MSUD Maxaxum Powder Unflavoured** (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £159.66

**Methylmalonic or propionic acidaemia**

**MMA/PA Anamix Infant**

Nutritional supplement for the dietary management of proven methylmalonic acidemia or propionic acidemia in children from birth to 3 years.

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

**MMA/PA Anamix Infant Powder** (Nutricia Ltd)

400 gram (ACBS) • NHS indicative price = £39.45

**XMTVI Asadon**

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia in children and adults.

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.

**XMTVI Asadon Powder** (Nutricia Ltd)

200 gram (ACBS) • NHS indicative price = £75.47

**MMA/PA Maxamaid**

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia.

**Powder**, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

**MMA/PA Maxamaid Powder** (Nutricia Ltd)

500 gram (ACBS) • NHS indicative price = £99.61

**MMA/PA Maxaxum**

Nutritional supplement for the dietary management of methylmalonic acidemia or propionic acidemia.
Nutritional supplements for metabolic diseases

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum powders are generally intended for use in children over 8 years.

MMA/PA Maxamum powder® (Nutricia Ltd) 500 gram (ACBS) - NHS indicative price = £159.66

Other inborn errors of metabolism

Cystine500® • Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, cystine 500 mg, carbohydrate 3.5 g, fat nil, energy 63 kJ (15 kcal)/4 g
Cystine500 oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £55.00

DocOmega® • Nutritional supplement for the dietary management of inborn errors of metabolism for adults from birth.
POWDER, protein (cows milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals
DocOmega oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £29.06

EAA® Supplement • Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders in children over 3 years.
POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.
EAA Supplement oral powder 12.5 g sachets® (Vitafo International Ltd) 50 sachet (ACBS) - NHS indicative price = £203.64

Isolucine50® • Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g
Isolucine50 oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.97

KeyOmega® • Nutritional supplement for the dietary management of inborn errors of metabolism.
POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g.
KeyOmega oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £39.94

Leucine100® • Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g
Leucine100 oral powder sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.97

Low protein drink • Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.
POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Termed Milupa® lp-drink by manufacturer.
Milupa LP drink® (Nutricia Ltd) 400 gram (ACBS) - NHS indicative price = £9.36

Phenylalanine50® • Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.
POWDER, phenylalanine 50 mg, carbohydrate 5.8 g, fat nil, energy 63 kJ (15 kcal)/4 g
Phenylalanine50 oral powder sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £52.40

ProZero® • A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.
LIQUID, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.
ProZero liquid® (Vitafo International Ltd) 250 ml (ACBS) - NHS indicative price = £1.44 | 1000 ml (ACBS) - NHS indicative price = £5.75

Tyrosine1000® • Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.
Tyrosine1000 oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £4.95

Valine50® • Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g
Valine50 oral powder 4 g sachets® (Vitafo International Ltd) 30 sachet (ACBS) - NHS indicative price = £53.97

Phenylketonuria

Add Ins® • Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years.
POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements.
Add Ins oral powder 18.2 g sachets® (Nutricia Ltd) 60 sachet (ACBS) - NHS indicative price = £381.00

Easiphen® • Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.
LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.
Easiphen liquid® (Nutricia Ltd) 250 ml (ACBS) - NHS indicative price = £9.79

L-Tyrosine • Nutritional supplement for the dietary management of phenylketonuria in pregnant women with low plasma tyrosine concentrations.
POWDER, L-tyrosine 20 g, carbohydrate 76.8 g, fat nil, energy 1612 kJ (379 kcal)/100 g.
L-Tyrosine powder® (Nutricia Ltd) 100 gram (ACBS) - NHS indicative price = £22.22

Lophlex® • Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, fibre 220 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements.
Lophlex powder 27.8 g sachets® (Nutricia Ltd) 30 sachet (ACBS) - NHS indicative price = £294.00
Nutritional supplements for metabolic diseases

Lophex powder 27.8g sachets orange (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £294.00
Lophex powder 27.8g sachets unflavoured (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £294.00
Lofrophen® PKU Drink
Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults.
LIQUID, protein (cows' milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL.
Lofrophen PKU drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £0.76
Lofrophen® Sno-Pro
Nutritional supplement for the dietary management of phenylketonuria and similar amino acid abnormalities.
LIQUID, protein (cows' milk) 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL.
Lofrophen Sno-Pro drink (Nutricia Ltd)
200 ml (ACBS) - NHS indicative price = £1.27
Phlexy-10® Exchange System
Nutritional supplement for the dietary management of phenylketonuria.
CAPSULES, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule.
Phlexy-10 500mg capsules (Nutricia Ltd)
200 capsule (ACBS) - NHS indicative price = £44.00
TABLETS, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg tablet.
Phlexy-10 tablets (Nutricia Ltd)
75 tablet (ACBS) - NHS indicative price = £28.50
DRINK MIX, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.35 g, carbohydrate 8.8 g/20-g sachet.
Phlexy-10 drink mix apple & blackcurrant (Nutricia Ltd)
600 gram (ACBS) - NHS indicative price = £130.20
Phlexy-10 drink mix citrus burst (Nutricia Ltd)
600 gram (ACBS) - NHS indicative price = £130.20
Phlexy-10 drink mix tropical surprise (Nutricia Ltd)
600 gram (ACBS) - NHS indicative price = £130.20
Phlexy-Vits
For use as a vitamin and mineral component of restricted therapeutic diets in children over 11 years and adults with phenylketonuria and similar amino acid abnormalities.
POWDER, vitamins, minerals, and trace elements
Phlexy-Vits powder (Nutricia Ltd)
210 gram (ACBS) - NHS indicative price = £72.30
TABLETS, vitamins, minerals, and trace elements
Phlexy-Vits tablets (Nutricia Ltd)
180 tablet (ACBS) - NHS indicative price = £82.80
PK Aid 4®
Nutritional supplement for the dietary management of phenylketonuria in children and adults.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (354 kcal)/100 g.
PK Aid 4 powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £145.04
PKU Anamix Junior LQ®
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.
PKU Anamix Junior LQ liquid berry (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £5.69
PKU Anamix® Infant
Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
PKU Anamix® Infant powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £35.86
PKU Anamix® Junior
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, fat 3.9 g, energy 455 kJ (108 kcal)/29-g sachet, with vitamins, minerals, and trace elements.
PKU Anamix Junior powder chocolate (Nutricia Ltd)
1080 gram (ACBS) - NHS indicative price = £128.10
PKU Anamix Junior powder neutral (Nutricia Ltd)
1080 gram (ACBS) - NHS indicative price = £128.10
PKU Anamix® Junior LQ
Nutritional supplement for the dietary supplement of phenylketonuria in children 1–10 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free.
PKU Anamix Junior LQ liquid berry (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £5.69
PKU Anamix Junior LQ liquid orange (Nutricia Ltd)
125 ml (ACBS) - NHS indicative price = £5.69
PKU cooler®
Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements.
PKU orange cooler 10 liquid (Vitaflora International Ltd)
87 ml (ACBS) - NHS indicative price = £4.56
PKU purple cooler 10 liquid (Vitaflora International Ltd)
87 ml (ACBS) - NHS indicative price = £4.56
PKU red cooler 10 liquid (Vitaflora International Ltd)
87 ml (ACBS) - NHS indicative price = £4.56
PKU white cooler 10 liquid (Vitaflora International Ltd)
87 ml (ACBS) - NHS indicative price = £4.56
PKU cooler®
Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 586 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements.
PKU orange cooler 15 liquid (Vitaflora International Ltd)
130 ml (ACBS) - NHS indicative price = £6.80
PKU purple cooler 15 liquid (Vitaflora International Ltd)
130 ml (ACBS) - NHS indicative price = £6.80
PKU red cooler 15 liquid (Vitaflora International Ltd)
130 ml (ACBS) - NHS indicative price = £6.80
PKU white cooler 15 liquid (Vitaflora International Ltd)
130 ml (ACBS) - NHS indicative price = £6.80
PKU cooler®
Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements.
PKU orange cooler 20 liquid (Vitaflora International Ltd)
174 ml (ACBS) - NHS indicative price = £9.12
PKU purple cooler 20 liquid (Vitaflo International Ltd) 174 ml (ACBS) · NHS indicative price = £9.12
PKU red cooler 20 liquid (Vitaflo International Ltd) 174 ml (ACBS) · NHS indicative price = £9.12
PKU white cooler 20 liquid (Vitaflo International Ltd) 174 ml (ACBS) · NHS indicative price = £9.12
PKU express®
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 295 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.
PKU express 15 powder lemon (Vitaflo International Ltd) 750 gram (ACBS) · NHS indicative price = £200.00
PKU express 15 powder orange (Vitaflo International Ltd) 750 gram (ACBS) · NHS indicative price = £200.00
PKU express 15 powder tropical (Vitaflo International Ltd) 750 gram (ACBS) · NHS indicative price = £200.00
PKU express 15 powder unflavoured (Vitaflo International Ltd) 750 gram (ACBS) · NHS indicative price = £200.00
PKU express®
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 3.3 g, energy 389 kJ (93 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.
PKU express 20 powder lemon (Vitaflo International Ltd) 1020 gram (ACBS) · NHS indicative price = £258.39
PKU express 20 powder orange (Vitaflo International Ltd) 1020 gram (ACBS) · NHS indicative price = £258.39
PKU express 20 powder tropical (Vitaflo International Ltd) 1020 gram (ACBS) · NHS indicative price = £258.39
PKU express 20 powder unflavoured (Vitaflo International Ltd) 1020 gram (ACBS) · NHS indicative price = £258.39
PKU gel®
- For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.
PKU gel powder lemon (Vitaflo International Ltd) 720 gram (ACBS) · NHS indicative price = £138.36
PKU gel powder orange (Vitaflo International Ltd) 720 gram (ACBS) · NHS indicative price = £138.36
PKU gel powder raspberry (Vitaflo International Ltd) 720 gram (ACBS) · NHS indicative price = £138.36
PKU gel powder unflavoured (Vitaflo International Ltd) 720 gram (ACBS) · NHS indicative price = £138.36
PKU Lophlex® LQ 20
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements.
PKU Lophlex LQ 20 liquid berry (Nutricia Ltd) 125 ml (ACBS) · NHS indicative price = £10.47
PKU Lophlex LQ 20 liquid juicy berries (Nutricia Ltd) 125 ml (ACBS) · NHS indicative price = £10.47
PKU Lophlex LQ 20 liquid orange (Nutricia Ltd) 125 ml (ACBS) · NHS indicative price = £10.47
PKU Lophlex® Sensation 20
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women. SEMI-SOLID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements.
PKU Sensation 20 berries (Nutricia Ltd) 327 gram (ACBS) · NHS indicative price = £33.45
PKU Sensation 20 orange (Nutricia Ltd) 327 gram (ACBS) · NHS indicative price = £33.45
PKU squeeze®
- Nutritional supplement for the dietary management of phenylketonuria in children from 6 months to 10 years. LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 22.5 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.
PKU squeeze liquid (Vitaflo International Ltd) 2550 gram (ACBS) · NHS indicative price = £132.27
PKU Maxamaid®
- Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.
PKU Maxamaid powder orange (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £58.92
PKU Maxamaid powder unflavoured (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £58.92
PKU Maxamum®
- Nutritional supplement for the dietary management of phenylketonuria in children over 8 years and adults. POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.
PKU Maxamum oral powder 50g sachets orange (Nutricia Ltd) 30 sachet (ACBS) · NHS indicative price = £273.30
PKU Maxamum oral powder 50g sachets unflavoured (Nutricia Ltd) 30 sachet (ACBS) · NHS indicative price = £273.30
PKU Maxamum powder orange (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £91.14
PKU Maxamum powder unflavoured (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £91.14
Tyrosinaemia

Methionine-free TYR Anamix® Infant
- Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
TYR Anamix Infant methionine free powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
TYR Anamix Infant methionine free powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 475 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements.
TYR Anamix Junior oral powder 29g sachets (Nutricia Ltd)
- Nutritional supplement for the management of tyrosinaemia in children over 3 years and adults.
XPTM Tyrosidon powder (Vitaflo International Ltd)
- Nutritional supplement for the management of tyrosinaemia in children over 3 years and adults.
XPHEN TYR Tyrosidon Free AA Mix powder
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.
TYR Maxamaid powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements.
TYR express20®
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.
TYR express 20 oral powder 34g sachets (Vitaflo International Ltd)
- Nutritional supplement for the dietary management of proven tyrosinaemia in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.5 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.
TYR Gel®
- Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.
XPTM Tyrosidon
- Nutritional supplement for the dietary management of tyrosinaemia in children over 3 years and adults.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.
TYR Lophlex LQ 20 liquid (Nutricia Ltd)
- Nutritional supplement for the management of tyrosinaemia in children 1–8 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 509 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements.
TYR Maxamaid®
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 15 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.
XPHEN TYR Tyrosidon Free AA Mix powder
- Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 7 g, fat 500 mg, energy 395 kJ (92 kcal)/130 mL, with vitamins, minerals, and trace elements.
TYR express 15 oral powder 25g sachets (Vitaflo International Ltd)
- Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.5 g, fat less than 100 mg, energy 339 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.
TYR Lophlex LQ 20 oral powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 20 g, carbohydrate 8.8 g, fat less than 500 mg, fibre 500 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.
TYR Maxamaid Powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 15 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g.
TYR Maxamaid powder (Nutricia Ltd)
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements.
TYR express 20 oral powder 34g sachets (Vitaflo International Ltd)
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/34 g, with vitamins, minerals, and trace elements. To flavour unflavoured products, see FlavourPac p. 1370.
TYR express 20 oral powder 34g sachets (Vitaflo International Ltd)
Appendix 3
Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discolouration of urine or stools by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if enquired the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard…. days after opening’ and ‘Do not use after….’, which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, ‘For external use only’ is a legal requirement on external liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF 61 (March 2011), a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1-19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label. These appear directly under the English label.

Labels

1 Warning: This medicine may make you sleepy

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd
To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy, if this happens, do not drive or use tools or machines. Do not drink alcohol

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd. Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd. Peidiwch ag yfed alcool
To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking...
the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 5). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines

Rhybudd: Gall y feddygyniaeth hon eich gwneud yn gysglyd. Peidiwch à gyrru, defnyddio offer llaw newi beirianuau os wv hyn yn digwyd

To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealkoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol

Rhybudd: Peidiwch ag yfed alcohol

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine

Peidiwch à chymryd meddygyniaethau camdreffiai 2 awr neu ar ôl y feddygyniaeth hon

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch à chymryd meddygyniaethau camdreffiai neu feddygyniaethau sy’n cynwys haearn neu sinc, 2 awr cyn neu ar ôl y feddygyniaeth hon

To be used on preparations containing ofoxacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine

Peidiwch à chymryd llæth, meddygyniaethau camdreffiai, neu feddygyniaeth sy’n cynwys haearn neu sinc, 2 awr cyn neu ar ôl cymryd y feddygyniaeth hon

To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

Doxycycline, lymecycline, and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop

Rhybudd: Peidiwch â stopio cymryd y feddygyniaeth hon, oni bai fod eich meddyg yn dweud wrthych am stopio

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs). Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop

Gadewch yr un faint o amser rhwng pob dôs yn ystod y dydd. Parhewch i gyrru y feddygyniaeth hon bos b y cyfan wedi’i offen, oni bai eich bod yn cael cyngor i stopio

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving cindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine

Rhybudd: Darllenwch y wybodaeth ychwanegol gyda’r feddygyniaeth hon

To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds

Diogelwch eich croen rhag golau’r haul, hyd yn oed ar ddiwrnod braf ond cymylog. Peidiwch à defnyddio gwely haul

To be used on preparations that may cause photosxic or phototaergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine

Peidiwch â chymryd un rhwyb eth sy’n cynwys aspirin gyda’r feddygyniaeth hon

To be used on preparations containing sulfinpyrazone whose activity is reduced by aspirin.

Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking

Gadewch i doddi mewn dwr cyn ei gymryd

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.
14 This medicine may cause irritation to your urine. This is harmless.

Gal y feddyginiæth hon liwio eich dŵr. Nid yw hyn yn arwydd o ddŵr.

To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames.

Rhybudd: Fflamadwy. Ar ôl rhoi’r feddyginiæth ymlaen, cadwch yn glir o dân neu fflamau.

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue–do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.

Rhowch y dabled i doddi dan eich tafod - peidiwch â i lyncu. Cadwch y tablidi yn y botel yma gyda’r caead wedi’i gau yn dynn. Gofynnwch am dabledi newydd 8 wythnos ar ôl el hagor.

To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to the plastic or less suitable containers.

17 Do not take more than... in 24 hours

Peidiwch â chymryd mwy na... mewn 24 awr

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules.

It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than... in 24 hours. Also, do not take more than... in any one week

Peidiwch â chymryd mwy na... mewn 24 awr. Hefyd, peidiwch â chymryd mwy na... mewn wythnos.

To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol.

Rhybudd: Bydd y feddyginiæth hon yn eich gwneud yn gysglyd. Os ydych yn da i dei’m o gysglyd drannoeith, peidiwch â gyrru, defnyddio offer llaw neu bei’ranau. Peidiwch agh yfed alcohol

To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions when hypnotics are prescribed for daytime administration (e.g. nitrazepam in epilepsy), this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

20 Take with or just after food, or a meal

Cymerwch gyda neu ar ôl bwyd

To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.

Patients should be advised that a small amount of food is sufficient.

21 Take 30 to 60 minutes before food

Cymerwch 30 i 60 munud cyn bwyd

To be used on some preparations whose absorption is thereby improved.

Most oral antibacterials require label 23 instead (see below).

22 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food

Cymerwch y feddyginiæth hon ar stumog wag. Mae hyn yn golygu awr cyn, neu 2 awr ar ôl bwyd

To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine

Bydd angen cooi neu sugno’r feddyginiæth hon

To be used on preparations that should be sucked or chewed.

The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or crush

Llynchwch yn gyfan. Peidiwch â choi neu fal’u fân.

To be used on preparations that are enteric-coated or designed for modified-release.

Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.

Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue

Gadewch i’r feddyginiæth hon doddi o dan y tafod

To be used on preparations designed for sublingual use.

Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water

Cymerwch gyda llond gwydr o ddŵr

To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only

Taenwch yn demau ar y croen sydd wedi’i efethio yn unig

To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours

Peidiwch â chymryd mwy na 2 ar unrhyw un adeg. Peidiwch â chymryd mwy nag 8 mewn 24 awr

To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules.

This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well

Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw beth arall sy’n cynnwys paracetamol tra’n cymryd y feddyginiæth hon. Siaradwch gyda’ch meddyg ar unwaith os ydych yn cymryd gormod, hyd yn oed os ydych yn teimlo’n iawn

To be used on all containers of dispensed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine

Yn cynnwys aspirin. Peidiwch â chymryd unrhyw beth arall sy’n cynnwys aspirin tra’n cymryd y feddyginiæth hon

To be used on all containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.
Appendix 4
Wound management products and elasticated garments

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are: cleansing, removal of debris; granulation, vascularisation; epithelialisation. The ideal dressing for moist wound healing needs to ensure that the wound remains: moist with exudate, but not macerated; free of clinical infection and excessive slough; free of toxic chemicals, particles or fibres; at the optimum temperature for healing; undisturbed by the need for frequent changes; at the optimum pH value. As wound healing passes through its different stages, different types of dressings may be required to satisfy better one or other of these requirements. Under normal circumstances, a moist environment is a necessary part of the wound healing process; exudate provides a moist environment and promotes healing, but excessive exudate can cause maceration of the wound and surrounding healthy tissue. The volume and viscosity of exudate changes as the wound heals. There are certain circumstances where moist wound healing is not appropriate (e.g. gangrenous toes associated with vascular disease).

Advanced wound dressings are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginates, foams).

Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water.

Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris. There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers' Guide: Advanced wound dressings (October 2008); NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing.

Prices quoted in Appendix 4 are basic NHS net prices; for further information see Prices in the BNF under How to use the BNF.

The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

### Basic wound contact dressings

#### Low adherence dressing

Low adherence dressings are used as interface layers under secondary absorbent dressings. Placed directly on the wound bed, non-absorbent, low adherence dressings are suitable for clean, granulating, lightly exuding wounds without necrosis, and protect the wound bed from direct contact with secondary dressings. Care must be taken to avoid granulation tissue growing into the weave of these dressings.
Wound contact material for different types of wounds

Note: In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces absorbency of the dressing. Dressings with a reduced content (light loading) of soft paraffin are less liable to interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer. Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

**Knitted polyester primary dressing**

**Atrauman**

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides

**Atrauman dressing** (Paul Hartmann Ltd) 10cm × 20cm = £0.63, 20cm × 30cm = £1.74, 5cm × 5cm = £0.27, 7.5cm × 10cm = £0.28

**Knitted viscose primary dressing**

**N-A Dressing**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm = £0.67, 9.5cm × 9.5cm = £0.35

**N-A Ultra**

Warp knitted fabric manufactured from a bright viscose monofilament.

**N-A Ultra dressing** (Systagenix Wound Management Ltd) 19cm × 9.5cm = £0.63, 9.5cm × 9.5cm = £0.33

**Profore**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Profore** (Smith & Nephew Healthcare Ltd) wound contact layer 14cm × 20cm = £0.32

**Tricotex**

Warp knitted fabric manufactured from a bright viscose monofilament.

**Tricotex dressing** (Smith & Nephew Healthcare Ltd) 9.5cm × 9.5cm = £0.34

**Paraffin Gauze Dressing**

**Cuticell**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

**Cuticell** (BSN medical Ltd) classic dressing 10cm × 10cm = £0.29

**Jelonet**

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

**Jelonet dressing** (Smith & Nephew Healthcare Ltd) 10cm × 10cm = £0.41
Neotulle
(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

Paragauze
(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin; for light or normal loading

Paranet
(C D Medical Ltd) dressing 10cm × 10cm= £0.28

Absorbent dressings
Perforated film absorbent dressings are suitable only for wounds with mild to moderate amounts of exudate; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate. Dressings with an absorbent cellulose or polymer wadding layer are suitable for use on moderately to heavily exuding wounds.

Absorbent cellulose dressing

CelluDress
Absorbent Cellulose Dressing with Fluid Repellent Backing

CelluDress dressing (Medicareplus International Ltd) 10cm × 10cm = £0.19, 10cm × 15cm = £0.20, 10cm × 20cm = £0.22, 15cm × 20cm = £0.30, 20cm × 25cm = £0.40, 20cm × 30cm = £0.85

Eclipse
Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclipse dressing (Advanced Medical) Boot dressing 60cm × 70cm= £13.78, dressing 15cm × 15cm = £0.97, 20cm × 30cm = £2.14, 60cm × 40cm= £8.15

Exu-Dry
Absorbent Cellulose Dressing with Fluid Repellent Backing

Exu-Dry dressing (Smith & Nephew Healthcare Ltd) 10cm × 15cm= £1.14, 15cm × 23cm= £2.32, 23cm × 38cm= £5.40

Mesorb
Cellulose wadding pad with gauze wound contact layer and non-woven repellent backing

Mesorb dressing (Möhlycke Health Care Ltd) 10cm × 10cm= £0.62, 10cm × 15cm= £0.81, 10cm × 20cm= £1.00, 15cm × 20cm= £1.43, 20cm × 25cm= £2.25, 20cm × 30cm= £2.55

Telfa Max
Absorbent Cellulose Dressing with Fluid Repellent Backing

Zetuv E
Absorbent Cellulose Dressing with Fluid Repellent Backing; sterile or non-sterile

Zetuv E (Paul Hartmann Ltd) non-sterile dressing 10cm × 10cm= £0.07, 10cm × 20cm= £0.09, 20cm × 20cm= £0.14, 20cm × 40cm= £0.28, sterile dressing 10cm × 10cm= £0.21, 10cm × 20cm= £0.25, 20cm × 20cm= £0.39, 20cm × 40cm= £1.11

Absorbent perforated dressing

Adpore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Adpore dressing (Medicareplus International Ltd) 10cm × 10cm= £0.10, 10cm × 15cm= £0.16, 10cm × 20cm= £0.30, 10cm × 25cm= £0.34, 10cm × 30cm= £0.42, 10cm × 35cm= £0.50, 7cm × 8cm= £0.08

Cosmopore E
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border

Cosmopore E dressing (Paul Hartmann Ltd) 10cm × 20cm= £0.46, 10cm × 25cm= £0.56, 10cm × 35cm= £0.78, 5cm × 7.2cm = £0.08, 8cm × 10cm= £0.18, 8cm × 15cm= £0.28

Cutiplast Steril
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cutiplast Steril dressing (Smith & Nephew Healthcare Ltd) 10cm × 20cm= £0.31, 10cm × 25cm= £0.32, 10cm × 30cm= £0.43, 8cm × 10cm= £0.11, 8cm × 15cm= £0.25

Leukomed
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Leukomed dressing (BSH medical Ltd) 10cm × 20cm= £0.43, 10cm × 25cm= £0.49, 10cm × 30cm= £0.63, 10cm × 35cm= £0.72, 5cm × 7.2cm= £0.09, 8cm × 10cm= £0.18, 8cm × 15cm= £0.32

Medipore + Pad
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medipore + Pads dressing (3M Health Care Ltd) 10cm × 10cm= £0.15, 10cm × 15cm= £0.25, 10cm × 20cm= £0.37, 10cm × 25cm= £0.46, 10cm × 35cm= £0.64, 5cm × 7.2cm= £0.07

Medisafe
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Medisafe dressing (Neomedic Ltd) 6cm × 8cm= £0.08, 8cm × 10cm= £0.13, 8cm × 12cm= £0.23, 9cm × 15cm= £0.29, 9cm × 20cm= £0.34, 9cm × 25cm= £0.36

Mepore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Mepore dressing (Mohlycke Health Care Ltd) 10cm × 11cm= £0.22, 11cm × 15cm= £0.38, 7cm × 8cm= £0.11, 8cm × 20cm= £0.44, 9cm × 25cm= £0.61, 9cm × 30cm= £0.70, 9cm × 35cm= £0.76

PremierPore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

PremierPore dressing (Sherwood) 10cm × 10cm= £0.12, 10cm × 15cm= £0.18, 10cm × 20cm= £0.32, 10cm × 25cm= £0.36, 10cm × 30cm= £0.45, 10cm × 35cm= £0.52, 5cm × 7cm= £0.05

Primapore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Primapore dressing (Smith & Nephew Healthcare Ltd) 10cm × 20cm= £0.44, 10cm × 25cm= £0.50, 10cm × 30cm= £0.63, 10cm × 35cm= £0.97, 6cm × 8.3cm= £0.18, 8cm × 10cm= £0.19, 8cm × 15cm= £0.34

Softpore
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Softpore dressing (Richardson Healthcare Ltd) 10cm × 10cm= £0.13, 10cm × 15cm= £0.20, 10cm × 20cm= £0.35, 10cm × 25cm= £0.40, 10cm × 30cm= £0.49, 10cm × 35cm= £0.56, 6cm × 7cm= £0.06

Sterifix
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Telfa Island
Low-adherence primary dressing consisting of viscose and rayon absorbent pad with adhesive border.

Telfa Island dressing (Aria Medical Ltd) 10cm × 12.5cm= £0.27, 10cm × 20cm= £0.35, 10cm × 25cm= £0.45, 10cm × 35cm= £0.62, 5cm × 10cm= £0.08

Absorbent perforated plastic film faced dressing

Absopad
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Absopad dressing (Medicareplus International Ltd) 10cm × 10cm= £0.13, 20cm × 10cm= £0.28

Askina Pad
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Askina (B.Braun Medical Ltd) Pad dressing 10cm × 10cm= £0.21
Cutisorb LA
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Interpose
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Melolin
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Melolin dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm = £0.28, 20cm × 10cm = £0.54, 5cm × 5cm = £0.17

Skintact
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Skintact dressing (Robinson Healthcare) 10cm × 10cm = £0.17, 20cm × 10cm = £0.34, 5cm × 5cm = £0.10

Solvaline N
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Solvaline N dressing (Lohmann & Rauscher (UK) Ltd) 10cm × 10cm = £0.18, 20cm × 10cm = £0.36, 5cm × 5cm = £0.10

Telfa
Low-adherence primary dressing consisting of 3 layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophobic backing.

Telfa dressing (Aria Medical Ltd) 10cm × 7.5cm = £0.16, 15cm × 7.5cm = £0.18, 20cm × 7.5cm = £0.29, 7.5cm × 5cm = £0.12

Super absorbent cellulose and polymer primary dressing

Curea P1
Super absorbent cellulose and polymer primary dressing.

Curea P1 dressing (Charles S. Bullen Stomacare Ltd) 10cm × 10cm square= £2.15, 10cm × 20cm rectangular= £3.64, 10cm × 30cm rectangular= £5.20, 12cm × 12cm square= £2.65, 20cm × 20cm square= £6.89, 20cm × 30cm rectangular= £10.03, 7.5cm × 7.5cm square= £1.72

Curea P2
Super absorbent cellulose and polymer primary dressing (non-adherent)

Curea P2 dressing (Charles S. Bullen Stomacare Ltd) 10cm × 20cm rectangular= £4.49, 11cm × 11cm square= £2.47, 20cm × 20cm square= £7.82, 20cm × 30cm rectangular= £10.60

Cutisorb Ultra
Super absorbent cellulose and polymer primary dressing

Cutisorb Ultra dressing (BSN medical Ltd) 10cm × 10cm square= £2.13, 10cm × 20cm rectangular= £3.56, 20cm × 20cm square= £6.68, 20cm × 30cm rectangular= £10.06

DryMax Extra
Super absorbent cellulose and polymer primary dressing

DryMax Extra dressing (Aspen Medical Europe Ltd) 10cm × 10cm square= £0.67, 20cm × 20cm rectangular= £1.04, 20cm × 30cm rectangular= £1.84, 20cm × 30cm rectangular= £2.33

ELECT Superabsorber
Super absorbent cellulose and polymer primary dressing

ELECT Superabsorber dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £0.96, 10cm × 20cm rectangular= £1.13, 20cm × 20cm square= £2.01, 20cm × 30cm rectangular= £2.54

Zetuvit Plus
Super absorbent cellulose primary dressing

Zetuvit Plus dressing (Paul Hartmann Ltd) 10cm × 10cm= £0.64, 10cm × 20cm= £0.88, 15cm × 20cm= £1.01, 20cm × 25cm= £1.38, 20cm × 40cm= £2.13

Super absorbent hydroconductive dressing

Drawtex
Super absorbent hydroconductive dressing with absorbent, cross-action structures of viscose, polyester and cotton

Drawtex dressing (Martindale Pharmaceuticals Ltd) 10cm × 1.3m= £16.00, 10cm × 10cm= £22.24, 10cm × 1m= £16.00, 15cm × 20cm= £6.00, 20cm × 20cm × 1m= £25.00, 20cm × 20cm= £6.98, 5cm × 5cm= £0.95, 7.5cm × 1m= £15.50, 7.5cm × 7.5cm= £1.77

Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sluggly wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy. Hydrogel sheets have a fixed structure and limited fluid-handling capacity; hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

Hydrogel application (amorphous)

ActivHeal Hydrgel
Hydrogel containing guar gum and propylene glycol

ActivHeal (Advanced Medical Solutions Ltd) Hydrogel dressing= £1.41

Aquaform
Hydrogel containing modified starch copolymer

AquaForm (Aspen Medical Europe Ltd) Hydrogel dressing= £2.02

Askina Gel
Hydrogel containing modified starch and glycerol

Askina (B.Braun Medical Ltd) Gel dressing= £2.01

Cutimed
Hydrogel

Cutimed (BSN medical Ltd) Gel dressing= £3.02

Flexigran
Hydrogel containing modified starch and glycerol

Flexigran (A1 Pharmaceuticals) Gel dressing= £1.90

GranuGel
Hydrogel containing carboxymethylcellulose, pectin and propylene glycol

GranuGel (Convatec Ltd) Hydrocolloid Gel dressing= £2.35

Intrasite Gel
Hydrogel containing modified carmellose polymer and propylene glycol

IntraSite (Smith & Nephew Healthcare Ltd) Gel dressing= £3.63

Nu-Gel
Hydrogel containing alginate and propylene glycol

Nu-Gel (Systagenix Wound Management Ltd) Gel dressing= £2.09

Purilon Gel
Hydrogel containing carboxymethylcellulose and calcium alginate

Purilon (Coloplast Ltd) Gel dressing= £2.30

Hydrogel sheet dressings

ActiFormCool
Hydrogel dressing

ActiFormCool sheet (Activa Healthcare Ltd) 10cm × 10cm square= £2.66, 10cm × 15cm rectangular= £3.83, 20cm × 20cm square= £8.01, 5cm × 6.5cm rectangular= £1.81

Aquaflo
Hydrogel dressing

Aquaflo (Covidien (UK) Commercial Ltd) sheet 7.5cm discs= £2.60

Coolie
Hydrogel dressing (without adhesive border)

Coolie (Zeroderma Ltd) sheet 7cm discs= £1.96
Gel FX
Hydrogel dressing (without adhesive border)
Gel FX sheet (Synergy Health Plc) 10cm × 10cm square= £1.60, 5cm × 15cm square= £3.20

Geliperm
Hydrogel sheets
Geliperm (Geistlich Sons Ltd) sheet 10cm × 10cm square= £2.53

Hydrosorb
Absorbs, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film
Hydrosorb sheet (Paul Hartmann Ltd) 10cm × 10cm square= £2.26, 20cm × 20cm square= £6.77, 5cm × 7.5cm rectangular= £1.58

Hydrosorb Comfort
Absorbs, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film (with adhesive, waterproof)
Hydrosorb Comfort sheet (Paul Hartmann Ltd) 12.5cm × 12.5cm square= £3.61, 4.5cm × 6.5cm rectangular= £1.87, 7.5cm × 10cm rectangular= £2.48

Intrasite Conformable
Soft non-woven dressing impregnated with Intrasite® gel
IntraSite Conformable dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £1.82, 10cm × 20cm rectangular= £2.46, 40cm × 40cm rectangular= £4.40

Novogel
Glycerol-based hydrogel sheets (standard or thin)
Novogel sheet (Ford Medical Associates Ltd) 10cm × 10cm square= £3.18, 15cm × 20cm rectangular= £6.07, 20cm × 40cm rectangular= £11.56, 30cm × 30cm (0.15cm thickness) square= £12.71, (0.30cm thickness) square= £13.47, 5cm × 7.5cm rectangular= £1.99, 7.5cm diameter circular= £2.89

SanoSkin NET
Hydrogel sheet (without adhesive border)
SanoSkin (Ideal Medical Solutions Ltd) NET sheet 8.5cm × 12cm rectangular= £2.28

Vacunet
Non-adherent, hydrogel coated polyester net dressing
Vacunet dressing (Protex Healthcare Ltd) 10cm × 10cm square= £1.93, 10cm × 15cm rectangular= £2.86

Sodium hyaluronate dressings
The hydrating properties of sodium hyaluronate promote wound healing, and dressings can be applied directly to the wound, or to a primary dressing (a secondary dressing should also be applied). The iodine and potassium iodide in these dressings prevent the bacterial decay of sodium hyaluronate in the wound. Hyiodine® should be used with caution in thyroid disorders.

Hyiodine
Sodium hyaluronate 1.5%, potassium iodide 0.15%, iodine 0.1%, in a viscous solution
Hyiodine (H & R Healthcare Ltd) dressing= £35.00

Vapour-permeable films and membranes
Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and moisten healing environments; transparent film dressings permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers. Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrogels; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

Non-woven fabric dressing with viscose-rayon pad.

Niko Fix
For intravascular and subcutaneous catheter sites
Niko (Unomedical Ltd) Fix dressing 7cm × 8.5cm= £0.19

Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

Askina Derm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Askina Derm dressing (B.Braun Medical Ltd) 10cm × 12cm= £1.08, 10cm × 20cm= £2.06, 15cm × 20cm= £2.50, 20cm × 30cm= £4.46, 6cm × 7cm= £0.37

C-View
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
C-View dressing (Aspen Medical Europe Ltd) 10cm × 12cm= £1.02, 12cm × 12cm= £1.09, 15cm × 20cm= £2.36, 6cm × 7cm= £0.38

Dressfilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Dressfilm (St Georges Medical Ltd) dressing 15cm × 20cm= £1.90

Hydrofilm
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Hydrofilm dressing (Paul Hartmann Ltd) 10cm × 12.5cm= £0.42, 10cm × 15cm= £0.53, 10cm × 25cm= £0.82, 12cm × 25cm= £0.87, 15cm × 20cm= £0.97, 20cm × 30cm= £1.61, 6cm × 7cm= £0.23

Hyfapix Transparent
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Hyfapix Transparent (BSN medical Ltd) dressing 10cm × 2m= £8.79

Leukomed T
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Leukomed T dressing (BSN medical Ltd) 10cm × 12.5cm= £1.02, 11cm × 14cm= £1.24, 15cm × 20cm= £2.37, 15cm × 25cm= £2.53, 7.2cm × 5cm= £0.38, 8cm × 10cm= £0.70

Mepitel Film
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Mepitel Film dressing (Mohlycke Health Care Ltd) 10.5cm × 12cm= £1.31, 10.5cm × 25cm= £2.55, 15.5cm × 20cm= £3.24, 6.5cm × 7cm= £0.49

Mepore Film
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
Mepore Film dressing (Mohlycke Health Care Ltd) 10cm × 12cm= £1.23, 10cm × 25cm= £2.39, 15cm × 20cm= £3.04, 6cm × 7cm= £0.46

OpSite Flexifix
Extensible, waterproof, water vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces
OpSite Flexifix dressing (Smith & Nephew Healthcare Ltd) 10cm × 1m= £6.67, 5cm × 1m= £3.95
OpSite Flexgrid
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

OpSite Flexgrid dressing (Smith & Nephew Healthcare Ltd) 12cm x 12cm = £1.14, 15cm x 20cm = £2.88, 6cm x 7cm = £0.40

Polyskin II
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Kendall Film dressing (Aria Medical Ltd) 10cm x 12cm = £1.03, 10cm x 20cm = £2.04, 15cm x 20cm = £2.35, 20cm x 25cm = £4.11, 4cm x 4cm = £0.36, 5cm x 7cm = £0.40

ProtectFilm
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

ProtectFilm dressing (Wallace, Cameron & Company Ltd) 10cm x 12cm = £0.20, 15cm x 20cm = £0.40, 6cm x 7cm = £0.11

Suprasorb F
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Suprasorb F dressing (Lohmann & Rauscher (UK) Ltd) 10cm x 12cm = £0.81, 15cm x 20cm = £2.52, 5cm x 7cm = £0.34

Tegaderm
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Film dressing (3M Health Care Ltd) 12cm x 12cm = £1.11, 15cm x 20cm = £2.41, 6cm x 7cm = £0.39

Tegaderm Diamond
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Tegaderm Diamond dressing (3M Health Care Ltd) 10cm x 12cm = £1.21, 6cm x 7cm = £0.45

Vellafilm
Exttensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces

Vellafilm dressing (Advancis Medical) 12cm x 12cm = £1.10, 12cm x 35cm = £2.75, 15cm x 20cm = £2.10

Vapour-permeable Adhesive Film Dressing with absorbent pad

Adpore Ultra
Film dressing with absorbent pad
Adpore Ultra dressing (Medicareplus International Ltd) 10cm x 10cm = £0.14, 10cm x 15cm = £0.22, 10cm x 20cm = £0.33, 10cm x 25cm = £0.35, 10cm x 30cm = £0.52, 7cm x 8cm = £0.12

Vapour-permeable Adhesive Film Dressing with absorbent pad

Alldress
Film dressing with absorbent pad
Alldress dressing (Molynlycke Health Care Ltd) 10cm x 10cm = £0.96, 15cm x 15cm = £2.10, 15cm x 20cm = £2.59

C-View Post-Op
Film dressing with absorbent pad
C-View Post-Op dressing (Aspen Medical Europe Ltd) 10cm x 12cm = £1.10, 10cm x 25cm = £1.60, 10cm x 35cm = £2.60, 6cm x 7cm = £0.40

Clearpore
Film dressing with absorbent pad
Clearpore dressing (Richardson Healthcare Ltd) 10cm x 10cm = £0.20, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.40, 10cm x 30cm = £0.65, 6cm x 10cm = £0.15, 6cm x 7cm = £0.12

Hydrofilm Plus
Film dressing with absorbent pad
Hydrofilm Plus dressing (Paul Hartmann Ltd) 10cm x 20cm = £0.46, 10cm x 25cm = £0.61, 10cm x 30cm = £0.69, 7.2cm x 5cm = £0.18, 9cm x 10cm = £0.27, 9cm x 15cm = £0.30

Leukomed T Plus
Film dressing with absorbent pad
Leukomed T Plus dressing (BSN medical Ltd) 10cm x 20cm = £1.35, 10cm x 25cm = £1.51, 10cm x 30cm = £2.53, 10cm x 35cm = £3.07, 7.2cm x 5cm = £0.27, 8cm x 10cm = £0.54, 8cm x 15cm = £0.81

Mepore Film & Pad
Film dressing with absorbent pad
Mepore Film & Pad dressing (Molynlycke Health Care Ltd) 4cm x 5cm = £0.24, 5cm x 7cm = £0.24, 9cm x 10cm = £0.62, 9cm x 15cm = £0.92, 9cm x 20cm = £1.36, 9cm x 25cm = £1.50, 9cm x 30cm = £2.01, 9cm x 35cm = £2.50

Mepore Ultra
Film dressing with absorbent pad
Mepore Ultra dressing (Molynlycke Health Care Ltd) 10cm x 11cm = £0.80, 11cm x 15cm = £1.18, 7cm x 8cm = £0.40, 9cm x 20cm = £1.51, 9cm x 25cm = £1.67, 9cm x 30cm = £2.75

OpSite Plus
Film dressing with absorbent pad
OpSite Plus dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.21, 10cm x 20cm = £2.04, 10cm x 35cm = £3.38, 6.5cm x 5cm = £0.32, 8.5cm x 9.5cm = £0.89

OpSite Post-op
Film dressing with absorbent pad
OpSite Post-Op dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.19, 10cm x 20cm = £2.00, 10cm x 25cm = £2.52, 10cm x 30cm = £2.98, 10cm x 35cm = £3.32, 8.5cm x 15.5cm = £1.21, 8.5cm x 9.5cm = £0.87

Pharmapore-PU
Film dressing with absorbent pad
Pharmapore-PU dressing (Wallace, Cameron & Company Ltd) 10cm x 25cm = £0.38, 10cm x 30cm = £0.58, 8.5cm x 15.5cm = £0.20

PremierPore VP
Film dressing with absorbent pad
PremierPore VP dressing (Shermod) 10cm x 10cm = £0.16, 10cm x 15cm = £0.24, 10cm x 20cm = £0.36, 10cm x 25cm = £0.38, 10cm x 30cm = £0.57, 10cm x 35cm = £0.69, 5cm x 7cm = £0.13

Tegaderm
Film dressing with absorbent pad
Tegaderm + Pad dressing (3M Health Care Ltd) 5cm x 7cm = £0.26, 9cm x 10cm = £0.65, 9cm x 15cm = £0.95, 9cm x 20cm = £1.40, 9cm x 25cm = £1.57, 9cm x 35cm = £2.60

Tegaderm Absorbent Clear
Film dressing with clear acrylic polymer oval-shaped pad or rectangular-shaped pad
Tegaderm Absorbent Clear Acrylic dressing (3M Health Care Ltd) 11.1cm x 12.7cm oval= £4.11, 14.2cm x 15.8cm oval= £5.78, 14.9cm x 15.2cm rectangular= £8.66, 16.8cm x 19cm sacral= £10.37, 20cm x 20.3cm rectangular= £13.91, 7.6cm x 9.5cm oval= £3.17

Vapour-permeable transparent film dressing with adhesive foam border.

Central Gard
For intravenous and subcutaneous catheter sites
Central Gard dressing (Unomedical Ltd) 16cm x 7cm = £0.95, 16cm x 8.8cm = £1.04

Easi-V
For intravenous and subcutaneous catheter sites
Easi-V (ConvTec Ltd) dressing 7cm x 7.5cm = £0.38

Vapour-permeable transparent, adhesive film dressing.

Hydrofilm I.V. Control
For intravenous and subcutaneous catheter sites
Hydrofilm (Paul Hartmann Ltd) I.V. Control dressing 7cm x 9cm = £0.31

Vapour-permeable, transparent, adhesive film dressing.

IV3000
For intravenous and subcutaneous catheter sites
IV3000 dressing (Smith & Nephew Healthcare Ltd) 10cm x 12cm = £1.41, 5cm x 6cm = £0.43, 6cm x 7cm = £0.56, 7cm x 9cm = £0.74, 9cm x 12cm = £1.47
Mepore IV
For intravenous and subcutaneous catheter sites
Mepore IV dressing (Molynex Health Care Ltd) 10cm × 11cm = £1.07, 5cm × 5.5cm = £0.31, 8cm × 9cm = £0.40

Pharmapore-PU IV
For intravenous and subcutaneous catheter sites
Pharmapore-PU-LV dressing (Wallace, Cameron & Company Ltd) 6cm × 7cm = £0.08, 7cm × 8.5cm = £0.07, 7cm × 9cm = £0.17

Tegaderm IV
For intravenous and subcutaneous catheter sites
Tegaderm IV dressing with securing tapes (3M Health Care Ltd) 10cm × 15.5cm = £1.67, 7cm × 8.5cm = £0.59, 8.5cm × 10.5cm = £1.16

Soft polyfoam dressings
Dressings with soft polyfoam, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polyfoam dressing with an absorbent pad can be used. Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes. Soft polyfoam dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface. For silicone keloid dressings see under Specialised dressings.

Cellulose dressings
Sorbiton Sachet Border
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope, with adhesive border
Cutimed Sorbiton Sachet Border dressing (BSN medical Ltd) 10cm × 10cm = £2.95, 15cm × 15cm = £4.49, 25cm × 15cm rectangular = £6.99

Sorbiton Sachet EXTRA
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbiton Sachet Extra dressing (BSN medical Ltd) 10cm × 10cm = £2.25, 20cm × 10cm = £3.73, 20cm × 20cm = £7.00, 30cm × 20cm = £9.99, 5cm × 5cm = £1.45, 7.5cm × 7.5cm = £1.78

Sorbiton Sachet Multi Star
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope
Cutimed Sorbiton Sachet Multi Star dressing (BSN medical Ltd) 14cm × 14cm = £4.89, 8cm × 8cm = £2.99

Sorbiton Sachet S Drainage
Absorbent polymers in cellulose matrix, hypoallergenic polypropylene envelope (‘V’ shaped dressing)
Cutimed (BSN medical Ltd) Sorbion Sachet S dressing 10cm × 10cm = £2.64

Suprasorb X
Biosynthetic cellulose fibre dressing
Suprasorb X dressing (Lohmann & Rauscher (UK) Ltd) 14cm × 20cm rectangular = £8.46, 2cm × 21cm rope = £6.58, 5cm × 5cm square = £2.05, 5cm × 5cm square = £4.27

With absorbent pad
Advazorb Border
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border dressing (Advancis Medical) 10cm × 10cm = £2.10, 10cm × 20cm = £2.50, 10cm × 30cm = £4.25, 12.5cm × 12.5cm = £2.58, 15cm × 15cm = £3.15, 20cm × 20cm = £5.46, 7.5cm × 7.5cm = £1.19

Advazorb Border Lite
Soft silicone wound contact dressing with polyurethane foam film backing and adhesive border
Advazorb Border Lite dressing (Advancis Medical) 10cm × 10cm = £1.89, 10cm × 20cm = £2.61, 10cm × 30cm = £3.83, 12.5cm × 12.5cm = £2.32, 15cm × 15cm = £2.84, 20cm × 20cm = £4.91, 7.5cm × 7.5cm = £1.07

Advazorb Silfix
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix dressing (Advancis Medical) 10cm × 10cm = £1.85, 10cm × 20cm = £3.18, 12.5cm × 12.5cm = £2.59, 15cm × 15cm = £3.36, 20cm × 20cm = £4.98, 7.5cm × 7.5cm = £0.99

Advazorb Silfix Lite
Soft silicone wound contact dressing with polyurethane foam film backing
Advazorb Silfix Lite dressing (Advancis Medical) 10cm × 10cm = £1.67, 10cm × 20cm = £2.86, 12.5cm × 12.5cm = £2.33, 15cm × 15cm = £3.02, 20cm × 20cm = £4.48, 7.5cm × 7.5cm = £0.89

Allevyn Gentle
Soft gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm = £2.53, 10cm × 20cm = £4.07, 15cm × 15cm = £4.25, 20cm × 20cm = £6.78, 5cm × 5cm = £1.27

Allevyn Gentle Border
Soft silicone wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border dressing (Smith & Nephew Healthcare Ltd) Heel dressing 23cm × 23.2cm = £9.74, dressing 10cm × 10cm = £2.21, 12.5cm × 12.5cm = £2.71, 17.5cm × 17.5cm = £5.34, 7.5cm × 7.5cm = £1.51

Allevyn Gentle Border Lite
Soft silicone gel wound contact dressing, with polyurethane foam film backing
Allevyn Gentle Border Lite dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm = £2.18, 15cm × 15cm = £3.85, 5.5cm × 12cm = £1.86, 5cm × 5cm = £0.91, 8cm × 15cm = £3.47

Allevyn Life
Soft silicone wound contact dressing, with central mesh screen, polyurethane foam film backing and adhesive border
Allevyn Life dressing (Smith & Nephew Healthcare Ltd) 10.3cm × 10.3cm = £1.71, 12.9cm × 12.9cm = £2.51, 15.4cm × 15.4cm = £3.06, 21cm × 21cm = £6.04

Cutimed Siltec
Soft silicone wound contact dressing, with polyurethane foam film backing
Cutimed Siltec (BSN medical Ltd) Heel dressing 16cm × 24cm = £7.72, Sacrum dressing 17.5cm × 17.5cm = £4.60, 23cm × 23cm = £7.36, dressing 10cm × 10cm = £2.48, 10cm × 20cm = £4.10, 15cm × 15cm = £4.64, 20cm × 20cm = £7.03, 5cm × 6cm = £1.33

Cutimed Siltec B
Soft silicone wound contact dressing, with polyurethane foam film backing, with adhesive border, for lightly to moderately exuding wounds
Cutimed Siltec B dressing (BSN medical Ltd) 12.5cm × 12.5cm = £3.27, 15cm × 15cm = £5.03, 17.5cm × 17.5cm = £5.29, 22.5cm × 22.5cm = £8.55, 7.5cm × 7.5cm = £1.54

Cutimed Siltec L
Soft silicone wound contact dressing, with polyurethane foam film backing, for lightly to moderately exuding wounds
Cutimed Siltec L dressing (BSN medical Ltd) 10cm × 10cm = £2.14, 15cm × 15cm = £3.52, 5cm × 6cm = £1.06

Eclypsy Adherent
Soft silicone wound contact layer with absorbent pad and film backing
Eclypsy Adherent dressing (Advancis Medical) 10cm × 10cm = £2.99, 10cm × 20cm = £3.75, 15cm × 15cm = £4.99, 20cm × 30cm = £9.99, 17cm × 19cm sacral = £3.76, 22cm × 23cm sacral = £6.23

Flivasorb
Absorbent polymer dressing with non-adherent wound contact layer
Flivasorb dressing (Lohmann & Rauscher (UK) Ltd) 10cm × 10cm square = £0.88, 10cm × 20cm rectangular = £1.05, 20cm × 20cm square = £1.86, 20cm × 30cm rectangular = £2.35
**Flivasorb Adhesive**
Absorbent polymer dressing with non-adherent wound contact layer and adhesive border

**Flivasorb Adhesive dressing** (Lohmann & Rauscher (UK) Ltd) 12cm × 12cm square= £3.35, 15cm × 15cm square= £4.58

**Mepilex**
Absorbent soft silicone dressing with polyurethane foam film backing

**Mepilex** (Molynex Health Care Ltd) Heel dressing 13cm × 20cm= £5.41, 15cm × 22cm= £6.22, XT dressing 10cm × 11cm= £2.66, 11cm × 20cm= £4.39, 15cm × 16cm= £4.82, 20cm × 21cm= £7.28, dressing 5cm × 5cm= £1.21

**Mepilex Border**
Absorbent soft silicone dressing with polyurethane foam film backing and adhesive border

**Mepilex Border** (Molynex Health Care Ltd) Heel dressing 18.5cm × 24cm= £6.63, Sacrum dressing 18cm × 18cm= £4.85, 23cm × 23cm= £7.91, dressing 10cm × 12.5cm= £2.72, 10cm × 20cm= £3.69, 10cm × 30cm= £5.55, 15cm × 17.5cm= £4.18, 17cm × 20cm= £6.07

**Mepilex Border Lite**
Thin absorbent soft silicone dressing with polyurethane foam film backing and adhesive border

**Mepilex Border Lite dressing** (Molynex Health Care Ltd) 10cm × 10cm= £1.87, 15cm × 15cm= £3.94, 4cm × 5cm= £0.92, 5cm × 12.5cm= £2.01, 7.5cm × 7.5cm= £1.35

**Mepilex Lite**
Thin absorbent soft silicone dressing with polyurethane foam film backing

**Mepilex Lite dressing** (Molynex Health Care Ltd) 10cm × 10cm= £2.17, 15cm × 15cm= £4.22, 20cm × 50cm= £26.66, 6cm × 8.5cm= £1.82

**Mepilex Transfer**
Soft silicone exudate transfer dressing

**Mepilex Transfer dressing** (Molynex Health Care Ltd) 10cm × 12cm= £3.51, 15cm × 20cm= £10.64, 20cm × 50cm= £27.20, 7.5cm × 8.5cm= £2.23

**Sorbion Sana**
Non-adherent polyethylene wound contact dressing with absorbent core

**Cutimed Sorbion Sana Gentle dressing** (BSN medical Ltd) 12cm × 12cm= £2.49, 12cm × 22cm= £4.49, 22cm × 22cm= £7.99, 8.5cm × 8.5cm= £1.99

**Urgotul Duo**
Non-adherent soft polymer wound contact dressing with absorbent pad

**Urgotul Duo dressing** (Urgo Ltd) 10cm × 12cm= £3.87, 15cm × 20cm= £8.98, 5cm × 10cm= £2.50

**Urgotul Duo Border**
Non-adherent soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing

**Without absorbant pad**

**Adaptic Touch**
Non-adherent soft silicone wound contact dressing

**Adaptic Touch dressing** (SyStagenix Wound Management Ltd) 12.7cm × 15cm= £4.65, 20cm × 32cm= £12.50, 5cm × 7.6cm= £1.13, 7.6cm × 11cm= £2.25

**Askina SilNet**
Soft silicone-coated wound contact dressing

**Askina SilNet dressing** (B.Braun Medical Ltd) 10cm × 18cm= £4.98, 20cm × 30cm= £12.20, 5cm × 7.5cm= £1.13, 7.5cm × 10cm= £2.28

**Mepitel**
Soft silicone, semi-transparent wound contact dressing

**Mepitel dressing** (Molynex Health Care Ltd) 12cm × 15cm= £5.60, 5cm × 7cm= £1.40, 8cm × 10cm= £2.80

**Mepitel One**
Soft silicone, thin, transparent wound contact dressing

**Mepitel One dressing** (Molynex Health Care Ltd) 13cm × 15cm= £4.98, 24cm × 27.5cm= £14.25, 6cm × 7cm= £1.22, 9cm × 10cm= £2.41

**Physiotulle**
Non-adherent soft polymer wound contact dressing

**Physiotulle dressing** (Coloplast Ltd) 10cm × 10cm= £2.28, 15cm × 20cm= £6.96

**Silflex**
Soft silicone-coated polyester wound contact dressing

**Silflex dressing** (Advantis Medical) 12cm × 30cm= £11.79, 35cm × 60cm= £39.54, 5cm × 7cm= £1.11, 8cm × 10cm= £2.27

**Silon-TSR**
Soft silicone polymer wound contact dressing

**Silon-TSR dressing** (Bio Med Sciences) 13cm × 13cm= £3.52, 13cm × 25cm= £5.47, 28cm × 30cm= £7.37

**Sobion Contact**
Non-adherent soft polymer wound contact dressing

**Cutimed Sorbion Contact dressing** (BSN medical Ltd) 10cm × 10cm= £1.99, 10cm × 20cm= £3.99, 20cm × 20cm= £6.99, 20cm × 30cm= £9.99, 7.5cm × 7.5cm= £1.49

**Tegaderm Contact**
Non-adherent soft polymer wound contact dressing

**Tegaderm Contact dressing** (3M Health Care Ltd) 20cm × 25cm= £10.86, 7.5cm × 10cm= £2.27

**Urgotul**
Non-adherent soft polymer wound contact dressing

**Urgotul dressing** (Urgo Ltd) 10cm × 10cm= £3.11, 10cm × 40cm= £10.44, 15cm × 15cm= £6.60, 15cm × 20cm= £8.79, 20cm × 30cm= £14.13, 5cm × 5cm= £1.55

**Hydrocolloid dressings**
Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Hydrocolloid-fibrous dressings made from modified carmelllose fibres resemble alginate dressings; hydrocolloid-fibrous dressings are more absorptive and suitable for moderately to heavily exuding wounds.

**Hydrocolloid-fibrous dressings**

**Aquacel**
Soft non-woven pad containing hydrocolloid-fibres

**Aquacel** (ConvaTec Ltd) Ribbon dressing 1cm × 45cm= £1.84, 2cm × 45cm= £2.48, dressing 10cm × 10cm square= £2.45, 15cm × 15cm square= £4.60, 4cm × 10cm rectangular= £1.32, 4cm × 20cm rectangular= £1.94, 4cm × 30cm rectangular= £2.92, 5cm × 5cm square= £1.03

**Aquacel Foam**
Soft non-woven pad containing hydrocolloid-fibres with foam layer; with or without adhesive border

**Aquacel Foam dressing** (ConvaTec Ltd) (adhesive) 10cm × 10cm= £2.16, 12.5cm × 12.5cm= £2.68, 17.5cm × 17.5cm= £5.36, 19.8cm × 14cm heel= £5.48, 20cm × 16.9cm sacral= £4.92, 21cm × 21cm= £7.84, 25cm × 30cm= £10.15, 8cm × 8cm= £1.39, non-adhesive) 10cm × 10cm= £2.56, 15cm × 15cm= £4.30, 15cm × 20cm= £5.88, 20cm × 20cm= £7.01

**UrgoClean Pad**
Pad, hydrocolloid fibres coated with soft-adherent lipo-colloidal wound contact layer

**UrgoClean Pad dressing** (Urgo Ltd) 10cm × 10cm square= £2.14, 20cm × 15cm rectangular= £4.02, 6cm × 6cm square= £0.96

**UrgoClean Rope**
Rope, non-woven rope containing hydrocolloid fibres

**UrgoClean rope dressing** (Urgo Ltd) 2.5cm × 40cm= £2.41, 5cm × 40cm= £3.18

**Polyurethane matrix dressing**

**Cutinova Hydro**
Polyurethane matrix with absorbent particles and waterproof polyurethane film
Comfeel Plus Transparent
Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Transparent dressing (Coloplast Ltd) 10cm × 10cm square= £1.28, 15cm × 15cm square= £3.35, 15cm × 20cm rectangular= £3.40, 20cm × 20cm square= £3.42, 5cm × 15cm rectangular= £1.59, 5cm × 25cm rectangular= £2.59, 5cm × 7cm rectangular= £0.67, 9cm × 14cm rectangular= £2.44, 9cm × 25cm rectangular= £3.47

Comfeel Plus Ulcer
Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Ulcer (bevelled edge) dressing (Coloplast Ltd) 10cm × 10cm square= £2.46, 18cm × 20cm triangular= £5.73, 20cm × 20cm square= £7.59, 4cm × 6cm rectangular= £0.96

DuoDERM Extra Thin
Semi-permeable hydrocolloid dressing

DuoDERM Extra Thin dressing (Convatec Ltd) 10cm × 10cm square= £1.33, 15cm × 15cm square= £2.88, 5cm × 10cm rectangular= £0.76, 7.5cm × 7.5cm square= £0.81, 9cm × 15cm rectangular= £1.78, 9cm × 25cm rectangular= £2.85, 9cm × 35cm rectangular= £3.98

DuoDERM Signal
Semi-permeable hydrocolloid dressing with 'Time to change' indicator

DuoDERM Signal dressing (Convatec Ltd) 10cm × 10cm square= £2.14, 11cm × 19cm oval= £3.25, 14cm × 14cm square= £3.75, 18.5cm × 19.5cm heel= £5.25, 20cm × 20cm square= £7.46, 22.5cm × 20cm sacral= £6.13

Flexigran
Semi-permeable hydrocolloid dressing without adhesive border; normal or thin

Flexigran (A1 Pharmaceuticals) Thin dressing 10cm × 10cm square= £1.08, dressing 10cm × 10cm square= £2.19

Granuflex
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

Granuflex (modified) dressing (Convatec Ltd) 10cm × 10cm square= £2.83, 15cm × 15cm square= £3.56, 15cm × 20cm rectangular= £5.81, 20cm × 20cm square= £8.07

Hydrocoll Basic
Hydrocolloid dressing with absorbent wound contact pad

Hydrocoll (Paul Hartmann Ltd) Basic dressing 10cm × 10cm square= £2.47

Hydrocol Thin Film
Thin hydrocolloid dressing with absorbent wound contact pad

Hydrocol Thin Film dressing (Paul Hartmann Ltd) 10cm × 10cm square= £1.16, 15cm × 15cm square= £2.61, 7.5cm × 7.5cm square= £0.70

Nu-Derm
Semi-permeable hydrocolloid dressing (normal and thin)

Nu-Derm dressing (Systagenix Wound Management Ltd) 10cm × 10cm square= £1.56, 15cm × 15cm square= £3.18, 15cm × 18cm sacral= £4.45, 20cm × 20cm square= £6.36, 5cm × 5cm square= £0.85, 8cm × 12cm heel/elbow= £3.18, thin 10cm × 10cm square= £1.06

Tegaderm Hydrocolloid
Hydrocolloid dressing without adhesive border; normal and thin

Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing 10cm × 10cm square= £1.55, dressing 10cm × 10cm square= £2.37

Ultex Pro
Semi-permeable hydrocolloid dressing; without adhesive border

Ultex Pro dressing (Covidien (UK) Commercial Ltd) 10cm × 10cm square= £2.28, 15cm × 15cm square= £4.44, 20cm × 20cm square= £6.69

Foam dressings
Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), with or without plastic film-

Cutinova Hydro dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square= £2.57, 15cm × 20cm rectangular= £5.44, 5cm × 6cm rectangular= £1.28

With adhesive border

Biatain Super
Semi-permeable hydrocolloid dressing; without adhesive border

Biatain Super dressing (adhesive) (Coloplast Ltd) 10cm × 10cm square= £2.12, 12.5cm × 12.5cm square= £3.60, 12cm × 20cm rectangular= £3.61, 15cm × 15cm square= £4.35, 20cm × 20cm square= £6.78

Granuflex Bordered
Hydrocolloid wound contact layer bonded to plastic foam layer, with outer semi-permeable polyurethane film

Granuflex Bordered dressing (Convatec Ltd) 10cm × 10cm square= £3.37, 10cm × 13cm triangular= £3.97, 15cm × 15cm square= £6.43, 15cm × 18cm triangular= £6.19, 6cm × 6cm square= £1.78

Hydrocoll Border
Hydrocolloid dressing with adhesive border and absorbent wound contact pad

Hydrocoll Border (bevelled edge) dressing (Paul Hartmann Ltd) 10cm × 10cm square= £2.43, 12cm × 18cm sacral= £3.64, 15cm × 15cm square= £4.57, 5cm × 5cm square= £1.01, 7.5cm × 7.5cm square= £1.67, 8cm × 12cm concave= £2.14

Tegaderm Hydrocolloid
Hydrocolloid dressing with adhesive border; normal or thin

Tegaderm Hydrocolloid (3M Health Care Ltd) Thin dressing 10cm × 12cm oval= £1.55, 13cm × 15cm oval= £2.89, dressing 10cm × 12cm oval= £2.33, 13cm × 15cm oval= £4.34, 17.1cm × 16.1cm sacral= £4.85

Ultex Pro
Semi-permeable hydrocolloid dressing with adhesive border

Ultex Pro dressing (adhesive) (Covidien (UK) Commercial Ltd) 15cm × 18cm sacral= £3.30, 19.5cm × 23cm sacral= £4.98, 21cm × 21cm square= £4.67

Without adhesive border

ActivHeal Hydrocolloid
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, with or without polyurethane foam later

ActivHeal Hydrocolloid (Advanced Medical Solutions Ltd) dressing 10cm × 10cm square= £1.58, 15cm × 15cm square= £3.43, 15cm × 18cm sacral= £3.98, 5cm × 7.5cm rectangular= £0.78, 6cm rectangular= £3.12, 10cm × 10cm square= £1.94, 15cm × 15cm square= £2.91, 15cm × 18cm sacral= £3.36, 5cm × 7.5cm rectangular= £0.97

Askina Biofilm Transparent
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive

Askina Biofilm Transparent dressing (B.Braun Medical Ltd) 10cm × 10cm square= £1.07, 20cm × 20cm square= £3.17

Biatain Super
Semi-permeable, hydrocolloid film dressing without adhesive border

Biatain Super dressing (non-adhesive) (Coloplast Ltd) 10cm × 10cm square= £2.18, 12.5cm × 12.5cm square= £3.60, 12cm × 20cm rectangular= £3.61, 15cm × 15cm square= £4.35, 20cm × 20cm square= £6.78

Comfeel Plus Contour
Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Contour dressing (Coloplast Ltd) 6cm × 8cm= £2.23, 9cm × 11cm= £3.87

Comfeel Plus Pressure Relieving
Hydrocolloid dressings containing carmellose sodium and calcium alginate

Comfeel Plus Pressure Relieving dressing (Coloplast Ltd) 10cm diameter circular= £4.66, 15cm diameter circular= £7.01, 7cm diameter circular= £3.48
backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant on the level of exudate Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound. Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin. A foam dressing containing I扑酚現 is available and may be useful for treating painful exuding wounds.

Cavi-Care
Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity

Polyurethane Foam Dressing

Cutimed Cavity

Cutimed Cavity dressing (BSN medical Ltd) 10cm × 10cm= £3.12, 15cm × 15cm= £4.68, 5cm × 6cm= £1.88

Kendall

Kendall Foam dressing (Aria Medical Ltd) 10cm × 10cm square= £2.05, 12.5cm × 12.5cm square= £1.80, 15cm × 15cm square= £2.60, 20cm × 20cm square= £3.01, 5cm × 5cm square= £0.71, 7.5cm × 7.5cm square= £1.21, 8.5cm × 7.5cm rectangular (fenestrated)= £0.91

Polyurethane Foam Dressing with Adhesive Border

ActivHeal Foam Adhesive

ActivHeal Foam Adhesive dressing (Advanced Medical Solutions Ltd) 10cm × 10cm square= £1.63, 12.5cm × 12.5cm square= £1.68, 15cm × 15cm square= £2.15, 20cm × 20cm square= £4.50, 7.5cm × 7.5cm square= £1.18

Tielle Xtra dressing (Systagenix Wound Management Ltd) 11cm × 11cm square= £2.24, 15cm × 15cm square= £3.37, 15cm × 20cm rectangular= £5.91

**Transorbent**

Transorbent dressing (adhesive) (B.Braun Medical Ltd) 10cm × 10cm square= £1.98, 15cm × 15cm square= £3.65, 20cm × 20cm square= £5.83, 5cm × 5cm rectangular= £1.07

**Trufoam NA**

Trufoam Non Adhesive dressing (Aspen Medical Europe Ltd) 10cm × 10cm square= £1.34, 15cm × 15cm square= £2.63, 5cm × 5cm square= £0.71

**UrgoCell TLC**

UrgoTul Absorb dressing (Urgo Ltd) 10cm × 10cm= £2.38, 15cm × 20cm= £4.20, 6cm × 6cm= £1.21, 12cm × 19cm heel= £4.80

**Alginate dressings**

Non-woven or fibrous, non-occlusive, alginate dressings, made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate. Alginate dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue. Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

**ActivHeal Alginate**

Calcium sodium alginate dressing

**ActivHeal Alginate dressing** (Advanced Medical Solutions Ltd) 10cm × 10cm= £1.15, 10cm × 20cm= £2.83, 5cm × 5cm= £0.59

**ActivHeal Aquafiber**

Non-woven, calcium sodium alginate dressing

**ActivHeal Aquafiber** (Advanced Medical Solutions Ltd) Rope dressing 2cm × 42cm= £1.81, dressing 10cm × 10cm= £1.80, 15cm × 15cm= £3.40, 5cm × 5cm= £0.76

**Algise M**

Calcium alginate fibre, non-woven dressing

**Algise M** (Smith & Nephew Healthcare Ltd) Rope dressing 2cm × 30cm= £3.50, dressing 10cm × 10cm= £1.93, 15cm × 20cm= £5.19, 5cm × 5cm= £0.93

**Algosteril**

Calcium alginate dressing

**Algosteril** (Smith & Nephew Healthcare Ltd) Rope dressing 2g= £3.83, dressing 10cm × 10cm= £2.12, 10cm × 20cm= £3.58, 5cm × 5cm= £0.93

**Biatain Alginate**

Alginate and carboxymethylcellulose dressing, highly absorbent, gelling dressing

**Biatain Alginate dressing** (Coloplast Ltd) 10cm × 10cm= £2.33, 15cm × 15cm= £4.43, 44cm= £2.75, 5cm × 5cm= £0.98

**Cutimed Alginate**

Calcium sodium alginate dressing

**Cutimed Alginate dressing** (BSN medical Ltd) 10cm × 10cm= £1.56, 10cm × 20cm= £2.94, 5cm × 5cm= £0.75

**Kaltostat**

Calcium alginate fibre, non-woven

**Kaltostat dressing** (ConvaTec Ltd) 10cm × 20cm= £4.12, 15cm × 25cm= £7.08, 2g= £3.86, 5cm × 5cm= £0.96, 7.5cm × 12cm= £2.10

**Kendall**

Calcium alginate dressing

**Kendall Calcium Alginate** (Aria Medical Ltd) Rope dressing 30cm= £2.89, 61cm= £5.07, 91cm= £5.46, dressing 10cm × 10cm= £1.52, 10cm × 14cm= £2.45, 10cm × 20cm= £2.98, 15cm × 25cm= £5.25, 30cm × 61cm= £27.56, 5cm × 5cm= £0.72

**Kendall Plus**

Calcium alginate dressing

**Kendall** (Aria Medical Ltd) Foam Plus dressing 10cm × 10cm square= £1.47

**Melgisorb**

Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven

**Melgisorb** (Molyncke Health Care Ltd) Cavity dressing 2.2cm × 32cm= £3.55, dressing 10cm × 10cm= £1.88, 10cm × 20cm= £3.52, 5cm × 5cm= £0.90

**Sorbalgon**

Calcium alginate dressing

**Sorbalgon** (Paul Hartmann Ltd) T dressing 2g= £3.51, dressing 10cm × 10cm= £1.72, 5cm × 5cm= £0.82

**Sorbstan Flat**

Calcium alginate fibre, highly absorbent, flat non-woven pads

**Sorbstan Flat dressing** (Aspen Medical Europe Ltd) 10cm × 10cm= £1.71, 10cm × 20cm= £3.20, 5cm × 5cm= £0.81

**Sorbstan Plus**

Alginate dressing bonded to a secondary absorbent viscose pad

**Sorbstan Plus dressing** (Aspen Medical Europe Ltd) 10cm × 15cm= £3.10, 10cm × 20cm= £3.96, 15cm × 20cm= £5.49, 7.5cm × 10cm= £1.76

**Sorbstan Ribbon**

Alginate dressing bonded to a secondary absorbent viscose pad

**Sorbstan** (Aspen Medical Europe Ltd) Ribbon dressing 40cm= £2.04
Sorbans Surgical Packing
Alginate dressing bonded to a secondary absorbent viscose pad
Sorbans (Aspen Medical Europe Ltd) Packing dressing 2g = £3.47

Suprasorb A
Calcium alginate dressing

Suprasorb A (Lohmann & Rauscher (UK) Ltd) alginate dressing 10cm x 10cm = £1.23, 5cm x 5cm = £0.63, cavity dressing 2g = £2.28

Tegaderm Alginate
Calcium alginate dressing

Tegaderm Alginate dressing (3M Health Care Ltd) 10cm x 10cm = £1.72, 2cm x 30.4cm = £2.87, 5cm x 5cm = £0.81

Urgosorb
Alginate and carboxymethylcellulose dressing without adhesive border

Urgosorb (Urgo Ltd) Pad dressing 10cm x 10cm = £2.13, 10cm x 20cm = £3.91, 5cm x 5cm = £0.89, Rope dressing 30cm = £2.79

Capillary-acting dressings
Advadraw
Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers

Advadraw dressing (Advancis Medical) 10cm x 10cm = £0.88, 10cm x 15cm = £1.19, 15cm x 20cm = £1.57, 5cm x 7.5cm = £0.57

Advadraw Spiral
Advadraw (Advancis Medical) Spiral dressing 0.5cm x 40cm = £0.82

Cerdak Aerocloth
Non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing

Cerdak Aerocloth dressing (Apollo Medical Products Ltd) 5cm x 10cm = £1.94, 5cm x 5cm = £1.37

Cerdak Aerofilm
Non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing

Cerdak Aerofilm dressing (Apollo Medical Products Ltd) 5cm x 10cm = £2.07, 5cm x 5cm = £1.51

Cerdak Basic
Non-adhesive wound contact sachet containing ceramic spheres

Cerdak Basic dressing (Apollo Medical Products Ltd) 10cm x 10cm = £1.56, 10cm x 15cm = £2.08, 5cm x 5cm = £0.70

Sumar Lite

Sumar Lite dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.59, 10cm x 15cm = £2.12, 5cm x 5cm = £0.93

Sumar Max

Sumar Max dressing (Lantor (UK) Ltd) 10cm x 10cm = £1.61, 10cm x 15cm = £2.15, 5cm x 5cm = £0.95

Sumar Spiral

Sumar (Lantor (UK) Ltd) Spiral dressing 0.5cm x 40cm = £1.57

Vacutex

Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer

Vacutex dressing (Haddenham Healthcare Ltd) 10cm x 10cm = £1.66, 10cm x 15cm = £2.23, 10cm x 20cm = £2.68, 5cm x 5cm = £0.94

Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

Askina Carbosorb dressing (B.Braun Medical Ltd) 10cm x 10cm = £2.89, 10cm x 20cm = £5.58

CarboFLEX
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer

CarboFLEX dressing (ConvaTec Ltd) 10cm x 10cm = £3.21, 15cm x 20cm = £7.30, 8cm x 15cm oval = £3.85

Carbolap VC
Activated charcoal non-absorbent dressing

Carbolap VC dressing (Synergy Health Plc) 10cm x 10cm = £1.62, 10cm x 20cm = £2.19

Clinisorb Odour Control Dressings
Activated charcoal cloth enclosed in viscose rayon with outer polyamide coating

Clinisorb dressing (CliniMed Ltd) 10cm x 10cm = £1.91, 10cm x 20cm = £2.54, 15cm x 25cm = £4.09

Sorbans Plus Carbon
Alginate dressing with activated carbon

Sorbans Plus Carbon dressing (Aspen Medical Europe Ltd) 10cm x 15cm = £4.96, 10cm x 20cm = £5.94, 15cm x 20cm = £6.84, 7.5cm x 10cm = £2.56

Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing. Medical grade honey has antimicrobial and anti-inflammatory properties. Dressings impregnated with iodine can be used to treat clinically infected wounds. Dressings containing silver should be used only when clinical signs or symptoms of infection are present. Dressings containing other antimicrobials such as polyhexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

Honey
Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings. For Activon Tulle®, where no size is stated by the prescriber the 5cm size is to be supplied. Medihoney® Antimicrobial Wound Gel is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult.

Honey-based topical application

Activon Honey
Medical grade manuka honey

L-Mesitran SOFT ointment dressing
Honey (medical grade) 40%

L-Mesitran (Aspen Medical Europe Ltd) SOFT ointment dressing = £3.59

MANUKApli Honey
Medical grade manuka honey

MANUKApli (Manuka Medical Ltd) dressing = £5.90
**Medihoney Antibacterial Medical Honey**  
Medical grade, Leptospermum sp.  
**Medihoney** (Derma Sciences Europe, Ltd) Antibacterial Medical Honey dressing= £9.90

**Medihoney Antibacterial Wound Gel**  
Medical grade, Leptospermum sp. 80% in natural waxes and oils  
**Medihoney** (Derma Sciences Europe, Ltd) Antibacterial Wound Gel dressing= £4.02

**Melladerm Plus Honey**  
Medical grade; Bulgarian, mountain flower) 45% in basis containing polyethylene glycol

**Mesitran Ointment**  
Honey (medical grade) 47%  
**Excipients** include lanolin  
**Mesitran** (Aspen Medical Europe Ltd) ointment dressing= £9.90

**Actilite**  
Knitted viscose impregnated with medical grade manuka honey and manuka oil  
**Actilite gauze dressing** (Advancis Medical) 10cm x 10cm= £0.98, 10cm x 20cm= £1.90, 5cm x 5cm= £0.57

**Activon Tulle**  
Knitted viscose impregnated with medical grade manuka honey  
**Activon Tulle gauze dressing** (Advancis Medical) 10cm x 10cm= £2.97, 5cm x 5cm= £1.80

**Algivan**  
Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey  
**Algivan dressing** (Advancis Medical) 10cm x 10cm= £3.40, 5cm x 5cm= £1.98

**Algivan Plus**  
Reinforced calcium alginate dressing impregnated with medical grade manuka honey  
**Algivan Plus** (Advancis Medical) Ribbon dressing 2.5cm x 20cm= £3.36, dressing 10cm x 10cm= £3.36, 5cm x 5cm= £1.96

**L-Mesitran Border**  
Hydrogel, semi-permeable dressing impregnated with medical grade honey, with adhesive border  
**L-Mesitran** (Aspen Medical Europe Ltd) Border sheet 10cm x 10cm square= £2.74

**L-Mesitran Hydro**  
Hydrogel, semi-permeable dressing impregnated with medical grade honey, without adhesive border  
**L-Mesitran Hydro sheet** (Aspen Medical Europe Ltd) 10cm x 10cm square= £2.63, 15cm x 20cm rectangular= £5.48

**L-Mesitran Net**  
Hydrogel, non-adherent wound contact layer, without adhesive border  
**L-Mesitran** (Aspen Medical Europe Ltd) Net sheet 10cm x 10cm square= £2.53

**Medihoney Antibacterial Honey Apinate**  
Non-adherent calcium alginate dressing, impregnated with medical grade honey  
**Medihoney Antibacterial Honey Apinate** (Derma Sciences Europe, Ltd) dressing 10cm x 10cm square= £3.40, 5cm x 5cm square= £2.00, rope dressing 1.9cm x 30cm= £4.20

**Medihoney Antibacterial Honey Tulle**  
Woven fabric impregnated with medical grade manuka honey  
**Medihoney** (Derma Sciences Europe, Ltd) Tulle dressing 10cm x 10cm= £2.98

**Medihoney Gel Sheet**  
Sodium alginate dressing impregnated with medical grade honey  
**Medihoney Gel Sheet dressing** (Derma Sciences Europe, Ltd) 10cm x 10cm= £4.20, 5cm x 5cm= £1.75

**MelMax**  
Acetate wound contact layer impregnated with buckwheat honey 75% in ointment basis  
**MelMax dressing** (CliniMed Ltd) 5cm x 5cm rectangular= £4.82, 8cm x 10cm rectangular= £9.90, 8cm x 20cm rectangular= £19.79

**Melladerm Plus Tulle**  
Knitted viscose impregnated with medical grade honey (Bulgarian, mountain flower) 45% in basis containing polyethylene glycol  
**Melladerm** (SanoMed Manufacturing BV) Plus Tulle dressing 10cm x 10cm= £2.10

**iodine**  
Cadoxem – iodine, like povidone–iodine, releases free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadoxem absorbs wound exudate and encourages de-sloughing. Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen. Povidone–iodine fabric dressing is a knitted viscose dressing with povidone–iodine incorporated in a hydrophilic polyethylene glycol basis; this facilitates diffusion of the iodine into the wound and permits removal of the dressing by irrigation. The iodine has a wide spectrum of antimicrobial activity but it is rapidly deactivated by wound exudate. Systemic absorption of iodine may occur, particularly from large wounds or with prolonged use.  
**Iodoflex®** and **Iodosorb®** are used for the treatment of chronic exuding wounds; max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment. They are contra-indicated in patients receiving lithium, in thyroid disorders, in pregnancy and breast feeding, and in children; they should be used with caution in patients with severe renal impairment or history of thyroid disorder.  
**Iodozyme®** is an antimicrobial dressing used for lightly to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.  
**Oxodyne®** is used for non-infected, dry to moderately exuding wounds. It is contra-indicated in thyroid disorders and in patients receiving lithium; it should be used with caution in children and in women who are pregnant or breast-feeding.  
**Povidone-iiodine Fabric Dressing** is used as a wound contact layer for abrasions and superficial burns. It is contra-indicated in patients with severe renal impairment and in women who are pregnant or breast-feeding; it should be used with caution in patients with thyroid disease and in children under 6 months.  
**Iodosorb Ointment**  
Iodine 0.9% as cadoxem–iodine in a paste basis with gauze backing  
**Iodosorb®** (Smith & Nephew Healthcare Ltd) ointment dressing= £9.12

**Iodosorb Powder**  
Iodine 0.9% as cadoxem–iodine microbeads, 3-g sachet  
**Iodosorb®** (Smith & Nephew Healthcare Ltd) powder dressing sachets= £1.95

**Iodozyme Hydrogel**  
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)  
**Iodozyme dressing** (Crawford Healthcare Ltd) 10cm x 10cm square= £12.62, 6.5cm x 5cm rectangular= £7.57

**Oxyzyme Hydrogel**  
Hydrogel (two-component dressing containing glucose oxidase and iodide ions)
Oxyzyme dressing (Crawford Healthcare Ltd) 10cm × 10cm square = £10.10, 6.5cm × 5cm rectangular = £6.06

Povidone-iodine fabric dressing

Inadine

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone-iodine 10%

Inadine dressing (Systagenix Wound Management Ltd) 5cm × 5cm = £0.33, 9.5cm × 9.5cm = £0.49

Silver

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also notes above). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing. Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration. The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulfonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulfonamides).

alginate dressings

Algisite Ag

Calcium alginate dressing, with silver

Algisite Ag dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm = £4.13, 10cm × 20cm = £7.65, 20cm × 5cm = £5.74, 5cm × 5cm = £1.66

Askina Calgitrol Ag

Calcium alginate and silver alginate dressing with polyurethane foam backing

Askina Calgitrol Ag dressing (B.Braun Medical Ltd) 10cm × 10cm square = £3.24, 15cm × 15cm square = £6.27, 20cm × 20cm square = £14.62

Askina Calgitrol Thin

Calcium alginate and silver alginate matrix, for use with absorptive secondary dressings

Askina Calgitrol Thin dressing (B.Braun Medical Ltd) 10cm × 10cm square = £4.08, 15cm × 15cm square = £9.16, 20cm × 20cm square = £16.18, 5cm × 5cm square = £1.97

Melgisorb Ag

Alginate and carboxymethylcellulose dressing, with ionic silver

Melgisorb Ag (Mohlycke Health Care Ltd) Cavity dressing 3cm × 4.4cm = £4.54, dressing 10cm × 10cm = £3.64, 15cm × 15cm = £7.71, 5cm × 5cm = £1.82

Silvercel

Alginate and carboxymethylcellulose dressing impregnated with silver

Silvercel dressing (Systagenix Wound Management Ltd) 10cm × 20cm rectangular = £7.68, 11cm × 11cm square = £4.14, 2.5cm × 30.5cm rectangular = £4.45, 5cm × 5cm square = £1.68

Silvercel Non-adherent

Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver

Silvercel Non-Adherent (Systagenix Wound Management Ltd) cavity dressing 2.5cm × 30.5cm = £3.94, dressing 10cm × 20cm rectangular = £7.25, 11cm × 11cm square = £3.89, 5cm × 5cm square = £1.62

Sorbsan Silver Flat

Calcium alginate fibre, highly absorbent, flat non-woven pads, with silver

Sorbsan Silver Flat dressing (Aspen Medical Europe Ltd) 10cm × 10cm = £3.97, 10cm × 20cm = £7.26, 5cm × 5cm = £1.57

Sorbsan Silver Plus

Calcium alginate dressing with absorbent backing, with silver

Sorbsan Silver Plus dressing (Aspen Medical Europe Ltd) 10cm × 10cm = £5.56, 10cm × 20cm = £6.77, 15cm × 20cm = £9.08, 7.5cm × 10cm = £3.35

Sorbsan Silver Ribbon

With silver

Sorbsan (Aspen Medical Europe Ltd) Silver Ribbon dressing 1g = £4.15

Sorbsan Silver Surgical Packing

With silver

Sorbsan (Aspen Medical Europe Ltd) Silver Packing dressing 2g = £5.76

Suprasorb A + Ag

Calcium alginate dressing, with silver

Suprasorb A + Ag (Loehmann & Rauscher (UK) Ltd) dressing 10cm × 10cm = £4.11, 10cm × 20cm = £7.59, 5cm × 5cm = £1.63, rope dressing 2g = £6.08

Tegaderm Alginate Ag

Calcium alginate and carboxymethylcellulose dressing, with silver

Tegaderm Alginate Ag dressing (3M Health Care Ltd) 10cm × 10cm = £3.24, 3cm × 30cm = £3.70, 5cm × 5cm = £1.39

Urgosorb Silver

Alginate and carboxymethylcellulose dressing, impregnated with silver

Urgosorb Silver (Urgo Ltd) Rope dressing 2.5cm × 30cm = £3.71, dressing 10cm × 10cm = £3.68, 10cm × 20cm = £6.95, 5cm × 5cm = £1.54

Foam dressings

Acticoat Moisture Control

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer

Acticoat Moisture Control dressing (Smith & Nephew Healthcare Ltd) 10cm × 10cm square = £16.95, 10cm × 20cm rectangular = £33.04, 5cm × 5cm square = £7.25

Allevyn Ag

Silver sulfadiazine impregnated polyurethane foam film dressing with or without adhesive border

Allevyn Ag (Smith & Nephew Healthcare Ltd) Adhesive dressing 10cm × 10cm = £5.50, 12.5cm × 12.5cm square = £7.23, 17.5cm × 17.5cm square = £13.90, 17cm × 17cm square = £10.85, 22cm × 22cm square = £14.54, 7.5cm × 7.5cm square = £3.49, Heal Non-Adhesive dressing 10.5cm × 13.5cm = £10.76, Non-Adhesive dressing 10cm × 10cm = £6.14, 15cm × 15cm square = £31.64, 20cm × 20cm square = £17.64, 5cm × 5cm square = £3.26

Biaitan Ag

Silver impregnated polyurethane foam film dressing, with or without adhesive border

Biaitan Ag (Coloplast Ltd) cavity dressing 5cm × 8cm = £4.07, dressing 10cm × 10cm square = £8.16, 10cm × 20cm rectangular = £15.00, 12.5cm × 12.5cm square = £9.34, 15cm × 15cm square = £16.38, 18cm × 18cm square = £18.73, 19cm × 20cm heel = £18.47, 20cm × 20cm square = £23.11, 23cm × 23cm square = £19.63, 5cm × 7cm rectangular = £3.35

PolyMem Silver

Silver impregnated polyurethane foam film dressing, with or without adhesive border

PolyMem Silver (Aspen Medical Europe Ltd) WIC dressing 8cm × 8cm = £7.05, dressing 10.8cm × 10.8cm = £8.86, 12.7cm × 8.8cm oval = £5.60, 17cm × 19cm rectangular = £17.76, 5cm × 7.6cm oval = £2.27

Urgocell Silver

Non-adherent, polyurethane foam film dressing with silver in wound contact layer

Urgocell Silver dressing (Urgo Ltd) 10cm × 10cm = £5.95, 15cm × 20cm = £10.90, 6cm × 6cm = £4.33
### Antimicrobial dressings

#### Hydrocolloid dressings

**Aquadel Ag**  
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated)

**Aquadel Ag** (Convatec Ltd) Ribbon dressing 1cm x 45cm = £3.08, 2cm x 45cm = £4.76, dressing 10cm x 10cm square = £4.74, 15cm x 15cm square = £8.92, 20cm x 30cm rectangular = £22.12, 4cm x 10cm rectangular = £2.88, 4cm x 20cm rectangular = £3.76, 4cm x 30cm rectangular = £5.63

**Physioutil Ag**  
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine

**Physioutil** (Coloplast Ltd) dressing 10cm x 10cm = £2.28

#### Low adherence dressing

**Acticoat**  
Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)

**Acticoat dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £6.65, 10cm x 20cm rectangular = £13.53, 20cm x 40cm rectangular = £46.28, 5cm x 5cm square = £3.54

**Acticoat 7**  
Five-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)

**Acticoat 7 dressing** (Smith & Nephew Healthcare Ltd) 10cm x 12.5cm rectangular = £18.94, 15cm x 15cm square = £32.97, 5cm x 5cm square = £6.15

**Acticoat Flex 3**  
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear)

**Acticoat Flex 3 dressing** (Smith & Nephew Healthcare Ltd) 10cm x 10cm square = £6.64, 10cm x 20cm rectangular = £13.50, 20cm x 40cm rectangular = £46.21, 5cm x 5cm square = £3.54

**Acticoat Flex 7**  
Conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear)

**Acticoat Flex 7 dressing** (Smith & Nephew Healthcare Ltd) 10cm x 12.5cm rectangular = £18.31, 15cm x 15cm square = £32.92, 5cm x 5cm square = £6.15

**Atrauman Ag**  
Non-adherent polyamide fabric impregnated with silver and neutral triglycerides

**Atrauman Ag dressing** (Paul Hartmann Ltd) 10cm x 10cm = £1.26, 10cm x 20cm = £2.47, 5cm x 5cm = £0.52

#### Soft polymer dressings

**Allevyn Ag Gentle**  
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with or without adhesive border

**Allevyn Ag Gentle** (Smith & Nephew Healthcare Ltd) Border dressing 10cm x 10cm = £6.43, 12.5cm x 12.5cm = £8.26, 17.5cm x 17.5cm = £15.75, 7.5cm x 7.5cm = £4.28, dressing 10cm x 10cm = £6.24, 10cm x 20cm = £10.31, 15cm x 15cm = £11.61, 20cm x 20cm = £17.19, 5cm x 5cm = £3.35

**Mepilex Ag**  
Soft silicone wound contact dressing with polyurethane foam film backing, with silver, with or without adhesive border

**Mepilex** (Mohlycke Health Care Ltd) Ag dressing 10cm x 10cm = £6.12, 10cm x 20cm = £10.09, 15cm x 15cm = £11.36, 20cm x 20cm = £16.84, 20cm x 50cm = £33.20, Border Ag dressing 10cm x 12.5cm = £6.16, 10cm x 20cm = £8.97, 10cm x 30cm = £13.46, 15cm x 15cm = £11.31, 17cm x 20cm = £14.66, 7cm x 7.5cm = £3.41, Border Sacrum Ag dressing 18cm x 18cm = £11.83, 20cm x 20cm = £14.38, 23cm x 23cm = £18.89, Heel Ag dressing 13cm x 20cm = £12.78, 15cm x 22cm = £14.32

**Urgotul Silver**  
Non-adherent soft polymer wound contact dressing, with silver

**Urgotul Silver dressing** (Urgo Ltd) 10cm x 12cm = £3.58, 15cm x 20cm = £9.75

**Urgotul Duo Silver**  
Non-adherent soft polymer wound contact dressing, with silver

**With charcoal**

**Actisorb Silver 220**  
Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve

**Actisorb Silver 220 dressing** (Systagenix Wound Management Ltd) 10.5cm x 10.5cm = £2.58, 10.5cm x 15cm = £4.70, 6.5cm x 9.5cm = £1.64

#### Other antimicrobials

**Cutimed Siltec Sorbact**  
Polyurethane foam dressing with acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

**Cutimed Siltec Sorbact dressing** (BSN medical Ltd) 12.5cm x 12.5cm = £6.44, 15cm x 15cm = £7.98, 17.5cm x 17.5cm = £11.17, 22.5cm x 22.5cm = £16.99, 7.5cm x 7.5cm = £2.51, 17.5cm x 17.5cm sacral = £8.07, 23cm x 23cm sacral = £12.14

**Cutimed Sorbact**  
Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride; dressing pad, swabs, round swabs or ribbon gauze, cotton

**Cutimed Sorbact** (BSN medical Ltd) Ribbon dressing 2cm x 50cm = £4.93, 5cm x 200cm = £7.95, Round swab 3cm = £3.30, dressing pad 10cm x 10cm = £5.50, 10cm x 20cm = £8.58, 7cm x 9cm = £3.52, swab 4cm x 6cm = £1.65, 7cm x 9cm = £2.75

**Cutimed Sorbact Gel**  
Hydrogel dressing impregnated with dialkylcarbamoyl chloride

**Cutimed Sorbact Gel dressing** (BSN medical Ltd) 7.5cm x 15cm rectangular = £4.48, 7.5cm x 7.5cm square = £2.65

**Cutimed Sorbact Hydroactive**  
Non-adhesive gel dressing with hydrogel matrix and acetate fabric coated with dialkylcarbamoyl chloride

**Cutimed Sorbact Hydroactive dressing** (BSN medical Ltd) 14cm x 14cm = £5.37, 14cm x 24cm = £8.60, 19cm x 15cm = £10.10, 24cm x 24cm = £15.31, 7cm x 8.5cm = £3.68

**Cutimed Sorbact Hydroactive B**  
Gel dressing with hydrogel matrix and acetate fabric coated with dialkylcarbamoyl chloride, with adhesive border

**Cutimed Sorbact Hydroactive B dressing** (BSN medical Ltd) 10cm x 10cm = £7.08, 10cm x 20cm = £11.35, 15cm x 15cm = £13.34, 5cm x 6.5cm = £3.97

**Flaminial Forte gel**  
Alginate with glucose oxidase and lactoperoxidase, for moderately to heavily exuding wounds

**Flaminial Forte gel dressing** (Flan Health UK Ltd) 15g = £7.68, 50g = £25.42

**Flaminial Hydro gel**  
Alginate with glucose oxidase and lactoperoxidase, for lightly to moderately exuding wounds

**Flaminial Hydro gel dressing** (Flan Health UK Ltd) 15g = £7.68, 50g = £25.42

**Kendall AMD**  
Foam dressing with polihexanide, without adhesive border

**Kendall AMD Antimicrobial foam dressing** (Aria Medical Ltd) 10cm x 10cm square = £4.71, 10cm x 20cm rectangular = £8.92, 15cm x 15cm square = £8.92, 20cm x 20cm square = £13.07, 5cm x 5cm square = £2.50, 8.8cm x 7.5cm rectangular (fenestrated) = £4.23

**Kendall AMD Plus**  
Foam dressing with polihexanide, with adhesive border

**Kendall AMD Antimicrobial Plus foam dressing** (Aria Medical Ltd) 10cm x 10cm square = £4.94, 8.8cm x 7.5cm rectangular (fenestrated) = £4.43
Ocetinil Wound gel
Wound gel, hydroxyethylcellulose and propylene glycol, with octenidine hydrochloride
Ocetinil Wound Gel dressing (Schulke & Mayr Ltd) 20ml= £4.78

Prontosan Wound Gel
Hydrogel containing betaine surfactant and polihexanide
Prontosan Wound Gel dressing (B. Braun Medical Ltd) 30ml= £6.44

Suprasorb X + PHMB
Biosynthetic cellulose fibre dressing with polihexanide
Suprasorb X + PHMB dressing (Lohmann & Rauscher (UK) Ltd) 14cm x 20cm rectangular= £11.64, 2cm x 21cm rope= £7.25, 5cm x 5cm square= £2.97, 9cm x 9cm square= £5.12

Telfa AMD
Low adherence absorbent perforated plastic film faced dressing with polihexanide
Telfa AMD dressing (Aria Medical Ltd) 10cm x 7.5cm= £0.18, 20cm x 7.5cm= £0.28

Telfa AMD Island
Low adherence dressing with adhesive border and absorbent pad, with polihexanide
Telfa AMD Island dressing (Aria Medical Ltd) 10cm x 12.5cm= £0.59, 10cm x 20cm= £0.86, 10cm x 25.5cm= £0.98, 10cm x 35cm= £1.22

Chlorhexidine gauze dressing
Bactigras
Fabric of leno weave, wet and warp threads of cotton and/or viscose yarn, impregnated with ointment containing chlorhexidine acetate
Bactigras gauze dressing (Smith & Nephew Healthcare Ltd) 10cm x 10cm= no price available, 5cm x 5cm= no price available

Irrigation fluids
Ocetinil Wound Irrigation solution
Aqueous solution containing glycerol, ethelyxylglycerin and octenidine hydrochloride
Ocetinil irrigation solution (Schulke & Mayr Ltd) 350mL bottles= £4.60

Prontosan Wound Irrigation Solution
Aqueous solution containing betaine surfactant and polihexanide
Prontosan irrigation solution (B. Braun Medical Ltd) 350mL bottles= £4.78, 40ml unit dose= £14.18

Specialised dressings
Protease-modulating matrix dressings
Cadesorb Ointment
Cadesorb (Smith & Nephew Healthcare Ltd) ointment= £9.32

Catrix
Catrix dressing (Cranage Healthcare Ltd) sachets= £3.80

Promogran
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing
Promogran dressing (Systagenix Wound Management Ltd) 123 square cm= £15.62, 28 square cm= £5.19

Promogran Prisma Matrix
Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing
Promogran Prisma dressing (Systagenix Wound Management Ltd) 123 square cm= £17.98, 28 square cm= £6.31

UrgoStart
Soft adherent polymer matrix containing nano-oligosaccharide factor (NOSF), with polyurethane foam film backing
UrgoStart dressing (Urgo Ltd) 10cm x 10cm= £6.16, 15cm x 20cm= £11.08, 6cm x 6cm= £4.45, 12cm x 19cm heelp= £8.49

UrgoStart Contact
Non-adherent soft polymer wound contact dressing containing nano-oligosaccharide factor (NOSF)
UrgoStart (Urgo Ltd) Contact dressing 5cm x 7cm= £3.00

Silicone keloid dressings
Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

Silicone gel
Bapsincare
Silicone gel
Bapsocrine (BAP Medical UK Ltd) gel= £17.00

Ciltech
Silicone gel
Ciltech (Su-Med International (UK) Ltd) gel= £50.00

Dermatix
Silicone gel
Dermatix gel (Meda Pharmaceuticals Ltd)= £60.53

Kelo-cote UV
Silicone gel with SPF 30 UV protection
Kelo-cote (Sinclair IS Pharma Plc) UV gel= £17.88

Kelo-cote gel
Silicone gel
Kelo-cote (Sinclair IS Pharma Plc) gel= £51.00

Kelo-cote spray
Silicone spray
Kelo-cote (Sinclair IS Pharma Plc) spray= £51.00

NewGel+E
Silicone gel with vitamin E
NewGel+E (Advantec Surgical Ltd) gel= £17.70

Scarsil
Silicone gel
Scarsil (Jobskin Ltd) gel= £15.19

Silgel STC-SE
Silicone gel
Silgel (Nagor Ltd) STC-SE gel= £19.00

Silicone sheets
Advasil Conform
Self-adhesive silicone gel sheet with polyurethane film backing
Advasil Conform sheet (Advancis Medical) 10cm x 10cm square= £5.20, 15cm x 10cm rectangular= £9.17

Bapsincare T
Self-adhesive silicone gel sheet
Bapsocrine T sheet (BAP Medical UK Ltd) 10cm x 15cm rectangular= £9.00, 5cm x 30cm rectangular= £9.00, 5cm x 7cm rectangular= £3.15

Cica-Care
Soft, self-adhesive, semi-occlusive silicone gel sheet with backing
Cica-Care sheet (Smith & Nephew Healthcare Ltd) 15cm x 12cm rectangular= £28.82, 6cm x 12cm rectangular= £14.79

Ciltech
Silicone gel sheet
Ciltech sheet (Su-Med International (UK) Ltd) 10cm x 10cm square= £7.50, 10cm x 20cm rectangular= £12.50, 15cm x 15cm square= £14.00

Dermatix
Self-adhesive silicone gel sheet (clear- or fabric-backed)
Dermatix (Meda Pharmaceuticals Ltd) Clear sheet 13cm x 13cm square= £15.79, 13cm x 25cm rectangular= £28.53, 20cm x 30cm rectangular= £51.97, 4cm x 13cm rectangular= £6.88, Fabric sheet 13cm x 13cm square= £15.79, 13cm x 25cm rectangular= £28.53, 20cm x 30cm rectangular= £51.97, 4cm x 13cm rectangular= £6.88

Mepiform
Self-adhesive silicone gel sheet with polyurethane film backing
Mepiform sheet (Molnycke Health Care Ltd) 4cm x 31cm rectangular= £10.90, 5cm x 7cm rectangular= £3.45, 9cm x 18cm rectangular= £13.49
Adjunct dressings and appliances

Surgical absorbents

Surgical absorbents applied directly to the wound have many disadvantages—dehydration of and adherence to the wound, shedding of fibres, and the leakage of exudate (‘strike through’) with an associated risk of infection. Gauze and cotton absorbent dressings can be used as secondary layers in the management of heavily exuding wounds (but see also Capillary-action dressings). Absorbent cotton gauze fabric can be used for swabbing and cleaning skin. Ribbon gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous, foam, or alginate) layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP
Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Absorbent Cotton, Hospital Quality
As for absorbent cotton but lower quality materials, shorter staple length etc.

Absorbent (Robert Bailey & Son Plc) cotton hospital quality

Gauze and cotton tissue

Gamgee Tissue (blue)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue blue label

Gamgee Tissue (pink)
Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2 Gamgee (Robinson Healthcare) tissue pink label DT

Gauze and tissue

Absorbent Cotton Gauze, BP 1988
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile

Absorbent (Robert Bailey & Son Plc) cotton BP 1988

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent cotton BP 1988

Clini (CliniSupplies Ltd) absorbent cotton BP 1988

Vernaid (Synergy Health Plc) absorbent cotton BP 1988

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988
Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile

Vernaid Fast Edge ribbon gauze sterile (Synergy Health Plc) 1.25cm, 2.5cm

Lint

Absorbent Lint, BPC
Cotton cloth of plain weave with nap raised on one side from warp yarns

Absorbent (Robinson Healthcare) lint

Alvita (Alliance Healthcare (Distribution) Ltd) absorbent lint BPC

Clini (CliniSupplies Ltd) absorbent lint BPC

Pads

Drisorb
Absorbent Dressing Pads, Sterile

Drisorb (Synergy Health Plc) dressing pad 10cm × 20cm= £0.17

PremierPad
Absorbent Dressing Pads, Sterile

PremierPad dressing pad (Shermond) 10cm × 20cm= £0.18, 20cm × 20cm= £0.25

XuPad
Absorbent Dressing Pads, Sterile

XuPad dressing pad (Richardson Healthcare Ltd) 10cm × 20cm= £0.17, 20cm × 20cm= £0.28, 20cm × 40cm= £0.40

Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol Draina S
Wound drainage pouch

Biotrol Draina S wound drainage bag (B.Braun Medical Ltd) large (Transparent)= £95.45, medium (Transparent)= £77.61, mini (Transparent)= £77.84

Biotrol Draina S Vision
Wound drainage pouch

Draina S Vision (B.Braun Medical Ltd) 100 wound drainage bag= £123.94, 50 wound drainage bag= £101.11, 75 wound drainage bag= £106.82

Eakin Access window
For use with Eakin® pouches

Eakin (Pelican Healthcare Ltd) access window= £37.74

Eakin Wound pouch, bung closure
Wound pouch, bung closure

Eakin wound drainage bag with bung closure (Pelican Healthcare Ltd) large= £102.45, medium= £75.49, small= £53.92, and access window for horizontal wounds, extra large= £102.45, for horizontal wounds, extra large= £91.66, for vertical incision wounds, extra large= £91.66, wounds, extra large= £91.66

Eakin Wound pouch, fold and tuck closure
Wound pouch, fold and tuck closure

Eakin wound drainage bag with fold and tuck closure (Pelican Healthcare Ltd) large= £91.66, medium= £70.10, small= £48.53, extra large= £80.88

Option Wound Manager
Wound drainage bag

Option wound manager bag (Oakmed Ltd) large= £160.22, medium= £134.42, small= £131.50, square= £140.27, extra square= £118.23

Option Wound Manager with access port
Wound drainage bag with access port

Option wound manager bag with access port (Oakmed Ltd) large= £171.27, medium= £140.27, small= £137.34, square= £146.11, extra small= £129.28

Option Wound Manager, cut to fit
Wound drainage bag, cut to fit

Option wound manager bag (Oakmed Ltd) large= £84.23, medium= £80.42, small= £72.59

Welland Fistula bag
Wound drainage bag, cut-to-fit

Welland (Welland Medical Ltd) Fistula wound drainage bag= £28.07

Physical debridement pads

DebrisoSoft® is a pad that is used for the debridement of superficial wounds containing loose slough and debris, and for the removal of hyperkeratosis from the skin. DebrisoSoft® must be fully moistened with a wound cleansing solution before use and is not appropriate for use as a wound dressing.

DebrisoSoft Pad
Polyester fibres with bound edges and knitted outer surface coated with polyacrylate

DebrisoSoft (Lohmann & Rauscher (UK) Ltd) pad 10cm × 10cm= £6.45
Complex adjunct therapies

Topical negative pressure therapy

**Accessories**

**Renasyx**
Soft port and connector
Renasyx (Smith & Nephew Healthcare Ltd) Soft Port = £11.21

**V.A.C.**
Drape, gel for canister, Sensa T.R.A.C. Pad
SensaT.R.A.C. (KCI Medical Ltd) pad = £10.95
T.R.A.C. (KCI Medical Ltd) connector = £3.13
V.A.C. (KCI Medical Ltd) drape = £9.39, gel strips = £3.76

**Venturi**
Gel patches, adhesive, and connector
Venturi (Talley Group Ltd) adhesive gel patch = £15.00, connector = £15.00

**WoundASSIST gel strip**
WoundASSIST (Huntleigh Healthcare Ltd) TNP gel strip = £3.37

**Vacuum assisted closure products**

**Exsu-Fast kit 1**
Dressing Kit

**Exsu-Fast kit 2**
Dressing Kit

**Exsu-Fast kit 3**
Dressing Kit

**Exsu-Fast kit 4**
Dressing Kit

**V.A.C. GranuFoam**
Polyurethane foam dressing (with adhesive drapes and pad connector); with or without silver
V.A.C. GranuFoam (KCI Medical Ltd) Bridge dressing kit = £32.04
Silver with SensaiT.R.A.C. dressing kit medium = £38.04, small = £32.79, dressing kit large = £31.70, medium = £27.32, small = £22.95

**V.A.C. Simplace**
Spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector)
V.A.C. Simplace EX dressing kit (KCI Medical Ltd) medium = £30.58, small = £26.60

**V.A.C. WhiteFoam**
Polyvinyl alcohol foam dressing or dressing kit
V.A.C. WhiteFoam dressing (KCI Medical Ltd) large = £17.04, medium = £10.64, kit large = £33.54, small = £25.91

**Venturi**
Wound sealing kit, flat drain; with or without channel drain
Venturi wound sealing kit with (Talley Group Ltd) channel drain = £15.00, flat drain, large = £17.50, standard = £15.00

**WoundASSIST**
Wound pack and channel drain
WoundASSIST TNP dressing pack (Huntleigh Healthcare Ltd) medium/large = £23.85, small/medium = £20.81, channel drain medium/large = £23.85, small/medium = £20.81, extra large = £34.95

**Wound drainage collection devices**

**ActiV.A.C.**
Canister with gel
ActiV.A.C. (KCI Medical Ltd) canister with gel = £28.42

**S-Canister**
Canister kit
S-Canister (Smith & Nephew Healthcare Ltd) kit = £19.00

**V.A.C. Freedom**
Canister with gel
V.A.C. (KCI Medical Ltd) Freedom Canister with gel = £28.85

**Venturi**
Canister kit with solidifier
Venturi (Talley Group Ltd) Compact canister kit = £12.50, canister kit = £12.50

**WoundASSIST wound pack**
Canister
WoundASSIST (Huntleigh Healthcare Ltd) TNP canister = £20.30

Wound care accessories

**Dressing packs**
The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

**Multiple Pack Dressing No. 1**
Consists of absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-woven bandages (banded)

**Vernaid**
(Synergy Health Plc) multiple pack dressing

Non-drug tariff specification sterile dressing packs

**Dressit**
Vitrex gloves, large apron, disposable bag, paper towel, softswabs, adsorbent pad, sterile field

**Dressit sterile dressing pack** (Richardson Healthcare Ltd) with medium/large gloves = £0.60, small/medium gloves = £0.60

**Nurse It**
Contains latex-free, powder-free nitrile gloves, sterile laminated paper sheet, large apron, non-oven swabs, paper towel, disposable bag, compartmented tray, disposable forceps, paper measuring tape

**Nurse It sterile dressing pack** (Medicareplus International Ltd) with medium/large gloves = £0.55, small/medium gloves = £0.55

**Polynitrile Nitrile Patient Pack**
Consists of powder-free nitrile gloves, laminated paper sheet, non-oven swabs, towel, polythene disposable bag, apron

**Polynitrile Nitrile Patient Pack with** (Shermond) large gloves = £0.52, medium gloves = £0.52, small gloves = £0.52

Sterile Dressing Pack with Non-Woven Pads

**Vernaid**
(Drug Tariff specification 35). Contains non-oven fabric covered dressing pack, non-oven fabric swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper

**Sterile Dressing Pack with Non-Woven Pads**
Vernaid (Synergy Health Plc) sterile dressing pack with non-oven pads

**Styler dressing packs**

**Vernaid**
(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper

**Vernaid (Synergy Health Plc) sterile dressing pack**

**Woven and fabric swabs**

**Gauze Swab, PB 1988**
Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile or non-sterile

**Alvita gauze swab 8ply** (Alliance Healthcare (Distribution) Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

**CS** (CliniSupplies Ltd) gauze swab 8ply non-sterile 10cm x 10cm

**Clini gauze swab 8ply** (CliniSupplies Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

**Gauze** (Robert Bailey & Son Plc) swab 8ply non-sterile 10cm x 10cm

**McCoBo gauze swab 8ply** (McCoBo Ltd) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm

**Propox gauze** (BSN medical Ltd) swab 8ply sterile 7.5cm x 7.5cm

**Sovereign** (Waymade Healthcare Plc) gauze swab 8ply sterile 7.5cm x 7.5cm

**Steraid** (Robert Bailey & Son Plc) gauze swab 8ply sterile 7.5cm x 7.5cm

**Vernaid gauze swab 8ply** (Synergy Health Plc) non-sterile 10cm x 10cm, sterile 7.5cm x 7.5cm
Non-woven Fabric Swab
(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile or non-sterile
- CS (CliniSupplies Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
- Clini non-woven fabric swab 4ply (CliniSupplies Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
- CliniMed (CliniMed Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
- MeCoBo (MeCoBo Ltd) non-woven fabric swab 4ply non-sterile 10cm × 10cm
- Multisorb (BSN medical Ltd) non-woven fabric swab 4ply sterile 7.5cm × 7.5cm
- Sofsorb non-woven fabric swab 4ply (Synergy Health Plc) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
- Softswab non-woven fabric swab 4ply (Richardson Healthcare Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm
- Topper 8 non-woven fabric swab 4ply (Systagenix Wound Management Ltd) non-sterile 10cm × 10cm, sterile 7.5cm × 7.5cm

Filamted non-woven Fabric Swab
Regal
(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile
Regal (Systagenix Wound Management Ltd) filamated swab 8ply 10cm × 10cm

Surgical adhesive tapes
Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and containing rubber, or undergoing prolonged treatment.
Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Occlusive adhesive tapes
Blenderm
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with a polymeric adhesive mass
Blenderm tape (3M Health Care Ltd) 2.5cm = £1.77, 5cm = £3.37
Sleek
(Impermeable Plastic Adhesive Tape, BP 1988). Extensible water-impermeable plastic film spread with an adhesive mass
Leukoplast Sleek tape (BSN medical Ltd) 2.5cm = £1.19, 5cm = £2.99

3m Kind Removal Silicone Tape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
3M Micropore Silicone tape (3M Health Care Ltd) 2.5cm = £3.58, 5cm = £6.48

Chemifix
Chemifix tape (Medicareplus International Ltd) 10cm = £2.10, 2.5cm = £0.90, 5cm = £1.40

Chemipore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Chemipore tape (Medicareplus International Ltd) 1.25cm = £0.27, 2.5cm = £0.70, 5cm = £0.95

Clinipore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Clinipore tape (CliniSupplies Ltd) 1.25cm = £0.35, 2.5cm = £0.73, 5cm = £0.99

Elastoplast
(Elastic Adhesive Tape, BP 1988). Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide
Tensoplast (BSN medical Ltd) elastic adhesive tape 2.5cm

Hypafix
Hypafix tape (BSN medical Ltd) 10cm = £6.67, 15cm = £6.92, 2.5cm = £1.69, 20cm = £9.18, 30cm = £13.27, 5cm = £2.68

Insil
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Insil tape (Insight Medical Products Ltd) 2cm = £5.77, 4cm = £5.77

Leukokfix
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Leukokfix tape (BSN medical Ltd) 1.25cm = £0.55, 2.5cm = £0.90, 5cm = £1.57

Leukopor
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Leukopor tape (BSN medical Ltd) 1.25cm = £0.49, 2.5cm = £0.77, 5cm = £1.35

Mediplast
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Mediplast tape (Neomedic Ltd) 1.25cm = £0.30, 2.5cm = £0.50

Mepitac
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Mepitac tape (Molynlycke Health Care Ltd) 2cm = £6.96, 4cm = £6.96

Micropore
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass
Micropore tape (3M Health Care Ltd) 1.25cm = £0.62, 2.5cm = £0.92, 5cm = £1.62

Omnifix
Omnifix tape (Paul Hartmann Ltd) 10cm = £4.08, 15cm = £6.02, 5cm = £2.42

OpSite Flexifix Gentle
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
OpSite Flexifix Gentle tape (Smith & Nephew Healthcare Ltd) 2.5cm = £10.30, 5cm = £19.31
Primafix

Primafix tape (Smith & Nephew Healthcare Ltd) 10cm = £2.36, 15cm = £3.48, 20cm = £4.29, 5cm = £1.61

Scantor
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Scantor tape (Bio-Diagnostics Ltd) 1.25cm = £0.55, 2.5cm = £0.92, 5cm = £1.75, 7.5cm = £2.56

Siltape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape

Siltape (Advancis Medical) 2cm = £5.60, 4cm = £5.60

Strappal
Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide

Strappal adhesive tape (BSN medical Ltd) 2.5cm = £1.39, 5cm = £2.34, 7.5cm = £3.53

Transpor
(Permeable Non-Woven Synthetic Adhesive Tape, BP 1988). Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass

Transpor tape (3M Health Care Ltd) 2.5cm = £0.84, 5cm = £1.48

Zinc Oxide Adhesive Tape, BP 1988
Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide

Fast Aid zinc oxide adhesive tape (Robinson Healthcare) 1.25cm, 2.5cm, 5cm, 7.5cm

Skin closure dressings
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

Skin closure strips, sterile

Leukostrip
Drug Tariff specifies that these are specifically for personal administration by the prescriber

Leukostrip (Smith & Nephew Healthcare Ltd) skin closure strips 6.4mm × 76mm = £6.38

Omnistrip
Drug Tariff specifies that these are specifically for personal administration by the prescriber

Omnistrip (Paul Hartmann Ltd) skin closure strips sterile 6mm × 76mm = £24.34

Steri-strip
Drug Tariff specifies that these are specifically for personal administration by the prescriber

Steri-strip (3M Health Care Ltd) skin closure strips 6mm × 75mm = £8.77

Bandages
Non-extensible bandages
Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive can be used for closure of minor skin wounds and for additional suture support.

Open-wove Bandage, Type 1 BP 1988
Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length

Clini open wove bandage Type 1 BP 1988 (CliniSupplies Ltd) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m

Vernair white open wove bandage (Synergy Health Plc) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m

White open wove bandage (Robert Bailey & Son Plc) 10cm × 5m, 2.5cm × 5m, 5cm × 5m, 7.5cm × 5m

Triangular Calico Bandage, BP 1980
Unbleached calico right-angled triangle

Clini (CliniSupplies Ltd) triangular calico bandage BP 1980 90cm × 127cm

Triangular (BSN medical Ltd) calico bandage 90cm × 127cm

Light-weight conforming bandages
Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.

Acti-Wrap
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)

Acti-Wrap (cohesive/latex free) bandage (Activa Healthcare Ltd) 10cm × 4m = £0.81, 6cm × 4m = £0.47, 8cm × 4m = £0.69

Cotton Conforming Bandage, BP 1988
Cotton fabric, plain weave, treated to impart some elasticity to warp and weft

Easifix Crinx bandage (BSN medical Ltd) 10cm × 3.5m = £1.03, 15cm × 3.5m = £1.41, 5cm × 3.5m = £0.68, 7.5cm × 3.5m = £0.84

Easifix
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Easifix bandage (BSN medical Ltd) 10cm × 4m = £0.51, 15cm × 4m = £0.86, 5cm × 4m = £0.35, 7.5cm × 4m = £0.43

Easifix K
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched

Easifix K bandage (BSN medical Ltd) 10cm × 4m = £0.18, 15cm × 4m = £0.32, 2.5cm × 4m = £0.10, 5cm × 4m = £0.11, 7.5cm × 4m = £0.16

Hospiform
Fabric, plain weave, warp of polyamide, weft of viscose

Hospiform bandage (Paul Hartmann Ltd) 10cm × 4m = £0.19, 12cm × 4m = £0.24, 6cm × 4m = £0.14, 8cm × 4m = £0.17

K-Band
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched

K-Band (Burgos Ltd) 10cm × 4m = £0.28, 15cm × 4m = £0.50, 5cm × 4m = £0.20, 7cm × 4m = £0.26

Knit Fix
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched

Knit Fix bandage (Robert Bailey & Son Plc) 10cm × 4m = £0.17, 15cm × 4m = £0.33, 5cm × 4m = £0.12, 7cm × 4m = £0.17

Knit-Band
Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched

Knit-Band bandage (CliniSupplies Ltd) 10cm × 4m = £0.17, 15cm × 4m = £0.30, 5cm × 4m = £0.10, 7cm × 4m = £0.15

Kontour
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched

Kontour bandage (Easigrab Ltd) 10cm × 4m = £0.40, 15cm × 4m = £0.66, 5cm × 4m = £0.28, 7.5cm × 4m = £0.35

Mollelast
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all)

Mollelast (Lohmann & Rauscher (UK) Ltd) bandage 4cm × 4m = £0.30

Peha-haft
Polyamide and Cellulose Contour Bandage, cohesive, latex-free
Peha-haft bandage (Paul Hartmann Ltd) 10cm x 4m= £0.77, 12cm x 4m= £0.91, 2.5cm x 4m= £0.74, 4cm x 4m= £0.48, 6cm x 4m= £0.56, 8cm x 4m= £0.67

PremierBand
Polyamide and Cellulose Contour Bandage
PremierBand 4cm (Shermond) 10cm x 4m= £0.17, 15cm x 4m= £0.25, 5cm x 4m= £0.12, 7.5cm x 4m= £0.14

Slinky
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
Slinky bandage (Molynche Health Care Ltd) 10cm x 4m= £0.72, 15cm x 4m= £1.04, 7.5cm x 4m= £0.59

Stayform
Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4m stretched (all)
Stayform bandage (Robinson Healthcare) 10cm x 4m= £0.40, 15cm x 4m= £0.68, 5cm x 4m= £0.29, 7.5cm x 4m= £0.36

Tubular bandages and garments
Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticised versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate. Compression hosiery reduces the recurrence of venous leg ulcers and should be considered for use after wound healing. Silk clothing is available as an alternative to elasticised viscose stockinettes, for use in the management of severe eczema and allergic skin conditions.

Elasticated Surgical Tubular Stockinette, Foam padded is used for relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface.
For Elasticated Tubular Bandage, BP 1993, where no size stated by the prescriber, the 50cm length should be supplied and width endorsed.
Non-elasticised Cotton Stockinette, Bleached, BP 1988 1m lengths is used as basis (with wadding) for plaster of Paris bandages etc., 6m length, compression bandage.
For Non Elasticated Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988, the Drug Tariff specifies various combinations of sizes to provide sufficient material for part or full body coverage. It is used as protective dressings with tar-based and other steroid ointments.

Elasticated

Acti-Fast
(Drug Tariff specification 46). Lightweight plain-knitted elasticised tubular bandage
Acti-Fast 2-way stretch stockinette (Activa Healthcare Ltd) 10.75cm= £0.04, 17.5cm= £1.83, 20cm= £3.20, 3.5cm= £0.56, 5cm= £0.58, 7.5cm= £0.77

Clinifast
(Drug Tariff specification 46). Lightweight plain-knitted elasticised tubular bandage; various colours and sizes
Clinifast stockinette (CliniSupplies Ltd) 10.75cm= £0.06, 17.5cm= £1.83, 3.5cm= £0.56, 5cm= £0.58, 7.5cm= £0.77, clava 5-14 years= £0.75, 6 months-5 years= £0.85, cycle shorts large adult= £16.25, medium adult= £14.25, small adult= £12.50, gloves large adult= £4.99, child/small adult= £4.99, gloves medium adult= £4.99, child= £4.99, gloves small child= £4.99, leggins (Blue, Pink, White) 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 6-24 months= £7.13, 8-11 years= £11.88, vest short sleeve large adult= £16.25, medium adult= £14.25, small adult= £12.50.

Comifast
(Drug Tariff specification 46). Lightweight plain-knitted elasticised tubular bandage; various colours and sizes
Comifast stockinette (Synergy Health Plc) 10.75cm= £0.04, 17.5cm= £1.83, 5cm= £0.56, 6cm= £0.58, 7.5cm= £0.77

Comifast Easywrap
(Drug Tariff specification 46). Lightweight plain-knitted elasticised tubular bandage; various colours and sizes
Comifast Easywrap stockinette (Synergy Health Plc) clava 5-14 years= £6.75, 6 months-5 years= £5.85, leggings 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 8-11 years= £11.88, mittens 2-8 years= £2.97, 8-14 years= £2.97, up to 24 months= £2.97, socks 8-14 years= £2.97, up to 8 years= £2.97, tights 6-24 months= £7.13, vest long sleeve 11-14 years= £11.88, 2-5 years= £9.50, 5-8 years= £10.69, 6-24 months= £7.13, 8-11 years= £11.88

Comifast Multistrong
(Drug Tariff specification 46). Lightweight plain-knitted elasticised tubular bandage; various colours and sizes
Comifast Multistrong 2-way stretch stockinette (Synergy Health Plc) 10.75cm= £0.45, 17.5cm= £2.45, 3.5cm= £0.61, 5cm= £0.63, 7.5cm= £0.83

Support bandages
Light support bandages, which include the various forms of
crepe bandage, are used in the prevention of oedema; they
are also used to provide support for mild sprains and joints
but their effectiveness has not been proven for this purpose.
Since they have limited extensibility, they are able to provide
light support without exerting undue pressure. For a warning
against injudicious compression see Compression bandages.
CliniLite
Knitted fabric, viscose and elastomer yarn. Type 2 (light
support bandage)
CliniLite bandage (CliniSupplies Ltd) 10cm 6 4.5m= £0.80, 15cm 6

Cotton Suspensory Bandage

(Drug Tariff) Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all)

Crepe Bandage, BP 1988

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage; 4.5 m stretched

Alvita crepe bandage (Alliance Healthcare (Distribution) Ltd) 10 cm × 4.5 m, 15 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Clinicrepe bandage (CliniSupplies Ltd) 10 cm × 4.5 m, 15 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Crepe bandage (Robert Bailey & Son Plc) 10 cm × 4.5 m, 15 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Propax crepe bandage (BSN medical Ltd) 10 cm × 4.5 m, 15 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Vernaid crepe bandage (Synergy Health Plc) 10 cm × 4.5 m, 15 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Elset

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Elset (Molinlycke Health Care Ltd) S bandage 15 cm × 12 m = £5.60, bandage 10 cm × 6 m = £2.61, 10 cm × 8 m = £3.34, 15 cm × 6 m = £2.80.

Hospicare 233

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

Hospicare 233 bandage (Paul Hartmann Ltd) 10 cm × 4.5 m = £0.96, 15 cm × 4.5 m = £1.36, 5 cm × 4.5 m = £0.52, 7.5 cm × 4.5 m = £0.72

Hospilite

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Hospilite bandage (Paul Hartmann Ltd) 10 cm × 4.5 m = £0.62, 15 cm × 4.5 m = £0.91, 5 cm × 4.5 m = £0.37, 7.5 cm × 4.5 m = £0.51

K-Lite

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

K-Lite (Urgo Ltd) Long bandage 10 cm × 5.25 m = £1.16, bandage 10 cm × 4.5 m = £1.01, 15 cm × 4.5 m = £1.46, 5 cm × 4.5 m = £0.55, 7 cm × 4.5 m = £0.77

K-Plus

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

K-Plus (Urgo Ltd) Long bandage 10 cm × 10.25 m = £2.65, bandage 10 cm × 8.7 m = £2.29

Knit-Firm

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Knit-Firm bandage (Millpledge Healthcare) 10 cm × 4.5 m = £0.66, 15 cm × 4.5 m = £0.96, 5 cm × 4.5 m = £0.36, 7 cm × 4.5 m = £0.51

L3

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

L3 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 8.6 m = £2.22

Neosport

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Neosport bandage (Neomedic Ltd) 10 cm × 4.5 m = £0.91, 15 cm × 4.5 m = £1.12, 5 cm × 4.5 m = £0.54, 7.5 cm × 4.5 m = £0.73

PremierBand

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all)

PremierBand bandage (Shermond) 10 cm × 4.5 m = £0.79, 15 cm × 4.5 m = £1.18, 5 cm × 4.5 m = £0.45, 7.5 cm × 4.5 m = £0.63

Profore #2

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Profore #2 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 4.5 m = £1.36, latex free bandage 10 cm × 4.5 m = £1.44

Profore #3

Knitted fabric, viscose and elastomer yarn. Type 2 (light support bandage)

Profore #3 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 8.7 m = £3.96, latex free bandage 10 cm × 8.7 m = £4.31

Setocrepe

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Setocrepe (Molinlycke Health Care Ltd) bandage 10 cm × 4.5 m = £1.20

Soffcrepe

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2), 4.5 m stretched (all)

Soffcrepe bandage (BSN medical Ltd) 10 cm × 4.5 m = £1.24, 15 cm × 4.5 m = £1.80, 5 cm × 4.5 m = £0.69, 7.5 cm × 4.5 m = £0.98

Adhesive bandages

Adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

Elastic Adhesive Bandage, BP 1993

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched

Tensoplast bandage (BSN medical Ltd) 10 cm × 4.5 m, 5 cm × 4.5 m, 7.5 cm × 4.5 m

Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages

Coban

Bandage

Coban (3M Health Care Ltd) self-adherent bandage 10 cm × 6 m = £2.93

K Press

Bandage

K Press bandage (Urgo Ltd) 10 cm × 6.5 m = £2.93, 10 cm × 7.5 m = £3.42, 12 cm × 7.5 m = £4.31, 8 cm × 7.5 cm = £3.22

Profore #4

Bandage

Profore #4 (Smith & Nephew Healthcare Ltd) bandage 10 cm × 2.5 m = £3.28, latex free bandage 10 cm × 2.5 m = £3.56

Ultra Fast

Bandage

Ultra (Robinson Healthcare) Fast cohesive bandage 10 cm × 6.3 m = £2.59

Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for
amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline p. 222 can be used as adjunct therapy if a chronic venous leg ulcer does not respond to compression bandaging [unlicensed indication].

**High compression bandages**

**High Compression Bandage**
Cotton, viscose, nylon, and Lycra® extensible bandage, 3m (unstretched)

- K-Threec (Urgo Ltd) bandage 10cm × 3m= £2.85
- SurePress (Convatec Ltd) bandage 10cm × 3m= £3.65

**PEC High Compression Bandages**
Polyamide, elastane, and cotton compression (high) extensible bandage, 3.5 m unstretched

- Setospread (Mohlycke Health Care Ltd) bandage 10cm × 3.5m= £3.55

**VEC High Compression Bandages**
Viscose, elastane, and cotton compression (high) extensible bandage, 2 m unstretched (both)

- Tensopress bandage (BSN medical Ltd) 10cm × 3m= £3.49, 7.5cm × 3m= £2.71

**Short stretch compression bandages**

**Actico**
Bandage

- Actico bandage (Activa Healthcare Ltd) 10cm × 6m= £3.38, 12cm × 6m= £4.31, 4cm × 6m= £2.42, 6cm × 6m= £2.83, 8cm × 6m= £3.25

**Comprilan**
Bandage

- Comprilan bandage (BSN medical Ltd) 10cm × 5m= £3.41, 12cm × 5m= £4.15, 6cm × 5m= £2.70, 8cm × 5m= £3.17

**Rosidal K**
Bandage

- Rosidal K bandage (Lohmann & Rauscher (UK) Ltd) 10cm × 10m= £6.02, 10cm × 5m= £3.46, 12cm × 5m= £4.20, 6cm × 5m= £2.65, 8cm × 5m= £3.17

**Silkolan**
Bandage

**Sub-compression wadding bandage**

**Cellona Undercast Padding**
Padding

- Cellona Undercast padding bandage (Lohmann & Rauscher (UK) Ltd) 10cm × 2.75m= £0.47, 15cm × 2.75m= £0.60, 5cm × 2.75m= £0.31, 7.5cm × 2.75m= £0.38

**Flexi-Ban**
Padding

- Flexi-Ban (Activa Healthcare Ltd) bandage 10cm × 3.5m= £0.50

**K Tech Reduced**
Padding

- K Tech Reduced bandage 10cm × (Urgo Ltd) 6m= £4.75, 7.3m= £5.18

**K-Soft**
Padding

- K-Soft (Urgo Ltd) Long bandage 10cm × 4.5m= £0.57, bandage 10cm × 3.5m= £0.46

**K-Tech (K Tech in DMD)**
Padding

- K Tech (Urgo Ltd) Reduced bandage 10cm × 7.3m= £5.18, bandage 10cm × 5m= £3.96, 10cm × 6m= £4.75, 12cm × 6m= £5.99, 12cm × 7.3m= £6.54, 8cm × 6m= £4.49, 8cm × 7.3m= £4.89

**Ortho-Band Plus**
Padding

- Ortho-Band (Millipede Healthcare) Plus bandage 10cm × 3.5m= £0.37

**Profores #1**
Padding

- Profores #1 (Smith & Nephew Healthcare Ltd) bandage 10cm × 3.5m= £0.71, latex free bandage 10cm × 3.5m= £0.77

**Softexe**
Padding

- Softexe (Mohlycke Health Care Ltd) bandage 10cm × 3.5m= £0.62

**SurePres**
Padding

- SurePres (Convatec Ltd) bandage 10cm × 3m= £3.65

**Ultra Soft**
Padding

- Ultra (Robinson Healthcare) Soft wadding bandage 10cm × 3.5m= £0.39

**Velband**
Padding

- Velband (BSN medical Ltd) absorbent bandage 10cm × 4.5m= £0.73

**Multi-layer compression bandaging**

Multi-layer compression bandaging systems are an alternative to High Compression Bandages for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

**Four layer systems**

**K-Four**
Padding

- K-Four multi-layer compression bandaging kit, four layer system

**Profores**
Wound contact layer

**Ultra Four**
Wound contact layer

**Two layer systems**

**Coban 2**
Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage)

**K Two**
Multi-layer compression bandaging kit, two layer system

**UrgoKTwo** (Urgo Ltd) Reduced latex free multi-layer compression bandage kit (10cm) 18cm-25cm ankle circumference= £8.68, 25cm-32cm ankle circumference= £8.93, Reduced multi-layer compression bandage kit 18cm-25cm ankle circumference= £8.18, 25cm-32cm ankle circumference= £8.93, latex free multi-layer compression bandage kit (10cm) 18cm-25cm ankle circumference= £8.17, 25cm-32cm ankle circumference= £8.93, multi-layer compression bandage kit (12cm) 18cm-25cm ankle circumference= £10.30, 25cm-32cm ankle circumference= £11.26, multi-layer compression bandage kit (6cm) 18cm-25cm ankle circumference= £7.71, 25cm-32cm ankle circumference= £8.93.
£8.39, multi-layer compression bandage kit size 0 short 18cm-25cm ankle circumference= £6.50, with UrgoStart multi-layer compression bandage kit 18cm-25cm ankle circumference= £10.19, 25cm-32cm ankle circumference= £10.86

**Medicated bandages**

Zinc Paste Bandage has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution. Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions. Zipzoc® can be used under appropriate compression bandages or hosiery in chronic venous insufficiency.

**Zinc Paste Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging

*Excipients: may include* cetostearyl alcohol, hydroxybenzoates

**Viscopaste** (Smith & Nephew Healthcare Ltd) PB7 bandage 7.5cm × 6m= £3.69

**Zinc Paste and Ichthammol Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging

*Excipients: may include* cetostearyl alcohol

**Ichthopaste** (Smith & Nephew Healthcare Ltd) bandage 7.5cm × 6m= £3.72

**Medicated stocking**

**Zipzoc**

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%

**Zipzoc** (Smith & Nephew Healthcare Ltd) stockings= £31.26

**Compression hosiery and garments**

Compression (elastic) hosiery is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging. Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

**Graduated Compression hosiery, Class 1 Light Support** is used for superficial or early varices, varicosity during pregnancy.

**Graduated Compression hosiery, Class 2 Medium Support** is used for varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosity during pregnancy.

**Graduated Compression hosiery, Class 3 Strong Support** is used for gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis.

**Compression values for hosiery and lymphoedema garments**

Class 1: Compression hosiery (British standard) 14–17 mmHg, lymphoedema garments (European classification) 18–21 mmHg; Class 2 Compression hosiery (British standard) 18–24 mmHg, lymphoedema garments (European classification) 23–32 mmHg; Class 3 Compression hosiery (British standard) 25–35 mmHg, lymphoedema garments (European classification) 34–46 mmHg; Class 4 Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 49–70 mmHg; Class 4 *super* Compression hosiery (British standard)—not available, lymphoedema garments (European classification) 60–90 mmHg.

**Graduated compression hosiery**

**Class 1 Light Support**

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Class 2 Light Support**

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel

**Accessories**

**Suspender**

Suspender, for thigh stockings

**Anklets**

**Class 2 Medium Support**

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Knee caps**

**Class 2 Medium Support**

Knee caps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Class 3 Strong Support**

Knee caps, compression 18–24 mmHg, circular knit (standard and made-to-measure)

**Lymphoedema garments**

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages. A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 50 mmHg, and accessories—see Drug Tariff for details. Note There are different compression values for lymphoedema garments and graduated compression hosiery, see above.
Dental Practitioners’ Formulary

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):

BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel
Glandosane® Saliveze®
Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP,
50 micrograms/metered inhalation, CFC-free, as: Clen modulite®
Benzylamine Mouthwash, BP 0.15%
Benzylamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, BP
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL

Diazepam Tablets, BP
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycline Tablets, Dispersible, BP
Doxycline Capsules, BP, 100 mg
Doxycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, BP
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxycycline Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxybenzylpenicillin Oral Solution, BP
Phenoxybenzylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Toothpaste
Sodium Fluoride Tablets, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations. For details of preparations that can be prescribed, see individual entries under the relevant drug monographs throughout the BNF publications.

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder
amoxicillin (as trihydrate) 3 g sachet
Artificial Saliva Gel
(proprietary product: Biotene Oralbalance), lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

Artificial Saliva Oral Spray
(proprietary product: Xerotin) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Artificial Saliva Pastilles
(proprietary product: Salivix), consists of acacia, malic acid, and other ingredients

Artificial Saliva Protective Spray
(proprietary product: Aquoral) consists of oxidised glycerol triesters, silicon dioxide, flavouring agents, aspartame

Artificial Saliva Substitute Spray
(proprietary product: AS Saliva Orthana Spray) consists of mucin, methylparaben, benzalkonium chloride, EDTA, xylitol, peppermint oil, spearmint oil, mineral salts

Azithromycin Capsules
azithromycin 250 mg

Azithromycin Oral Suspension 200 mg/5 mL
azithromycin 200 mg/5 mL when reconstituted with water

Azithromycin Tablets
azithromycin 250 mg and 500 mg

Betamethasone Soluble Tablets 500 micrograms
betamethasone (as sodium phosphate) 500 micrograms

Chlorhexidine Oral Spray
(proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL
clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL
clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg
(proprietary product: Periostat), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg
fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL
(proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water

Lidocaine Spray 10%
(proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Syrup 5 mg/5 mL
loratadine 5 mg/5 mL

Saliva Stimulating Tablets
(proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619%
(proprietary product: Duraphat '2800 ppm' Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1%
(proprietary product: Duraphat '5000 ppm' Toothpaste), sodium fluoride 1.1%
Nurse Prescribers’ Formulary

Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations.

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets)
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, 'Solution G', NPF
Catheter Maintenance Solution, 'Solution R', NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthrane Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthrusate Capsules, NPF
Co-danthrusate Oral Suspension, Strong, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP
Emollients as listed below:
  Aquadrate® 10% w/w Cream
  Arachis Oil, BP
  Balneum® Plus Cream
  Cetraben® Emollient Cream
  Dermamist®
  Diprobse® Cream
  Diprobse® Ointment
  Doublebase®
  Doublebase® Dayleve Gel
  E45® Cream
  E45® Itch Relief Cream
  Emulsifying Ointment, BP
  Eucerin® Intensive 10% w/w Urea Treatment Cream
  Eucerin® Intensive 10% w/w Urea Treatment Lotion
  Hydromol® Cream
  Hydromol® Intensive
  Hydrosol Ointment, BP
  Lipobase®
  Liquid and White Soft Paraffin Ointment, NPF
  Neutrogena® Norwegian Formula Dermatological Cream
  Nutraplus® Cream
  Oilatum® Cream
  Oilatum® Junior Cream
  Paraffin, White Soft, BP
  Paraffin, Yellow Soft, BP
  Ultrabase®
  Unguentum M®

Emollient Bath and Shower Preparations as listed below:
Aqueous Cream, BP
Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff))
Cetraben® Emollient Bath Additive
Dermalo® Bath Emollient
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Doublebase® Emollient Wash Gel
Hydromol® Bath and Shower Emollient
Oilatum® Emollient
Oilatum® Gel
Oilatum® Junior Bath Additive
Zerolatum® Emollient Medicinal Bath Oil
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only)
Ibuprofen Tablets, BP (except for indications and doses that are prescription-only)
Isophagula Husk Granules, BP
Isophagula Husk Granules, Effervescent, BP
Isophagula Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP
Lidocaine and Chlorhexidine Gel, BP
Macrogol Oral Liquid, Compound, NPF
Macrogol Oral Powder, Compound, NPF
Macrogol Oral Powder, Compound, Half-strength, NPF
Magnesium Hydroxide Mixture, BP
Magnesium Sulfate Paste, BP
Malathion aqueous lotions containing at least 0.5%
Mebendazole Oral Suspension, NPF
Mebendazole Tablets, NPF
Methylcellulose Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oromucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oromucosal Use, NPF
Nicotine Lozenge, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Nasal Spray, NPF
Nicotine Oral Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nystatin Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermicidal contraceptives as listed below: Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Oxidation, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticon Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

Appliances (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff). (Where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP1(P) (forms WP10CN and WP10PN in Wales), they may prescribe using the same system as doctors in the clinic.)

Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).
The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.hscbusiness.hscni.net/services/2034.htm
Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema
arachis oil 100%

Catheter Maintenance Solution, Sodium Chloride
(proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, ‘Solution G’
(proprietary products: OptiFlo G; Uro-Tainer Suby G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, ‘Solution R’
(proprietary products: OptiFlo R; Uro-Tainer Solution R; Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions
(proprietary products: ChlorPrep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions
(proprietary product: Unisept), chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules
co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg)

Co-danthramer Capsules, Strong
co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg)

Co-danthramer Oral Suspension
(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/L)

Co-danthramer Oral Suspension, Strong
(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/L)

Co-danthrusate Oral Suspension
(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/L)

Dimeticone barrier creams
(proprietary products Conotranse Cream, dimeticone ‘350’ 22%; Silopel Barrier Cream, dimeticone ‘1000’ 10%), dimeticone 10–22%

Dimeticone Lotion
(proprietary product: Hedrin), dimeticone 4%

Docusate Enema
(proprietary product: Norgalax Micro-enema), docusate sodium 120 mg in 10 g

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Liquid, Compound
(proprietary product: Movicol Liquid), macrocol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

Macrogol Oral Powder, Compound
(proprietary products: Lasido Orange, Molaxole, Movicol), macrocol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre)

Macrogol Oral Powder, Compound, Half-strength
(proprietary product: Movicol-Half), macrocol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions
(proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension
(proprietary product: Vermox), mebendazole 100 mg/5 mL
Mebendazole Tablets (proprietary products: Ovex, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use (proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

Nicotine Lozenge nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), or nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum (proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray (proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray (proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets (proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

Nicotine Transdermal Patches releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear) (prescriber should specify the brand to be dispensed)

Permethrin Cream (proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution (proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules (proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema (proprietary products: Micolette Micro-ename; Micralax Micro-ename; Relaxit Micro-ename), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules (proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir (proprietary product: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

Sterculia Granules (proprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules (proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

Zinc Oxide Impregnated Medicated Bandage (proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking (proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary p. 1413 for Community Practitioners provides information on prescribing.

Pharmacists
Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.
Index of proprietary manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see ‘Special-order manufacturers’.

Special-order manufacturers

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdslike.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File: www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxford Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

Date reaction(s) started: Date reaction(s) stopped:

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):

- [ ] Patient died due to reaction
- [ ] Life threatening
- [ ] Congenital abnormality
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Involved persistent or significant disability or incapacity
- [ ] Medically significant; please give details:

If the reactions were not serious according to the categories above, how bad was the suspected reaction?

- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities
OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>

REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See ‘Adverse reactions to drugs’ section in BNF or www.mhra.gov.uk/yellowcard for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS**
- Patient Initials: __________
- Sex: M / F
- Is the patient pregnant? Y / N
- Ethnicity: __________
- Age (at time of reaction): __________
- Weight (kg): __________
- Identification number (e.g. Practice or Hospital Ref): __________

Adult Advanced Life Support Algorithm

Unresponsive and not breathing normally

Call resuscitation team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/Pulseless VT)

1 Shock
Minimise interruptions

Immediately resume CPR for 2 min
Minimise interruptions

Return of spontaneous circulation

Immediate post cardiac arrest treatment
- Use ABCDE approach
- Aim for SpO2 of 94-96%
- Aim for normal PaCO2
- 12-lead ECG
- Treat precipitating cause
- Targeted temperature management

Non-shockable (PEA/Asystole)

Immediately resume CPR for 2 min
Minimise interruptions

During CPR
- Ensure high quality chest compressions
- Minimise interruptions to compressions
- Give oxygen
- Use waveform capnography
- Continuous compressions when advanced airway in place
- Vascular access (intravenous or intracessous)
- Give adrenaline every 3-5 min
- Give amiodarone after 3 shocks

Treat Reversible Causes
- Hypoxia
- Hypovolaemia
- Hypo-/hyperkalaemia/metabolic
- Hypothermia
- Thrombosis - coronary or pulmonary
- Tension pneumothorax
- Tamponade – cardiac
- Toxins

Consider
- Ultrasound imaging
- Mechanical chest compressions to facilitate transfer/treatment
- Coronary angiography and percutaneous coronary intervention
- Extracorporeal CPR

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, 2015
Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Acute coronary syndromes

▶ ANGINA: UNSTABLE
Aspirin dispersible tablets p. 114 (75 mg, 300 mg)
BY MOUTH (DISPERSED IN WATER OR CHEWED)
  ▶ Adult: 300 mg

▶ PLUS
▶ EITHER Glyceryl trinitrate aerosol spray p. 207
(400 micrograms/metered dose)
SUBLINGUALLY
  ▶ Adult: 1–2 sprays, repeated as required
▶ OR Glyceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
SUBLINGUALLY
  ▶ Adult: 0.3–1 mg, repeated as required

▶ MYOCARDIAL INFARCTION: NON-ST-SEGMENT ELEVATION
Treat as for Angina: unstable

▶ MYOCARDIAL INFARCTION: ST-SEGMENT ELEVATION
Aspirin dispersible tablets (75 mg, 300 mg)
BY MOUTH (DISPERSED IN WATER OR CHEWED)
  ▶ Adult: 300 mg
Glyceryl trinitrate aerosol spray (400 micrograms/metered dose)
SUBLINGUALLY
  ▶ Adult: 1–2 sprays, repeated as required
▶ OR Glyceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
SUBLINGUALLY
  ▶ Adult: 0.3–1 mg, repeated as required
Metoclopramide hydrochloride injection p. 403 (5 mg/mL)
BY INTRAVENOUS INJECTION
  ▶ Adult 18-19 years (body-weight up to 60 kg): 5 mg
  ▶ Adult 18-19 years (body-weight 60 kg and over): 10 mg
  ▶ Adult over 19 years: 10 mg
Diamorphine hydrochloride injection p. 423 (5 mg powder for reconstitution)
BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)
  ▶ Adult: 5 mg followed by a further 2.5–5 mg if necessary
  ▶ Elderly or frail patients: reduce dose by half
▶ OR Morphine sulfate injection p. 429 (10 mg/mL)
BY SLOW INTRAVENOUS INJECTION (1-2 mg/minute)
  ▶ Adult: 5–10 mg followed by a further 5–10 mg if necessary
  ▶ Elderly or frail patients: reduce dose by half
Oxygen, if appropriate

Airways disease, obstructive

▶ ASThma: ACUTE
Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

▶ EITHER Salbutamol aerosol inhaler p. 239
(100 micrograms/metered inhalation)
BY AEROsOL INHALATION VIA LARGE-VOLUME SPACER (AND A CLOSE-FITTING FACE MASK IF CHILD UNDER 3 YEARS)
  ▶ Adult and Child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
▶ OR Salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
  ▶ Child 4 years and below: 2.5 mg every 20–30 minutes or as necessary
  ▶ Child 5–11 years: 2.5–5 mg every 20–30 minutes or as necessary
  ▶ Child 12-17 years: 5 mg every 20–30 minutes or as necessary
  ▶ Adult: 5 mg every 20–30 minutes or as necessary
▶ OR Terbutaline sulfate nebuliser solution p. 241 (2.5 mg/mL)
BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)
  ▶ Child 4 years and below: 5 mg every 20–30 minutes or as necessary
  ▶ Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary
  ▶ Child 12-17 years: 10 mg every 20–30 minutes or as necessary
  ▶ Adult: 10 mg every 20–30 minutes or as necessary

▶ PLUS (in all cases)
▶ EITHER Prednisolone tablets p. 622 (or prednisolone soluble tablets) (5 mg)
BY MOUTH
  ▶ Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  ▶ Child 12-17 years: 40–50 mg once daily for at least 5 days
  ▶ Adult: 40–50 mg once daily for at least 5 days
▶ OR Hydrocortisone p. 620 (preferably as sodium succinate)
BY INTRAVENOUS INJECTION
  ▶ Child 17 years and below: 4 mg/kg (max.100 mg) every 6 hours until conversion to oral prednisolone is possible; alternative dose if weight unavailable:
    ▶ Child 1 year and below: 25 mg
    ▶ Child 2-4 years: 50 mg
    ▶ Child 5-17 years: 100 mg
  ▶ Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible
High-flow oxygen should be given if available (via face mask in children)
Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission.
While awaiting ambulance, repeat nebulised β₂ agonist (as above) and give with
Ipratropium bromide nebuliser solution p. 234
(250 micrograms/mL)
*BY INHALATION OF NEBULISED SOLUTION (VIA OXYGEN-DRIVEN NEBULISER IF AVAILABLE)*
- Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
- Child 12-17 years: 500 micrograms every 4–6 hours as necessary
- Adult: 500 micrograms every 4–6 hours as necessary

**CROUP**
Dexamethasone oral solution p. 618 (2 mg/5 mL)
*BY MOUTH*
- Child 1 month-2 years: 150 micrograms/kg as a single dose

**Anaphylaxis**

**ANAPHYLAXIS**
Adrenaline/epinephrine injection p. 211 (1 mg/mL (1 in 1000))
*BY INTRAMUSCULAR INJECTION*
- Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
- Child 6-11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
- Child 12-17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal
- Adult: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
High-flow oxygen and intravenous fluids should be given as soon as available.

Chlorphenamine maleate injection p. 266
*BY INTRAMUSCULAR OR INTRavenous INJECTION*
May help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate)
*BY INTRavenous INJECTION*
Has delayed action but should be given to severely affected patients to prevent further deterioration.

**Bacterial infection**

**MENINGOCOCCAL DISEASE**
Benzylenicillin sodium injection p. 504 (600 mg, 1.2 g)
*BY INTRavenous INJECTION (OR BY INTRamuscular INJECTION IF VENous ACCESS NOT AVAILABLE)*
- Neonate: 300 mg
- Child 1 month-11 months: 300 mg
- Child 1-9 years: 600 mg
- Child 10-17 years: 1.2 g
- Adult: 1.2 g
*NOTE* A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

**OR** if history of allergy to penicillin

Cefotaxime injection p. 487 (1 g)
*BY INTRavenous INJECTION (OR BY INTRamuscular INJECTION IF VENous ACCESS NOT AVAILABLE)*
- Neonate: 50 mg/kg
- Child 1 month-11 years: 50 mg/kg (max. 1 g)
- Child 12-17 years: 1 g
- Adult: 1 g
*NOTE* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.

**OR** if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection p. 524 (1 g)
*BY INTRavenous INJECTION*
- Child: 12.5–25 mg/kg
- Adult: 12.5–25 mg/kg
*NOTE* A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer. See also Central nervous system infections, bacterial p. 473.

**Hypoglycaemia**

**DIABETIC HYPOGLYCAEMIA**
Glucose or sucrose
*BY MOUTH*
- Adult and Child over 2 years: approx. 10–20 g
  - (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola®—both non-diet versions or 2–4 teaspoonfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary
- **OR** if hypoglycaemia unresponsive or if oral route cannot be used

Glucagon injection p. 660 (1 mg/mL)
*BY SUBCUTANEOUS OR INTRamuscular INJECTION*
- Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
- Child body-weight 25 kg and over: 1 mg (1 mL)
- Adult: 1 mg (1 mL)
- **OR** if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes

Glucose intravenous infusion p. 915 (10%)
*BY INTRavenous INJECTION INTO LARGE VEIN*
- Child: 5 mL/kg (glucose 500 mg/kg)
- Glucose intravenous infusion p. 915 (20%)
*BY INTRavenous INJECTION INTO LARGE VEIN*
- Adult: 50 mL

**Seizures**

**CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES**

**EITHER** Diazepam rectal solution p. 321 (2 mg/mL, 4 mg/mL)
*BY RECTUM*
- Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
- Child 1 month-1 year: 5 mg, repeated once after 10–15 minutes if necessary
- Child 1-4 years: 5 mg
- Child 5–9 years: 7.5 mg
- Child 10–17 years: 10 mg
- Adult: 10 mg [unlicensed]

**OR** Midazolam oromucosal solution p. 318
*BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY*
- Neonate: 300 micrograms/kg [unlicensed]
- Child 1-2 months: 300 micrograms/kg [max. 2.5 mg] [unlicensed]
- Child 3 months–11 months: 2.5 mg
- Child 1-4 years: 5 mg
- Child 5–9 years: 7.5 mg
- Child 10–17 years: 10 mg
- Adult: 10 mg [unlicensed]

**Mass**

- 1 kilogram (kg) = 1000 grams (g)
- 1 gram (g) = 1000 milligrams (mg)
- 1 milligram (mg) = 1000 micrograms
- 1 microgram = 1000 nanograms
- 1 nanogram = 1000 picograms

**Volume**

- 1 litre = 1000 millilitres (mL)
- 1 millilitre (1 mL) = 1000 microlitres
- 1 pint = 568 mL

**Other units**

- 1 kilocalorie (kcal) = 4186.8 joules (J)
- 1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
- 1 megajoule (MJ) = 238.8 kilocalories (kcal)
- 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
- 1 kilopascal (kPa) = 7.5 mmHg (pressure)

**Plasma-drug concentrations**

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

**Prescribing for children: weight, height, and gender**

The table below shows the mean values for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

<table>
<thead>

</tbody>
</table>

**Length**

- 1 metre (m) = 1000 millimetres (mm)
- 1 centimetre (cm) = 10 mm
- 1 inch (in) = 25.4 mm
- 1 foot (ft) = 12 inches
- 12 inches = 304.8 mm
Recommended wording of cautionary and advisory labels

For details including Welsh Language translation see p. 1383

1. **Warning:** This medicine may make you sleepy
2. **Warning:** This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. **Warning:** This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. **Warning:** Do not drink alcohol
5. **Do not take indigestion remedies 2 hours before or after you take this medicine**
6. **Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**
7. **Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine**
8. **Warning:** Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. **Warning:** Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. **Do not take anything containing aspirin while taking this medicine**
13. **Dissolve or mix with water before taking**
14. **This medicine may colour your urine. This is harmless**
15. **Caution:** flammable. Keep your body away from fire or flames after you have put on the medicine
16. **Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening**
17. **Do not take more than... in 24 hours**
18. **Do not take more than... in 24 hours. Also, do not take more than... in any one week**
19. **Warning:** This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20. **Take with or just after food, or a meal**
21. **Take 30 to 60 minutes before food**
22. **Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food**
23. **Suck or chew this medicine**
24. **Swallow this medicine whole. Do not chew or crush**
25. **Dissolve this medicine under your tongue**
26. **Take with a full glass of water**
27. **Spread thinly on the affected skin only**
28. **Do not take more than 2 at any one time. Do not take more than 8 in 24 hours**
29. **Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well**
30. **Contains aspirin. Do not take anything else containing aspirin while taking this medicine**
Abbreviations and Symbols

Internationally recognised units and symbols are used in the BNF publications where possible.

- **ACBS**: Advisory Committee on Borderline Substances
- **ACE**: Angiotensin-converting enzyme
- **ADHD**: Attention deficit hyperactivity disorder
- **AIDS**: Acquired immunodeficiency syndrome
- **approx.**: approximately
- **AV**: atroventricular
- **AV**: atrioventricular
- **BP**: British Pharmacopoeia
- **BMI**: body mass index
- **BNP**: British National Formulary
- **BPC**: British Pharmaceutical Codex 1973 and Supplement 1976
- **BRECA**: breast cancer gene
- **CAPD**: Continuous ambulatory peritoneal dialysis
- **CD**: Continuous Dependent
- **CD2**: preparation in Schedule 2 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled drugs and drug dependence p. 8.
- **CD3**: preparation in Schedule 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled drugs and drug dependence p. 8.
- **CD4**: preparation in Schedule 4 (Part I) of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled drugs and drug dependence p. 8.
- **CD5**: preparation in Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments). For regulations see Controlled drugs and drug dependence p. 8.
- **CHM**: Commission on Human Medicines
- **CHMP**: Committee for Medicinal Products for Human Use
- **CNS**: central nervous system
- **CSM**: Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
- **d. c.**: direct current
- **DMARD**: Disease-modifying antirheumatic drug
- **DPF**: Dental Practitioners’ Formulary
- **e/c**: enteric-coated (termed gastro-resistant in BP)
- **EEG**: electroencephalogram
- **eGFR**: estimated glomerular filtration rate, see Prescribing in renal impairment p. 19
- **f/c**: film-coated
- **G6PD**: glucose-6-phosphate dehydrogenase
- **HIV**: Human immunodeficiency virus
- **HRT**: Hormone replacement therapy
- **i/m**: intramuscular
- **i/v**: intravenous
- **INR**: international normalised ratio
- **MAOI**: Monoamine-oxidase inhibitor
- **max.**: maximum
- **MHRA**: Medicines and Healthcare products Regulatory Agency
- **m/r**: modified-release
- **NCL**: no cautionary labels (prescription endorsement made by prescriber when recommended cautionary labels are not required)
- **NHS**: National Health Service
- **NICE**: National Institute for Health and Care Excellence
- **NPF**: Nurse Prescribers’ Formulary
- **NSAID**: Non-steroidal anti-inflammatory drug
- **NSTEMI**: non-ST-segment elevation myocardial infarction
- **PARP**: poly (ADP-ribose) polymerase
- **PGD**: patient group direction
- **PHE**: Public Health England (formerly Health Protection Agency (HPA))
- **PoM**: prescription-only medicine, see Fig. 1 How to use BNF publications
- **rINN**: Recommended International Non-proprietary Name
- **RSV**: respiratory syncytial virus
- **s/c**: sugar-coated
- **SLS**: Selected List Scheme
- **SMC**: Scottish Medicines Consortium
- **SPC**: Summary of Product Characteristics
- **SSRI**: Selective serotonin reuptake inhibitor
- **STEMI**: ST-segment elevation myocardial infarction
- **UK**: United Kingdom
- **WHO**: World Health Organization
- **GSL**: General Sales List
- **p. r. n.**: pro re nata (when required)
- **q. d.**: quater die sumendum (to be taken four times daily)
- **q. h.**: quarta hora (four times daily)
- **q. d. s.**: quatuor die sumendum (to be taken four times daily)
- **r. c.**: pre cibum (before food)
- **r. d.**: re die sumendum (to be taken three times daily)
- **r. c.**: post cibum (after food)
- **r. m.**: omni mane (every morning)
- **r. n.**: omni nocte (every night)
- **r. c.**: pro re nata (when required)
- **t. d. s.**: ter die sumendum (to be taken three times daily)
- **t. i. d.**: ter in die (three times daily)

**Latin abbreviations**

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

- **a. c.**: ante cibum (before food)
- **b. d.**: bis die (twice daily)
- **o. d.**: omni die (every day)
- **o. m.**: omni mane (every morning)
- **o. n.**: omni nocte (every night)
- **p. c.**: post cibum (after food)
- **p. r. n.**: pro re nata (when required)
- **q. d. s.**: quater die sumendum (to be taken four times daily)
- **q. h.**: quarta hora (four times daily)
- **stat.**: immediately
- **t. d. s.**: ter die sumendum (to be taken three times daily)
- **t. i. d.**: ter in die (three times daily)

**E numbers**

The following is a list of common E numbers and the inactive ingredients to which they correspond.

- **E102**: Tartrazine
- **E121**: Sodium Benzoate
- **E104**: Quinoline Yellow
- **E223**: Sodium Metabisulfi te
- **E222**: Sodium Benzoate
- **E121**: Tartrazine
- **E421**: Mannitol
- **E132**: Indigo Carmine
- **E123**: Erythrosine BS
- **E322**: Lecithins
- **E127**: Erythrosine B5
- **E420**: Sorbitol
- **E223**: Sodium Metabisulfi te
- **E110**: Sunset Yellow FCF
- **E320**: Butylated Hydroxyani sole
- **E123**: Amaranth
- **E321**: Butylated Hydroxytoluene
- **E124**: Ponceau 4R
- **E322**: Lecithins
- **E127**: Erythrosine B5
- **E420**: Sorbitol
- **E422**: Glycerol
- **E171**: Titanium Dioxide
- **E901**: Beeswax (white and yellow)
- **E172**: Iron oxides, iron hydroxides
- **E1520**: Propylene Glycol
