- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY Important: teratogenic risk.**

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

### ● MONITORING REQUIREMENTS

- ▶ Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- ▶ Monitor for arterial or venous thromboembolism.
- ▶ Monitor patients for signs and symptoms of peripheral neuropathy.
- ▶ **Hepatic disorder** Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as

fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop.

**Conception and contraception** Patient counselling advised for thalidomide capsules (pregnancy and contraception).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)** NICE TA228  
Thalidomide (*Thalidomide Celgene*®) in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.  
[www.nice.org.uk/guidance/ta228](http://www.nice.org.uk/guidance/ta228)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

##### Tablet

- ▶ **Talidex** (Alan Pharmaceuticals)  
**Thalidomide 25 mg** Talidex 25mg tablets | 30 tablet £1,075.00

##### Capsule

CAUTIONARY AND ADVISORY LABELS 2

- ▶ **Thalidomide (Non-proprietary)**  
**Thalidomide 50 mg** Thalidomide Celgene 50mg capsules | 28 capsule [PoM] £298.48

## 6 Photodynamic therapy responsive malignancy

### PHOTOSENSITISERS

#### Porfimer sodium

- **DRUG ACTION** Porfimer sodium accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

##### ● INDICATIONS AND DOSE

**Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 · broncho-oesophageal fistula · tracheo-oesophageal fistula
- **SIDE-EFFECTS** Alopecia · bone marrow depression · constipation · hyperuricaemia · nausea · photosensitivity reaction (sunscreens ineffective) · stomatitis · thromboembolism · tumour lysis syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** No information available—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment (may increase duration of photosensitivity); avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE**  
Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for injection

- ▶ **Photofrin** (Axcan Pharma Inc, Pinnacle Biologics BV)  
**Porfimer sodium 15 mg** Photofrin 15mg powder for solution for injection vials | 1 vial [PoM] [X] (Hospital only)
- Porfimer sodium 75 mg** Photofrin 75mg powder for solution for injection vials | 1 vial [PoM] £1,011.00 (Hospital only)

### Temoporfin

- **DRUG ACTION** Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

##### ● INDICATIONS AND DOSE

**Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 · concomitant photosensitising treatment · diseases exacerbated by light · elective surgery · ophthalmic slit-lamp examination for 30 days after administration
- **SIDE-EFFECTS** Alopecia · bone marrow depression · constipation · dizziness · dysphagia · haemorrhage · hyperuricaemia · nausea · oedema · pain · photosensitivity reaction (sunscreens ineffective) · skin reactions · stomatitis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy for at least 3 months after treatment.
- **PREGNANCY** Toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.
- **PATIENT AND CARER ADVICE**  
Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration.  
Avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration.  
If extravasation occurs protect area from light for at least 3 months.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- ▶ **Foscan** (Biolitec Pharma Ltd)  
**Temoporfin 1 mg per 1 ml** Foscan 3mg/3ml solution for injection vials | 1 vial [PoM] £1,800.00 (Hospital only)
- Foscan 6mg/6ml solution for injection vials | 1 vial [PoM] £3,400.00 (Hospital only)

## 7 Targeted therapy responsive malignancy

### ANTINEOPLASTIC DRUGS > PROTEASOME INHIBITORS

#### Bortezomib

07-Jun-2018

● **DRUG ACTION** Bortezomib is a proteasome inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone) | Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone) | Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)**

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

#### IMPORTANT SAFETY INFORMATION

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

- **CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease · pericardial disease
- **CAUTIONS** Amyloidosis · cardiovascular disease · consider antiviral prophylaxis for herpes zoster infection · dehydration · diabetes (may affect blood glucose) · history of syncope · pulmonary disease (discontinue if interstitial lung disease develops) · risk factors for seizures · risk of neuropathy—consult product literature
- **INTERACTIONS** → Appendix 1: bortezomib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · anxiety · appetite abnormal · arrhythmias · asthenia · chills · constipation · cough · decreased leucocytes · diabetes mellitus · diarrhoea · dizziness · dysphagia · dyspnoea · electrolyte imbalance · encephalopathy · enzyme abnormality · eye inflammation · fever · fluid imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair disorder · headaches · hearing impairment · heart failure · hepatic disorders · hiccups · hyperbilirubinaemia · hypersensitivity · hypertension · hypotension · increased risk of infection · ischaemic heart disease · lethargy · loss of consciousness · malaise · mood altered · muscle complaints · muscle weakness · nausea · nerve disorders · neuromuscular dysfunction · neutropenia · oedema · oral disorders · oropharyngeal complaints · pain · renal impairment · sensation abnormal · sepsis · skin reactions · sleep disorder · syncope · taste altered · thrombocytopenia · tinnitus · ventricular dysfunction · vertigo · vision disorders · vomiting · weight changes
  - ▶ **Uncommon** Altered smell sensation · angioedema · antibiotic associated colitis · arthritis · azotaemia · cardiac arrest · cardiomyopathy · cardiovascular disorder · cerebrovascular insufficiency · chest discomfort · circulation impaired · circulatory collapse · coagulation

disorders · concentration impaired · confusion · Cushing's syndrome · dry eye · dysphonia · ear discomfort · embolism and thrombosis · eye discomfort · eye disorders · failure to thrive · gait abnormal · gas exchange abnormal · genital pain · haemolytic anaemia · hallucination · hyperthyroidism · increased leucocytes · injury · irritable bowel syndrome · joint disorders · lymphadenopathy · memory loss · movement disorders · mucous membrane disorder · myopathy · neurotoxicity · palpitations · pancreatitis · pancytopenia · pericardial disorders · pericarditis · posterior reversible encephalopathy syndrome (PRES) (discontinue) · proteinuria · psychiatric disorders · psychotic disorder · pulmonary hypertension · pulmonary oedema · reflexes abnormal · respiratory disorders · rhinorrhoea · seizure · sensation of pressure · severe cutaneous adverse reactions (SCARs) · sexual dysfunction · shock · SIADH · skin mass · skin ulcers · speech disorder · sweat changes · temperature sensation altered · thirst change · tremor · tumour lysis syndrome · urinary disorders · urinary tract disorder · vascular disorders · vasculitis · vasodilation

- ▶ **Rare or very rare** Acidosis · acute coronary syndrome · alcohol intolerance · amyloidosis · apnoea · ascites · atrioventricular block · bladder irritation · blood disorders · bone disorder · bone fracture · brain oedema · breast disorder · cardiac valve disorder · cholelithiasis · CNS haemorrhage · cognitive disorder · coma · coronary artery insufficiency · delirium · drooling · ear disorder · erythromelalgia · fistula · gout · healing impaired · hypothyroidism · inflammation · lymphoedema · macrophage activation · mass · meningitis · metabolic disorder · multi organ failure · nail disorder · neoplasm malignant · neoplasms · nervous system disorder · paralysis · paresis · pelvic pain · perforation · photosensitivity reaction · platelet abnormalities · procedural complications · prostatitis · radiation injury · seborrhoea · sudden death · suicidal ideation · testicular disorders · throat complaints · ulcer · vaginal ulceration · venous insufficiency · vitamin deficiencies
- ▶ **Frequency not known** Herpes zoster reactivation · JC virus infection · progressive multifocal leukoencephalopathy (PML)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—monitor for toxicity. **Dose adjustments** Manufacturer advises reduce dose in moderate to severe impairment—consult product literature.
- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood-glucose concentration in patients on oral antidiabetics.
  - ▶ Monitor for symptoms of progressive multifocal leukoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.
  - ▶ Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - ▶ **Bortezomib for previously untreated mantle cell lymphoma (December 2015)** NICE TA370  
Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma

in adults for whom haematopoietic stem cell transplantation is unsuitable.

[www.nice.org.uk/TA370](http://www.nice.org.uk/TA370)

▶ **Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014)** NICE TA311

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

[www.nice.org.uk/TA311](http://www.nice.org.uk/TA311)

▶ **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)** NICE TA228

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate **and**
- the person is unable to tolerate or has contra-indications to thalidomide.

[www.nice.org.uk/TA228](http://www.nice.org.uk/TA228)

▶ **Bortezomib monotherapy for relapsed multiple myeloma (October 2007)** NICE TA129

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

[www.nice.org.uk/TA129](http://www.nice.org.uk/TA129)

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium*, has advised (December 2013) that bortezomib (*Velcade*®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- ▶ **Velcade** (Janssen-Cilag Ltd)

**Bortezomib 3.5 mg** Velcade 3.5mg powder for solution for injection vials | 1 vial (POM) £762.38 (Hospital only)

## Carfilzomib

08-Feb-2019

- **DRUG ACTION** Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.

● **INDICATIONS AND DOSE**

**Treatment of multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone, or with dexamethasone and lenalidomide) (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** (consult product literature or local protocols)

- **CAUTIONS** Elderly (over 75 years)—higher incidence of adverse effects · ensure adequate hydration · infusion-related reactions · recent history of myocardial infarction · risk of cardiac failure · risk of herpes zoster reactivation · uncontrolled angina · uncontrolled arrhythmias

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Infusion-related reactions** Manufacturer advises premedication with dexamethasone to reduce incidence and severity of infusion-related reactions.
- ▶ **Risk of herpes zoster reactivation** Manufacturer advises consider antiviral prophylaxis for herpes zoster infection.
- **INTERACTIONS** → Appendix 1: carfilzomib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · cataract · chest pain · chills · constipation · cough · decreased leucocytes · dehydration · diarrhoea · dizziness · dyspnoea · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · haemorrhage · headache · heart failure · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypertension · hyperuricaemia · hypoalbuminaemia · hypotension · increased risk of infection · infusion related reaction · insomnia · muscle complaints · muscle weakness · nausea · neutropenia · oropharyngeal pain · pain · palpitations · peripheral neuropathy · peripheral oedema · pulmonary hypertension · pulmonary oedema · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · thrombocytopenia · tinnitus · toothache · vision blurred · vomiting
  - ▶ **Uncommon** Cardiac arrest · gastrointestinal perforation · haemolytic anaemic syndrome · hepatic disorders · intracranial haemorrhage · multi organ failure · myocardial infarction · myocardial ischaemia · pericardial effusion · pericarditis · stroke · tumour lysis syndrome
  - ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES) · thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; efficacy of oral contraceptives may be reduced, and hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 2 days after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (increased risk of side-effects), particularly in moderate to severe impairment (limited information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—increased incidence of adverse effects.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: serum potassium concentration at least monthly; signs and symptoms of fluid overload, especially in those at risk of cardiac failure; renal function at treatment initiation and at least monthly during treatment—consider dose modification; hepatic function at treatment initiation and monthly during treatment—consider dose modification; platelet count and blood pressure. Also monitor for signs and symptoms of thrombotic microangiopathy.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and carers are warned to report signs and symptoms of thromboembolism (such as dyspnoea, chest pain, arm or leg swelling or pain).  
**Driving and skilled tasks** Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness, hypotension and blurred vision.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**

- ▶ **Carfilzomib for previously treated multiple myeloma (July 2017)** NICE TA457

Carfilzomib (*Kyprolis*®) in combination with dexamethasone is recommended as an option for treating multiple myeloma in adults, only if:

- they have had only 1 previous therapy, which did not include bortezomib, **and**
- the manufacturer provides carfilzomib with the discount agreed in the patient access scheme.

Patients currently receiving carfilzomib whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta457](http://www.nice.org.uk/guidance/ta457)

- **Scottish Medicines Consortium (SMC) decisions**

SMC No. 1171/16

The *Scottish Medicines Consortium* has advised (January 2017) that carfilzomib (*Kyprolis*®) in combination with lenalidomide and dexamethasone is **not** recommended for use within NHS Scotland for the treatment of adults with multiple myeloma who have received at least one prior therapy as the economic case was not demonstrated.

SMC No. 1242/17

The *Scottish Medicines Consortium* has advised (August 2017) that carfilzomib (*Kyprolis*®) is accepted for use within NHS Scotland, in combination with dexamethasone alone for the treatment of adults with multiple myeloma who have received at least one prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Kyprolis** (Amgen Ltd) ▼

**Carfilzomib 10 mg** Kyprolis 10mg powder for solution for infusion vials | 1 vial [PoM] £176.00

**Carfilzomib 30 mg** Kyprolis 30mg powder for solution for infusion vials | 1 vial [PoM] £528.00

**Carfilzomib 60 mg** Kyprolis 60mg powder for solution for infusion vials | 1 vial [PoM] £1,056.00

## Ixazomib

21-Mar-2018

- **DRUG ACTION** Ixazomib is a proteasome inhibitor.

- **INDICATIONS AND DOSE**

**Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)**

- ▶ BY MOUTH
    - ▶ Adult: 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

- **IMPORTANT SAFETY INFORMATION**

- **RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 888.

- **CAUTIONS** Risk of herpes zoster reactivation  
**CAUTIONS, FURTHER INFORMATION**
  - ▶ Herpes zoster reactivation Manufacturer advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
  - **INTERACTIONS** → Appendix 1: ixazomib
  - **SIDE-EFFECTS**
  - ▶ **Common or very common** Back pain · constipation · diarrhoea · increased risk of infection · nausea · neutropenia · peripheral neuropathy (monitor for symptoms) · peripheral oedema · rash · thrombocytopenia · vomiting
  - ▶ **Frequency not known** Posterior reversible encephalopathy syndrome (PRES) (discontinue)
  - **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
  - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).  
**Dose adjustments** Manufacturer advises dose reduction to 3 mg in moderate to severe impairment.
  - **RENAL IMPAIRMENT**  
**Dose adjustments** Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).
  - **MONITORING REQUIREMENTS** Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.
  - **PATIENT AND CARER ADVICE**  
**Missed doses** Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - ▶ **Ixazomib with lenalidomide and dexamethasone for treating relapsed or refractory multiple myeloma (February 2018)** NICE TA505  
Ixazomib, with lenalidomide and dexamethasone, is recommended for use within the Cancer Drugs Fund as an option for treating multiple myeloma in adults only if:
      - they have already had 2 or 3 lines of therapy, **and**
      - the conditions in the managed access agreement for ixazomib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta505](http://www.nice.org.uk/guidance/ta505)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

## ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

### Abemaciclib

05-Mar-2019

- **DRUG ACTION** Abemaciclib is a selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

#### ● INDICATIONS AND DOSE

**Locally advanced or metastatic breast cancer (initiated by a specialist)**

##### ▶ BY MOUTH

- ▶ **Adult:** 150 mg twice daily, for dose adjustments due to side-effects—consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce abemaciclib dose to 100 mg twice daily; in those already taking a reduced dose, consult product literature. If the CYP3A4 inhibitor is stopped, increase the abemaciclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

#### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **INTERACTIONS** → Appendix 1: abemaciclib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · decreased leucocytes · diarrhoea · dizziness · embolism and thrombosis · excessive tearing · fatigue · fever · infection · muscle weakness · nausea · neutropenia · skin reactions · taste altered · thrombocytopenia · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment. Temporary or permanent withdrawal may be needed following increases in aminotransferases—consult product literature.  
**Dose adjustments** Manufacturer advises dose reduction to 150 mg once daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—monitor for signs of toxicity.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count, and alanine and aspartate aminotransferases before starting treatment, every 2 weeks for the first 2 months, monthly for the following 2 months, and as clinically indicated thereafter.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Abemaciclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (February 2019)**

NICE TA563

Abemaciclib (*Verzenios*®) with an aromatase inhibitor is recommended, within its marketing authorisation, as an option for treating locally advanced or metastatic, hormone receptor-positive, human epidermal growth factor receptor 2 (HER2)-negative breast cancer as first endocrine-based therapy in adults. Abemaciclib is recommended only if the manufacturer provides it according to the commercial arrangement.

[www.nice.org.uk/guidance/ta563](http://www.nice.org.uk/guidance/ta563)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Afatinib

27-Mar-2019

- **DRUG ACTION** Afatinib is a protein kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor**

##### ▶ BY MOUTH

- ▶ **Adult:** 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

#### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **CAUTIONS** Cardiac risk factors · conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment · diarrhoea—proactive management recommended (consult product literature) · exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded · severe dry eyes · signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment · signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms

(including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded

- **INTERACTIONS** → Appendix 1: afatinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite decreased · cystitis · dehydration · diarrhoea · dry eye · dyspepsia · epistaxis · eye inflammation · fever · hypokalaemia · muscle spasms · nausea · oral disorders · paronychia · renal impairment · rhinorrhoea · skin reactions · taste altered · vomiting · weight decreased
  - ▶ **Uncommon** Interstitial lung disease · pancreatitis
  - ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).
  - ▶ **Dose adjustments** Manufacturer advises consider dose interruption if hepatic function worsens in mild to moderate impairment—consult product literature.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose.
  - ▶ *Giotrif*<sup>®</sup> tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.
- **PATIENT AND CARER ADVICE** Patient counselling advised (administration).
  - ▶ **Driving and skilled tasks** Ocular adverse reactions may affect performance of skilled tasks e.g. driving.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - ▶ **NICE decisions**
    - ▶ **Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)** NICE TA310

## Alectinib

15-Aug-2018

- **DRUG ACTION** Alectinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

#### **Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 600 mg twice daily, for dose adjustments due to side-effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **INTERACTIONS** → Appendix 1: alectinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · arrhythmias · constipation · diarrhoea · eye disorders · eye inflammation · hyperbilirubinaemia · musculoskeletal pain · myalgia · nausea · oedema · photosensitivity reaction · skin reactions · vision disorders · vomiting
  - ▶ **Uncommon** Drug-induced liver injury · respiratory disorders
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for at least 3 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT**
  - ▶ **Dose adjustments** Manufacturer advises reduce dose to 450 mg twice daily in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor creatine phosphokinase every 2 weeks for the first month and as clinically indicated thereafter in patients reporting symptoms of myalgia.
  - ▶ Manufacturer advises monitor heart rate and blood pressure as clinically indicated.
  - ▶ Manufacturer advises monitor liver function at baseline then every 2 weeks during the first 3 months of treatment and periodically thereafter as clinically indicated; more frequent monitoring should be performed in patients who develop aminotransferase and bilirubin elevations.
  - ▶ Manufacturer advises monitor for symptoms of interstitial lung disease and pneumonitis.
- **PATIENT AND CARER ADVICE**
  - ▶ **Photosensitivity** Manufacturer advises patients should use a broad spectrum sunscreen and lip balm and be advised to avoid prolonged sun exposure during treatment, and for 7 days after discontinuation.
  - ▶ **Myalgia** Manufacturer advises patients should be advised to report any unexplained muscle pain, tenderness or weakness.
  - ▶ **Vomiting** Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.
  - ▶ **Missed doses** Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
  - ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of symptomatic bradycardia and vision disorders.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ **Alectinib for untreated ALK-positive advanced non-small-cell lung cancer (August 2018)** NICE TA536  
Alectinib (*Alecensa*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer in adults. It is recommended only if the manufacturer provides alectinib according to the commercial arrangement.  
[www.nice.org.uk/guidance/ta536](http://www.nice.org.uk/guidance/ta536)

### Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2012  
The *Scottish Medicines Consortium* has advised (August 2018) that alectinib (*Alecensa*<sup>®</sup>) is accepted for use within NHS Scotland as monotherapy for the first-line treatment of adults with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

CAUTIONARY AND ADVISORY LABELS 11, 21  
ELECTROLYTES: May contain Sodium

- ▶ **Alecensa** (Roche Products Ltd) ▼  
Alectinib (as Alectinib hydrochloride) 150 mg Alecensa 150mg capsules | 224 capsule [PoM] £5,032.00

## Axitinib

10-Apr-2019

- **DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** Recent active gastro-intestinal bleeding · untreated brain metastases
- **CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)
- **INTERACTIONS** → Appendix 1: axitinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · constipation · cough · dehydration · diarrhoea · dizziness · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hyperbilirubinaemia · hypertension · hyperthyroidism · hypothyroidism · mucositis · myalgia · nausea · oral disorders · oropharyngeal pain · pain in extremity · polycythaemia · proteinuria · renal failure · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting · weight decreased
  - ▶ **Uncommon** Leucopenia · neutropenia · posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for up to 1 week after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.  
**Dose adjustments** Manufacturer advises reduce dose in moderate impairment.

### ● MONITORING REQUIREMENTS

- ▶ Monitor for thyroid dysfunction.
- ▶ Monitor haemoglobin or haematocrit before and during treatment.
- ▶ Monitor for symptoms of gastro-intestinal perforation.
- ▶ Monitor for symptoms of fistula.
- ▶ Monitor for proteinuria before and during treatment.
- ▶ Monitor liver function before and during treatment.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ **Axitinib for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015)** NICE TA333  
Axitinib (*Inlyta*<sup>®</sup>) is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, **only** if the manufacturer provides axitinib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta333](http://www.nice.org.uk/guidance/ta333)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Inlyta** (Pfizer Ltd)

- Axitinib 1 mg Inlyta 1mg tablets | 56 tablet [PoM] £703.40 (Hospital only)
- Axitinib 3 mg Inlyta 3mg tablets | 56 tablet [PoM] £2,110.20 (Hospital only)
- Axitinib 5 mg Inlyta 5mg tablets | 56 tablet [PoM] £3,517.00 (Hospital only)
- Axitinib 7 mg Inlyta 7mg tablets | 56 tablet [PoM] £4,923.80 (Hospital only)

## Binimetinib

05-Mar-2019

- **DRUG ACTION** Binimetinib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically mitogen-activated extracellular kinases MEK 1 and 2, thereby inhibiting BRAF V600 mutation-positive cell growth.

### ● INDICATIONS AND DOSE

**Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with encorafenib) (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: 45 mg twice daily, for dose adjustments due to side-effects, consult product literature

### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** History of retinal vein occlusion
- **CAUTIONS** Left ventricular dysfunction (ejection fraction below 50%, or below the institutional lower limits of normal) · neuromuscular conditions associated with elevated creatine kinase and rhabdomyolysis · risk factors for retinal vein occlusion · risk factors for venous thromboembolism

### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · angioedema · arthralgia · constipation · detachment of retinal pigment epithelium · diarrhoea · dizziness · embolism and thrombosis · eye inflammation · fatigue · fever · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hypersensitivity · hypersensitivity vasculitis · hypertension · intracranial haemorrhage · left ventricular dysfunction · lip squamous cell carcinoma · muscle complaints · muscle weakness · myopathy · nausea · neoplasms · nerve disorders · oedema · pain · panniculitis · photosensitivity reaction · renal failure · skin reactions · taste altered · ulcerative colitis · vision disorders · vomiting
- ▶ **Uncommon** Facial paralysis · pancreatitis · paresis
- ▶ **Frequency not known** Respiratory disorders · retinal occlusion (discontinue permanently)

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for at least one month after stopping treatment.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment (increased exposure).

### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.
- ▶ Manufacturer advises assess left ventricular ejection fraction before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.
- ▶ Manufacturer advises monitor for visual disturbances.
- ▶ Manufacturer advises monitor blood pressure before and during treatment.
- ▶ Manufacturer advises monitor creatine kinase and creatinine levels monthly during the first 6 months of treatment, and as clinically indicated.

### ● PATIENT AND CARER ADVICE

- ▶ **Missed doses** Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- ▶ **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ Encorafenib with binimetinib for unresectable or metastatic BRAF V600 mutation-positive melanoma (February 2019) NICE TA562  
Encorafenib with binimetinib (*Mektovi*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides binimetinib according to the commercial arrangements.  
[www.nice.org.uk/guidance/ta562](http://www.nice.org.uk/guidance/ta562)

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

**Binimetinib 15 mg** Mektovi 15mg tablets | 84 tablet **PoM**  
£2,240.00 (Hospital only)

## Bosutinib

08-Mar-2019

### ● INDICATIONS AND DOSE

**Previously treated chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)**

#### ▶ BY MOUTH

- ▶ **Adult:** 500 mg once daily, consult product literature for dose adjustment due to side-effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

**Newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (specialist use only)**

#### ▶ BY MOUTH

- ▶ **Adult:** 400 mg once daily, consult product literature for dose adjustment due to side-effects, or failure to demonstrate breakpoint cluster region-Abelson (BCR-ABL) transcripts ≤10% by month 3

### ● IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · hepatitis B infection · history of pancreatitis—withhold treatment if lipase elevated and abdominal symptoms occur · history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder

### ● CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

● **INTERACTIONS** → Appendix 1: bosutinib

### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · arthralgia · asthenia · chest discomfort · cough · dehydration · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · fever · gastritis · gastrointestinal discomfort · headache · hepatic disorders · hypersensitivity · hypertension · increased risk of infection · leucopenia · long QT syndrome · malaise · myalgia · nausea · neutropenia · oedema · pain · pericardial effusion · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting
- ▶ **Uncommon** Haemorrhage · pancreatitis acute · pericarditis · pulmonary hypertension · pulmonary oedema · tinnitus · tumour lysis syndrome
- ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment in women.

- **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT**

**Dose adjustments** For *chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia*, manufacturer advises reduce dose to 400 mg in moderate impairment; reduce dose to 300 mg in severe impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

For *newly-diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia*, manufacturer advises reduce dose to 300 mg in moderate impairment; reduce dose to 200 mg in severe impairment; consult product literature for dose adjustment due to side-effects, or incomplete haematological, cytogenetic, or molecular response.

- **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- ▶ Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- ▶ Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Bosutinib for previously treated chronic myeloid leukaemia (August 2016)** NICE TA401

Bosutinib (*Bosulif*<sup>®</sup>) is recommended as a treatment option, within its marketing authorisation, for chronic, accelerated and blast phase Philadelphia-chromosome-positive CML in adults, when:

- they have previously been treated with 1 or more tyrosine kinase inhibitor, **and**
- imatinib, nilotinib and dasatinib are not appropriate, **and**
- the manufacturer provides bosutinib with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta401](http://www.nice.org.uk/guidance/ta401)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

  - ▶ **Bosutinib 500 mg** Bosulif 500mg tablets | 28 tablet PoM £3,436.67 (Hospital only)

## Brigatinib

27-Mar-2019

- **DRUG ACTION** Brigatinib is a tyrosine kinase inhibitor.

- **INDICATIONS AND DOSE**

**Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 90 mg once daily for 7 days, then increased to 180 mg once daily, for dose adjustments

due to dose interruption or side-effects—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce brigatinib dose to 90 mg once daily; in those starting treatment already taking a reduced dose, consult product literature.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **INTERACTIONS** → Appendix 1: brigatinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · cataract · chest discomfort · constipation · cough · diarrhoea · dizziness · dry mouth · dyspnoea · electrolyte imbalance · eye disorders · eye inflammation · facial swelling · fever · flatulence · gastrointestinal discomfort · glaucoma · headaches · hyperbilirubinaemia · hyperglycaemia · hyperinsulinaemia · hypertension · increased risk of infection · insomnia · memory loss · muscle complaints · musculoskeletal discomfort · nausea · nerve disorders · neurotoxicity · oedema · oral disorders · pain · palpitations · peripheral swelling · photosensitivity reaction · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · taste altered · vision disorders · vomiting · weight decreased
  - ▶ **Uncommon** Pancreatitis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective non-hormonal contraception in females of childbearing potential during and for at least 4 months after treatment. Male patients with partners of childbearing potential should use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
 

**Dose adjustments** Manufacturer advises dose reduction to 60 mg once daily for 7 days, then increase to 120 mg once daily in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
 

**Dose adjustments** Manufacturer advises dose reduction to 60 mg once daily for 7 days, then increase to 90 mg once daily in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor for new or worsening respiratory symptoms, particularly in the first week of treatment—promptly investigate if pneumonitis suspected (consult product literature).
  - ▶ Manufacturer advises monitor blood pressure, heart rate, creatine phosphokinase, amylase, and lipase regularly.
  - ▶ Manufacturer advises monitor liver function at baseline, then every 2 weeks during the first 3 months of treatment, and periodically thereafter.
  - ▶ Manufacturer advises monitor fasting serum glucose at baseline and periodically thereafter.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be told to report symptoms of visual disturbance, or unexplained muscle pain, tenderness, or weakness.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbance, dizziness, or fatigue.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Brigatinib for treating ALK-positive advanced non-small-cell lung cancer after crizotinib (March 2019)** NICE TA571 Brigatinib (*Alunbrig*<sup>®</sup>) is recommended, within its marketing authorisation, for treating anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer in adults who have already had crizotinib. It is recommended only if the manufacturer provides it according to the commercial arrangement. [www.nice.org.uk/guidance/ta571](http://www.nice.org.uk/guidance/ta571)

## Cabozantinib

29-Aug-2017

- **DRUG ACTION** Cabozantinib is an inhibitor of several protein kinases.

● **INDICATIONS AND DOSE**

**Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma (initiated by a specialist)**

▶ BY MOUTH USING CAPSULES

- ▶ Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

**Advanced renal cell carcinoma (initiated by a specialist)**

▶ BY MOUTH USING TABLETS

- ▶ Adult: 60 mg once daily, for dose adjustment or treatment interruption due to side-effects, consult product literature (closely monitor for first 8 weeks of therapy)

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Cabozantinib tablets and capsules are not bioequivalent—consult product literature when switching formulations.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** Reversible Posterior Leukoencephalopathy Syndrome
- **CAUTIONS** Hypertension—discontinue treatment if uncontrolled despite medical intervention · palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 · patients at increased risk of fistulas—consult product literature · patients at increased risk of gastro-intestinal perforation—consult product literature · patients at increased risk of intra-abdominal abscess—consult product literature · patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop · patients at risk of thromboembolic events including

myocardial infarction—discontinue if symptoms develop · risk of osteonecrosis of the jaw · susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Elective surgery** Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
  - ▶ **Risk of osteonecrosis of the jaw** Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.
  - **INTERACTIONS** → Appendix 1: cabozantinib
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Abscess · alopecia · anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chills · cholelithiasis · confusion · constipation · dehydration · depression · diarrhoea · dizziness · dysphagia · dysphonia · dysuria · ear pain · electrolyte imbalance · embolism and thrombosis · fistula · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair changes · headache · healing impaired · hyperbilirubinaemia · hypertension · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · lymphopenia · mucositis · muscle spasms · nausea · neutropenia · oedema · oral disorders · oropharyngeal pain · osteonecrosis of jaw · pain · pallor · pancreatitis · paraesthesia · peripheral coldness · peripheral neuropathy · proteinuria · skin reactions · taste altered · thrombocytopenia · tinnitus · tremor · vision blurred · vomiting · weight decreased
    - ▶ **Uncommon** Abnormal dreams · acute kidney injury · amenorrhoea · angina pectoris · ataxia · cataract · concentration impaired · conjunctivitis · cyst · delirium · encephalopathy · hearing impairment · loss of consciousness · respiratory disorders · rhabdomyolysis · skin ulcer · speech disorder · telangiectasia · throat oedema · transient ischaemic attack
  - **CONCEPTION AND CONTRACEPTION** Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
  - **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
  - **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
  - **HEPATIC IMPAIRMENT** For *capsules* manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment (no information available). For *tablets* manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available). **Dose adjustments** For *capsules* manufacturer advises dose reduction to 60 mg once daily in mild to moderate impairment.
  - **RENAL IMPAIRMENT** Manufacturer advises caution in renal impairment. Avoid in severe impairment.
  - **MONITORING REQUIREMENTS** Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
  - **PATIENT AND CARER ADVICE** Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.
- Driving and skilled tasks** Fatigue and weakness may affect performance of skilled tasks e.g. driving.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ **Cabozantinib for previously treated advanced renal cell carcinoma (August 2017) NICE TA463**  
Cabozantinib (*Cabometyx*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for treating advanced renal cell carcinoma in adults after vascular endothelial growth factor (VEGF)-targeted therapy, only if the company provides cabozantinib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta463](http://www.nice.org.uk/guidance/ta463)
- ▶ **Cabozantinib for untreated advanced renal cell carcinoma (October 2018) NICE TA542**  
Cabozantinib (*Cabometyx*<sup>®</sup>) is recommended, within its marketing authorisation, for adults with untreated advanced renal cell carcinoma that is intermediate- or poor-risk as defined in the International Metastatic Renal Cell Carcinoma Database Consortium criteria. It is recommended only if the manufacturer provides cabozantinib according to the commercial arrangement.  
[www.nice.org.uk/guidance/ta542](http://www.nice.org.uk/guidance/ta542)
- ▶ **Cabozantinib for treating medullary thyroid cancer (March 2018) NICE TA516**  
Cabozantinib (*Cometriq*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for treating progressive medullary thyroid cancer in adults with unresectable, locally advanced or metastatic disease, only if the manufacturer provides cabozantinib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta516](http://www.nice.org.uk/guidance/ta516)

### Scottish Medicines Consortium (SMC) decisions

SMC No. 1234/17

The *Scottish Medicines Consortium* has advised (June 2017) that cabozantinib (*Cabometyx*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of advanced renal cell carcinoma in adults following vascular endothelial growth factor (VEGF)-targeted therapy. This advice is contingent upon continuing availability of the patient access scheme or a list price that is equivalent or lower.

SMC No. SMC2136

The *Scottish Medicines Consortium* has advised (February 2019) that cabozantinib (*Cabometyx*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the treatment of advanced renal cell carcinoma in treatment-naïve adults with intermediate or poor risk as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Ceritinib

21-Feb-2019

- **DRUG ACTION** Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

### ● INDICATIONS AND DOSE

**First-line treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only) | Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib (specialist use only)**

#### ▶ BY MOUTH

- ▶ Adult: 450 mg once daily, dose interruption, dose reduction or discontinuation may be required based on individual safety and tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 150 mg daily

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Diabetes mellitus · history or susceptibility to QT-interval prolongation
- CAUTIONS, FURTHER INFORMATION**
  - ▶ QT-interval prolongation QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.
- **INTERACTIONS** → Appendix 1: ceritinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · appetite decreased · arrhythmias · asthenia · azotemia · constipation · diarrhoea · dysphagia · gastrointestinal discomfort · gastroesophageal reflux disease · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypophosphataemia · nausea · oesophageal disorder · pericardial effusion · pericarditis · QT interval prolongation · renal impairment · respiratory disorders · skin reactions · vision disorders · vitreous floater · vomiting · weight decreased
  - ▶ **Uncommon** Pancreatitis
- SIDE-EFFECTS, FURTHER INFORMATION** **Gastro-intestinal effects** Manufacturer advises monitor for signs of gastro-intestinal toxicity and consider dose reduction or discontinuation of treatment.
  - ▶ **Interstitial lung disease** Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (limited information available).

**Dose adjustments** Manufacturer advises reduce dose by approx. 33% in severe impairment (round to the nearest multiple of the 150 mg dosage strength).

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor fasting plasma-glucose concentration, amylase and lipase levels before treatment initiation and periodically thereafter as clinically indicated.
  - ▶ Manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first three months of treatment and monthly thereafter; if transaminases are elevated, more frequent monitoring should be performed as clinically indicated.
  - ▶ Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease and pneumonitis—discontinue treatment if diagnosis confirmed; also monitor heart rate and blood pressure regularly.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *Zykadia*<sup>®</sup> capsules should be taken with food at the same time each day—consult product literature for dosing information if patients are unable to take capsules with food.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of capsules.
 

**Missed doses** If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Ceritinib for previously treated anaplastic lymphoma kinase-positive non-small cell lung cancer (June 2016)** NICE TA395 Ceritinib (*Zykadia*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta395](http://www.nice.org.uk/guidance/ta395)
- ▶ **Ceritinib for untreated ALK-positive non-small cell lung cancer (January 2018)** NICE TA500 Ceritinib (*Zykadia*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta500](http://www.nice.org.uk/guidance/ta500)

##### Scottish Medicines Consortium (SMC) decisions

SMC No. 1097/15

The *Scottish Medicines Consortium* has advised (December 2015) that ceritinib (*Zykadia*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

## Cobimetinib

11-Feb-2019

- **DRUG ACTION** Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)**

##### ▶ BY MOUTH

- ▶ **Adult:** 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Left ventricular dysfunction · risk factors for bleeding
- **INTERACTIONS** → Appendix 1: cobimetinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · basal cell carcinoma · chills · dehydration · diarrhoea · electrolyte imbalance · fever · haemorrhage · hyperglycaemia · hypertension · nausea · photosensitivity reaction · pneumonitis · serous retinopathy · skin reactions · vision disorders · vomiting
  - ▶ **Uncommon** Rhabdomyolysis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.
- **MONITORING REQUIREMENTS**
  - ▶ Creatine kinase elevation Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.
  - ▶ Left ventricular function Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.
  - ▶ Liver function Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).
  - ▶ Visual disturbances Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.
- **PATIENT AND CARER ADVICE**

Vomiting Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

**Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ **Cobimetinib in combination with vemurafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2016) NICE TA414**  
Cobimetinib (*Cotellic*<sup>®</sup>) in combination with vemurafenib (*Zelboraf*<sup>®</sup>) is **not** recommended within its marketing authorisation for treating unresectable or metastatic melanoma with a BRAF V600 mutation.  
Patients currently receiving cobimetinib may continue without change to prior funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta414](http://www.nice.org.uk/guidance/ta414)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- ▶ **Cotellic** (Roche Products Ltd) ▼  
Cobimetinib (as Cobimetinib hemifumarate) 20 mg Cotellic 20mg tablets | 63 tablet [PoM] £4,275.67

## Crizotinib

06-Aug-2018

- **DRUG ACTION** Crizotinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (specialist use only) | ROS1-positive advanced non-small cell lung cancer (specialist use only)**

- ▶ BY MOUTH
- ▶ **Adult:** 250 mg twice daily, consult product literature for information on dose adjustments based on individual patient safety and tolerability

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE**  
Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:

- Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur

- **CAUTIONS** History of diverticulitis (risk of gastrointestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required · risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs · vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

### CAUTIONS, FURTHER INFORMATION

- ▶ **Fatal interstitial lung disease and pneumonitis** Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).
- **INTERACTIONS** → Appendix 1: crizotinib

## ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · appetite decreased · arrhythmias · constipation · diarrhoea · dizziness · fatigue · gait abnormal · gastrointestinal discomfort · gastrointestinal disorders · heart failure · hepatic function abnormal · hypogonadism · hypophosphataemia · leucopenia · local swelling · movement disorders · muscle atrophy · muscle tone decreased · muscle weakness · nausea · nerve disorders · neuralgia · neurotoxicity · neutropenia · oedema · periorbital oedema · peroneal nerve palsy · pulmonary oedema · QT interval prolongation · renal abscess · renal cyst · respiratory disorders · sensation abnormal · skin reactions · syncope · taste altered · vision disorders · vitreous floater · vomiting
- ▶ **Uncommon** Gastrointestinal perforation (including fatal cases) · hepatic failure (including fatal cases) · renal impairment

**SIDE-EFFECTS, FURTHER INFORMATION** Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 90 days after treatment.
- **PREGNANCY** Avoid (toxicity in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.  
**Dose adjustments** Manufacturer advises reduce dose in moderate to severe impairment—consult product literature.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.
- **MONITORING REQUIREMENTS** Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated. Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter. Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.
- **PATIENT AND CARER ADVICE** Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advise to seek immediate medical attention.  
**Driving and skilled tasks** Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE decisions**  
▶ **Crizotinib for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (September 2016) NICE TA406**  
Crizotinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta406](http://www.nice.org.uk/guidance/ta406)  
▶ **Crizotinib for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (December 2016) NICE TA422**  
Crizotinib is recommended, within its marketing authorisation, as an option for previously treated

anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta422](http://www.nice.org.uk/guidance/ta422)

- ▶ **Crizotinib for treating ROS1-positive advanced non-small-cell lung cancer (July 2018)** NICE TA529

Crizotinib is recommended for use within the Cancer Drugs Fund as an option for treating ROS1-positive advanced non-small-cell lung cancer (NSCLC) in adults, only if the conditions in the managed access agreement are followed. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta529](http://www.nice.org.uk/guidance/ta529)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1329/18

The *Scottish Medicines Consortium* has advised (June 2018) that crizotinib (*Xalkori*®) is accepted for use within NHS Scotland for the treatment of adults with ROS1-positive advanced non-small cell lung cancer. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

£4,689.00 (Hospital only)

## Dabrafenib

24-Jul-2018

- **DRUG ACTION** Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

#### ● INDICATIONS AND DOSE

**Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib) (specialist use only)** **Advanced non-small cell lung cancer with a BRAF V600 mutation (in combination with trametinib) (specialist use only)**

- ▶ BY MOUTH

▶ Adult: 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature

**Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with trametinib) (specialist use only)**

- ▶ BY MOUTH

▶ Adult: 150 mg every 12 hours for 12 months, for dose adjustments due to side-effects, consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** BRAF wild-type melanoma · BRAF wild-type non-small cell lung cancer
- **CAUTIONS** Elderly (more frequent dose adjustments may be required) · prior or concurrent cancer associated with RAS mutations—risk of secondary or recurrent malignancy
- **INTERACTIONS** → Appendix 1: dabrafenib

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · chills · constipation · cough · diarrhoea · fever · headache · hyperglycaemia · hypophosphataemia · influenza like illness · myalgia · nausea · neoplasms · pain in extremity · photosensitivity reaction · skin reactions · vomiting
- ▶ **Uncommon** Nephritis · pancreatitis · panniculitis · renal impairment · uveitis

**SIDE-EFFECTS, FURTHER INFORMATION** Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective non-hormonal contraception during and for 4 weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor full blood count as clinically indicated; monitor for ophthalmologic reactions including uveitis, iridocyclitis and iritis; monitor serum creatinine.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should be informed to immediately report new skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.  
**Missed doses** Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of ocular adverse reactions.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE decisions**
  - ▶ Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014) NICE TA321 Dabrafenib (*Tafinlar*®) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta321](http://www.nice.org.uk/guidance/ta321)
  - ▶ Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016) NICE TA396 Trametinib (*Mekinist*®) in combination with dabrafenib (*Tafinlar*®) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation only when the manufacturer provides trametinib and dabrafenib with the discounts agreed in the patient access schemes. [www.nice.org.uk/guidance/ta396](http://www.nice.org.uk/guidance/ta396)

- ▶ **Dabrafenib with trametinib for adjuvant treatment of resected BRAF V600 mutation-positive melanoma (October 2018) NICE TA544**

Dabrafenib (*Tafinlar*<sup>®</sup>) with trametinib (*Mekinist*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for the adjuvant treatment of resected stage III BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides dabrafenib and trametinib with the discounts agreed in the commercial arrangements.

[www.nice.org.uk/guidance/ta544](http://www.nice.org.uk/guidance/ta544)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1023/15

The *Scottish Medicines Consortium* has advised (March 2015) that dabrafenib (*Tafinlar*<sup>®</sup>) is accepted for restricted use within NHS Scotland, as monotherapy, for the treatment of unresectable or metastatic BRAF V600 mutation-positive melanoma in adults who have received no prior therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower. SMC No. SMC2131

The *Scottish Medicines Consortium* has advised (February 2019) that dabrafenib (*Tafinlar*<sup>®</sup>) is accepted for use within NHS Scotland in combination with trametinib for the adjuvant treatment of adults with stage III melanoma with a BRAF V600 mutation, following complete resection. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 3, 23, 25

▶ **Tafinlar** (Novartis Pharmaceuticals UK Ltd)

**Dabrafenib (as Dabrafenib mesilate) 50 mg** Tafinlar 50mg capsules | 28 capsule [POM] £933.33 (Hospital only)

## Dasatinib

30-Apr-2019

- **DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Chronic phase chronic myeloid leukaemia (initiated by a specialist)**

▶ BY MOUTH USING TABLETS

- ▶ Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily, for dose adjustment due to side-effects—consult product literature

**Accelerated and blast phase chronic myeloid leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist) | Acute lymphoblastic leukaemia [resistant or intolerant to prior therapy] (initiated by a specialist)**

▶ BY MOUTH USING TABLETS

- ▶ Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily, for dose adjustment due to side-effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS** An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: dasatinib

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite abnormal · arrythmias · arthralgia · asthenia · bone marrow depression · cardiac disorder · cardiomyopathy · chest pain · chills · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dyspnoea · eye inflammation · facial swelling · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · genital abnormalities · haemorrhage · headache · heart failure · hypertension · hyperuricaemia · increased risk of infection · insomnia · milia · mucositis · muscle complaints · muscle weakness · musculoskeletal stiffness · myocardial dysfunction · nausea · nerve disorders · neutropenia · oedema · oral disorders · pain · palpitations · pericardial effusion · perinephric effusion · pulmonary hypertension · pulmonary oedema · respiratory disorders · sepsis · skin reactions · sweat changes · taste altered · thrombocytopenia · tinnitus · vision disorders · vomiting · weight changes
- ▶ **Uncommon** Acute coronary syndrome · anxiety · arthritis · ascites · asthma · cardiac inflammation · cardiomegaly · cerebrovascular insufficiency · cholecystitis · CNS haemorrhage · confusion · dysphagia · embolism and thrombosis · emotional lability · excessive tearing · gynaecomastia · hair disorder · hearing loss · hepatic disorders · hypercholesterolaemia · hypoalbuminaemia · hypotension · hypothyroidism · ischaemic heart disease · libido decreased · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual disorder · movement disorders · myopathy · nail disorder · osteonecrosis · pancreatitis · panniculitis · penile disorders · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · scrotal oedema · skin ulcer · syncope · tendinitis · testicular swelling · tremor · tumour lysis syndrome · urinary frequency increased · vertigo · vulvovaginal swelling
- ▶ **Rare or very rare** Cardiac arrest · dementia · diabetes mellitus · facial paralysis · gait abnormal · hypersensitivity vasculitis · hyperthyroidism · pure red cell aplasia · seizure · thyroiditis
- ▶ **Frequency not known** Hepatitis B reactivation · nephrotic syndrome · Stevens-Johnson syndrome
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises evaluate for signs and symptoms of underlying cardiopulmonary disease before initiation of therapy—echocardiography should be performed at treatment initiation in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.

- ▶ Manufacturer advises monitor patients with risk factors or a history of cardiac disease for signs or symptoms of cardiac dysfunction during treatment.
- ▶ When used for Accelerated or blast phase chronic myeloid leukaemia or Acute lymphoblastic leukaemia Manufacturer advises monitor full blood count weekly for the first 2 months, then monthly or as clinically indicated thereafter.
- ▶ When used for Chronic phase chronic myeloid leukaemia Manufacturer advises monitor full blood count every 2 weeks for 3 months, then every 3 months or as clinically indicated thereafter.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426 Dasatinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta426](http://www.nice.org.uk/guidance/ta426)

- ▶ **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425 Dasatinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant **and** the manufacturer provides dasatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta425](http://www.nice.org.uk/guidance/ta425)

##### Scottish Medicines Consortium (SMC) decisions

SMC No. 370/07

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (*Sprycel*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 1170/16

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (*Sprycel*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Sprycel** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Dasatinib 20 mg** Sprycel 20mg tablets | 60 tablet **[PoM]** £1,252.48 DT = £1,252.48 (Hospital only)

**Dasatinib 50 mg** Sprycel 50mg tablets | 60 tablet **[PoM]** £2,504.96 DT = £2,504.96 (Hospital only)

**Dasatinib 80 mg** Sprycel 80mg tablets | 30 tablet **[PoM]** £2,504.96 DT = £2,504.96 (Hospital only)

**Dasatinib 100 mg** Sprycel 100mg tablets | 30 tablet **[PoM]** £2,504.96 DT = £2,504.96 (Hospital only)

**Dasatinib 140 mg** Sprycel 140mg tablets | 30 tablet **[PoM]** £2,504.96 DT = £2,504.96 (Hospital only)

## Encorafenib

05-Mar-2019

- **DRUG ACTION** Encorafenib inhibits the mitogen-activated protein kinase (MAPK) pathway, specifically BRAF kinase, thereby inhibiting BRAF V600 mutation-positive cell growth.

#### ● INDICATIONS AND DOSE

##### Unresectable or metastatic melanoma with a BRAF V600 mutation (in combination with binimetinib) (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: 450 mg once daily, for dose adjustments due to side-effects, consult product literature

#### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** BRAF wild-type malignant melanoma
- **CAUTIONS** Prior or concurrent cancer associated with RAS mutation - risk factors for QT-interval prolongation
- **INTERACTIONS** → Appendix 1: encorafenib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · angioedema · appetite decreased · arrhythmias · arthralgia · arthritis · constipation · detachment of retinal pigment epithelium · diarrhoea · dizziness · embolism and thrombosis · eye inflammation · facial paralysis · fatigue · fever · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · heart failure · hypersensitivity · hypersensitivity vasculitis · hypertension · insomnia · intracranial haemorrhage · left ventricular dysfunction · lip squamous cell carcinoma · muscle complaints · muscle weakness · myopathy · nausea · neoplasms · nerve disorders · oedema · pain · panniculitis · paresis · photosensitivity reaction · renal impairment · skin reactions · taste altered · ulcerative colitis · vision disorders · vomiting
  - ▶ **Uncommon** Pancreatitis
  - ▶ **Frequency not known** QT interval prolongation
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for at least one month after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment (increased exposure); avoid in moderate or severe impairment (no information available).  
**Dose adjustments** Manufacturer advises dose reduction to 300 mg once daily in mild impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, every 2 months during treatment, and for up to 6 months after discontinuation; assess for non-cutaneous malignancy and monitor full blood count before, during, and after treatment discontinuation as clinically indicated—consult product literature.
  - ▶ Manufacturer advises monitor liver function before treatment, at least monthly during the first 6 months, and thereafter as clinically indicated.

- ▶ Manufacturer advises assess ECG before treatment, one month after starting treatment, then every 3 months or more frequently as clinically indicated.
- ▶ Manufacturer advises monitor blood creatinine levels as clinically indicated.
- ▶ Manufacturer advises monitor for ophthalmologic reactions including uveitis, iridocyclitis, and iritis.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should be informed to immediately report new skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.
- Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Encorafenib with binimetinib for unresectable or metastatic BRAF V600 mutation-positive melanoma (February 2019)** NICE TA562
- Encorafenib (*Braftovi*<sup>®</sup>) with binimetinib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides encorafenib according to the commercial arrangements.
- [www.nice.org.uk/guidance/ta562](http://www.nice.org.uk/guidance/ta562)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Braftovi** (Pierre Fabre Ltd) ▼

**Encorafenib 50 mg** Braftovi 50mg capsules | 28 capsule PoM  
£622.22 (Hospital only)

**Encorafenib 75 mg** Braftovi 75mg capsules | 42 capsule PoM  
£1,400.00 (Hospital only)

## Erlotinib

28-Mar-2019

- **DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy**

- ▶ BY MOUTH
- ▶ Adult: 150 mg once daily

**Treatment of metastatic pancreatic cancer (in combination with gemcitabine)**

- ▶ BY MOUTH
- ▶ Adult: 100 mg once daily

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

#### IMPORTANT SAFETY INFORMATION

**EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor

receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

#### ● CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

- ▶ Smoking Dose adjustment may be necessary if smoking started or stopped during treatment.
- **INTERACTIONS** → Appendix 1: erlotinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · diarrhoea · eye inflammation · haemorrhage · increased risk of infection · renal failure · skin reactions
  - ▶ **Uncommon** Brittle nails · eye disorders · gastrointestinal disorders · hair changes · interstitial lung disease · nephritis · proteinuria
  - ▶ **Rare or very rare** Hepatic failure · severe cutaneous adverse reactions (SCARs)
  - ▶ **Frequency not known** Appetite decreased · chills · cough · depression · dyspnoea · fatigue · fever · gastrointestinal discomfort · headache · nausea · neuropathy sensory · stomatitis · vomiting · weight decreased
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 2 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during treatment and for at least 2 weeks after the last dose.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment—monitor liver function and interrupt treatment if changes in liver function are severe (increased risk of hepatic failure); avoid in severe impairment—no information available.  
**Dose adjustments** Manufacturer advises consider dose reduction or interruption if serious adverse effects occur.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

##### NICE decisions

  - ▶ **Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011)** NICE TA227
  - Erlotinib (*Tarceva*<sup>®</sup>) monotherapy is **not** recommended for maintenance treatment in patients with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.  
Patients currently receiving erlotinib monotherapy for maintenance treatment should have the option to continue treatment until they and their clinician consider it appropriate to stop.
  - [www.nice.org.uk/guidance/ta227](http://www.nice.org.uk/guidance/ta227)
  - ▶ **Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012)** NICE TA258
  - Erlotinib (*Tarceva*<sup>®</sup>) is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:
    - they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation, **and**

- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).

[www.nice.org.uk/guidance/ta258](http://www.nice.org.uk/guidance/ta258)

- ▶ **Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy** (December 2015) NICE TA374

Erlotinib is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta374](http://www.nice.org.uk/guidance/ta374)

- ▶ **Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy** (December 2015) NICE TA374

Erlotinib is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours of unknown epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation status, only if:

- the result of an EGFR-TK mutation diagnostic test is unobtainable because of an inadequate tissue sample or poor-quality DNA, **and**
- the treating clinician considers that the tumour is very likely to be EGFR-TK mutation-positive, **and**
- the patient's condition responds to the first 2 cycles of treatment with erlotinib, **and**
- the manufacturer provides erlotinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta374](http://www.nice.org.uk/guidance/ta374)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Tarceva** (Roche Products Ltd)

**Erlotinib (as Erlotinib hydrochloride) 25 mg** Tarceva 25mg tablets | 30 tablet [PoM](#) £378.33

## Everolimus

24-May-2019

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Neuroendocrine tumours of pancreatic origin | Neuroendocrine tumours of gastro-intestinal origin**

▶ BY MOUTH

- ▶ **Adult:** 10 mg once daily, for dose interruption or adjustments due to side effects—consult product literature

#### AFINITOR®

**Neuroendocrine tumours of pancreatic origin | Neuroendocrine tumours of lung origin | Neuroendocrine tumours of gastro-intestinal origin | Renal cell carcinoma | Hormone-receptor positive HER2-negative breast cancer [in combination with exemestane]**

▶ BY MOUTH

- ▶ **Adult:** 10 mg once daily, for dose interruption or adjustments due to side-effects—consult product literature

#### CERTICAN®

**Liver transplantation**

▶ BY MOUTH

- ▶ **Adult:** Initially 1 mg twice daily, to be started approximately 4 weeks after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

**Renal transplantation | Heart transplantation**

▶ BY MOUTH

- ▶ **Adult:** Initially 750 micrograms twice daily, to be started as soon as possible after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

#### VOTUBIA® DISPERSIBLE TABLETS

**Subependymal giant cell astrocytoma associated with tuberous sclerosis complex**

▶ BY MOUTH USING DISPERSIBLE TABLETS

- ▶ **Adult:** (consult product literature)

**Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex**

▶ BY MOUTH USING DISPERSIBLE TABLETS

- ▶ **Adult:** (consult product literature)

#### VOTUBIA® TABLETS

**Subependymal giant cell astrocytoma associated with tuberous sclerosis complex**

▶ BY MOUTH USING TABLETS

- ▶ **Adult:** (consult product literature)

**Renal angiomyolipoma associated with tuberous sclerosis complex**

▶ BY MOUTH USING TABLETS

- ▶ **Adult:** (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** History of bleeding disorders · peri-surgical period (impaired wound healing)
- **INTERACTIONS** → Appendix 1: everolimus
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · cough · decreased leucocytes · dehydration · diabetes mellitus · diarrhoea · dry mouth · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · eye inflammation · fever · gastrointestinal discomfort · haemorrhage · headache · hyperglycaemia · hypertension · increased risk of infection · insomnia · menstrual cycle irregularities · mucositis · nail disorders · nausea · neutropenia · oral disorders · peripheral oedema · proteinuria · renal impairment · respiratory disorders · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
  - ▶ **Uncommon** Congestive heart failure · embolism and thrombosis · flushing · healing impaired · hepatitis B · musculoskeletal chest pain · pancytopenia · sepsis · urinary frequency increased

- ▶ **Rare or very rare** Pure red cell aplasia
- ▶ **Frequency not known** Hepatitis B reactivation
- SIDE-EFFECTS, FURTHER INFORMATION** Reduce dose or discontinue if severe side-effects occur—consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Consult product literature.
- **MONITORING REQUIREMENTS**
- ▶ For *Votubia*<sup>®</sup> preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
- ▶ For *Certican*<sup>®</sup>: manufacturer advises pre-dose ('trough') whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using **chromatographic** assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
- ▶ Manufacturer advises monitor blood-glucose concentration, complete blood count, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor renal function before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor for signs and symptoms of infection before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION**
- VOTUBIA<sup>®</sup> DISPERSIBLE TABLETS** Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.
- VOTUBIA<sup>®</sup> TABLETS** Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.
- **PRESCRIBING AND DISPENSING INFORMATION** *Votubia*<sup>®</sup> is available as both *tablets* and *dispersible tablets*. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.
- **PATIENT AND CARER ADVICE**
- Pneumonitis** Non-infectious pneumonitis reported. Manufacturer advises patients and their carers should be informed to seek urgent medical advice if new or worsening respiratory symptoms occur.
- Infections** Manufacturer advises patients and their carers should be informed of the risk of infection.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
- ▶ **Everolimus with exemestane for treating advanced breast cancer after endocrine therapy (December 2016)** NICE TA421  
Everolimus, in combination with exemestane, is recommended within its marketing authorisation for treating advanced human epidermal growth factor receptor 2 (HER2)-negative, hormone-receptor-positive breast cancer in postmenopausal women without symptomatic visceral disease that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. Everolimus is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA421](http://www.nice.org.uk/TA421)
- ▶ **Everolimus for advanced renal cell carcinoma after previous treatment (February 2017)** NICE TA432  
Everolimus is recommended within its marketing authorisation as an option for treating advanced renal cell carcinoma that has progressed during or after treatment with vascular endothelial growth factor targeted therapy. Everolimus is only recommended if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA432](http://www.nice.org.uk/TA432)
- ▶ **Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017)** NICE TA449  
Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease.  
Everolimus is recommended, within its marketing authorisation, as an option for treating well-differentiated (grade 1 or grade 2) non-functional unresectable or metastatic NETs of gastrointestinal or lung origin in adults with progressive disease.  
Everolimus is recommended only when the company provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA449](http://www.nice.org.uk/TA449)
- VOTUBIA<sup>®</sup> DISPERSIBLE TABLETS**
- Scottish Medicines Consortium (SMC) decisions**  
SMC No. 1331/18  
The *Scottish Medicines Consortium* has advised (June 2018) that everolimus (*Votubia*<sup>®</sup> dispersible tablets) are accepted for use within NHS Scotland for the adjunctive treatment of patients aged two years and older whose refractory partial-onset seizures, with or without secondary generalisation, are associated with tuberous sclerosis complex. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.
- AFINITOR<sup>®</sup>**
- NICE decisions**
- ▶ **Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018)** NICE TA498  
Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:
  - their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, **and**
  - the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta498](http://www.nice.org.uk/guidance/ta498)
- CERTICAN<sup>®</sup>**
- NICE decisions**
- ▶ **Everolimus for preventing organ rejection in liver transplantation (July 2015)** NICE TA348  
Everolimus (*Certican*<sup>®</sup>) is **not** recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/TA348](http://www.nice.org.uk/guidance/TA348)

- ▶ **Immunosuppressive therapy for kidney transplant in adults (October 2017) NICE TA481**  
Everolimus is not recommended as an initial treatment to prevent organ rejection in adults having a kidney transplant. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/TA481](http://www.nice.org.uk/guidance/TA481)

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis—monitor for adverse events (risk of increased drug plasma concentrations).
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.
- **MONITORING REQUIREMENTS**
- ▶ Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
- ▶ Monitor liver function—consider discontinuing if severe changes in liver function occur.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
- ▶ **Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192**  
Gefitinib (*Iressa*®) is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation **and** the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.  
[www.nice.org.uk/guidance/ta192](http://www.nice.org.uk/guidance/ta192)

- ▶ **Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374**

Gefitinib (*Iressa*®) is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta374](http://www.nice.org.uk/guidance/ta374)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 615/10

The *Scottish Medicines Consortium* has advised (December 2015) that gefitinib (*Iressa*®) is accepted for restricted use within NHS Scotland for the treatment of adults with previously untreated locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor tyrosine kinase. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**Gefitinib**

14-Feb-2019

- **DRUG ACTION** Gefitinib is a tyrosine kinase inhibitor.

● **INDICATIONS AND DOSE**

**Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor**

- ▶ BY MOUTH
- ▶ Adult: 250 mg once daily

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- ▶ **Iressa** (AstraZeneca UK Ltd)  
Gefitinib 250 mg Iressa 250mg tablets | 30 tablet **PoM** £2,167.71

## Ibrutinib

30-Apr-2019

- **DRUG ACTION** Ibrutinib is a tyrosine kinase inhibitor.

### INDICATIONS AND DOSE

#### Treatment of relapsed or refractory mantle cell lymphoma

- ▶ **BY MOUTH**
- ▶ Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

#### Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy | Treatment of Waldenström's macroglobulinaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients who are unsuitable for chemo-immunotherapy

- ▶ **BY MOUTH**
- ▶ Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4, amiodarone or ciprofloxacin is unavoidable, reduce dose to 280 mg once daily.
- ▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE: IBRUTINIB (IMBRUVICA®): REPORTS OF VENTRICULAR TACHYARRHYTHMIA; RISK OF HEPATITIS B REACTIVATION AND OF OPPORTUNISTIC INFECTIONS (AUGUST 2017)**

Cases of ventricular tachyarrhythmia have been reported with the use of ibrutinib. The MHRA advises that ibrutinib should be temporarily discontinued in patients who develop symptoms suggestive of ventricular arrhythmia and to assess benefit-risk before restarting therapy.

Hepatitis B virus status should be established before initiating therapy—for patients with positive hepatitis B serology, consultation with a liver disease expert is recommended before the start of treatment; monitor and manage patients according to local protocols to minimise the risk of hepatitis B virus reactivation. Prophylaxis should be considered for those at an increased risk of opportunistic infections.

- **CAUTIONS** Family history of congenital short QT syndrome · increased lymphocytes—increased risk of leukostasis, consider withholding treatment temporarily and monitor closely · patients at risk from further shortening of QTc interval · personal history of congenital short QT syndrome · risk of haemorrhagic events—withdraw ibrutinib treatment for at least 3 to 7 days before and after surgery depending on risk of bleeding
- **INTERACTIONS** → Appendix 1: ibrutinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmias · arthralgia · broken nails · CNS haemorrhage · constipation · diarrhoea · dizziness · fever · haemorrhage · headache · hypertension ·

hyperuricaemia · increased leucocytes · increased risk of infection · interstitial lung disease · muscle spasms · musculoskeletal pain · nausea · neoplasms · neutropenia · peripheral oedema · sepsis · skin reactions · stomatitis · thrombocytopenia · tumour lysis syndrome · vision blurred · vomiting

- ▶ **Uncommon** Angioedema · hepatitis B reactivation · leukostasis syndrome · panniculitis
- ▶ **Frequency not known** Anaemia · hepatic failure · progressive multifocal leukoencephalopathy (PML) · Stevens-Johnson syndrome
- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (risk of increased exposure)—monitor for toxicity.  
**Dose adjustments** Manufacturer advises dose reduction to 280 mg daily in mild impairment and to 140 mg daily in moderate impairment with further adjustments if necessary—consult product literature.
- **RENAL IMPAIRMENT** Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity.  
**Monitoring** Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count once a month.
  - ▶ Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE decisions**
  - ▶ Ibrutinib for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017) NICE TA429 Ibrutinib (*Imbruvica*®) alone is recommended within its marketing authorisation as an option for treating chronic lymphocytic leukaemia in adults who have had at least one prior therapy or who have a 17p deletion or TP53 mutation, and in whom chemo-immunotherapy is unsuitable, and only when the manufacturer provides ibrutinib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta429](http://www.nice.org.uk/guidance/ta429)
  - ▶ Ibrutinib for treating Waldenström's macroglobulinaemia (November 2017) NICE TA491 Ibrutinib (*Imbruvica*®) is recommended for use in the Cancer Drugs Fund as an option for treating Waldenström's macroglobulinaemia in adults who have had at least one prior therapy, only if the conditions in the managed access agreement for ibrutinib are followed.  
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta491](http://www.nice.org.uk/guidance/ta491)

- ▶ **Ibrutinib for treating relapsed or refractory mantle cell lymphoma (January 2018) NICE TA502**  
Ibrutinib (*Imbruvica*<sup>®</sup>) is recommended as an option for treating relapsed or refractory mantle cell lymphoma in adults, only if:

- they have had only one previous line of therapy, **and**
- the manufacturer provides ibrutinib with the discount agreed in the commercial access agreement with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta502](http://www.nice.org.uk/guidance/ta502)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1151/16

The *Scottish Medicines Consortium* has advised (April 2017) that ibrutinib (*Imbruvica*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of relapsed or refractory chronic lymphocytic leukaemia in adults who have received at least one prior therapy and for whom fludarabine-based regimens are inappropriate. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ *Imbruvica* (Janssen-Cilag Ltd) ▼

Ibrutinib 140 mg | *Imbruvica* 140mg capsules | 90 capsule [PoM]  
£4,599.00 | 120 capsule [PoM] £6,132.00

## Idelalisib

27-Mar-2019

- **DRUG ACTION** Idelalisib is a protein kinase inhibitor.

#### INDICATIONS AND DOSE

**Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab) |**

**Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)**

#### ▶ BY MOUTH

- ▶ Adult: 150 mg twice daily, for dose adjustment due to side effects, consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE: IDELALISIB (ZYDELIG<sup>®</sup>): UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)**

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of *Pneumocystis jirovecii* pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

- **CAUTIONS** Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withhold treatment (consult product literature)
- **INTERACTIONS** → Appendix 1: idelalisib

#### SIDE-EFFECTS

- ▶ **Common or very common** Colitis · diarrhoea · fever · infection · neutropenia · pneumonitis · rash
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (in addition to barrier method) required during and for one month after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure-limited information available in severe impairment)—monitor for adverse reactions.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor liver function—consult product literature.
  - ▶ Manufacturer advises monitor for signs and symptoms of infection, including *cytomegalovirus* infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm<sup>3</sup> should be monitored weekly.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Idelalisib for treating chronic lymphocytic leukaemia (October 2015) NICE TA359**

Idelalisib (*Zydelig*<sup>®</sup>), in combination with rituximab, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia with a 17p deletion or TP53 mutation, **or**
- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months, **and**

- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta359](http://www.nice.org.uk/guidance/ta359)

##### Scottish Medicines Consortium (SMC) decisions

SMC No. 1026/15

The *Scottish Medicines Consortium* has advised (March 2015) that idelalisib (*Zydelig*<sup>®</sup>) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemotherapy, only whilst idelalisib is available at the price agreed in the patient access scheme.

SMC No. 1039/15

The *Scottish Medicines Consortium* has advised (May 2015) that idelalisib (*Zydelig*<sup>®</sup>) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of patients with follicular lymphoma that is refractory to two prior lines of treatment. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

##### All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 2597

The *All Wales Medicines Strategy Group* has advised (April 2017) that idelalisib (*Zydelig*<sup>®</sup>) is recommended as an option for use within NHS Wales as monotherapy for the treatment of patients with follicular lymphoma, that is refractory to two prior lines of treatment. The

recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

## Imatinib

21-Jul-2016

- **DRUG ACTION** Imatinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

#### Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

► BY MOUTH

► Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

#### Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

► BY MOUTH

► Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

#### Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy) | Monotherapy for relapsed or refractory acute lymphoblastic leukaemia

► BY MOUTH

► Adult: 600 mg once daily

#### Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

► BY MOUTH

► Adult: 400 mg once daily

#### Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery

► BY MOUTH

► Adult: 800 mg daily in 2 divided doses

#### Treatment of advanced hyper eosinophilic syndrome and chronic eosinophilic leukaemia

► BY MOUTH

► Adult: 100–400 mg once daily

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure

#### CAUTIONS, FURTHER INFORMATION

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely

monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: imatinib

#### ● SIDE-EFFECTS

- **Common or very common** Alopecia · anaemia · appetite abnormal · asthenia · bone marrow disorders · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · excessive tearing · eye inflammation · fever · fluid imbalance · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · insomnia · joint disorders · muscle complaints · nausea · neutropenia · oedema · pain · photosensitivity reaction · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vision blurred · vomiting · weight changes
- **Uncommon** Anxiety · arrhythmias · ascites · breast abnormalities · broken nails · burping · chest pain · CNS haemorrhage · congestive heart failure · depression · drowsiness · dysphagia · electrolyte imbalance · eosinophilia · eye discomfort · gout · gynaecomastia · hearing loss · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · hyperuricaemia · hypotension · increased risk of infection · laryngeal pain · lymphadenopathy · lymphopenia · malaise · memory loss · menstrual cycle irregularities · nerve disorders · oral disorders · palpitations · pancreatitis · peripheral coldness · pulmonary oedema · Raynaud's phenomenon · renal impairment · renal pain · respiratory disorders · restless legs · scrotal oedema · sepsis · sexual dysfunction · syncope · thrombocytosis · tinnitus · tremor · urinary frequency increased · vertigo
- **Rare or very rare** Angina pectoris · angioedema · arthritis · cardiac arrest · cataract · confusion · glaucoma · haemolytic anaemia · haemorrhagic ovarian cyst · hepatic failure (including fatal cases) · hypersensitivity vasculitis · inflammatory bowel disease · intracranial pressure increased · muscle weakness · myocardial infarction · myopathy · nail discolouration · pericardial disorders · pulmonary hypertension · seizure · severe cutaneous adverse reactions (SCARs) · tumour lysis syndrome
- **Frequency not known** Embolism and thrombosis · hepatitis B reactivation · neoplasm complications · osteonecrosis · pericarditis
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**  
**Dose adjustments** Max. 400 mg daily; reduce dose further if not tolerated.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.
- **MONITORING REQUIREMENTS**
  - Monitor for gastrointestinal haemorrhage.
  - Monitor complete blood counts regularly.
  - Monitor for fluid retention.
  - Monitor liver function.
  - Monitor growth in children (may cause growth retardation).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water or apple juice.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ **Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014)** NICE TA326  
Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for KIT (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years.

Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/TA326](http://www.nice.org.uk/TA326)

- ▶ **Imatinib for chronic myeloid leukaemia (updated January 2016)** NICE TA70

Imatinib is recommended as an option for patients with Philadelphia-chromosome-positive chronic myeloid leukaemia who initially present in the accelerated phase or with blast crisis. Imatinib is also recommended as an option for patients who present in the chronic phase and then progress to the accelerated phase or blast crisis if they have not received imatinib previously.

[www.nice.org.uk/TA70](http://www.nice.org.uk/TA70)

- ▶ **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)** NICE TA86  
Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at [www.nice.org.uk/TA86](http://www.nice.org.uk/TA86)] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

[www.nice.org.uk/TA86](http://www.nice.org.uk/TA86)

- ▶ **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)** NICE TA209

Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

[www.nice.org.uk/TA209](http://www.nice.org.uk/TA209)

- ▶ **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426  
Imatinib is recommended as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults.

[www.nice.org.uk/TA426](http://www.nice.org.uk/TA426)

- ▶ **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425  
High-dose imatinib (600 mg in the chronic phase or 800 mg in the accelerated and blast-crisis phases) is **not** recommended for treating Philadelphia-chromosome-positive CML in adults whose disease is imatinib-resistant.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA425](http://www.nice.org.uk/TA425)

### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (March 2002) that imatinib (*Glivec*<sup>®</sup>) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

The *Scottish Medicines Consortium* has also advised (February 2012) that imatinib (*Glivec*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

#### ▶ Imatinib (Non-proprietary)

**Imatinib (as Imatinib mesilate) 100 mg** Imatinib 100mg tablets | 30 tablet [PoM](#) | £486.66 | 60 tablet [PoM](#) | £973.32 DT = £603.10

**Imatinib (as Imatinib mesilate) 400 mg** Imatinib 400mg tablets | 30 tablet [PoM](#) | £1,946.67 DT = £1,157.46 | 60 tablet [PoM](#) | £3,893.34

#### ▶ *Glivec* (Novartis Pharmaceuticals UK Ltd) ▼

## Lapatinib

01-Aug-2018

- **DRUG ACTION** Lapatinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)**

▶ BY MOUTH

▶ Adult: 1 g once daily

**Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)**

▶ BY MOUTH

▶ Adult: 1.25 g once daily

**Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)**

▶ BY MOUTH

▶ Adult: 1.5 g once daily

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Diarrhoea—withhold treatment if severe (consult product literature) · low gastric pH (reduced absorption) · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: lapatinib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · constipation · cough · dehydration · diarrhoea (treat promptly) · dyspnoea · epistaxis · gastrointestinal discomfort · headache · hepatotoxicity (discontinue permanently if severe) · hot flush · hyperbilirubinaemia · insomnia · mucositis · nail disorder · nausea · pain · paronychia · skin reactions · stomatitis · vomiting

- ▶ **Uncommon** Respiratory disorders
- ▶ **Frequency not known** Severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—increased exposure (limited information available).
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor left ventricular function.
  - ▶ Monitor for pulmonary toxicity.
  - ▶ Monitor liver function before treatment and at monthly intervals.
- **DIRECTIONS FOR ADMINISTRATION** Always take at the same time in relation to food: either one hour before or one hour after food.
- **PATIENT AND CARER ADVICE** Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA257](http://www.nice.org.uk/TA257)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Tyverb** (Novartis Pharmaceuticals UK Ltd)  
Lapatinib (as Lapatinib ditosylate monohydrate) 250 mg Tyverb 250mg tablets | 84 tablet **[PoM]** £965.16 | 105 tablet **[PoM]** £1,206.45

## Lenvatinib

26-Feb-2019

- **DRUG ACTION** Lenvatinib is a multireceptor tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

##### KISPLYX<sup>®</sup>

**Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to side-effects—consult product literature

#### LENVIMA<sup>®</sup>

##### Differentiated thyroid carcinoma (specialist use only)

- ▶ **BY MOUTH**
- ▶ **Adult:** 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

##### Hepatocellular carcinoma (specialist use only)

- ▶ **BY MOUTH**
- ▶ **Adult (body-weight up to 60 kg):** 8 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature
- ▶ **Adult (body-weight 60 kg and above):** 12 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** Fistulae
- **CAUTIONS** Arterial thromboembolism within the previous 6 months · elderly (75 years and over)—reduced tolerability · hypertension—blood pressure should be well-controlled prior to treatment · impaired wound healing—consider temporary interruption of treatment for major surgical procedures
- **INTERACTIONS** → Appendix 1: lenvatinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · cerebrovascular insufficiency · cholecystitis · constipation · dehydration · diarrhoea · dizziness · dry mouth · dysphonia · electrolyte imbalance · embolism and thrombosis · gastrointestinal discomfort · gastrointestinal disorders · headache · heart failure · hepatic disorders · hypercholesterolaemia · hypertension · hypoalbuminaemia · hypotension · hypothyroidism · increased risk of infection · insomnia · lymphopenia · malaise · metrorrhagia · mucositis · myalgia · myocardial infarction · nausea · oral disorders · oropharyngeal pain · pain · peripheral oedema · proteinuria · QT interval prolongation · renal impairment · renal tubular necrosis · skin reactions · taste altered · thrombocytopenia · vomiting · weight decreased
  - ▶ **Uncommon** Pancreatitis · paresis · posterior reversible encephalopathy syndrome (PRES) · splenic infarction
  - ▶ **Frequency not known** Fistula

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises gastrointestinal toxicity should be actively managed — dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective contraception during treatment and for 1 month after the last dose, an additional barrier method of contraception should be used in women using oral hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**

**KISPLYX<sup>®</sup>** Manufacturer advises caution in severe impairment (risk of increased exposure).

**Dose adjustments** Manufacturer advises dose reduction to 10 mg once daily in severe impairment.

**LENVIMA**® Manufacturer advises caution.

- ▶ When used for Hepatocellular carcinoma Manufacturer advises avoid in severe impairment (no information available).

**Dose adjustments** ▶ When used for Differentiated thyroid carcinoma Manufacturer advises dose reduction to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

#### ● RENAL IMPAIRMENT

**KISPLIX**® Manufacturer advises avoid in end-stage renal disease.

**Dose adjustments** Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature.

**LENVIMA**®

- ▶ When used for Differentiated thyroid carcinoma Manufacturer advises caution in severe impairment; avoid in end-stage renal disease.
  - ▶ When used for Hepatocellular carcinoma The available data do not allow for a dosing recommendation in severe impairment—consult product literature.
- Dose adjustments**
- ▶ When used for Differentiated thyroid carcinoma Manufacturer advises dose reduction to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor blood pressure after 1 week of treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary—consult product literature).
- ▶ Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.
- ▶ Manufacturer advises monitor ECG and electrolytes before and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should be swallowed whole. Alternatively, capsules may be added to a tablespoon of water or apple juice in a small glass (without breaking or crushing), allowed to sit for at least 10 minutes, then stirred for at least 3 minutes to dissolve the capsule shells before swallowing; the same amount of liquid should then be added to the glass, swirled a few times, then swallowed.

#### ● PATIENT AND CARER ADVICE

**Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Lenvatinib and sorafenib for treating differentiated thyroid cancer after radioactive iodine (August 2018)** NICE TA535 Lenvatinib (*Lenvima*®) is recommended as an option for treating progressive, locally advanced or metastatic differentiated thyroid cancer (papillary, follicular or Hürthle cell) in adults whose disease does not respond to radioactive iodine, only if:
  - they have not had a tyrosine kinase inhibitor before, or
  - they have had to stop taking a tyrosine kinase inhibitor within 3 months of starting it because of toxicity

(specifically, toxicity that cannot be managed by dose delay or dose modification), and

- the manufacturer provides lenvatinib according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta535](http://www.nice.org.uk/guidance/ta535)

- ▶ **Lenvatinib for untreated advanced hepatocellular carcinoma (December 2018)** NICE TA551

Lenvatinib (*Lenvima*®) is recommended as an option for untreated, advanced, unresectable hepatocellular carcinoma in adults, only if:

- they have Child–Pugh grade A liver impairment and an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1, and
- the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta551](http://www.nice.org.uk/guidance/ta551)

##### Scottish Medicines Consortium (SMC) decisions

SMC No. SM2138

The *Scottish Medicines Consortium* has advised (April 2019) that lenvatinib (*Lenvima*®) is accepted for use within NHS Scotland as monotherapy for the treatment of adults with advanced or unresectable hepatocellular carcinoma who have received no prior systemic therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

**KISPLIX**®

##### NICE decisions

- ▶ **Lenvatinib with everolimus for previously treated advanced renal cell carcinoma (January 2018)** NICE TA498

Lenvatinib plus everolimus is recommended as an option for treating advanced renal cell carcinoma in adults who have had one previous vascular endothelial growth factor (VEGF)-targeted therapy, only if:

- their Eastern Cooperative Oncology Group (ECOG) performance status score is 0 or 1, and
- the manufacturer provides lenvatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta498](http://www.nice.org.uk/guidance/ta498)

**LENVIMA**®

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (October 2016) that lenvatinib (*Lenvima*®) is accepted for use within NHS Scotland for treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

##### All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2017) that lenvatinib (*Lenvima*®) is recommended as an option for restricted use within NHS Wales for the treatment of adults with progressive, locally advanced or metastatic, differentiated

(papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This recommendation applies only in circumstances where the approved Wales Patient Access Scheme (WPAS) is utilised or where the list/contract price is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Midostaurin

06-Jul-2018

- **DRUG ACTION** Midostaurin is an inhibitor of multiple tyrosine kinases.

#### ● INDICATIONS AND DOSE

##### Acute myeloid leukaemia (specialist use only)

###### ▶ BY MOUTH

- ▶ **Adult:** 50 mg twice daily, on days 8–21 of induction and consolidation chemotherapy cycles; for administration following consolidation chemotherapy, and dose adjustment or treatment interruption due to side-effects—consult product literature

##### Aggressive systemic mastocytosis (specialist use only) | Systemic mastocytosis with associated haematological neoplasm (specialist use only) | Mast cell leukaemia (specialist use only)

###### ▶ BY MOUTH

- ▶ **Adult:** 100 mg twice daily, for dose adjustment or treatment interruption due to side-effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **CAUTIONS** Active severe infection (control before initiation of monotherapy) · elderly (limited experience) · patients at risk of congestive heart failure · risk factors for QT-interval prolongation
- **INTERACTIONS** → Appendix 1: midostaurin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Concentration impaired · constipation · cough · diarrhoea · dizziness · dyspepsia · dyspnoea · fatigue · febrile neutropenia · fever · haemorrhage · headache · hypotension · infection · nausea · oropharyngeal pain · peripheral oedema · respiratory disorders · tremor · vertigo · vomiting · weight increased
  - ▶ **Frequency not known** Congestive heart failure · QT interval prolongation
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test in women of childbearing potential within 7 days prior to treatment initiation; effective contraception must be used during treatment and for at least 4 months after stopping treatment—additional barrier method recommended in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 4 months after stopping treatment—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment and monitor for toxicity—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and monitor for toxicity—limited information available.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor white blood cell count regularly, especially at treatment initiation; also monitor for signs and symptoms of infection.
  - ▶ Manufacturer advises assess left ventricular ejection fraction in patients at risk of congestive heart failure at baseline and during treatment as clinically indicated; consider performing ECGs if concomitant use with drugs that can prolong QT-interval.
  - ▶ Manufacturer advises monitor for pulmonary symptoms indicative of interstitial lung disease or pneumonitis.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE decisions

- ▶ **Midostaurin for untreated acute myeloid leukaemia (June 2018)** NICE TA523

Midostaurin is recommended, within its marketing authorisation, as an option in adults for treating newly diagnosed acute FLT3-mutation-positive myeloid leukaemia with standard daunorubicin and cytarabine as induction therapy, with high-dose cytarabine as consolidation therapy, and alone after complete response as maintenance therapy. It is recommended only if the manufacturer provides midostaurin with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta523](http://www.nice.org.uk/guidance/ta523)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1330/18

The *Scottish Medicines Consortium* has advised (June 2018) that midostaurin (*Rydapt*®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed acute myeloid leukaemia who are FMS-like tyrosine kinase 3 (FLT3) mutation-positive, when used in combination with standard daunorubicin and cytarabine induction and high-dose cytarabine consolidation chemotherapy, and for patients in complete response followed by midostaurin single agent maintenance therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

## Nilotinib

21-Feb-2019

- **DRUG ACTION** Nilotinib is a tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

##### Newly diagnosed chronic phase Philadelphia chromosome-positive chronic myeloid leukaemia (initiated by a specialist)

###### ▶ BY MOUTH

- ▶ **Adult:** 300 mg twice daily, for dose adjustments due to side-effects—consult product literature continued →

**Chronic and accelerated phase Philadelphia chromosome-positive chronic myeloid leukaemia resistant or intolerant to previous therapy, including imatinib (initiated by a specialist)**

► BY MOUTH

- Adult: 400 mg twice daily, for dose adjustments due to side-effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Clinically significant bradycardia · congestive heart failure · hepatitis B infection · history of pancreatitis · recent myocardial infarction · susceptibility to QT-interval prolongation (including electrolyte disturbances) · unstable angina
- **CAUTIONS, FURTHER INFORMATION**
  - **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- **INTERACTIONS** → Appendix 1: nilotinib
- **SIDE-EFFECTS**
  - **Common or very common** Alopecia · anaemia · angina pectoris · anxiety · appetite abnormal · arrhythmias · arthralgia · asthenia · bone marrow disorders · cardiac conduction disorders · chest discomfort · constipation · cough · decreased leucocytes · depression · diabetes mellitus · diarrhoea · dizziness · dry eye · dyslipidaemia · dyspnoea · electrolyte imbalance · eosinophilia · eye discomfort · eye disorders · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypertension · increased risk of infection · insomnia · muscle complaints · muscle weakness · myocardial infarction · nausea · neoplasms · neutropenia · oedema · pain · palpitations · peripheral neuropathy · QT interval prolongation · respiratory disorders · sensation abnormal · skin reactions · sweat changes · taste altered · thrombocytopenia · vertigo · vomiting · weight changes
  - **Uncommon** Atherosclerosis · cerebrovascular insufficiency · chills · cyanosis · erectile dysfunction · dry mouth · facial swelling · gynaecomastia · hepatitis B reactivation · hyperparathyroidism · hyperuricaemia · hypoglycaemia · lethargy · memory loss · menorrhagia · oesophageal pain · oropharyngeal pain · pericardial effusion · pericarditis · restless legs · sebaceous hyperplasia · syncope · tremor · urinary disorders · urine discolouration
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises highly effective contraception in women of childbearing potential during treatment and for up to two weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also

*Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor lipid profiles before initiating treatment, at 3 and 6 months, and then yearly thereafter; monitor blood glucose before initiating treatment and then periodically during treatment, as clinically indicated.
  - Manufacturer advises monitor full blood count every 2 weeks for the first 2 months of treatment, then monthly thereafter, or as clinically indicated.
  - Manufacturer advises perform baseline ECG before treatment and as clinically indicated thereafter; correct any electrolyte disturbances before treatment and monitor periodically during treatment.
  - Manufacturer advises monitor and actively manage cardiovascular risk factors during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should either be swallowed whole or the contents of each capsule may be dispersed in one teaspoon of apple sauce and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** All prescribers should be familiar with the *Summary of Key Safety Recommendations for Tasigna® (nilotinib)* provided by the manufacturer.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should seek immediate medical attention if signs or symptoms of cardiovascular events occur.
 

All patients should be provided with the *Important Information About How to Take Your Medication* leaflet provided by the manufacturer.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426 Nilotinib (*Tasigna®*) is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta426](http://www.nice.org.uk/guidance/ta426)
  - **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425 Nilotinib (*Tasigna®*) is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant, **and** the manufacturer provides nilotinib with the discount agreed in the patient access scheme. [www.nice.org.uk/guidance/ta425](http://www.nice.org.uk/guidance/ta425)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Nintedanib

27-Apr-2019

- **DRUG ACTION** Nintedanib is a tyrosine protein kinase inhibitor.

### ● INDICATIONS AND DOSE

#### OFEV<sup>®</sup>

##### Treatment of idiopathic pulmonary fibrosis

- ▶ BY MOUTH
- Adult: 200 mg twice daily, reduced if not tolerated to 100 mg twice daily, for dose adjustments due to side-effects, consult product literature

#### VARGATEF<sup>®</sup>

##### Treatment of locally advanced, metastatic or locally recurrent non-small cell lung cancer of adenocarcinoma histology after first-line chemotherapy (in combination with docetaxel) (initiated under specialist supervision)

- ▶ BY MOUTH
- Adult: 200 mg twice daily on days 2–21 of a standard 21 day docetaxel cycle, for treatment following discontinuation of docetaxel and for dose adjustments due to side-effects, consult product literature

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **CAUTIONS** History or risk factors for QT prolongation · impaired wound healing · increased risk of bleeding · patients at high risk of cardiovascular disease · previous abdominal surgery · recent history of hollow organ perforation · theoretical increased risk of gastrointestinal perforation · theoretical increased risk of venous thromboembolism
- **INTERACTIONS** → Appendix 1: nintedanib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abscess · appetite decreased · dehydration · diarrhoea · electrolyte imbalance · haemorrhage · hyperbilirubinaemia · hypertension · mucositis · nausea · neutropenia · peripheral neuropathy · sepsis · skin reactions · stomatitis · thrombocytopenia · venous thromboembolism · vomiting · weight decreased
  - ▶ **Uncommon** Drug-induced liver injury · gastrointestinal perforation · myocardial infarction · pancreatitis · renal impairment
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with peanut or soya hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment (risk of increased exposure); avoid in moderate to severe impairment (limited information available).
- **OFEV<sup>®</sup> Dose adjustments** Manufacturer advises dose reduction to 100 mg twice daily in mild impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ For *Vargatef<sup>®</sup>*, manufacturer advises monitor full blood count before each treatment cycle and regularly thereafter; monitor hepatic function before each

treatment cycle during combination therapy and monthly during monotherapy; monitor renal function during treatment; monitor for thromboembolic events; monitor prothrombin time, INR and for bleeding if used concomitantly with anticoagulants; monitor for cerebral bleeding in patients with stable brain metastases.

- ▶ For *Ofev<sup>®</sup>* manufacturer advises monitor hepatic function before treatment initiation and during the first month of treatment, then at regular intervals during the subsequent 2 months and as clinically indicated thereafter; monitor renal function during treatment; monitor blood pressure as clinically indicated.

### ● PRESCRIBING AND DISPENSING INFORMATION

**VARGATEF<sup>®</sup>** Not to be taken on the same day as docetaxel therapy.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small-cell lung cancer (July 2015)** NICE TA347  
Nintedanib (*Vargatef<sup>®</sup>*), in combination with docetaxel is recommended as an option for the treatment of patients with locally advanced, metastatic, or locally recurrent non-small-cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta347](http://www.nice.org.uk/guidance/ta347)

- ▶ **Nintedanib for treating idiopathic pulmonary fibrosis (January 2016)** NICE TA379

Nintedanib (*Ofev<sup>®</sup>*) is recommended as an option for treating idiopathic pulmonary fibrosis, only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
- the manufacturer provides nintedanib with the discount agreed in the patient access scheme, **and**,
- treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta379](http://www.nice.org.uk/guidance/ta379)

### Scottish Medicines Consortium (SMC) decisions

SMC No. 1076/15

The *Scottish Medicines Consortium* has advised (October 2015) that nintedanib (*Ofev<sup>®</sup>*) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Osimertinib

21-Apr-2017

● **DRUG ACTION** Osimertinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Locally advanced or metastatic epidermal growth factor receptor T790M mutation-positive non-small-cell lung cancer (specialist use only)**

► BY MOUTH

► Adult: 80 mg once daily, for dose adjustment due to side-effects—consult product literature

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

● **CONTRA-INDICATIONS** Congenital long QT syndrome

● **CAUTIONS** Elderly (more frequent dose adjustments may be required) · history of interstitial lung disease · radiation pneumonitis requiring steroid treatment · risk factors for QTc interval prolongation

● **INTERACTIONS** → Appendix 1: osimertinib

### ● SIDE-EFFECTS

► **Common or very common** Diarrhoea · eyelid pruritus · increased risk of infection · nail discolouration · nail disorders · respiratory disorders · skin reactions · stomatitis  
 ► **Uncommon** Eye disorders · eye inflammation · QT interval prolongation

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of effective, non-hormonal, contraception during and for 2 months after treatment in women, and 4 months after treatment in men.

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

● **BREAST FEEDING** Manufacturer advises avoid—may be present in milk based on *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe and end-stage impairment—limited information available.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer's instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.

### ● PATIENT AND CARER ADVICE

**Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

► Osimertinib for treating locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer (October 2016) NICE TA416

Osimertinib is recommended as an option, for use within the Cancer Drugs Fund, for treating locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer in adults whose disease has progressed only:

- after first-line treatment with an EGFR tyrosine kinase inhibitor, and
- if the conditions in the managed access agreement for osimertinib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA416](http://www.nice.org.uk/TA416)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (February 2017) that osimertinib (*Tagrisso*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer, only in patients who have received previous treatment with an EGFR tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

► **Tagrisso** (AstraZeneca UK Ltd) ▼

**Osimertinib (as Osimertinib mesylate) 40 mg** Tagrisso 40mg tablets | 30 tablet [PoM] £5,770.00

**Osimertinib (as Osimertinib mesylate) 80 mg** Tagrisso 80mg tablets | 30 tablet [PoM] £5,770.00

## Palbociclib

25-Jan-2019

● **DRUG ACTION** Palbociclib is a highly selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

### ● INDICATIONS AND DOSE

**Locally advanced or metastatic breast cancer (initiated by a specialist)**

► BY MOUTH

► Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises if concomitant use with potent CYP3A4 inhibitors is unavoidable, reduce palbociclib dose to 75 mg once daily. If the CYP3A4 inhibitor is stopped, increase the palbociclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

● **INTERACTIONS** → Appendix 1: palbociclib

### ● SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry eye · epistaxis · excessive tearing · fever · infection · leucopenia · mucositis

· nausea · neutropenia · oral disorders · oropharyngeal complaints · skin reactions · taste altered · thrombocytopenia · vision blurred · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects are reported when used in combination with letrozole or fulvestrant.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. Male patients should use effective contraception during treatment and for at least 14 weeks after completing treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 888.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution and close monitoring for signs of toxicity in moderate-to-severe impairment.

**Dose adjustments** Manufacturer advises reduce dose to 75 mg once daily in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution and monitor closely for signs of toxicity in moderate-to-severe impairment.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count prior to starting therapy, at the start of each cycle, on day 14 of the first 2 cycles and as clinically indicated.

● **PATIENT AND CARER ADVICE**

**Missed doses** Manufacturer advises to take palbociclib at the same time each day; if a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

▶ **Palbociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)**  
NICE TA495

Palbociclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2-negative, locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Palbociclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta495](http://www.nice.org.uk/guidance/ta495)

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (December 2017) that palbociclib (*Ibrance*®) is accepted for restricted use within NHS Scotland in combination with an aromatase inhibitor for the first-line treatment of hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

## Pazopanib

27-Apr-2019

● **DRUG ACTION** Pazopanib is a tyrosine kinase inhibitor.

● **INDICATIONS AND DOSE**

**First-line treatment of advanced renal cell carcinoma | Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy**

▶ **BY MOUTH**

▶ Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

**Treatment of selective subtypes of advanced soft-tissue sarcoma**

▶ **BY MOUTH**

▶ Adult: (consult product literature)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CONTRA-INDICATIONS** Cerebral haemorrhage · clinically significant gastro-intestinal haemorrhage · haemoptysis in the past 6 months

● **CAUTIONS** Cardiac disease · increased risk of gastro-intestinal fistulas · increased risk of gastro-intestinal perforation · increased risk of haemorrhage · increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop · ischaemic stroke · myocardial infarction · risk of thrombotic events · susceptibility to QT-interval prolongation (including electrolyte disturbances) · transient ischaemic attack

**CAUTIONS, FURTHER INFORMATION**

▶ **Elective surgery** Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.

▶ **Blood pressure** Blood pressure must be controlled before initiating treatment.

● **INTERACTIONS** → Appendix 1: pazopanib

● **SIDE-EFFECTS**

▶ **Common or very common** Alopecia · appetite decreased · arthralgia · asthenia · bradycardia · cancer pain · cardiac disorder · chest pain · chills · cough · dehydration · diarrhoea · dizziness · drowsiness · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair colour changes · headache · hepatic disorders · hiccups · hyperbilirubinaemia · hyperhidrosis · hypertension · hypoalbuminaemia · hypothyroidism · increased risk of infection · insomnia · left ventricular dysfunction · leucopenia · mucosal abnormalities · muscle complaints · musculoskeletal pain · nail disorder · nausea · neutropenia · oedema · oral disorders · peripheral neuropathy · proteinuria · respiratory disorders · sensation abnormal · skin reactions · taste altered · thrombocytopenia · vasodilation · venous thromboembolism · vision blurred · vomiting · weight decreased

▶ **Uncommon** Cerebrovascular insufficiency · eye disorders · haemolytic uraemic syndrome · menstrual cycle irregularities · myocardial infarction · myocardial ischaemia · oropharyngeal pain · pancreatitis · photosensitivity reaction · polycythaemia · QT interval prolongation · rhinorrhoea · skin ulcer · thrombotic microangiopathy

- ▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)
- **CONCEPTION AND CONTRACEPTION** Effective contraception advised during treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises dose reduction to 200 mg daily in moderate impairment.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 30 mL/minute—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.
  - ▶ Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).
  - ▶ Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
  - ▶ Monitor for proteinuria.
  - ▶ Monitor thyroid function.
  - ▶ Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013) NICE TA215** Pazopanib (*Votrient*®) is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
  - who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1, **and**
  - if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

People who are currently being treated with pazopanib for advanced metastatic renal cell carcinoma but who do not meet this criteria should have the option to continue their therapy until they and their clinicians consider it appropriate to stop.

[www.nice.org.uk/guidance/ta215](http://www.nice.org.uk/guidance/ta215)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 676/11

The *Scottish Medicines Consortium* has advised (March 2011) that pazopanib (*Votrient*®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland.

SMC No. 820/12

The *Scottish Medicines Consortium* has advised (December 2012) that pazopanib (*Votrient*®) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy

for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 23, 25

- ▶ **Votrient** (Novartis Pharmaceuticals UK Ltd)

**Pazopanib (as Pazopanib hydrochloride) 200 mg** *Votrient* 200mg tablets | 30 tablet (POM) £560.50

**Pazopanib (as Pazopanib hydrochloride) 400 mg** *Votrient* 400mg tablets | 30 tablet (POM) £1,121.00

**Ponatinib**

19-Jul-2017

● **INDICATIONS AND DOSE**

**Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate**

▶ **BY MOUTH**

- ▶ **Adult:** 45 mg once daily, for dose adjustments due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION (UPDATED APRIL 2017)**

The benefits and risks of ponatinib were reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that supports new advice on dose modification to reduce this risk. The MHRA advise that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
  - side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
  - time to cytogenetic response;
  - BCR-ABL transcript levels.
- The MHRA recommends close monitoring of response, if dose reduction is undertaken.

**MHRA/CHM ADVICE: RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS (MAY 2016)**

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**MHRA/CHM ADVICE: PONATINIB (ICLUSIG®): REPORTS OF POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (OCTOBER 2018)**

Post-marketing cases of posterior reversible encephalopathy syndrome (PRES) have been reported in patients receiving ponatinib.

Treatment should be interrupted if PRES is confirmed and resumed only once the event is resolved and if the benefit of continued treatment outweighs the risk.

Patients should be advised to contact their healthcare professional immediately if they develop sudden-onset severe headache, confusion, seizures, or vision changes.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Alcohol abuse—increased risk of pancreatitis · current severe hypertriglyceridaemia—increased risk of pancreatitis · discontinue treatment if a complete haematologic response has not occurred within 3 months · hepatitis B infection · history of myocardial infarction—do not use unless potential benefit outweighs potential risk · history of pancreatitis · history of stroke—do not use unless potential benefit outweighs potential risk · hypertension—medically control during treatment and interrupt treatment if uncontrolled
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Cardiovascular status Assess cardiovascular status before treatment—manage cardiovascular risk factors before and during treatment.
  - ▶ Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.
- **INTERACTIONS** → Appendix 1: ponatinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acute coronary syndrome · alopecia · anaemia · appetite decreased · arrhythmias · arthralgia · asthenia · cerebrovascular insufficiency · chills · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysphonia · dyspnoea · electrolyte imbalance · embolism and thrombosis · erectile dysfunction · eye inflammation · febrile neutropenia · fever · fluid imbalance · gastrointestinal discomfort · gastroesophageal reflux disease · haemorrhage · headaches · heart failure · hyperglycaemia · hypertension · hypertriglyceridaemia · hyperuricaemia · hypothyroidism · increased risk of infection · influenza like illness · insomnia · ischaemic heart disease · lethargy · mass · muscle complaints · nausea · oedema · pain · pancreatitis · pancytopenia · pericardial effusion · peripheral neuropathy · peripheral vascular disease · pleural effusion · pulmonary hypertension · sensation abnormal · sepsis · skin reactions · stomatitis · sweat changes · vasodilation · vision disorders · vomiting · weight decreased
  - ▶ **Uncommon** Cardiac discomfort · cardiomyopathy · ischaemic · coronary vasospasm · hepatic disorders · hepatic failure (including fatal cases) · intracranial haemorrhage · left ventricular dysfunction · posterior reversible encephalopathy syndrome (PRES) · renal artery stenosis · splenic infarction · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter—withhold treatment if lipase elevated and abdominal symptoms occur.
  - ▶ Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
  - ▶ Manufacturer advises monitor liver function periodically.
  - ▶ Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ Ponatinib for treating chronic myeloid leukaemia and acute lymphoblastic leukaemia (June 2017) NICE TA451  
Ponatinib is recommended, within its marketing authorisation, as an option for treating chronic-, accelerated- or blast-phase chronic myeloid leukaemia in adults when:
    - the disease is resistant to dasatinib or nilotinib **or**
    - they cannot tolerate dasatinib or nilotinib and for whom subsequent treatment with imatinib is not clinically appropriate **or**
    - the T3151 gene mutation is present.

Ponatinib is recommended, within its marketing authorisation, as an option for treating Philadelphia-chromosome-positive acute lymphoblastic leukaemia in adults when:

  - the disease is resistant to dasatinib **or**
  - they cannot tolerate dasatinib and for whom subsequent treatment with imatinib is not clinically appropriate **or**
  - the T3151 gene mutation is present.

Ponatinib is recommended only if the company provides the drug with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta451](http://www.nice.org.uk/guidance/ta451)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Regorafenib

21-Dec-2017

- **DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

### ● INDICATIONS AND DOSE

**Metastatic colorectal cancer (specialist use only) | Unresectable or metastatic gastrointestinal stromal tumours (specialist use only) | Hepatocellular carcinoma (specialist use only)**

#### ▶ BY MOUTH

- ▶ Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Ensure measures to prevent hand-foot skin reaction · Gilbert's syndrome—risk of hyperbilirubinaemia · history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop · hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) · may impair wound healing— withhold treatment for major surgical procedures · predisposition to bleeding

- **INTERACTIONS** → Appendix 1: regorafenib

### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · diarrhoea · dry mouth · dysphonia · electrolyte imbalance · fever · gastroesophageal reflux disease · headache · hyperbilirubinaemia · hypertension · hyperuricaemia · hypothyroidism · increased risk of infection · leucopenia · mucositis · musculoskeletal stiffness · nausea · pain · proteinuria · skin reactions · stomatitis · taste altered · thrombocytopenia · tremor · vomiting · weight decreased
- ▶ **Uncommon** Gastrointestinal fistula (discontinue) · gastrointestinal perforation (including fatal cases, discontinue) · hepatic disorders · myocardial infarction · myocardial ischaemia · nail disorder
- ▶ **Rare or very rare** Neoplasms · posterior reversible encephalopathy syndrome (PRES) · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (limited information available); avoid in severe impairment (no information available).

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

### ● MONITORING REQUIREMENTS

- ▶ Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
- ▶ Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least

monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.

- ▶ Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
- ▶ Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

- **PATIENT AND CARER ADVICE** Counselling advised (administration).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Regorafenib for previously treated unresectable or metastatic gastrointestinal stromal tumours (November 2017)**

NICE TA488

Regorafenib (*Stivarga*®) is recommended as an option for treating unresectable or metastatic gastrointestinal stromal tumours in adults whose disease has progressed on, or who are intolerant to, prior treatment with imatinib and sunitinib, only if:

- their Eastern Cooperative Oncology Group (ECOG) performance status is 0 to 1, **and**
- the manufacturer provides regorafenib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta488](http://www.nice.org.uk/guidance/ta488)

- ▶ **Regorafenib for previously treated advanced hepatocellular carcinoma (January 2019)** NICE TA555

Regorafenib (*Stivarga*®) is recommended as an option for treating advanced unresectable hepatocellular carcinoma in adults who have had sorafenib, only if:

- they have Child–Pugh grade A liver impairment and an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1, **and**
- the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta555](http://www.nice.org.uk/guidance/ta555)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1316/18

The *Scottish Medicines Consortium* has advised (May 2018) that regorafenib (*Stivarga*®) is accepted for use within NHS Scotland as monotherapy for the treatment of adults with hepatocellular carcinoma who have been previously treated with sorafenib. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## Ribociclib

29-Jan-2018

● **DRUG ACTION** Ribociclib is an inhibitor of cyclin-dependent kinases 4 and 6, which are involved in cancer cell proliferation; their inhibition results in prevention of cancer cell growth.

### ● INDICATIONS AND DOSE

#### Locally advanced or metastatic breast cancer (specialist use only)

##### ► BY MOUTH

► Adult: 600 mg once daily for 21 consecutive days of repeated 28 day cycles, to be taken at approximately the same time each day, preferably in the morning, for dose adjustments due to side-effects—consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

► Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg once daily; in those already taking 400 mg once daily, reduce dose to 200 mg once daily.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CONTRA-INDICATIONS** Pre-existing QTc prolongation · risk factors for QTc prolongation (including concomitant use of drugs known to prolong QTc interval)

● **INTERACTIONS** → Appendix 1: ribociclib

#### ● SIDE-EFFECTS

► **Common or very common** Alopecia · anaemia · appetite decreased · asthenia · back pain · constipation · decreased leucocytes · diarrhoea · dry eye · dyspnoea · electrolyte imbalance · epistaxis · excessive tearing · fever · gastrointestinal discomfort · headache · hepatotoxicity · insomnia · nausea · neutropenia · peripheral oedema · QT interval prolongation · skin reactions · stomatitis · syncope · taste altered · thrombocytopenia · urinary tract infection · vomiting · weight decreased

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to peanut or soya products.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

**Dose adjustments** Manufacturer advises initial dose reduction to 400 mg once daily in moderate to severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe renal impairment—limited information available.

#### ● MONITORING REQUIREMENTS

► Manufacturer advises to perform full blood counts and liver function tests before initiating treatment, every 2 weeks for the first 2 cycles, at the beginning of the subsequent 4 cycles, and then as clinically indicated thereafter.

► Manufacturer advises to assess ECG before initiating treatment (only initiate treatment in patients with QTcF values <450 milliseconds); ECG should be repeated at approx. day 14 of the first cycle and at the beginning of the second cycle, then as clinically indicated.

► Manufacturer advises to monitor serum electrolytes (including potassium, calcium, phosphorus and magnesium) before initiating treatment, at the beginning of the first 6 cycles and then as clinically indicated; any abnormality should be corrected before initiating treatment.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

► Ribociclib with an aromatase inhibitor for previously untreated, hormone receptor-positive, HER2-negative, locally advanced or metastatic breast cancer (December 2017)  
NICE TA496

Ribociclib, with an aromatase inhibitor, is recommended within its marketing authorisation, as an option for treating hormone receptor-positive, human epidermal growth factor receptor 2-negative, locally advanced or metastatic breast cancer as initial endocrine-based therapy in adults. Ribociclib is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta496](http://www.nice.org.uk/guidance/ta496)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1295/18

The *Scottish Medicines Consortium* has advised (March 2018) that ribociclib (*Kisqali*<sup>®</sup>) is accepted for use within NHS Scotland in combination with an aromatase inhibitor, for the treatment of postmenopausal women with hormone receptor (HR)-positive, human epidermal growth factor receptor 2 (HER2)-negative locally advanced or metastatic breast cancer as initial endocrine-based therapy. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

## Ruxolitinib

21-Feb-2019

● **DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

### ● INDICATIONS AND DOSE

**Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis**

##### ► BY MOUTH

► Adult: (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CAUTIONS** Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

#### CAUTIONS, FURTHER INFORMATION

► Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment.

● **INTERACTIONS** → Appendix 1: ruxolitinib

#### ● SIDE-EFFECTS

► **Common or very common** Anaemia · bruising · constipation · dizziness · dyslipidaemia · flatulence · haemorrhage · headache · hypertension · increased risk of infection · intracranial haemorrhage · neutropenia · sepsis · thrombocytopenia · weight increased

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises initial dose reduction—consult product literature.
- **RENAL IMPAIRMENT** **Dose adjustments** Reduce dose in severe impairment (consult product literature).
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
  - ▶ Monitor for infection during treatment.
  - ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ **Ruxolitinib for treating disease-related splenomegaly or symptoms in adults with myelofibrosis (March 2016)**  
NICE TA386  
Ruxolitinib (*Jakavi*<sup>®</sup>) is recommended as an option for treating disease-related splenomegaly or symptoms in adults with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, **and** if the manufacturer provides ruxolitinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta386](http://www.nice.org.uk/guidance/ta386)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Jakavi** (Novartis Pharmaceuticals UK Ltd)
  - Ruxolitinib (as Ruxolitinib phosphate) 5 mg** Jakavi 5mg tablets | 56 tablet [PoM] £1,428.00 DT = £1,428.00
  - Ruxolitinib (as Ruxolitinib phosphate) 10 mg** Jakavi 10mg tablets | 56 tablet [PoM] £2,856.00 DT = £2,856.00
  - Ruxolitinib (as Ruxolitinib phosphate) 15 mg** Jakavi 15mg tablets | 56 tablet [PoM] £2,856.00 DT = £2,856.00
  - Ruxolitinib (as Ruxolitinib phosphate) 20 mg** Jakavi 20mg tablets | 56 tablet [PoM] £2,856.00 DT = £2,856.00

**Sorafenib**

03-Aug-2018

- **DRUG ACTION** Sorafenib is an inhibitor of multiple kinases.
- **INDICATIONS AND DOSE**

**Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma**

  - ▶ BY MOUTH
  - ▶ Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Cardiac ischaemia · major surgical procedures · potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: sorafenib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anaemia · appetite decreased · arthralgia · asthenia · congestive heart failure · constipation · decreased leucocytes · depression · diarrhoea · dry mouth · dysphagia · dysphonia · electrolyte imbalance · erectile dysfunction · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothyroidism · increased risk of infection · influenza like illness · intracranial haemorrhage · mucositis · muscle complaints · myocardial infarction · myocardial ischaemia · nausea · neoplasms · neutropenia · oral disorders · pain · peripheral neuropathy · proteinuria · renal failure · rhinorrhoea · skin reactions · taste altered · thrombocytopenia · tinnitus · vomiting · weight decreased
  - ▶ **Uncommon** Cholangitis · cholecystitis · dehydration · encephalopathy · gynaecomastia · hepatic disorders · hyperthyroidism · pancreatitis · radiation injuries · respiratory disorders
  - ▶ **Rare or very rare** Angioedema · hypersensitivity vasculitis · nephrotic syndrome · QT interval prolongation · rhabdomyolysis · severe cutaneous adverse reactions (SCARs)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **MONITORING REQUIREMENTS**
  - ▶ Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
  - ▶ Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
  - ▶ Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
  - ▶ Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE decisions

- ▶ Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma.

Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

[www.nice.org.uk/guidance/ta178](http://www.nice.org.uk/guidance/ta178)

- ▶ Sorafenib for treating advanced hepatocellular carcinoma (September 2017) NICE TA474

Sorafenib is recommended as an option for treating advanced hepatocellular carcinoma only for patients with Child-Pugh grade A liver impairment, only if the manufacturer provides sorafenib within the agreed commercial access arrangement. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta474](http://www.nice.org.uk/guidance/ta474)

- ▶ Lenvatinib and sorafenib for treating differentiated thyroid cancer after radioactive iodine (August 2018) NICE TA535

Sorafenib (*Nexavar*<sup>®</sup>) is recommended as an option for treating progressive, locally advanced or metastatic differentiated thyroid cancer (papillary, follicular or Hürthle cell) in adults whose disease does not respond to radioactive iodine, only if:

- they have not had a tyrosine kinase inhibitor before, or
- they have had to stop taking a tyrosine kinase inhibitor within 3 months of starting it because of toxicity (specifically, toxicity that cannot be managed by dose delay or dose modification), **and**
- the manufacturer provides sorafenib according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta535](http://www.nice.org.uk/guidance/ta535)

### Scottish Medicines Consortium (SMC) decisions

SMC No. 482/08

The *Scottish Medicines Consortium* has advised (January 2016) that sorafenib (*Nexavar*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of advanced hepatocellular carcinoma in patients where surgical or loco-regional therapies have failed or are unsuitable. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

| 112 tablet [PoM] £3,576.56

## Sunitinib

24-Jul-2017

- **DRUG ACTION** Sunitinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib | Treatment of advanced or metastatic renal cell carcinoma**

#### ▶ BY MOUTH

- ▶ Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

**Treatment of unresectable or metastatic pancreatic neuroendocrine tumours**

#### ▶ BY MOUTH

- ▶ Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.
- ▶ Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, dose may need to be decreased to a minimum of 37.5 mg per day for gastrointestinal stromal tumours or renal cell carcinoma, or to a minimum of 25 mg per day for pancreatic neuroendocrine tumours.

### IMPORTANT SAFETY INFORMATION

#### RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Cardiovascular disease—discontinue if congestive heart failure develops · hypertension · increased risk of bleeding · susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: sunitinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abscess · alopecia · anaemia · appetite decreased · arthralgia · burping · chest pain · chills · constipation · cough · dehydration · depression · diarrhoea · dizziness · dry mouth · dysphagia · dyspnoea · embolism and thrombosis · excessive tearing · eye inflammation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hair colour changes · headache · hypertension · hypoglycaemia · hypothyroidism · increased risk of infection · influenza like illness · insomnia · leucopenia · mucositis · muscle complaints · muscle weakness · myocardial ischaemia · nail disorder · nasal complaints · nausea · neutropenia · oedema · oral disorders · oropharyngeal pain · pain · peripheral neuropathy · proteinuria · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions ·

taste altered · thrombocytopenia · urine discolouration · vasodilation · vomiting · weight decreased

- ▶ **Uncommon** Anal fistula (interrupt treatment) · cardiomyopathy · cerebrovascular insufficiency · cholecystitis · fistula (interrupt treatment) · healing impaired · heart failure · hepatic disorders · hypersensitivity · hyperthyroidism · intracranial haemorrhage · myocardial infarction · osteonecrosis of jaw · pancreatitis · pancytopenia · pericardial effusion · QT interval prolongation · tumour haemorrhage
- ▶ **Rare or very rare** Angioedema · myopathy · nephrotic syndrome · posterior reversible encephalopathy syndrome (PRES) · pyoderma gangrenosum · severe cutaneous adverse reactions (SCARs) · thrombotic microangiopathy · thyroiditis · torsade de pointes · tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Discontinue breast-feeding.
- **MONITORING REQUIREMENTS** Monitor for thyroid dysfunction.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)** NICE TA169  
Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1. [www.nice.org.uk/TA169](http://www.nice.org.uk/TA169)
- ▶ **Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009)** NICE TA179  
Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer. [www.nice.org.uk/TA179](http://www.nice.org.uk/TA179)
- ▶ **Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)** NICE TA178  
Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)
- ▶ **Everolimus and sunitinib for treating unresectable or metastatic neuroendocrine tumours in people with progressive disease (June 2017)** NICE TA449  
Everolimus and sunitinib are recommended, within their marketing authorisations, as options for treating well- or moderately differentiated unresectable or metastatic neuroendocrine tumours (NETs) of pancreatic origin in adults with progressive disease. [www.nice.org.uk/guidance/TA449](http://www.nice.org.uk/guidance/TA449)

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (November 2009) that sunitinib (*Sutent*®) is accepted for use within NHS Scotland for the treatment of unresectable and/or metastatic malignant gastrointestinal stromal tumours after failure of imatinib.

The *Scottish Medicines Consortium* has advised (May 2011) that sunitinib (*Sutent*®) is accepted for use within NHS Scotland for the treatment of unresectable or metastatic, well-differentiated pancreatic neuroendocrine tumours with disease progression in adults.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 14

▶ **Sutent** (Pfizer Ltd)

**Sunitinib (as Sunitinib malate) 12.5 mg** Sutent 12.5mg capsules | 28 capsule [PoM] £784.70 (Hospital only)

**Sunitinib (as Sunitinib malate) 25 mg** Sutent 25mg capsules |

28 capsule [PoM] £1,569.40 (Hospital only)

**Sunitinib (as Sunitinib malate) 50 mg** Sutent 50mg capsules | 28 capsule [PoM] £3,138.80 (Hospital only)

## Temsirolimus

06-Feb-2019

- **DRUG ACTION** Temsirolimus is a protein kinase inhibitor.

- **INDICATIONS AND DOSE**

**First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma**

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

- **INTERACTIONS** → Appendix 1: temsirolimus
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abscess · anaemia · anxiety · appetite decreased · arthralgia · asthenia · chest pain · chills · conjunctivitis · constipation · cough · cystitis · decreased leucocytes · dehydration · depression · diabetes mellitus · diarrhoea · dizziness · drowsiness · dyslipidaemia · dysphagia · dyspnoea · electrolyte imbalance · embolism and thrombosis · fever · gastrointestinal discomfort · gastrointestinal disorders · genital oedema · haemorrhage · headache · hypersensitivity · hypertension · increased risk of infection · insomnia · lacrimation disorder · mucositis · myalgia · nail disorder · nausea · neutropenia · oedema · oral disorders · pain · paraesthesia · post procedural infection · renal failure · respiratory disorders · scrotal oedema · sepsis · skin reactions · taste altered · thrombocytopenia · vomiting
- ▶ **Uncommon** Healing impaired · intracranial haemorrhage · pericardial effusion

**SIDE-EFFECTS, FURTHER INFORMATION** Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Manufacturer advises avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**
- ▶ When used for Renal cell carcinoma Manufacturer advises caution.
- ▶ When used for Mantle cell lymphoma Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.
- Dose adjustments** ▶ When used for Renal cell carcinoma Manufacturer advises dose reduction in severe impairment—consult product literature.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor respiratory function.
- ▶ Monitor blood lipids.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced and/or metastatic renal cell carcinoma (August 2009) NICE TA178
- Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced and/or metastatic renal cell carcinoma.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta178](http://www.nice.org.uk/guidance/ta178)

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Ethanol, propylene glycol

- ▶ **Torisel** (Pfizer Ltd)

Temsirolimus 25 mg per 1 ml Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial (POM) £620.00 (Hospital only)

## Tivozanib

26-Apr-2018

● **DRUG ACTION** Tivozanib is a tyrosine kinase inhibitor.

● **INDICATIONS AND DOSE**

**Advanced renal cell carcinoma (specialist use only)**

▶ **BY MOUTH**

- ▶ **Adult:** 1340 micrograms once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CAUTIONS** History of arterial thromboembolic events · history of bleeding disorders · history of posterior reversible encephalopathy syndrome following tivozanib treatment · history of QT-interval prolongation · history of venous thromboembolic events · major surgical procedures—interrupt treatment · patients aged over 65 years—increased risk of adverse effects · pre-existing cardiac disease · risk factors for arterial thromboembolic events · risk factors for gastro-intestinal fistula · risk factors for gastro-intestinal perforation · risk factors for venous thromboembolic events · risk of bleeding

● **INTERACTIONS** → Appendix 1: tivozanib

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · angina pectoris · appetite decreased · arthralgia · asthenia · chills · constipation · cough · diarrhoea · dizziness · dry mouth · dysphagia · dysphonia · dyspnoea · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hypertension · hypothyroidism · increased risk of infection · insomnia · myalgia · myocardial infarction · nasal complaints · nausea · oral disorders · pain · pancreatitis · peripheral neuropathy · peripheral oedema · proteinuria · skin reactions · tachycardia · taste altered · tinnitus · vertigo · visual impairment · vomiting · weight decreased

- ▶ **Uncommon** Ear congestion · excessive tearing · goitre · hyperhidrosis · hyperthyroidism · memory loss · mucositis · muscle weakness · pulmonary oedema · QT interval prolongation · thrombocytopenia · transient ischaemic attack

▶ **Rare or very rare** Posterior reversible encephalopathy syndrome (PRES)

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men, women of childbearing potential, and their partners during treatment and for at least one month after the last dose; an additional barrier method of contraception should be used in women using hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment—monitor patients for tolerability; avoid in severe impairment.

**Dose adjustments** Manufacturer advises reduce dose to 1340 micrograms on alternate days in moderate impairment—increased risk of adverse effects due to increased exposure.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises perform liver function tests (including ALT, AST and AP) before and during treatment; monitor for proteinuria before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor blood pressure before and during treatment; monitor for signs or symptoms of cardiac failure during treatment.
- ▶ Manufacturer advises perform baseline ECG and monitor electrolytes before treatment and as clinically indicated thereafter.
- ▶ Manufacturer advises monitor thyroid function before treatment and periodically thereafter.
- ▶ Manufacturer advises monitor for symptoms of gastro-intestinal perforation or fistula.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ Tivozanib for treating advanced renal cell carcinoma (March 2018) NICE TA512

Tivozanib is recommended as an option for treating advanced renal cell carcinoma in adults, only if:

- they have had no previous treatment, **and**
- the manufacturer provides tivozanib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta512](http://www.nice.org.uk/guidance/ta512)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1335/18

The *Scottish Medicines Consortium* has advised (July 2018) that tivozanib (*Fotivda*®) is accepted for restricted use within NHS Scotland for the first line treatment of adults with advanced renal cell carcinoma. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Fotivda** (EUSA Pharma Ltd) ▼

**Tivozanib** (as **Tivozanib hydrochloride monohydrate**). 89 mg Fotivda 890microgram capsules | 21 capsule [PoM] £2,052.00 (Hospital only)

**Tivozanib** (as **Tivozanib hydrochloride monohydrate**). 1.34 mg Fotivda 1340microgram capsules | 21 capsule [PoM] £2,052.00 (Hospital only)

- mucositis · nausea · oedema · respiratory disorders · skin reactions · stomatitis · vision disorders · vomiting
- ▶ **Uncommon** Chorioretinopathy · gastrointestinal disorders · heart failure · retinal detachment · retinal occlusion · rhabdomyolysis

**SIDE-EFFECTS, FURTHER INFORMATION** Additional side-effects reported when used in combination with dabrafenib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective non-hormonal contraception during, and for 4 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises measure blood pressure at baseline and monitor during treatment; evaluate left ventricular ejection fraction before treatment, after one month of treatment, and then approximately every 3 months thereafter; monitor liver function every 4 weeks for 6 months after treatment initiation, and thereafter as clinically indicated.
- **HANDLING AND STORAGE** Manufacturer advises store in refrigerator (2–8 °C); once opened, bottle may be stored for 30 days at not more than 30 °C.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told to seek immediate medical attention if symptoms of pulmonary embolism or deep vein thrombosis occur; patients and their carers should also be advised to report new visual disturbances.
- Missed doses** Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.
- Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and visual disturbances.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016)** NICE TA396 Trametinib (*Mekinist*®) in combination with dabrafenib (*Tafinlar*®) is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation only when the manufacturer provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.  
[www.nice.org.uk/guidance/ta396](http://www.nice.org.uk/guidance/ta396)
- ▶ **Dabrafenib with trametinib for adjuvant treatment of resected BRAF V600 mutation-positive melanoma (October 2018)** NICE TA544 Dabrafenib (*Tafinlar*®) with trametinib (*Mekinist*®) is recommended, within its marketing authorisation, as an option for the adjuvant treatment of resected stage III BRAF V600 mutation-positive melanoma in adults. It is recommended only if the manufacturer provides dabrafenib and trametinib with the discounts agreed in the commercial arrangements.  
[www.nice.org.uk/guidance/ta544](http://www.nice.org.uk/guidance/ta544)

## Trametinib

12-Jul-2018

- **DRUG ACTION** Trametinib is a protein kinase inhibitor.

### ● INDICATIONS AND DOSE

**Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib) (specialist use only) | Advanced non-small cell lung cancer with a BRAF V600 mutation (in combination with dabrafenib) (specialist use only)**

#### ▶ BY MOUTH

- ▶ **Adult:** 2 mg once daily, when used in combination with dabrafenib, the dose should be taken at the same time each day with *either* the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

**Adjuvant treatment of stage III melanoma with a BRAF V600 mutation following complete resection (in combination with dabrafenib) (specialist use only)**

#### ▶ BY MOUTH

- ▶ **Adult:** 2 mg once daily for 12 months, the dose should be taken at the same time each day with *either* the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2016): TRAMETINIB: RISK OF GASTROINTESTINAL PERFORATION AND COLITIS

A review by EU medicines regulators has concluded that trametinib can cause gastrointestinal perforation or colitis.

Trametinib should be used with caution in patients with risk factors for gastrointestinal perforation, such as gastrointestinal metastases, diverticulitis, or use of concomitant medicines that can cause gastrointestinal perforation. Prescribers should be vigilant for signs and symptoms of gastrointestinal perforation and should advise patients to seek urgent medical attention if they develop severe abdominal pain.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** History of retinal vein occlusion
- **CAUTIONS** Concomitant antiplatelet or anticoagulant therapy—increased risk of haemorrhage · conditions that could impair left ventricular function · elderly (more frequent dose adjustments may be required) · impaired left ventricular function · predisposing factors for retinal vein occlusion · risk factors for gastrointestinal perforation
- **INTERACTIONS** → Appendix 1: trametinib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · asthenia · bradycardia · constipation · cough · dehydration · diarrhoea · dry mouth · dyspnoea · eye inflammation · fever · haemorrhage · hypersensitivity · hypotension · increased risk of infection · intracranial haemorrhage · left ventricular dysfunction · lymphoedema

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1161/16

The *Scottish Medicines Consortium* has advised (August 2016) that trametinib (*Mekinist*®), in combination with dabrafenib, is accepted for restricted use within NHS Scotland for first-line treatment of adults with unresectable or metastatic melanoma with a BRAF V600 mutation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3, 23, 25

- ▶ **Mekinist** (Novartis Pharmaceuticals UK Ltd) ▼

**Trametinib 500 microgram** Mekinist 0.5mg tablets | 7 tablet [PoM] £280.00 | 30 tablet [PoM] £1,200.00

**Trametinib 2 mg** Mekinist 2mg tablets | 7 tablet [PoM] £1,120.00 | 30 tablet [PoM] £4,800.00

**Vandetanib**

21-Dec-2018

- **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

● **INDICATIONS AND DOSE**

**Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease**

▶ BY MOUTH

- ▶ Adult: 300 mg once daily, for dose adjustment due to side effects—consult product literature

**IMPORTANT SAFETY INFORMATION**

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 888.

- **CONTRA-INDICATIONS** Congenital long QT syndrome · QT interval greater than 480 milliseconds
- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vandetanib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · anxiety · appetite decreased · asthenia · cerebral ischaemia · cholelithiasis · constipation · corneal deposits · cystitis · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysphagia · electrolyte imbalance · eye disorders · eye inflammation · fever · gastrointestinal discomfort · gastrointestinal disorders · glaucoma · haemorrhage · headache · hyperglycaemia · hypertension · hypothyroidism · increased risk of infection · insomnia · lethargy · loss of consciousness · movement disorders · nail disorder · nausea · nephrolithiasis · oedema · pain · photosensitivity reaction · proteinuria · QT interval prolongation · renal impairment · respiratory disorders · sensation abnormal · sepsis · skin reactions · stomatitis · taste altered · tremor · urinary disorders · vision disorders · vomiting · weight decreased
  - ▶ **Uncommon** Arrhythmias · brain oedema · cardiac arrest · cardiac conduction disorder · cataract · healing impaired · heart failure · malnutrition · pancreatitis · posterior reversible encephalopathy syndrome (PRES) · seizure · Stevens-Johnson syndrome · urine discoloration
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 30 mL/minute.  
**Dose adjustments** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute.
- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.  
Alert card An alert card should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Vandetanib for treating medullary thyroid cancer (December 2018)** NICE TA550

Vandetanib (*Caprelsa*®) is **not** recommended, within its marketing authorisation, for treating aggressive and symptomatic medullary thyroid cancer in adults with unresectable, locally advanced or metastatic disease.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta550](http://www.nice.org.uk/guidance/ta550)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Caprelsa** (Genzyme Therapeutics Ltd) ▼

**Vandetanib 100 mg** Caprelsa 100mg tablets | 30 tablet [PoM] £2,500.00

**Vandetanib 300 mg** Caprelsa 300mg tablets | 30 tablet [PoM] £5,000.00

## Vemurafenib

● **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

### ● INDICATIONS AND DOSE

**Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma**

► BY MOUTH

► Adult: 960 mg twice daily, for dose adjustment due to side effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)**

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

**MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY**

Potiation of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy— use with caution.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma

● **CAUTIONS** Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation

● **INTERACTIONS** → Appendix 1: vemurafenib

### ● SIDE-EFFECTS

► **Common or very common** 7th nerve paralysis · alopecia · appetite decreased · arthralgia · arthritis · asthenia · connective tissue disorders · constipation · cough · diarrhoea · dizziness · eye inflammation · fever · folliculitis · headache · myalgia · nausea · neoplasms · pain · panniculitis · peripheral oedema · photosensitivity reaction · QT interval prolongation · radiation injuries · skin reactions · taste altered · vomiting · weight decreased

► **Uncommon** Liver injury · neutropenia · pancreatitis · peripheral neuropathy · retinal occlusion · severe cutaneous adverse reactions (SCARs) · vasculitis

► **Rare or very rare** Acute tubular necrosis · nephritis acute interstitial

► **Frequency not known** Acute kidney injury

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of increased exposure)—monitor ECG monthly during the first 3 months of treatment, followed by at least every 3 months thereafter (if QTc interval is prolonged, consult product literature).

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

### ● MONITORING REQUIREMENTS

► Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not

recommended if QT interval greater than 500 milliseconds at baseline).

► Monitor liver function before treatment and periodically thereafter.

► Monitor for uveitis, iritis and retinal vein occlusion.

► Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.

● **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).

● **PATIENT AND CARER ADVICE** Counselling advised (administration).

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

► **Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012)** NICE TA269

Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA269](http://www.nice.org.uk/TA269)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (November 2013) that vemurafenib (*Zelboraf*<sup>®</sup>) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

**Vemurafenib 240 mg** Zelboraf 240mg tablets | 56 tablet (PoM)  
£1,750.00 (Hospital only)

## ANTINEOPLASTIC DRUGS > ANTINEOPLASTICS, OTHER

### Niraparib

10-Aug-2018

● **DRUG ACTION** Niraparib is an inhibitor of PARP enzymes which are involved in DNA repair. PARP inhibition results in disruption of cellular homeostasis and cell death.

### ● INDICATIONS AND DOSE

**Ovarian cancer (initiated by a specialist) | Fallopian tube cancer (initiated by a specialist) | Peritoneal cancer (initiated by a specialist)**

► BY MOUTH

► Adult: 300 mg once daily, consider initial dose of 200 mg in patients with body-weight less than 58 kg, for dose adjustments due to side-effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

● **CAUTIONS** Pre-existing hypertension (control before treatment initiation)

### ● SIDE-EFFECTS

► **Common or very common** Anaemia · anxiety · appetite decreased · arthralgia · back pain · conjunctivitis ·

constipation · cough · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · fatigue · gastrointestinal discomfort · headache · hypertension · hypokalaemia · increased risk of infection · insomnia · leucopenia · mucositis · myalgia · nausea · neutropenia · palpitations · peripheral oedema · photosensitivity reaction · rash · stomatitis · tachycardia · taste altered · thrombocytopenia · vomiting

► **Uncommon** Pancytopenia

► **Frequency not known** Neoplasms

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for 1 month after receiving the last dose.

● **PREGNANCY** Manufacturer advises avoid—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

► Manufacturer advises monitor full blood count weekly for the first month of treatment, then monthly for the next 10 months and periodically thereafter.

► Manufacturer advises monitor blood pressure monthly for the first year of treatment and periodically thereafter.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness and fatigue.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

► **Niraparib for maintenance treatment of relapsed, platinum-sensitive ovarian, fallopian tube and peritoneal cancer (July 2018) NICE TA528**

Niraparib (*Zejula*®) is recommended for use within the Cancer Drugs Fund as an option for treating relapsed, platinum-sensitive high-grade serous epithelial ovarian, fallopian tube or primary peritoneal cancer that has responded to the most recent course of platinum-based chemotherapy in adults, only if:

- they have a germline BRCA mutation and have had 2 courses of platinum-based chemotherapy, or
- they do not have a germline BRCA mutation and have had 2 or more courses of platinum-based chemotherapy, and
- the conditions in the managed access agreement for niraparib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta528](http://www.nice.org.uk/guidance/ta528)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1341/18

The *Scottish Medicines Consortium* has advised (August 2018) that niraparib (*Zejula*®) is accepted for restricted use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy. It is restricted to those patients who do not have a germline BRCA mutation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

► **Zejula** (Tesaro UK Ltd) ▼

**Niraparib (as Niraparib tosylate monohydrate) 100 mg** Zejula 100mg capsules | 56 capsule [POM] £4,500.00 (Hospital only) | 84 capsule [POM] £6,750.00 (Hospital only)

## Olaparib

30-Jul-2018

● **DRUG ACTION** Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

● **INDICATIONS AND DOSE**

**Ovarian cancer (initiated by a specialist) | Fallopian tube cancer (initiated by a specialist) | Peritoneal cancer (initiated by a specialist)**

► **BY MOUTH USING CAPSULES**

► **Adult:** 400 mg twice daily, patients should start treatment no later than 8 weeks after completion of their final dose of the platinum-containing regimen, for dose adjustments due to side-effects—consult product literature

► **BY MOUTH USING TABLETS**

► **Adult:** 300 mg twice daily, patients should start treatment no later than 8 weeks after completion of their final dose of the platinum-containing regimen, for dose adjustments due to side-effects—consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

► Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 200 mg twice daily and tablets to 150 mg twice daily.

► Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose of capsules to 150 mg twice daily and tablets to 100 mg twice daily.

**DOSE EQUIVALENCE AND CONVERSION**

► Manufacturer advises capsules and tablets are not interchangeable on a milligram-for-milligram basis due to differences in dosing and bioavailability.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

**MHRA/CHM ADVICE: LYNPARZA® (OLAPARIB): RISK OF MEDICATION ERRORS WITH NEW PHARMACEUTICAL FORM (MAY 2018)**

A tablet formulation of olaparib was approved by the European Commission in May 2018. Capsules and tablets are not to be substituted on a milligram-to-milligram basis due to differences in dosing and bioavailability of each formulation. Prescribers should specify the formulation and dosage of olaparib on each prescription and pharmacists should ensure that the correct formulation and dose is dispensed. Patients should be instructed on the correct dose they should take for their capsules or tablets and if switched, informed of the difference in dosing.

● **INTERACTIONS** → Appendix 1: olaparib

● **SIDE-EFFECTS**

► **Common or very common** Anaemia · appetite decreased · diarrhoea · dizziness · fatigue · gastrointestinal discomfort · headache · lymphopenia · nausea · neutropenia · skin

reactions · stomatitis · taste altered · thrombocytopenia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** **Haematological toxicity** Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.

**Pneumonitis** If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 1 month after receiving the last dose. Consider an additional non-hormonal method of contraception.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment unless benefit outweighs potential risk—no information available.

**Dose adjustments** For *capsules*, manufacturer advises reduce dose to 300 mg twice daily in moderate impairment.

For *tablets*, manufacturer advises reduce dose to 200 mg twice daily in moderate impairment.

● **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count before treatment initiation, then every month for the first 12 months of treatment and periodically thereafter.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *capsules* should be taken at least 1 hour after food, and food should preferably be avoided for up to 2 hours after administration.

● **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of malaise and dizziness.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

▶ **Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy (January 2016)** NICE TA381  
Olaparib is recommended as an option for treating adults with relapsed, platinum sensitive ovarian, fallopian tube or peritoneal cancer who have BRCA1 or BRCA2 mutations and whose disease has responded to platinum based chemotherapy only if:

- they have had 3 or more courses of platinum-based chemotherapy and;
- the drug cost of olaparib for people who remain on treatment after 15 months will be met by the company.

[www.nice.org.uk/guidance/ta381](http://www.nice.org.uk/guidance/ta381)

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (November 2016) that olaparib (*Lynparza*®) is accepted for use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Venetoclax

07-Sep-2017

- **DRUG ACTION** Venetoclax is a potent, selective inhibitor of B-cell lymphoma-2 (BCL-2).

#### ● INDICATIONS AND DOSE

**Chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation when a B-cell receptor pathway inhibitor is unsuitable or ineffective (specialist use only) | Chronic lymphocytic leukaemia in the absence of 17p deletion or TP53 mutation when both chemo-immunotherapy and a B-cell receptor pathway inhibitor has been ineffective (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

**Chronic lymphocytic leukaemia in patients who have received at least one prior therapy [in combination with rituximab] (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1: venetoclax
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · constipation · diarrhoea · electrolyte imbalance · fatigue · hyperuricaemia · increased risk of infection · lymphopenia · nausea · neutropenia · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment (increased risk of toxicity); avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function before starting treatment.
- **PATIENT AND CARER ADVICE**
- Hydration Manufacturer advises patients should drink 1.5–2L of water daily, starting 2 days before and throughout the dose-titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.

Vomiting Manufacturer advises that if vomiting occurs following dose administration, no additional doses should be taken on that day and the next dose should be taken at the normal time.

**Missed doses** Manufacturer advises that if a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Venetoclax for treating chronic lymphocytic leukaemia (November 2017)** NICE TA487

Venetoclax is recommended for use within the Cancer Drugs Fund, within its authorisation, as an option for treating chronic lymphocytic leukaemia in adults:

- with a 17p deletion or TP53 mutation and when a B-cell receptor pathway inhibitor is unsuitable, or whose disease has progressed after a B-cell receptor pathway inhibitor or
- without a 17p deletion or TP53 mutation, and whose disease has progressed after both chemo-immunotherapy and a B-cell receptor pathway inhibitor, and
- only if the conditions in the managed access agreement are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA487](http://www.nice.org.uk/guidance/TA487)

- ▶ **Venetoclax with rituximab for previously treated chronic lymphocytic leukaemia (February 2019)** NICE TA561

Venetoclax (*Venclyxto*®) with rituximab is recommended, within its marketing authorisation, as an option for treating chronic lymphocytic leukaemia in adults who have had at least 1 previous therapy. It is recommended only if the manufacturer provides it according to the commercial arrangement.

[www.nice.org.uk/guidance/ta561](http://www.nice.org.uk/guidance/ta561)

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (August 2017) that venetoclax (*Venclyxto*®) is accepted for use within NHS Scotland as monotherapy for the treatment of chronic lymphocytic leukaemia:

- in the presence of 17p deletion or TP53 mutation in patients who are unsuitable for or have failed a B-cell receptor pathway inhibitor; or
- in the absence of 17p deletion or TP53 mutation in patients who have failed both chemoimmunotherapy and a B-cell receptor pathway inhibitor.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Vismodegib

17-Jan-2018

- **DRUG ACTION** Vismodegib is a hedgehog pathway inhibitor.

### ● INDICATIONS AND DOSE

**Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy**

- ▶ BY MOUTH
- ▶ Adult: 150 mg once daily

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 888.

- **INTERACTIONS** → Appendix 1: vismodegib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · amenorrhoea · appetite decreased · arthralgia · asthenia · constipation · dehydration · diarrhoea · gastrointestinal discomfort · hair growth abnormal · muscle complaints · nausea · pain · skin reactions · taste altered · vomiting · weight decreased
  - ▶ **Frequency not known** Epiphyses premature fusion
- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.
- **PREGNANCY** **Important: teratogenic risk**—may cause severe birth defects and embryo-fetal death.
- **BREAST FEEDING** Avoid during treatment and for 24 months after final dose.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.
- **PATIENT AND CARER ADVICE**

**Conception and contraception** Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer's pregnancy prevention programme.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ **Vismodegib for treating basal cell carcinoma (November 2017) NICE TA489**  
Vismodegib is not recommended within its marketing authorisation for treating symptomatic metastatic basal cell carcinoma, or locally advanced basal cell carcinoma that is inappropriate for surgery or radiotherapy, in adults. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/TA489](http://www.nice.org.uk/guidance/TA489)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Erivedge** (Roche Products Ltd) ▼  
**Vismodegib 150 mg** Erivedge 150mg capsules | 28 capsule **[PoM]**  
£6,285.00 (Hospital only)

## ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

### Aflibercept

06-Dec-2017

- **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

### ● INDICATIONS AND DOSE

**In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Moderate or severe congestive heart failure · uncontrolled hypertension
- **CAUTIONS** Febrile neutropenia · history of cardiovascular disease (may be exacerbated by hypertension) · increased risk of haemorrhage (including fatal events) · increased risk of hypertension · increased risk of thromboembolic events (consult product literature if event occurs) · may impair wound healing—withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed · neutropenic infection · risk of fistula formation (discontinue if fistula develops) · risk of neutropenia · risk of thrombocytopenia
- **INTERACTIONS** → Appendix 1: aflibercept
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Cataract · eye discomfort · eye disorders · eye inflammation · haemorrhage · retinal pigment epithelial tear · vision disorders
  - ▶ **Uncommon** Lens opacity
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment.
  - ▶ Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
  - ▶ Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.

- ▶ Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- ▶ Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **NICE decisions**

- ▶ **Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307**  
Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.  
[www.nice.org.uk/guidance/TA307](http://www.nice.org.uk/guidance/TA307)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for infusion**

## Blood and blood-forming organs

### 1 Anaemias

#### Anaemias

##### Anaemia treatment considerations

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

##### Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza

vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 935 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

##### G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

#### Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Fluoroquinolones (including ciprofloxacin, moxifloxacin, norfloxacin, and ofloxacin)
- Methylthionium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (such as nalidixic acid [not on UK market])
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

#### Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

### Hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 1080, antilymphocyte immunoglobulin, rituximab p. 882 [unlicensed indication], and various corticosteroids are used in hypoplastic and haemolytic anaemias.

**Antilymphocyte immunoglobulin** given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 838 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but, in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 587 treatment, pyridoxine hydrochloride is also indicated.

**Corticosteroids** have an important place in the management of haematological disorders. They include conditions with an *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

#### Erythropoietins

**Epoetins** (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 1015 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol.

Darbepoetin alpha p. 1012 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 1017 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

## IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008) ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

- **CONTRA-INDICATIONS** Patients unable to receive thromboprophylaxis · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the

response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident · risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

## • SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · embolism and thrombosis · headache · hypertension (dose-dependent) · influenza like illness · skin reactions · stroke
- ▶ **Uncommon** Hypertensive crisis (in isolated patients with normal or low blood pressure) · respiratory tract congestion · seizure
- ▶ **Rare or very rare** Thrombocytosis
- ▶ **Frequency not known** Pure red cell aplasia (more common following subcutaneous administration in patients with chronic renal failure)

## SIDE-EFFECTS, FURTHER INFORMATION Hypertensive

**crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.

**Pure red cell aplasia** There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

## • MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

## Darbepoetin alfa

30-Apr-2019

## • INDICATIONS AND DOSE

**Symptomatic anaemia associated with chronic renal failure in patients on dialysis**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when

changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

#### Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

#### Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

##### ► BY INTRAVENOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

#### Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

● **INTERACTIONS** → Appendix 1: darbepoetin alfa

● **SIDE-EFFECTS**

► **Common or very common** Hypersensitivity · oedema

● **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- **Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014)** NICE TA323  
Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

## Epoetin alfa

### ● INDICATIONS AND DOSE

#### EPREX® PRE-FILLED SYRINGES

#### Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### Symptomatic anaemia in adults receiving cancer chemotherapy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite

dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

#### To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

#### Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

- **INTERACTIONS** → Appendix 1: epoetin alfa
- **SIDE-EFFECTS**
  - ▶ Common or very common Chills · cough · diarrhoea · fever · myalgia · nausea · pain · peripheral oedema · vomiting
  - ▶ Uncommon Hyperkalaemia
- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic hepatic failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

### ● INDICATIONS AND DOSE

#### Symptomatic anaemia associated with chronic renal failure

##### ▶ BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

##### ▶ BY INTRAVENOUS INJECTION

- **Adult:** Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

#### Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

##### ▶ BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved), increased to 900 units/kg once weekly, dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration

does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

#### To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** (consult product literature)

- **INTERACTIONS** → Appendix 1: epoetin beta
- **SIDE-EFFECTS** Severe cutaneous adverse reactions (SCARs)
- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic hepatic failure.

NeoRecormon 5,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £210.42 DT = £210.42

**Epoetin beta 20000 unit per 1 ml** NeoRecormon 6,000units/0.3ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £252.50 DT = £252.50

**Epoetin beta 33333 unit per 1 ml** NeoRecormon 20,000units/0.6ml solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £841.71 DT = £841.71

**Epoetin beta 50000 unit per 1 ml** NeoRecormon 30,000units/0.6ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM] £841.71 DT = £841.71

## Epoetin zeta

30-Apr-2019

## ● INDICATIONS AND DOSE

**Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis**

## ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

**Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis**

## ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

**Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis**

## ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

**Symptomatic anaemia in adults receiving cancer chemotherapy**

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, only increase dose if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery**

## ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: 600 units/kg twice weekly for 3 weeks before surgery, intravenous injection to be given over 1–5 minutes, consult product literature for details and advice on ensuring high iron stores

**Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable**

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 600 units/kg every week for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, maximum 1 mL per injection site, consult product literature for details

- **INTERACTIONS** → Appendix 1: epoetin zeta

● **SIDE-EFFECTS**

- ▶ **Common or very common** Asthenia · dizziness
- ▶ **Uncommon** Intracranial haemorrhage
- ▶ **Rare or very rare** Angioedema
- ▶ **Frequency not known** Aneurysm · cerebrovascular insufficiency · hypertensive encephalopathy · myocardial infarction · myocardial ischaemia

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in chronic hepatic failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Epoetin zeta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323**  
Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

[www.nice.org.uk/guidance/ta323](http://www.nice.org.uk/guidance/ta323)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Methoxy polyethylene glycol-epoetin beta

29-Nov-2017

### ● INDICATIONS AND DOSE

#### Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, maintenance dose of double the previous fortnightly dose may be given once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained

#### Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins

- ▶ INITIALLY BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 1.2 micrograms/kg every month, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, subcutaneous route preferred in patients not on haemodialysis, dose to be adjusted according to response at intervals of at least 1 month, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose once a month if haemoglobin concentration is above 10 g/100 mL, reduce dose by approximately 25% if rate of rise in haemoglobin concentration exceeds 2 g/100 mL in 1 month or if haemoglobin concentration is increasing or approaching 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, dose may be increased by approximately 25% if the rate of rise in haemoglobin concentration is less than 1 g/100 mL over 1 month; further increases of approximately 25% may be made at monthly intervals until the individual target haemoglobin concentration is obtained

### Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: RECOMBINANT HUMAN ERYTHROPOIETINS: VERY RARE RISK OF SEVERE CUTANEOUS ADVERSE REACTIONS (UPDATED JANUARY 2018)

The MHRA is aware of very rare cases of severe cutaneous adverse reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, in patients treated with erythropoietins; some cases were fatal. More severe cases were recorded with long-acting agents (darbepoetin alfa and methoxy polyethylene glycol-epoetin beta).

Patients and their carers should be advised of the signs and symptoms of severe skin reactions when starting treatment and instructed to stop treatment and seek immediate medical attention if they develop widespread rash and blistering; these rashes often follow fever or flu-like symptoms—discontinue treatment permanently if such reactions occur.

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

- **CONTRA-INDICATIONS** Pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Bone marrow fibrosis (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · haematological disease (can impair the response to erythropoietin) · haemolysis (can impair the response to erythropoietin) · inflammatory or traumatic episodes (can impair the response to erythropoietin) · malignant disease · occult blood loss (can impair the response to erythropoietin) · severe aluminium toxicity (can impair the response to erythropoietin)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Hypertension (dose-dependent)
  - ▶ **Uncommon** Embolism and thrombosis · headache
  - ▶ **Rare or very rare** Hot flush · hypertensive encephalopathy · rash maculopapular
  - ▶ **Frequency not known** Pure red cell aplasia (discontinue) · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Manufacturer advises caution with escalation of doses in chronic renal failure.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor haemoglobin concentration every 2 weeks until stabilised and periodically thereafter—if patient fails to respond, check reticulocyte count, and search for causative factors such as deficiencies of iron, folic acid or vitamin B12, and correct if necessary. Monitor iron status before and during treatment.
  - ▶ Manufacturer advises monitor blood pressure before and during treatment—if inadequately controlled, reduce dose or discontinue treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Methoxy polyethylene glycol-epoetin beta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.
 

The manufacturer of *Mircera*<sup>®</sup> has provided a *Physician's Guide* which includes important safety information to minimise the risk of pure red cell aplasia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**▶ *Mircera* (Roche Products Ltd)

**Methoxy polyethylene glycol-epoetin beta 100 microgram per 1 ml** *Mircera* 30micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £44.05

**Methoxy polyethylene glycol-epoetin beta 166.667 microgram per 1 ml** *Mircera* 50micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £73.41

**Methoxy polyethylene glycol-epoetin beta 250 microgram per 1 ml** *Mircera* 75micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £110.11

**Methoxy polyethylene glycol-epoetin beta 333.333 microgram per 1 ml** *Mircera* 100micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £146.81

**Methoxy polyethylene glycol-epoetin beta 400 microgram per 1 ml** *Mircera* 120micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £176.18

**Methoxy polyethylene glycol-epoetin beta 500 microgram per 1 ml** *Mircera* 150micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £220.22

**Methoxy polyethylene glycol-epoetin beta 600 microgram per 1 ml** *Mircera* 360micrograms/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £528.56

**Methoxy polyethylene glycol-epoetin beta 666.667 microgram per 1 ml** *Mircera* 200micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £293.62

**Methoxy polyethylene glycol-epoetin beta 833.333 microgram per 1 ml** *Mircera* 250micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £367.03

## 1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

### IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

#### Eculizumab

04-Dec-2017

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

#### ● INDICATIONS AND DOSE

**Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

**Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection

- **CAUTIONS** Active systemic infection

**CAUTIONS, FURTHER INFORMATION**

- ▶ Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (trivalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · asthenia · chills · cough · decreased leucocytes · diarrhoea · dizziness · fever · gastrointestinal discomfort · headache · hypertension · increased risk of infection · influenza like illness · joint disorders · muscle complaints · nausea · oropharyngeal pain · pain · skin reactions · sleep disorders · taste altered · tremor · vomiting
- ▶ **Uncommon** Abscess · anxiety · appetite decreased · chest discomfort · constipation · cystitis · depression · dysuria · haemorrhage · hot flush · hyperhidrosis · hypersensitivity · hypotension · meningitis meningococcal · mood swings · nasal complaints · oedema · palpitations · paraesthesia · sepsis · spontaneous penile erection · throat irritation · tinnitus · vascular disorders · vertigo · vision blurred
- ▶ **Rare or very rare** Abnormal clotting factor · conjunctival irritation · feeling hot · gastrooesophageal reflux disease · gingival discomfort · Grave's disease · infusion related reaction · jaundice · malignant melanoma · menstrual disorder · syncope · urogenital tract gonococcal infection

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for 1 hour after infusion.
  - ▶ For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
  - ▶ For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Soliris<sup>®</sup>)*, give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).
- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** Patient or carers should be advised to report promptly any signs of meningococcal infection.

A patient information card should be provided.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Eculizumab for treating atypical haemolytic uraemic syndrome (January 2015)** NICE HST1  
Eculizumab, within its marketing authorisation, is recommended for funding for treating atypical haemolytic uraemic syndrome, only if all the following arrangements are in place:
  - coordination of eculizumab use through an expert centre, **and**
  - monitoring systems to record the number of people with a diagnosis of atypical haemolytic uraemic syndrome and the number who have eculizumab, and the dose and duration of treatment, **and**
  - a national protocol for starting and stopping eculizumab for clinical reasons, **and**
  - a research programme with robust methods to evaluate when stopping treatment or dose adjustment might occur.

The long-term budget impact of eculizumab for treating atypical haemolytic uraemic syndrome is uncertain but will be considerable. NHS England and the manufacturer should consider what opportunities might exist to reduce the cost of eculizumab to the NHS.

[www.nice.org.uk/guidance/HST1](http://www.nice.org.uk/guidance/HST1)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Soliris** (Alexion Pharma UK Ltd)

**Eculizumab 10 mg per 1 ml** Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial [PoM] £3,150.00 (Hospital only)

## 1.2 Iron deficiency anaemia

### Anaemia, iron deficiency

#### Iron deficiency, treatment and prophylaxis

*Treatment* with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastrointestinal cancer).

*Prophylaxis* with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

#### Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

#### Iron content of different iron salts

Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate, dried 200 mg	65 mg

#### Compound preparations

Preparations containing iron and folic acid p. 1025 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 1082 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women).

#### Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

#### Parenteral iron

Iron can be administered parenterally as iron dextran p. 1020, iron sucrose p. 1021, ferric carboxymaltose p. 1020, or iron isomaltoside 1000 p. 1021. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not

take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

## MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

### Iron (injectable)

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

- **CONTRA-INDICATIONS** Disturbances in utilisation of iron · iron overload
- **CAUTIONS** Allergic disorders · eczema · hepatic dysfunction · immune conditions · infection (discontinue if ongoing bacteraemia) · inflammatory conditions · oral iron should not be given until 5 days after the last injection · severe asthma
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dizziness · flushing · headache · hypertension · hypophosphataemia · hypotension · nausea · taste altered
  - ▶ **Uncommon** Arrhythmias · arthralgia · bronchospasm · chest pain · chills · constipation · diarrhoea · dyspnoea · fatigue · fever · gastrointestinal discomfort · hyperhidrosis · hypersensitivity · loss of consciousness · muscle complaints · pain · peripheral oedema · sensation abnormal · skin reactions · vision blurred · vomiting
  - ▶ **Rare or very rare** Angioedema · anxiety · circulatory collapse · influenza like illness · malaise · pallor ·

palpitations · psychiatric disorder · seizure · syncope · tremor

**SIDE-EFFECTS, FURTHER INFORMATION** Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

**Overdose** For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1359.

**F** above

## Ferric carboxymaltose

09-Apr-2019

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia

- ▶ **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Dose calculated according to body-weight and iron deficit (consult product literature)

- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
  - ▶ **Rare or very rare** Face oedema · flatulence
- **PREGNANCY** Avoid in first trimester; crosses the placenta in *animal* studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor iron status to avoid iron overload; avoid where iron overload increases risk of impairment (particularly porphyria cutanea tarda).
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Ferinject*®), give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

ELECTROLYTES: May contain Sodium

▶ **Ferinject** (Vifor Pharma UK Ltd) ▼

**Iron (as Ferric carboxymaltose) 50 mg per 1 ml** Ferinject 1000mg/20ml solution for injection vials | 1 vial [PoM] £154.23  
 Ferinject 100mg/2ml solution for injection vials | 5 vial [PoM] £81.18  
 Ferinject 500mg/10ml solution for injection vials | 5 vial [PoM] £405.88

**F** above

## Iron dextran

09-Apr-2019

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
- ▶ **Adult:** Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
- ▶ **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- ▶ **Adult:** Doses calculated according to body-weight and iron deficit (consult product literature)

- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Feeling hot
  - ▶ **Rare or very rare** Deafness (transient) · haemolysis
  - ▶ **Frequency not known** Injection site necrosis · rheumatoid arthritis aggravated
- **PREGNANCY** Avoid in first trimester.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in acute renal failure.

**● DIRECTIONS FOR ADMINISTRATION**

▶ With intravenous use For *intravenous infusion* (Cosmofer<sup>®</sup>), give intermittently in Glucose 5% or Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; *total dose infusion* diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).

● **PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

**Iron isomaltoside 1000****● INDICATIONS AND DOSE****Iron-deficiency anaemia**

▶ BY INTRAVENOUS INJECTION

▶ Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: iron (injectable)

**● SIDE-EFFECTS**

▶ **Uncommon** Infection  
▶ **Rare or very rare** Dysphonia

● **PREGNANCY** Avoid in first trimester.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in compensated hepatic disease—monitor iron status to avoid iron overload; avoid in decompensated hepatic disease, in hepatitis and where iron overload is a precipitating factor (particularly porphyria cutanea tarda).

**● NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (February 2017) that iron (III) isomaltoside 1000 5% (*Diafer*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of iron deficiency in adults with chronic kidney disease on dialysis, when oral iron preparations are ineffective or cannot be used. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

Iron (as Iron sucrose) 20 mg per 1 mL Venofer 100mg/5ml solution for injection vials | 5 vial [PoM] £43.52  
Venofer 50mg/2.5ml solution for injection vials | 5 vial [PoM] £

**MINERALS AND TRACE ELEMENTS > IRON, ORAL****Iron (oral)****● SIDE-EFFECTS**

▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · nausea

▶ **Uncommon** Vomiting

▶ **Frequency not known** Appetite decreased · faeces discoloured

**SIDE-EFFECTS, FURTHER INFORMATION** Iron can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

**Overdose** For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1359.

**● MONITORING REQUIREMENTS**

▶ **Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

**● PRESCRIBING AND DISPENSING INFORMATION**

▶ In children Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

● **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

## Ferric maltol

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia

##### ► BY MOUTH

- Adult: 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks

- **CONTRA-INDICATIONS** Exacerbation of inflammatory bowel disease · haemochromatosis · haemoglobin less than 9.5 g/dL · iron overload syndromes · repeated blood transfusions

- **INTERACTIONS** → Appendix 1: iron (oral)

### ● SIDE-EFFECTS

- Common or very common Flatulence
- **Uncommon** Headache · joint stiffness · pain in extremity · skin reactions · small intestinal bacterial overgrowth · thirst

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2016) that ferric maltol (*Feracru*®) is **not** recommended for use within NHS Scotland for the treatment of iron deficiency anaemia in adults with inflammatory bowel disease as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 23

## Ferrous fumarate

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia (prophylactic)

##### ► BY MOUTH USING TABLETS

- Child 12-17 years: 210 mg 1-2 times a day
- Adult: 210 mg 1-2 times a day

##### ► BY MOUTH USING SYRUP

- Child 12-17 years: 140 mg twice daily
- Adult: 140 mg twice daily

#### Iron-deficiency anaemia (therapeutic)

##### ► BY MOUTH USING TABLETS

- Child 12-17 years: 210 mg 2-3 times a day
- Adult: 210 mg 2-3 times a day

##### ► BY MOUTH USING SYRUP

- Child 12-17 years: 280 mg twice daily
- Adult: 280 mg twice daily

#### GALFER® CAPSULES

#### Iron-deficiency anaemia (prophylactic)

##### ► BY MOUTH

- Child 12-17 years: 305 mg daily
- Adult: 305 mg daily

#### Iron-deficiency anaemia (therapeutic)

##### ► BY MOUTH

- Child 12-17 years: 305 mg twice daily
- Adult: 305 mg twice daily

#### GALFER® SYRUP

#### Iron-deficiency anaemia (prophylaxis)

##### ► BY MOUTH

- Child 1 month-11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started

4-6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day

- Child 12-17 years: 10 mL once daily
- Adult: 10 mL once daily

#### Iron-deficiency anaemia (therapeutic)

##### ► BY MOUTH

- Child 1 month-11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses; maximum 20 mL per day

**Ferrous sulfate**

29-Mar-2019

● **INDICATIONS AND DOSE****Iron-deficiency anaemia (prophylactic)**

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6–17 years: 200 mg daily
- ▶ Adult: 200 mg daily

**Iron-deficiency anaemia (therapeutic)**

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6–17 years: 200 mg 2–3 times a day
- ▶ Adult: 200 mg 2–3 times a day

**FEOSPAN<sup>®</sup>****Iron-deficiency anaemia**

- ▶ BY MOUTH
- ▶ Child 1–17 years: 1 capsule daily, capsule can be opened and sprinkled on food
- ▶ Adult: 1–2 capsules daily, capsule can be opened and sprinkled on food

**FERROGRAD<sup>®</sup>****Iron-deficiency anaemia (prophylactic and therapeutic)**

- ▶ BY MOUTH
- ▶ Child 12–17 years: 1 tablet daily
- ▶ Adult: 1 tablet daily

**IRONORM<sup>®</sup> DROPS****Iron-deficiency anaemia (prophylactic)**

- ▶ BY MOUTH
- ▶ Adult: 2.4–4.8 mL daily

**Iron-deficiency anaemia (therapeutic)**

- ▶ BY MOUTH
- ▶ Adult: 4 mL 1–2 times a day

- **INTERACTIONS** → Appendix 1: iron (oral)
- **SIDE-EFFECTS** Tooth discolouration

● **PRESCRIBING AND DISPENSING INFORMATION**

Iron content Ferrous sulfate 200 mg is equivalent to 65 mg iron; *Ironorm*<sup>®</sup> drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; *Feospan*<sup>®</sup> spansules contain ferrous sulfate 150 mg (47 mg iron) (spansule (= capsules m/r)); *Ferrograd*<sup>®</sup> tablets contain ferrous sulfate 325 mg (105 mg iron).

- ▶ With oral use in adults Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

● **PATIENT AND CARER ADVICE**

## 1.3 Megaloblastic anaemia

### Anaemia, megaloblastic

#### Overview

Most megaloblastic anaemias result from a lack of either vitamin B<sub>12</sub> or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B<sub>12</sub>.

Vitamin B<sub>12</sub> is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B<sub>12</sub> should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial gastrectomy* if a vitamin B<sub>12</sub> absorption test shows vitamin B<sub>12</sub> malabsorption).

Apart from dietary deficiency, all other causes of vitamin B<sub>12</sub> deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B<sub>12</sub> orally and none for vitamin B<sub>12</sub> intrinsic factor complexes given by mouth. Vitamin B<sub>12</sub> in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 1026 has completely replaced cyanocobalamin p. 1025 as the form of vitamin B<sub>12</sub> of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B<sub>12</sub> neuropathy.

Folic acid p. 1025 has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B<sub>12</sub> is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states*, *malabsorption*, or in *renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 941 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B<sub>12</sub> or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 1089.

## VITAMINS AND TRACE ELEMENTS &gt; FOLATES

## Folic acid

09-Jun-2016

## ● INDICATIONS AND DOSE

**Folate-deficient megaloblastic anaemia**

## ▶ BY MOUTH

- ▶ Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- ▶ Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states
- ▶ Adult: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

**Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see Neural tube defects (prevention in pregnancy) p. 1089)**

## ▶ BY MOUTH

- ▶ Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

**Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see Neural tube defects (prevention in pregnancy) p. 1089)**

## ▶ BY MOUTH

- ▶ Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

**Prevention of neural tube defects (in those with sickle-cell disease)**

## ▶ BY MOUTH

- ▶ Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

**Prevention of methotrexate-induced side-effects in rheumatic disease**

## ▶ BY MOUTH

- ▶ Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

**Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis**

## ▶ BY MOUTH

- ▶ Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

**Prophylaxis in chronic haemolytic states**

## ▶ BY MOUTH

- ▶ Adult: 5 mg every 1-7 days, frequency dependent on underlying disease

**Prophylaxis of folate deficiency in dialysis**

## ▶ BY MOUTH

- ▶ Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- ▶ Child 12-17 years: 5-10 mg once daily
- ▶ Adult: 5 mg every 1-7 days

**Prophylaxis of folate deficiency in patients receiving parenteral nutrition**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 15 mg 1-2 times a week, usually given by *intravenous infusion* in the parenteral nutrition solution

- **UNLICENSED USE** Not licensed for prevention of methotrexate-induced side-effects in severe Crohn's disease. Not licensed for prevention of methotrexate-induced side-effects in rheumatic disease. Not licensed for prevention of methotrexate-induced side-effects in severe psoriasis.

- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS** Abdominal distension · appetite decreased · flatulence · nausea · vitamin B12 deficiency exacerbated
- **PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia [www.medicinesforchildren.org.uk/folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia](http://www.medicinesforchildren.org.uk/folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia)
- **EXCEPTIONS TO LEGAL CATEGORY**  
▶ With oral use Can be sold to the public provided daily doses do not exceed 500 micrograms.

## VITAMINS AND TRACE ELEMENTS &gt; VITAMIN B GROUP

## Cyanocobalamin

29-Mar-2019

## ● INDICATIONS AND DOSE

**Vitamin B<sub>12</sub> deficiency of dietary origin**

## ▶ BY MOUTH

- ▶ Adult: 50-150 micrograms daily, dose to be taken between meals
- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mg every 2-3 days for 11 doses; maintenance 1 mg every month

- **PRESCRIBING AND DISPENSING INFORMATION** Currently available brands of the tablet may not be suitable for vegans.

The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied.

- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** *Cyanocobalamin* solution and *Cytamen*® injection are not prescribable in NHS primary care.
- **LESS SUITABLE FOR PRESCRIBING** Cyanocobalamin is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Solution for injection**▶ **Cytamen** (RPH Pharmaceuticals AB)

**Cyanocobalamin 1 mg per 1 ml** Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule (PoM) £14.50 DT = £14.50

**Tablet**▶ **Cyanocobalamin (Non-proprietary)**

**Cyanocobalamin 50 microgram** Cyanocobalamin 50microgram tablets | 50 tablet [P] £11.81 DT = £10.83

- ▶ **Behepan (Imported: Sweden)**  
Cyanocobalamin 1 mg Behepan 1mg tablets | 100 tablet PoM X

## Hydroxocobalamin

20-Jul-2017

### ● INDICATIONS AND DOSE

#### Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 mg every 2–3 months

#### Pernicious anaemia and other macrocytic anaemias without neurological involvement

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 2–3 months

#### Pernicious anaemia and other macrocytic anaemias with neurological involvement

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

#### Tobacco amblyopia

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

#### Leber's optic atrophy

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

### CYANOKIT®

#### Poisoning with cyanides

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability
- ▶ Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

### ● UNLICENSED USE

- ▶ With intramuscular use or oral use in children Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

### ● CAUTIONS

- ▶ With intramuscular use or oral use should not be given before diagnosis fully established

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

Diarrhoea · dizziness · headache · hot flush · nausea · skin reactions · urine discolouration

#### SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Arrhythmia · chills · drug fever · hypokalaemia · malaise · pain · thrombocytosis · tremor · vomiting
- ▶ With intravenous use Angioedema · dysphagia · extrasystole · gastrointestinal discomfort · memory loss · mucosal discolouration red · peripheral oedema · pleural effusion · rash pustular · red discolouration of plasma · restlessness · swelling · throat complaints
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **EFFECT ON LABORATORY TESTS**
- ▶ With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Cyanokit)*®, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
- ▶ With oral use in children For administration by *mouth*, injection solution may be given orally; it will not have prolonged effect via this route.

### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied.  
Poisoning by cyanides
- ▶ With intravenous use *Cyanokit*® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

### ● NATIONAL FUNDING/ACCESS DECISIONS

- **NHS restrictions** *Cobalin-H*® is not prescribable in NHS primary care.  
*Neo-Cytamen*® is not prescribable in NHS primary care.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Hydroxocobalamin (Non-proprietary)

**Hydroxocobalamin 1 mg per 1 ml** Hydroxocobalamin 1mg/1ml solution for injection ampoules | 5 ampoule PoM £12.90 DT = £10.60

##### ▶ Cobalin (Advanz Pharma)

**Hydroxocobalamin 1 mg per 1 ml** Cobalin-H 1mg/1ml solution for injection ampoules | 5 ampoule PoM £9.50 DT = £10.60

##### ▶ Neo-Cytamen (RPH Pharmaceuticals AB)

**Hydroxocobalamin 1 mg per 1 ml** Neo-Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule PoM £12.49 DT = £10.60

#### Powder for solution for infusion

##### ▶ Cyanokit (SERB)

**Hydroxocobalamin 5 gram** Cyanokit 5g powder for solution for infusion vials | 1 vial PoM £772.00

## 2 Iron overload

### Iron overload

#### Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 1028 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 1082 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

## ANTIDOTES AND CHELATORS > IRON CHELATORS

### Deferasirox

28-Jun-2018

● **DRUG ACTION** Deferasirox is an oral iron chelator.

#### ● INDICATIONS AND DOSE

**Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)**

▶ BY MOUTH

• **Adult:** Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

**Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)**

**Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)**

▶ BY MOUTH

• **Adult:** Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

**Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)**

▶ BY MOUTH

• **Adult:** Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 14 mg/kg per day

● **CAUTIONS** Elderly (increased risk of side-effects) · history of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than  $50 \times 10^9$ /litre · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

● **INTERACTIONS** → Appendix 1: iron chelators

#### ● SIDE-EFFECTS

▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · headache · nausea · skin reactions · urine abnormalities · vomiting

▶ **Uncommon** Anxiety · cataract · cholelithiasis · deafness · dizziness · fatigue · fever · gastrointestinal disorders · gastrointestinal haemorrhage (including fatal cases) · hepatic disorders · laryngeal pain · maculopathy · oedema · renal tubular disorders · sleep disorder

▶ **Rare or very rare** Optic neuritis

▶ **Frequency not known** Acute kidney injury · alopecia · anaemia aggravated · angioedema · hypersensitivity vasculitis · metabolic acidosis · nephritis tubulointerstitial · nephrolithiasis · neutropenia · pancreatitis acute · pancytopenia · renal tubular necrosis · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

● **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises reduce initial dose considerably then gradually increase to max. 50% of normal dose in moderate impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute. **Dose adjustments** Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute and serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—consult product literature.

● **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.

● **DIRECTIONS FOR ADMINISTRATION** For *film-coated tablets*, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

● **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox tablets.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2017) that deferasirox (*Exjade*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Patients with myelodysplastic syndromes, the commonest cause of transfusion-dependent anaemia, were poorly represented in the clinical trial population and the economic case was not demonstrated in this group.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Exjade** (Novartis Pharmaceuticals UK Ltd) ▼

**Deferasirox 90 mg** Exjade 90mg tablets | 30 tablet [PoM](#) £126.00

**Deferasirox 360 mg** Exjade 360mg tablets | 30 tablet [PoM](#)  
£504.00 DT = £504.00

## Deferiprone

● **DRUG ACTION** Deferiprone is an oral iron chelator.

#### ● INDICATIONS AND DOSE

**Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate**

▶ BY MOUTH

• **Adult:** 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia
- **INTERACTIONS** → Appendix 1: deferiprone
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain (reducing dose and increasing gradually may improve tolerance) · agranulocytosis · appetite increased · arthralgia · diarrhoea (reducing dose and increasing gradually may improve tolerance) · fatigue · headache · nausea (reducing dose and increasing gradually may improve tolerance) · neutropenia · urine discolouration · vomiting (reducing dose and increasing gradually may improve tolerance)
- ▶ **Frequency not known** Skin reactions · zinc deficiency
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
  - ▶ Monitor plasma-zinc concentration.
- **PATIENT AND CARER ADVICE**

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Oral solution**

CAUTIONARY AND ADVISORY LABELS 14

- ▶ **Ferriprox** (Swedish Orphan Biovitrum Ltd)

**Deferiprone 100 mg per 1 ml** Ferriprox 100mg/ml oral solution sugar-free | 500 ml [PoM] £152.39 DT = £152.39

**Tablet**

CAUTIONARY AND ADVISORY LABELS 14

**Deferiprone 500 mg** Ferriprox 500mg tablets | 100 tablet [PoM] £152.39 DT = £152.39

**Deferiprone 1 gram** Ferriprox 1000mg tablets | 50 tablet [PoM] £175.25 DT = £175.25

**Desferrioxamine mesilate****(Deferoxamine Mesilate)**● **INDICATIONS AND DOSE****Iron poisoning**

- ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**
- ▶ **Adult:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

**Aluminium overload in dialysis patients**

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** (consult product literature or local protocols)

**Chronic iron overload (low iron overload)**

- ▶ **BY SUBCUTANEOUS INFUSION**
- ▶ **Adult:** The dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**

- ▶ **BY SUBCUTANEOUS INFUSION**
- ▶ **Adult:** 20–50 mg/kg daily

- **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)
- **INTERACTIONS** → Appendix 1: iron chelators
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · bone disorder · fever · growth retardation · headache · muscle complaints · nausea · skin reactions
  - ▶ **Uncommon** Abdominal pain · asthma · deafness · neurosensory · tinnitus · vomiting
  - ▶ **Rare or very rare** Angioedema · blood disorder · cataract · diarrhoea · dizziness · encephalopathy · eye disorders · hypersensitivity · hypotension (more common when given too rapidly by intravenous injection) · increased risk of infection · nerve disorders · nervous system disorder · paraesthesia · respiratory disorders · shock · tachycardia · thrombocytopenia · vision disorders
  - ▶ **Frequency not known** Acute kidney injury · hypocalcaemia · leucopenia · renal tubular disorder · seizure · urine red
- **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
  - ▶ Eye and ear examinations before treatment and at 3-month intervals during treatment.
  - ▶ Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.
- **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.

For *intravenous infusion* (*Desferal*®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- ▶ **Desferrioxamine mesilate (Non-proprietary)**

**Desferrioxamine mesilate 500 mg** Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £39.90

**Desferrioxamine mesilate 2 gram** Desferrioxamine 2g powder for solution for injection vials | 10 vial [PoM] £179.50

- ▶ **Desferal** (Novartis Pharmaceuticals UK Ltd)

**Desferrioxamine mesilate 500 mg** Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63

**3 Neutropenia and stem cell mobilisation****3.1 Neutropenia****Neutropenia****Management**

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia

and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim below (unglycosylated rhG-CSF) and lenograstim p. 1030 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 1031 is a polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipefilgrastim p. 1031 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

## IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

### Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.
- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arthralgia · cutaneous vasculitis · dyspnoea · haemoptysis · headache · hypersensitivity · leucocytosis · pain · spleen abnormalities · thrombocytopenia
  - ▶ **Uncommon** Acute febrile neutrophilic dermatosis · capillary leak syndrome · hypoxia · pulmonary oedema · respiratory disorders · sickle cell anaemia with crisis
- SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY** Manufacturers advise avoid—toxicity in animal studies.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.
- **MONITORING REQUIREMENTS**
  - ▶ Full blood counts including differential white cell and platelet counts should be monitored.
  - ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

### Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

#### ● INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least

24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

**Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)**

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)**

- ▶ BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

**Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult 18–59 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

**Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Persistent neutropenia in HIV infection (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics
- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · diarrhoea · dysuria · haemorrhage · hepatomegaly · hyperuricaemia · hypotension · osteoporosis · rash

- ▶ **Uncommon** Fluid imbalance · graft versus host disease · peripheral vascular disease · pseudogout · rheumatoid arthritis aggravated · urine abnormalities
- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For *intravenous infusion (Neupogen<sup>®</sup>); (Nivestim<sup>®</sup>); (Zarzio<sup>®</sup>)* give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.
- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.
  - 1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Zarzio** (Sandoz Ltd)
  - Filgrastim 60 mega u per 1 ml** Zarzio 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £250.75
  - Filgrastim 96 mega u per 1 ml** Zarzio 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £399.50

## Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

### ● INDICATIONS AND DOSE

**Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)** |

**Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

**Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

**Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

**Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · asthenia
- ▶ **Rare or very rare** Erythema nodosum · pyoderma gangrenosum · toxic epidermal necrolysis

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Granocyte<sup>®</sup>)*, give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte-13* or up to 100 mL infusion fluid for *Granocyte-34*; give over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** *Granocyte<sup>®</sup>* solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

- ▶ **Granocyte** (Chugai Pharma UK Ltd)

**Lenograstim 13.4 mega u** Granocyte 13million unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £40.11 | 5 pre-filled disposable injection [PoM] £200.55

**Lenograstim 33.6 mega u** Granocyte 34million unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £62.54 | 5 pre-filled disposable injection [PoM] £312.69

F 1029

## Lipegfilgrastim

(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

### ● INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

### ● CAUTIONS

Myelosuppressive chemotherapy

### ● SIDE-EFFECTS

- **Common or very common** Chest pain · hypokalaemia · skin eruption

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Lonquex (Teva UK Ltd) ▼

Lipegfilgrastim 10 mg per 1 ml Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £652.06

F 1029

## Pegfilgrastim

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

### ● INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose is expressed as filgrastim

### ● CAUTIONS

Acute leukaemia · myelosuppressive chemotherapy

### ● SIDE-EFFECTS

- **Common or very common** Myalgia · nausea
- **Uncommon** Glomerulonephritis

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Neulasta (Amgen Ltd)

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Neulasta 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £686.38

Neulasta 6mg/0.6ml solution for injection pre-filled syringes with Onpro kit | 1 pre-filled disposable injection [PoM] £686.38 (Hospital only)

##### ► Pelgraz (Accord Healthcare Ltd) ▼

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Pelgraz 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £686.37 (Hospital only)

##### ► Pelmeg (Napp Pharmaceuticals Ltd) ▼

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Pelmeg 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £411.83 (Hospital only)

##### ► Zixtenzo (Sandoz Ltd) ▼

Filgrastim (as Pegfilgrastim) 10 mg per 1 ml Zixtenzo 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £617.74

## 3.2 Stem cell mobilisation

**IMMUNOSTIMULANTS** > CHEMOKINE RECEPTOR ANTAGONISTS

### Plerixafor

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

### ● INDICATIONS AND DOSE

**Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

### ● SIDE-EFFECTS

- **Common or very common** Arthralgia · constipation · diarrhoea · dizziness · dry mouth · erythema · fatigue · flatulence · gastrointestinal discomfort · headache · hyperhidrosis · malaise · musculoskeletal pain · nausea · oral hypoaesthesia · sleep disorders · vomiting
- **Uncommon** Hypersensitivity

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment— teratogenic in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless essential— teratogenic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** No information available if creatinine clearance less than 20 mL/minute.  
**Dose adjustments** Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute.

- **MONITORING REQUIREMENTS** Monitor platelets and white blood cell count.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Mozobil (Sanofi)

Plerixafor 20 mg per 1 ml Mozobil 24mg/1.2ml solution for injection vials | 1 vial [PoM] £4,882.77

## 4 Platelet disorders

### Platelet disorders

#### Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone p. 678, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh<sub>0</sub>) immunoglobulin p. 1289 is effective in raising the platelet count in about 80% of

unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1290 for intravenous use, but further doses are usually required.

Other therapies that have been tried in refractory idiopathic thrombocytopenic purpura include: azathioprine p. 836, cyclophosphamide p. 894, vincristine sulfate p. 929, ciclosporin p. 838, and danazol p. 742. Rituximab p. 882 [unlicensed indication] may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 110 may be given to reduce the severity of haemorrhage.

Eltrombopag below and romiplostim p. 1034 are thrombopoietin receptor agonists. They are licensed for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments, such as corticosteroids or immunoglobulins. Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

### Essential thrombocythaemia

Anagrelide below inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than  $1000 \times 10^9/L$  or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

## 4.1 Essential thrombocythaemia

### Other drugs used for Essential thrombocythaemia

Hydroxycarbamide, p. 935

### ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

## Anagrelide

28-May-2018

#### ● INDICATIONS AND DOSE

**Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)**

#### ▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment • concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment • risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1: anagrelide

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia • arrhythmias • asthenia • diarrhoea • dizziness • fluid retention • gastrointestinal discomfort • gastrointestinal disorders • headaches • nausea • palpitations • skin reactions • vomiting
- ▶ **Uncommon** Alopecia • appetite decreased • arthralgia • chest pain • chills • confusion • congestive heart failure • constipation • depression • dry mouth • dyspnoea • erectile

dysfunction • fever • haemorrhage • hypertension • insomnia • malaise • memory loss • myalgia • nervousness • oedema • pain • pancreatitis • pancytopenia • pneumonia • pulmonary hypertension • respiratory disorders • sensation abnormal • syncope • thrombocytopenia • weight changes

- ▶ **Rare or very rare** Angina pectoris • cardiomegaly • cardiomyopathy • coordination abnormal • drowsiness • dysarthria • influenza like illness • myocardial infarction • nocturia • pericardial effusion • postural hypotension • renal failure • tinnitus • vasodilation • vision disorders

- ▶ **Frequency not known** Hepatitis • nephritis tubulointerstitial

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in mild impairment; avoid in moderate-to-severe impairment or if serum transaminases exceed 5 times the upper limit of normal.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

#### ● MONITORING REQUIREMENTS

- ▶ Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- ▶ Monitor liver function.
- ▶ Monitor serum creatinine.
- ▶ Monitor urea.
- ▶ Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

##### ▶ Anagrelide (Non-proprietary)

**Anagrelide (as Anagrelide hydrochloride)**

500 microgram Anagrelide 500microgram capsules | 100 capsule [POM] £404.57 DT = £396.62

##### ▶ Xagrid (Shire Pharmaceuticals Ltd)

Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 100 capsule [POM] £404.57 DT = £396.62

## 4.2 Immune thrombocytopenia

### ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

## Eltrombopag

17-Aug-2018

#### ● INDICATIONS AND DOSE

**Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)**

#### ▶ BY MOUTH

- ▶ Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9/litre$  or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- ▶ Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9/litre$  or more—consult product literature for

dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

**Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)**

▶ BY MOUTH

- ▶ Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of  $50\text{--}75 \times 10^9$ /litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

**Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)**

▶ BY MOUTH

- ▶ Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day
- ▶ Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: ELTROMBOPAG (REVOLADE<sup>®</sup>): REPORTS OF INTERFERENCE WITH BILIRUBIN AND CREATININE TEST RESULTS (JULY 2018)

See *Effect on laboratory tests*.

- **CAUTIONS** Patients of East Asian origin · risk factors for thromboembolism
- **INTERACTIONS** → Appendix 1: eltrombopag
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abnormal loss of weight · alopecia · anaemia · anxiety · appetite abnormal · arthralgia · asthenia · cataract · chest discomfort · chills · concentration impaired · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dysphagia · dyspnoea · eye discomfort · eye disorders · fever · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · headaches · hepatic disorders · hyperbilirubinaemia · hyperglycaemia · hypoglycaemia · increased risk of infection · influenza like illness · iron overload · lymphopenia · malaise · memory loss · menorrhagia · mood altered · muscle complaints · nasal complaints · nausea · neutropenia · oedema · oral disorders · oropharyngeal complaints · pain · palpitations · QT interval prolongation · sensation abnormal · skin reactions · sleep disorders · splenic infarction · sweat changes · syncope · taste altered · urine discolouration · vertigo · vision disorders · vomiting · weight decreased
- ▶ **Uncommon** Anisocytosis · arrhythmias · balance impaired · cardiovascular disorder · cyanosis · ear pain · electrolyte imbalance · embolism and thrombosis · eosinophilia · eye inflammation · feeling hot · feeling jittery · food poisoning · gout · hemiparesis · increased leucocytes · lens opacity · muscle weakness · myocardial infarction · nephritis lupus · nerve disorders · rectosigmoid cancer · renal failure · retinal pigment epitheliopathy · sinus disorder · sleep apnoea · speech disorder · sunburn · thrombocytopenia · tremor · urinary disorders · urine abnormalities · vasodilation · wound inflammation
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
- ▶ When used for Idiopathic thrombocytopenic purpura Manufacturer advises consider avoiding.
- ▶ When used for Severe aplastic anaemia Manufacturer advises caution.
- ▶ When used for Thrombocytopenia associated with chronic hepatitis C infection Manufacturer advises caution (increased risk of hepatic decompensation and thromboembolic events).
- Dose adjustments**
- ▶ When used for Idiopathic thrombocytopenic purpura Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.
- ▶ When used for Severe aplastic anaemia Manufacturer advises initial dose reduction to 25 mg once daily and wait at least 2 weeks before upwards titration of dose.
- ▶ When used for Thrombocytopenia associated with chronic hepatitis C infection Manufacturer advises initial dose reduction to 25 mg once daily in moderate to severe impairment and wait at least 2 weeks before upwards titration of dose.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** For *severe aplastic anaemia*, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- ▶ Manufacturer advises regular ophthalmological examinations for cataract formation.
- ▶ Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- ▶ For *idiopathic thrombocytopenic purpura*, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached ( $50 \times 10^9$ /litre or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.
- ▶ For *severe aplastic anaemia*, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.
- ▶ For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached ( $50\text{--}75 \times 10^9$ /litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.
- **EFFECT ON LABORATORY TESTS** Eltrombopag is highly coloured and can cause serum discolouration and interference with total bilirubin and creatinine testing. If laboratory results are inconsistent with clinical observations, manufacturer advises re-testing using another method to help determine the validity of the result.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron,

magnesium, zinc, or selenium to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura** (updated October 2018)  
NICE TA293

Eltrombopag (*Revolade*<sup>®</sup>) is recommended as an option for treating chronic immune (idiopathic) thrombocytopenic purpura in adults, only if:

- their condition is refractory to standard active treatments and rescue therapies, **or**
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Eltrombopag is recommended only if the manufacturer provides it with the discount agreed in the patient access scheme.

Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta293](http://www.nice.org.uk/guidance/ta293)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 625/10

The *Scottish Medicines Consortium* has advised (August 2010) that eltrombopag (*Revolade*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Revolade** (Novartis Pharmaceuticals UK Ltd)

**Eltrombopag (as Eltrombopag olamine) 25 mg** Revolade 25mg tablets | 28 tablet [PoM] £770.00 DT = £770.00

**Eltrombopag (as Eltrombopag olamine) 50 mg** Revolade 50mg tablets | 28 tablet [PoM] £1,540.00 DT = £1,540.00

**Eltrombopag (as Eltrombopag olamine) 75 mg** Revolade 75mg tablets | 28 tablet [PoM] £2,310.00 DT = £2,310.00

## Romiplostim

28-Jan-2019

- **DRUG ACTION** Romiplostim is an Fc-peptide fusion protein that binds to and activates the thrombopoietin (TPO) receptor, thereby increasing platelet production.

- **INDICATIONS AND DOSE**

**Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg once weekly (max. per dose 10 micrograms/kg once weekly) until a stable platelet count of  $50 \times 10^9$ /litre or more is reached, consult product literature for further details of dose adjustments, discontinue treatment if inadequate response after 4 weeks at maximum dose

- **CAUTIONS** Risk factors for thromboembolism
- **SIDE-EFFECTS**
- ▶ **Common or very common** Anaemia · angioedema · arthralgia · asthenia · bone marrow disorders · chills · constipation · diarrhoea · dizziness · embolism and thrombosis · fever · flushing · gastrointestinal discomfort · headaches · hypersensitivity · increased risk of infection · influenza like illness · muscle complaints · nausea · pain ·

palpitations · peripheral oedema · sensation abnormal · skin reactions · sleep disorders

- ▶ **Uncommon** Alopecia · appetite decreased · chest pain · clonus · cough · dehydration · depression · dry throat · dysphagia · dyspnoea · erythromelalgia · eye disorders · eye pruritus · feeling hot · feeling jittery · gastroesophageal reflux disease · gout · haemorrhage · hair growth abnormal · hypotension · irritability · leucocytosis · malaise · muscle weakness · myocardial infarction · nasal complaints · neoplasms · oral disorders · papilloedema · peripheral ischaemia · peripheral neuropathy · photosensitivity reaction · pleuritic pain · portal vein thrombosis · skin nodule · splenomegaly · taste altered · thrombocytosis · tooth discolouration · vertigo · vision disorders · vomiting · weight changes

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution; consider avoiding in moderate to severe impairment (risk of thromboembolic complications).

- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

- **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor full blood count and peripheral blood smears for morphological abnormalities before and during treatment.
- ▶ Manufacturer advises monitor platelet count weekly until platelet count reaches  $50 \times 10^9$ /litre or more for at least 4 weeks without dose adjustment, then monthly thereafter.
- ▶ Manufacturer advises monitor platelet count following treatment discontinuation—risk of bleeding.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises that patients and their carers should be counselled on the effects on driving and the performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura** (updated October 2018)  
NICE TA221

Romiplostim (*Nplate*<sup>®</sup>) is recommended as an option for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults, only if:

- their condition is refractory to standard active treatments and rescue therapies, **or**
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Romiplostim is recommended only if the manufacturer makes it available with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta221](http://www.nice.org.uk/guidance/ta221)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 553/09

The *Scottish Medicines Consortium* has advised (October 2009) that romiplostim (*Nplate*<sup>®</sup>) is accepted for restricted use within NHS Scotland for adult chronic immune (idiopathic) thrombocytopenic purpura (ITP) splenectomised patients who are refractory to other treatments (e.g. corticosteroids, immunoglobulins) and as second-line treatment for adult non-splenectomised patients where surgery is contra-indicated. Romiplostim is

restricted to those with severe symptomatic ITP or those with a high risk of bleeding.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Nplate** (Amgen Ltd)

**Romiplostim 250 microgram** Nplate 250microgram powder and solvent for solution for injection pre-filled disposable devices | 1 pre-filled disposable injection [POM] £482.00

**Powder for solution for injection**

- **Nplate** (Amgen Ltd)

**Romiplostim 125 microgram** Nplate 125microgram powder for solution for injection vials | 1 vial [POM] £241.00

## Nutrition and metabolic disorders

### 1 Fluid and electrolyte imbalances

#### Fluids and electrolytes

##### Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

##### Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

##### Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see **warning on renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 227 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency (common in the elderly)* to reduce the **risk of hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

##### Management of hyperkalaemia

**Acute severe hyperkalaemia** (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 1045 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 1041 given over 5–15 minutes, reduces serum-potassium concentration; this is required if necessary or a continuous infusion instituted. Salbutamol p. 252 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 1038 should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

##### Oral sodium and water

Sodium chloride p. 1040 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

##### Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na<sup>+</sup> 75 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

**Fluids and electrolytes**

## Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre				
	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>	Ca <sup>2+</sup>
<i>Normal plasma values</i>	142	4.5	26	103	2.5
Sodium Chloride 0.9%	150	-	-	150	-
Compound Sodium Lactate (Hartmann's)	131	5	29	111	2
Sodium Chloride 0.18% and Glucose 4% (Adults only)	30	-	-	30	-
Sodium Chloride 0.45% and Glucose 5% (Children only)	75	-	-	75	-
Potassium Chloride 0.15% and Glucose 5% (Children only)	-	20	-	20	-
Potassium Chloride 0.15% and Sodium Chloride 0.9% (Children only)	150	20	-	170	-
Potassium Chloride 0.3% and Glucose 5%	-	40	-	40	-
Potassium Chloride 0.3% and Sodium Chloride 0.9%	150	40	-	190	-
<i>To correct metabolic acidosis</i>					
Sodium Bicarbonate 1.26%	150	-	150	-	-
Sodium Bicarbonate 8.4% for cardiac arrest	1000	-	1000	-	-
Sodium Lactate (m/6)	167	-	167	-	-

## Electrolyte content—gastro-intestinal secretions

Type of fluid	Millimoles per litre				
	H <sup>+</sup>	Na <sup>+</sup>	K <sup>+</sup>	HCO <sub>3</sub> <sup>-</sup>	Cl <sup>-</sup>
Gastric	40-60	20-80	5-20	-	100-150
Biliary	-	120-140	5-15	30-50	80-120
Pancreatic	-	120-140	5-15	70-110	40-80
Small bowel	-	120-140	5-15	20-40	90-130

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

**Oral bicarbonate**

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

**Parenteral preparations for fluid and electrolyte imbalance****Electrolytes and water**

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 1040 or glucose 5% p. 1041) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

**Intravenous sodium**

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected

by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride with glucose solutions p. 1041 are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma  $\text{Na}^+$  remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

#### **Intravenous glucose**

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

#### **Intravenous potassium**

Potassium chloride with sodium chloride intravenous infusion p. 1040 is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

#### **Bicarbonate and lactate**

Sodium bicarbonate p. 1038 is used to control severe *metabolic acidosis* ( $\text{pH} < 7.1$ ) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours

with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

#### **Plasma and plasma substitutes**

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 1047, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

#### **Plasma substitutes**

Dextran, gelatin p. 1048, and the hydroxyethyl starch, tetra starch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

## BICARBONATE

## Sodium bicarbonate

## ● INDICATIONS AND DOSE

**Alkalinisation of urine | Relief of discomfort in mild urinary-tract infections**

## ▶ BY MOUTH

- ▶ Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

**Maintenance of alkaline urine**

## ▶ BY MOUTH

- ▶ Adult: 5–10 g daily, to be dissolved in water

**Chronic acidotic states such as uraemic acidosis or renal tubular acidosis**

## ▶ BY MOUTH

- ▶ Adult: 4.8 g daily, (57 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ), higher doses may be required and should be adjusted according to response

**Severe metabolic acidosis**

## ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- ▶ Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

## ● CONTRA-INDICATIONS

- ▶ With oral use Salt restricted diet

- **CAUTIONS** Avoid prolonged use in urinary conditions · cardiac disease · elderly · patients on sodium-restricted diet · respiratory acidosis

- **INTERACTIONS** → Appendix 1: sodium bicarbonate

● **SIDE-EFFECTS**

- ▶ With intravenous use Skin exfoliation · soft tissue necrosis · ulcer
- ▶ With oral use Abdominal cramps · burping · flatulence · hypokalaemia · metabolic alkalosis

● **PREGNANCY**

- ▶ With oral use Use with caution in urinary conditions.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use Manufacturer advises caution in cirrhosis. Salt restriction will be covered in the prelims.

● **RENAL IMPAIRMENT**

- ▶ With oral use Avoid (except for specialised role in some forms of renal disease).

● **MONITORING REQUIREMENTS**

- ▶ With intravenous use Plasma-pH and electrolytes should be monitored.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *slow intravenous injection* use a small volume of hypertonic solution (such as 50 mL of 8.4%). For *continuous intravenous infusion* a weaker solution of 1.26% solution can be infused over 3–4 hours.
- ▶ With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ . Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

- ▶ With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ /litre), various other strengths available.

● **PATIENT AND CARER ADVICE**

- ▶ With oral use Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, liquid

**Tablet**▶ **Sodium bicarbonate (Non-proprietary)**

- ▶ **Sodium bicarbonate 600 mg** Sodium bicarbonate 600mg tablets | 100 tablet [GS1] £29.75 DT = £26.77

**Solution for injection**▶ **Sodium bicarbonate (Non-proprietary)**

- ▶ **Sodium bicarbonate 84 mg per 1 ml** (1mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £98.34 DT = £98.34

- ▶ **Sodium bicarbonate 8.4%** (1mmol/ml) solution for injection 250ml bottles | 10 bottle [PoM] £100.00 DT = £100.00

- ▶ **Sodium bicarbonate 8.4%** (1mmol/ml) solution for injection 100ml bottles | 10 bottle [PoM] £100.00 DT = £100.00

**Oral solution**▶ **Thamcarb** (Thame Laboratories Ltd)

- ▶ **Sodium bicarbonate 84 mg per 1 ml** Thamcarb 84mg/1ml oral solution sugar-free | 100 ml [P] £39.80 DT = £39.80 sugar-free | 500 ml [P] £199.20 DT = £199.20

**Capsule**▶ **Sodium bicarbonate (Non-proprietary)**

- ▶ **Sodium bicarbonate 500 mg** Sodium bicarbonate 500mg capsules | 56 capsule [P] £17.56 DT = £1.47 | 100 capsule £2.89

**Infusion**▶ **Sodium bicarbonate (Non-proprietary)**

- ▶ **Sodium bicarbonate 12.6 mg per 1 ml** Polyfusor sodium bicarbonate 1.26% solution for infusion 500ml bottles | 1 bottle [PoM] £11.41

- ▶ **Sodium bicarbonate 14 mg per 1 ml** Polyfusor sodium bicarbonate 1.4% solution for infusion 500ml bottles | 1 bottle [PoM] £11.41

- ▶ **Sodium bicarbonate 27.4 mg per 1 ml** Polyfusor sodium bicarbonate 2.74% solution for infusion 500ml bottles | 1 bottle [PoM] £11.41

- ▶ **Sodium bicarbonate 42 mg per 1 ml** Polyfusor sodium bicarbonate 4.2% solution for infusion 500ml bottles | 1 bottle [PoM] £11.41

- ▶ **Sodium bicarbonate 84 mg per 1 ml** Polyfusor sodium bicarbonate 8.4% solution for infusion 200ml bottles | 1 bottle [PoM] £11.41

## ELECTROLYTES AND MINERALS &gt; POTASSIUM

## Potassium chloride with calcium chloride and sodium chloride and sodium lactate

(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann's Solution for Injection; Ringier-Lactate Solution for Injection)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 1057, sodium chloride p. 1040, calcium chloride p. 1045.

● **INDICATIONS AND DOSE**

**For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium**

## ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts · potassium chloride

- **PRESCRIBING AND DISPENSING INFORMATION** Compound sodium lactate intravenous infusion contains  $\text{Na}^+$

131 mmol, K<sup>+</sup> 5 mmol, Ca<sup>2+</sup> 2 mmol, HCO<sub>3</sub><sup>-</sup> (as lactate) 29 mmol, Cl<sup>-</sup> 111 mmol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Infusion

- ▶ **Potassium chloride with calcium chloride and sodium chloride and sodium lactate (Non-proprietary)**

## ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

### Sodium chloride

- **INDICATIONS AND DOSE**

**Prophylaxis of sodium chloride deficiency**

- ▶ BY MOUTH

- ▶ Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

**Chronic renal salt wasting**

- ▶ BY MOUTH

- ▶ Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

### Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 500 mL, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

**Diluent for instillation of drugs to the bladder**

- ▶ BY INTRAVESICAL INSTILLATION

- ▶ Adult: (consult product literature)

- **CAUTIONS**

- ▶ With intravenous use Avoid excessive administration · cardiac failure · dilutional hyponatraemia especially in the elderly · hypertension · peripheral oedema · pulmonary oedema · restrict intake in impaired renal function · toxæmia of pregnancy

- **SIDE-EFFECTS**

- ▶ With intravenous use Chills · fever · hypervolaemia · hypotension · local reaction · localised pain · paraesthesia · skin reactions · tremor · vascular irritation · venous thrombosis
- ▶ With oral use Abdominal cramps · acidosis hyperchloraemic · diarrhoea · generalised oedema · hypertension · hypotension · irritability · muscle complaints · nausea · vomiting

- **MONITORING REQUIREMENTS**

- ▶ With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

- **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With intravenous use Sodium chloride 0.9% intravenous infusion contains Na<sup>+</sup> and Cl<sup>-</sup> each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- ▶ With oral use Each *Slow Sodium*<sup>®</sup> tablet contains approximately 10 mmol each of Na<sup>+</sup> and Cl<sup>-</sup>;  tablets can be crushed before administration .

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

**Modified-release tablet**

## NUTRIENTS > SUGARS

### Glucose

#### (Dextrose Monohydrate)

#### • INDICATIONS AND DOSE

##### Establish presence of gestational diabetes

► BY MOUTH

► Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

##### Oral glucose tolerance test

► BY MOUTH

► Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

##### Hypoglycaemia

► BY INTRAVENOUS INFUSION

► Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

► Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

##### Energy source

► BY INTRAVENOUS INFUSION

► Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

##### Water replacement

► BY INTRAVENOUS INFUSION

► Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

##### Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

► BY INTRAVENOUS INFUSION

► Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

##### Management of diabetic ketoacidosis

► BY INTRAVENOUS INFUSION

► Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

► Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion

##### DOSE EQUIVALENCE AND CONVERSION

► 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

• **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances

- **SIDE-EFFECTS** Chills · electrolyte imbalance · fever · fluid imbalance · hypersensitivity · local reaction · localised pain · polyuria · rash · venous thrombosis
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use in children Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

## 1.1 Calcium imbalance

### Calcium imbalance

#### Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 1045 should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 1045 is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 1051.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

#### Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 1040. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 729 is probably the most effective.

**Corticosteroids** are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 733 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

#### Hyperparathyroidism

Paricalcitol p. 1087 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

Parathyroidectomy may be indicated for hyperparathyroidism.

#### Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 166. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

### 1.1a Hypercalcaemia and hypercalciuria

#### CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

### Cinacalcet

20-Feb-2019

- **DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

#### ● INDICATIONS AND DOSE

##### Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis

###### ▶ BY MOUTH

- ▶ Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

##### Treatment of hypercalcaemia in parathyroid carcinoma | Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate

###### ▶ BY MOUTH

- ▶ Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

- **CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia

- **INTERACTIONS** → Appendix 1: cinacalcet

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · back pain · constipation · cough · diarrhoea · dizziness · dyspnoea · electrolyte imbalance · gastrointestinal discomfort · headache · hypersensitivity · hypotension · muscle complaints · nausea · paraesthesia · rash · seizure · upper respiratory tract infection · vomiting
- ▶ **Frequency not known** Heart failure aggravated · osteodystrophy · QT interval prolongation · tetany · ventricular arrhythmia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.

#### ● MONITORING REQUIREMENTS

- ▶ Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.
- ▶ In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TA117 Cinacalcet (*Mimpara*®) is **not** recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet (*Mimpara*®) is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:

- who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
- in whom surgical parathyroidectomy is contra-indicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

[www.nice.org.uk/guidance/ta117](http://www.nice.org.uk/guidance/ta117)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

#### ▶ *Mimpara* (Amgen Ltd)

Cinacalcet (as Cinacalcet hydrochloride) 30 mg *Mimpara* 30mg tablets | 28 tablet [PoM] £125.75 DT = £125.75

Cinacalcet (as Cinacalcet hydrochloride) 60 mg *Mimpara* 60mg tablets | 28 tablet [PoM] £231.97 DT = £231.97

Cinacalcet (as Cinacalcet hydrochloride) 90 mg *Mimpara* 90mg tablets | 28 tablet [PoM] £347.96 DT = £347.96

## Etelcalcetide

26-Jul-2017

- **DRUG ACTION** Etelcalcetide reduces parathyroid hormone secretion, which leads to a decrease in serum calcium concentrations.

### ● INDICATIONS AND DOSE

#### Secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis

##### ▶ BY INTRAVENOUS INJECTION

- ▶ Adult: Initially 5 mg 3 times a week, then increased in steps of 2.5–5 mg if required, dose to be increased at intervals of at least 4 weeks; usual maintenance 2.5–15 mg 3 times a week, max. dose 15 mg 3 times a week; consult product literature for information on missed doses, and for dose adjustment due to parathyroid hormone levels or serum-calcium concentrations

- **CAUTIONS** Conditions that may worsen with hypocalcaemia · hypocalcaemia (do not initiate if serum-calcium concentration is less than the lower limit of normal range) · switching from cinacalcet (do not initiate until 7 days after the last dose of cinacalcet)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Conditions that may worsen with hypocalcaemia Manufacturer advises caution with use in patients with conditions that may worsen with hypocalcaemia, including predisposition to QT-interval prolongation, history of seizures, and history of congestive heart failure—serum-calcium concentration should be closely monitored.
- **INTERACTIONS** → Appendix 1: etelcalcetide

### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · electrolyte imbalance · headache · heart failure aggravated · hypotension · muscle complaints · nausea · paraesthesia · QT interval prolongation · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises if formation of anti-etelcalcetide antibodies with a clinically significant effect is suspected, contact manufacturer to discuss antibody testing.

- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor parathyroid hormone level 4 weeks after treatment initiation or dose adjustment and approximately every 1–3 months during maintenance treatment; monitor serum-calcium concentration before treatment initiation, within 1 week of initiation or dose adjustment, and then approximately every 4 weeks during maintenance treatment.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be told to seek medical advice if symptoms of hypocalcaemia occur.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ Etelcalcetide for treating secondary hyperparathyroidism (June 2017) NICE TA448

Etelcalcetide is recommended as an option for treating secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis, only if treatment with a calcimimetic is indicated but cinacalcet is not suitable, and the manufacturer provides etelcalcetide with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA448](http://www.nice.org.uk/guidance/TA448)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2017) that etelcalcetide (*Parsabiv*®) is not recommended for use within NHS Scotland for the treatment of secondary hyperparathyroidism in patients with chronic kidney disease on haemodialysis as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Calcium carbonate 500 mg Tums Assorted Fruit Antacid tablets | 36 tablet [GSL] £1.33 | 75 tablet [GSL] £2.14

## Calcium carbonate with calcium lactate gluconate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate above.

### ● INDICATIONS AND DOSE

#### Calcium deficiency

- ▶ BY MOUTH
- ▶ Adult: Dose according to requirements

- **INTERACTIONS** → Appendix 1: calcium salts
- **PRESCRIBING AND DISPENSING INFORMATION** Each *Sandocal*<sup>®</sup> tablet contains 1 g calcium (Ca<sup>2+</sup> 25 mmol); flavours of soluble tablet formulations may include orange.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

EXCIPIENTS: May contain Aspartame

- ▶ **Sandocal** (GlaxoSmithKline Consumer Healthcare)  
Calcium carbonate 1.75 gram, Calcium lactate gluconate 2.263 gram Sandocal 1000 effervescent tablets sugar-free | 30 tablet [P] £11.65 DT = £11.65

F 1044

## Calcium chloride

### ● INDICATIONS AND DOSE

#### Severe acute hypocalcaemia or hypocalcaemic tetany

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: Dose according to requirements

- **CAUTIONS** Avoid in respiratory acidosis · avoid in respiratory failure
- **INTERACTIONS** → Appendix 1: calcium salts
- **SIDE-EFFECTS** Soft tissue calcification · taste unpleasant · vasodilation
- **DIRECTIONS FOR ADMINISTRATION** Care should be taken to avoid extravasation.
- **PRESCRIBING AND DISPENSING INFORMATION** Non-proprietary *Calcium chloride dihydrate* 7.35% (calcium 20 mg or Ca<sup>2+</sup> 500 micromol/mL); *Calcium chloride dihydrate* 10% (calcium 27.3 mg or Ca<sup>2+</sup> 680 micromol/mL); *Calcium chloride dihydrate* 14.7% (calcium 40.1 mg or Ca<sup>2+</sup> 1000 micromol/mL).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

#### Solution for injection

- ▶ **Calcium chloride (Non-proprietary)**  
Calcium chloride dihydrate 100 mg per 1 ml Calcium chloride 10% solution for injection 10ml pre-filled syringes | 1 pre-filled disposable injection [PoM] £9.42 DT = £9.42
- Calcium chloride dihydrate 147 mg per 1 ml Calcium chloride 14.7% solution for injection 5ml ampoules | 10 ampoule [PoM] £120.98
- Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule [PoM] £88.28 DT = £88.28

F 1044

## Calcium gluconate

### ● INDICATIONS AND DOSE

#### Severe acute hypocalcaemia or hypocalcaemic tetany

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with continued →

plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 mL/hour, adjusted according to response, infusion to be administered using 100 mL of calcium gluconate 10% diluted in 1 litre of glucose 5% or sodium chloride 0.9%

**Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement

**Calcium deficiency | Mild asymptomatic hypocalcaemia**

- ▶ BY MOUTH
- ▶ Adult: Dose according to requirements

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

**IMPORTANT SAFETY INFORMATION**

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

- **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**  
Arrhythmias

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Circulatory collapse · feeling hot · hyperhidrosis · hypotension · vasodilation · vomiting
- ▶ With oral use Gastrointestinal disorder
- **MONITORING REQUIREMENTS**
- ▶ With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intravenous use For continuous intravenous infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.
- **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or  $\text{Ca}^{2+}$  2.23 mmol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

**Solution for injection**

- ▶ **Calcium gluconate (Non-proprietary)**  
Calcium gluconate 100 mg per 1 ml Calcium gluconate 10% solution for injection 10ml ampoules | 10 ampoule [PoM] £7.50-£12.50 DT = £12.50 | 20 ampoule [PoM] £30.00

**Effervescent tablet**

CAUTIONARY AND ADVISORY LABELS 13

ELECTROLYTES: May contain Sodium

- ▶ **Calcium gluconate (Non-proprietary)**  
Calcium gluconate 1 gram Calcium gluconate 1g effervescent tablets | 28 tablet [GSL] £16.10-£16.11 DT = £16.11

## Calcium lactate

● **INDICATIONS AND DOSE**

**Calcium deficiency**

- ▶ BY MOUTH
- ▶ Adult: Dose according to requirements

- **INTERACTIONS** → Appendix 1: calcium salts

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

▶ **Calcium lactate (Non-proprietary)**

Calcium lactate 300 mg Calcium lactate 300mg tablets | 84 tablet [GSL] DT = £4.57 | 84 tablet [GSL] £4.57 DT = £4.57

1044

## Calcium phosphate

● **INDICATIONS AND DOSE**

**Indications listed in combination monographs (available in the UK only in combination with other drugs)**

- ▶ BY MOUTH
- ▶ Adult: Doses listed in combination monographs

- **INTERACTIONS** → Appendix 1: calcium salts

- **SIDE-EFFECTS** Epigastric pain · gastrointestinal disorder · hypercalciuria

- **MEDICINAL FORMS** No licensed medicines listed.

## PARATHYROID HORMONES AND ANALOGUES

### Parathyroid hormone

21-Nov-2017

**(Human recombinant parathyroid hormone)**

- **DRUG ACTION** Parathyroid hormone is produced by recombinant DNA technology; endogenous parathyroid hormone is involved in modulating serum calcium and phosphate levels, regulating renal calcium and phosphate excretion, activating vitamin D, and maintaining normal bone turnover.

● **INDICATIONS AND DOSE**

**Chronic hypoparathyroidism (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Bone metastases · current or previous radiation therapy to skeleton · increased risk factors for osteosarcoma (including Paget's disease or hereditary disorders) · pseudohypoparathyroidism · skeletal malignancy · unexplained raised levels of bone-specific alkaline phosphatase

- **CAUTIONS** Concomitant use of cardiac glycosides (hypercalcaemia may predispose to digitalis toxicity)—monitor cardiac glycoside levels and check for signs and symptoms of digitalis toxicity · concomitant use of drugs that affect calcium levels · young adults with open epiphyses—increased risk of osteosarcoma

- **INTERACTIONS** → Appendix 1: parathyroid hormone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Electrolyte imbalance · fatigue · pain in extremity

**SIDE-EFFECTS, FURTHER INFORMATION** Hypercalcaemia is more likely during initial dose titration; if severe hypercalcaemia develops, hydrate and consider suspending treatment (including calcium supplement and active vitamin D).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **PRE-TREATMENT SCREENING** Manufacturer advises confirm sufficient 25-hydroxyvitamin D stores and normal serum magnesium before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor serum calcium and assess for signs and symptoms of hypocalcaemia and hypercalcaemia—adjust active vitamin D and calcium supplement as necessary; consult product literature.
  - ▶ Manufacturer advises periodic monitoring of the response of serum calcium to treatment (response may decrease over time—if 25-hydroxyvitamin D is low, supplementation may restore serum calcium response).
- **TREATMENT CESSATION** Abrupt interruption or discontinuation can result in severe hypocalcaemia—manufacturer advises to monitor serum calcium and adjust calcium supplement and active vitamin D treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Manufacturer advises record the brand name and batch number after each administration.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); reconstituted solution may be stored for up to 14 days in a refrigerator, and up to 3 days outside of a refrigerator (below 25 °C), during the 14-day use period.
- **PATIENT AND CARER ADVICE** Patients may self-administer *Natpar*<sup>®</sup>, after appropriate training in subcutaneous injection technique.
 

**Missed doses** Manufacturer advises missed doses should be administered as soon as possible, and additional treatment with calcium and/or active vitamin D must be taken, based on symptoms of hypocalcaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

ELECTROLYTES: May contain Sodium

#### ▶ **Natpar** (Shire Pharmaceuticals Ltd) ▼

**Parathyroid hormone 25 microgram** Natpar 25micrograms/dose powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £4,880.00

**Parathyroid hormone 50 microgram** Natpar 50micrograms/dose powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £4,880.00

**Parathyroid hormone 75 microgram** Natpar 75micrograms/dose powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £4,880.00

**Parathyroid hormone 100 microgram** Natpar 100micrograms/dose powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £4,880.00

## 1.2 Low blood volume

### BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

#### Albumin solution

(Human Albumin Solution)

##### ● INDICATIONS AND DOSE

**Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac failure · severe anaemia
- **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability
- **SIDE-EFFECTS**
  - ▶ Rare or very rare Fever · flushing · nausea · shock · urticaria
- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Infusion

##### ▶ **Flexbumin** (Baxalta UK Ltd)

**Albumin solution human 200 gram per 1 litre** Flexbumin 20% infusion 100ml bags | 1 bag [PoM] £3.75  
Flexbumin 20% infusion 50ml bags | 1 bag [PoM] £2.00

#### Solution for infusion

##### ▶ **Albumnorm** (Octapharma Ltd)

**Albumin solution human 50 mg per 1 ml** Albumnorm 5% solution for infusion 250ml bottles | 1 bottle [PoM] £33.75  
Albumnorm 5% solution for infusion 100ml bottles | 1 bottle [PoM] £13.50  
**Albumin solution human 200 mg per 1 ml** Albumnorm 20% solution for infusion 500ml bottles | 1 bottle [PoM] £67.50

**Albumin solution human 200 mg per 1 ml** Albumnorm 20% solution for infusion 100ml bottles | 1 bottle [PoM] £54.00  
Albumnorm 20% solution for infusion 50ml bottles | 1 bottle [PoM] £27.00

##### ▶ **Alburex** (CSL Behring UK Ltd)

**Albumin solution human 50 mg per 1 ml** Alburex 5% solution for infusion 500ml vials | 1 vial [PoM] £50.00  
**Albumin solution human 200 mg per 1 ml** Alburex 20% solution for infusion 100ml vials | 1 vial [PoM] £40.00

##### ▶ **Albutein** (Grifols UK Ltd)

**Albumin solution human 50 mg per 1 ml** Albutein 5% solution for infusion 500ml vials | 1 vial [PoM] £3.75  
**Albumin solution human 200 mg per 1 ml** Albutein 5% solution for infusion 250ml vials | 1 vial [PoM] £2.00

**Albumin solution human 200 mg per 1 ml** Albutein 20% solution for infusion 100ml vials | 1 vial [PoM] [X]

**Albumin 20% solution for infusion 50ml vials** | 1 vial [PoM] [X]

▶ **Biotest** (Biotest (UK) Ltd)

**Albumin solution human 50 mg per 1 ml** Human Albumin Biotest 5% solution for infusion 250ml vials | 1 vial [PoM] [X]

**Albumin solution human 200 mg per 1 ml** Human Albumin Biotest 20% solution for infusion 50ml vials | 1 vial [PoM] [X]  
Human Albumin Biotest 20% solution for infusion 100ml vials | 1 vial [PoM] [X]

▶ **Grifols** (Grifols UK Ltd)

**Albumin solution human 50 mg per 1 ml** Human albumin Grifols 5% solution for infusion 500ml bottles | 1 bottle [PoM] £42.75  
Human albumin Grifols 5% solution for infusion 250ml bottles | 1 bottle [PoM] £21.38

Human albumin Grifols 5% solution for infusion 100ml bottles | 1 bottle [PoM] £9.90

**Albumin solution human 200 mg per 1 ml** Human Albumin Grifols 20% solution for infusion 50ml vials | 1 vial [PoM] £23.40  
Human Albumin Grifols 20% solution for infusion 100ml vials | 1 vial [PoM] £46.80

▶ **Zenab** (Bio Products Laboratory Ltd)

**Albumin solution human 45 mg per 1 ml** Zenab 4.5% solution for infusion 250ml bottles | 1 bottle [PoM] £27.51  
Zenab 4.5% solution for infusion 500ml bottles | 1 bottle [PoM] £55.02

**Albumin solution human 200 mg per 1 ml** Zenab 20% solution for infusion 100ml bottles | 1 bottle [PoM] £54.00  
Zenab 20% solution for infusion 50ml bottles | 1 bottle [PoM] £27.00

## PLASMA SUBSTITUTES

### Dextran 70 with sodium chloride

31-Mar-2017

#### ● INDICATIONS AND DOSE

##### **Initial treatment of hypovolaemia with hypotension induced by traumatic injury**

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 250 mL, to be given over 2–5 minutes using *RescueFlow*<sup>®</sup>, followed immediately by administration of isotonic fluids.

- **CAUTIONS** Cardiac disease · hyperosmolality · severe hypoglycaemia · severe liver disease
- **SIDE-EFFECTS** Anaphylactic reaction
- **PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS**
  - ▶ Where possible, monitor central venous pressure.
  - ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
  - ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.
- **PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextran with an average molecular weight of about '70 000'.
- **MEDICINAL FORMS** No licensed medicines listed.

## Gelatin

#### ● INDICATIONS AND DOSE

##### **Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass**

▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 500–1000 mL, use 3.5–4% solution

- **CAUTIONS** Cardiac disease · severe liver disease
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Chills · dyspnoea · fever · hyperhidrosis · hypersensitivity · hypertension · hypotension · hypoxia · tachycardia · tremor · urticaria · wheezing
- **PREGNANCY** Manufacturer of *Geloplasma*<sup>®</sup> advises avoid at the end of pregnancy.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid preparations that contain lactate (risk of impaired lactate metabolism).
- **RENAL IMPAIRMENT** Use with caution in renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
  - ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.
- **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.  
*Gelaspan*<sup>®</sup> contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na<sup>+</sup> 151 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1 mmol, Cl<sup>-</sup> 103 mmol, Ca<sup>2+</sup> 1 mmol, acetate 24 mmol/litre; *Gelofusine*<sup>®</sup> contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 124 mmol/litre; *Geloplasma*<sup>®</sup> contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na<sup>+</sup> 150 mmol, K<sup>+</sup> 5 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 100 mmol, lactate 30 mmol/litre; *Isoplex*<sup>®</sup> contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 145 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 0.9 mmol, Cl<sup>-</sup> 105 mmol, lactate 25 mmol/litre; *Volplex*<sup>®</sup> contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 125 mmol/litre.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Infusion**

▶ **Gelaspan** (B.Braun Medical Ltd)

**Gelatin 40 mg per 1 ml** Gelaspan 4% infusion 500ml Ecobags | 1 bag [PoM] £5.95 (Hospital only)

▶ **Gelofusine** (B.Braun Medical Ltd)

**Gelatin 40 mg per 1 ml** Gelofusine 4% infusion 1litre Ecobags | 1 bag [PoM] £9.31  
Gelofusine 4% infusion 500ml Ecobags | 1 bag [PoM] £4.97

▶ **Geloplasma** (Fresenius Kabi Ltd)

**Gelatin 30 mg per 1 ml** Geloplasma 3% infusion 500ml Freeflex bags | 20 bag [PoM] [X]

▶ **Isoplex** (Kent Pharmaceuticals Ltd)

**Gelatin 40 mg per 1 ml** Isoplex 4% infusion 500ml bags | 10 bag [PoM] £75.00 (Hospital only)

▶ **Volplex** (Kent Pharmaceuticals Ltd)

**Gelatin 40 mg per 1 ml** Volplex 4% infusion 500ml bags | 10 bag [PoM] £47.00 (Hospital only)

## Tetrastarch

### ● INDICATIONS AND DOSE

#### VOLULYTE® INFUSION

#### Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

#### VOLUVEN® INFUSION

#### Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

- **CONTRA-INDICATIONS** Burns · cerebral haemorrhage · critically ill patients · dehydration · hyperhydration · intracranial haemorrhage · pulmonary oedema · sepsis · severe coagulopathy

- **CAUTIONS** Cardiac disease · care should be taken to avoid haematocrit concentration from falling below 25–30% · children · renal impairment · severe liver disease · surgery · trauma

#### ● SIDE-EFFECTS

- ▶ Rare or very rare Hypersensitivity
- ▶ Frequency not known Pruritus

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid.

#### ● MONITORING REQUIREMENTS

- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.

- ▶ Monitor renal function.
- ▶ Monitor for hypersensitivity reactions.
- ▶ Urine output should be monitored.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Hydroxyethyl starch is composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Volulyte® contains hydroxyethyl starch 6% (average molecular weight 130 000) in sodium chloride intravenous infusion 0.6%, containing Na<sup>+</sup> 137 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 110 mmol, acetate 34 mmol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Infusion

- ▶ **Volulyte** (Fresenius Kabi Ltd) ▼

Magnesium chloride hexahydrate 300 mg per 1 litre, Potassium chloride 300 mg per 1 litre, Sodium acetate trihydrate 4.63 gram per 1 litre, Sodium chloride 6.02 gram per 1 litre, Tetrastarch 60 gram per 1 litre Volulyte 6% infusion 500ml Freeflex bags | 15 bag [PoM] £229.60

- ▶ **Voluven** (Fresenius Kabi Ltd) ▼

Tetrastarch 60 mg per 1 gram Voluven 6% infusion 500ml Freeflex bags | 1 bag [PoM] £10.63  
Tetrastarch 100 mg per 1 ml Voluven 10% infusion 500ml Freeflex bags | 20 bag [PoM] £

## 1.3 Magnesium imbalance

### Magnesium imbalance

#### Overview

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate p. 1051 as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypomagnesaemia* (causing muscle weakness and arrhythmias) is rare.

#### Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg<sup>2+</sup> over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution p. 1050 is available as a licensed preparation and, magnesium glycerophosphate tablets and liquid p. 1050 [unlicensed] are available from 'special-order' manufacturers or specialist importing companies.

#### Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

#### Myocardial infarction

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

#### Eclampsia and pre-eclampsia

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent

seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection p. 1045 is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully.

## 1.3a Hypomagnesaemia

### ELECTROLYTES AND MINERALS > MAGNESIUM

#### Magnesium aspartate

##### ● INDICATIONS AND DOSE

##### Treatment and prevention of magnesium deficiency

###### ▶ BY MOUTH

- ▶ Adult: 10–20 mmol daily, taken as 1–2 sachets of *Magnaspartate*<sup>®</sup> powder.

- **CONTRA-INDICATIONS** Disorders of cardiac conduction

- **INTERACTIONS** → Appendix 1: magnesium

##### ● SIDE-EFFECTS

- ▶ **Uncommon** Diarrhoea · faeces soft
- ▶ **Rare or very rare** Fatigue · hypermagnesaemia
- ▶ **Frequency not known** Gastrointestinal irritation

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

**Overdose** Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Avoid in severe impairment (eGFR less than 30 mL/minute/1.73<sup>2</sup>).
- **DIRECTIONS FOR ADMINISTRATION** Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** *Magnaspartate*<sup>®</sup> contains magnesium aspartate 6.5 g (10 mmol Mg<sup>2+</sup>)/sachet.
- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer magnesium aspartate powder.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

##### Powder

EXCIPIENTS: May contain Sucrose

##### ▶ *Magnesiocard* (Imported (Germany))

Magnesium (as Magnesium aspartate hydrochloride) 121.5 mg *Magnesiocard* (magnesium 5mmol) oral powder 5g sachets | 50 sachet [P]

##### ▶ *Magnaspartate* (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg *Magnaspartate* 243mg (magnesium 10mmol) oral powder sachets | 10 sachet [PoM] £8.95 DT = £8.95

#### Magnesium glycerophosphate

24-Oct-2017

##### ● INDICATIONS AND DOSE

##### Prevent recurrence of magnesium deficit

###### ▶ BY MOUTH

- ▶ Adult: 24 mmol daily in divided doses, dose expressed as Mg<sup>2+</sup>

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium glycerophosphate 1 g is approximately equivalent to Mg<sup>2+</sup> 4 mmol or magnesium 97 mg.

##### NEOMAG<sup>®</sup> CHEWABLE TABLETS

##### Hypomagnesaemia

###### ▶ BY MOUTH

- ▶ Adult: Initially 1–2 tablets 3 times a day, dose to be adjusted according to the serum total magnesium level

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ Each *Neomag*<sup>®</sup> chewable tablet contains Mg<sup>2+</sup> 4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Preparations other than *Neomag*<sup>®</sup> are not licensed for use.

- **INTERACTIONS** → Appendix 1: magnesium

- **SIDE-EFFECTS** Diarrhoea · hypermagnesaemia

**Overdose** Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Increased risk of toxicity.

**Dose adjustments** Avoid or reduce dose.

**NEOMAG<sup>®</sup> CHEWABLE TABLETS** Manufacturer advises avoid in severe impairment.

- **MONITORING REQUIREMENTS** Manufacturer advises to monitor serum magnesium levels every 3–6 months.

- **DIRECTIONS FOR ADMINISTRATION**

**NEOMAG<sup>®</sup> CHEWABLE TABLETS** Manufacturer advises that tablets may be broken into quarters and chewed or swallowed with water.

- **NATIONAL FUNDING/ACCESS DECISIONS**

##### NEOMAG<sup>®</sup> CHEWABLE TABLETS

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2017) that magnesium glycerophosphate (*Neomag*<sup>®</sup>) is accepted for use within NHS Scotland as an oral magnesium supplement for the treatment of patients with chronic magnesium loss, hypomagnesaemia or drug-induced hypomagnesaemia.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, powder

##### Tablet

###### ▶ *Mag-4* (Ennogen Healthcare Ltd)

Magnesium (as Magnesium glycerophosphate) 97.2 mg *Mag-4* (magnesium 97.2mg (4mmol)) tablets | 30 tablet £84.50

##### Oral solution

###### ▶ *LiquaMag GP* (Fontus Health Ltd)

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml *LiquaMag GP* (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution sugar-free | 200 ml £49.99

###### ▶ *MagnaPhos* (TriOn Pharma Ltd)

Magnesium (as Magnesium glycerophosphate) 19.44 mg per 1 ml *MagnaPhos* 97.2mg/5ml (4mmol/5ml) oral solution | 200 ml £37.87 DT = £97.84

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml *MagnaPhos* 121.25mg/5ml (5mmol/5ml) oral solution | 200 ml £37.87 DT = £37.87

##### Chewable tablet

EXCIPIENTS: May contain Aspartame

###### ▶ *MagnEss Gly* (Essential-Healthcare Ltd)

Magnesium (as Magnesium glycerophosphate) 97.2 mg *MagnEss Gly* 97.2mg (4mmol) chewable tablets sugar-free | 50 tablet £13.89 DT = £22.77

###### ▶ *MagnaPhate* (Arjun Products Ltd)

Magnesium (as Magnesium glycerophosphate) 97.2 mg *MagnaPhate* (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 50 tablet £22.64 DT = £22.77

- ▶ **MagnaPhos** (TriOn Pharma Ltd)  
**Magnesium (as Magnesium glycerophosphate)**  
97.2 mg MagnaPhos 97.2mg (4mmol) chewable tablets sugar-free | 50 tablet £15.44 DT = £22.77
- Capsule**
- ▶ **MagnEss Gly** (Essential-Healthcare Ltd)  
**Magnesium (as Magnesium glycerophosphate)** 39.5 mg MagnEss Gly 39.5mg (1.6mmol) capsules | 50 capsule £28.17
- ▶ **Magnesium (as Magnesium glycerophosphate)** 48.6 mg MagnEss Gly 48.6mg (2mmol) capsules | 50 capsule £25.97
- ▶ **Magnesium (as Magnesium glycerophosphate)** 97.2 mg MagnEss Gly 97.2mg (4mmol) capsules | 50 capsule £27.83
- ▶ **MagnaPhos** (TriOn Pharma Ltd)  
**Magnesium (as Magnesium glycerophosphate)**  
48.6 mg MagnaPhos 48.6mg (2mmol) capsules | 50 capsule £28.86
- ▶ **Magnesium (as Magnesium glycerophosphate)**  
97.2 mg MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £31.86

## Magnesium sulfate

### ● INDICATIONS AND DOSE

#### Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
- ▶ Adult: 1.2–2 g, to be given over 20 minutes

#### Prevention of seizures in pre-eclampsia

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

#### Treatment of seizures and prevention of seizure recurrence in eclampsia

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

#### Hypomagnesaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

#### Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 2.5–5 g daily, usual dose 3 g daily

#### Emergency treatment of serious arrhythmias

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

#### Rapid bowel evacuation (acts in 2–4 hours)

- ▶ BY MOUTH
- ▶ Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Magnesium sulfate heptahydrate 1 g equivalent to Mg<sup>2+</sup> approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma and continuing respiratory deterioration in anaphylaxis.
- **CONTRA-INDICATIONS**
- ▶ With oral use in rapid bowel evacuation—acute gastrointestinal conditions (in adults)

### ● CAUTIONS

- ▶ With oral use in rapid bowel evacuation—elderly and debilitated patients (in adults)

### ● INTERACTIONS → Appendix 1: magnesium

### ● SIDE-EFFECTS

- ▶ **Rare or very rare**
- ▶ With oral use Paralytic ileus (in adults)
- ▶ **Frequency not known**
- ▶ With intravenous use Electrolyte imbalance
- ▶ With oral use Diarrhoea (in adults) · gastrointestinal discomfort (in adults) · hypermagnesaemia (in adults)

**Overdose** Symptoms of hypermagnesaemia may include nausea, vomiting, flushing, thirst, hypotension, drowsiness, confusion, reflexes absent (due to neuromuscular blockade), respiratory depression, speech slurred, diplopia, muscle weakness, arrhythmias, coma, and cardiac arrest.

### ● PREGNANCY

- ▶ When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression. Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

### ● HEPATIC IMPAIRMENT

Avoid in hepatic coma if risk of renal failure.

### ● RENAL IMPAIRMENT

Increased risk of toxicity.  
Dose adjustments Avoid or reduce dose.

### ● MONITORING REQUIREMENTS

Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For intravenous injection, in arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg<sup>2+</sup>); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute Mg<sup>2+</sup>).

### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg<sup>2+</sup>) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

### ● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With oral use in adults Magnesium sulfate is on sale to the public as Epsom Salts.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

#### Solution for injection

##### ▶ Magnesium sulfate (Non-proprietary)

- ▶ **Magnesium sulfate heptahydrate 500 mg per 1 ml** Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule [POM] £21.70-£21.71 DT = £21.71 | 50 ampoule [POM] £21.71
- ▶ Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial [POM] £57.40

Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule [PoM] £42.00-£61.26  
 Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule [PoM] £17.30-£17.35 DT = £17.35

#### Solution for infusion

##### ► Magnesium sulfate (Non-proprietary)

**Magnesium sulfate heptahydrate 100 mg per 1 ml** Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £66.26-£72.89 DT = £71.24

**Magnesium sulfate heptahydrate 500 mg per 1 ml** Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 100ml vials | 10 vial [PoM] £76.00

Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £81.10

#### Powder

##### ► Magnesium sulfate (Non-proprietary)

**Magnesium sulfate dried 1 mg per 1 mg** Magnesium sulfate powder | 300 gram [GSL] £2.09 | 500 gram [GSL] £3.20-£3.26 DT = £3.26 | 2000 gram [GSL] £5.60-£5.71 | 5000 gram [GSL] £11.49-£11.72

## 1.4 Phosphate imbalance

### Phosphate imbalance

#### Phosphate supplements

Oral phosphate supplements p. 1055 may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 1071.

#### Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

Sevelamer p. 1054 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 1053 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

Sucroferric oxyhydroxide p. 1054 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

## 1.4a Hyperphosphataemia

### ELECTROLYTES AND MINERALS > ALUMINIUM

#### Aluminium hydroxide

28-May-2018

##### ● INDICATIONS AND DOSE

#### Hyperphosphataemia in renal failure

##### ► BY MOUTH USING CAPSULES

► Adult: 4–20 capsules daily in divided doses, to be taken with meals

#### Antacid

##### ► BY MOUTH USING CAPSULES

► Adult: 475 mg 5 times a day, last dose to be taken at bedtime

● **CONTRA-INDICATIONS** Hypophosphataemia

● **INTERACTIONS** → Appendix 1: antacids

● **SIDE-EFFECTS** Constipation

● **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

► Alu-Cap (Meda Pharmaceuticals Ltd)

**Aluminium hydroxide 475 mg** Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT = £13.71

### ELECTROLYTES AND MINERALS >

#### CALCIUM

F 1044

#### Calcium acetate

##### ● INDICATIONS AND DOSE

#### PHOSEX<sup>®</sup> TABLETS

#### Hyperphosphataemia

##### ► BY MOUTH

► Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose 4–6 tablets daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

#### RENACET<sup>®</sup> TABLETS

#### Hyperphosphataemia

##### ► BY MOUTH

► Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

● **INTERACTIONS** → Appendix 1: calcium salts

● **SIDE-EFFECTS**

► **Uncommon** Vomiting

● **DIRECTIONS FOR ADMINISTRATION**

**PHOSEX<sup>®</sup> TABLETS** Phosex<sup>®</sup> tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

**RENACET<sup>®</sup> TABLETS** Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet<sup>®</sup> to reduce the possible interference with absorption of other drugs.

Renacet<sup>®</sup> tablets are taken with meals.

## ● PRESCRIBING AND DISPENSING INFORMATION

**PHOSEX® TABLETS** *Phosex®* tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca<sup>2+</sup> 6.2 mmol).

**RENACET® TABLETS** *Renacet®* tablets contain calcium acetate 475 mg (equivalent to calcium 120.25 mg or Ca<sup>2+</sup> 3 mmol).

## ● PATIENT AND CARER ADVICE

**PHOSEX® TABLETS** Patients or carers should be given advice on how to administer *Phosex®* tablets.

**RENACET® TABLETS** Patients or carers should be given advice on how to administer *Renacet®* tablets.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 25

▶ **Phosex** (Pharmacosmos UK Ltd)

Calcium acetate 1 gram Phosex 1g tablets | 180 tablet [PoM] £19.79  
DT = £19.79

▶ **Renacet** (Stanningley Pharma Ltd)

Calcium acetate 475 mg Renacet 475mg tablets | 200 tablet [PoM]  
£9.71 DT = £9.71

Calcium acetate 950 mg Renacet 950mg tablets | 200 tablet [PoM]  
£18.45 DT = £18.45

Combinations available: *Calcium acetate with magnesium carbonate*, below

## PHOSPHATE BINDERS

### Calcium acetate with magnesium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium acetate p. 1052, magnesium carbonate p. 71.

## ● INDICATIONS AND DOSE

### Hyperphosphataemia

▶ BY MOUTH

▶ Adult: Initially 1 tablet 3 times a day, adjusted according to serum-phosphate concentration, to be taken with food; usual dose 3–10 tablets daily; maximum 12 tablets per day

● **CONTRA-INDICATIONS** Hypercalcaemia · hypermagnesaemia · myasthenia gravis · third-degree AV block

● **INTERACTIONS** → Appendix 1: antacids · calcium salts

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after calcium acetate with magnesium carbonate to reduce possible interference with absorption of other drugs.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer calcium acetate with magnesium carbonate tablets.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 25

Magnesium carbonate heavy 235 mg, Calcium acetate 435 mg Osvaren 435mg/235mg tablets | 180 tablet [PoM] £24.00 DT = £24.00

## Lanthanum

08-Mar-2019

## ● INDICATIONS AND DOSE

**Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet**

▶ BY MOUTH

▶ Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

● **CAUTIONS** Acute peptic ulcer · bowel obstruction · Crohn's disease · ulcerative colitis

● **INTERACTIONS** → Appendix 1: lanthanum

## ● SIDE-EFFECTS

▶ **Common or very common** Constipation · diarrhoea · electrolyte imbalance · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting

▶ **Uncommon** Alopecia · appetite abnormal · arthralgia · asthenia · burping · chest pain · dizziness · dry mouth · eosinophilia · hyperglycaemia · hyperhidrosis · hyperparathyroidism · increased risk of infection · irritable bowel syndrome · malaise · myalgia · oral disorders · osteoporosis · pain · peripheral oedema · taste altered · thirst · vertigo · weight decreased

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution (may be excreted in bile—possible risk of slower elimination and increased plasma concentrations in patients with reduced bile flow)—monitor liver function tests.

● **DIRECTIONS FOR ADMINISTRATION** Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

● **PATIENT AND CARER ADVICE** Patient and carers should be given advice on how to administer lanthanum tablets and powder.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### Scottish Medicines Consortium (SMC) decisions

SMC No. 286/06

The *Scottish Medicines Consortium* has advised (May 2007) that lanthanum chewable tablets (*Fosrenol®*) are accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

SMC No. 640/10

The *Scottish Medicines Consortium* has advised (October 2010) that lanthanum (*Fosrenol®*) is **not** recommended for use within NHS Scotland for the control of hyperphosphataemia in patients with chronic kidney disease not on dialysis with serum phosphate levels  $\geq 1.78$  mmol/L in whom a low phosphate diet alone is insufficient to control serum phosphate levels, as the clinical and economic analysis presented was not demonstrated.

SMC No. 821/12

The *Scottish Medicines Consortium* has advised (December 2012) that lanthanum oral powder (*Fosrenol®*) is accepted for restricted use within NHS Scotland as a second-line agent in the control of hyperphosphataemia in chronic renal failure patients on haemodialysis or CAPD

where a non-aluminium, non-calcium phosphate binder is required.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Sucoferric oxyhydroxide

16-Feb-2016

### • INDICATIONS AND DOSE

#### Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

- ▶ BY MOUTH

▶ **Adult:** Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2–4 weeks, dose adjusted according to serum-phosphate concentration; maintenance 1.5–2 g daily in divided doses; maximum 3 g per day

- **CONTRA-INDICATIONS** Haemochromatosis · iron accumulation disorders
- **CAUTIONS** Gastric disorders · hepatic disorders · major gastrointestinal surgery · peritonitis in the last 3 months
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea · product taste abnormal · tooth discolouration · vomiting
  - ▶ **Uncommon** Dysphagia · dyspnoea · electrolyte imbalance · fatigue · headache · skin reactions · tongue discolouration

**SIDE-EFFECTS, FURTHER INFORMATION** Discoloured faeces may mask the visual signs of gastrointestinal bleeding.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** *Velphoro*<sup>®</sup> tablets must be chewed or crushed, not swallowed whole.
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of sucroferic oxyhydroxide tablets and advised that this medication can cause discoloured black stools.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Chewable tablet

- ▶ **Velphoro** (Vifor Fresenius Medical Care Renal Pharma UK Ltd) ▼  
Iron (as Sucroferic oxyhydroxide) 500 mg Velphoro 500mg chewable tablets | 90 tablet [PoM] £179.00 DT = £179.00

## 1.4b Hypophosphataemia

### LAXATIVES > OSMOTIC LAXATIVES

#### Phosphate

##### ● INDICATIONS AND DOSE

#### Treatment of moderate to severe hypophosphatemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

#### Established hypophosphataemia (with monobasic potassium phosphate)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), increased dose to be used in critically ill patients; dose to be infused over 6–12 hours, according to severity

#### Vitamin D-resistant hypophosphataemic osteomalacia

- ▶ BY MOUTH USING EFFERVESCENT TABLETS
- ▶ Adult: 4–6 tablets daily, using *Phosphate Sandoz*<sup>®</sup>.

##### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea
- ▶ **Frequency not known** Nausea

#### SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Acute kidney injury · extravasation necrosis · hypocalcaemia · hypotension · metastatic calcification · oedema
- ▶ With oral use Abdominal distress

**SIDE-EFFECTS, FURTHER INFORMATION** Diarrhoea is a common side-effect and should prompt a reduction in dosage.

##### ● RENAL IMPAIRMENT

- Dose adjustments** Reduce dose.
- Monitoring** Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

- **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*<sup>®</sup> contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na<sup>+</sup> 20.4 mmol), potassium 123 mg (K<sup>+</sup> 3.1 mmol); *Polyfusor NA*<sup>®</sup> contains Na<sup>+</sup> 162 mmol/litre, K<sup>+</sup> 19 mmol/litre, PO<sub>4</sub><sup>3-</sup> 100 mmol/litre;

non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Phosphate Sandoz** (HK Pharma Ltd)

**Sodium dihydrogen phosphate anhydrous 1.936 gram** Phosphate Sandoz effervescent tablets | 100 tablet [P] £19.39 DT = £19.39

#### Solution for infusion

- ▶ **Phosphate (Non-proprietary)**

**Potassium dihydrogen phosphate 136 mg per 1 ml** Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £101.96 DT = £101.96

#### Infusion

- ▶ **Phosphate (Non-proprietary)**

**Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre** Polyfusor NA phosphates infusion 500ml bottles | 1 bottle [PoM] £5.15

## 1.5 Potassium imbalance

### 1.5a Hyperkalaemia

**Other drugs used for Hyperkalaemia** Calcium gluconate, p. 1045

### ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

#### Calcium polystyrene sulfonate

##### ● INDICATIONS AND DOSE

#### Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH
- ▶ Adult: 15 g 3–4 times a day
- ▶ BY RECTUM
- ▶ Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis
- **INTERACTIONS** → Appendix 1: polystyrene sulfonate
- **SIDE-EFFECTS** Appetite decreased · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · gastrointestinal necrosis (in combination with sorbitol) · hypercalcaemia (in dialysed patients and occasionally in those with renal impairment) · increased risk of infection · nausea · vomiting
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

#### Powder

CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbister<sup>®</sup> powder only)

EXCIPIENTS: May contain Sucrose

- ▶ **Calcium Resonium** (Sanofi)

**Calcium polystyrene sulfonate 999.34 mg per 1 gram** Calcium Resonium powder sugar-free | 300 gram **£** 82.16 DT = £82.16

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Veltassa** (Vifor Fresenius Medical Care Renal Pharma UK Ltd) ▼

**Patiromer calcium (as Patiromer sorbitex calcium)**

**8.4 gram** Veltassa 8.4g oral powder sachets | 30 sachet **£** 300.00

**Patiromer calcium (as Patiromer sorbitex calcium)**

**16.8 gram** Veltassa 16.8g oral powder sachets | 30 sachet **£** 300.00

## Patiromer calcium

13-Sep-2018

- **DRUG ACTION** Patiromer is a non-absorbed cation-exchange polymer that acts as a potassium binder in the gastro-intestinal tract.

### ● INDICATIONS AND DOSE

#### Hyperkalaemia

- ▶ BY MOUTH

- ▶ **Adult:** Initially 8.4 g once daily; adjusted in steps of 8.4 g as required, dose adjustments should be made at intervals of at least one week; maximum 25.2 g per day

#### PHARMACOKINETICS

- ▶ Onset of action 4–7 hours.

- **CAUTIONS** Risk factors for hypercalcaemia (calcium partially released from counterion complex) · severe gastro-intestinal disorders (ischaemia, necrosis, and intestinal perforation reported with other potassium binders)
- **INTERACTIONS** → Appendix 1: patiromer
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · flatulence · hypomagnesaemia
  - ▶ **Uncommon** Nausea · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available (although no effects on the infant are anticipated).
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for electrolyte disturbances, particularly plasma-potassium (as clinically indicated) and plasma-magnesium (continue to monitor for at least 1 month after initiation of treatment).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises *Veltassa*<sup>®</sup> should be mixed with approx. 40 mL of water, then stirred and mixed with a further approx. 40 mL of water; the powder will not dissolve. More water may be added as needed. The mixture should be taken within 1 hour of preparation. Apple juice or cranberry juice may be used instead of water, other liquids should be avoided as they may contain high amounts of potassium.
- **HANDLING AND STORAGE** Store in a refrigerator (2–8°C) prior to dispensing; once dispensed, patient may store below 25°C for up to 6 months.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**  
SMC No. SMC2084

The *Scottish Medicines Consortium* has advised (August 2018) that patiromer calcium (*Veltassa*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the treatment of hyperkalaemia in adults as the economic case was not demonstrated.

## Sodium polystyrene sulfonate

### ● INDICATIONS AND DOSE

#### Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH

- ▶ **Adult:** 15 g 3–4 times a day

- ▶ BY RECTUM

- ▶ **Adult:** 30 g, retain for 9 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Obstructive bowel disease
  - **CAUTIONS** Congestive heart failure · hypertension · oedema
  - **INTERACTIONS** → Appendix 1: polystyrene sulfonate
  - **SIDE-EFFECTS** Appetite decreased · bezoar · constipation (discontinue—avoid magnesium-containing laxatives) · diarrhoea · electrolyte imbalance · epigastric discomfort · gastrointestinal disorders · increased risk of infection · nausea · necrosis (in combination with sorbitol) · vomiting
  - **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
  - **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
  - **RENAL IMPAIRMENT** Use with caution.
  - **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
  - **DIRECTIONS FOR ADMINISTRATION**
    - ▶ With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.
    - ▶ With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
- Powder**
- CAUTIONARY AND ADVISORY LABELS 13
- ▶ **Resonium A** (Sanofi)
- Sodium polystyrene sulfonate 999.34 mg per 1 gram** Resonium A powder sugar-free | 454 gram **£** 81.11 DT = £81.11

## 1.5b Hypokalaemia

### ELECTROLYTES AND MINERALS > POTASSIUM

#### Potassium bicarbonate with potassium acid tartrate

##### ● INDICATIONS AND DOSE

**Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Hypochloreaemia · plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS** Cardiac disease · elderly
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.  
**Effervescent tablet**  
CAUTIONARY AND ADVISORY LABELS 13, 21
  - ▶ **Potassium bicarbonate with potassium acid tartrate (Non-proprietary)**  
Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet  £81.27 DT = £90.99

#### Potassium chloride

##### ● INDICATIONS AND DOSE

**Prevention of hypokalaemia (patients with normal diet)**

- ▶ BY MOUTH
- ▶ Adult: 2–4 g daily in divided doses

**Electrolyte imbalance**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Dose dependent on deficit or the daily maintenance requirements

##### IMPORTANT SAFETY INFORMATION

###### SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

- **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre
- **CAUTIONS**
  - ▶ With intravenous use seek specialist advice in very severe potassium depletion or difficult cases
  - ▶ With oral use Cardiac disease · elderly · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)
- **INTERACTIONS** → Appendix 1: potassium chloride

##### ● SIDE-EFFECTS

###### GENERAL SIDE-EFFECTS

Hyperkalaemia

###### SPECIFIC SIDE-EFFECTS

- ▶ With oral use Abdominal cramps · diarrhoea · gastrointestinal disorders · nausea · vomiting
- **RENAL IMPAIRMENT** Avoid in severe impairment. **Dose adjustments** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. **Monitoring** Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
  - ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
  - ▶ With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).
  - ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**. Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K<sup>+</sup> 20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L<sup>®</sup> contains 1 mmol/mL each of K<sup>+</sup> and Cl<sup>-</sup>. Potassium Tablets
  - ▶ With oral use Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt<sup>®</sup>* and *Ruthmol<sup>®</sup>*). These should not be used by patients with renal failure as potassium intoxication may result.
- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

###### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

###### ▶ Potassium chloride (Imported)

Potassium chloride 600 mg Kaleorid LP 600mg tablets | 30 tablet    
Duro-K 600mg tablets | 100 tablet  

**Solution for infusion**▶ **Potassium chloride (Non-proprietary)**

**Potassium chloride 150 mg per 1 ml** Potassium chloride 15% (potassium 20mmol/10ml) solution for infusion 10ml ampoules | 10 ampoule [PoM] £10.00 | 20 ampoule [PoM] £6.50-£10.70

**Potassium chloride 200 mg per 1 ml** Potassium chloride 20% (potassium 13.3mmol/5ml) solution for infusion 5ml ampoules | 10 ampoule [PoM] £8.00

- The UK Porphyria Medicines Information Service (UKPMIS)
- University Hospital of Wales
- CF14 4XW
- Cardiff
- (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

**Unsafe Drug Groups (check first)**

- Anabolic steroids
- Antidepressants, MAOIs (contact UKPMIS for advice)
- Antidepressants, Tricyclic and related (contact UKPMIS for advice)
- Barbiturates (includes primidone and thiopental)
- Contraceptives, hormonal (for detailed advice contact UKPMIS or a porphyria specialist)
- Hormone replacement therapy (for detailed advice contact UKPMIS or a porphyria specialist)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact UKPMIS for advice)
- Progestogens (for detailed advice contact UKPMIS or a porphyria specialist)
- Protease inhibitors (contact UKPMIS for advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonyleureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact UKPMIS for advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

**Unsafe Drugs (check groups above first)**

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Busulfan
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clemastine
- Clindamycin
- Cocaine
- Danazol
- Dapsone
- Diltiazem
- Disopyramide
- Disulfiram
- Ergometrine
- Ergotamine
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Flutamide
- Fosaprepitant
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Ifosfamide
- Indapamide

## 2 Metabolic disorders

### 2.1 Acute porphyrias

#### Acute porphyrias

01-Oct-2017

**Overview**

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 75 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

**[EvGr]** Where there is no safe alternative, drug treatment for serious or life-threatening conditions should not be withheld from patients with acute porphyria. Where possible, the clinical situation should be discussed with a porphyria specialist for advice on how to proceed and monitor the patient. In the UK clinical advice can be obtained from the National Acute Porphyria Service or from the UK Porphyria Medicines Information Service (UKPMIS)—see details below. 

Haem arginate p. 1059 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from two centres (University Hospital of Wales and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

**Drugs unsafe for use in acute porphyrias**

**[EvGr]** The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available. 

An up-to-date list of drugs considered safe in acute porphyrias is available from the UKPMIS, see *Useful resources* below.

Further information may be obtained from: [porphyria.eu/](http://porphyria.eu/) and also from:

- Isometheptene mucate
- Isoniazid (safety uncertain, contact UKPMIS for advice)
- Ketamine
- Mefenamic acid (safety uncertain, contact UKPMIS for advice)
- Meprobamate
- Methyl dopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (safety uncertain, contact UKPMIS for advice)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine
- Pentoxifylline
- Pergolide
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Pizotifen
- Porfimer
- Raloxifene
- Rifabutin (safety uncertain, contact UKPMIS for advice)
- Rifampicin
- Riluzole
- Risperidone
- Spironolactone
- Sulfinpyrazone
- Tamoxifen
- Temoporfin
- Thiotepa
- Tiagabine
- Tibolone
- Topiramate
- Toremfene
- Trimethoprim
- Valproate
- Verapamil
- Xipamide

### Useful Resources

Acute porphyrias safe list. UK Porphyria Medicines Information Service. 2017.

## BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

### Haem arginate

(Human hemin)

#### ● INDICATIONS AND DOSE

**Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria**

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Poor venous access
- ▶ **Rare or very rare** Fever
- ▶ **Frequency not known** Headache · injection site necrosis · skin discolouration · venous thrombosis

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (Normosang<sup>®</sup>)*, give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter *via* large antebraclial or central vein; administer within 1 hour after dilution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

▶ **Normosang** (Recordati Rare Diseases UK Ltd)

**Haem arginate 25 mg per 1 ml** Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule **[PoM]** £1,737.00

## 2.2 Carnitine deficiency

### AMINO ACIDS AND DERIVATIVES

#### Levocarnitine

(Carnitine)

#### ● INDICATIONS AND DOSE

**Primary carnitine deficiency due to inborn errors of metabolism**

▶ BY MOUTH

▶ Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

▶ BY SLOW INTRAVENOUS INJECTION

▶ Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

**Secondary carnitine deficiency in haemodialysis patients**

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

▶ Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

- **CAUTIONS** Diabetes mellitus

#### ● SIDE-EFFECTS

- ▶ **Rare or very rare** Abdominal cramps · diarrhoea · nausea · skin odour abnormal · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.

- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

#### ● MONITORING REQUIREMENTS

- ▶ Monitoring of free and acyl carnitine in blood and urine recommended.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Solution for injection

▶ **Carnitor** (Logixx Pharma Solutions Ltd)

**L-Carnitine 200 mg per 1 ml** Carnitor 1g/5ml solution for injection ampoules | 5 ampoule **[PoM]** £59.50

#### Oral solution

▶ **Levocarnitine (Non-proprietary)**

**L-Carnitine 300 mg per 1 ml** Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml **[PoM]** £71.40 DT = £71.40 | 40 ml **[PoM]** £118.00

▶ **Carnitor** (Logixx Pharma Solutions Ltd)

**L-Carnitine 100 mg per 1 ml** Carnitor oral single dose 1g solution sugar-free | 10 unit dose **[PoM]** £35.00 DT = £35.00

**Chewable tablet**

- ▶ **Carnitor** (Logixx Pharma Solutions Ltd)  
L-Carnitine 1 gram Carnitor 1g chewable tablets | 10 tablet [PoM]  
£35.00

**Capsule**

- ▶ **Levocarnitine (Non-proprietary)**  
L-Carnitine 250 mg Bio-Carnitine 250mg capsules | 125 capsule  
£11.06

## 2.3 Cystinosis

### 2.3a Nephropathic cystinosis

#### AMINO ACIDS AND DERIVATIVES

### Mercaptamine

#### (Cysteamine)

21-Nov-2017

**INDICATIONS AND DOSE****Nephropathic cystinosis (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

**Corneal cystine crystal deposits in patients with cystinosis (specialist use only)**

- ▶ TO THE EYE
- ▶ Adult: Apply 1 drop 4 times a day, to be applied to both eyes (minimum 4 hours between doses); dose may be reduced according to response (minimum daily dose 1 drop in each eye)

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ With oral use
- ▶ 1.3 g/m<sup>2</sup> is approximately equivalent to 50 mg/kg.

**IMPORTANT SAFETY INFORMATION****SAFE PRACTICE**

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

**CAUTIONS**

- ▶ When used by eye Contact lens wearers
- ▶ With oral use dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

**SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ When used by eye (topical) Dry eye · eye discomfort · eye disorders · vision blurred
- ▶ With oral use Appetite decreased · asthenia · breath odour · diarrhoea · drowsiness · encephalopathy · fever · gastroenteritis · gastrointestinal discomfort · headache · nausea · skin reactions · vomiting
- ▶ **Uncommon**
- ▶ With oral use Compression fracture · gastrointestinal ulcer · hair colour changes · hallucination · joint hyperextension · leg pain · leucopenia · musculoskeletal disorders · nephrotic syndrome · nervousness · osteopenia · seizure
- ▶ **Frequency not known**
- ▶ With oral use Depression · intracranial pressure increased · papilloedema

- ▶ **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

**PREGNANCY**

- ▶ With oral use Manufacturer advises avoid—teratogenic and toxic in *animal* studies.

**BREAST FEEDING**

- ▶ With oral use Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- ▶ With oral use Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION**

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

**HANDLING AND STORAGE**

- ▶ When used by eye Manufacturer advises store in a refrigerator (2–8°C)—after opening store at room temperature up to 25°C for up to 7 days; protect from light.

**NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) decisions**

- ▶ With oral use The *Scottish Medicines Consortium* has advised (November 2017) that mercaptamine (*Procybsi*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the treatment of proven nephropathic cystinosis.

- ▶ **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Gastro-resistant capsule**

- ▶ *Procybsi* (Chiesi Ltd)

**Mercaptamine (as Mercaptamine bitartrate) 25 mg** Procybsi 25mg gastro-resistant capsules | 60 capsule [PoM] £335.97

**Mercaptamine (as Mercaptamine bitartrate) 75 mg** Procybsi 75mg gastro-resistant capsules | 250 capsule [PoM] £4,199.65

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Cystaran (Imported (United States))**

**Mercaptamine (as Mercaptamine hydrochloride) 4.4 mg per 1 ml** Cystaran 0.44% eye drops | 15 ml [PoM] £

- ▶ **Cystadrops** (Recordati Rare Diseases UK Ltd)

**Mercaptamine (as Mercaptamine hydrochloride) 3.8 mg per 1 ml** Cystadrops 3.8mg/ml eye drops | 5 ml [PoM] £865.00

**Capsule**

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Cystagon** (Recordati Rare Diseases UK Ltd)

**Mercaptamine (as Mercaptamine bitartrate) 50 mg** Cystagon 50mg capsules | 100 capsule [PoM] £70.00 DT = £70.00

**Mercaptamine (as Mercaptamine bitartrate) 150 mg** Cystagon 150mg capsules | 100 capsule [PoM] £190.00 DT = £190.00

## 2.4 Fabry's disease

#### ENZYMES

### Agalsidase alfa

- ▶ **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

**INDICATIONS AND DOSE****Fabry's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 200 micrograms/kg every 2 weeks

- ▶ **INTERACTIONS** → Appendix 1: agalsidase

**SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · dyspnoea · excessive tearing · fever · flushing · gastrointestinal discomfort · headache · hoarseness · hypersomnia · hypertension · increased risk of infection · influenza like illness · joint disorders · malaise · musculoskeletal discomfort · myalgia · nausea · ototoxicity · pain ·

palpitations · peripheral oedema · peripheral swelling · rhinorrhoea · sensation abnormal · skin reactions · taste altered · temperature sensation altered · throat complaints · tremor · vomiting

- ▶ **Uncommon** Altered smell sensation · angioedema · hypersensitivity · sensation of pressure
- ▶ **Frequency not known** Heart failure · hyperhidrosis · hypotension · myocardial ischaemia

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions; manage by interrupting the infusion, or minimise by pre-treatment with an antihistamine or corticosteroid — consult product literature.

- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

▶ **Replagal** (Shire Pharmaceuticals Ltd)

**Agalsidase alfa 1 mg per 1 mL** Replagal 3.5mg/3.5mL solution for infusion vials | 1 vial [PoM] £1,049.94

## Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

#### ● INDICATIONS AND DOSE

##### Fabry's disease (specialist use only)

▶ BY INTRAVENOUS INFUSION

▶ Adult: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · arrhythmias · arthralgia · asthenia · chest discomfort · chills · cough · diarrhoea · dizziness · drowsiness · dyspnoea · eye disorders · fever · gastrointestinal discomfort · headache · hypertension · hyperthermia · hypotension · increased risk of infection · muscle complaints · musculoskeletal stiffness · nasal complaints · nausea · oedema · oral hypoaesthesia · pain · pallor · palpitations · respiratory disorders · sensation abnormal · skin reactions · syncope · temperature sensation altered · throat complaints · tinnitus · vasodilation · vertigo · vomiting

- ▶ **Uncommon** Dysphagia · ear discomfort · eye pruritus · influenza like illness · malaise · peripheral coldness · tremor

- ▶ **Frequency not known** Anaphylactoid reaction · hypersensitivity vasculitis · hypoxia

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions; manage by slowing the infusion rate, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid — consult product literature.

- **PREGNANCY** Use with caution.
- **BREAST FEEDING** Use with caution—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less

than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

▶ **Fabrazyme** (Genzyme Therapeutics Ltd)

**Agalsidase beta 5 mg** Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM] £315.08

**Agalsidase beta 35 mg** Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM] £2,196.59

## ENZYME STABILISER

### Migalastat

24-Nov-2017

- **DRUG ACTION** Migalastat is a pharmacological chaperone that binds to the active sites of certain mutant forms of alpha-galactosidase A, thereby stabilising these mutant forms in the endoplasmic reticulum, and facilitating normal trafficking to lysosomes.

#### ● INDICATIONS AND DOSE

##### Fabry's disease (specialist use only)

▶ BY MOUTH

▶ Adult: 123 mg once daily on alternate days, take at the same time of day, at least 2 hours before or after food

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · defaecation urgency · depression · diarrhoea · dizziness · dry mouth · dyspnoea · epistaxis · fatigue · gastrointestinal discomfort · headache · muscle complaints · nausea · pain in extremity · palpitations · proteinuria · sensation abnormal · skin reactions · torticollis · vertigo
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal studies*.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function, echocardiographic parameters and biochemical markers every 6 months.
- **PATIENT AND CARER ADVICE**  
**Missed doses** Manufacturer advises if a dose is missed entirely for the day, the missed dose should not be taken and the next dose should be taken on the normal day and at the normal time (not to be taken on 2 consecutive days).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Migalastat for treating Fabry disease (February 2017)**  
NICE HST4

Migalastat is recommended, within its marketing authorisation, as an option for treating Fabry disease in people over 16 years of age with an amenable mutation, only if migalastat is provided with the discount agreed in the patient access scheme, and only if enzyme replacement therapy would otherwise be offered.  
[www.nice.org.uk/guidance/hst4](http://www.nice.org.uk/guidance/hst4)

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* (November 2016) has advised that migalastat (*Galafold*<sup>®</sup>) is accepted for restricted use within NHS Scotland for long-term treatment of adults and adolescents aged 16 years and older with a confirmed diagnosis of Fabry disease ( $\alpha$ -

galactosidase A deficiency) and who have an amenable mutation—consult SMC advice for full details of restriction.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- ▶ **Galafoid** (Amicus Therapeutics UK Ltd) ▼  
**Migalastat (as Migalastat hydrochloride) 123 mg** Galafoid 123mg capsules | 14 capsule **[POM]** £16,153.85

## 2.5 Gaucher's disease

**Other drugs used for Gaucher's disease** Miglustat, p. 1066

### ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

#### Eliglustat

04-Dec-2017

- **DRUG ACTION** Eliglustat is an inhibitor of glucosylceramide synthase.

#### ● INDICATIONS AND DOSE

**Type 1 Gaucher disease (CYP2D6 poor metabolisers) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: 84 mg once daily

**Type 1 Gaucher disease (CYP2D6 intermediate or extensive metabolisers) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: 84 mg twice daily

- **CONTRA-INDICATIONS** Cardiac disease (no information available) · concurrent use of Class IA and Class III antiarrhythmics · long QT syndrome (no information available)

- **INTERACTIONS** → Appendix 1: eliglustat

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · constipation · dyspepsia · fatigue · gastrointestinal disorders · nausea · palpitations

- ▶ **Frequency not known** Syncope

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **PRE-TREATMENT SCREENING** Manufacturer advises CYP2D6 metaboliser status should be determined before initiation of treatment.

#### ● MONITORING REQUIREMENTS

- ▶ For treatment-naïve patients showing less than 20% spleen volume reduction after 9 months of treatment, manufacturer advises monitor for further improvement or consider an alternative treatment.
- ▶ For patients with stable disease who have switched from enzyme replacement therapy, manufacturer advises monitor for disease progression—consider reinstatement of enzyme replacement therapy or an alternative treatment if response sub-optimal.

- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Cerdelga*<sup>®</sup> has provided a *Prescriber Guide*, which includes a prescriber checklist.

- **PATIENT AND CARER ADVICE** A patient alert card should be provided.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Eliglustat for treating type 1 Gaucher disease (June 2017)**

##### NICE HST5

Eliglustat is recommended within its marketing authorisation for treating type 1 Gaucher disease, that is, for long-term treatment in adults who are cytochrome P450 2D6 poor, intermediate or extensive metabolisers. Eliglustat is only recommended when the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/hst5](http://www.nice.org.uk/guidance/hst5)

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2017) that eliglustat (*Cerdelga*<sup>®</sup>) is accepted for use within NHS Scotland for the long-term treatment of adult patients with type 1 Gaucher disease who are CYP2D6 poor metabolisers, intermediate metabolisers or extensive metabolisers. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Cerdelga** (Sanofi) ▼

**Eliglustat (as Eliglustat tartrate) 84.4 mg** Cerdelga 84mg capsules | 56 capsule **[POM]** £19,164.96

### ENZYMES

#### Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

#### ● INDICATIONS AND DOSE

**Non-neurological manifestations of type I Gaucher's disease (specialist use only) | Non-neurological manifestations of type III Gaucher's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Angioedema · cough · dyspnoea · hypersensitivity · skin reactions
- ▶ **Uncommon** Abdominal cramps · arthralgia · back pain · chest discomfort · chills · cyanosis · diarrhoea · dizziness · fatigue · fever · flushing · headache · hypotension · nausea · paraesthesia · tachycardia · vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

#### ● MONITORING REQUIREMENTS

- ▶ Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- ▶ When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Cerezyme*<sup>®</sup>), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume

of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Cerezyme** (Genzyme Therapeutics Ltd)

**Imiglucerase 400 unit** Cerezyme 400unit powder for solution for infusion vials | 1 vial [POM] £1,071.29 (Hospital only)

## Velaglucerase alfa

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

• **INDICATIONS AND DOSE**

**Type I Gaucher's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

• **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · asthenia · chest discomfort · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypersensitivity · hypertension · hypotension · infusion related reaction · nausea · pain · skin reactions · tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions are very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (VPRIV<sup>®</sup>), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **VPRIV** (Shire Pharmaceuticals Ltd)

**Velaglucerase alfa 400 unit** VPRIV 400units powder for solution for infusion vials | 1 vial [POM] £1,410.20

## 2.6 Homocystinuria

### METHYL DONORS

#### Betaine

27-Apr-2019

• **INDICATIONS AND DOSE**

**Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)**

- ▶ BY MOUTH

▶ **Adult:** 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

• **SIDE-EFFECTS**

- ▶ **Uncommon** Abdominal discomfort · agitation · alopecia · appetite decreased · brain oedema · diarrhoea · glossitis · irritability · nausea · skin reactions · urinary incontinence · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.
- **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of *Cystadane*<sup>®</sup> powder.
- **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B<sub>12</sub>, pyridoxine, and folate under specialist advice.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) decisions**  
SMC No. 407/07  
The *Scottish Medicines Consortium* has advised (August 2010) that betaine anhydrous (*Cystadane*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

**Powder**

- ▶ **Cystadane** (Recordati Rare Diseases UK Ltd)

**Betaine 1 gram per 1 gram** Cystadane oral powder | 180 gram [POM] £347.00 DT = £347.00

## 2.7 Hypophosphatasia

### ENZYMES

#### Asfotase alfa

04-Dec-2017

- **DRUG ACTION** Asfotase alfa is a human recombinant tissue-nonspecific alkaline phosphatase that promotes mineralisation of the skeleton.

#### ● INDICATIONS AND DOSE

##### Paediatric-onset hypophosphatasia (initiated by a specialist)

###### ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 2 mg/kg 3 times a week, alternatively 1 mg/kg 6 times a week, dosing frequency depends on body-weight—consult product literature for further information

- **CAUTIONS** Hypersensitivity reactions

#### CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Reactions, including signs and symptoms consistent with anaphylaxis, have occurred within minutes of administration and can occur in patients on treatment for more than one year; if these reactions occur, manufacturer advises immediate discontinuation of treatment and initiation of appropriate medical treatment. For information on re-administration, consult product literature.

#### ● SIDE-EFFECTS

- ▶ Common or very common Bruising tendency · chills · cutis laxa · fever · headache · hypersensitivity · irritability · lipohypertrophy · myalgia · nausea · oral hypoaesthesia · pain · skin reactions · vasodilation

**SIDE-EFFECTS, FURTHER INFORMATION** Injection-site reactions including hypertrophy, induration, skin discolouration, and cellulitis may occur, particularly in patients receiving treatment 6 times a week. Manufacturer advises rotation of injection sites to manage these reactions; interrupt treatment if severe reactions occur and administer appropriate medical therapy.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor serum parathyroid hormone and calcium concentrations—supplements of calcium and oral vitamin D may be required.
- ▶ Manufacturer advises periodic ophthalmological examination and renal ultrasounds.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises max. 1 mL per injection site; administer multiple injections if more than 1 mL is required—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C).

#### ● PATIENT AND CARER ADVICE

Injection guides The manufacturer has produced injection guides for patients and carers to support training given by health care professionals.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ Asfotase alfa for treating paediatric-onset hypophosphatasia (August 2017) NICE HST6  
Asfotase alfa is recommended as an option for treating paediatric-onset hypophosphatasia only:

- for people who meet the criteria for treatment within the managed access arrangement (see section 4.18 of the guidance), **and**
- for the duration of this arrangement and in line with the other conditions it specifies, **and**
- when the manufacturer provides asfotase alfa with the confidential commercial terms agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/HST6](http://www.nice.org.uk/guidance/HST6)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Strensiq (Alexion Pharma UK Ltd) ▼

**Asfotase alfa 40 mg per 1 ml** Strensiq 18mg/0.45ml solution for injection vials | 12 vial [PoM](#) £12,700.80 (Hospital only)

Strensiq 28mg/0.7ml solution for injection vials | 12 vial [PoM](#)

£19,756.80 (Hospital only)

Strensiq 40mg/1ml solution for injection vials | 12 vial [PoM](#)

£28,224.00 (Hospital only)

**Asfotase alfa 100 mg per 1 ml** Strensiq 80mg/0.8ml solution for injection vials | 12 vial [PoM](#) £56,448.00 (Hospital only)

## 2.8 Mucopolysaccharidosis

### ENZYMES

#### Elosulfase alfa

04-Dec-2017

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

#### ● INDICATIONS AND DOSE

##### Mucopolysaccharidosis IVA (specialist use only)

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 2 mg/kg once weekly

- **CAUTIONS** Elderly—no information available · infusion-related reactions

#### CAUTIONS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

#### ● SIDE-EFFECTS

- ▶ Common or very common Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · fever · headache · hypersensitivity · infusion related reaction · myalgia · nausea · oropharyngeal pain · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Vimizim*®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight

25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Elosulfase alfa for treating mucopolysaccharidosis type IVa (December 2015) NICE HST2**  
Elosulfase alfa, within its marketing authorisation, is recommended for funding for treating mucopolysaccharidosis type IVa (MPS IVa) according to the conditions in the managed access agreement for elosulfase alfa.  
[www.nice.org.uk/guidance/HST2](http://www.nice.org.uk/guidance/HST2)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Polysorbates, sorbitol  
ELECTROLYTES: May contain Sodium

- ▶ **Vimizim** (BioMarin Europe Ltd) ▼

**Elosulfase alfa 1 mg per 1 ml** Vimizim 5mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £750.00

## Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

- **INDICATIONS AND DOSE**

**Mucopolysaccharidosis VI (specialist use only)**

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease
- **SIDE-EFFECTS** Abdominal pain · apnoea · chest pain · chills · conjunctivitis · corneal opacity · dyspnoea · ear pain · face oedema · hypertension · increased risk of infection · infusion related reaction · malaise · nasal congestion · reflexes absent · umbilical hernia
- SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid — consult product literature for details.
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Naglazyme*®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid

overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ▶ **Naglazyme** (BioMarin Europe Ltd) ▼

**Galsulfase 1 mg per 1 ml** Naglazyme 5mg/5ml solution for infusion vials | 1 vial [PoM] £982.00

## Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

- **INDICATIONS AND DOSE**

**Mucopolysaccharidosis II (specialist use only)**

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

- **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · arthralgia · chest pain · cough · cyanosis · diarrhoea · dizziness · dyspnoea · fever · flushing · gastrointestinal discomfort · headache · hypertension · hypotension · hypoxia · infusion related reaction · nausea · oedema · respiratory disorders · skin reactions · tongue swelling · tremor · vomiting
- ▶ **Frequency not known** Hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Elaprase*®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ▶ **Elaprase** (Shire Pharmaceuticals Ltd) ▼

**Idursulfase 2 mg per 1 ml** Elaprase 6mg/3ml concentrate for solution for infusion vials | 1 vial [PoM] £1,985.00

## Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

### ● INDICATIONS AND DOSE

#### Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur
- **INTERACTIONS** → Appendix 1: laronidase
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · alopecia · anaphylactic reaction · angioedema · chills · cough · diarrhoea · dizziness · dyspnoea · fatigue · fever · flushing · headache · hypotension · influenza like illness · joint disorders · nausea · pain · pallor · paraesthesia · peripheral coldness · respiratory disorders · restlessness · skin reactions · sweat changes · tachycardia · temperature sensation altered · vomiting
  - ▶ **Frequency not known** Cyanosis · hypoxia · oedema
- **SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aldurazyme<sup>®</sup>), give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Aldurazyme** (Genzyme Therapeutics Ltd)

Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial [PoM](#) £444.70

## 2.9 Niemann-Pick type C disease

### ENZYMЕ INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

## Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

### ● INDICATIONS AND DOSE

#### Mild to moderate type I Gaucher's disease for whom enzyme replacement therapy is unsuitable (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

#### Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: 200 mg 3 times a day

### ● SIDE-EFFECTS

- ▶ **Common or very common** Appetite decreased · asthenia · chills · constipation · depression · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · insomnia · libido decreased · malaise · muscle spasms · muscle weakness · nausea · peripheral neuropathy · sensation abnormal · thrombocytopenia · tremor · vomiting · weight decreased

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

**Dose adjustments** For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>.

Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>.

For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>.

Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>.

### ● MONITORING REQUIREMENTS

- ▶ Monitor cognitive and neurological function.
- ▶ Monitor growth and platelet count in Niemann-Pick type C disease.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- ▶ **Zavesca** (Actelion Pharmaceuticals UK Ltd)

Miglustat 100 mg Zavesca 100mg capsules | 84 capsule [PoM](#) £3,934.17 (Hospital only)

## 2.10 Pompe disease

### ENZYMES

#### Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

#### ● INDICATIONS AND DOSE

##### Pompe disease (specialist use only)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · arrhythmias · chest discomfort · chills · cough · cyanosis · diarrhoea · dizziness · fatigue · feeling hot · fever · flushing · hyperhidrosis · hypersensitivity · hypertension · irritability · local swelling · muscle complaints · nausea · oedema · pallor · paraesthesia · respiratory disorders · skin reactions · throat complaints · tremor · vomiting
  - ▶ **Frequency not known** Abdominal pain · angioedema · apnoea · arthralgia · cardiac arrest · dyspnoea · excessive tearing · eye inflammation · headache · hypotension · nephrotic syndrome · peripheral coldness · proteinuria · vasoconstriction
- SIDE-EFFECTS, FURTHER INFORMATION** Infusion-related reactions are very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.
- **PREGNANCY** Toxicity in *animal* studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor closely if cardiac dysfunction.
  - ▶ Monitor closely if respiratory dysfunction.
  - ▶ Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Myozyme*®), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- ▶ **Myozyme** (Genzyme Therapeutics Ltd)  
**Alglucosidase alfa 50 mg** Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £356.06 (Hospital only)

## 2.11 Tyrosinaemia type I

### ENZYME INHIBITORS > 4-

#### HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

#### Nitisinone

##### (NTBC)

#### ● INDICATIONS AND DOSE

##### Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

- **INTERACTIONS** → Appendix 1: nitisinone
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Corneal opacity · eye inflammation · eye pain · granulocytopenia · leucopenia · photophobia · thrombocytopenia
  - ▶ **Uncommon** Leucocytosis · skin reactions
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.
- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function regularly.
  - ▶ Monitor platelet and white blood cell count every 6 months.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral suspension

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)  
**Nitisinone 4 mg per 1 mL** Orfadin 4mg/1ml oral suspension sugar-free | 90 mL [PoM] £1,692.00 DT = £1,692.00

#### Capsule

##### ▶ Nitisinone (Non-proprietary)

- Nitisinone 2 mg** Nitisinone 2mg capsules | 60 capsule [PoM] £423.00
- Nitisinone 5 mg** Nitisinone 5mg capsules | 60 capsule [PoM] £845.25
- Nitisinone 10 mg** Nitisinone 10mg capsules | 60 capsule [PoM] £1,546.50
- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)  
**Nitisinone 2 mg** Orfadin 2mg capsules | 60 capsule [PoM] £564.00
- Nitisinone 5 mg** Orfadin 5mg capsules | 60 capsule [PoM] £1,127.00
- Nitisinone 10 mg** Orfadin 10mg capsules | 60 capsule [PoM] £2,062.00
- Nitisinone 20 mg** Orfadin 20mg capsules | 60 capsule [PoM] £4,512.00 DT = £4,512.00

## 2.12 Urea cycle disorders

### AMINO ACIDS AND DERIVATIVES

#### Carglumic acid

##### ● INDICATIONS AND DOSE

##### Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

###### ► BY MOUTH

- Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

##### Hyperammonaemia due to organic acidemia (under expert supervision)

###### ► BY MOUTH

- Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

##### IMPORTANT SAFETY INFORMATION

###### EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

##### ● SIDE-EFFECTS

- **Common or very common** Hyperhidrosis
- **Uncommon** Bradycardia · diarrhoea · fever · vomiting
- **Frequency not known** Rash
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13

###### ► Carglumic acid (Non-proprietary)

**Carglumic acid 200 mg** Carglumic acid 200mg dispersible tablets sugar free sugar-free | 5 tablet [PoM](#) £218.69 sugar-free | 60 tablet [PoM](#) £2,624.30

## DRUGS FOR METABOLIC DISORDERS >

### AMMONIA LOWERING DRUGS

#### Glycerol phenylbutyrate

13-Sep-2018

- **DRUG ACTION** Glycerol phenylbutyrate is a nitrogen-binding agent that provides an alternative vehicle for waste nitrogen excretion.

##### ● INDICATIONS AND DOSE

##### Urea cycle disorders (specialist use only)

###### ► BY MOUTH, OR BY GASTROSTOMY TUBE, OR BY NASOGASTRIC TUBE

- Adult (body surface area up to 1.3 m<sup>2</sup>): Initially 9.4 g/m<sup>2</sup> daily in divided doses, usual maintenance 5.3–12.4 g/m<sup>2</sup> daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature
- Adult (body surface area 1.3 m<sup>2</sup> and above): Initially 8 g/m<sup>2</sup> daily in divided doses, usual maintenance 5.3–12.4 g/m<sup>2</sup> daily in divided doses, each dose should be rounded up to the nearest 0.5 mL and given with each meal. For dose adjustments based on individual requirements—consult product literature

##### DOSE EQUIVALENCE AND CONVERSION

- 1 mL of liquid contains 1.1 g of glycerol phenylbutyrate.
- For patients switching from sodium phenylbutyrate or sodium benzoate—consult product literature.

##### IMPORTANT SAFETY INFORMATION

###### EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

- **CONTRA-INDICATIONS** Treatment of acute hyperammonaemia
- **CAUTIONS** Elderly—limited information available · intestinal malabsorption · pancreatic insufficiency
- **INTERACTIONS** → Appendix 1: glycerol phenylbutyrate
- **SIDE-EFFECTS**
  - **Common or very common** Appetite abnormal · constipation · diarrhoea · dizziness · fatigue · food aversion · gastrointestinal discomfort · gastrointestinal disorders · headache · menstrual cycle irregularities · nausea · oral disorders · peripheral oedema · skin reactions · tremor · vomiting
  - **Uncommon** Akathisia · alopecia · biliary colic · bladder pain · burping · confusion · depressed mood · drowsiness · dry mouth · dysphonia · epistaxis · fever · gastrointestinal infection viral · hot flush · hyperhidrosis · hypoalbuminaemia · hypokalaemia · hypothyroidism · joint swelling · muscle spasms · nasal congestion · oropharyngeal pain · pain · paraesthesia · plantar fasciitis · speech disorder · taste altered · throat irritation · ventricular arrhythmia · weight changes
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).  
**Dose adjustments** Manufacturer advises use lowest possible dose—consult product literature.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises may be added to a small amount of apple sauce, ketchup,

or squash puree and used within 2 hours. For administration advice via nasogastric or gastrostomy tube—consult product literature.

- **HANDLING AND STORAGE** Manufacturer advises discard contents of bottle 14 days after opening.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1342/18

The *Scottish Medicines Consortium* has advised (August 2018) that glycerol phenylbutyrate (*Ravicti*®) is accepted for use within NHS Scotland as an adjunctive therapy for chronic management of adult and paediatric patients aged 2 months and older with urea cycle disorders who cannot be managed by dietary protein restriction and/or amino acid supplementation alone. Glycerol phenylbutyrate must be used with dietary protein restriction and, in some cases, dietary supplements. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

- ▶ **Ravicti** (Swedish Orphan Biovitrum Ltd) ▼  
Glycerol phenylbutyrate 1.1 gram per 1 ml Ravicti 1.1g/ml oral liquid | 25 ml [PoM](#) £161.00

## Sodium phenylbutyrate

- **INDICATIONS AND DOSE**

**Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: 9.9–13 g/m<sup>2</sup> daily in divided doses, with meals; maximum 20 g per day

**IMPORTANT SAFETY INFORMATION**

**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

- **CAUTIONS** Congestive heart failure (preparations contain significant amounts of sodium)
- **INTERACTIONS** → Appendix 1: sodium phenylbutyrate
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anaemia · appetite decreased · constipation · depression · headache · irritability · leucocytosis · leucopenia · menstrual cycle irregularities · metabolic acidosis · metabolic alkalosis · nausea · oedema · renal tubular acidosis · skin reactions · syncope · taste altered · thrombocytopenia · thrombocytosis · vomiting · weight increased
  - ▶ **Uncommon** Anorectal haemorrhage · aplastic anaemia · arrhythmia · gastrointestinal disorders · pancreatitis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION** Granules should be mixed with food before taking. *Pheburane*® granules must not be administered by nasogastric or gastrostomy tubes.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Granules**

- ▶ **Ammonaps** (Swedish Orphan Biovitrum Ltd)  
Sodium phenylbutyrate 940 mg per 1 gram Ammonaps 940mg/g granules sugar-free | 266 gram [PoM](#) £860.00 DT = £860.00
- ▶ **Pheburane** (Lucane Pharma Ltd)

## 2.13 Wilson's disease

**Other drugs used for Wilson's disease** Penicillamine, p. 1097

### ANTIDOTES AND CHELATORS > COPPER ABSORPTION INHIBITORS

#### Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

- **INDICATIONS AND DOSE**

**Wilson's disease (initiated under specialist supervision)**

- ▶ BY MOUTH
- ▶ Adult: 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Doses expressed as elemental zinc.

**PHARMACOKINETICS**

- ▶ Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Epigastric discomfort (usually transient)
  - ▶ **Uncommon** Leucopenia · sideroblastic anaemia
  - ▶ **Frequency not known** Condition aggravated
- **SIDE-EFFECTS, FURTHER INFORMATION** Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.
- **PREGNANCY**  
**Dose adjustments** Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.
- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 23

▶ **Wilzin** (Recordati Rare Diseases UK Ltd)

Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [PoM] £132.00

Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [PoM] £242.00

**ANTIDOTES AND CHELATORS > COPPER CHELATORS****Trientine dihydrochloride**● **INDICATIONS AND DOSE****Wilson's disease in patients intolerant of penicillamine**

▶ BY MOUTH

▶ Adult: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

- **INTERACTIONS** → Appendix 1: trientine

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Anaemia
- ▶ **Frequency not known** Gastrointestinal disorders · nausea · neurological deterioration in Wilson's Disease · rash
- **PREGNANCY** Teratogenic in *animal* studies—use only if benefit outweighs risk.

**Monitoring** Monitor maternal and neonatal serum-copper concentrations.

- **PRESCRIBING AND DISPENSING INFORMATION** Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 6, 22

▶ **Trientine dihydrochloride (Non-proprietary)**

Trientine dihydrochloride 300 mg Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] £3,090.00 DT = £3,090.00

**3 Mineral and trace elements deficiencies****3.1 Selenium deficiency****Selenium deficiency****Overview**

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

**VITAMINS AND TRACE ELEMENTS****Selenium**● **INDICATIONS AND DOSE****Selenium deficiency**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100–500 micrograms daily

- **UNLICENSED USE** The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.
- **INTERACTIONS** → Appendix 1: selenium

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**▶ **Selenium (Non-proprietary)**

L-Selenomethionine 200 microgram Selenium 200microgram capsules | 30 capsule £3.20 | 60 capsule £5.79

**3.2 Zinc deficiency****Zinc deficiency****Overview**

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

**ELECTROLYTES AND MINERALS > ZINC****Zinc sulfate**● **INDICATIONS AND DOSE****Zinc deficiency or supplementation in zinc-losing conditions**

▶ BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in

water and taken after food, dose expressed as elemental zinc

- Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Adult (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

#### Additional elemental zinc for intravenous nutrition

- ▶ BY INTRAVENOUS INJECTION
- Adult: 6.5 mg daily (Zn<sup>2+</sup> 100 micromol)

- **UNLICENSED USE** *Solvazinc*<sup>®</sup> is not licensed for use in acrodermatitis enteropathica.
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS** Diarrhoea · gastritis · gastrointestinal discomfort · nausea · vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Each *Solvazinc*<sup>®</sup> tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ *Solvazinc* (Galen Ltd)

Zinc sulfate monohydrate 125 mg *Solvazinc* 125mg effervescent tablets sugar-free | 90 tablet (P) £17.20 DT = £17.20

## 4 Nutrition (intravenous)

### Intravenous nutrition

#### Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 1072.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B<sub>12</sub>, as hydroxocobalamin p. 1026, is given by intramuscular injection; regular vitamin B<sub>12</sub> injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 1025 is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out before and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

**Protein** is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of nonessential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose p. 1041) and electrolytes.

**Energy** is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

**Fat** emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. **Additives should not be mixed with fat emulsions unless compatibility is known.**

#### Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *product literature and other specialist literature should be consulted.*

## NUTRIENTS &gt; PARENTERAL NUTRITION

## Parenteral nutrition supplements

## ● INDICATIONS AND DOSE

**Supplement in intravenous nutrition**

- ▶ BY INTRAVENOUS INFUSION, OR BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

**DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES****Amino acid supplement for hypercatabolic or hypermetabolic states**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

## ● CAUTIONS

**PEDITRACE SOLUTION FOR INFUSION 10ML VIALS** Reduced biliary excretion · reduced biliary excretion in cholestatic liver disease · reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) · total parenteral nutrition exceeding one month

**CAUTIONS, FURTHER INFORMATION**

- ▶ Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.
- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other specialist literature should be consulted*. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

**CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT**

Dissolve in 5 mL water for injections.

**PEDITRACE SOLUTION FOR INFUSION 10ML VIALS** For addition to *Vaminolact*<sup>®</sup>, *Vamin*<sup>®</sup> 14 Electrolyte-Free solutions, and glucose intravenous infusions.

**ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES** For addition to *Vamin*<sup>®</sup> solutions and glucose intravenous infusions.

**DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES** For addition to infusion solutions containing amino acids.

**ADDIPHOS<sup>®</sup> VIALS** For addition to *Vamin*<sup>®</sup> solutions and glucose intravenous infusions.

**DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES** For addition to infusion solutions.

**TRACUTIL<sup>®</sup> AMPOULES** For addition to infusion solutions.

**SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS**

Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*<sup>®</sup>; dissolve in *Vitlipid N*<sup>®</sup> or *Intralipid*<sup>®</sup> for adding to *Intralipid*<sup>®</sup> only.

**VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES** For addition to *Intralipid*<sup>®</sup>.

## ● PRESCRIBING AND DISPENSING INFORMATION

**CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT**

*Cernevit*<sup>®</sup> solution contains *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, coalfeciferol 220 units, cyanocobalamin 6 micrograms, folic acid 41.4 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate)

3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. **PEDITRACE SOLUTION FOR INFUSION 10ML VIALS** For use in neonates (when kidney function established, usually second day of life), infants, and children.

*Peditrace*<sup>®</sup> solution contains traces of Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, Se<sup>4+</sup>, F<sup>-</sup>, I<sup>-</sup>.

**ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES** For patients over 40 kg.

*Additrace*<sup>®</sup> solution contains traces of Fe<sup>3+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, F<sup>-</sup>, I<sup>-</sup>.

**DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES** *Dipeptiven*<sup>®</sup> solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

**ADDIPHOS<sup>®</sup> VIALS** *Addiphos*<sup>®</sup> sterile solution contains phosphate 40 mmol, K<sup>+</sup> 30 mmol, Na<sup>+</sup> 30 mmol/20 mL.

**DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES** For patients over 40 kg.

*Decan*<sup>®</sup> solution contains trace elements Fe<sup>2+</sup>, Zn<sup>2+</sup>, Cu<sup>2+</sup>, Mn<sup>2+</sup>, F<sup>-</sup>, Co<sup>2+</sup>, I<sup>-</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, Cr<sup>3+</sup>.

**TRACUTIL<sup>®</sup> AMPOULES** *Tracutil*<sup>®</sup> solution contains trace elements Fe<sup>2+</sup>, Zn<sup>2+</sup>, Mn<sup>2+</sup>, Cu<sup>2+</sup>, Cr<sup>3+</sup>, Se<sup>4+</sup>, Mo<sup>6+</sup>, I<sup>-</sup>, F<sup>-</sup>.

**SOLIVITO N POWDER FOR SOLUTION FOR INFUSION VIALS**

*Solvito N*<sup>®</sup> powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

**VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES**

*Vitlipid N*<sup>®</sup> adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytonadione 15 micrograms/mL.

For adults and children over 11 years.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- ▶ **Cernevit** (Baxter Healthcare Ltd)

Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 41.4 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Pantothenic acid (as Dexpantenol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit. *Cernevit* solution for injection vials and diluent | 10 vial [POM] 

**Solution for infusion**

- ▶ **Parenteral nutrition supplements (Non-proprietary)**

**Sodium glycerophosphate 216 mg per 1 ml** Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial [POM] £5.60

- ▶ **Additrac** (Fresenius Kabi Ltd)

Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml. *Additrac* concentrate for solution for infusion 10ml ampoules | 1 ampoule [POM] £1.96

- ▶ **Dipeptiven** (Fresenius Kabi Ltd)

**N(2)-L-alanyl-L-glutamine 200 mg per 1 ml** Dipeptiven 20g/100ml concentrate for solution for infusion bottles | 1 bottle [POM] £25.93  
Dipeptiven 10g/50ml concentrate for solution for infusion bottles | 1 bottle [POM] £13.94

- ▶ **Peditrace** (Fresenius Kabi Ltd)

**Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride)**

57 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml Peditrace solution for infusion 10ml vials | 1 vial [PoM] £3.55

▶ **Tracutil** (B.Braun Melsungen AG)

## 5 Nutrition (oral)

### Enteral nutrition

#### Overview

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds.

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

#### Enteral nutrition in children

Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought.

## 5.1 Special diets

### Nutrition in special diets

#### Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS).

#### Coeliac disease

Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 37.

#### Phenylketonuria

*Phenylketonuria* (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with *phenylketonuria* and *tetrahydrobiopterin deficiency*.

**Aspartame** (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of *phenylketonuria*. Where the presence of **aspartame** is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

### 5.1a Phenylketonuria

#### DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES

#### Sapropterin dihydrochloride

14-Sep-2018

##### ● INDICATIONS AND DOSE

**Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)**

▶ BY MOUTH

▶ Adult: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

**Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)**

▶ BY MOUTH

▶ Adult: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

● **CAUTIONS** History of convulsions

● **INTERACTIONS** → Appendix 1: sapropterin

##### ● SIDE-EFFECTS

▶ **Common or very common** Abdominal pain · cough · diarrhoea · headache · laryngeal pain · nasal congestion · vomiting

▶ **Frequency not known** Hypersensitivity

● **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.
  - ▶ Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 558/09

The *Scottish Medicines Consortium* has advised (August 2018) that sapropterin dihydrochloride (*Kuvan*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the treatment of hyperphenylalaninaemia in adults and paediatric patients of all ages with phenylketonuria (who have been shown to be responsive to such treatment) as the economic case was not demonstrated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Soluble tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ *Kuvan* (BioMarin Europe Ltd)

**Sapropterin dihydrochloride 100 mg** *Kuvan* 100mg soluble tablets sugar-free | 30 tablet [PoM] E597.22

## 6 Vitamin deficiency

### Vitamins

#### Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 1082 and pyridoxine hydrochloride p. 1080, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

#### Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if

this is suspected the patient should be referred to a medical practitioner.

#### Vitamin A

Deficiency of vitamin A p. 1079 (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

#### Vitamin B group

Deficiency of the B vitamins, other than vitamin B<sub>12</sub>, is rare in the UK and is usually treated by preparations containing thiamine p. 1080 (B<sub>1</sub>), riboflavin (B<sub>2</sub>), and nicotinamide p. 1272, which is used in preference to nicotinic acid p. 201, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate p. 233, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism, are best treated initially by the parenteral administration of B vitamins (*Pabrinex*<sup>®</sup>), followed by oral administration of thiamine in the longer term. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B<sub>6</sub>) deficiency is rare, but it may occur during isoniazid p. 587 therapy or penicillamine p. 1097 treatment in Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia. There is evidence to suggest that pyridoxine hydrochloride may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride. Folic acid p. 1025 and vitamin B<sub>12</sub> are used in the treatment of megaloblastic anaemia. Folinic acid p. 941 (available as calcium folinate) is used in association with cytotoxic therapy.

#### Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proven.

#### Vitamin D

The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol p. 1086 (calciferol, vitamin D<sub>2</sub>), colecalciferol p. 1084 (vitamin D<sub>3</sub>), dihydrocholesterol p. 1086, alfalcidol p. 1083 (1 $\alpha$ -hydroxycholecalciferol), and calcitriol p. 1083 (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of ergocalciferol (calciferol, vitamin D<sub>2</sub>) or colecalciferol (vitamin D<sub>3</sub>) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for severe deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing colecalciferol with calcium carbonate p. 1085 are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency.

Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with *severe renal impairment* require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol p. 1087, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease.

### Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined but is probably 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

### Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. Menadiol sodium phosphate p. 1089 is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K.

### Other compounds

Potassium aminobenzoate p. 1080 has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie's disease. In Peyronie's disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

## VITAMINS AND TRACE ELEMENTS > MULTIVITAMINS

### Vitamins A and D

#### ● INDICATIONS AND DOSE

##### Prevention of vitamin A and D deficiency

###### ▶ BY MOUTH

- ▶ Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D
- ▶ Adult: (consult product literature)

#### ● UNLICENSED USE

- ▶ In children Not licensed in children under 6 months of age.

#### ● SIDE-EFFECTS

**Overdose** Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

##### ▶ Vitamins A and D (Non-proprietary)

**Vitamin D 400 unit, Vitamin A 4000 unit** Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 84 capsule £6.75-£8.42 DT = £8.42

## Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 1082.

#### ● INDICATIONS AND DOSE

##### Prevention of vitamin deficiency

###### ▶ BY MOUTH

- ▶ Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **INTERACTIONS** → Appendix 1: ascorbic acid · vitamin A

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at [www.healthystart.nhs.uk](http://www.healthystart.nhs.uk). Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

*Healthy Start Vitamins for women* (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at [www.healthystart.nhs.uk](http://www.healthystart.nhs.uk). Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral drops

- ▶ **Healthy Start Children's Vitamin** (Secretary of State for Health) Vitamin A and D3 concentrate.55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml Healthy Start Children's Vitamin drops | 10 ml 

## VITAMINS AND TRACE ELEMENTS > VITAMIN A

### Vitamin A

#### (Retinol)

#### ● INDICATIONS AND DOSE

##### Vitamin A deficiency

###### ▶ BY MOUTH

- ▶ Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- ▶ Child 1-17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

- **UNLICENSED USE** Preparations containing only vitamin A are not licensed.

- **INTERACTIONS** → Appendix 1: vitamin A
- **SIDE-EFFECTS**  
**Overdose** Massive overdose can cause rough skin, dry hair, an enlarged liver, and increases in erythrocyte sedimentation rate, serum calcium and serum alkaline phosphatase concentration.
- **PREGNANCY** Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.
- **BREAST FEEDING** Theoretical risk of toxicity in infants of mothers taking large doses.
- **MONITORING REQUIREMENTS** Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral drops, solution for injection

**Oral drops**

- ▶ **Arovit (Imported (Italy))**

Vitamin A 150000 unit per 1 ml Arovit 150,000units/ml drops | 7.5 ml [PoM] 

Combinations available: *Vitamins A, C and D*, p. 1079

**VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP****Potassium aminobenzoate**

24-Jul-2018

● **INDICATIONS AND DOSE****Peironie's disease | Scleroderma**

- ▶ BY MOUTH
- ▶ Adult: 12 g daily in divided doses, to be taken after food

- **CONTRA-INDICATIONS** Hyperkalaemia · severe liver damage
- **CAUTIONS** Interrupt treatment during periods of low food intake (such as fasting, anorexia and nausea)—increased risk of hypoglycaemia
- **INTERACTIONS** → Appendix 1: potassium aminobenzoate
- **SIDE-EFFECTS** Hepatitis · hypoglycaemia
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises unknown if excreted in milk—risk to infant cannot be excluded.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—increased risk of hyperkalaemia; avoid if GFR less than 45 mL/minute.
- **MONITORING REQUIREMENTS** Manufacturer advises liver function tests should be performed monthly—discontinue immediately if elevated.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder**

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Potaba** (Cheplapharm Arzneimittel GmbH)

Potassium aminobenzoate 3 gram Potaba 3g sachets | 40 sachet [P] £34.31 DT = £34.31

**Pyridoxine hydrochloride****(Vitamin B<sub>6</sub>)**● **INDICATIONS AND DOSE****Deficiency states**

- ▶ BY MOUTH
- ▶ Adult: 20–50 mg 1–3 times a day

**Severe deficiency**

- ▶ BY MOUTH
- ▶ Adult: 200–300 mg daily in divided doses

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE (SEPTEMBER 2007)**

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

- **CAUTIONS** Anaphylaxis may occasionally follow injection
- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

#### Tablet

- ▶ **Ketovite** (Essential Pharmaceuticals Ltd)  
Biotin 170 microgram, Folic acid 250 microgram, Pyridoxine hydrochloride 330 microgram, Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Calcium pantothenate 1.16 mg, Nicotinamide 3.3 mg, Alpha tocopheryl acetate 5 mg, Ascorbic acid 16.6 mg, Inositol 50 mg *Ketovite tablets* | 100 tablet **[PoM]** £9.21

#### Capsule

- ▶ **Forceval** (Forum Health Products Ltd)  
Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 200 microgram, Molybdenum 250 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Riboflavin 1.6 mg, Copper 2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopheryl acetate 10 mg, Iron 12 mg, Zinc 15 mg, Nicotinamide 18 mg, Magnesium 30 mg, Ascorbic acid 60 mg, Phosphorus 77 mg, Calcium 100 mg, Ergocalciferol 400 unit, Vitamin A 2500 unit *Forceval capsules* | 15 capsule **P** £5.46 | 30 capsule **P** £9.92 | 90 capsule **P** £28.77

## VITAMINS AND TRACE ELEMENTS > VITAMIN C

### Ascorbic acid

(Vitamin C)

### ● INDICATIONS AND DOSE

**Prevention of scurvy**

- ▶ BY MOUTH
- ▶ Adult: 25–75 mg daily

**Treatment of scurvy**

- ▶ BY MOUTH
- ▶ Adult: Not less than 250 mg daily in divided doses

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Iron overload** Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

- **INTERACTIONS** → Appendix 1: ascorbic acid

- **SIDE-EFFECTS** Diarrhoea · gastrointestinal disorder · hyperoxaluria · oxalate nephrolithiasis · polyuria

- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

#### Tablet

EXCIPIENTS: May contain Aspartame

#### ▶ Ascorbic acid (Non-proprietary)

**Ascorbic acid 50 mg** *Ascorbic acid 50mg tablets* | 28 tablet **[GSL]** £15.05 DT = £15.05

**Ascorbic acid 100 mg** *Ascorbic acid 100mg tablets* | 28 tablet **[GSL]** £14.30 DT = £14.30

**Ascorbic acid 200 mg** *Ascorbic acid 200mg tablets* | 28 tablet **[GSL]** £19.86 DT = £19.86

**Ascorbic acid 250 mg** *Ascorbic acid 250mg tablets* | 1000 tablet **[PoM]** £50

**Ascorbic acid 500 mg** *Ascorbic acid 500mg tablets* | 28 tablet **[GSL]** £26.87 DT = £26.87 | 28 tablet **[N]** DT = £26.87

#### Chewable tablet

CAUTIONARY AND ADVISORY LABELS 24

EXCIPIENTS: May contain Aspartame

#### ▶ Ascur (Ennogen Healthcare Ltd)

**Ascorbic acid 100 mg** *Ascur 100mg chewable tablets* | 30 tablet £3.95

**Ascorbic acid (as Sodium ascorbate) 500 mg** *Ascur 500mg chewable tablets sugar-free* | 30 tablet £2.99

**Combinations available: Vitamin B substances with ascorbic acid**, p. 1081 · *Vitamins A, C and D*, p. 1079

## VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

### Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · headache · hypercalcaemia · hypercalciuria · nausea · skin reactions
- ▶ **Uncommon** Appetite decreased · constipation · thirst · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

**Overdose** Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation,

weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

- **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS** **Important:** all patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

## Alfacalcidol

### (1 $\alpha$ -Hydroxycholecalciferol)

#### ● INDICATIONS AND DOSE

**Patients with severe renal impairment requiring vitamin D therapy**

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 1 microgram daily, dose to be adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily
- ▶ Elderly: Initially 500 nanograms daily, dose adjusted to avoid hypercalcaemia; maintenance 0.25–1 microgram daily

**Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism**

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
- ▶ Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

**Prevention of vitamin D deficiency in renal or cholestatic liver disease**

- ▶ BY MOUTH, OR BY INTRAVENOUS INJECTION
- ▶ Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- ▶ Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary
- ▶ Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal discomfort · hyperphosphataemia · rash pustular
  - ▶ **Uncommon** Asthenia · diarrhoea · malaise · myalgia · urolithiasis
  - ▶ **Rare or very rare** Dizziness
  - ▶ **Frequency not known** Confusion · renal impairment
- **RENAL IMPAIRMENT**

**Monitoring** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With intravenous use For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

##### ▶ One-Alpha (LEO Pharma)

**Alfacalcidol 2 microgram per 1 ml** One-Alpha 2micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £41.13  
**One-Alpha 1micrograms/0.5ml solution for injection ampoules** | 10 ampoule [PoM] £21.57

#### Oral drops

EXCIPIENTS: May contain Alcohol

##### ▶ One-Alpha (LEO Pharma)

**Alfacalcidol 2 microgram per 1 ml** One-Alpha 2micrograms/ml oral drops sugar-free | 10 ml [PoM] £21.30 DT = £21.30

#### Capsule

EXCIPIENTS: May contain Sesame oil

##### ▶ Alfacalcidol (Non-proprietary)

**Alfacalcidol 250 nanogram** Alfacalcidol 250nanogram capsules | 30 capsule [PoM] £5.00 DT = £4.94

**Alfacalcidol 500 nanogram** Alfacalcidol 500nanogram capsules | 30 capsule [PoM] £10.00 DT = £9.89

**Alfacalcidol 1 microgram** Alfacalcidol 1microgram capsules | 30 capsule [S] DT = £13.82 | 30 capsule [PoM] £14.00 DT = £13.82

##### ▶ One-Alpha (LEO Pharma)

**Alfacalcidol 250 nanogram** One-Alpha 250nanogram capsules | 30 capsule [PoM] £3.37 DT = £4.94

**Alfacalcidol 500 nanogram** One-Alpha 0.5microgram capsules | 30 capsule [PoM] £6.27 DT = £9.89

**Alfacalcidol 1 microgram** One-Alpha 1microgram capsules | 30 capsule [PoM] £8.75 DT = £13.82

## Calcitriol

### (1,25-Dihydroxycholecalciferol)

26-Jun-2018

#### ● INDICATIONS AND DOSE

##### Renal osteodystrophy

▶ BY MOUTH

- ▶ Adult: Initially 250 nanograms daily, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

##### Renal osteodystrophy (in patients with normal or only slightly reduced plasma-calcium concentration)

▶ BY MOUTH

- ▶ Adult: Initially 250 nanograms once daily on alternate days, adjusted in steps of 250 nanograms every 2–4 weeks if required; usual dose 0.5–1 microgram daily

##### Established postmenopausal osteoporosis

▶ BY MOUTH

- ▶ Adult: 250 nanograms twice daily, plasma-calcium concentration and creatinine to be monitored (consult product literature)

- **INTERACTIONS** → Appendix 1: vitamin D substances

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Urinary tract infection
- ▶ **Frequency not known** Abdominal pain upper · apathy · arrhythmia · dehydration · drowsiness · fever · growth retardation · muscle weakness · paralytic ileus · polydipsia · psychiatric disorder · sensory disorder · urinary disorders · weight decreased

- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

**Monitoring** Monitor plasma-calcium concentration in renal impairment.

#### ● MONITORING REQUIREMENTS

- ▶ Monitor plasma calcium, phosphate, and creatinine during dosage titration.
- ▶ Monitor plasma-calcium concentration in patients receiving high doses.

- **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
- Capsule**
  - ▶ **Calcitriol (Non-proprietary)**
    - Calcitriol 250 nanogram** Calcitriol 250nanogram capsules | 30 capsule [PoM] £5.41-£18.04
    - Calcitriol 500 nanogram** Calcitriol 500nanogram capsules | 30 capsule [PoM] £9.68-£32.25
  - ▶ **Rocaltrol** (Roche Products Ltd)
    - Calcitriol 250 nanogram** Rocaltrol 250nanogram capsules | 100 capsule [PoM] £18.04 DT = £18.04
    - Calcitriol 500 nanogram** Rocaltrol 500nanogram capsules | 100 capsule [PoM] £32.25 DT = £32.25

F 1082

## Colectiferol

(Cholecalciferol; Vitamin D<sub>3</sub>)

### ● INDICATIONS AND DOSE

#### Prevention of vitamin D deficiency

- ▶ BY MOUTH
- ▶ Adult: 400 units daily

#### Treatment of vitamin D deficiency

- ▶ BY MOUTH
- ▶ Adult: 800 units daily, higher doses may be necessary for severe deficiency

- **CAUTIONS** Take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS** Laryngeal oedema
- **RENAL IMPAIRMENT**
  - Monitoring** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **DIRECTIONS FOR ADMINISTRATION**
  - INVITA D3<sup>®</sup> ORAL SOLUTION** May be mixed with a small amount of cold or lukewarm food immediately before administration.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, oral drops

### Tablet

**Colecalciferol 2500 unit** SunVit-D3 2,500unit capsules | 28 capsule £5.49  
**Colecalciferol 10000 unit** SunVit-D3 10,000unit capsules | 28 capsule £6.99  
**Colecalciferol 40000 unit** SunVit-D3 40,000unit capsules | 10 capsule £9.99 DT = £15.00
- Orodispersible tablet**
- ▶ **Colecalciferol (Non-proprietary)**  
**Colecalciferol 2000 unit** D3 Lemon Melts 2,000unit tablets sugar-free | 120 tablet £4.88

## **Colecalciferol with calcium carbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 1084, calcium carbonate p. 1045.

### ● **INDICATIONS AND DOSE**

#### **Prevention and treatment of vitamin D and calcium deficiency**

- ▶ **BY MOUTH**
- ▶ **Adult:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts · vitamin D substances
- **PRESCRIBING AND DISPENSING INFORMATION** *Accrete D3*<sup>®</sup> contains calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), *colecalciferol 10 micrograms (400 units)*; *Adcal-D3*<sup>®</sup> tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), *colecalciferol 10 micrograms (400 units)*; *Cacit*<sup>®</sup> D3 contains calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), *colecalciferol 11 micrograms (440 units)*/sachet; *Calceos*<sup>®</sup> contains calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), *colecalciferol 10 micrograms (400 units)*; *Calcichew-D3*<sup>®</sup> tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), *colecalciferol 5 micrograms (200 units)*; *Calcichew-D3*<sup>®</sup> Forte tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), *colecalciferol 10 micrograms (400 units)*; *Calcichew-D3*<sup>®</sup> 500 mg/400 unit caplets contain calcium

carbonate (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 10 micrograms (400 units); *Kalcipos-D*<sup>®</sup> contains calcium carbonate (calcium 500 mg or Ca<sup>2+</sup> 12.5 mmol), colecalciferol 20 micrograms (800 units); *Natecal D3*<sup>®</sup> contains calcium carbonate 1.5 g (calcium 600 mg or Ca<sup>2+</sup> 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Colecalciferol with calcium carbonate (Non-proprietary)**

**Calcium carbonate 2.5 gram, Colecalciferol 880 unit** Colecalciferol 880unit / Calcium carbonate 2.5g effervescent granules sachets | 24 sachet [PoM] [X]

- ▶ **Cacit D3** (Theramex HQ UK Ltd)

**Calcium carbonate 1.25 gram, Colecalciferol 440 unit** Cacit D3 effervescent granules sachets | 30 sachet [P] £4.06 DT = £4.06

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Adcal-D3** (Kyowa Kirin Ltd)

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Adcal-D3 Dissolve 1500mg/400unit effervescent tablets | 56 tablet [P] £5.99 DT = £5.99

#### Tablet

EXCIPIENTS: May contain Propylene glycol

- ▶ **Accrete D3** (Internis Pharmaceuticals Ltd)

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Accrete D3 tablets | 60 tablet [P] £2.95 DT = £2.95

- ▶ **Adcal-D3** (Kyowa Kirin Ltd)

**Calcium carbonate 750 mg, Colecalciferol 200 unit** Adcal-D3 750mg/200unit caplets | 112 tablet [P] £2.95 DT = £2.95

- ▶ **Calcichew D3** (Takeda UK Ltd)

**Calcium carbonate 1.25 gram, Colecalciferol 400 unit** Calcichew D3 500mg/400unit caplets | 100 tablet [P] £7.43 DT = £7.43

#### Chewable tablet

CAUTIONARY AND ADVISORY LABELS 24

EXCIPIENTS: May contain Aspartame

- ▶ **Colecalciferol with calcium carbonate (Non-proprietary)**

**Calcium carbonate 1.25 gram, Colecalciferol 400 unit** Colecalciferol 400unit / Calcium carbonate 1.25g chewable tablets | 60 tablet £4.24 DT = £4.24 | 100 tablet £14.75

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Colecalciferol 400unit / Calcium carbonate 1.5g chewable tablets | 56 tablet [P] £3.65 DT = £3.65 | 60 tablet [P] £3.91

- ▶ **Accrete D3 One a Day** (Internis Pharmaceuticals Ltd)

**Calcium carbonate 2.5 gram, Colecalciferol 880 unit** Accrete D3 One a Day 1000mg/880unit chewable tablets | 30 tablet [P] £2.95 DT = £2.95

- ▶ **Adcal-D3** (Kyowa Kirin Ltd)

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Adcal-D3 Lemon chewable tablets | 56 tablet [P] £3.65 DT = £3.65 | 112 tablet [P] £7.49  
Adcal-D3 chewable tablets tutti frutti | 56 tablet [P] £3.65 DT = £3.65 | 112 tablet [P] £7.49

- ▶ **Calceos** (Galen Ltd)

**Calcium carbonate 1.25 gram, Colecalciferol 400 unit** Calceos 500mg/400unit chewable tablets | 60 tablet [P] £3.51 DT = £4.24

- ▶ **Calci-D** (Consilient Health Ltd)

**Calcium carbonate 2.5 gram, Colecalciferol 1000 iu** Calci-D 1000mg/1,000unit chewable tablets | 28 tablet [PoM] £2.25 DT = £2.25

- ▶ **Calcichew D3** (Takeda UK Ltd)

**Calcium carbonate 2.5 gram, Colecalciferol 800 iu** Calcichew D3 1000mg/800unit Once Daily chewable tablets | 30 tablet [P] £6.75 DT = £6.75

**Calcium carbonate 1.25 gram, Colecalciferol 200 unit** Calcichew D3 chewable tablets | 100 tablet [P] £7.68 DT = £7.68

- ▶ **Calcichew D3 Forte** (Takeda UK Ltd)

**Calcium carbonate 1.25 gram, Colecalciferol 400 unit** Calcichew D3 Forte chewable tablets | 60 tablet [P] £4.24 DT = £4.24 | 100 tablet [P] £7.08

- ▶ **Evacal D3** (Teva UK Ltd)

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Evacal D3 1500mg/400unit chewable tablets | 56 tablet [P] £2.75 DT = £3.65 | 112 tablet [P] £5.50

- ▶ **Kalcipos-D** (Meda Pharmaceuticals Ltd)

**Calcium carbonate 1.25 gram, Colecalciferol 800 unit** Kalcipos-D 500mg/800unit chewable tablets | 30 tablet [PoM] £4.21 DT = £4.21

- ▶ **Natecal** (Chiesi Ltd)

**Calcium carbonate 1.5 gram, Colecalciferol 400 unit** Natecal D3 600mg/400unit chewable tablets | 60 tablet [P] £3.63

- ▶ **TheiCal-D3** (Stirling Anglian Pharmaceuticals Ltd)

**Calcium carbonate 2.5 gram, Colecalciferol 880 unit** TheiCal-D3 1000mg/880unit chewable tablets | 30 tablet [P] £2.95 DT = £2.95

## Colecalciferol with calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 1084, calcium phosphate p. 1046.

### • INDICATIONS AND DOSE

#### Calcium and vitamin D deficiency

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts · vitamin D substances

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Powder

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Calfoviti D3** (A. Menarini Farmaceutica Internazionale SRL)

**Calcium phosphate 3.1 gram, Colecalciferol 800 unit** Calfoviti D3 oral powder sachets | 30 sachet [P] £4.32 DT = £4.32

1082

## Dihydratichysterol

### • INDICATIONS AND DOSE

#### Acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS** Abdominal cramps · apathy · dehydration · hypertension · paralysis · renal failure · stupor · urinary disorders · vertigo
- **RENAL IMPAIRMENT**  
**Monitoring** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

EXCIPIENTS: May contain Arachis (peanut) oil

- ▶ **AT10** (Intrapharm Laboratories Ltd)

**Dihydratichysterol 250 microgram per 1 ml** AT10 250micrograms/ml oral solution sugar-free | 15 ml ml [P] £22.87

1082

## Ergocalciferol

### (Calciferol; Vitamin D<sub>2</sub>)

### • INDICATIONS AND DOSE

#### Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease

- ▶ BY MOUTH
- ▶ Adult: Up to 40 000 units daily

**Hypocalcaemia of hypoparathyroidism to achieve normocalcaemia**

## ▶ BY MOUTH

▶ Adult: Up to 100 000 units daily

**Prevention of vitamin D deficiency**

## ▶ BY MOUTH

▶ Adult: 400 units daily

**Treatment of vitamin D deficiency**

## ▶ BY MOUTH

▶ Adult: 800 units daily, higher doses may be necessary for severe deficiency

- **CAUTIONS** Take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **RENAL IMPAIRMENT**  
**Monitoring** Monitor plasma-calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

- ▶ **Ergo-D2** (Ennogen Healthcare Ltd)  
**Ergocalciferol 12.5 microgram** Ergo-D2 12.5microgram tablets | 30 tablet 
- ▶ **Ergoral** (Cubic Pharmaceuticals Ltd)  
**Ergocalciferol 125 microgram** Ergoral D2 5,000unit tablets | 30 tablet £14.95
- ▶ **Ergocalciferol 250 microgram** Ergoral D2 10,000unit tablets | 30 tablet £17.95

**Oral solution**

- ▶ **Uvesterol (Imported (France))**  
**Ergocalciferol 1500 unit per 1 ml** Uvesterol D 1,500units/ml oral solution sugar-free | 20 ml  
- ▶ **Eciferol** (Rhodes Pharma Ltd)  
**Ergocalciferol 3000 unit per 1 ml** Eciferol D2 3,000units/ml liquid | 60 ml £55.00 DT = £81.73

**Capsule**

- ▶ **Eciferol** (Rhodes Pharma Ltd)  
**Ergocalciferol 1.25 mg** Eciferol D2 50,000unit capsules | 10 capsule £29.99
- ▶ **Ergoral** (Cubic Pharmaceuticals Ltd)  
**Ergocalciferol 1.25 mg** Ergoral D2 50,000unit capsules | 10 capsule £19.95

**Ergocalciferol with calcium lactate and calcium phosphate****(Calcium and vitamin D)**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol p. 1086, calcium lactate p. 1046.

**● INDICATIONS AND DOSE****Prevention of calcium and vitamin D deficiency | Treatment of calcium and vitamin D deficiency**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: calcium salts · vitamin D substances
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.
- **PRESCRIBING AND DISPENSING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca<sup>2+</sup> 2.4 mmol), ergocalciferol 10 micrograms (400 units).
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)**  
**Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg** Calcium and Ergocalciferol tablets | 28 tablet  £25.55 DT = £22.94

**F 1082**

24-Jul-2018

**Paricalcitol****● INDICATIONS AND DOSE****Prevention and treatment of secondary hyperparathyroidism associated with chronic kidney disease**

## ▶ BY MOUTH

▶ Adult: (consult product literature)

**Prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis**

▶ Adult: To be administered via haemodialysis access (consult product literature)

- **INTERACTIONS** → Appendix 1: vitamin D substances

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Electrolyte imbalance · hypoparathyroidism · taste altered
  - ▶ **Uncommon** Asthenia · diarrhoea · dizziness · dry mouth · malaise · muscle complaints · pain
  - ▶ **Frequency not known** Angioedema · laryngeal oedema
- SPECIFIC SIDE-EFFECTS**
- ▶ **Uncommon**
  - ▶ With oral use Breast tenderness · gastrointestinal discomfort · gastroesophageal reflux disease · palpitations · peripheral oedema · pneumonia
  - ▶ With parenteral use Alopecia · anaemia · anxiety · arrhythmias · asthma · breast cancer · breast pain · cardiac arrest · cerebrovascular insufficiency · chest pain · coma · condition aggravated · confusion · conjunctivitis · cough · delirium · depersonalisation · dyspepsia · dysphagia · dyspnoea · ear disorder · erectile dysfunction · fever · gait abnormal · gastrointestinal disorders · glaucoma · haemorrhage · hirsutism · hyperhidrosis · hyperparathyroidism · hypertension · hypotension · increased risk of infection · insomnia · joint disorders · leucopenia · lymphadenopathy · myoclonus · oedema · pulmonary oedema · sensation abnormal · sepsis · syncope · weight decreased

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

**● MONITORING REQUIREMENTS**

- ▶ Monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised.
- ▶ Monitor parathyroid hormone concentration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Ethanol, propylene glycol

▶ **Zemplar** (AbbVie Ltd)

**Paricalcitol 5 microgram per 1 ml** Zemplar 5micrograms/1ml solution for injection vials | 5 vial [PoM] £62.00 (Hospital only)

**Capsule**

EXCIPIENTS: May contain Ethanol

▶ **Zemplar** (AbbVie Ltd)

**Paricalcitol 1 microgram** Zemplar 1microgram capsules | 28 capsule [PoM] £69.44 DT = £69.44

**Paricalcitol 2 microgram** Zemplar 2microgram capsules | 28 capsule [PoM] £138.88 DT = £138.88

**VITAMINS AND TRACE ELEMENTS > VITAMIN E****Alpha tocopherol**

28-Mar-2017

**(Tocopherol)**● **INDICATIONS AND DOSE****Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis**

- ▶ BY MOUTH USING ORAL SOLUTION
- ▶ Child: 17 mg/kg daily, dose to be adjusted as necessary

- **CAUTIONS** Predisposition to thrombosis
- **INTERACTIONS** → Appendix 1: vitamin E substances
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea
  - ▶ **Uncommon** Alopecia · asthenia · headache · skin reactions
  - ▶ **Frequency not known** Abdominal pain
- **PREGNANCY** Manufacturer advises caution, no evidence of harm in *animal* studies.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content.
- **Monitoring** Manufacturer advises monitor closely in renal impairment.
- **TOCOPHEROL AND DISPENSING INFORMATION** Tocopherol is a water-soluble form of D-alpha tocopherol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**▶ **Vedrop** (Recordati Rare Diseases UK Ltd) ▼

**D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml** Vedrop 50mg/ml oral solution sugar-free | 20 ml [PoM] £54.55 DT = £54.55 sugar-free | 60 ml [PoM] £163.65

**Alpha tocopheryl acetate****(Tocopherol)**● **INDICATIONS AND DOSE****Vitamin E deficiency**

- ▶ BY MOUTH
- ▶ Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

**Malabsorption in cystic fibrosis**

- ▶ BY MOUTH
- ▶ Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

- ▶ Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Child 12–17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Adult: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

**Vitamin E deficiency in cholestasis and severe liver disease**

- ▶ BY MOUTH
- ▶ Child 1-month–11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- ▶ Child 12–17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

**Malabsorption in abetalipoproteinaemia**

- ▶ BY MOUTH
- ▶ Adult: 50–100 mg/kg once daily

- **CAUTIONS** Predisposition to thrombosis
- **INTERACTIONS** → Appendix 1: vitamin E substances
- **SIDE-EFFECTS** Abdominal pain (more common at high doses) · bleeding tendency · diarrhoea (more common at high doses) · increased risk of thrombosis
- **PREGNANCY** No evidence of safety of high doses.
- **BREAST FEEDING** Excreted in milk; minimal risk, although caution with large doses.
- **MONITORING REQUIREMENTS** Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

**Oral suspension**

EXCIPIENTS: May contain Sucrose

▶ **Alpha tocopheryl acetate (Non-proprietary)**

**Alpha tocopheryl acetate 100 mg per 1 ml** Alpha tocopheryl acetate 500mg/5ml oral suspension | 100 ml [GS] £67.97 DT = £67.97

**Alpha tocopherol 200 unit** E-Caps 200unit capsules | 30 capsule £89.50

**Alpha tocopherol 400 unit** E-Caps 400unit capsules | 30 capsule £128.50

**Alpha tocopherol 1000 unit** E-Caps 1,000unit capsules | 30 capsule £130.20

- ▶ **Nutra-E** (TriOn Pharma Ltd)  
**Alpha tocopherol 75 unit** Nutra-E 75unit capsules | 100 capsule £5.86  
**Alpha tocopherol 200 unit** Nutra-E 200unit capsules | 100 capsule £12.88  
**Alpha tocopherol 400 unit** Nutra-E 400unit capsules | 100 capsule £19.82
- ▶ **Vita-E** (Typharm Ltd)  
**Alpha tocopherol 75 unit** Vita-E 75unit capsules | 100 capsule £6.99  
**Alpha tocopherol 200 unit** Vita-E 200unit capsules | 30 capsule £5.35 | 100 capsule £14.99  
**Alpha tocopherol 400 unit** Vita-E 400unit capsules | 30 capsule £7.99 | 100 capsule £21.85

## VITAMINS AND TRACE ELEMENTS > VITAMIN K

### Menadiol sodium phosphate

#### ● INDICATIONS AND DOSE

##### Prevention of Vitamin K deficiency in malabsorption syndromes

- ▶ BY MOUTH
- ▶ Adult: 10–40 mg daily, dose to be adjusted as necessary

- **CONTRA-INDICATIONS** Infants · neonates
- **CAUTIONS** G6PD deficiency (risk of haemolysis) · vitamin E deficiency (risk of haemolysis)
- **PREGNANCY** Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.
- **MEDICINAL FORMS** No licensed medicines listed.

### Phytomenadione

(Vitamin K<sub>1</sub>)

26-Mar-2019

#### ● INDICATIONS AND DOSE

##### Major bleeding in patients on warfarin (in combination with dried prothrombin complex or fresh frozen plasma)

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 5 mg for 1 dose, stop warfarin treatment

##### INR > 8.0 with minor bleeding in patients on warfarin

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1–3 mg, stop warfarin treatment, dose may be repeated if INR still too high after 24 hours, restart warfarin treatment when INR <5

##### INR > 8.0 with no bleeding in patients on warfarin

- ▶ BY MOUTH
- ▶ Adult: 1–5 mg, intravenous preparation to be used orally, stop warfarin treatment, repeat dose if INR still too high after 24 hours, restart warfarin treatment when INR <5

##### INR 5.0–8.0 with minor bleeding in patients on warfarin

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: 1–3 mg, stop warfarin treatment, restart warfarin treatment when INR <5

##### Reversal of anticoagulation prior to elective surgery (after warfarin stopped)

- ▶ BY MOUTH
- ▶ Adult: 1–5 mg, intravenous preparation to be used orally, dose to be given the day before surgery if INR ≥1.5

##### Reversal of anticoagulation prior to emergency surgery (when surgery can be delayed 6–12 hours)

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 5 mg as a single dose, if surgery cannot be delayed, dried prothrombin complex can be given in addition to phytomenadione and the INR checked before surgery

- **UNLICENSED USE** Oral use of intravenous preparations is unlicensed.
- **CAUTIONS** Intravenous injections should be given very slowly—risk of vascular collapse  
**KONAKION® MM** Reduce dose in elderly
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk.
- **HEPATIC IMPAIRMENT**  
**KONAKION® MM** Manufacturer advises caution—monitor INR in patients with severe impairment (contains glycocholic acid which may displace bilirubin).
- **DIRECTIONS FOR ADMINISTRATION**  
**KONAKION® MM PAEDIATRIC** *Konakion® MM Paediatric* may be administered by mouth or by intramuscular injection or by intravenous injection. For intravenous injection, may be diluted with Glucose 5% if necessary.  
**KONAKION® MM** *Konakion® MM* may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; **not** for intramuscular injection. For intravenous infusion (*Konakion® MM*), give intermittently in Glucose 5%; dilute with 55 mL; may be injected into lower part of infusion apparatus.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Solution for injection

EXCIPIENTS: May contain Glycocholic acid, lecithin

- ▶ **Konakion MM** (Cheplapharm Arzneimittel GmbH)  
**Phytomenadione 10 mg per 1 ml** Konakion MM Paediatric 2mg/0.2ml solution for injection ampoules | 5 ampoule **[PoM]** £4.71 DT = £4.71  
 Konakion MM 10mg/1ml solution for injection ampoules | 10 ampoule **[PoM]** £3.78 DT = £3.78

## 6.1 Neural tube defects (prevention in pregnancy)

### Neural tube defects (prevention in pregnancy)

01-Aug-2017

#### Description of condition

Neural tube defects represent a group of congenital defects, caused by incomplete closure of the neural tube within 28 days of conception. The most common forms are anencephaly, spina bifida and encephalocele.

The main risk factors are maternal folate deficiency, maternal vitamin B<sub>12</sub> deficiency, previous history of having an infant with a neural tube defect, smoking, diabetes, obesity, and use of antiepileptic drugs. For information on smoking cessation see Smoking cessation p. 497.

#### Prevention in pregnancy

**[EvGr]** Pregnant women or women who wish to become pregnant should be advised to take supplementation with folic acid p. 1025 before conception and until week 12 of pregnancy.

A higher daily dose (see folic acid) is recommended for women at a high risk of conceiving a child with a neural tube defect, including women who have previously had an infant with a neural tube defect, who are receiving antiepileptic medication (see Epilepsy p. 305), or who have diabetes or sickle-cell disease. **⚠**

## 1 Arthritis

### Osteoarthritis and soft-tissue disorders

#### Overview

For pain relief in osteoarthritis and soft-tissue disorders, paracetamol p. 444 should be used first and may need to be taken regularly. A topical NSAID or topical capsaicin 0.025% p. 483 should also be considered, particularly in knee or hand osteoarthritis. An oral NSAID can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an opioid analgesic may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered before a NSAID in patients taking low-dose aspirin.

Intra-articular corticosteroid injections may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine p. 1095 and rubefacients are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate p. 1169 (*Durolane*<sup>®</sup>, *Euflexxa*<sup>®</sup>, *Fermathron*<sup>®</sup>, *Orthovisc*<sup>®</sup>, *Ostenil*<sup>®</sup>, *Ostenil Plus*<sup>®</sup>, *RenheVis*<sup>®</sup>, *Suplasyn*<sup>®</sup>, *Synocrom*<sup>®</sup>, *Synopsis*<sup>®</sup>) or hylan G-F 20 (*Synvisc*<sup>®</sup>) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (*SportVis*<sup>®</sup>) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

### Rheumatoid arthritis

10-Sep-2018

#### Description of condition

Rheumatoid arthritis is a chronic systemic inflammatory disease that causes persistent symmetrical joint synovitis (inflammation of the synovial membrane) typically of the small joints of the hands and feet, although any synovial joint can be affected. Synovitis presents as pain and prolonged stiffness that tends to be worse at rest or following periods of inactivity, swelling, tenderness, and

heat in the affected joints. Other symptoms of rheumatoid arthritis include rheumatoid nodules and non-specific symptoms such as malaise, fatigue, fever, and weight loss.

As the disease progresses, it can cause joint deformity and affect different organs of the body, such as the heart, lungs, and eyes; therefore early diagnosis and treatment of rheumatoid arthritis is essential to reduce the impact of the disease.

Palindromic rheumatism is a rare form of inflammatory arthritis which causes attacks of joint pain and swelling similar to rheumatoid arthritis, but the joints return to normal in between attacks. Patients with palindromic rheumatism may later develop rheumatoid arthritis.

#### Aims of treatment

The aims of treatment are to relieve the symptoms of rheumatoid arthritis, achieve disease remission or low disease activity if remission cannot be achieved, and to improve the patient's ability to perform daily activities.

#### Non-drug treatment

**EvGr** Patients with rheumatoid arthritis should have access to a multidisciplinary team, and may benefit from physiotherapy to encourage exercise, enhance flexibility of joints and strengthen muscles. Psychological interventions such as relaxation, stress management, and cognitive coping skills to support patients with their perception and management of their disease can also be offered. **⚡**

#### Drug treatment

**EvGr** All patients with suspected persistent synovitis of unknown cause should be referred to a specialist for advice as soon as possible to confirm diagnosis and evaluate disease activity.

In patients with newly diagnosed active rheumatoid arthritis, monotherapy with a conventional disease-modifying antirheumatic drug (DMARD), either oral methotrexate p. 913, leflunomide p. 1096, or sulfasalazine p. 44, should be given as first-line treatment; hydroxychloroquine sulfate p. 1095, a weak DMARD, is an alternative in patients with mild rheumatoid arthritis or those with palindromic rheumatism. Treatment should be started as soon as possible, ideally within 3 months of onset of persistent symptoms, and the dose should be titrated to the maximum tolerated effective dose. **⚡**

Conventional DMARDs have a slow onset of action and can take 2–3 months to take effect. **EvGr** Consider short-term bridging treatment with a corticosteroid (by oral, intramuscular, or intra-articular administration) when starting treatment with a new DMARD to provide rapid symptomatic control, while waiting for the DMARD to take

effect. Short-term corticosteroids should also be given to rapidly decrease inflammation during flare-ups.

If symptoms of rheumatoid arthritis are inadequately controlled despite dose escalation on DMARD monotherapy, combination therapy with another conventional DMARD (either oral methotrexate p. 913, leflunomide p. 1096, sulfasalazine p. 44, or hydroxychloroquine sulfate p. 1095) should be given.

Treatment with a tumour necrosis factor (TNF) alpha inhibitor (either adalimumab p. 1108, certolizumab pegol p. 1111, etanercept p. 1113, golimumab p. 1115, or infliximab p. 1116), other biological DMARD (either abatacept p. 1107, sarilumab p. 1099, or tocilizumab p. 1101), or targeted synthetic DMARD (either baricitinib p. 1104 or tofacitinib p. 1105) is recommended if there has been an inadequate response to combination therapy with conventional DMARDs. [▲](#) See *National funding/access decisions* for individual drugs for full prescribing information.

**EvGr** Rituximab p. 882 in combination with methotrexate p. 913 is an alternative option for patients with severe active rheumatoid arthritis who have had an inadequate response to, or are intolerant of other DMARDs, including at least one TNF alpha inhibitor. [▲](#) See *National funding/access decisions* for rituximab p. 882.

**EvGr** In patients with established rheumatoid arthritis, the long-term use of corticosteroids should only be continued if all other treatments options (including biological and targeted synthetic DMARDs) have been offered.

Patients with active rheumatoid arthritis should be monitored monthly until the treatment target (either remission or low disease activity) has been achieved, and all patients with rheumatoid arthritis should be reviewed annually. In patients who have maintained the treatment target for at least 1 year without corticosteroids, cautiously reducing drug doses to the lowest that are clinically effective, or tapering and stopping at least one drug if the patient is being treated with two or more DMARDs should be considered. [▲](#)

Older conventional DMARDs such as sodium aurothiomalate p. 1098 (gold), azathioprine p. 836, ciclosporin p. 838 and penicillamine p. 1097 are no longer commonly used in practice due to the availability of newer, more effective drugs.

### Pain relief

**EvGr** Short-term use of an oral non-steroidal anti-inflammatory drug (NSAID) or a selective cyclo-oxygenase-2 inhibitor should be considered for additional control of pain and stiffness associated with rheumatoid arthritis. Patients should be offered a proton pump inhibitor to minimise associated gastrointestinal adverse effects. In patients already taking low-dose aspirin p. 121, paracetamol p. 444 or a compound analgesic should be considered before giving a NSAID. NSAIDs should be used at the lowest effective dose, and if possible, withdrawn when a good response to DMARDs is achieved. [▲](#)

### Surgery

**EvGr** Surgery may be an option for some patients if drug treatment has failed to adequately manage persistent pain due to joint damage or other identifiable soft tissue causes, if there is worsening of joint function, progressive deformity, or persistent localised synovitis. [▲](#)

### Useful Resources

Rheumatoid arthritis in adults: management. National Institute for Health and Care Excellence. NICE guideline 100. July 2018.

[www.nice.org.uk/guidance/ng100](http://www.nice.org.uk/guidance/ng100)

## Spondyloarthritis

01-Sep-2017

### Description of condition

Spondyloarthritis refers to a group of inflammatory musculoskeletal conditions with shared features which affect both axial and peripheral joints. Most people with these conditions have either axial spondyloarthritis (which includes ankylosing spondylitis and non-radiographic axial spondyloarthritis) or psoriatic arthritis. Axial spondyloarthritis primarily affects the spine, in particular the sacroiliac joint.

Psoriatic arthritis may present in several forms, including involvement of small joints (in the hands and feet), large joints (particularly in the knees), or combinations of both. Psoriatic arthritis may also involve the axial joints, finger and toe joints, and inflammation of the connective tissue between tendon/ligament and bone.

Less common subgroups are enteropathic spondyloarthritis, which is associated with inflammatory bowel disease (Crohn's disease p. 38 and Ulcerative colitis p. 39), and reactive arthritis (a form of peripheral arthritis), which can occur following gastro-intestinal or genitourinary infections.

### Aims of treatment

The aims of treatment are to relieve symptoms, slow the progression of the condition, and improve quality of life.

### Non-drug treatment

**EvGr** Patients who have difficulties with everyday activities should be referred to a specialist therapist (such as a physiotherapist, occupational therapist, hand therapist, orthotist or podiatrist). Hydrotherapy can be considered as an adjunctive therapy to manage pain and maintain or improve function for people with axial spondyloarthritis. [▲](#)

### Drug treatment

#### Axial spondyloarthritis

**EvGr** For pain associated with axial spondyloarthritis, start one of the Non-steroidal anti-inflammatory drugs p. 1130 (NSAIDs) at the lowest effective dose. Clinical assessment, monitoring of risk factors, and the use of gastroprotective treatment should be considered. If an NSAID taken at the maximum tolerated dose for 2–4 weeks does not provide adequate pain relief, consider switching to a different NSAID.

A tumour necrosis factor (TNF) alpha inhibitor (or biological DMARD) such as adalimumab p. 1108, certolizumab pegol p. 1111, etanercept p. 1113, golimumab p. 1115, or infliximab p. 1116 is recommended as an option for treating severe active **ankylosing spondylitis** in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

Secukinumab p. 1100 is recommended as an option for treating active ankylosing spondylitis in patients who have responded inadequately to NSAIDs or TNF-alpha inhibitors (see *National funding/access decisions* under secukinumab p. 1100).

Adalimumab p. 1108, certolizumab pegol p. 1111 and etanercept p. 1113 are also recommended as options for treating severe **non-radiographic axial spondyloarthritis** in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The choice of treatment should depend on patient preference and extra-articular involvement. The response to treatment should be assessed after 12 weeks and should only be continued if there is clear evidence of response.

Treatment with another TNF-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response. [▲](#)

**Psoriatic arthritis and other peripheral spondyloarthritis**  
**EvGr** Monotherapy with local corticosteroid injections should be considered for non-progressive **monoarthritis** (see Corticosteroids, inflammatory disorders p. 1153).

Standard DMARDs, such as methotrexate p. 913, leflunomide p. 1096 or sulfasalazine p. 44, can be used for patients with peripheral **polyarthritis**, **oligoarthritis**, or persistent or progressive **monoarthritis** associated with peripheral spondyloarthritis.

Standard DMARDs, such as methotrexate p. 913 or leflunomide p. 1096 can also be used for patients with **psoriatic arthritis**.

The choice of DMARD will depend on numerous factors such as the patient's circumstances (such as pregnancy planning and alcohol consumption), comorbidities (such as uveitis, psoriasis and inflammatory bowel disease), and potential side-effects.

If a standard DMARD taken at the maximum tolerated dose for at least 3 months does not provide adequate relief from symptoms, a switch to, or the addition of, another standard DMARD can be considered.

An NSAID can be used as an adjunct to standard DMARDs or biological DMARDs to manage symptoms. If NSAIDs do not provide adequate relief from symptoms, consider corticosteroid injections or short-term oral corticosteroid therapy as an adjunct to standard DMARDs or biological DMARDs to manage symptoms.

If extra-articular disease is adequately controlled by an existing standard DMARD but peripheral spondyloarthritis is not, consider adding another standard DMARD. **⚠**

#### Further options for psoriatic arthritis

**EvGr** The targeted DMARD apremilast p. 1119, used alone or in combination with standard DMARDs, is recommended for the treatment of active and progressive psoriatic arthritis if the patient has peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

The biological DMARDs etanercept p. 1113, infliximab p. 1116, golimumab p. 1115 and adalimumab p. 1108 (TNF- $\alpha$  inhibitors) are recommended for the treatment of active and progressive psoriatic arthritis if the patients has peripheral arthritis with 3 or more tender joints and 3 or more swollen joints, and the psoriatic arthritis has not responded to at least 2 standard DMARDs given alone or in combination.

Ustekinumab p. 1103, alone or in combination with methotrexate, is recommended for treating active psoriatic arthritis when treatment with TNF- $\alpha$  inhibitors is contra-indicated but would otherwise be considered or the patient has had treatment with one or more TNF- $\alpha$  inhibitors. The response to treatment should be assessed at 24 weeks and should only be continued if there is clear evidence of response. **⚠**

#### Reactive arthritis

**EvGr** After treating the initial infection, do not offer long-term (4 weeks or longer) treatment with an antibacterial solely to manage reactive arthritis caused by a gastro-intestinal or genito-urinary infection. **⚠**

#### Useful Resources

Spondyloarthritis in over 16s: diagnosis and management. National Institute for Health and Care Excellence. Clinical Guideline NG65. February 2017.  
[www.nice.org.uk/guidance/ng65](http://www.nice.org.uk/guidance/ng65)

## Rheumatic disease, suppressing drugs

### Overview

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*, see Rheumatoid arthritis p. 1091 or Spondyloarthritis p. 1092. *Systemic* and *discoid lupus erythematosus* are sometimes treated with chloroquine p. 616 or hydroxychloroquine sulfate p. 1095.

The choice of a disease-modifying antirheumatic drug (DMARD) should take into account co-morbidity and patient preference. Methotrexate p. 913, sulfasalazine p. 44, intramuscular gold, and penicillamine p. 1097 are similar in efficacy. However, methotrexate or sulfasalazine may be better tolerated.

### Gold

**Gold**, given as sodium aurothiomalate p. 1098, is licensed for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose must be given followed by doses at weekly intervals until there is definite evidence of remission. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

### Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

### Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Sulfasalazine may also be used by specialists, in the management of psoriatic arthritis affecting peripheral joints [unlicensed indication]. Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

### Antimalarials

The antimalarial hydroxychloroquine sulfate is used to treat rheumatoid arthritis of mild inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed.

Chloroquine and hydroxychloroquine sulfate are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis. Chloroquine and hydroxychloroquine sulfate are better tolerated than gold or penicillamine. Retinopathy rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine hydrochloride p. 505 is sometimes used in discoid lupus erythematosus [unlicensed].

### Drugs affecting the immune response

Methotrexate is a DMARD used in active rheumatoid arthritis. Methotrexate is usually given by mouth once a week, adjusted according to response. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid p. 1025 given every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Leflunomide p. 1096 acts on the immune system as a DMARD. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months.

Drugs that affect the immune response are also used in the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of *polymyositis* that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine p. 836 is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

### Juvenile idiopathic arthritis

Many children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require DMARDs. Methotrexate is effective; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine are no longer used. Cytokine modulators have a role in *juvenile idiopathic arthritis*.

### Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 1108, certolizumab pegol p. 1111, etanercept p. 1113, golimumab p. 1115, and infliximab p. 1116 inhibit the activity of tumour necrosis factor alpha (TNF- $\alpha$ ).

Adalimumab is licensed for moderate to severe active *rheumatoid arthritis* when response to other DMARDs (including methotrexate) has been inadequate; it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive *psoriatic arthritis* and severe active *ankylosing spondylitis* that have not responded adequately to other DMARDs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. Adalimumab also has a role in inflammatory bowel disease and plaque psoriasis.

Certolizumab pegol is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to DMARDs (including methotrexate) has been inadequate. Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active *ankylosing spondylitis* in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active *axial spondyloarthritis*, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

Etanercept is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in combination with methotrexate when the response to other DMARDs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate. It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other DMARDs, and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy. Etanercept also has a role in plaque psoriasis.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to DMARD therapy (including methotrexate) has been inadequate; it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate p. 913, when response to DMARD therapy has been inadequate; it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment.

Infliximab p. 1116 is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other DMARDs, including methotrexate, is inadequate; it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to DMARDs.

Rituximab p. 882 is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other DMARDs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them. Rituximab has a role in malignant disease.

Abatacept p. 1107 prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in patients unresponsive to other DMARDs (including methotrexate or a tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

Anakinra p. 1098 inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone. Anakinra is not recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Baricitinib p. 1104 and tofacitinib p. 1105 are licensed alone or in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* in patients who have had an inadequate response to, or who are intolerant to, one or more DMARDs.

Belimumab p. 845 inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy.

Sarilumab p. 1099 is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines; it is

licensed alone or in combination with methotrexate for the treatment of moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more DMARDs.

Secukinumab p. 1100 inhibits the activity of interleukin-17A. Secukinumab is licensed for the treatment of active *psoriatic arthritis*, in combination with methotrexate or alone, which has not responded adequately to DMARDs; it is also licensed for the treatment of *ankylosing spondylitis*, in patients who have not responded adequately to conventional therapy. Secukinumab also has a role in plaque psoriasis.

Tocilizumab p. 1101 antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one DMARD or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated.

Ustekinumab p. 1103 inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more DMARDs.

## CHONDROPROTECTIVE DRUGS

### Glucosamine

08-Mar-2019

- **DRUG ACTION** Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin.

#### ● INDICATIONS AND DOSE

##### ALATERIS<sup>®</sup>

**Symptomatic relief of mild to moderate osteoarthritis of the knee**

- ▶ BY MOUTH
- ▶ Adult: 1250 mg once daily, review treatment if no benefit after 2–3 months

##### DOLENIO<sup>®</sup>

**Symptomatic relief of mild to moderate osteoarthritis of the knee**

- ▶ BY MOUTH
- ▶ Adult: 1500 mg once daily, review treatment if no benefit after 2–3 months

##### GLUSARTEL<sup>®</sup>

**Symptomatic relief of mild to moderate osteoarthritis of the knee**

- ▶ BY MOUTH
- ▶ Adult: 1500 mg once daily, dose to be dissolved in at least 250 mL of water, review treatment if no benefit after 2–3 months

- **CAUTIONS** Asthma · impaired glucose tolerance · predisposition to cardiovascular disease
- **INTERACTIONS** → Appendix 1: glucosamine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Constipation · diarrhoea · fatigue · gastrointestinal discomfort · headache · nausea

- ▶ **Uncommon** Flushing · skin reactions
- ▶ **Rare or very rare** Jaundice
- ▶ **Frequency not known** Angioedema · asthma · diabetes mellitus · dizziness · hypercholesterolaemia · oedema · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a shellfish allergy.
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **MONITORING REQUIREMENTS**
- ▶ Monitor blood-glucose concentration before treatment and periodically thereafter in patients with impaired glucose tolerance.
- ▶ Monitor cholesterol in patients with predisposition to cardiovascular disease.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **Scottish Medicines Consortium (SMC) decisions**  
SMC No. 471/08  
The *Scottish Medicines Consortium* has advised (June 2008) that glucosamine (*Alateris*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.  
SMC No. 647/10  
The *Scottish Medicines Consortium* has advised (August 2011) that glucosamine (*Glusartel*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing—the mechanism of action is not understood and there is limited evidence to show it is effective.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

ELECTROLYTES: May contain Sodium

- ▶ **Dolenio** (Alissa Healthcare Research Ltd)  
Dolenio 1500mg tablets | 30 tablet (POM) £18.20 DT = £18.20

## DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

### Hydroxychloroquine sulfate

#### ● INDICATIONS AND DOSE

**Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)**

- ▶ BY MOUTH
- ▶ Adult: 200–400 mg daily, daily maximum dose to be based on ideal body-weight; maximum 6.5 mg/kg per day

- **CAUTIONS** Acute porphyrias p. 1058 · diabetes (may lower blood glucose) · elderly · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy—may lower seizure threshold) · severe gastro-intestinal disorders

#### CAUTIONS, FURTHER INFORMATION

- ▶ Screening for retinopathy A review group convened by the Royal College of Ophthalmologists has updated guidelines on screening for chloroquine and hydroxychloroquine retinopathy (*Hydroxychloroquine and Chloroquine Retinopathy: Recommendations on Screening* 2018). Recent data have highlighted that hydroxychloroquine retinopathy is more common than previously reported.  
Screening recommendations for hydroxychloroquine:

- All patients planning to be on long-term treatment should receive a baseline examination (including fundus photography and spectral domain optical coherence tomography) within 6–12 months of treatment initiation;
- Annual screening is recommended in all patients who have taken hydroxychloroquine for greater than 5 years;
- Annual screening may be commenced before 5 years of treatment if additional risk factors for retinal toxicity exist, such as concomitant tamoxifen therapy, impaired renal function (eGFR less than 60 mL/minute/1.73 m<sup>2</sup>) or high-dose therapy (greater than 5 mg/kg/day of hydroxychloroquine sulfate).

• **INTERACTIONS** → Appendix 1: hydroxychloroquine

• **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · appetite decreased · diarrhoea · emotional lability · headache · nausea · skin reactions · vision disorders · vomiting
  - ▶ **Uncommon** Alopecia · corneal oedema · dizziness · eye disorders · hair colour changes · nervousness · neuromuscular dysfunction · retinopathy · seizure · tinnitus · vertigo
  - ▶ **Frequency not known** Acute hepatic failure · agranulocytosis · anaemia · angioedema · bone marrow disorders · bronchospasm · cardiac conduction disorders · cardiomyopathy · hearing loss · hypoglycaemia · leucopenia · movement disorders · muscle weakness · myopathy · photosensitivity reaction · psychosis · reflexes absent · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tremor · ventricular hypertrophy
- Overdose** Hydroxychloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

• **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

• **BREAST FEEDING** Avoid—risk of toxicity in infant.

• **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

• **RENAL IMPAIRMENT** Manufacturer advises caution.

**Monitoring** Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

• **MONITORING REQUIREMENTS** Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists).

• **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

▶ **Hydroxychloroquine sulfate (Non-proprietary)**

**Hydroxychloroquine sulfate 200 mg** Hydroxychloroquine 200mg tablets | 60 tablet **[PoM]** £32.49 DT = £3.70

▶ **Quinoric** (Bristol Laboratories Ltd)

**Hydroxychloroquine sulfate 200 mg** Quinoric 200mg tablets | 60 tablet **[PoM]** £4.75 DT = £3.70

## Leflunomide

01-Aug-2018

• **INDICATIONS AND DOSE**

**Moderate to severe active rheumatoid arthritis (specialist use only)**

▶ **BY MOUTH**

▶ **Adult:** Initially 100 mg once daily for 3 days, then reduced to 10–20 mg once daily

**Active psoriatic arthritis (specialist use only)**

▶ **BY MOUTH**

▶ **Adult:** Initially 100 mg once daily for 3 days, then reduced to 20 mg once daily

• **CONTRA-INDICATIONS** Serious infection · severe hypoproteinaemia · severe immunodeficiency

• **CAUTIONS** Anaemia (avoid if significant and due to causes other than rheumatoid arthritis) · history of tuberculosis · impaired bone-marrow function (avoid if significant and due to causes other than rheumatoid arthritis) · leucopenia (avoid if significant and due to causes other than rheumatoid arthritis) · thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis)

• **INTERACTIONS** → Appendix 1: leflunomide

• **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · accelerated hair loss · appetite decreased · asthenia · diarrhoea · dizziness · gastrointestinal disorders · headache · leucopenia · nausea · oral disorders · paraesthesia · peripheral neuropathy · skin reactions · tendon disorders · vomiting · weight decreased
  - ▶ **Uncommon** Anaemia · anxiety · electrolyte imbalance · hyperlipidaemia · taste altered · thrombocytopenia
  - ▶ **Rare or very rare** Agranulocytosis · eosinophilia · hepatic disorders · infection · pancreatitis · pancytopenia · respiratory disorders · sepsis · severe cutaneous adverse reactions (SCARs) · vasculitis
  - ▶ **Frequency not known** Cutaneous lupus erythematosus · hypouricaemia · pulmonary hypertension · renal failure
- SIDE-EFFECTS, FURTHER INFORMATION** Discontinue treatment and institute washout procedure in case of serious side-effect (consult product literature).

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported usually in the first 6 months. Discontinue treatment (and institute washout procedure—consult product literature) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure.

• **CONCEPTION AND CONTRACEPTION** Effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature). The concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature.

• **PREGNANCY** Avoid—active metabolite teratogenic in *animal* studies.

• **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

• **HEPATIC IMPAIRMENT** Manufacturer advises avoid—active metabolite may accumulate.

• **RENAL IMPAIRMENT** Manufacturer advises avoid in moderate or severe impairment—no information available.

• **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

### ● MONITORING REQUIREMENTS

- ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks.
- ▶ Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks.
- ▶ Monitor blood pressure.

### ● TREATMENT CESSATION

**Washout Procedure** The active metabolite persists for a long period; to aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception, stop treatment and give either colestyramine p. 197 or charcoal, activated p. 1366. Procedure may be repeated as necessary.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Penicillamine

- **DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

### ● INDICATIONS AND DOSE

#### Severe active rheumatoid arthritis (administered on expert advice)

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 125–250 mg daily for 1 month, then increased in steps of 125–250 mg, at intervals of not less than 4 weeks; maintenance 500–750 mg daily in divided doses, then reduced in steps of 125–250 mg every 12 weeks, dose reduction attempted only if remission sustained for 6 months; maximum 1.5 g per day
- ▶ **Elderly:** Initially up to 125 mg daily for 1 month, then increased in steps of up to 125 mg, at intervals of at least 4 weeks; maximum 1 g per day

#### Wilson's disease

##### ▶ BY MOUTH

- ▶ **Adult:** 1.5–2 g daily in divided doses, adjusted according to response, to be taken before food; maintenance 0.75–1 g daily, a dose of 2 g daily should not be continued for more than one year; maximum 2 g per day
- ▶ **Elderly:** 20 mg/kg daily in divided doses, adjusted according to response

#### Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids)

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 500 mg daily in divided doses, to be increased slowly over 3 months; maintenance 1.25 g daily

#### Cystinuria, therapeutic

##### ▶ BY MOUTH

- ▶ **Adult:** 1–3 g daily in divided doses, to be adjusted to maintain urinary cystine below 200 mg/litre, to be taken before food

#### Cystinuria, prophylactic

##### ▶ BY MOUTH

- ▶ **Adult:** 0.5–1 g daily, maintain urinary cystine below 300 mg/litre and adequate fluid intake (at least 3 litres daily), to be taken at bedtime
- ▶ **Elderly:** Minimum dose to maintain urinary cystine below 200 mg/litre is recommended

- **CONTRA-INDICATIONS** Lupus erythematosus

- **CAUTIONS** Neurological involvement in Wilson's disease

- **INTERACTIONS** → Appendix 1: penicillamine

### ● SIDE-EFFECTS

- ▶ **Common or very common** Proteinuria · thrombocytopenia
- ▶ **Rare or very rare** Alopecia · breast enlargement (males and females) · connective tissue disorders · haematuria (discontinue immediately if cause unknown) · hypersensitivity · oral disorders · skin reactions
- ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · appetite decreased · fever · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · increased risk of infection · jaundice cholestatic · leucopenia · lupus-like syndrome · myasthenia gravis · nausea · nephrotic syndrome · neurological deterioration in Wilson's Disease · neutropenia · pancreatitis · polymyositis · pulmonary haemorrhage · rash (consider dose reduction) · respiratory disorders · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · vomiting · yellow nail syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Proteinuria occurs in up to 30% of patients—can be a sign of immune-mediated nephropathy. Discontinue immediately if nephrotoxicity occurs.

Nausea and rash more common early in treatment if full dose used from initiation. Delayed rash can occur after months or years of treatment—manufacturer advises reduce dose.

- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

### ● RENAL IMPAIRMENT

**Dose adjustments** Reduce dose and monitor renal function or avoid (consult product literature).

### ● MONITORING REQUIREMENTS

- ▶ Consider withdrawal if platelet count falls below 120 000/mm<sup>3</sup> or white blood cells below 2500/mm<sup>3</sup> or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
- ▶ Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase).
- ▶ A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase.
- ▶ Longer intervals may be adequate in cystinuria and Wilson's disease.
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 6, 22

▶ **Penicillamine (Non-proprietary)**

**Penicillamine 125 mg** Penicillamine 125mg tablets | 56 tablet [PoM]  
£54.00 DT = £45.00

**Penicillamine 250 mg** Penicillamine 250mg tablets |  
56 tablet [PoM] £88.77 DT = £88.77

## Sodium aurothiomalate

### ● INDICATIONS AND DOSE

#### Active progressive rheumatoid arthritis (administered on expert advice)

## ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ **Adult:** Test dose 10 mg, followed by 50 mg once weekly until there is definite evidence of remission, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, dose to be reduced gradually. Benefit is not expected until 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given

#### Relapse in patients who have previously received sodium aurothiomalate therapy for active progressive rheumatoid arthritis (administered on expert advice)

## ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ **Adult:** 50 mg once weekly until control has been obtained again, then reduced to 50 mg every 4 weeks continued for up to 5 years after complete remission, if no response is seen within 2 months, alternative treatment should be sought

- **CONTRA-INDICATIONS** Exfoliative dermatitis · history of blood disorders · history of bone marrow aplasia · necrotising enterocolitis · pulmonary fibrosis · systemic lupus erythematosus
- **CAUTIONS** Colitis · eczema · elderly · history of urticaria  
**CAUTIONS, FURTHER INFORMATION** Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre.
- **INTERACTIONS** → Appendix 1: sodium aurothiomalate
- **SIDE-EFFECTS** Abdominal pain · agranulocytosis · albuminuria · alopecia · asthenia · blood disorder · bone marrow disorders · circulatory collapse · dry cough · dyspnoea · encephalopathy · enterocolitis · eosinophilia · flushing · hepatic disorders · hypersensitivity · hypotension · leucopenia · nephrotic syndrome · nerve disorders · neutropenia · palpitations · respiratory disorders · shock · skin reactions · tachycardia · thrombocytopenia  
**SIDE-EFFECTS, FURTHER INFORMATION** Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.
- **PREGNANCY** Manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled.  
**Dose adjustments** Consider reducing dose and frequency.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

### ● MONITORING REQUIREMENTS

- ▶ Urine tests and full blood counts (including total and differential white cell and platelet counts) must be performed before starting treatment and before each intramuscular injection.
- ▶ Monitor for pulmonary fibrosis with annual chest X-ray.
- **PATIENT AND CARER ADVICE** Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

CAUTIONARY AND ADVISORY LABELS 11

▶ **Myocrisin (Sanofi)**

**Sodium aurothiomalate 20 mg per 1 ml** Myocrisin 10mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £45.55 DT = £45.55

**Sodium aurothiomalate 100 mg per 1 ml** Myocrisin 50mg/0.5ml solution for injection ampoules | 10 ampoule [PoM] £134.80 DT = £134.80

## IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

### Anakinra

13-Nov-2018

#### ● INDICATIONS AND DOSE

#### Rheumatoid arthritis (in combination with methotrexate) which has not responded to methotrexate alone (specialist use only)

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 100 mg once daily

#### Cryopyrin-associated periodic syndromes (specialist use only)

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** 1–2 mg/kg daily, for severe cryopyrin-associated periodic syndromes, usual maintenance is 3–4 mg/kg daily, up to a maximum of 8 mg/kg daily

#### Still's disease (specialist use only)

## ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult (body-weight up to 49 kg):** 1–2 mg/kg daily
- ▶ **Adult (body-weight 50 kg and above):** 100 mg daily

- **CONTRA-INDICATIONS** Active infection · neutropenia (absolute neutrophil count less than  $1.5 \times 10^9$ /litre)—do not initiate · pre-existing malignancy
- **CAUTIONS** Elderly · history of asthma (increased risk of serious infection) · history of recurrent infection · predisposition to infection
- **INTERACTIONS** → Appendix 1: anakinra
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Headache · infection · neutropenia · thrombocytopenia
  - ▶ **Uncommon** Skin reactions
  - ▶ **Frequency not known** Hepatitis
- **SIDE-EFFECTS, FURTHER INFORMATION** Neutropenia reported commonly—discontinue if neutropenia develops.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in moderate impairment.  
**Dose adjustments** Manufacturer advises consider alternate day dosing in severe impairment.

- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be screened for latent tuberculosis and viral hepatitis prior to initiation of treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor neutrophil count before treatment, then every month for 6 months, then every 3 months thereafter.
  - ▶ When used for Cryopyrin-associated periodic syndromes Manufacturer advises monitor for CNS inflammation (including ear and eye tests) 3 months after starting treatment, then every 6 months until effective treatment doses have been identified, then yearly thereafter.
  - ▶ When used for Still's disease Manufacturer advises consider routine monitoring of hepatic enzymes during the first month of treatment.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ When used for Cryopyrin-associated periodic syndromes or Still's disease The manufacturer of *Kineret*<sup>®</sup> has provided a *Guide for Healthcare Professionals*.
- **PATIENT AND CARER ADVICE**
  - ▶ Blood disorders Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, bruising or, bleeding) develop.
  - ▶ When used for Still's disease A patient card and patient booklet should be provided.
  - ▶ When used for Cryopyrin-associated periodic syndromes A patient booklet should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**  
SMC No. 05/02  
The *Scottish Medicines Consortium* has advised (November 2002) that anakinra (*Kineret*<sup>®</sup>) is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.  
SMC No. SMC2104  
The *Scottish Medicines Consortium* has advised (October 2018) that anakinra (*Kineret*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of Still's disease, as monotherapy or in combination with other anti-inflammatory drugs and disease-modifying anti-rheumatic drugs.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ *Kineret* (Swedish Orphan Biovitrum Ltd)

Anakinra 150 mg per 1 ml *Kineret* 100mg/0.67ml solution for injection pre-filled syringes | 7 pre-filled disposable injection PoM  
£183.61

## Sarilumab

30-Nov-2017

- **DRUG ACTION** Sarilumab is a recombinant human monoclonal antibody that specifically binds to interleukin-6 receptors and blocks the activity of pro-inflammatory cytokines.

#### INDICATIONS AND DOSE

**Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 200 mg every 2 weeks, for dose adjustments due to neutropenia, thrombocytopenia, or liver enzyme elevations—consult product literature

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than  $2 \times 10^9$ /litre · do not initiate if platelet count less than  $150 \times 10^3$ /microlitre · do not

initiate if serum transaminases (ALT or AST) greater than 1.5 times the upper limit of normal · severe active infection

- **CAUTIONS** Chronic or recurrent infection · elderly (increased risk of infection) · history of diverticulitis · history of intestinal ulceration · history of serious or opportunistic infection · predisposition to infection
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Infection Manufacturer advises caution in patients who have been exposed to tuberculosis, or who have lived in or travelled to areas of endemic tuberculosis or mycoses. Patients with latent tuberculosis should complete anti-tuberculosis therapy before initiation of sarilumab; consider anti-tuberculosis therapy before initiation of sarilumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed, and for those with a negative test for latent tuberculosis but have risk factors for tuberculosis—consultation with a tuberculosis specialist may be appropriate.  
Manufacturer advises patients should be brought up-to-date with current immunisation schedule before initiating treatment.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dyslipidaemia · increased risk of infection · neutropenia · thrombocytopenia
  - ▶ **Frequency not known** Hypersensitivity · skin reactions
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for up to 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid (no information available).
- **PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor for signs and symptoms of infection; monitor neutrophil count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if absolute neutrophil count less than  $0.5 \times 10^9$ /litre.
  - ▶ Manufacturer advises monitor platelet count 4 to 8 weeks after treatment initiation and according to clinical judgement thereafter—discontinue if platelet count less than  $50 \times 10^3$ /microlitre.
  - ▶ Manufacturer advises monitor hepatic transaminases (ALT and AST) 4 to 8 weeks after treatment initiation and every 3 months thereafter, and consider other liver function tests if clinically indicated—discontinue if ALT is greater than 5 times the upper limit of normal.
  - ▶ Manufacturer advises monitor lipid profile approximately 4 to 8 weeks after treatment initiation and approximately every 6 months thereafter—hyperlipidaemia should be managed according to clinical guidelines.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that are tender, damaged, or have bruises or scars; patients may self-administer *Kezvara*<sup>®</sup>, after appropriate training in subcutaneous injection technique.
- **PRESCRIBING AND DISPENSING INFORMATION** Sarilumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should be advised to seek immediate medical attention if symptoms of a hypersensitivity reaction occur. Self-administration Manufacturer advises patients and their carers should be given training in subcutaneous injection technique if appropriate. Alert card An alert card should be provided. Missed doses Manufacturer advises if a dose is more than 3 days late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**

- ▶ **Sarilumab for moderate-to-severe rheumatoid arthritis (November 2017) NICE TA485**
- Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:
- disease is severe (a disease activity score [DAS28] of more than 5.1), **and**
  - the manufacturer provides sarilumab with the discount agreed in the patient access scheme.
- Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to or who cannot have other DMARDs, including at least 1 biological DMARD, only if:

- disease is severe (a DAS28 of more than 5.1), **and**
- they cannot have rituximab, **and**
- the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

Sarilumab can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

Sarilumab, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to rituximab and at least 1 biological DMARD, only if:

- disease is severe (a DAS28 of more than 5.1), **and**
- the manufacturer provides sarilumab with the discount agreed in the patient access scheme.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta485](http://www.nice.org.uk/guidance/ta485)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1314/18

The *Scottish Medicines Consortium* has advised (April 2018) that sarilumab (*Kezvara*<sup>®</sup>) is accepted for restricted use within NHS Scotland for treatment of severely active rheumatoid arthritis (a disease activity score [DAS28] greater than 5.1) that has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs (DMARDs). In patients with severe disease inadequately controlled by a TNF antagonist, it may be used in patients ineligible to receive rituximab. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

CAUTIONARY AND ADVISORY LABELS 10

## Secukinumab

15-Aug-2017

- **DRUG ACTION** Secukinumab is a recombinant human monoclonal antibody that selectively binds to cytokine interleukin-17A (IL-17A) and inhibits the release of proinflammatory cytokines and chemokines.

- **INDICATIONS AND DOSE**

- **Ankylosing spondylitis (initiated by a specialist)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, review treatment if no response within 16 weeks of initial dose

- **Psoriatic arthritis (initiated by a specialist)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 150 mg every week for 5 doses, then maintenance 150 mg every month, dose may be increased to 300 mg according to clinical response. Review treatment if no response within 16 weeks of initial dose

- **Psoriatic arthritis with concomitant moderate to severe plaque psoriasis or if inadequate response to anti-TNF $\alpha$  treatment (initiated by a specialist) | Plaque psoriasis (initiated by a specialist)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: 300 mg every week for 5 doses, then maintenance 300 mg every month, review treatment if no response within 16 weeks of initial dose

- **CONTRA-INDICATIONS** Severe active infection
- **CAUTIONS** Chronic infection · Crohn's disease (monitor for exacerbations) · history of recurrent infection · predisposition to infection (discontinue if new serious infection develops)

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Tuberculosis** Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting secukinumab.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
- ▶ **Common or very common** Diarrhoea · increased risk of infection · rhinorrhoea
- ▶ **Uncommon** Conjunctivitis · neutropenia (usually mild and reversible) · urticaria
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 20 weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for up to 20 weeks after discontinuing treatment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe or pen out of the refrigerator

20 minutes before administration and to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer *Cosentyx*<sup>®</sup> pre-filled pen.

#### ● PATIENT AND CARER ADVICE

**Self-administration** Patients and their carers should be given training in subcutaneous injection technique.  
**Infection** Patients and their carers should be advised to seek immediate medical attention if symptoms of infection develop during treatment with secukinumab.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

#### ▶ Secukinumab for treating moderate to severe plaque psoriasis (July 2015) NICE TA350

Secukinumab is recommended as an option for the treatment of moderate to severe plaque psoriasis in adults if:

- the disease has failed to respond to standard systemic treatments (including ciclosporin, methotrexate, and PUVA), or when standard treatments are contra-indicated or not tolerated; *and*
- the manufacturer provides secukinumab with the discount agreed in the patient access scheme

Secukinumab should be withdrawn in patients whose psoriasis has not responded adequately within 12 weeks of initial dose; further treatment cycles are not recommended.

Patients whose treatment with secukinumab was started before this guidance was published, but does not meet these criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA350](http://www.nice.org.uk/TA350)

#### ▶ Secukinumab for active ankylosing spondylitis after treatment with non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors (September 2016) NICE TA407

Secukinumab is recommended, within its marketing authorisation, as an option for treating active ankylosing spondylitis in adults who have responded inadequately to conventional therapy (non-steroidal anti-inflammatory drugs or TNF-alpha inhibitors) only if the manufacturer provides secukinumab with the discount agreed in the patient access scheme.

Assess response to secukinumab after 16 weeks of treatment and continue only if there is clear evidence of response, defined as a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units **and** a reduction in the spinal pain visual analogue scale (VAS) by 2 cm or more.

[www.nice.org.uk/TA407](http://www.nice.org.uk/TA407)

#### ▶ Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017) NICE TA445

Secukinumab alone, or in combination with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:

- it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2) or,
- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after 12 weeks or,
- TNF-alpha inhibitors are contra-indicated but would otherwise be considered.

Secukinumab is only recommended if the manufacturer provides it as agreed in the patient access scheme.

Assess the response to secukinumab after 16 weeks of treatment. Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria

(PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA445](http://www.nice.org.uk/guidance/TA445)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2015) that secukinumab (*Cosentyx*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), or when standard treatments cannot be used because of intolerance or contra-indications.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ *Cosentyx* (Novartis Pharmaceuticals UK Ltd) ▼

**Secukinumab 150 mg per 1 ml** *Cosentyx* 150mg/1ml solution for injection pre-filled pens | 2 pre-filled disposable injection [PoM] £1,218.78

*Cosentyx* 150mg/1ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] Ⓢ

## Tocilizumab

24-May-2018

#### ● INDICATIONS AND DOSE

**Rheumatoid arthritis [severe, active and progressive, not previously treated with methotrexate] Rheumatoid arthritis [moderate-to-severe, in combination with methotrexate or alone if methotrexate inappropriate, when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs]**

##### ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** 8 mg/kg every 4 weeks (max. per dose 800 mg), for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature

##### ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature

**Giant cell arteritis [in combination with a tapering course of glucocorticoid or alone following discontinuation of glucocorticoid]**

##### ▶ BY SUBCUTANEOUS INJECTION

▶ **Adult:** 162 mg once weekly, administer to abdomen, thigh or upper arm, for dose adjustments in patients with liver enzyme abnormalities, or low absolute neutrophil or platelet count—consult product literature, not to be used alone for acute relapses; review need for treatment beyond 52 weeks

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than  $2 \times 10^3$ /litre · severe active infection

- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count ·

predisposition to infection (interrupt treatment if serious infection occurs)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · conjunctivitis · cough · dizziness · dyslipidaemia · dyspnoea · gastrointestinal disorders · headache · hypersensitivity · hypertension · increased risk of infection · leucopenia · neutropenia · oral disorders · peripheral oedema · skin reactions · weight increased
- ▶ **Uncommon** Hypothyroidism · nephrolithiasis
- ▶ **Frequency not known** Infusion related reaction · interstitial lung disease · pancytopenia · Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Discontinue if absolute neutrophil count less than  $0.5 \times 10^9$ /litre or platelet count less than  $50 \times 10^3$ /microlitre).

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

#### ● RENAL IMPAIRMENT

- ▶ With intravenous use Manufacturer advises monitor renal function closely in moderate-to-severe impairment—no information available.
- ▶ With subcutaneous use Manufacturer advises monitor renal function closely in severe impairment—no information available.

#### ● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- ▶ Manufacturer advises monitor for demyelinating disorders.
- ▶ Manufacturer advises monitor hepatic transaminases every 4–8 weeks for first 6 months of treatment, then every 12 weeks thereafter.
- ▶ Manufacturer advises monitor neutrophil and platelet count 4–8 weeks after starting treatment and then as indicated.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, manufacturer advises give intermittently in Sodium chloride 0.9%; dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour.

▶ With subcutaneous use For *subcutaneous injection*, manufacturer advises rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer RoActemra<sup>®</sup>, after appropriate training in subcutaneous injection technique.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises protect from light and store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek

immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

An alert card should be provided.

**Driving and skilled tasks** Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)

NICE TA375

Tocilizumab (*RoActemra*<sup>®</sup>), in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), and
- the manufacturers provide tocilizumab as agreed in the patient access schemes.

Tocilizumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving tocilizumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta375](http://www.nice.org.uk/guidance/ta375)

- ▶ Tocilizumab for the treatment of rheumatoid arthritis (February 2012) NICE TA247

Tocilizumab (*RoActemra*<sup>®</sup>), in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:

- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab because of contra-indications or intolerance, **and** tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010), *or*
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- **and** the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

[www.nice.org.uk/guidance/ta247](http://www.nice.org.uk/guidance/ta247)

- ▶ Tocilizumab for treating giant cell arteritis (April 2018) NICE TA518

Tocilizumab (*RoActemra*<sup>®</sup>), when used with a tapering course of glucocorticoids (and when used alone after glucocorticoids), is recommended as an option for treating giant cell arteritis in adults, only if:

- they have relapsing or refractory disease,
- they have not already had tocilizumab,
- tocilizumab is stopped after 1 year of uninterrupted treatment at most, **and**

- the manufacturer provides it with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta518](http://www.nice.org.uk/guidance/ta518)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. SMC2014

The *Scottish Medicines Consortium* has advised (September 2018) that tocilizumab (*RoActemra*®) is accepted for restricted use within NHS Scotland for the treatment of giant cell arteritis in adults, subject to a 12-month clinical stopping rule. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- RoActemra** (Roche Products Ltd)

**Tocilizumab 180 mg per 1 ml** RoActemra 162mg/0.9ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM](#)  
£913.12 DT = £913.12

RoActemra 162mg/0.9ml solution for injection pre-filled syringes | 4 pre-filled disposable injection [PoM](#) £913.12 DT = £913.12 (Hospital only)

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- RoActemra** (Roche Products Ltd)

**Tocilizumab 20 mg per 1 ml** RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM](#) £512.00 (Hospital only)

RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial [PoM](#) £256.00 (Hospital only)

RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial [PoM](#) £102.40 (Hospital only)

## Ustekinumab

03-Oct-2017

### INDICATIONS AND DOSE

**Moderate-to-severe plaque psoriasis that has not responded to other systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications (specialist use only)**

- BY SUBCUTANEOUS INJECTION

- Adult (body-weight up to 100 kg): Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks

- Adult (body-weight 100 kg and above): Initially 90 mg, then 90 mg after 4 weeks, then 90 mg every 12 weeks, consider discontinuation if no response within 28 weeks

**Active psoriatic arthritis (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs (specialist use only)**

- BY SUBCUTANEOUS INJECTION

- Adult: Initially 45 mg, then 45 mg after 4 weeks, then 45 mg every 12 weeks, consider discontinuation if no response within 28 weeks, higher doses of 90 mg may be used in patients with body-weight over 100 kg

**Moderate to severe active Crohn's disease in patients who have had an inadequate response with, lost response to, are intolerant to, or have contra-indications to either conventional therapy or a tumour necrosis factor alpha inhibitor (specialist use only)**

- INITIALLY BY INTRAVENOUS INFUSION

- Adult (body-weight up to 56 kg): 260 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by

subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

- Adult (body-weight 56–85 kg): 390 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency
- Adult (body-weight 86 kg and above): 520 mg, then (by subcutaneous injection) 90 mg after 8 weeks, then (by subcutaneous injection) 90 mg every 12 weeks, if response is inadequate 8 weeks after first subcutaneous dose, or if treatment is interrupted or response is lost, dosing frequency may be increased—consult product literature; review treatment if no response within 16 weeks of initial dose or increase in dosing frequency

- CONTRA-INDICATIONS** Active infection

- CAUTIONS** Development of malignancy · elderly · history of malignancy · predisposition to infection · start appropriate treatment if widespread erythema and skin exfoliation develop, and stop ustekinumab treatment if exfoliative dermatitis suspected

#### CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting ustekinumab. Patients who have previously received adequate treatment for tuberculosis can start ustekinumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting ustekinumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with ustekinumab.

- INTERACTIONS** → Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

- Common or very common** Arthralgia · asthenia · back pain · diarrhoea · dizziness · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain · skin reactions · vomiting

- Uncommon** Depression · facial paralysis · hypersensitivity (may be delayed) · nasal congestion

- CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 15 weeks after stopping treatment.

- PREGNANCY** Avoid.

- BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

#### PRE-TREATMENT SCREENING

- Tuberculosis Patients should be evaluated for tuberculosis before treatment.

#### MONITORING REQUIREMENTS

- Monitor for non-melanoma skin cancer, especially in patients with a history of PUVA treatment or prolonged immunosuppressant therapy, or those over 60 years of age.
- Monitor for signs and symptoms of exfoliative dermatitis or erythrodermic psoriasis.

- DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (*Stelara*®), give intermittently in Sodium Chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and give over at least 1 hour

through an in-line low-protein binding filter (pore size 0.2 micron); use within 4 hours of dilution.

#### ● PATIENT AND CARER ADVICE

**Exfoliative dermatitis** Patients should be advised to seek prompt medical attention if symptoms suggestive of exfoliative dermatitis or erythrodermic psoriasis (such as increased redness and shedding of skin over a larger area of the body) develop.

**Tuberculosis** Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Ustekinumab for the treatment of adults with moderate to severe psoriasis (updated March 2017)** NICE TA180  
Ustekinumab is recommended as a treatment option for adults with plaque psoriasis only if:

- the disease is severe, defined by a total Psoriasis Area Severity Index (PASI) score of 10 or more and a Dermatology Life Quality Index (DLQI) score of 10 or more, **and**
- the psoriasis has not responded to standard systemic therapies (e.g. ciclosporin, methotrexate and psoralen and long-wave ultraviolet radiation), or patients are intolerant to or have a contra-indication to these treatments.

Ustekinumab treatment should be stopped 16 weeks after starting treatment if the psoriasis has not shown a 75% reduction in the PASI score from when treatment started, or a 50% reduction in the PASI score and a 5-point reduction in the DLQI score from when treatment started. [www.nice.org.uk/guidance/TA180](http://www.nice.org.uk/guidance/TA180)

- ▶ **Ustekinumab for treating active psoriatic arthritis (updated March 2017)** NICE TA340

Ustekinumab is recommended as an option, alone or in combination with methotrexate, for treating active psoriatic arthritis in adults only when:

- treatment with tumour necrosis factor (TNF) alpha inhibitors is contra-indicated but would otherwise be considered, *or*
- the patient has had treatment with 1 or more TNF-alpha inhibitors.

Ustekinumab should be stopped at 24 weeks, if the psoriatic arthritis has not shown adequate response using the Psoriatic Arthritis Response Criteria (PsARC).

Patients currently receiving ustekinumab who do not meet the above criteria and whose treatment was started within the NHS before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA340](http://www.nice.org.uk/guidance/TA340)

- ▶ **Ustekinumab for moderately to severely active Crohn's disease after previous treatment (July 2017)** NICE TA456  
Ustekinumab is recommended as an option for treating moderately to severely active Crohn's disease in adults who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a TNF-alpha inhibitor or have medical contra-indications to such therapies.

Ustekinumab should be given until treatment failure (including the need for surgery) or until 12 months after the start of treatment, whichever is shorter.

[www.nice.org.uk/guidance/TA456](http://www.nice.org.uk/guidance/TA456)

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (February 2014) that ustekinumab (*Stelara*<sup>®</sup>) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

The *Scottish Medicines Consortium* has advised (July 2017) that ustekinumab (*Stelara*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active Crohn's disease who have had an inadequate response with, lost response to, or were intolerant to either conventional therapy or a tumour necrosis factor-alpha antagonist or have medical contra-indications to such therapies. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Stelara** (Janssen-Cilag Ltd)

**Ustekinumab 90 mg per 1 ml** Stelara 90mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £2,147.00

Stelara 45mg/0.5ml solution for injection vials | 1 vial [PoM](#) £2,147.00

Stelara 45mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £2,147.00

##### Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Stelara** (Janssen-Cilag Ltd)

**Ustekinumab 5 mg per 1 ml** Stelara 130mg/26ml concentrate for solution for infusion vials | 1 vial [PoM](#) £2,147.00

## IMMUNOSUPPRESSANTS > PROTEIN KINASE INHIBITORS

### Baricitinib

28-Sep-2017

- **DRUG ACTION** Baricitinib selectively and reversibly inhibits the Janus-associated tyrosine kinases JAK1 and JAK2.

#### ● INDICATIONS AND DOSE

**Moderate-to-severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to, one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (initiated by a specialist)**

▶ BY MOUTH

- ▶ Adult 18-74 years: 4 mg once daily, for dose adjustments due to side-effects or dose reduction due to history of infection or sustained control of disease activity, consult product literature
- ▶ Adult 75 years and over: 2 mg once daily, for dose adjustments due to side-effects, consult product literature

- **CONTRA-INDICATIONS** Absolute lymphocyte count less than  $0.5 \times 10^9$  cells/litre (do not initiate) · absolute neutrophil count less than  $1 \times 10^9$  cells/litre (do not initiate) · active tuberculosis · haemoglobin less than 8 g/dL (do not initiate)
- **CAUTIONS** Active, chronic or recurrent infection (interrupt treatment if no response to standard therapy) · risk of viral reactivation (consult product literature)
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Tuberculosis Manufacturer advises consider anti-tuberculosis therapy prior to initiation of baricitinib in patients with previously untreated latent tuberculosis.
- **INTERACTIONS** → Appendix 1: baricitinib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Dyslipidaemia · herpes zoster (interrupt treatment) · increased risk of infection · nausea · oropharyngeal pain · thrombocytosis
- ▶ **Uncommon** Acne · neutropenia · weight increased

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 week after treatment in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.  
**Dose adjustments** Manufacturer advises reduce dose to 2 mg once daily if creatinine clearance 30–60 mL/minute.
- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor patients with hepatitis B surface antibody and hepatitis B core antibody, without hepatitis B surface antigen, for expression of hepatitis B virus (HBV) DNA—if HBV DNA detected, consult liver specialist for advice.
  - ▶ Manufacturer advises monitor lipid profile 12 weeks after treatment initiation—hyperlipidaemia should be managed according to international clinical guidelines; monitor hepatic transaminases routinely—interrupt treatment if drug-induced liver injury suspected.
  - ▶ Manufacturer advises monitor for haematological abnormalities; interrupt treatment if absolute neutrophil count less than  $1 \times 10^9$  cells/litre, absolute lymphocyte count less than  $0.5 \times 10^9$  cells/litre, or haemoglobin less than 8 g/dL—treatment may be restarted when levels return above these values.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Baricitinib for moderate to severe rheumatoid arthritis (August 2017) NICE TA466**  
Baricitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in patients whose disease has responded inadequately to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs), only if:
  - disease is severe (a disease activity score [DAS28] of more than 5.1), **and**
  - the company provides baricitinib with the discount agreed in the patient access scheme (PAS).
 Baricitinib, with methotrexate, is recommended as an option for treating active rheumatoid arthritis in patients whose disease has responded inadequately to or who cannot have other DMARDs, including at least one biological DMARD, only if:
  - disease is severe (a DAS28 of more than 5.1), **and**
  - they cannot have rituximab, **and**
  - the company provides baricitinib with the discount agreed in the PAS.
 Baricitinib can be used as monotherapy for people who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above two sets of criteria are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients currently receiving baricitinib whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA466](http://www.nice.org.uk/guidance/TA466)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (September 2017) that baricitinib (*Olumiant*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of active rheumatoid arthritis only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**
- disease has not responded to intensive therapy with a combination of conventional disease-modifying anti-rheumatic drugs, **or**
- disease inadequately controlled by a tumour necrosis factor antagonist and patients are ineligible to receive rituximab.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent of lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Olumiant** (Eli Lilly and Company Ltd) ▼

**Baricitinib 2 mg** Olumiant 2mg tablets | 28 tablet (PoM) £805.56 DT = £805.56

**Baricitinib 4 mg** Olumiant 4mg tablets | 28 tablet (PoM) £805.56 DT = £805.56

## Tofacitinib

22-May-2019

- **DRUG ACTION** Tofacitinib selectively inhibits the Janus-associated tyrosine kinases JAK1 and JAK3.

#### ● INDICATIONS AND DOSE

**Moderate to severe active rheumatoid arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (as monotherapy or in combination with methotrexate) (specialist use only) | Active psoriatic arthritis in patients who have had an inadequate response to, or are intolerant to one or more disease-modifying anti-rheumatic drugs (in combination with methotrexate) (specialist use only)**

##### ▶ BY MOUTH

- ▶ Adult: 5 mg twice daily, for dose adjustments due to side-effects—consult product literature

**Moderate to severe active ulcerative colitis in patients who have had an inadequate or lost response to, or are intolerant to either conventional therapy or a biologic agent (specialist use only)**

##### ▶ BY MOUTH

- ▶ Adult: Initially 10 mg twice daily for 8 weeks, then maintenance 5 mg twice daily, if an adequate therapeutic response is not achieved after 8 weeks, the initial dose can be extended for an additional 8 weeks, discontinue treatment if no response 16 weeks after initial dose, for dose adjustments due to side-effects, decreased response during maintenance treatment or following treatment interruption—consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose with concurrent use of potent CYP3A4 inhibitors or drugs which are both moderate CYP3A4 and potent CYP2C19 inhibitors. Dose should be reduced to 5 mg once daily continued →

in patients receiving 5 mg twice daily. Dose should be reduced to 5 mg twice daily in patients receiving 10 mg twice daily.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: TOFACITINIB (XELJANZ®): INCREASED RISK OF PULMONARY EMBOLISM AND MORTALITY IN RHEUMATOID ARTHRITIS PATIENTS RECEIVING 10 MG TWICE DAILY IN A CLINICAL TRIAL (MARCH 2019)**

Due to these increased risks, prescribers are advised to adhere to the licensed dose for rheumatoid arthritis. Patients receiving tofacitinib, regardless of indication, should be monitored for signs and symptoms of pulmonary embolism and advised to seek immediate medical attention if they occur.

- **CONTRA-INDICATIONS** Absolute lymphocyte count less than 750 cells/mm<sup>3</sup> (do not initiate) · absolute neutrophil count less than 1000 cells/mm<sup>3</sup> (do not initiate) · active infection including localised infection · active tuberculosis · haemoglobin less than 9 g/dL (do not initiate)
- **CAUTIONS** Active, chronic or recurrent infection · elderly · predisposition to infection · previous or current malignancy · raised serum transaminases (particularly in combination with potentially hepatotoxic drugs) · risk of gastrointestinal perforation (new onset abdominal signs and symptoms should be evaluated promptly) · risk of viral reactivation (consult product literature)
- CAUTIONS, FURTHER INFORMATION** Manufacturer advises patients should receive all recommended vaccinations before starting treatment (consider prophylactic varicella zoster vaccination); live vaccines should be given at least 2 weeks, but preferably 4 weeks before treatment initiation—consult product literature.
- ▶ **Tuberculosis** Manufacturer advises consider anti-tuberculosis therapy prior to initiation of tofacitinib in patients with previously untreated latent tuberculosis.
- **INTERACTIONS** → Appendix 1: tofacitinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · cough · decreased leucocytes · diarrhoea · dyslipidaemia · dyspnoea · fatigue · fever · gastritis · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · joint disorders · musculoskeletal pain · nausea · peripheral oedema · skin reactions · vomiting · weight increased
  - ▶ **Uncommon** Dehydration · hepatic steatosis · ligament sprain · muscle strain · neutropenia · non-melanoma skin cancer · paraesthesia · sepsis · sinus congestion · tendinitis
  - ▶ **Rare or very rare** Meningitis cryptococcal
  - ▶ **Frequency not known** Increased risk of pulmonary embolism (with high doses)
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 4 weeks after treatment in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment.
- Dose adjustments** Manufacturer advises dose reduction in moderate impairment—consult product literature.
- **RENAL IMPAIRMENT**
  - Dose adjustments** Manufacturer advises reduce dose in severe impairment—consult product literature.
- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be evaluated for tuberculosis and viral hepatitis before treatment.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor for signs and symptoms of infection during and after treatment.
- ▶ Manufacturer advises periodic skin examination in patients at increased risk for skin cancer.
- ▶ Manufacturer advises monitor liver function routinely; monitor lipid profile 8 weeks after treatment initiation.
- ▶ Manufacturer advises monitor lymphocytes at baseline and every 3 months thereafter; neutrophils and haemoglobin should be monitored at baseline, after 4 to 8 weeks of treatment and every 3 months thereafter.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablets may be crushed and taken with water.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

▶ **Tofacitinib for moderate-to-severe rheumatoid arthritis (October 2017)** NICE TA480  
Tofacitinib (*Xeljanz*®), with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to intensive therapy with a combination of conventional DMARDs, only if:

- disease is severe (a disease activity score [DAS28] of more than 5.1), **and**
  - the manufacturer provides tofacitinib with the discount agreed in the patient access scheme.
- Tofacitinib (*Xeljanz*®), with methotrexate, is recommended as an option for treating active rheumatoid arthritis in adults whose disease has responded inadequately to, or who cannot have, other DMARDs, including at least 1 biological DMARD, only if:
- disease is severe (a DAS28 of more than 5.1), **and**
  - they cannot have rituximab, **and**
  - the manufacturer provides tofacitinib with the discount agreed in the patient access scheme.

Tofacitinib can be used as monotherapy for adults who cannot take methotrexate because it is contra-indicated or because of intolerance, when the above criteria are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After an initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta480](http://www.nice.org.uk/guidance/ta480)

▶ **Tofacitinib for treating active psoriatic arthritis after inadequate response to DMARDs (October 2018)** NICE TA543  
Tofacitinib (*Xeljanz*®), with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults, only if:

- it is used as described in NICE's technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2), **or**
  - the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after 12 weeks, **or**
  - TNF-alpha inhibitors are contra-indicated but would otherwise be considered (as described in NICE's technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis).
- Tofacitinib is only recommended if the manufacturer provides it according to the commercial arrangement.

Assess the response to treatment after 12 weeks. Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria

(PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta543](http://www.nice.org.uk/guidance/ta543)

► **Tofacitinib for moderately to severely active ulcerative colitis (November 2018) NICE TA547**

Tofacitinib (*Xeljanz*<sup>®</sup>) is recommended, within its marketing authorisation, as an option for treating moderately to severely active ulcerative colitis in adults when conventional therapy or a biological agent cannot be tolerated or the disease has responded inadequately or lost response to treatment. It is recommended only if the manufacturer provides tofacitinib with the discount agreed in the commercial arrangement.

[www.nice.org.uk/guidance/ta547](http://www.nice.org.uk/guidance/ta547)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 1298/18

The *Scottish Medicines Consortium* has advised (February 2018) that tofacitinib citrate (*Xeljanz*<sup>®</sup>) is accepted for restricted use within NHS Scotland in combination with methotrexate in adults with severe active rheumatoid arthritis (a disease activity score [DAS28] greater than 5.1) that has not responded to intensive therapy with a combination of conventional DMARDs. In patients with severe disease inadequately controlled by a tumour necrosis factor (TNF) antagonist it may be used in patients ineligible to receive rituximab.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2116

The *Scottish Medicines Consortium* has advised (January 2019) that tofacitinib (*Xeljanz*<sup>®</sup>) is accepted for restricted use within NHS Scotland in combination with methotrexate for the treatment of adults with psoriatic arthritis whose disease has not responded adequately to at least two conventional DMARDs, given either alone or in combination. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. SMC2122

The *Scottish Medicines Consortium* has advised (February 2019) that tofacitinib (*Xeljanz*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with moderately to severely active ulcerative colitis who have had an inadequate response, lost response, or were intolerant to either conventional therapy or a biologic agent. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

► *Xeljanz* (Pfizer Ltd) ▼

**Tofacitinib (as Tofacitinib citrate) 5 mg** *Xeljanz* 5mg tablets |

56 tablet (POM) £690.03 (Hospital only)

**Tofacitinib (as Tofacitinib citrate) 10 mg** *Xeljanz* 10mg tablets |

56 tablet (POM) £1,380.06 (Hospital only)

## IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

### Abatacept

01-Dec-2017

● **INDICATIONS AND DOSE**

**Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)**

► BY INTRAVENOUS INFUSION

► Adult (body-weight up to 60 kg): 500 mg every 2 weeks for 3 doses, then 500 mg every 4 weeks, review treatment if no response within 6 months

► Adult (body-weight 60–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months

► Adult (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

**Moderate-to-severe active rheumatoid arthritis (specialist use only) | Active psoriatic arthritis (specialist use only)**

► BY SUBCUTANEOUS INJECTION

► Adult: 125 mg once weekly, review treatment if no response within 6 months, subcutaneous dosing may be initiated with or without an intravenous loading dose—consult product literature

- **CONTRA-INDICATIONS** Severe infection

● **CAUTIONS** Do not initiate until active infections are controlled · elderly (increased risk of side-effects) · predisposition to infection (screen for latent tuberculosis and viral hepatitis) · progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

- **INTERACTIONS** → Appendix 1: abatacept

● **SIDE-EFFECTS**

- **Common or very common** Asthenia · cough · diarrhoea · dizziness · gastrointestinal discomfort · headaches · hypertension · increased risk of infection · nausea · oral ulceration · skin reactions · vomiting
- **Uncommon** Alopecia · anxiety · arrhythmias · arthralgia · bruising tendency · conjunctivitis · depression · dry eye · dyspnoea · gastritis · hyperhidrosis · hypotension · influenza like illness · leucopenia · menstrual cycle irregularities · pain in extremity · palpitations · paraesthesia · respiratory disorders · sepsis · sleep disorders · throat tightness · thrombocytopenia · vasculitis · vasodilation · vertigo · visual acuity decreased · weight increased
- **Rare or very rare** Pelvic inflammatory disease · respiratory malignancy

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195**  
Abatacept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.  
[www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375**

Abatacept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provides abatacept as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving abatacept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA375](http://www.nice.org.uk/TA375)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Orencia** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
**Abatacept 125 mg per 1 ml** Orencia 125mg/1ml solution for injection pre-filled syringes | 4 pre-filled disposable injection **[PoM]** £1,209.60 DT = £1,209.60 (Hospital only)
- ▶ **Orencia ClickJect** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
**Abatacept 125 mg per 1 ml** Orencia ClickJect 125mg/1ml solution for injection pre-filled pen | 4 pre-filled disposable injection **[PoM]** £1,209.60 DT = £1,209.60

#### Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Orencia** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
**Abatacept 250 mg** Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial **[PoM]** £302.40 (Hospital only)

## IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF- $\alpha$ ) INHIBITORS

### Adalimumab

13-Dec-2018

#### ● INDICATIONS AND DOSE

##### Plaque psoriasis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 80 mg, then 40 mg every 2 weeks, to be started 1 week after initial dose, review treatment if no response within 16 weeks—consult product literature

##### Rheumatoid arthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, dose to be increased only in patients receiving adalimumab alone, review treatment if no response within 12 weeks

##### Psoriatic arthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist) | Axial spondyloarthritis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 40 mg every 2 weeks, review treatment if no response within 12 weeks

##### Crohn's disease (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

##### Crohn's disease (accelerated regimen) (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 12 weeks

##### Ulcerative colitis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, alternatively 80 mg every 2 weeks, review treatment if no response within 8 weeks

##### Hidradenitis suppurativa (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 160 mg, dose can alternatively be given as divided injections over 2 days, followed by 80 mg after 2 weeks, then maintenance 40 mg once weekly, after 2 weeks, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

##### Uveitis (initiated by a specialist)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 80 mg, then 40 mg after 1 week; maintenance 40 mg every 2 weeks

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infection
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · development of malignancy · do not initiate until active infections are controlled (discontinue if new serious infection develops) · hepatitis B virus—monitor for active infection · history of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin

test, chemoprophylaxis can be given concurrently with adalimumab.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Agranulocytosis · alopecia · anaemia · anxiety · arrhythmias · arterial occlusion · asthma · broken nails · chest pain · coagulation disorder · connective tissue disorders · cough · dehydration · depression · dyspnoea · electrolyte imbalance · embolism and thrombosis · eye inflammation · fever · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headaches · healing impaired · hyperglycaemia · hypersensitivity · hypertension · increased risk of infection · insomnia · leucocytosis · leucopenia · mood altered · muscle spasms · musculoskeletal pain · nausea · neoplasms · nerve disorders · neutropenia · oedema · renal impairment · seasonal allergy · sensation abnormal · sepsis · skin reactions · sweat changes · thrombocytopenia · vasculitis · vertigo · vision disorders · vomiting
- ▶ **Uncommon** Aortic aneurysm · congestive heart failure · deafness · demyelinating disorders · dysphagia · erectile dysfunction · gallbladder disorders · hepatic disorders · inflammation · lupus erythematosus · meningitis viral · myocardial infarction · nocturia · pancreatitis · respiratory disorders · rhabdomyolysis · sarcoidosis · solid organ neoplasm · stroke · tinnitus · tremor
- ▶ **Rare or very rare** Cardiac arrest · pancytopenia · Stevens-Johnson syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises can be used—excreted in breast milk at very low concentrations (limited information available).

● **PRE-TREATMENT SCREENING**

Tuberculosis Manufacturer advises patients should be evaluated for active and latent tuberculosis before treatment.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor for infection before, during, and for 4 months after treatment.
- ▶ Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.
- ▶ *For uveitis*, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

● **PRESCRIBING AND DISPENSING INFORMATION**

Adalimumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

● **PATIENT AND CARER ADVICE** When used to treat *hidradenitis suppurativa*, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab. Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop. Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood

disorders (such as fever, sore throat, bruising, or bleeding) develop.

Alert card An alert card should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Adalimumab for plaque psoriasis in adults (June 2008)** NICE TA146

Adalimumab is recommended for the treatment of severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Adalimumab should be withdrawn if the response is not adequate after 16 weeks.

[www.nice.org.uk/guidance/ta146](http://www.nice.org.uk/guidance/ta146)

- ▶ **Infliximab and adalimumab for Crohn's disease (May 2010)** NICE TA187

Adalimumab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.

Adalimumab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, adalimumab can be restarted.

[www.nice.org.uk/guidance/ta187](http://www.nice.org.uk/guidance/ta187)

- ▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329 Adalimumab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Adalimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

[www.nice.org.uk/guidance/ta329](http://www.nice.org.uk/guidance/ta329)

- ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199 Adalimumab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Adalimumab should be discontinued if there is an inadequate response at 12 weeks.

[www.nice.org.uk/guidance/ta199](http://www.nice.org.uk/guidance/ta199)

- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195 Adalimumab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients

who cannot use methotrexate because of intolerance or contra-indications, adalimumab can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

[www.nice.org.uk/guidance/ta195](http://www.nice.org.uk/guidance/ta195)

- ▶ Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Adalimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**,
- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).

Adalimumab can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving adalimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta375](http://www.nice.org.uk/guidance/ta375)

- ▶ TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs.

The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

[www.nice.org.uk/guidance/ta383](http://www.nice.org.uk/guidance/ta383)

- ▶ Adalimumab for treating moderate-to-severe hidradenitis suppurativa (June 2016) NICE TA392

Adalimumab is recommended, within its marketing authorisation, as an option for treating active moderate-to-severe hidradenitis suppurativa in adults whose disease has not responded to conventional systemic therapy. The drug is recommended only if the manufacturer provides it at the price agreed in the patient access scheme. Response should be assessed after 12 weeks of treatment, and the drug continued only if there is clear evidence of response, defined as a reduction of 25% or more in the total abscess and inflammatory nodule count and no increase in abscesses and draining fistulas.

[www.nice.org.uk/guidance/ta392](http://www.nice.org.uk/guidance/ta392)

- ▶ Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017) NICE TA460

Adalimumab is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids, only if there is:

- active disease (that is, current inflammation in the eye), **and**
- inadequate response or intolerance to immunosuppressants, **and**
- systemic disease or both eyes are affected (or one eye is affected if the second eye has poor visual acuity), **and**
- worsening vision with a high risk of blindness (for example, risk of blindness that is similar to that seen in people with macular oedema).

Stop adalimumab for non-infectious uveitis in the posterior segment of the eye in adults with inadequate response to corticosteroids if there is one of the following:

- new active inflammatory chorioretinal or inflammatory retinal vascular lesions, or both, **or**
- a two-step increase in vitreous haze or anterior chamber cell grade, **or**
- worsening of best corrected visual acuity by three or more lines or 15 letters.

Patients currently receiving adalimumab whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta460](http://www.nice.org.uk/guidance/ta460)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* issued similar advice for plaque psoriasis to NICE TA146 in May 2008.

## Certolizumab pegol

23-Aug-2018

### ● INDICATIONS AND DOSE

**Moderate to severe active rheumatoid arthritis when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (as monotherapy or in combination with methotrexate) | Severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate or other disease-modifying antirheumatic drugs (in combination with methotrexate) | Active psoriatic arthritis when response to disease-modifying antirheumatic drugs has been inadequate (as monotherapy or in combination with methotrexate)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, once clinical response is confirmed, an alternative maintenance dosing of 400 mg every 4 weeks can be considered, review treatment if no response within 12 weeks

**Treatment of severe active ankylosing spondylitis in patients who have had an inadequate response to, or are intolerant of NSAIDs | Treatment of severe active axial spondyloarthritis, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, alternatively maintenance 400 mg every 4 weeks, review treatment if no response within 12 weeks

**Moderate to severe plaque psoriasis**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Loading dose 400 mg every 2 weeks for 3 doses, then maintenance 200 mg every 2 weeks, an alternative maintenance dosing of 400 mg every 2 weeks can be considered in patients with insufficient response, review treatment if no response within 16 weeks

- **CONTRA-INDICATIONS** Moderate to severe heart failure · severe active infection
- **CAUTIONS** Demyelinating CNS disorders (risk of exacerbation) · do not initiate until active infections are controlled (discontinue if new serious infection develops and until infection controlled) · hepatitis B virus (monitor for active infection) · history or development of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

### CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

- **Common or very common** Abscess · asthenia · decreased leucocytes · eosinophilic disorders · fever · headaches · hepatic disorders · hypertension · increased risk of infection · nausea · neoplasms · neutropenia · pain · sensory disorder · skin reactions
- **Uncommon** Alopecia · anaemia · anxiety · appetite disorder · arrhythmias · ascites · asthma · breast disorder ·

cardiomyopathy · chills · coronary artery disease · cough · cyst · dizziness · dyslipidaemia · electrolyte imbalance · embolism and thrombosis · eye inflammation · flushing · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · healing impaired · heart failure · hypercoagulation · influenza like illness · lacrimation disorder · lymphadenopathy · menstrual cycle irregularities · mood disorder · muscle disorder · nail disorder · nerve disorders · oedema · oral disorders · oropharyngeal dryness · palpitations · photosensitivity reaction · renal impairment · respiratory disorders · sepsis · skin ulcer · solid organ neoplasm · sweat changes · syncope · systemic lupus erythematosus (SLE) · temperature perception abnormal · thrombocytopenia · thrombocytosis · tinnitus · tremor · urinary tract disorder · vasculitides · vertigo · vision disorders · weight change

- **Rare or very rare** Atherosclerosis · atrioventricular block · cholelithiasis · cognitive impairment · delirium · fistula · haemosiderosis · hair texture abnormal · movement disorders · nephritis · nephropathy · odygnophagia · pancytopenia · panniculitis · pericarditis · polycythaemia · Raynaud's phenomenon · sarcoidosis · seizure · serum sickness · sexual dysfunction · splenomegaly · stroke · suicide attempt · telangiectasia · thyroid disorder

- **Frequency not known** Multiple sclerosis

**SIDE-EFFECTS, FURTHER INFORMATION** Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception in women of childbearing potential during treatment and for 5 months after last dose.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.
- **PATIENT AND CARER ADVICE** Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Tuberculosis Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss and fever) develop. Alert card An alert card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016) NICE TA375

Certolizumab pegol, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:

  - disease is severe, that is, a disease activity score (DAS28) greater than 5.1,
  - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
  - the manufacturers provide certolizumab pegol as agreed in the patient access schemes.

Certolizumab pegol can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After

initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving certolizumab pegol within the NHS whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/ta375](http://www.nice.org.uk/ta375)

▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)**  
NICE TA383

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in adult patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs.

Adalimumab, certolizumab pegol and etanercept are also recommended as options for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF)-alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

[www.nice.org.uk/ta383](http://www.nice.org.uk/ta383)

▶ **Certolizumab pegol for treating rheumatoid arthritis after inadequate response to a TNF-alpha inhibitor (October 2016)**  
NICE TA415

Certolizumab pegol, in combination with methotrexate, or as monotherapy, is recommended as an option for treating active rheumatoid arthritis in adults who have had an inadequate response to, or who cannot tolerate, other disease-modifying antirheumatic drugs (DMARDs) including at least 1 tumour necrosis factor-alpha (TNF-alpha) inhibitor, only if the following criteria are met:

- disease activity is severe **and**
- rituximab is contra-indicated or not tolerated, or if monotherapy, rituximab cannot be given because methotrexate is contra-indicated or not tolerated **and**
- the manufacturers provide certolizumab pegol as agreed in the patient access scheme.

Continue treatment only if there is at least a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if at least a moderate EULAR response is not maintained.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/ta415](http://www.nice.org.uk/ta415)

▶ **Certolizumab pegol and secukinumab for treating active psoriatic arthritis after inadequate response to DMARDs (May 2017)**  
NICE TA445

Certolizumab pegol alone, or in combination with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:

- it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2), **or**
- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has stopped responding after the first 12 weeks.

Certolizumab pegol is only recommended if the manufacturer provides it as agreed in the patient access scheme.

Assess the response to treatment after 12 weeks.

Treatment should only be continued if there is clear evidence of response, defined as an improvement in at least 2 of the 4 Psoriatic Arthritis Response Criteria (PsARC), 1 of which must be joint tenderness or swelling score, with no worsening in any of the 4 criteria. People whose disease has a Psoriasis Area and Severity Index (PASI) 75 response but whose PsARC response does not justify continuing treatment should be assessed by a dermatologist.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta445](http://www.nice.org.uk/guidance/ta445)

▶ **Certolizumab pegol for treating moderate to severe plaque psoriasis (April 2019)**  
NICE TA574

Certolizumab pegol (*Cimzia*<sup>®</sup>) is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, **and**
- the disease has not responded to other systemic treatments, including ciclosporin, methotrexate and phototherapy, or these options are contraindicated or not tolerated, **and**
- the lowest maintenance dosage of certolizumab pegol is used after the loading dosage, **and**
- the manufacturer provides the drug according to the commercial arrangement.

Stop certolizumab pegol at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, **or**
- a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta574](http://www.nice.org.uk/guidance/ta574)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2132

The *Scottish Medicines Consortium* has advised (April 2019) that certolizumab pegol (*Cimzia*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contraindication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

01-Aug-2018

### ● INDICATIONS AND DOSE

#### BENEPALI<sup>®</sup> SOLUTION FOR INJECTION

**Moderate-to-severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate** | Severe, active and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis when the response to other disease-modifying antirheumatic drugs is inadequate | Severe active ankylosing spondylitis when the response to conventional therapy is inadequate | Severe, non-radiographic axial spondyloarthritis when the response to non-steroidal anti-inflammatory drugs is inadequate

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 50 mg once weekly, review treatment if no response within 12 weeks of initial dose

**Moderate-to-severe plaque psoriasis when the response to other systemic therapies or psoralen and ultraviolet-A light (PUVA) is inadequate, or when these therapies cannot be used because of intolerance or contra-indications**

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 50 mg once weekly, alternatively 50 mg twice weekly for up to 12 weeks, followed by 50 mg once weekly if required continue treatment for up to 24 weeks—continuous therapy beyond 24 weeks may be appropriate in some patients (consult product literature), discontinue if no response after 12 weeks

#### ENBREL<sup>®</sup> POWDER AND SOLVENT FOR SOLUTION FOR INJECTION

**Moderate-to-severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate** | Severe, active and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis when the response to other disease-modifying antirheumatic drugs is inadequate | Severe active ankylosing spondylitis when the response to conventional therapy is inadequate | Severe, non-radiographic axial spondyloarthritis when the response to non-steroidal anti-inflammatory drugs is inadequate

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, review treatment if no response within 12 weeks of initial dose

**Moderate-to-severe plaque psoriasis when the response to other systemic therapies or psoralen and ultraviolet-A light (PUVA) is inadequate, or when these therapies cannot be used because of intolerance or contra-indications**

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, alternatively 50 mg twice weekly for up to 12 weeks, followed by 25 mg twice weekly, alternatively 50 mg once weekly if required continue treatment for up to 24 weeks—continuous therapy beyond 24 weeks may be appropriate in some patients (consult product literature), discontinue if no response after 12 weeks

### ENBREL<sup>®</sup> SOLUTION FOR INJECTION

**Moderate-to-severe active rheumatoid arthritis (alone or in combination with methotrexate) when the response to other disease-modifying antirheumatic drugs is inadequate** | Severe, active and progressive rheumatoid arthritis not previously treated with methotrexate | Active and progressive psoriatic arthritis when the response to other disease-modifying antirheumatic drugs is inadequate | Severe active ankylosing spondylitis when the response to conventional therapy is inadequate | Severe, non-radiographic axial spondyloarthritis when the response to non-steroidal anti-inflammatory drugs is inadequate

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, review treatment if no response within 12 weeks of initial dose

**Moderate-to-severe plaque psoriasis when the response to other systemic therapies or psoralen and ultraviolet-A light (PUVA) is inadequate, or when these therapies cannot be used because of intolerance or contra-indications**

#### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 25 mg twice weekly, alternatively 50 mg once weekly, alternatively 50 mg twice weekly for up to 12 weeks, followed by 25 mg twice weekly, alternatively 50 mg once weekly if required continue treatment for up to 24 weeks—continuous therapy beyond 24 weeks may be appropriate in some patients (consult product literature), discontinue if no response after 12 weeks

- **CONTRA-INDICATIONS** Active infection
- **CAUTIONS** Development of malignancy · diabetes mellitus · heart failure (risk of exacerbation) · hepatitis B virus—monitor for active infection · hepatitis C infection (monitor for worsening infection) · history of blood disorders · history of malignancy · history or increased risk of demyelinating disorders · predisposition to infection (avoid if predisposition to septicæmia) · significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.
- **INTERACTIONS** → Appendix 1: etanercept
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Cystitis · fever · hypersensitivity · increased risk of infection · pain · skin reactions · swelling
  - ▶ **Uncommon** Abscess · bursitis · cholecystitis · diarrhoea · endocarditis · eye inflammation · gastritis · hepatic disorders · myositis · neoplasms · respiratory disorders · sepsis · skin ulcers · thrombocytopenia · vasculitis
  - ▶ **Rare or very rare** Anaemia · bone marrow disorders · congestive heart failure · cutaneous lupus erythematosus · demyelination · leucopenia · lupus-like syndrome · nerve disorders · neutropenia · sarcoidosis · seizure · severe cutaneous adverse reactions (SCARs) · transverse myelitis
  - ▶ **Frequency not known** Dermatomyositis exacerbated · hepatitis B reactivation

10

Musculoskeletal system

**SIDE-EFFECTS, FURTHER INFORMATION** Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.
- **PREGNANCY** Avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe alcoholic hepatitis.
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS** Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).
- **PRESCRIBING AND DISPENSING INFORMATION** Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **PATIENT AND CARER ADVICE** Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop. Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Alert card An alert card should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- ▶ **Etanercept and efalizumab for plaque psoriasis (July 2006)** NICE TA103  
Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks. [www.nice.org.uk/TA103](http://www.nice.org.uk/TA103)
- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195  
Etanercept, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months. [www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)
- ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199  
Etanercept is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept should be discontinued if there is an inadequate response at 12 weeks.

[www.nice.org.uk/TA199](http://www.nice.org.uk/TA199)

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375  
Etanercept, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
  - disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**
  - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs)
 Etanercept can be used as monotherapy in patients who cannot take methotrexate because it is contra-indicated or because of intolerance, when the criteria above are met. Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained. Patients currently receiving etanercept whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA375](http://www.nice.org.uk/TA375)
- ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383  
Etanercept is recommended as an option for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Etanercept is also recommended as an option for treating severe non-radiographic axial spondyloarthritis in patients whose disease has responded inadequately to, or who are intolerant of, NSAIDs. The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response. Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response. **SIDE-EFFECTS, FURTHER INFORMATION** Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 6 months after last dose.
- **PREGNANCY** Use only if essential.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 6 months after treatment—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS** Monitor for infection before, during, and for 5 months after treatment.
- **DIRECTIONS FOR ADMINISTRATION** For doses requiring multiple injections, each injection should be administered at a different site.  
Missed dose If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date.

● **PATIENT AND CARER ADVICE**

**Tuberculosis** All patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**Blood disorders** Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

**Alert card** An alert card should be provided.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Golimumab for the treatment of psoriatic arthritis (April 2011)** NICE TA220

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors, **and**
- the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

[www.nice.org.uk/guidance/ta220](http://www.nice.org.uk/guidance/ta220)

- ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375

Golimumab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if **all** the following criteria are met:

- disease is severe, that is, a disease activity score (DAS28) greater than 5.1,

- disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs),
- the manufacturers provides golimumab as agreed in the patient access schemes.

Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.

Patients currently receiving treatment with golimumab whose disease does not meet the above criteria should have the option to continue their treatment until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta375](http://www.nice.org.uk/guidance/ta375)

- ▶ **Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011) NICE TA225**

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in patients who have had an inadequate response to DMARDs, including a TNF inhibitor, if golimumab is used as described in the NICE technology appraisal guidance 195 (August 2010) for other TNF inhibitors, **and** the manufacturer provides the 100 mg dose of golimumab at the same price as the 50 mg dose.

[www.nice.org.uk/guidance/ta225](http://www.nice.org.uk/guidance/ta225)

- ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016) NICE TA383**

Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs).

The response to treatment should be assessed 12 weeks after the start of treatment. Treatment should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) -alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response.

[www.nice.org.uk/guidance/ta383](http://www.nice.org.uk/guidance/ta383)

- ▶ **Golimumab for treating non-radiographic axial spondyloarthritis (January 2018) NICE TA497**

Golimumab is recommended, within its marketing authorisation, as an option for treating severe non-radiographic axial spondyloarthritis in adults whose disease has responded inadequately to, or who cannot tolerate, nonsteroidal anti-inflammatory drugs.

If patients and their clinicians consider golimumab to be one of a range of suitable treatments, including adalimumab, etanercept and certolizumab pegol, the least expensive (taking into account administration costs and patient access schemes) should be chosen.

Assess the response to golimumab 12 weeks after the start of treatment. Continue treatment only if there is clear evidence of response, defined as:

- a reduction in the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score to 50% of the pre-treatment value or by 2 or more units, **and**
- a reduction in the spinal pain visual analogue scale (VAS) score by 2 cm or more.

[www.nice.org.uk/guidance/ta497](http://www.nice.org.uk/guidance/ta497)

- ▶ **Infliximab, adalimumab and golimumab for treating moderately-to-severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329**
- Golimumab is an option for treating moderately-to-severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy

including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.

Golimumab is recommended only if the manufacturer provides the 100 mg dose of golimumab at the same cost as the 50 mg dose, as agreed in the patient access scheme.

The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.

Golimumab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.

[www.nice.org.uk/guidance/ta329](http://www.nice.org.uk/guidance/ta329)

### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2012) that golimumab (*Simponi*<sup>®</sup>) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

The *Scottish Medicines Consortium* has advised (February 2016) that golimumab (*Simponi*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with severe, active non-radiographic axial spondyloarthritis with objective signs of inflammation as indicated by elevated C-reactive protein (CRP) and/or magnetic resonance imaging (MRI) evidence, who have had an inadequate response to, or are intolerant to non-steroidal anti-inflammatory drugs (NSAIDs). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Simponi** (Merck Sharp & Dohme Ltd)

**Golimumab 100 mg per 1 ml** Simponi 50mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £762.97 DT = £762.97

Simponi 50mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £762.97 DT = £762.97

Simponi 100mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £1,525.94 DT = £1,525.94

## Infliximab

31-May-2016

### ● INDICATIONS AND DOSE

#### Severe active Crohn's disease

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, if condition has responded, then maintenance 5 mg/kg every 8 weeks

#### Fistulating Crohn's disease

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

#### Severe active ulcerative colitis

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every

8 weeks, discontinue if no response 14 weeks after initial dose

### Rheumatoid arthritis (in combination with methotrexate)

#### ▶ BY INTRAVENOUS INFUSION

• Adult: Initially 3 mg/kg, then 3 mg/kg after 2 weeks, followed by 3 mg/kg after 4 weeks, then 3 mg/kg every 8 weeks, dose to be increased only if response is inadequate after 12 weeks of initial treatment; increased in steps of 1.5 mg/kg every 8 weeks, increased if necessary up to 7.5 mg/kg every 8 weeks, alternatively increased if necessary to 3 mg/kg every 4 weeks, discontinue if no response by 12 weeks of initial infusion or after dose adjustment

### Ankylosing spondylitis

#### ▶ BY INTRAVENOUS INFUSION

• Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 6–8 weeks, discontinue if no response by 6 weeks of initial infusion

### Psoriatic arthritis (in combination with methotrexate)

#### ▶ BY INTRAVENOUS INFUSION

• Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, followed by 5 mg/kg every 8 weeks

### Plaque psoriasis

#### ▶ BY INTRAVENOUS INFUSION

• Adult: 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 14 weeks of initial infusion

### IMPORTANT SAFETY INFORMATION

Adequate resuscitation facilities must be available when infliximab is used.

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infections
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) · dermatomyositis · development of malignancy · hepatitis B virus—monitor for active infection · history of colon carcinoma (in inflammatory bowel disease) · history of dysplasia (in inflammatory bowel disease) · history of malignancy · history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection (discontinue if new serious infection develops) · risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Infection Manufacturer advises patients should be up-to-date with current immunisation schedule before initiating treatment.
  - ▶ Tuberculosis Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).

- ▶ Hypersensitivity reactions Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abscess · alopecia · anaemia · arrhythmias · arthralgia · chest pain · chills · constipation · decreased leucocytes · depression · diarrhoea · dizziness · dyspnoea · eye inflammation · fatigue · fever · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · hepatic disorders · hyperhidrosis · hypertension · hypotension · increased risk of infection · infusion related reaction · insomnia · lymphadenopathy · myalgia · nausea · neutropenia · oedema · pain · palpitations · respiratory disorders · sensation abnormal · sepsis · skin reactions · vasodilation · vertigo
  - ▶ **Uncommon** Anxiety · cheilitis · cholecystitis · confusion · drowsiness · healing impaired · heart failure · hypersensitivity · lupus-like syndrome · lymphocytosis · memory loss · neoplasms · nerve disorders · pancreatitis · peripheral ischaemia · pulmonary oedema · seborrhoea · seizure · syncope · thrombocytopenia · thrombophlebitis
  - ▶ **Rare or very rare** Agranulocytosis · circulatory collapse · cyanosis · demyelinating disorders · granuloma · haemolytic anaemia · hepatitis B reactivation · meningitis · pancytopenia · pericardial effusion · sarcoidosis · severe cutaneous adverse reactions (SCARs) · transverse myelitis · vasculitis · vasospasm
  - ▶ **Frequency not known** Dermatomyositis exacerbated · hepatosplenic T-cell lymphoma (increased risk in inflammatory bowel disease) · myocardial infarction · myocardial ischaemia · vision loss
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.
- **PREGNANCY** Use only if essential.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **PRE-TREATMENT SCREENING** Tuberculosis Manufacturer advises patients should be evaluated for tuberculosis before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for infection before, during, and for 6 months after treatment.
  - ▶ All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
  - ▶ Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
  - ▶ Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Remicade*®), give intermittently in Sodium chloride 0.9%; reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours (adults over 18 years who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution.

- **PRESCRIBING AND DISPENSING INFORMATION** Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.
- **PATIENT AND CARER ADVICE**
  - Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
  - Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.
  - Alert card An alert card should be provided.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE decisions**
    - ▶ **Infliximab for plaque psoriasis in adults (January 2008)** NICE TA134  
Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) or to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.  
[www.nice.org.uk/TA134](http://www.nice.org.uk/TA134)
    - ▶ **Infliximab for acute exacerbations of ulcerative colitis (December 2008)** NICE TA163  
Infliximab is recommended as an option for the treatment of acute exacerbations of severe ulcerative colitis when treatment with ciclosporin is contra-indicated or inappropriate.  
[www.nice.org.uk/TA163](http://www.nice.org.uk/TA163)
    - ▶ **Infliximab and adalimumab for Crohn's disease (May 2010)** NICE TA187  
Infliximab is recommended for the treatment of severe active Crohn's disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications; infliximab can also be used in a similar way in children over 6 years of age. In adults over 18 years of age, infliximab is recommended for the treatment of fistulating Crohn's disease that has not responded to conventional therapy (including antibacterials, drainage, and other drugs affecting the immune response) or when conventional therapy cannot be used because of intolerance or contra-indications.  
Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.  
[www.nice.org.uk/TA187](http://www.nice.org.uk/TA187)
    - ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195  
Infliximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.  
[www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)
    - ▶ **Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)** NICE TA199  
Infliximab is recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).  
Infliximab should be discontinued if there is an inadequate response at 12 weeks.  
[www.nice.org.uk/TA199](http://www.nice.org.uk/TA199)
    - ▶ **Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015)** NICE TA329  
Infliximab is an option for treating moderately to severely active ulcerative colitis in adults whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine, or in adults who are intolerant to or have contra-indications for conventional therapies.  
The choice of treatment should be made on an individual basis and if more than one treatment is suitable, the least expensive should be chosen.  
Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed at least every 12 months to determine whether ongoing treatment is still clinically appropriate.  
[www.nice.org.uk/TA329](http://www.nice.org.uk/TA329)
    - ▶ **Adalimumab, etanercept, infliximab, certolizumab pegol, golimumab, tocilizumab and abatacept for rheumatoid arthritis not previously treated with DMARDs or after conventional DMARDs only have failed (January 2016)** NICE TA375  
Infliximab, in combination with methotrexate, is recommended as an option for treating rheumatoid arthritis, only if the following criteria are met:
      - disease is severe, that is, a disease activity score (DAS28) greater than 5.1, **and**,
      - disease has not responded to intensive therapy with a combination of conventional disease-modifying antirheumatic drugs (DMARDs).
 Continue treatment only if there is a moderate response measured using European League Against Rheumatism (EULAR) criteria at 6 months after starting therapy. After initial response within 6 months, withdraw treatment if a moderate EULAR response is not maintained.  
Patients currently receiving infliximab whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA375](http://www.nice.org.uk/TA375)
    - ▶ **TNF-alpha inhibitors for ankylosing spondylitis and non-radiographic axial spondyloarthritis (February 2016)** NICE TA383  
Adalimumab, certolizumab pegol, etanercept, golimumab and infliximab are recommended as options for treating severe active ankylosing spondylitis in patients whose disease has responded inadequately to, or who are intolerant of, non-steroidal anti-inflammatory drugs (NSAIDs). Infliximab is recommended only if treatment is started with the least expensive infliximab product.  
Patients currently receiving infliximab should continue treatment with the same infliximab product until they and their clinician considers it appropriate to stop.  
The response to treatment should be assessed 12 weeks after the start of treatment and should only be continued if there is clear evidence of response.

Treatment with another tumour necrosis factor (TNF) - alpha inhibitor is recommended in those who cannot tolerate, or whose disease has not responded to, treatment with the first TNF-alpha inhibitor, or in those whose disease has stopped responding after an initial response. [www.nice.org.uk/TA383](http://www.nice.org.uk/TA383)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## PHOSPHODIESTERASE TYPE-4 INHIBITORS

### Apremilast

13-Apr-2017

- **DRUG ACTION** Apremilast inhibits the activity of phosphodiesterase type-4 (PDE4) which results in suppression of pro-inflammatory mediator synthesis and promotes anti-inflammatory mediators.

#### ● **INDICATIONS AND DOSE**

**Active psoriatic arthritis (in combination with disease-modifying antirheumatic drugs or alone) in patients who have had an inadequate response or who have been intolerant to a prior disease-modifying antirheumatic drug therapy | Moderate to severe chronic plaque psoriasis that has not responded to standard systemic treatments or photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 10 mg daily on day 1, then 10 mg twice daily on day 2, then 10 mg in the morning and 20 mg in the evening on day 3, then 20 mg twice daily on day 4, then 20 mg in the morning and 30 mg in the evening on day 5, then maintenance 30 mg twice daily, doses should be taken approximately 12 hours apart; review treatment if no response within 24 weeks of initiation

#### **IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JANUARY 2017): APREMILAST (OTEZLA®): RISK OF SUICIDAL THOUGHTS AND BEHAVIOUR

A review of evidence from clinical trials and postmarketing cases has suggested a causal association between apremilast and suicidal thoughts and behaviour.

- **CAUTIONS** Concomitant use of drugs likely to cause psychiatric symptoms · history of psychiatric illness · low body-weight—consider discontinuation if weight loss is unexplained or clinically significant
- **INTERACTIONS** → Appendix 1: apremilast
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite decreased · back pain · cough · depression · diarrhoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · headaches · increased risk of infection · insomnia · nausea · vomiting

- ▶ **Uncommon** Gastrointestinal haemorrhage · rash · suicidal tendencies · weight decreased
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment and ensure effective contraception during treatment.
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Reduce dose if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>; consult product literature for initial dose titration.
- **MONITORING REQUIREMENTS**
- ▶ Manufacturer advises monitor body-weight regularly in patients underweight at the start of treatment.
- ▶ Manufacturer advises monitor for psychiatric symptoms (including depression, suicidal ideation and behaviour)—discontinue treatment if new or worsening psychiatric symptoms are identified.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be instructed to notify the prescriber of any changes in behaviour or mood, and of any suicidal ideation.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NICE decisions**
- ▶ **Apremilast for treating active psoriatic arthritis (February 2017)** NICE TA433  
Apremilast, alone or in combination with disease-modifying antirheumatic drugs (DMARDs), is recommended as an option for treating active psoriatic arthritis in adults only if:
  - they have peripheral arthritis with 3 or more tender joints and 3 or more swollen joints **and**
  - their disease has not responded to adequate trials of at least 2 standard DMARDs, given either alone or in combination **and**
  - the manufacturer provides apremilast with the discount agreed in the patient access scheme.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA433](http://www.nice.org.uk/TA433)
- ▶ **Apremilast for treating moderate to severe plaque psoriasis (November 2016)** NICE TA419  
Apremilast is recommended as an option for treating chronic plaque psoriasis in patients whose disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA, or when these treatments are contra-indicated or not tolerated, only if:
  - the disease is severe, as defined by a total Psoriasis Area Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10 **and**
  - treatment is stopped if the psoriasis has not responded adequately at 16 weeks (defined as a 75% reduction in the PASI score (PASI 75) from when treatment started or a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from start of treatment), **and**
  - the manufacturer provides apremilast with the discount agreed in the patient access scheme.
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA419](http://www.nice.org.uk/TA419)

#### **Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (June 2015) that apremilast (Otezla®) is accepted for restricted use within NHS Scotland for the treatment of active psoriatic

arthritis in patients who have had an inadequate response with at least two prior Disease Modifying Antirheumatic Drug (DMARD) therapies or who are intolerant to such therapies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## 2 Hyperuricaemia and gout

### Gout

#### Overview

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack. The management of gout in adolescents requires specialist supervision.

#### Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac sodium p. 1135, diclofenac potassium p. 1135, etoricoxib p. 1139, indometacin p. 1143, ketoprofen p. 1144, naproxen p. 1148 or sulindac p. 1150. Colchicine below is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin p. 121 is *not* indicated in gout. Allopurinol p. 1121, febuxostat p. 1121, and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants.

Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute monoarticular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

Canakinumab p. 844, a recombinant monoclonal antibody, can be used for the symptomatic treatment of frequent gouty arthritis attacks (at least 3 in the previous 12 months). It is licensed for use in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.

#### Long-term control of gout

Frequent recurrence of acute attacks of gout, the presence of tophi, or signs of chronic gouty arthritis may call for the initiation of long-term ('interval') treatment. For long-term control of gout the formation of uric acid from purines may be reduced with the xanthine-oxidase inhibitors allopurinol or febuxostat alternatively the uricosuric drug sulfinpyrazone may be used to increase the excretion of uric acid in the urine. Treatment should be continued indefinitely to prevent further attacks of gout by correcting the hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore an anti-

inflammatory analgesic or colchicine should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is *not* indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Febuxostat is licensed for the treatment of chronic hyperuricaemia where urate deposition has already occurred; it is *not* indicated for patients in whom the rate of urate formation is greatly increased, such as in malignant disease or in Lesch-Nyhan syndrome.

Sulfinpyrazone can be used instead of allopurinol or in conjunction with it in cases that are resistant to treatment.

Benzbromarone (available from 'special-order' manufacturers or specialist importing companies) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline.

Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless *not* indicated in gout.

**Other drugs used for Hyperuricaemia and gout** Naproxen with esomeprazole, p. 1149

### ALKALOIDS > PLANT ALKALOIDS

#### Colchicine

##### • INDICATIONS AND DOSE

##### Acute gout

- ▶ BY MOUTH
- ▶ Adult: 500 micrograms 2–4 times a day until symptoms relieved, maximum 6 mg per course, do not repeat course within 3 days

##### Short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs

- ▶ BY MOUTH
- ▶ Adult: 500 micrograms twice daily

##### Prophylaxis of familial Mediterranean fever (recurrent polyserositis)

- ▶ BY MOUTH
- ▶ Adult: 0.5–2 mg once daily

##### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose by half with concurrent use of moderate inhibitors of CYP3A4.
- ▶ Manufacturer advises reduce dose by 75% (to one quarter of usual dose) with concurrent use of potent inhibitors of CYP3A4 or P-glycoprotein inhibitors; avoid concurrent use in patients with hepatic or renal impairment.

- **UNLICENSED USE** BNF doses may differ from those in the product literature. Use of colchicine for prophylaxis of familial Mediterranean fever (recurrent polyserositis) is an unlicensed indication.
- **CONTRA-INDICATIONS** Blood disorders
- **CAUTIONS** Cardiac disease · elderly · gastro-intestinal disease
- **INTERACTIONS** → Appendix 1: colchicine

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · diarrhoea · nausea · vomiting
- ▶ **Frequency not known** Agranulocytosis · alopecia · bone marrow disorders · gastrointestinal haemorrhage · kidney injury · liver injury · menstrual cycle irregularities · myopathy · nerve disorders · rash · sperm abnormalities · thrombocytopenia
- **PREGNANCY** Avoid—teratogenicity in *animal* studies.
- **BREAST FEEDING** Present in milk but no adverse effects reported. Manufacturers advise caution.
- **HEPATIC IMPAIRMENT** Use with caution.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.  
**Dose adjustments** Reduce dose or increase dosage interval if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## XANTHINE OXIDASE INHIBITORS

### Allopurinol

20-Aug-2018

#### ● INDICATIONS AND DOSE

**Prophylaxis of gout and of uric acid and calcium oxalate renal stones | Prophylaxis of hyperuricaemia associated with cancer chemotherapy**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 100 mg daily, for maintenance adjust dose according to plasma or urinary uric acid concentration, dose to be taken preferably after food

**Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in mild conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in mild conditions)**

##### ▶ BY MOUTH

- ▶ **Adult:** 100–200 mg daily, dose to be taken preferably after food

**Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in moderately severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in moderately severe conditions)**

##### ▶ BY MOUTH

- ▶ **Adult:** 300–600 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

**Prophylaxis of gout and of uric acid and calcium oxalate renal stones (usual maintenance in severe conditions) | Prophylaxis of hyperuricaemia associated with cancer chemotherapy (usual maintenance in severe conditions)**

##### ▶ BY MOUTH

- ▶ **Adult:** 700–900 mg daily in divided doses (max. per dose 300 mg), dose to be taken preferably after food

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately

- **CAUTIONS** Ensure adequate fluid intake (2–3 litres/day) · for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy

**CAUTIONS, FURTHER INFORMATION** Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine until at least 1 month after hyperuricaemia corrected (usually for first 3 months) to avoid precipitating an acute attack.

- **INTERACTIONS** → Appendix 1: allopurinol

### ● SIDE-EFFECTS

- ▶ **Common or very common** Rash (discontinue therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
- ▶ **Uncommon** Hypersensitivity · nausea · vomiting
- ▶ **Rare or very rare** Agranulocytosis · alopecia · angina pectoris · angioedema · angioimmunoblastic T-cell lymphoma · aplastic anaemia · asthenia · ataxia · boil · bradycardia · cataract · coma · depression · diabetes mellitus · drowsiness · erectile dysfunction · fever · gastrointestinal disorders · gynaecomastia · haemorrhage · hair colour changes · headache · hepatic disorders · hyperlipidaemia · hypertension · infertility male · maculopathy · malaise · oedema · paraesthesia · paralysis · peripheral neuropathy · severe cutaneous adverse reactions (SCARs) · skin reactions · stomatitis · taste altered · thrombocytopenia · vertigo · visual impairment
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **BREAST FEEDING** Present in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function periodically during early stages of therapy.  
**Dose adjustments** Manufacturer advises reduce dose.
- **RENAL IMPAIRMENT**  
**Dose adjustments** Max. 100 mg daily, increased only if response inadequate; in severe impairment, reduce daily dose below 100 mg, or increase dose interval; if facilities available, adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

## Febuxostat

27-Mar-2019

#### ● INDICATIONS AND DOSE

**Treatment of chronic hyperuricaemia in gout**

##### ▶ BY MOUTH

- ▶ **Adult:** Initially 80 mg once daily, if after 2–4 weeks of initial dose, serum uric acid greater than 6 mg/100 mL then increase dose; increased if necessary to 120 mg once daily

continued →

**Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematologic malignancies**

## ▶ BY MOUTH

- ▶ Adult: 120 mg once daily, to be started 2 days before start of cytotoxic therapy and continued for 7–9 days, according to chemotherapy duration

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS (JUNE 2012)**

There have been rare but serious reports of hypersensitivity reactions, including Stevens-Johnson syndrome and acute anaphylactic shock with febuxostat. Patients should be advised of the signs and symptoms of severe hypersensitivity; febuxostat must be stopped immediately if these occur (early withdrawal is associated with a better prognosis), and must not be restarted in patients who have ever developed a hypersensitivity reaction to febuxostat. Most cases occur during the first month of treatment; a prior history of hypersensitivity to allopurinol and/or renal disease may indicate potential hypersensitivity to febuxostat.

- **CONTRA-INDICATIONS** Not a treatment for acute gout but continue if attack develops when already receiving febuxostat, and treat attack separately
- **CAUTIONS** Congestive heart failure · ischaemic heart disease · thyroid disorders · transplant recipients
- CAUTIONS, FURTHER INFORMATION** Administer prophylactic NSAID (*not* aspirin or salicylates) or colchicine for at least 6 months after starting febuxostat to avoid precipitating an acute attack.
- **INTERACTIONS** → Appendix 1: febuxostat
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · gout aggravated · headache · hepatic disorders · nausea · oedema · skin reactions
  - ▶ **Uncommon** Altered smell sensation · appetite abnormal · arrhythmias · arthritis · bundle branch block · chest discomfort · cholelithiasis · constipation · cough · diabetes mellitus · dizziness · drowsiness · dry mouth · dyspnoea · fatigue · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · hemiparesis · hyperlipidaemia · hypertension · increased risk of infection · insomnia · joint disorders · muscle complaints · muscle weakness · musculoskeletal pain · nephrolithiasis · palpitations · proteinuria · renal failure · sensation abnormal · sexual dysfunction · taste altered · urinary disorders · vasodilation · vomiting · weight changes
  - ▶ **Rare or very rare** Alopecia · angioedema · hyperhidrosis · hypersensitivity · musculoskeletal stiffness · nephritis tubulointerstitial · nervousness · oral ulceration · pancreatitis · pancytopenia · rhabdomyolysis · severe cutaneous adverse reactions (SCARs) · thirst · thrombocytopenia · tinnitus · vision blurred
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. **Dose adjustments** Manufacturer advises max. 80 mg daily in mild impairment; no dose information available in moderate to severe impairment.
- **RENAL IMPAIRMENT** Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available.
- **PRE-TREATMENT SCREENING** Monitor liver function tests before treatment as indicated.
- **MONITORING REQUIREMENTS** Monitor liver function tests periodically during treatment as indicated.

**● NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ Febuxostat for the management of hyperuricaemia in patients with gout (December 2008) NICE TA164

Febuxostat (*Adenuric*<sup>®</sup>) is recommended as an option for the management of chronic hyperuricaemia in gout only for patients who are intolerant of allopurinol or for whom allopurinol is contra-indicated.

For the purposes of this guidance, intolerance of allopurinol is defined as adverse effects that are sufficiently severe to warrant discontinuation, or to prevent full dose escalation for optimal effectiveness.

[www.nice.org.uk/guidance/ta164](http://www.nice.org.uk/guidance/ta164)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 637/10

The *Scottish Medicines Consortium* has advised (September 2010) that febuxostat (*Adenuric*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of chronic hyperuricaemia when treatment with allopurinol is inadequate, not tolerated or contra-indicated.

SMC No. 1153/16

The *Scottish Medicines Consortium* has advised (June 2016) that febuxostat (*Adenuric*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the prevention and treatment of hyperuricaemia in patients undergoing chemotherapy for haematological malignancies at intermediate to high risk of tumour lysis syndrome, only when allopurinol is not tolerated or contra-indicated.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**▶ **Febuxostat (Non-proprietary)**

**Febuxostat 80 mg** Febuxostat 80mg tablets | 28 tablet **POm**

£24.36 DT = £24.36

## 3 Neuromuscular disorders

### Neuromuscular disorders

**Drugs that enhance neuromuscular transmission**

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 836 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

**Anticholinesterases**

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions,

increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 1334.

Neostigmine p. 1125 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 86 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

Pyridostigmine bromide p. 1126 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

#### Immunosuppressant therapy

**Corticosteroids** are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis.

In *generalised myasthenia gravis* prednisolone p. 678 is given. About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Smaller doses of corticosteroid are usually required in *ocular myasthenia*. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose.

In *generalised myasthenia gravis* azathioprine is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used. Cyclosporin p. 838, methotrexate p. 913, or mycophenolate mofetil p. 846 can be used in patients unresponsive or intolerant to other treatments [unlicensed indications].

#### Acetylcholine-release enhancers

Amifampridine p. 1126 is licensed for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS), a rare disorder of neuromuscular transmission.

Fampridine p. 850 is licensed for the improvement of walking in patients with Multiple sclerosis p. 848 who have a walking disability.

#### Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with Multiple sclerosis p. 848 or other neurological damage; they are not indicated for spasm associated with minor injuries. Baclofen, diazepam, and tizanidine act principally on the central nervous system. Dantrolene has a peripheral site of action; cannabis extract has both a central and a peripheral action. Skeletal muscle relaxants differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Baclofen p. 1128 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of

sedation and muscular hypotonia (other adverse events are uncommon).

A cannabis extract p. 1127 containing dronabinol (delta-9-tetrahydrocannabinol) and cannabidiol is licensed as an adjunct treatment for moderate to severe spasticity associated with Multiple sclerosis p. 848 in patients who have not responded adequately to other skeletal muscle relaxants. The dose should be titrated over 2 weeks; response to treatment should be reviewed after 4 weeks and treatment stopped if an adequate response is not achieved.

Dantrolene sodium p. 1346 acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

Diazepam p. 343 can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses.

Tizanidine p. 1129 is an alpha<sub>2</sub>-adrenoceptor agonist indicated for spasticity associated with Multiple sclerosis p. 848 or spinal cord injury.

#### Other muscle relaxants

The clinical efficacy of methocarbamol p. 1129 and meprobamate p. 346 as muscle relaxants is **not** well established, although they have been included in compound analgesic preparations.

## NEUROPROTECTIVE DRUGS

### Riluzole

07-Feb-2019

#### ● INDICATIONS AND DOSE

**To extend life in patients with amyotrophic lateral sclerosis, initiated by specialist experienced in the management of motor neurone disease**

- ▶ BY MOUTH
- ▶ Adult: 50 mg twice daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 1058

● **CAUTIONS** History of abnormal hepatic function (consult product literature for details) · interstitial lung disease

#### CAUTIONS, FURTHER INFORMATION

▶ Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.

● **INTERACTIONS** → Appendix 1: riluzole

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · pain · tachycardia · vomiting
- ▶ **Uncommon** Anaemia · angioedema · interstitial lung disease · pancreatitis
- ▶ **Frequency not known** Hepatitis · neutropenia

**SIDE-EFFECTS, FURTHER INFORMATION** White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

● **PREGNANCY** Avoid—no information available.

● **BREAST FEEDING** Avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid (risk of increased exposure).

● **RENAL IMPAIRMENT** Avoid—no information available.

#### ● PATIENT AND CARER ADVICE

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

**Driving and skilled tasks** Dizziness or vertigo may affect performance of skilled tasks (e.g. driving).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Guidance on the use of Riluzole (*Rilutek*®) for the treatment of Motor Neurone Disease (January 2001)** NICE TA20  
Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of Motor Neurone Disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.  
[www.nice.org.uk/guidance/ta20](http://www.nice.org.uk/guidance/ta20)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

#### Oral suspension

- ▶ **Teglutik** (Martindale Pharmaceuticals Ltd)  
Riluzole 5 mg per 1 ml Teglutik 5mg/1ml oral suspension sugar-free | 300 ml **[PoM]** £100.00 DT = £100.00

#### Tablet

- ▶ **Riluzole (Non-proprietary)**  
Riluzole 50 mg Riluzole 50mg tablets | 56 tablet **[PoM]** £320.00 DT = £12.08
- ▶ **Rilutek** (Sanofi)  
Riluzole 50 mg Rilutek 50mg tablets | 56 tablet **[PoM]** £320.33 DT = £12.08

## 3.1 Muscular dystrophy

### DRUGS FOR NEUROMUSCULAR DISORDERS

#### Ataluren

08-May-2019

- **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

#### ● INDICATIONS AND DOSE

**Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)**

- ▶ BY MOUTH
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: ataluren
- **SIDE-EFFECTS**
- ▶ **Common or very common** Appetite decreased · constipation · cough · enuresis · fever · flatulence · gastrointestinal discomfort · haemorrhage · headache · hypertension · hypertriglyceridaemia · nausea · pain · rash erythematous · vomiting · weight decreased
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and cholesterol and triglyceride concentrations at least annually.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises the contents of each sachet should be mixed with at least 30 mL of liquid (water, milk, fruit juice), or 3 tablespoons of semi-solid food (yoghurt or apple sauce).
- **PATIENT AND CARER ADVICE** Manufacturer advises patients should maintain adequate hydration during treatment.

**Missed doses** Manufacturer advises if a morning or midday dose is more than 3 hours late, or an evening dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Ataluren for treating Duchenne muscular dystrophy with a nonsense mutation in the dystrophin gene (July 2016)**

#### NICE HST3

Ataluren, within its marketing authorisation, is recommended for treating Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene in people aged 5 years and older who can walk, only when:

- the manufacturer provides ataluren with the discount agreed in the patient access scheme, **and**
- the conditions under which ataluren is made available are set out in the managed access agreement between the manufacturer and NHS England, which should include the conditions set out in sections 5.12–5.15 and 5.23 of the guidance.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/HST3](http://www.nice.org.uk/guidance/HST3)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2016) that ataluren (*Translarna*®) is **not** recommended for use within NHS Scotland for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older as the economic case was not demonstrated.

#### All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 940

The *All Wales Medicines Strategy Group* has advised (August 2016) that the NICE HST advice for ataluren (*Translarna*®) for the treatment of Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients aged 5 years and older should be implemented within NHS Wales.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Granules

- ▶ **Translarna** (PTC Therapeutics Ltd) ▼
- Ataluren 125 mg** Translarna 125mg granules for oral suspension sachets | 30 sachet **[PoM]** £2,532.00
- Ataluren 250 mg** Translarna 250mg granules for oral suspension sachets | 30 sachet **[PoM]** £5,064.00
- Ataluren 1 gram** Translarna 1,000mg granules for oral suspension sachets | 30 sachet **[PoM]** £20,256.00

## Nusinersen

31-Aug-2018

● **DRUG ACTION** Nusinersen is an antisense oligonucleotide that increases the production of survival motor neurone (SMN) protein, thereby helping to compensate for the defect in the SMN1 gene found in 5q spinal muscular atrophy.

### ● INDICATIONS AND DOSE

#### 5q spinal muscular atrophy (initiated by a specialist)

##### ► BY INTRATHECAL INJECTION

● **Adult:** Initially 12 mg for 4 doses, on days 0, 14, 28 and 63, then 12 mg every 4 months, for advice on missed doses—consult product literature

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: NUSINERSEN (SPINRAZA®): REPORTS OF COMMUNICATING HYDROCEPHALUS NOT RELATED TO MENINGITIS OR BLEEDING (JULY 2018)

Communicating hydrocephalus not related to meningitis or bleeding has been reported in patients treated with *Spinraza*®. Patients and caregivers should be informed about the signs and symptoms of hydrocephalus before *Spinraza*® is started and should be instructed to seek medical attention in case of: persistent vomiting or headache, unexplained decrease in consciousness, and in children increase in head circumference. Patients with signs and symptoms suggestive of hydrocephalus should be further investigated by a physician with expertise in its management.

- **CAUTIONS** Risk factors for renal toxicity—monitor urine protein (preferably using a first morning urine specimen) - risk factors for thrombocytopenia and coagulation disorders—monitor platelet and coagulation profile before treatment
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C); may be stored (in the original carton, protected from light) at or below 30 °C, for up to 14 days.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► *Spinraza* (Biogen Idec Ltd) ▼

Nusinersen (as Nusinersen sodium) 2.4 mg per 1 ml *Spinraza* 12mg/5ml solution for injection vials | 1 vial [POM](#) £75,000.00

## 3.2 Myasthenia gravis and Lambert-Eaton myasthenic syndrome

### ANTICHOLINESTERASES

## Anticholinesterases

- **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.
- **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction
- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by

injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia

- **SIDE-EFFECTS** Abdominal cramps · diarrhoea · excessive tearing · hypersalivation · nausea · vomiting

**Overdose** Signs of overdose include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

above

## Neostigmine

### (Neostigmine methylsulfate)

### ● INDICATIONS AND DOSE

#### Treatment of myasthenia gravis

##### ► BY MOUTH

● **Adult:** Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

##### ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

● **Adult:** 1–2.5 mg, dose repeated at suitable intervals throughout the day (usual total daily dose 5–20 mg)

#### Reversal of non-depolarising (competitive) neuromuscular blockade

##### ► BY INTRAVENOUS INJECTION

● **Adult:** 2.5 mg (max. per dose 5 mg), repeated if necessary after or with glycopyrronium or atropine, to be given over 1 minute

### ● CAUTIONS

► With intravenous use glycopyrronium or atropine should also be given when reversing neuromuscular blockade

● **INTERACTIONS** → Appendix 1: neostigmine

### ● SIDE-EFFECTS

► With parenteral use Intestinal hypermotility · muscle spasms

### ● RENAL IMPAIRMENT

Dose adjustments May need dose reduction.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Solution for injection

##### ► Neostigmine (Non-proprietary)

Neostigmine metilsulfate 2.5 mg per 1 ml Neostigmine 2.5mg/1ml solution for injection ampoules | 10 ampoule [POM](#) £5.45-£7.72 DT = £6.13

#### Tablet

##### ► Neostigmine (Non-proprietary)

Neostigmine bromide 15 mg Neostigmine 15mg tablets | 140 tablet [POM](#) £120.52 DT = £120.52

10

Musculoskeletal system

## Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

### ● INDICATIONS AND DOSE

#### Myasthenia gravis

- ▶ INITIALLY BY MOUTH
- ▶ Adult: 30–120 mg, doses to be given at suitable intervals throughout day; (by mouth) usual dose 0.3–1.2 g daily in divided doses, it is inadvisable to exceed a total daily dose of 450 mg in order to avoid acetylcholine receptor down-regulation; patients requiring doses exceeding 450 mg daily will usually require input from a specialised neuromuscular service. Immunosuppressant therapy is usually considered if the dose of pyridostigmine exceeds 360 mg daily

- **INTERACTIONS** → Appendix 1: pyridostigmine
- **SIDE-EFFECTS** Gastrointestinal hypermotility · muscle cramps · rash
- **RENAL IMPAIRMENT**  
**Dose adjustments** Reduce dose; excreted by kidney.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

#### Tablet

- ▶ **Pyridostigmine bromide (Non-proprietary)**  
**Pyridostigmine bromide 60 mg** Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.48 DT = £44.30
- ▶ **Mestinon** (Meda Pharmaceuticals Ltd)  
**Pyridostigmine bromide 60 mg** Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT = £44.30

## CHOLINERGIC RECEPTOR STIMULATING DRUGS

### Amifampridine

27-Apr-2019

### ● INDICATIONS AND DOSE

#### Symptomatic treatment of Lambert-Eaton myasthenic syndrome (specialist use only)

- ▶ BY MOUTH
- ▶ Adult: Initially 15 mg daily in 3 divided doses, then increased in steps of 5 mg every 4–5 days, increased to up to 60 mg daily in 3–4 divided doses (max. per dose 20 mg); maximum 60 mg per day

- **CONTRA-INDICATIONS** Congenital QT syndromes · epilepsy · uncontrolled asthma
- **CAUTIONS** Non-paraneoplastic form of Lambert-Eaton myasthenic syndrome
- **INTERACTIONS** → Appendix 1: amifampridine
- **SIDE-EFFECTS** Anxiety · arrhythmia · asthenia · asthma · bronchial secretion increased · cough · dizziness · drowsiness · gastrointestinal disorder · headache · movement disorders · palpitations · paraesthesia · Raynaud's phenomenon · seizure · sleep disorder · vision blurred
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased exposure).  
**Dose adjustments** Manufacturer advises initial dose reduction to 5 mg twice daily in mild impairment, titrate in steps of 5 mg every 7 days.

Manufacturer advises initial dose reduction to 5 mg once daily in moderate to severe impairment, titrate in steps of 5 mg every 7 days.

- **RENAL IMPAIRMENT** Use with caution.  
**Dose adjustments** In mild impairment reduce initial dose to 10 mg daily in divided doses, increased in steps of 5 mg every 7 days.  
In moderate or severe impairment reduce initial dose to 5 mg daily in divided doses, increased in steps of 5 mg every 7 days.
- **MONITORING REQUIREMENTS** Clinical and ECG monitoring required at treatment initiation and yearly thereafter.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) decisions**  
SMC No. 660/10  
The *Scottish Medicines Consortium* has advised (August 2012) that amifampridine phosphate (*Firdapse*®) is **not** recommended for use within NHS Scotland for the symptomatic treatment of Lambert-Eaton myasthenic syndrome (LEMS).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 21

- ▶ **Firdapse** (BioMarin Europe Ltd) ▼

**Amifampridine (as Amifampridine phosphate) 10 mg** Firdapse 10mg tablets | 100 tablet [PoM] £1,815.00

## 3.3 Myotonic disorders

### DRUGS FOR NEUROMUSCULAR DISORDERS

#### Mexiletine

25-Mar-2019

- **DRUG ACTION** Mexiletine is a sodium channel blocker which reduces the delay of muscle relaxation thereby decreasing muscle stiffness.

### ● INDICATIONS AND DOSE

#### Myotonia in non-dystrophic myotonic disorders

- ▶ BY MOUTH
- ▶ Adult: 167 mg once daily for at least 1 week, then increased if necessary to 333 mg daily in divided doses for at least 1 week, then increased if necessary to 500 mg daily in divided doses; maintenance 167–500 mg daily; maximum 500 mg per day

- **CONTRA-INDICATIONS** Abnormal Q-waves · atrial tachyarrhythmia, fibrillation or flutter · complete heart block or any heart block susceptible to evolve to complete heart block · heart failure (with ejection fraction less than 50%) · history of myocardial infarction · sinus node dysfunction · symptomatic coronary artery disease · ventricular tachyarrhythmia
- **CAUTIONS** Cardiac disorders other than those contra-indicated · epilepsy (increased risk of seizures)
- **INTERACTIONS** → Appendix 1: mexiletine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · arrhythmias · asthenia · chest discomfort · drowsiness · headache · hypotension · insomnia · malaise · nausea · pain in extremity · paraesthesia · skin reactions · vasodilation · vertigo · vision disorders
  - ▶ **Uncommon** Seizure · speech disorder
  - ▶ **Rare or very rare** Hepatic disorders · severe cutaneous adverse reactions (SCARs)
  - ▶ **Frequency not known** Atrioventricular block · circulatory collapse · confusion · diarrhoea · gastrointestinal disorders · hallucination · leucopenia · lupus-like syndrome ·

pulmonary fibrosis · taste altered · thrombocytopenia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises evaluation and correction of electrolytes prior to therapy initiation, with monitoring continued throughout treatment with mexiletine, due to possible proarrhythmic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Manufacturer advises avoid if hypersensitivity to any local anaesthetic.
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in human milk and insufficient information on the effects in infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild or moderate impairment; avoid in severe impairment (limited information available).  
**Dose adjustments** Manufacturer advises any dose increase should only be made after at least 2 weeks of treatment in mild or moderate impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment (limited information available).
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises cardiac evaluation before starting treatment, within 48 hours of starting treatment, and during treatment (consult product literature).
  - ▶ Manufacturer advises monitor electrolytes before starting treatment and during treatment—imbalances should be corrected.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises capsules should be swallowed whole with water, while in an upright position. If digestive intolerance occurs, capsules should be taken during a meal.
- **PRESCRIBING AND DISPENSING INFORMATION** The manufacturer of *Namuscla*<sup>®</sup> has provided a *Guide for Healthcare Professionals*.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be informed about the presenting symptoms of arrhythmias (e.g. fainting, palpitation, chest pain, shortness of breath, light-headedness, lipothymia, and syncope) and advised to seek immediate medical attention if symptoms develop. Alert card An alert card should be provided.  
**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue, confusion, and blurred vision.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- ▶ **Namuscla** (Lupin Healthcare (UK) Ltd)  
Mexiletine hydrochloride 167 mg Namuscla 167mg capsules | 100 capsule [POM] £5,000.00

## 3.4 Nocturnal leg cramps

### Nocturnal leg cramps

#### Quinine salts

Quinine salts p. 619, such as quinine sulfate are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients; however, because of potential toxicity, quinine is not recommended for routine treatment and should not be used unless cramps cause regular disruption to sleep. Quinine should only be considered when cramps are very painful or frequent; when other treatable causes of cramp have been excluded; and when non-

pharmacological treatments have not worked (e.g. passive stretching exercises). It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. In patients taking quinine long term, a trial discontinuation may be considered. Quinine is toxic in overdosage and accidental fatalities have occurred.

## 3.5 Spasticity

**Other drugs used for Spasticity** Dantrolene sodium, p. 1346  
· Diazepam, p. 343

### CANNABINOIDS

#### Cannabis extract

26-Jun-2018

##### ● INDICATIONS AND DOSE

**Adjunct in moderate to severe spasticity in multiple sclerosis (specialist use only)**

- ▶ BY BUCCAL ADMINISTRATION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Family history of psychosis · history of other severe psychiatric disorder · personal history of psychosis
- **CAUTIONS** History of epilepsy · significant cardiovascular disease
- **INTERACTIONS** → Appendix 1: cannabis extract
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Appetite abnormal · balance impaired · concentration impaired · constipation · depression · diarrhoea · disorientation · dizziness · drowsiness · dry mouth · dysarthria · euphoric mood · feeling drunk · malaise · memory loss · nausea · oral disorders · perception altered · taste altered · vertigo · vision blurred · vomiting
  - ▶ **Uncommon** Abdominal pain upper · delusions · hallucinations · hypertension · palpitations · paranoia · pharyngitis · suicidal ideation · syncope · tachycardia · throat irritation · tooth discolouration
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 3 months after treatment in men and women.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment (risk of accumulation with chronic dosing)—no information available.
- **RENAL IMPAIRMENT**  
**Monitoring** Manufacturer advises more frequent monitoring in significant renal impairment—possible risk of prolonged or enhanced effect.
- **MONITORING REQUIREMENTS** Monitor oral mucosa—interrupt treatment if lesions or persistent soreness.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including cannabis, see Drugs and driving under Guidance on prescribing p. 1.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Spray

EXCIPIENTS: May contain Propylene glycol

- ▶ **Sativex** (Bayer Plc)

**Cannabidiol 2.5 mg per 1 dose, Dronabinol 2.7 mg per**

**1 dose** Sativex oromucosal spray | 270 dose **[PoM]** £375.00 DT = £375.00 **[CD4-3]**

## MUSCLE RELAXANTS > MUSCLE RELAXANTS, CENTRALLY ACTING

### Baclofen

05-Jun-2018

#### ● INDICATIONS AND DOSE

##### Pain of muscle spasm in palliative care

▶ BY MOUTH

- ▶ Adult: 5–10 mg 3 times a day

##### Hiccup due to gastric distension in palliative care

▶ BY MOUTH

- ▶ Adult: 5 mg twice daily

##### Chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

▶ BY MOUTH

- ▶ Adult: Initially 5 mg 3 times a day, gradually increased; maintenance up to 60 mg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 100 mg per day

##### Severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures (specialist use only)

▶ BY INTRATHECAL INJECTION

- ▶ Adult: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not given more often than every 24 hours to determine appropriate dose, then *dose-titration phase*, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1.4 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis

#### IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

#### ● CONTRA-INDICATIONS

- ▶ With intrathecal use Local infection · systemic infection
- ▶ With oral use avoid oral route in active peptic ulceration

#### ● CAUTIONS

**GENERAL CAUTIONS** Cerebrovascular disease · diabetes · elderly · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · Parkinson's disease · psychiatric illness · respiratory impairment

#### SPECIFIC CAUTIONS

- ▶ With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

- **INTERACTIONS** → Appendix 1: baclofen

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Confusion · constipation · depression · diarrhoea · dizziness · drowsiness · dry mouth · euphoric mood · hallucination · headache · hyperhidrosis · hypotension · nausea · paraesthesia · skin reactions · urinary disorders · vision disorders · vomiting
- ▶ **Uncommon** Bradycardia · hypothermia
- ▶ **Rare or very rare** Withdrawal syndrome

##### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intrathecal use Anxiety · appetite decreased · asthenia · chills · dyspnoea · fever · hypersalivation · insomnia · neuromuscular dysfunction · oedema · pain · pneumonia · respiratory disorders · seizure · sexual dysfunction
- ▶ With oral use Fatigue · gastrointestinal disorder · muscle weakness · myalgia · respiratory depression · sleep disorders
- ▶ **Uncommon**
- ▶ With intrathecal use Alopecia · deep vein thrombosis · dehydration · flushing · hypertension · hypogeusia · ileus · memory loss · pallor · paranoia · suicidal tendencies
- ▶ **Rare or very rare**
- ▶ With oral use Abdominal pain · erectile dysfunction · hepatic function abnormal · taste altered
- ▶ **Frequency not known**
- ▶ With intrathecal use Scoliosis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal studies*).

- **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

#### ● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises use with caution—no information available.

#### ● RENAL IMPAIRMENT Excreted by the kidney.

**Dose adjustments** ▶ With oral use Risk of toxicity—use smaller doses (e.g. 5 mg daily by mouth) and if necessary increase dosage interval; if eGFR less than 15 mL/minute/1.73 m<sup>2</sup> manufacturer advises use by mouth only if potential benefit outweighs risk.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

**Palliative care** For further information on the use of baclofen in palliative care, see [www.medicinescomplete.com/#/content/palliative/baclofen](http://www.medicinescomplete.com/#/content/palliative/baclofen).

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

#### Tablet

CAUTIONARY AND ADVISORY LABELS 2, 8, 21

**Tizanidine****INDICATIONS AND DOSE****Spasticity associated with multiple sclerosis or spinal cord injury or disease**

## ▶ BY MOUTH

- ▶ **Adult:** Initially 2 mg daily, then increased in steps of 2 mg daily in divided doses, increased at intervals of at least 3–4 days and adjust according to response; usual dose up to 24 mg daily in 3–4 divided doses; maximum 36 mg per day

● **CAUTIONS** Elderly● **INTERACTIONS** → Appendix 1: tizanidine● **SIDE-EFFECTS**

- ▶ **Common or very common** Arrhythmias · dizziness · drowsiness · dry mouth · fatigue · hypotension · rebound hypertension
- ▶ **Rare or very rare** Gastrointestinal disorder · hallucination · hepatic disorders · muscle weakness · nausea · sleep disorders
- ▶ **Frequency not known** Abdominal pain · accommodation disorder · anxiety · appetite decreased · confusion · headache · QT interval prolongation · skin reactions · vomiting · withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if liver enzymes are persistently raised—consult product literature.

- **PREGNANCY** Avoid (toxicity in *animal studies*).
- **BREAST FEEDING** Avoid (present in milk in *animal studies*).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in significant impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Monitor liver function monthly for first 4 months for daily doses of 12 mg or higher, and in those who develop unexplained nausea, anorexia or fatigue.
- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of rebound hypertension and tachycardia); to minimise risk, discontinue gradually and monitor blood pressure.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

## 4 Pain and inflammation in musculoskeletal disorders

### Low back pain and sciatica

08-Mar-2017

#### Description of condition

Low back pain is pain in the lumbosacral area of the back. It can be described as *non-specific, mechanical, musculoskeletal* or *simple* (if it is not associated with serious or potentially serious causes). Episodes of back pain do not usually last long, with rapid improvements in pain and disability seen within a few weeks to months.

Sciatica (*radicular pain* or *radiculopathy*) is neuropathic leg pain secondary to compressive lumbosacral nerve root pathology.

#### Non-drug treatment

**EvGr** Exercise programmes, manual therapy, and psychological therapies should be considered for managing low back pain with or without sciatica.

Spinal decompression may be considered in patients with sciatica when pain and function has not improved with non-surgical treatment (including drug treatment). **A**

#### Drug treatment

**EvGr** An oral NSAID (see Non-steroidal anti-inflammatory drugs below) should be considered for managing acute low back pain, taking into consideration the gastro-intestinal, cardio-renal and hepatic risks associated with NSAIDs; as well as the need for continued monitoring, and the possible need for gastroprotective treatment (see *NSAID-associated ulcers* under Peptic ulceration p. 72).

A weak opioid, either alone or with paracetamol p. 444, can be used to manage acute low back pain only if an NSAID is contra-indicated, not tolerated or ineffective (see *Opioid analgesics* under Analgesics p. 442). Paracetamol alone is ineffective for managing low back pain. **A**

**EvGr** Benzodiazepines are sometimes used to manage acute low back pain (particularly in loss of lordosis); however evidence to support their use is very weak. **E**

**EvGr** In patients with chronic low back pain who have had an inadequate response to non-drug treatment, NSAIDs should be considered as first-line therapy. Opioids should be the last treatment option considered and should be considered only in patients for whom other therapies have failed and only if the potential benefits outweigh the risks for individual patients. If indicated, opioids should only be prescribed for a limited period of time. Long term opioid therapy should be avoided.

Selective serotonin re-uptake inhibitors (SSRIs), serotonin and noradrenaline re-uptake inhibitors (SNRIs), tricyclic antidepressants, and antiepileptic drugs should **not** be offered for managing low back pain.

When non-surgical treatment is ineffective in patients with moderate and severe localised back pain arising from structures supplied by the medial branch nerve, radiofrequency denervation can be considered. **A**

#### Sciatica

Patients with sciatica may require specific treatment for Neuropathic pain p. 483.

**EvGr** Patients with acute and severe sciatica may benefit from treatment with epidural injections of local anaesthetic and/or corticosteroid. **A**

#### Useful Resources

Low back pain and sciatica. National Institute for Health and Care Excellence. Clinical guideline NG59. November 2016. [www.nice.org.uk/guidance/ng59](http://www.nice.org.uk/guidance/ng59)

## Non-steroidal anti-inflammatory drugs

05-Jun-2017

### Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 444, but paracetamol is preferred, particularly in the elderly.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

### Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastrointestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen p. 1141 is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. It is unsuitable for conditions where inflammation is prominent, such as acute gout. Dexibuprofen p. 1133 is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen p. 1148 is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen).

Flurbiprofen p. 1140 may be slightly more effective than naproxen, and is associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen p. 1144 has anti-inflammatory properties similar to ibuprofen and has more side-effects.

Dexketoprofen p. 1134, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenac p. 1152 is as effective as naproxen; it has more side-effects than ibuprofen.

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac sodium p. 1135 and aceclofenac p. 1132 are similar in efficacy to naproxen.

Etodolac p. 1138 is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin p. 1143 has an action equal to or superior to that of naproxen, but with a high incidence of side-effects

including headache, dizziness, and gastro-intestinal disturbances.

Mefenamic acid p. 1145 has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam p. 1146 is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone p. 1147 is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam p. 1149 is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Sulindac p. 1150 is similar in tolerance to naproxen.

Tenoxicam p. 1151 is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid p. 476 is licensed for the treatment of migraine.

Ketorolac trometamol p. 1342 and the selective inhibitor of cyclo-oxygenase-2, parecoxib p. 1342, are licensed for the short-term management of postoperative pain.

The selective inhibitors of cyclo-oxygenase-2, etoricoxib p. 1139 and celecoxib p. 1132, are as effective as non-selective NSAIDs such as diclofenac sodium and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Aspirin p. 121 has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

#### Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen, diclofenac sodium, and diclofenac potassium p. 1135.

#### Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen **and** others) purchased over the counter.

#### NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. Although there are limited data regarding the thrombotic effects of aceclofenac, treatment advice has been updated in line with diclofenac, based on aceclofenac's structural similarity to diclofenac and its metabolism to diclofenac. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic

risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

#### NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam, ketoprofen, and ketorolac trometamol are associated with the highest risk; indometacin p. 1143, diclofenac, and naproxen p. 1148 are associated with intermediate risk, and ibuprofen p. 1141 with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose* **and** not to use more than one oral NSAID at a time.

The combination of a NSAID **and** low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary **and** the patient should be monitored closely.

While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness.

Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment.

Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

#### NSAIDs and alcohol

Alcohol increases the risk of gastro-intestinal haemorrhage associated with NSAIDs. Specialist sources recommend that concurrent use need not be avoided with moderate alcohol intake, but greater caution is warranted in those who drink more than the recommended daily limits.

Some cases of acute kidney injury have been attributed to use of NSAIDs and acute excessive alcohol consumption.

#### Advanced Pharmacy Services

Patients taking NSAIDs may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Guidance on prescribing p. 1.

**Other drugs used for Pain and inflammation in musculoskeletal disorders** Tramadol with dextketoprofen, p. 474

## ANALGESICS &gt; NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

## Aceclofenac

01-Jun-2016

## ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis**

## ▶ BY MOUTH

▶ Adult: 100 mg twice daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild heart failure · peripheral arterial disease · severe heart failure
- **CAUTIONS** Allergic disorders · avoid in Acute porphyrias p. 1058 · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Diarrhoea · dizziness · gastrointestinal discomfort · nausea
  - ▶ **Uncommon** Constipation · gastrointestinal disorders · oral disorders · skin reactions · vomiting
  - ▶ **Rare or very rare** Anaemia · angioedema · bone marrow disorders · depression · drowsiness · dyspnoea · fatigue · haemolytic anaemia · haemorrhage · headache · heart failure · hepatic disorders · hyperkalaemia · hypersensitivity · hypertension · inflammatory bowel disease · leg cramps · nephrotic syndrome · neutropenia · oedema · palpitations · pancreatitis · paraesthesia · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · severe cutaneous adverse reactions (SCARs) · sleep disorders · taste altered · thrombocytopenia · tinnitus · tremor · vasculitis · vasodilation · vertigo · visual impairment · weight increased
  - ▶ **Frequency not known** Acute coronary syndrome · agranulocytosis · asthma · confusion · hallucination · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · optic neuritis · photosensitivity reaction · platelet aggregation inhibition · respiratory tract reaction
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the

potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in hepatic failure. **Dose adjustments** Manufacturer advises consider initial dose reduction to 100 mg daily in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution; avoid in moderate to severe impairment. **Dose adjustments** The lowest effective dose should be used for the shortest possible duration. **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## Celecoxib

02-Jun-2017

## ● INDICATIONS AND DOSE

**Pain and inflammation in osteoarthritis**

## ▶ BY MOUTH

▶ Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

**Pain and inflammation in rheumatoid arthritis**

## ▶ BY MOUTH

▶ Adult: 100 mg twice daily, then increased if necessary to 200 mg twice daily, discontinue if no improvement after 2 weeks on maximum dose

**Ankylosing spondylitis**

## ▶ BY MOUTH

▶ Adult: 200 mg daily in 1–2 divided doses, then increased if necessary up to 400 mg daily in 1–2 divided doses, discontinue if no improvement after 2 weeks on maximum dose

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

▶ Manufacturer advises reduce dose by half with concurrent use of fluconazole.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1: NSAIDs

### ● SIDE-EFFECTS

- ▶ **Common or very common** Angina pectoris · benign prostatic hyperplasia · cough · diarrhoea · dizziness · dysphagia · dyspnoea · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headache · hypersensitivity · hypertension · increased risk of infection · influenza like illness · injury · insomnia · irritable bowel syndrome · joint disorders · muscle tone increased · myocardial infarction · nausea · nephrolithiasis · oedema · skin reactions · vomiting · weight increased
- ▶ **Uncommon** Anaemia · anxiety · arrhythmias · breast tenderness · burping · cerebral infarction · chest pain · conjunctivitis · constipation · depression · drowsiness · dysphonia · electrolyte imbalance · embolism and thrombosis · fatigue · haemorrhage · hearing impairment · heart failure · hepatic disorders · lipoma · lower limb fracture · muscle complaints · nocturia · oral disorders · palpitations · paraesthesia · respiratory disorders · tinnitus · vision blurred · vitreous floater
- ▶ **Rare or very rare** Acute kidney injury (more common in patients with pre-existing renal impairment) · alopecia · angioedema · anosmia · ataxia · confusion · flushing · hallucination · intracranial haemorrhage · leucopenia · meningitis aseptic · menstrual disorder · myositis · nephritis tubulointerstitial · nephropathy · pancreatitis · pancytopenia · photosensitivity reaction · seizures · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vasculitis
- ▶ **Frequency not known** Infertility

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

Contra-indicated in patients with sulfonamide sensitivity.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies).
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).  
**Dose adjustments** Manufacturer advises initial dose reduction of 50% in moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.  
**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.  
**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before and during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Dexibuprofen

21-May-2018

### ● INDICATIONS AND DOSE

#### Osteoarthritis

##### ▶ BY MOUTH

- ▶ **Adult:** 600–900 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg)

#### Dysmenorrhoea

##### ▶ BY MOUTH

- ▶ **Adult:** 600–900 mg daily in up to 3 divided doses (max. per dose 400 mg)

#### Mild-to-moderate pain

##### ▶ BY MOUTH

- ▶ **Adult:** 600 mg daily in up to 3 divided doses; increased if necessary up to 1200 mg daily (max. per dose 400 mg), higher dose for short-term use for acute pain

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · congestive heart failure · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

#### CAUTIONS, FURTHER INFORMATION

- ▶ High-dose dexibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose dexibuprofen ( $\geq 1.2$  g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

- **INTERACTIONS** → Appendix 1: NSAIDs

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · dizziness · drowsiness · fatigue · gastrointestinal discomfort · headache · nausea · skin reactions · vertigo · vomiting
- ▶ **Uncommon** Angioedema · anxiety · gastrointestinal disorders · haemorrhage · increased risk of infection · insomnia · oral disorders · respiratory disorders · tinnitus · vasculitis · vision disorders
- ▶ **Rare or very rare** Agranulocytosis · alopecia · asthma · blood disorder · bone marrow disorders · confusion · constipation · depression · fever · granulocytopenia · haemolytic anaemia · hearing impairment · hepatic disorders · hypersensitivity · hypotension · inflammatory bowel disease · irritability · leucopenia · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · psychotic disorder · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · shock · tachycardia · thrombocytopenia
- ▶ **Frequency not known** Fluid retention · generalised oedema · glomerulonephritis · increased risk of arterial

thromboembolism · renal impairment · renal papillary necrosis

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk—but risk to infant minimal.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. **Dose adjustments** Manufacturer advises initial dose reduction in mild to moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. **Monitoring** Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure. **Dose adjustments** Reduce initial dose. The lowest effective dose should be used for the shortest possible duration.

**Acute exacerbations of pain**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg 1–2 times a day for maximum 2 days, twice daily administration in severe cases, to be injected into the gluteal muscle

**Ureteric colic**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult: 75 mg, then 75 mg after 30 minutes if required

**Acute postoperative pain (in hospital setting)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 75 mg, then 75 mg after 4–6 hours if required for maximum 2 days; maximum 150 mg per day

**Prevention of postoperative pain (in hospital setting)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 25–50 mg, to be given after surgery over 15–60 minutes, then 5 mg/hour for maximum 2 days; maximum 150 mg per day

**● CONTRA-INDICATIONS**

- ▶ With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage
- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

**● CAUTIONS**

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

**● INTERACTIONS** → Appendix 1: NSAIDs**● SIDE-EFFECTS****▶ Common or very common**

- ▶ With systemic use Appetite decreased · diarrhoea · dizziness · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · oedema · rash (discontinue) · skin reactions · vertigo · vomiting
- ▶ With topical use Conjunctivitis · muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions · skin ulcer

**▶ Uncommon**

- ▶ With systemic use Chest pain · heart failure · myocardial infarction · palpitations
- ▶ With topical use Abdominal pain · alopecia · diarrhoea · eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea

**▶ Rare or very rare**

- ▶ With rectal use Ulcerative colitis aggravated
- ▶ With systemic use Acute kidney injury · agranulocytosis · alopecia · anaemia · angioedema · anxiety · aplastic anaemia · asthma · chest pain · confusion · constipation · depression · drowsiness · dyspnoea · erectile dysfunction · fatigue · haemolytic anaemia · haemorrhage · hearing impairment · heart failure · hepatic disorders · hypersensitivity · hypertension · hypotension · irritability · leucopenia · memory loss · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · myocardial infarction · nephritis tubulointerstitial · nephrotic syndrome · oesophageal disorder · oral disorders · palpitations · pancreatitis · photosensitivity reaction · pneumonitis · proteinuria · psychotic disorder · renal papillary necrosis · seizure · sensation abnormal · severe cutaneous adverse reactions (SCARs) · shock · sleep disorders · stroke · taste altered · thrombocytopenia · tinnitus · tremor · vasculitis · vision disorders
- ▶ With topical use Acute kidney injury · asthma · hypersensitivity · photosensitivity reaction · rash pustular
- ▶ **Frequency not known**
- ▶ With parenteral use Injection site necrosis

- ▶ With systemic use Fertility decreased female · fluid retention · hallucination · malaise · optic neuritis · platelet aggregation inhibition
- ▶ With topical use Hair colour changes

**SIDE-EFFECTS, FURTHER INFORMATION** Topical application of large amounts of diclofenac can result in systemic effects.

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

#### ● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

#### ● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

#### ● BREAST FEEDING

- ▶ With systemic use Use with caution during breast-feeding. Amount in milk too small to be harmful.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

#### ● HEPATIC IMPAIRMENT

- ▶ With systemic use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

#### ● RENAL IMPAIRMENT

- ▶ With systemic use Avoid if possible or use with caution. Avoid in severe impairment.
- ▶ With intravenous use Avoid intravenous use if serum creatinine greater than 160 micromol/litre. Contra-indicated in moderate or severe renal impairment.
- Dose adjustments** ▶ With systemic use The lowest effective dose should be used for the shortest possible duration.
- Monitoring** ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Voltarol®)*, give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution). For intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes. For continuous infusion give at a rate of 5 mg/hour.
- ▶ With topical use For topical preparations, apply with gentle massage only.

#### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With oral use *Voltarol®* dispersible tablets are more suitable for **short-term** use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months).

- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use. Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

#### ● PROFESSIONAL SPECIFIC INFORMATION

##### Dental practitioners' formulary

Diclofenac Sodium Tablets may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

##### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Dicloflex 75mg SR** (Dexel-Pharma Ltd)

Diclofenac sodium 75 mg Dicloflex 75mg SR tablets | 28 tablet [PoM] £9.00 | 56 tablet [PoM] £17.56 DT = £8.06

##### Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

- ▶ **Diclofenac sodium (Non-proprietary)**

Diclofenac sodium 25 mg Diclofenac sodium 25mg gastro-resistant tablets | 28 tablet [PoM] £3.87-£8.99 DT = £1.77 | 84 tablet [PoM] £1.50-£26.97

Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 28 tablet [PoM] £4.97 DT = £1.89 | 84 tablet [PoM] £2.48-£15.00

- ▶ **Dicloflex** (Dexel-Pharma Ltd)

Diclofenac sodium 25 mg Dicloflex 25mg gastro-resistant tablets | 84 tablet [PoM] £4.42

Diclofenac sodium 50 mg Dicloflex 50mg gastro-resistant tablets | 28 tablet [PoM] £2.75 DT = £1.89 (Hospital only) | 84 tablet [PoM] £8.05

- ▶ **Fenactol** (Discovery Pharmaceuticals)

Diclofenac sodium 50 mg Fenactol 50mg gastro-resistant tablets | 100 tablet [PoM] £3.70

##### Suppository

- ▶ **Econac** (Advanz Pharma)

Diclofenac sodium 100 mg Econac 100mg suppositories | 10 suppository [PoM] £3.04 DT = £3.64

- ▶ **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 12.5 mg Voltarol 12.5mg suppositories | 10 suppository [PoM] £0.70 DT = £0.70

Diclofenac sodium 25 mg Voltarol 25mg suppositories | 10 suppository [PoM] £1.24 DT = £1.24

Diclofenac sodium 50 mg Voltarol 50mg suppositories | 10 suppository [PoM] £2.04 DT = £2.04

Diclofenac sodium 100 mg Voltarol 100mg suppositories | 10 suppository [PoM] £3.64 DT = £3.64

##### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

- ▶ **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 25 mg per 1 mL Voltarol 75mg/3ml solution for injection ampoules | 10 ampoule [PoM] £9.91 DT = £9.91

##### Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21 (does not apply to Motifene® 75 mg), 25

EXCIPIENTS: May contain Propylene glycol

- ▶ **Diclomax Retard** (Galen Ltd)

Diclofenac sodium 100 mg Diclomax Retard 100mg capsules | 28 capsule [PoM] £8.20 DT = £8.20

- ▶ **Diclomax SR** (Galen Ltd)

Diclofenac sodium 75 mg Diclomax SR 75mg capsules | 56 capsule [PoM] £11.40 DT = £11.40

- ▶ **Motifene** (Daiichi Sankyo UK Ltd)

Diclofenac sodium 75 mg Motifene 75mg modified-release capsules | 56 capsule [PoM] £8.00 DT = £8.00

## Diclofenac sodium with misoprostol

22-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, diclofenac sodium p. 1135, misoprostol p. 77.

### ● INDICATIONS AND DOSE

#### ARTHROTEC<sup>®</sup> 50/200

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet 2–3 times a day, take with food

#### ARTHROTEC<sup>®</sup> 75/200

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, take with food

#### MISOFEN<sup>®</sup> 50/200

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet 2–3 times a day, take with food

#### MISOFEN<sup>®</sup> 75/200

**Prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet twice daily, take with food

- **UNLICENSED USE** The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by the combination preparations of diclofenac and misoprostol.

- **INTERACTIONS** → Appendix 1: NSAIDs

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

#### ▶ Arthrotec (Pfizer Ltd)

Misoprostol 200 microgram, Diclofenac sodium 50 mg Arthrotec 50 gastro-resistant tablets | 60 tablet PoM £11.98 DT = £11.98

Misoprostol 200 microgram, Diclofenac sodium 75 mg Arthrotec 75 gastro-resistant tablets | 60 tablet PoM £15.83 DT = £15.83

#### ▶ Misofen (Morningside Healthcare Ltd)

Misoprostol 200 microgram, Diclofenac sodium 50 mg Misofen 50mg/200microgram gastro-resistant tablets | 60 tablet PoM £11.98 DT = £11.98

Misoprostol 200 microgram, Diclofenac sodium 75 mg Misofen 75mg/200microgram gastro-resistant tablets | 60 tablet PoM £15.83 DT = £15.83

## Etodolac

29-Jun-2016

### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatoid arthritis and osteoarthritis**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: 300–600 mg daily in 1–2 divided doses
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 600 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy ·

history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthenia · asthma · bilirubinuria · bronchospasm · chills · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fever · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · insomnia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritic syndrome · nephritis tubulointerstitial · nephrotoxicity · nervousness · neutropenia · oedema · optic neuritis · oral ulceration · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · tremor · urinary disorders · vasculitis · vertigo · visual impairment · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

## Etoricoxib

23-Nov-2016

### ● INDICATIONS AND DOSE

#### Pain and inflammation in osteoarthritis

- ▶ BY MOUTH
- ▶ Child 16-17 years: 30 mg once daily, increased if necessary to 60 mg once daily
- ▶ Adult: 30 mg once daily, increased if necessary to 60 mg once daily

#### Pain and inflammation in rheumatoid arthritis | Ankylosing spondylitis

- ▶ BY MOUTH
- ▶ Child 16-17 years: 60 mg once daily, increased if necessary to 90 mg once daily
- ▶ Adult: 60 mg once daily, increased if necessary to 90 mg once daily

#### Acute gout

- ▶ BY MOUTH
- ▶ Child 16-17 years: 120 mg once daily for maximum 8 days
- ▶ Adult: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · elderly (risk of serious side-effects and fatalities) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmias · asthenia · bronchospasm · constipation · diarrhoea · dizziness · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · headache · hypertension · increased risk of infection · influenza like illness · nausea · oedema · oral ulceration · palpitations · skin reactions · vomiting
  - ▶ **Uncommon** Alertness decreased · anaemia · angina pectoris · anxiety · appetite abnormal · cerebrovascular insufficiency · chest pain · congestive heart failure · conjunctivitis · cough · depression · drowsiness · dry mouth · dyspnoea · flushing · haemorrhage · hallucination · hyperkalaemia · hypersensitivity · insomnia · irritable bowel syndrome · leucopenia · myocardial infarction · pancreatitis · proteinuria · renal failure (more common in patients with pre-existing renal impairment) · sensation abnormal · taste altered · thrombocytopenia · tinnitus · vasculitis · vertigo · vision blurred · weight increased

- ▶ **Rare or very rare** Angioedema · confusion · hepatic disorders · muscle complaints · severe cutaneous adverse reactions (SCARs) · shock
  - ▶ **Frequency not known** Nephritis tubulointerstitial · nephropathy
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Manufacturer advises avoid (teratogenic in *animal* studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in *animal* studies.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).  
**Dose adjustments** Manufacturer advises max. 60 mg once daily in mild impairment; max. 30 mg once daily in moderate impairment.
  - **RENAL IMPAIRMENT** Avoid if possible or use with caution.
    - ▶ In adults Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
    - ▶ In children Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m<sup>2</sup>.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Felbinac

- **DRUG ACTION** Felbinac is an active metabolite of the NSAID fenbufen.

### ● INDICATIONS AND DOSE

**Relief of pain in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

#### ► TO THE SKIN

- Adult: Apply 2–4 times a day, therapy should be reviewed after 14 days; maximum 25 g per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal haemorrhage (two or more distinct episodes) · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · not for use with occlusive dressings · peripheral arterial disease · risk factors for cardiovascular events · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported) · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Bronchospasm · gastrointestinal disorder · hypersensitivity · paraesthesia · photosensitivity reaction · skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.

- **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Deterioration in renal function has also been reported after topical use.

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.

- **PRESCRIBING AND DISPENSING INFORMATION** Caution—topical preparations not generally suitable for children.

- **PATIENT AND CARER ADVICE** For topical preparations patients and carers should be advised to wash hands immediately after use.

**Photosensitivity** Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Gel

- **Traxam** (Advanz Pharma)

**Felbinac 30 mg per 1 gram** Traxam 3% gel | 100 gram [POM] £8.03 DT = £8.03

### Foam

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Traxam** (Advanz Pharma)

**Felbinac 31.7 mg per 1 gram** Traxam 3.17% foam | 100 gram [POM] £8.41 DT = £8.41

## Flurbiprofen

06-Sep-2016

### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain**

#### ► BY MOUTH

- Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions
- Adult: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

### Dysmenorrhoea

#### ► BY MOUTH

- Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Agranulocytosis · angioedema · aplastic anaemia · asthma · bronchospasm · confusion · constipation · Crohn's disease · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · renal failure (more common in patients with pre-existing renal impairment) · respiratory tract reaction · severe cutaneous adverse reactions (SCARs) · skin reactions ·

stroke · thrombocytopenia · tinnitus · vertigo · visual impairment · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.  
**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.  
**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Ibuprofen

28-Sep-2016

### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders** | **Mild to moderate pain including dysmenorrhoea** | **Postoperative analgesia** | **Migraine** | **Dental pain**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Adult: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate
- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 1.6 g once daily, dose to be taken in the early evening, increased if necessary to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Mild to moderate pain** | **Pain and inflammation of soft-tissue injuries** | **Pyrexia with discomfort**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

- ▶ Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- ▶ Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- ▶ Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

### Pain and inflammation

#### ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES

- ▶ Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

### Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

#### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

### Pain and inflammation in systemic juvenile idiopathic arthritis

#### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

### Post-immunisation pyrexia in infants (on doctor's advice only)

#### ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

#### ▶ TO THE SKIN

- ▶ Adult: Apply up to 3 times a day, ibuprofen gel 5% gel to be administered

### FENBID<sup>®</sup> FORTE

### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

#### ▶ TO THE SKIN

- ▶ Adult: Apply up to 4 times a day, therapy should be reviewed after 14 days

### IBUGEL<sup>®</sup> FORTE

### Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)

#### ▶ TO THE SKIN

- ▶ Adult: Apply up to 3 times a day

### ● UNLICENSED USE

- ▶ With oral use in children Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

### ● CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure · varicella infection

### ● CAUTIONS

- ▶ With systemic use Allergic disorders (in adults) · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart

failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

#### CAUTIONS, FURTHER INFORMATION

- ▶ High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen ( $\geq 2.4$  g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

● **INTERACTIONS** → Appendix 1: NSAIDs

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- ▶ **Uncommon** Gastrointestinal discomfort · hypersensitivity · rash (discontinue) · skin reactions
- ▶ **Rare or very rare** Angioedema · dyspnoea
- ▶ **Frequency not known** Asthma

##### SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
  - ▶ With oral use Headache · nausea
  - ▶ **Rare or very rare**
    - ▶ With oral use Acute kidney injury · agranulocytosis · anaemia · constipation · diarrhoea · gastrointestinal disorders · haemorrhage · leucopenia · liver disorder · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · oedema · oral ulceration · pancytopenia · renal papillary necrosis · severe cutaneous adverse reactions (SCARs) · shock · thrombocytopenia · vomiting
- ▶ **Frequency not known**
  - ▶ With oral use Crohn's disease · fertility decreased female · fluid retention · heart failure · hypertension · increased risk of arterial thromboembolism · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · respiratory tract reaction
- ▶ With topical use Bronchospasm · renal impairment · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

**With topical use** Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

**Overdose** Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 1359.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

#### ● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use in adults Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

#### ● PREGNANCY

- ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.

#### ● BREAST FEEDING

- ▶ With oral use Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
- ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.

#### ● HEPATIC IMPAIRMENT

- ▶ With oral use Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

#### ● RENAL IMPAIRMENT

- ▶ With oral use Avoid if possible or use with caution. Avoid in severe impairment.
- ▶ With topical use Deterioration in renal function has also been reported after topical use.
  - Dose adjustments** ▶ With oral use The lowest effective dose should be used for the shortest possible duration.
  - Monitoring** ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With topical use For topical preparations, apply with gentle massage only.

#### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With oral use Flavours of syrup may include orange.

#### ● PATIENT AND CARER ADVICE

- ▶ With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.
  - Photosensitivity
  - ▶ With topical use For topical preparations, patients or their carers should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

**Indometacin****(Indomethacin)**● **INDICATIONS AND DOSE****Pain and moderate to severe inflammation in rheumatic disease and other musculoskeletal disorders**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ Adult: 50–200 mg daily in divided doses

▶ **BY RECTUM**

▶ Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ Adult: 75 mg 1–2 times a day

**Acute gout**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ Adult: 150–200 mg daily in divided doses

▶ **BY RECTUM**

▶ Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ Adult: 75 mg 1–2 times a day

**Dysmenorrhoea**▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

▶ Adult: Up to 75 mg daily

▶ **BY RECTUM**

▶ Adult: 100 mg twice daily if required, dose to be administered at night and in the morning, combined oral and rectal treatment, maximum total daily dose 150–200 mg

▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

▶ Adult: 75 mg daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

● **CAUTIONS**

**GENERAL CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · parkinsonism · peripheral arterial

disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

#### SPECIFIC CAUTIONS

- ▶ With rectal use Avoid rectal administration in haemorrhoids · avoid rectal administration in proctitis

● **INTERACTIONS** → Appendix 1: NSAIDs

#### ● SIDE-EFFECTS

**GENERAL SIDE-EFFECTS** Agranulocytosis · alopecia · anaphylactic reaction · angioedema · anxiety · appetite decreased · arrhythmias · asthma · blood disorder · bone marrow disorders · breast abnormalities · chest pain · coma · confusion · congestive heart failure · constipation · corneal deposits · depression · diarrhoea · disseminated intravascular coagulation · dizziness · drowsiness · dysarthria · erythema nodosum · eye disorder · eye pain · fatigue · fluid retention · flushing · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypotension · inflammatory bowel disease · insomnia · leucopenia · movement disorders · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · peripheral neuropathy · photosensitivity reaction · platelet aggregation inhibition · psychiatric disorders · renal failure (more common in patients with pre-existing renal impairment) · respiratory disorders · seizures · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · thrombocytopenia · tinnitus · urine abnormalities · vasculitis · vertigo · vision disorders · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ With oral use Dyspnoea · malaise · pulmonary oedema · sigmoid lesion perforation

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.  
**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.  
**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** During prolonged therapy ophthalmic and blood examinations particularly advisable.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Suppository

## Ketoprofen

15-May-2018

#### ● INDICATIONS AND DOSE

**Pain and mild inflammation in rheumatic disease and musculoskeletal conditions | Dysmenorrhoea | Acute gout**

- ▶ BY MOUTH  
▶ Adult: 100–200 mg once daily

**Relief of pain in rheumatic disease and musculoskeletal conditions**

- ▶ TO THE SKIN  
▶ Adult: Apply 2–4 times a day for up to 7 days, ketoprofen 2.5% gel to be administered; maximum 15 g per day

#### POWERGEL<sup>®</sup>

**Relief of pain in musculoskeletal conditions | Adjunctive treatment in knee or hand osteoarthritis**

- ▶ TO THE SKIN  
▶ Adult: Apply 2–3 times a day for up to max. 10 days

#### ● CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · severe heart failure
- **CAUTIONS**
  - ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
  - ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

  - ▶ **Uncommon** Diarrhoea · paraesthesia · skin reactions
  - ▶ **Rare or very rare** Hypersensitivity · photosensitivity reaction
  - ▶ **Frequency not known** Angioedema

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With oral use Gastrointestinal discomfort · nausea · vomiting
- ▶ **Uncommon**
- ▶ With oral use Constipation · dizziness · drowsiness · fatigue · gastrointestinal disorders · headache · oedema · rash (discontinue)
- ▶ With topical use Increased risk of infection
- ▶ **Rare or very rare**
- ▶ With oral use Asthma · haemorrhagic anaemia · hepatic disorders · pancreatitis · shock · stomatitis · tinnitus · vision disorders · weight increased
- ▶ With topical use Renal impairment
- ▶ **Frequency not known**
- ▶ With oral use Acute kidney injury (more common in patients with pre-existing renal impairment) · agranulocytosis · alopecia · bone marrow failure · bronchospasm · confusion · Crohn's disease aggravated · depression · dyspnoea · fertility decreased female · haemorrhage · hallucination · heart failure · hypertension · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · increased risk of myocardial infarction · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · mood altered · nephritic syndrome · nephritis tubulointerstitial · neutropenia · optic neuritis · rhinitis · seizure · severe cutaneous adverse reactions (SCARs) · taste altered · thrombocytopenia · vasodilation · vertigo
- ▶ With topical use Eosinophilia · eyelid oedema · fever · gastrointestinal haemorrhage · lip swelling · peptic ulcer · vasculitis · wound complications

**SIDE-EFFECTS, FURTHER INFORMATION** Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported).

For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION**

continued →

**Acute pain including dysmenorrhoea | Menorrhagia**

## ► BY MOUTH

- Child 12-17 years: 500 mg 3 times a day
- Adult: 500 mg 3 times a day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · inflammatory bowel disease · severe heart failure
- **CAUTIONS** Acute porphyrias p. 1058 · allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · anaemia · angioedema · appetite decreased · asthma · bone marrow disorders · confusion · constipation · Crohn's disease · depression · diarrhoea (discontinue) · disseminated intravascular coagulation · dizziness · drowsiness · dyspnoea · dysuria · ear pain · eosinophilia · eye irritation · fatigue · fertility decreased female · gastrointestinal discomfort · gastrointestinal disorders · glomerulonephritis · glucose tolerance impaired · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hyperhidrosis · hypersensitivity · hypertension · hyponatraemia · hypotension · insomnia · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · multi organ failure · nausea · nephritis acute interstitial · nephrotic syndrome · nervousness · neutropenia · oedema · optic neuritis · oral ulceration · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · proteinuria · rash (discontinue) · renal failure (more common in patients with pre-existing renal impairment) · renal failure non-oliguric · renal papillary necrosis · respiratory disorders · seizure · sepsis · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · vertigo · vision disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130
- Overdose** Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent, require treatment.  
For details on the management of poisoning, see Emergency treatment of poisoning p. 1359, in particular, Convulsions.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.  
**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.  
**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**

CAUTIONARY AND ADVISORY LABELS 21

04-Nov-2016

● **INDICATIONS AND DOSE****Exacerbation of osteoarthritis (short-term)**

## ► BY MOUTH

- Child 16-17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
- Adult: 7.5 mg once daily, then increased if necessary up to 15 mg once daily

**Pain and inflammation in rheumatic disease | Ankylosing spondylitis**

## ► BY MOUTH

- Child 16-17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Adult: 15 mg once daily, then reduced to 7.5 mg once daily if required
- Elderly: 7.5 mg once daily

**Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs**

## ► BY MOUTH

- Child 12-17 years (body-weight up to 50 kg): 7.5 mg once daily
- Child 12-17 years (body-weight 50 kg and above): 15 mg once daily

- **UNLICENSED USE** Not licensed for use in children under 16 years.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal

haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · headache · nausea · vomiting
- ▶ **Uncommon** Anaemia · angioedema · burping · dizziness · drowsiness · electrolyte imbalance · fluid retention · flushing · haemorrhage · hepatic disorders · hypersensitivity · oedema · skin reactions · stomatitis · vertigo
- ▶ **Rare or very rare** Acute kidney injury · asthma · conjunctivitis · leucopenia · mood altered · nightmare · palpitations · severe cutaneous adverse reactions (SCARs) · thrombocytopenia · tinnitus · vision disorders
- ▶ **Frequency not known** Agranulocytosis · confusion · fertility decreased female · heart failure · increased risk of arterial thromboembolism · nephritis tubulointerstitial · nephrotic syndrome · photosensitivity reaction · renal necrosis

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs, p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution.
  - ▶ In adults Avoid if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>.
  - ▶ In children Avoid if estimated glomerular filtration rate less than 25 mL/minute/1.73 m<sup>2</sup>.
- **Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- **Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Meloxicam 15 mg** Meloxicam 15mg tablets | 30 tablet (PoM) £1.35 DT = £1.04

## Nabumetone

11-Nov-2016

### ● INDICATIONS AND DOSE

#### Pain and inflammation in osteoarthritis and rheumatoid arthritis

- ▶ **BY MOUTH**
- ▶ **Adult:** 1 g once daily, dose to be taken at night
- ▶ **Elderly:** 0.5–1 g daily

#### Pain and inflammation in osteoarthritis and rheumatoid arthritis (severe and persistent symptoms)

- ▶ **BY MOUTH**
- ▶ **Adult:** 0.5–1 g, dose to be taken in the morning and 1 g, dose to be taken at night
- ▶ **Elderly:** 0.5–1 g daily

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · diarrhoea · ear disorder · gastrointestinal discomfort · gastrointestinal disorders · nausea · oedema · skin reactions · tinnitus
  - ▶ **Uncommon** Anxiety · asthenia · confusion · dizziness · drowsiness · dry mouth · dyspnoea · eye disorder · haemorrhage · headache · hyperhidrosis · insomnia · myopathy · oral disorders · paraesthesia · photosensitivity reaction · respiratory disorders · urinary tract disorder · visual impairment · vomiting
  - ▶ **Rare or very rare** Alopecia · angioedema · hepatic disorders · hypersensitivity · menorrhagia · nephrotic syndrome · pancreatitis · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · thrombocytopenia
  - ▶ **Frequency not known** Agranulocytosis · aplastic anaemia · asthma · Crohn's disease aggravated · depression · fertility decreased female · haemolytic anaemia · hallucination · heart failure · hypertension · increased risk of arterial thromboembolism · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nephritis tubulointerstitial · neutropenia · optic neuritis · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 1130
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of

asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - **RENAL IMPAIRMENT** Avoided if possible or use with caution. Avoid in severe impairment.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### ● INDICATIONS AND DOSE

#### Pain and inflammation in rheumatic disease

##### ▶ BY MOUTH

- ▶ Adult: 0.5–1 g daily in 1–2 divided doses

#### Pain and inflammation in musculoskeletal disorders |

#### Dysmenorrhoea

##### ▶ BY MOUTH

- ▶ Adult: Initially 500 mg, then 250 mg every 6–8 hours as required, maximum dose after the first day 1.25 g daily

#### Acute gout

##### ▶ BY MOUTH

- ▶ Adult: Initially 750 mg, then 250 mg every 8 hours until attack has passed

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Agranulocytosis · alopecia · angioedema · aplastic anaemia · asthma · cognitive impairment · concentration impaired · confusion · constipation · corneal opacity · depression · diarrhoea · dizziness · drowsiness · dyspnoea · erythema nodosum · fatigue · gastrointestinal discomfort · gastrointestinal disorders · glomerulonephritis · haemolytic anaemia · haemorrhage · hallucination · headache · hearing impairment · heart failure · hepatic disorders · hyperhidrosis · hyperkalaemia · hypersensitivity · hypertension · increased risk of arterial thromboembolism · infertility female · inflammatory bowel disease · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · muscle weakness · myalgia · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral disorders · palpitations · pancreatitis · papillitis · papilloedema · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · pulmonary oedema · rash pustular · renal failure (more common in patients with pre-existing renal impairment) · renal papillary necrosis · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · sleep disorders · thirst · thrombocytopenia · tinnitus · vasculitis · vertigo · visual impairment · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

## Naproxen with esomeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, naproxen p. 1148, esomeprazole p. 78.

#### ● INDICATIONS AND DOSE

**Patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective**

##### ▶ BY MOUTH

• Adult: 500/20 mg twice daily, dose expressed as x/y mg naproxen/esomeprazole

- **INTERACTIONS** → Appendix 1: NSAIDs · proton pump inhibitors

- **PRESCRIBING AND DISPENSING INFORMATION** Naproxen component is gastro-resistant.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 22, 25

##### ▶ Vimovo (AstraZeneca UK Ltd)

**Esomeprazole (as Esomeprazole magnesium trihydrate) 20 mg,**

**Naproxen 500 mg** Vimovo 500mg/20mg modified-release tablets | 60 tablet [PoM] £14.95 DT = £14.95

## Piroxicam

#### ● INDICATIONS AND DOSE

**Rheumatoid arthritis (initiated by a specialist) | Osteoarthritis (initiated by a specialist) | Ankylosing spondylitis (initiated by a specialist)**

##### ▶ BY MOUTH

• Adult: Up to 20 mg once daily

**Pain relief in musculoskeletal conditions | Treatment in knee or hand osteoarthritis (adjunct)**

##### ▶ TO THE SKIN

• Adult: Apply 3–4 times a day, 0.5% gel to be applied; review treatment after 4 weeks

#### IMPORTANT SAFETY INFORMATION

##### CHMP ADVICE—PIROXICAM (JUNE 2007)

##### ▶ With systemic use

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent should be considered.

Topical preparations containing piroxicam are not affected by these restrictions.

#### ● CONTRA-INDICATIONS

- ▶ With systemic use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

#### ● CAUTIONS

- ▶ With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- ▶ With topical use Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1: NSAIDs

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastrointestinal discomfort · gastrointestinal disorders · nausea · skin reactions
- ▶ **Rare or very rare** Severe cutaneous adverse reactions (SCARs)
- ▶ **Frequency not known** Bronchospasm · dyspnoea · photosensitivity reaction

#### SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
  - ▶ With oral use Anaemia · appetite decreased · constipation · diarrhoea · dizziness · drowsiness · eosinophilia · headache · hyperglycaemia · leucopenia · oedema · rash (discontinues) · thrombocytopenia · tinnitus · vertigo · vomiting · weight changes
- ▶ **Uncommon**
  - ▶ With oral use Hypoglycaemia · palpitations · stomatitis · vision blurred
- ▶ **Rare or very rare**
  - ▶ With oral use Nephritis tubulointerstitial · nephrotic syndrome · renal failure · renal papillary necrosis
- ▶ **Frequency not known**
  - ▶ With oral use Alopecia · angioedema · aplastic anaemia · confusion · depression · embolism and thrombosis · eye irritation · eye swelling · fertility decreased female · fluid retention · haemolytic anaemia · haemorrhage · hallucination · hearing impairment · heart failure · hepatic disorders · hypersensitivity · hypertension · malaise · mood altered · nervousness · onycholysis · pancreatitis · paraesthesia · sleep disorders · vasculitis

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

Topical application of large amounts can result in systemic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION**
  - ▶ With systemic use Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY**
  - ▶ With systemic use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - ▶ With topical use Patient packs for topical preparations carry a warning to avoid during pregnancy.
- **BREAST FEEDING**
  - ▶ With systemic use Use with caution during breast-feeding. Amount too small to be harmful.
  - ▶ With topical use Patient packs for topical preparations carry a warning to avoid during breast-feeding.
- **HEPATIC IMPAIRMENT**
  - ▶ With systemic use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT**
  - ▶ With systemic use Avoid if possible or use with caution.
  - ▶ With topical use Deterioration in renal function has also been reported after topical use.

**Dose adjustments** ▶ With systemic use The lowest effective dose should be used for the shortest possible duration.

**Monitoring** ▶ With systemic use In renal impairment monitor renal function; sodium and water retention may

occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION** Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing.
- ▶ With topical use For topical preparations apply with gentle massage only.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - ▶ With topical use Caution—topical preparations not generally suitable for children.
- **PATIENT AND CARER ADVICE**
  - ▶ With topical use For topical preparations, patients and their carers should be advised to wash hands immediately after use.
  - Photosensitivity
    - ▶ With topical use Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.
- **LESS SUITABLE FOR PRESCRIBING**
  - ▶ With oral use Piroxicam is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Sulindac

21-Nov-2016

### ● INDICATIONS AND DOSE

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Acute gout**

#### ▶ BY MOUTH

- ▶ **Adult:** 200 mg twice daily for maximum duration 7–10 days in peri-articular disorders, dose may be reduced according to response; acute gout should respond within 7 days; maximum 400 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · ensure adequate hydration · heart

failure · history of renal stones · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Acute psychosis · agranulocytosis · alopecia · angioedema · appetite decreased · arrhythmia · asthenia · asthma · bone marrow disorders · cholecystitis · confusion · constipation · Crohn's disease aggravated · depression · diarrhoea · dizziness · drowsiness · dyspnoea · dysuria · eye disorder · fever · gastrointestinal discomfort · gastrointestinal disorders · gynaecomastia · haemolytic anaemia · haemorrhage · hallucination · headache · hearing loss · heart failure · hepatic disorders · hyperglycaemia · hyperhidrosis · hyperkalaemia · hypersensitivity · hypersensitivity vasculitis · hypertension · increased risk of arterial thromboembolism · increased risk of infection · insomnia · leucopenia · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · mucosal abnormalities · muscle weakness · nausea · nephritis tubulointerstitial · nephrotic syndrome · nerve disorders · nervousness · neutropenia · oedema · oral disorders · palpitations · pancreatitis · paraesthesia · photosensitivity reaction · psychiatric disorder · renal impairment · respiratory disorders · seizure · severe cutaneous adverse reactions (SCARs) · skin reactions · syncope · taste altered · thrombocytopenia · tinnitus · urine abnormalities · urine discolouration · vertigo · vision disorders · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs, p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
  - **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
  - **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
  - **BREAST FEEDING** Use with caution during breast-feeding.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
  - **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.
- Dose adjustments** The lowest effective dose should be used for the shortest possible duration.
- Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## Tenoxicam

22-Nov-2016

### ● INDICATIONS AND DOSE

#### Pain and inflammation in rheumatic disease

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

#### Pain and inflammation in acute musculoskeletal disorders

- ▶ BY MOUTH
- ▶ Adult: 20 mg once daily for 7 days; maximum duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 20 mg once daily as initial treatment for 1–2 days if oral administration not possible

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation · Crohn's disease aggravated · diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · haemorrhage · headache · nausea · vomiting
  - ▶ **Uncommon** Fatigue · oedema · skin reactions
  - ▶ **Rare or very rare** Asthma · bronchospasm · depression · dyspnoea · hyperglycaemia · nervousness · palpitations · pancreatitis · severe cutaneous adverse reactions (SCARs) · sleep disorders · vertigo · weight changes
  - ▶ **Frequency not known** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · confusion · eosinophilia · fertility decreased female · haemolytic anaemia · hallucination · heart failure · hepatic disorders · hypersensitivity · hypertension · leucopenia · malaise · nail disorder · nephritis tubulointerstitial · nephropathy · paraesthesia · photosensitivity reaction · platelet aggregation inhibition · purpura non-thrombocytopenic · renal failure (more common in patients with pre-existing renal impairment) · thrombocytopenia · tinnitus · vasculitis · vision disorders
- **SPECIFIC SIDE-EFFECTS**
  - ▶ **Common or very common**
  - ▶ With oral use Dizziness · dry mouth · oral disorders
  - ▶ **Rare or very rare**
  - ▶ With oral use Embolism and thrombosis · metabolic disorder
  - ▶ **Frequency not known**
  - ▶ With oral use Drowsiness · eye irritation · eye swelling
  - ▶ With parenteral use Appetite decreased · increased risk of arterial thromboembolism · increased risk of ischaemic stroke · increased risk of myocardial infarction · meningitis aseptic (patients with connective-tissue disorders such as

systemic lupus erythematosus may be especially susceptible) · neutropenia · oral ulceration

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.

**Dose adjustments** The lowest effective dose should be used for the shortest possible duration.

**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

## Tiaprofenic acid

● **INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders**

- ▶ BY MOUTH
- ▶ Adult: 300 mg twice daily

**IMPORTANT SAFETY INFORMATION**

**CSM ADVICE**

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop.

Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine).

- **CONTRA-INDICATIONS** Active bladder disease (or symptoms) · active gastro-intestinal bleeding · active gastro-intestinal ulceration · active prostate disease (or symptoms) · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more

distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · history of recurrent urinary-tract disorders (if urinary symptoms develop discontinue immediately and perform urine tests and culture) · severe heart failure

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · elderly (risk of serious side-effects and fatalities) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS** Agranulocytosis · alopecia · anaemia · angioedema · aplastic anaemia · appetite decreased · asthma · bladder pain · bronchospasm · confusion · constipation · Crohn's disease aggravated · cystitis · depression · diarrhoea · dizziness · drowsiness · dyspnoea · fatigue · fertility decreased female · fluid retention · gastrointestinal discomfort · gastrointestinal disorders · haemolytic anaemia · haemorrhage · hallucination · headache · heart failure · hepatic disorders · hypersensitivity · hypertension · increased risk of arterial thromboembolism · malaise · meningitis aseptic (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · nausea · nephritis tubulointerstitial · nephropathy · neutropenia · oedema · optic neuritis · oral ulceration · pancreatitis · paraesthesia · photosensitivity reaction · renal failure (more common in patients with pre-existing renal impairment) · severe cutaneous adverse reactions (SCARs) · skin reactions · sodium retention · thrombocytopenia · tinnitus · urinary disorders · urinary tract inflammation · vertigo · visual impairment · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs. p. 1130

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.  
**Dose adjustments** Reduce dose in mild or moderate impairment.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment.  
**Dose adjustments** Reduce dose in mild or moderate impairment. The lowest effective dose should be used for the shortest possible duration.  
**Monitoring** In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## 5 Soft tissue and joint disorders

### 5.1 Local inflammation of joints and soft tissue

**Other drugs used for Local inflammation of joints and soft tissue** Betamethasone, p. 674

#### CORTICOSTEROIDS

### Corticosteroids, inflammatory disorders

#### Systemic corticosteroids

Short-term treatment with corticosteroids can help to rapidly decrease inflammatory symptoms of rheumatoid arthritis. **[EvG]** Long-term treatment in patients with established rheumatoid arthritis should only be continued after evaluating the risks and all other treatments have been considered **[A]**, see Rheumatoid arthritis p. 1091.

*Polymyalgia rheumatica* and *giant cell (temporal) arteritis* are always treated with corticosteroids. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

*Polyarteritis nodosa* and *polymyositis* are usually treated with corticosteroids.

*Systemic lupus erythematosus* is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis. Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine p. 616 or hydroxychloroquine sulfate p. 1095, should be considered.

*Ankylosing spondylitis* should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

#### Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for disease-modifying antirheumatic drugs (DMARDs) to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of

the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone p. 1154 acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

### Dexamethasone

21-Dec-2017

- **DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

#### ● INDICATIONS AND DOSE

##### Local inflammation of joints

- ▶ BY INTRA-ARTICULAR INJECTION

▶ Adult: 0.3–3.3 mg, where appropriate, dose may be repeated at intervals of 3–21 days according to response, dose given according to size—consult product literature

##### Local inflammation of soft tissues

- ▶ BY LOCAL INFILTRATION

▶ Adult: 1.7–5 mg, dose given according to size—consult product literature, where appropriate may be repeated at intervals of 3–21 days, use the 3.3 mg/mL injection preparation for this dose

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **PRESCRIBING AND DISPENSING INFORMATION** Dexamethasone 3.8 mg/mL Injection has replaced dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

## Hydrocortisone

21-Dec-2017

F 672

- **DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

### ● INDICATIONS AND DOSE

#### HYDROCORTISTAB®

##### Local inflammation of joints and soft-tissues

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Adult: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Myocardial rupture (following recent myocardial infarction)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Hydrocortistab** (Advanz Pharma)  
Hydrocortisone acetate 25 mg per 1 ml Hydrocortistab 25mg/1ml suspension for injection ampoules | 10 ampoule [PoM] £68.72 DT = £68.72

## Methylprednisolone

03-Nov-2017

F 672

- **DRUG ACTION** Methylprednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

### ● INDICATIONS AND DOSE

#### DEPO-MEDRONE®

##### Local inflammation of joints and soft tissues

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Adult: 4–80 mg, select dose according to size; where appropriate dose may be repeated at intervals of 7–35 days, for details consult product literature

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Angioedema · cataract · confusion · delusions · depressed mood · diarrhoea · dizziness · drug dependence · dyslipidaemia · embolism and thrombosis · epidural lipomatosis · gastrointestinal disorders · glucose tolerance impaired · hallucination · hepatitis · hiccups · hypopituitarism · increased insulin requirement · intracranial pressure increased · memory loss · metabolic acidosis · muscle weakness · myalgia · neuropathic arthropathy · peripheral oedema · psychiatric disorder · schizophrenia exacerbated · sterile abscess · suicidal ideation · vision loss · withdrawal syndrome
- **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

#### CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Depo-Medrone** (Pfizer Ltd)  
Methylprednisolone acetate 40 mg per 1 ml Depo-Medrone 40mg/1ml suspension for injection vials | 1 vial [PoM] £3.44 DT = £3.44 | 10 vial [PoM] £34.04  
Depo-Medrone 80mg/2ml suspension for injection vials | 1 vial [PoM] £6.18 DT = £6.18 | 10 vial [PoM] £61.39  
Depo-Medrone 120mg/3ml suspension for injection vials | 1 vial [PoM] £8.96 DT = £8.96 | 10 vial [PoM] £88.81

## Methylprednisolone with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, methylprednisolone above, lidocaine hydrochloride p. 103.

### ● INDICATIONS AND DOSE

#### Local inflammation of joints

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Adult: 4–80 mg, dose adjusted according to size; where appropriate may be repeated at intervals of 7–35 days, for details consult product literature

- **INTERACTIONS** → Appendix 1: antiarrhythmics · corticosteroids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Depo-Medrone with Lidocaine** (Pfizer Ltd)  
Lidocaine hydrochloride 10 mg per 1 ml, Methylprednisolone acetate 40 mg per 1 ml Depo-Medrone with Lidocaine suspension for injection 2ml vials | 1 vial [PoM] £7.06 DT = £7.06 | 10 vial [PoM] £70.13  
Depo-Medrone with Lidocaine suspension for injection 1ml vials | 1 vial [PoM] £3.94 DT = £3.94 | 10 vial [PoM] £38.88

## Prednisolone

21-Dec-2017

F 672

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

### ● INDICATIONS AND DOSE

#### DELTA STAB®

##### Local inflammation of joints

- ▶ BY INTRA-ARTICULAR INJECTION
- ▶ Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

### IMPORTANT SAFETY INFORMATION

#### SAFE PRACTICE

Prednisolone has been confused with propranolol; care must be taken to ensure the correct drug is prescribed and dispensed.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Diarrhoea · dizziness · hiccups · Kaposi's sarcoma · myocardial rupture (following recent myocardial infarction) · scleroderma renal crisis · vomiting
- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.
- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

- ▶ **Deltastab** (Advanz Pharma)  
Prednisolone acetate 25 mg per 1 ml Deltastab 25mg/1ml suspension for injection ampoules | 10 ampoule [PoM] £68.72

F 672

## Triamcinolone acetonide

21-Dec-2017

- **DRUG ACTION** Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effect.

### ● INDICATIONS AND DOSE

#### ADCORTYL® INTRA-ARTICULAR/INTRADERMAL

##### Local inflammation of joints and soft tissues

###### ► BY INTRA-ARTICULAR INJECTION

- Adult: 2.5–15 mg, adjusted according to size (for larger doses use *Kenalog*®). Where appropriate dose may be repeated when relapse occurs, for details consult product literature.
- BY INTRADERMAL INJECTION
- Adult: 2–3 mg, max. 5 mg at any one site (total max. 30 mg). Where appropriate may be repeated at intervals of 1–2 weeks, for details consult product literature

#### KENALOG® VIALS

##### Local inflammation of joints and soft tissues

###### ► BY INTRA-ARTICULAR INJECTION

- Adult: 5–40 mg (max. per dose 80 mg), for further details consult product literature, select dose according to size. For doses below 5 mg use *Adcortyl*® Intra-articular/Intradermal injection, where appropriate dose may be repeated when relapse occurs.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PATIENT AND CARER ADVICE** Patient counselling is advised for triamcinolone acetonide injection (steroid card).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol

- **Adcortyl Intra-articular / Intradermal** (Bristol-Myers Squibb Pharmaceuticals Ltd)  
Triamcinolone acetonide 10 mg per 1 ml Adcortyl Intra-articular / Intradermal 50mg/5ml suspension for injection vials | 1 vial [PoM](#) £3.63

F 672

## Triamcinolone hexacetonide

21-Dec-2017

- **DRUG ACTION** Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralcorticoid effects.

### ● INDICATIONS AND DOSE

#### Local inflammation of joints and soft-tissues (for details, consult product literature)

###### ► BY INTRA-ARTICULAR INJECTION

- Adult: 2–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day, where appropriate, may be repeated at intervals of 3–4 weeks
- BY PERI-ARTICULAR INJECTION
- Adult: 10–20 mg, adjusted according to size of joint, no more than 2 joints should be treated on any one day

- **CONTRA-INDICATIONS** Consult product literature
- **CAUTIONS** Consult product literature
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Protein catabolism

- **PRESCRIBING AND DISPENSING INFORMATION** Various strengths available from 'special order' manufacturers or specialist importing companies.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

###### ► Triamcinolone hexacetonide (Non-proprietary)

Triamcinolone hexacetonide 20 mg per 1 ml Triamcinolone hexacetonide 20mg/1ml suspension for injection ampoules | 10 ampoule [PoM](#) £120.00 DT = £120.00

## 5.2 Soft tissue disorders

### Soft-tissue disorders

#### Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

#### Extravasation prevention

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration. Placing a glyceryl trimitate p. 218 patch distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse.

Patients should be asked to report any pain or burning at the site of injection immediately.

#### Extravasation management

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 676 or dexamethasone p. 675 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury.

**Antihistamines** and **analgesics** may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it.

The first method may be appropriate following extravasation of vesicant drugs and involves administration

of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase p. 1157. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique). Dextrazoxane p. 940 is licensed for the treatment of anthracycline-induced extravasation.

## Enzymes used in soft-tissue disorders

### Collagenase

Collagenase below are proteolytic enzymes that are derived from the fermentation of *Clostridium histolyticum* and have the ability to break down collagen. A preparation containing a mixture of two collagenases is licensed for the treatment of Dupuytren's contracture; the preparation should be injected into a palpable cord with a contracture of a metacarpophalangeal joint or proximal interphalangeal joint.

### Hyaluronidase

Hyaluronidase is used to render the tissues more readily permeable to injected fluids, e.g. for introduction of fluids by subcutaneous infusion (termed hypodermoclysis).

### Rubefacients

**Rubefacients** act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method that itself produces irritation of the skin. Topical rubefacient preparations may contain nicotine and salicylate compounds, essential oils, capsicum, and camphor. The evidence available does not support the use of topical rubefacients in acute or chronic musculoskeletal pain.

### Topical NSAIDs

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac p. 1140, ibuprofen p. 1141, ketoprofen p. 1144, and fluroxacin p. 1149) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis.

### Capsaicin

A preparation containing capsaicin 0.025% p. 483 can be considered as an adjunct in hand or knee osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved.

A capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia after lesions have healed, and for the relief of painful diabetic neuropathy.

A self-adhesive patch containing capsaicin 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients.

## ENZYMES

### Collagenase

21-Feb-2019

#### ● INDICATIONS AND DOSE

#### Dupuytren's contracture in patients with a palpable cord (specialist use only)

##### ► BY INTRALESIONAL INJECTION

- Adult: 580 micrograms, then 580 micrograms every 4 weeks if required, inject into palpable cord, up to 2 cords or 2 affected joints in the same hand may be treated at a time. Maximum 3 injections per cord, maximum 8 injections in total

#### Peyronie's disease (specialist use only)

##### ► BY INTRALESIONAL INJECTION

- Adult: 580 micrograms, then 580 micrograms after 1–3 days, doses to be administered into the Peyronie's plaque; if more than one plaque is present, only the plaque causing the deformity should be injected, a treatment course consists of a maximum of 4 treatment cycles, administered at intervals of approximately 6 weeks. Each treatment cycle consists of 2 injections and 1 penile modelling procedure; the modelling procedure is performed 1–3 days after the second injection of each treatment cycle

- **CONTRA-INDICATIONS** Avoid injecting into other structures containing collagen (e.g. tendons, nerves, blood vessels, urethra and corpora cavernosa)—risk of injury
- **CAUTIONS** Coagulation disorders · use of anticoagulants
- **SIDE-EFFECTS**
- **Common or very common** Axillary mass · dizziness · headache · hyperhidrosis · inflammation · joint disorders · lymphatic abnormalities · muscle complaints · nausea · pain · peripheral oedema · sensation abnormal · skin reactions
- **Uncommon** Abdominal pain upper · anxiety · breast abnormalities · disorientation · dyspnoea · eyelid oedema · facial swelling · fatigue · feeling hot · fever · haematoma · hypersensitivity · hypotension · influenza like illness · insomnia · irritability · ligament injury · limb discomfort · limb injury · local swelling · lymphangitis · malaise · monoplegia · muscle weakness · musculoskeletal discomfort · syncope · tendon disorders · thrombocytopenia · tremor · vomiting · wound complications
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor patients for at least 30 minutes after injection—risk of severe allergic reaction.
- **DIRECTIONS FOR ADMINISTRATION** Reconstitution and injected volumes vary with site of injection—consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE decisions**
- **Collagenase clostridium histolyticum for treating Dupuytren's contracture (July 2017) NICE TA459**  
For people not taking part in the ongoing clinical trial (HTA-15/102/04), collagenase clostridium histolyticum (*Xiapex*<sup>®</sup>) is recommended as an option for treating Dupuytren's contracture with a palpable cord in patients only if the following apply:
  - There is evidence of moderate disease (functional problems and metacarpophalangeal joint contracture of 30° to 60° and proximal interphalangeal joint contracture of less than 30° or first web contracture) plus up to 2 affected joints, **and**
  - Percutaneous needle fasciotomy is not considered appropriate, but limited fasciectomy is considered appropriate by the treating hand surgeon, **and**
  - The choice of treatment (collagenase clostridium histolyticum or limited fasciectomy) is made on an individual basis after discussion between the responsible hand surgeon and the patient about the risks and benefits of the treatments available, **and**
  - One injection is given per treatment session by a hand surgeon in an outpatient setting.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding

arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta459](http://www.nice.org.uk/guidance/ta459)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- ▶ **Xiapex** (Swedish Orphan Biovitrum Ltd)  
**Collagenase clostridium histolyticum 900 microgram** Xiapex  
0.9mg powder and solvent for solution for injection vials | 1 vial **[PoM]**  
£572.00

## Hyaluronidase

### ● INDICATIONS AND DOSE

**Enhance permeation of subcutaneous or intramuscular injections**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1500 units, to be dissolved directly into the solution to be injected (ensure compatibility)

**Enhance permeation of local anaesthetics**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be mixed with the local anaesthetic solution

**Enhance permeation of ophthalmic local anaesthetic**

- ▶ TO THE EYE
- ▶ Adult: 15 units/mL, to be mixed with the local anaesthetic solution

**Hypodermoclysis**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid

**Extravasation**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area as soon as possible after extravasation

**Haematoma**

- ▶ BY LOCAL INFILTRATION
- ▶ Adult: 1500 units, to be dissolved in 1 mL water for injections or 0.9% sodium chloride and infiltrated into affected area

- **CONTRA-INDICATIONS** Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings
- **CAUTIONS** Elderly (control speed and total volume and avoid overhydration especially in renal impairment)
- **SIDE-EFFECTS** Oedema · periorbital oedema

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- ▶ **Hyaluronidase (Non-proprietary)**  
**Hyaluronidase 1500 unit** Hyaluronidase 1,500unit powder for solution for injection ampoules | 10 ampoule **[PoM]** £136.55

## Eye

### Eye treatment: drug administration

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—consult individual manufacturers for information. They are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

### Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. Instillation of more than one drop should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

After using eye drops or eye ointments, patients should be warned not to drive or perform other skilled tasks until vision is clear.

Also see warnings relating to eye drops and contact lenses.

### Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies

as a first-aid treatment. Sterile sodium chloride 0.9% solution p. 1169 is usually used. Clean water will suffice in an emergency.

### Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

### Ophthalmic Specials

Certain eye drops, e.g. amphotericin p. 593, ceftazidime p. 528, cefuroxime p. 1171, colistimethate sodium p. 556, desferrioxamine mesilate p. 1028, dexamethasone p. 1162, gentamicin p. 1171, and vancomycin p. 534 can be prepared aseptically from material supplied for injection.

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product is not suitable for a patient's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website ([www.rcophth.ac.uk](http://www.rcophth.ac.uk)). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

### Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

### Eye preparations: control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary use* should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

### Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

### Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some

beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 272 and hyalalazine hydrochloride p. 180). Other drugs that may affect contact lens wear are isotretinoin p. 1270 (can cause conjunctival inflammation), aspirin p. 121 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 582 and sulfasalazine p. 44 (can discolour lenses).

## 1 Allergic and inflammatory eye conditions

### Eye, allergy and inflammation

#### Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

*Topical corticosteroids* are applied frequently for the first 24–48 hours; once inflammation is controlled, the frequency of application is reduced. They should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Combination products containing a corticosteroid with an anti-infective drug are sometimes used after ocular surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified.

*Systemic corticosteroids* may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

#### Intravitreal corticosteroids

An intravitreal implant containing dexamethasone p. 1162 (*Ozurdex*<sup>®</sup>) is licensed for the treatment of adults with macular oedema following either branch retinal vein occlusion or central retinal vein occlusion; it is also licensed for the treatment of adult patients with inflammation of the posterior segment of the eye presenting as non-infectious uveitis.

An intravitreal implant containing fluocinolone acetonide p. 1192 (*Iluvien*<sup>®</sup>) is licensed for the treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies. It should be administered by specialists experienced in the use of intravitreal injections.

#### Eye care, other anti-inflammatory preparations

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide p. 1161, and sodium cromoglycate p. 1161.

Eye drops containing antihistamines, such as **antazoline** (with xylometazoline hydrochloride p. 1203 as *Otrivine-Antistin*<sup>®</sup>), azelastine hydrochloride p. 1160, epinastine hydrochloride p. 1160, ketotifen p. 1160, and olopatadine p. 1161, can be used for allergic conjunctivitis.

Sodium cromoglycate (sodium cromoglycate) and nedocromil sodium eye drops p. 1161 can be useful for vernal

keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac sodium eye drops p. 1178 are also licensed for seasonal allergic conjunctivitis.

Non-steroidal anti-inflammatory eye drops are used for the prophylaxis and treatment of inflammation of the eye following surgery or laser treatment.

Ciclosporin p. 1165 is licensed for severe keratitis in patients with dry eye disease, which has not improved despite treatment with tear substitutes.

Cenegermin p. 1165 is licensed for moderate to severe neurotrophic keratitis.

## 1.1 Allergic conjunctivitis

**Other drugs used for Allergic conjunctivitis** Diclofenac sodium, p. 1178

### ANTIHISTAMINES

#### Antazoline with xylometazoline

##### ● INDICATIONS AND DOSE

###### Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply 2-3 times a day for maximum 7 days
- ▶ Adult: Apply 2-3 times a day for maximum 7 days

- **CAUTIONS** Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention

- **INTERACTIONS** → Appendix 1: antihistamines, sedating · sympathomimetics, vasoconstrictor

- **SIDE-EFFECTS** Drowsiness · eye irritation · headache · hyperhidrosis · hypertension · mydriasis · nausea · palpitations · vascular disorders · vision blurred

**SIDE-EFFECTS, FURTHER INFORMATION** Absorption of antazoline and xylometazoline may result in systemic side-effects.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Otrivine Antistin** (Thea Pharmaceuticals Ltd)  
Xylometazoline hydrochloride 500 microgram per 1 ml,  
Antazoline sulfate 5 mg per 1 ml Otrivine Antistin 0.5%/0.05% eye  
drops | 10 ml P £3.35 DT = £3.35

#### Azelastine hydrochloride

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day

###### Perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks
- ▶ Adult: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye irritation · taste bitter (if applied incorrectly)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Optilast** (Meda Pharmaceuticals Ltd)  
Azelastine hydrochloride 500 microgram per 1 ml Optilast 0.05%  
eye drops | 8 ml PoM £6.40 DT = £6.40

#### Epinastine hydrochloride

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 12-17 years: Apply twice daily for maximum 8 weeks
- ▶ Adult: Apply twice daily for maximum 8 weeks

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort
- ▶ **Uncommon** Dry eye · eye disorders · headache · nasal irritation · rhinitis · taste altered · visual impairment

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Relestat** (Allergan Ltd)  
Epinastine hydrochloride 500 microgram per 1 ml Relestat  
500micrograms/ml eye drops | 5 ml PoM £9.90 DT = £9.90

#### Ketotifen

##### ● INDICATIONS AND DOSE

###### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily
- ▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: antihistamines, sedating

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye disorders · eye inflammation
- ▶ **Uncommon** Conjunctival haemorrhage · drowsiness · dry eye · dry mouth · headache · skin reactions · vision disorders
- ▶ **Frequency not known** Asthma exacerbated · facial swelling · oedema

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

###### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Ketofall** (Scope Ophthalmics Ltd)  
**Ketotifen (as Ketotifen hydrogen fumarate) 250 microgram per 1 ml** Ketofall 0.25mg/ml eye drops 0.4ml unit dose | 30 unit dose PoM £6.95 DT = £6.95
- ▶ **Zaditen** (Thea Pharmaceuticals Ltd)  
**Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml** Zaditen 250micrograms/ml eye drops | 5 ml PoM £7.80 DT = £7.80

## Olopatadine

### ● INDICATIONS AND DOSE

#### Seasonal allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 3-17 years: Apply twice daily for maximum 4 months
- ▶ Adult: Apply twice daily for maximum 4 months

### ● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · dry eye · eye discomfort · headache · nasal dryness · taste altered
- ▶ **Uncommon** Dizziness · eye disorders · eye inflammation · increased risk of infection · numbness · skin reactions · vision disorders
- ▶ **Frequency not known** Drowsiness · dyspnoea · malaise · nausea · vomiting

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Opatanol** (Novartis Pharmaceuticals UK Ltd)  
**Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml** Opatanol 1mg/ml eye drops | 5 ml [PoM] £4.68 DT = £4.68

## MAST-CELL STABILISERS

## Lodoxamide

### ● INDICATIONS AND DOSE

#### Allergic conjunctivitis

- ▶ TO THE EYE
- ▶ Child 4-17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
- ▶ Adult: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

### ● SIDE-EFFECTS

- ▶ **Common or very common** Dry eye · eye discomfort · eye disorders · vision disorders
- ▶ **Uncommon** Corneal deposits · dizziness · eye inflammation · headache · nausea
- ▶ **Rare or very rare** Nasal complaints · rash · taste altered

- **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- ▶ **Alomide** (Novartis Pharmaceuticals UK Ltd)  
**Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml** Alomide 0.1% eye drops | 10 ml [PoM] £5.21 DT = £5.21

## Nedocromil sodium

25-Jul-2018

### ● INDICATIONS AND DOSE

#### Seasonal and perennial conjunctivitis

- ▶ TO THE EYE
- ▶ Child 6-17 years: Apply twice daily, increased if necessary to 4 times a day, max.12 weeks duration of treatment for seasonal allergic conjunctivitis
- ▶ Adult: Apply twice daily, increased if necessary to 4 times a day, max.12 weeks duration of treatment for seasonal allergic conjunctivitis

#### Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child 6-17 years: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye discomfort · eye strain · taste altered

- **MEDICINAL FORMS** No licensed medicines listed.

## Sodium cromoglicate

25-Jul-2018

### (Sodium cromoglycate)

### ● INDICATIONS AND DOSE

#### Allergic conjunctivitis | Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply 4 times a day
- ▶ Adult: Apply 4 times a day

- **SIDE-EFFECTS** Eye stinging

- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

- ▶ **Sodium cromoglicate (Non-proprietary)**  
**Sodium cromoglicate 20 mg per 1 ml** Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £10.13 DT = £10.09
- ▶ **Opticrom** (Sanofi)  
**Sodium cromoglicate 20 mg per 1 ml** Opticrom Allergy 2% eye drops | 13.5 ml [PoM] £8.03 DT = £10.09

## 1.2 Inflammatory eye conditions

### Other drugs used for inflammatory eye conditions

Adalimumab, p. 1108

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

## Nepafenac

06-Jun-2017

### ● INDICATIONS AND DOSE

#### Prophylaxis and treatment of postoperative pain and inflammation associated with cataract surgery | Reduction in the risk of postoperative macular oedema associated with cataract surgery in diabetic patients

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **CAUTIONS** Avoid sunlight · corneal epithelial breakdown (if evidence of, then discontinue immediately)

- **INTERACTIONS** → Appendix 1: NSAIDs

### ● SIDE-EFFECTS

- ▶ **Uncommon** Eye discomfort · eye disorders · eye inflammation
- ▶ **Rare or very rare** Allergic dermatitis · corneal deposits · dizziness · dry eye · headache · nausea
- ▶ **Frequency not known** Cutis laxa · vision disorders · vomiting

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (May 2017) that nepafenac (*Nevanac*<sup>®</sup>) 3 mg/mL eye drops are accepted for use within NHS Scotland for the reduction in risk of postoperative macular oedema associated with cataract surgery in diabetic patients.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Nevanac** (Novartis Pharmaceuticals UK Ltd)

Nepafenac 1 mg per 1 ml Nevanac 1mg/ml eye drops | 5 ml (PoM)

£14.92 DT = £14.92

Nepafenac 3 mg per 1 ml Nevanac 3mg/ml eye drops | 3 ml (PoM)

£14.92 DT = £14.92

## CORTICOSTEROIDS

672

### Betamethasone

21-Dec-2017

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

#### INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

###### ▶ TO THE EYE USING EYE DROP

- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency

- ▶ Adult: Apply every 1–2 hours until controlled then reduce frequency

###### ▶ TO THE EYE USING EYE OINTMENT

- ▶ Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- ▶ Adult: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Vision disorders

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol** (RPH Pharmaceuticals AB)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml (PoM) £2.32 DT = £2.32

- ▶ **Vistamethasone** (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml (PoM) £1.02 | 10 ml (PoM) £1.16 DT = £2.32

£2.32

#### Eye ointment

- ▶ **Betamethasone (Non-proprietary)**

Betamethasone sodium phosphate 1 mg per

1 gram Betamethasone 0.1% eye ointment | 3 gram (PoM) £3.48 DT

= £1.41

Combinations available: **Betamethasone with neomycin**, p. 1164

### Dexamethasone

21-Dec-2017

- **DRUG ACTION** Dexamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

#### INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

###### ▶ TO THE EYE USING EYE DROP

- ▶ Child: Apply 4–6 times a day

- ▶ Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

##### Short term local treatment of inflammation (severe conditions)

###### ▶ TO THE EYE USING EYE DROP

- ▶ Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

**Macular oedema following either branch retinal vein occlusion or central retinal vein occlusion (specialist use only) | Visual impairment due to diabetic macular oedema in adults who are pseudophakic, or who are insufficiently responsive to, or unsuitable for non-corticosteroid therapy (specialist use only) | For the treatment of inflammation of the posterior segment of the eye presenting as non-infectious uveitis (specialist use only)**

###### ▶ BY INTRAVITREAL INJECTION

- ▶ Adult: 700 micrograms, to be administered into the affected eye, concurrent administration to both eyes not recommended. For further information on pre-treatment, administration and repeat dosing, consult product literature

- **UNLICENSED USE** *Maxidex*<sup>®</sup> not licensed for use in children under 2 years. *Dropodex*<sup>®</sup> not licensed for use in children.

#### CONTRA-INDICATIONS

- With intravitreal use Active ocular herpes simplex · active or suspected ocular infection · active or suspected periocular infection · rupture of the posterior lens capsule in patients with aphakia, iris or transscleral fixated intra-ocular lens or anterior chamber intra-ocular lens · uncontrolled advanced glaucoma

#### CAUTIONS

- ▶ With intravitreal use history of ocular viral infection (including herpes simplex) · posterior capsule tear or iris defect (risk of implant migration into the anterior chamber which may cause corneal oedema and, in persistent severe cases, the need for corneal transplantation) · retinal vein occlusion with significant retinal ischaemia

- **INTERACTIONS** → Appendix 1: corticosteroids

#### SIDE-EFFECTS

##### ▶ Common or very common

- ▶ When used by eye (topical) Eye discomfort

- ▶ With intravitreal use Eye discomfort

##### ▶ Uncommon

- ▶ When used by eye (topical) Photophobia · taste altered

- ▶ With intravitreal use Retinitis necrotising

- **PREGNANCY** Dexamethasone readily crosses the placenta.

- ▶ With intravitreal use in adults Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

#### BREAST FEEDING

- ▶ With intravitreal use in adults Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

#### MONITORING REQUIREMENTS

- ▶ With intravitreal use in adults Monitor intra-ocular pressure and for signs of ocular infection. In patients with posterior capsule tear or iris defect monitor for implant migration to allow for; early diagnosis and management.

#### PRESCRIBING AND DISPENSING INFORMATION

- ▶ When used by eye Although multi-dose dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Dexamethasone intravitreal implant for the treatment of macular oedema secondary to retinal vein occlusion (July 2011) NICE TA229**
- ▶ With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for the treatment of macular oedema following central retinal vein occlusion. Dexamethasone intravitreal implant is also recommended as an option for the treatment of macular oedema following branch retinal vein occlusion when:

- treatment with laser photocoagulation has not been beneficial, *or*
- treatment with laser photocoagulation is not considered suitable because of the extent of macular haemorrhage.

[www.nice.org.uk/TA229](http://www.nice.org.uk/TA229)

- ▶ **Dexamethasone intravitreal implant for treating diabetic macular oedema (July 2015)** NICE TA349
- ▶ With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for treating diabetic macular oedema only if:
  - the implant is to be used in an eye with an intraocular (pseudophakic) lens **and**
  - the diabetic macular oedema does not respond to non-corticosteroid treatment, or such treatment is unsuitable.

[www.nice.org.uk/TA349](http://www.nice.org.uk/TA349)

- ▶ **Adalimumab and dexamethasone for treating non-infectious uveitis (July 2017)** NICE TA460
- ▶ With intravitreal use in adults Dexamethasone intravitreal implant is recommended as an option for treating non-infectious uveitis in the posterior segment of the eye in patients, only if there is:
  - active disease (that is, current inflammation in the eye), **and**
  - worsening vision with a risk of blindness.
 Patients currently receiving dexamethasone whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA460](http://www.nice.org.uk/TA460)

#### Scottish Medicines Consortium (SMC) decisions

- ▶ With intravitreal use in adults The *Scottish Medicines Consortium* has advised (June 2012) that dexamethasone intravitreal implant (*Ozurdex*®) is accepted for restricted use within NHS Scotland for the treatment of patients with macular oedema following central retinal vein occlusion, and in patients with branch retinal vein occlusion who are not clinically suitable for laser treatment, including patients with dense macular haemorrhage, or patients who have received and failed on previous laser treatment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- ▶ **Dexafree** (Thea Pharmaceuticals Ltd)  
Dexamethasone sodium phosphate **1 mg per 1 ml** Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.70
- ▶ **Dropodex** (Rayner Pharmaceuticals Ltd)  
Dexamethasone sodium phosphate **1 mg per 1 ml** Dropodex 0.1% eye drops 0.4ml unit dose | 20 unit dose [PoM] £10.48 DT = £10.48
- ▶ **Eythalm** (Aspire Pharma Ltd)  
Dexamethasone **1 mg per 1 ml** Eythalm 1mg/ml eye drops | 6 ml [PoM] £9.75 DT = £9.75
- ▶ **Maxidex** (Novartis Pharmaceuticals UK Ltd)  
Dexamethasone **1 mg per 1 ml** Maxidex 0.1% eye drops | 5 ml [PoM] £1.42 DT = £1.42 | 10 ml [PoM] £2.80 DT = £2.80

#### Implant

- ▶ **Ozurdex** (Allergan Ltd)  
Dexamethasone **700 microgram** Ozurdex 700microgram intravitreal implant in applicator | 1 device [PoM] £870.00 (Hospital only)

Combinations available: *Dexamethasone with framycetin sulfate and gramicidin*, p. 1164 • *Dexamethasone with hypromellose, neomycin and polymyxin B sulfate*, p. 1164 • *Dexamethasone with tobramycin*, p. 1164

## Fluorometholone

21-Dec-2017

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short term)

- ▶ TO THE EYE
- ▶ Child 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day
- ▶ Adult: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **SIDE-EFFECTS** Cataract • eye discomfort • eye disorders • eye infection • eye inflammation • rash • taste altered • vision disorders

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- ▶ **FML Liquifilm** (Allergan Ltd)  
Fluorometholone **1 mg per 1 ml** FML Liquifilm 0.1% ophthalmic suspension | 5 ml [PoM] £1.71 DT = £1.71 | 10 ml [PoM] £2.95 DT = £2.95

**672**

## Prednisolone

21-Dec-2017

- **DRUG ACTION** Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

### ● INDICATIONS AND DOSE

#### Local treatment of inflammation (short-term)

- ▶ TO THE EYE
- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ Adult: Apply every 1–2 hours until controlled then reduce frequency

### ● UNLICENSED USE

- ▶ In children *Pred Forte*® not licensed for use in children (age range not specified by manufacturer).

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Eye discomfort • taste altered • visual impairment

- **DESCRIBING AND DISPENSING INFORMATION** Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- ▶ **Pred Forte** (Allergan Ltd)  
Prednisolone acetate **10 mg per 1 ml** Pred Forte 1% eye drops | 5 ml [PoM] £1.82 DT = £1.82 | 10 ml [PoM] £3.66 DT = £3.66

#### Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Predsol** (RPH Pharmaceuticals AB)  
Prednisolone sodium phosphate **5 mg per 1 ml** Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

## CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

### Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1162, neomycin sulfate p. 520.

#### ● INDICATIONS AND DOSE

##### Local treatment of eye inflammation and bacterial infection (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Adult: Apply up to 6 times a day

#### POTENCY

- ▶ Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (RPH Pharmaceuticals AB)

**Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml** Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

### Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, framycetin sulfate p. 1195.

#### ● INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE
- ▶ Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency
- ▶ Adult: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: corticosteroids
- **LESS SUITABLE FOR PRESCRIBING** Sofradex® is less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

- ▶ **Sofradex** (Sanofi)

**Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml** Sofradex ear/eye drops | 8 ml [PoM] £7.50

### Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, neomycin sulfate p. 520.

#### ● INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Adult: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Adult: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

- ▶ **Maxitrol** (Novartis Pharmaceuticals UK Ltd)

**Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram** Maxitrol eye ointment | 3.5 gram [PoM] £1.44

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- ▶ **Maxitrol** (Novartis Pharmaceuticals UK Ltd)

**Dexamethasone 1 mg per 1 ml, Hypromellose 5 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml** Maxitrol eye drops | 5 ml [PoM] £1.68

### Dexamethasone with tobramycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 1162, tobramycin p. 1171.

#### ● INDICATIONS AND DOSE

##### Local treatment of inflammation (short-term)

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: aminoglycosides · corticosteroids
- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with tobramycin eye-drops are less suitable for prescribing.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Tobradex** (Novartis Pharmaceuticals UK Ltd)

**Dexamethasone 1 mg per 1 ml, Tobramycin 3 mg per 1 ml** Tobradex 3mg/ml / 1mg/ml eye drops | 5 ml [PoM] £5.37 DT = £5.37

## IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

### Ciclosporin

16-Nov-2018

#### (Cyclosporin)

- **DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

#### ● INDICATIONS AND DOSE

##### IKERVIS<sup>®</sup>

#### Severe keratitis in dry eye disease that has not responded to treatment with tear substitutes (initiated by a specialist)

- ▶ TO THE EYE
  - ▶ Adult: Apply 1 drop once daily, to be applied to the affected eye(s) at bedtime, review treatment at least every 6 months
- **CONTRA-INDICATIONS** Active or suspected ocular or peri-ocular infection
- **CAUTIONS** Glaucoma—limited information available · history of ocular herpes—no information available
- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Eye discomfort · eye disorders · eye inflammation · vision blurred
  - ▶ **Uncommon** Eye deposit · increased risk of infection
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—limited information.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises keep eyes closed for 2 minutes after using eye drops to increase local drug action and reduce systemic absorption.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of blurred vision.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ **Ciclosporin for treating dry eye disease that has not improved despite treatment with artificial tears (December 2015)** NICE TA369

Ciclosporin (Ikervis<sup>®</sup>) is recommended as an option, within its marketing authorisation, for treating severe keratitis in patients with dry eye disease that has not improved despite treatment with tear substitutes.  
[www.nice.org.uk/guidance/ta369](http://www.nice.org.uk/guidance/ta369)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

**Eye drops**

  - ▶ **Ikervis** (Santen UK Ltd)  
**Ciclosporin 1 mg per 1 ml** Ikervis 0.1% eye drops 0.3ml unit dose | 30 unit dose [POM] £72.00 DT = £72.00

## NERVE GROWTH FACTORS

### Cenegermin

10-Aug-2018

- **DRUG ACTION** Cenegermin is a recombinant form of human nerve growth factor which allows restoration of corneal integrity; endogenous human nerve growth factor is involved in the differentiation and maintenance of neurons.

#### ● INDICATIONS AND DOSE

#### Moderate or severe neurotrophic keratitis (specialist use only)

- ▶ TO THE EYE
  - ▶ Adult: Apply 1 drop 6 times a day, to be applied every 2 hours, starting in the morning and completing within 12 hours; treatment should be continued for 8 weeks
- **CONTRA-INDICATIONS** Eye infection—resolve before initiating treatment (if an infection occurs during treatment, cenegermin should be suspended until infection resolution) · patients requiring immediate corneal surgery (assess for risk of corneal melting or impending perforation before initiating treatment)
- **CAUTIONS** Ocular cancer—manufacturer recommends monitor for cancer progression before and after treatment
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Eye disorders · eye inflammation · eye pain · headache · photophobia
  - ▶ **Uncommon** Corneal abscess
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that other topical ophthalmic preparations should be administered at least 15 minutes before or after use.
- **HANDLING AND STORAGE** For information on storage of cenegermin, consult product literature.
- **PATIENT AND CARER ADVICE** Manufacturer advises patients and carers should be counselled on how to administer cenegermin eye drops.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

  - ▶ **Cenegermin for treating neurotrophic keratitis (July 2018)** NICE TA532

Cenegermin (Oxervate<sup>®</sup>) is not recommended, within its marketing authorisation, for treating moderate or severe neurotrophic keratitis in adults. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/guidance/ta532](http://www.nice.org.uk/guidance/ta532)
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

**Eye drops**

  - ▶ **Oxervate** (Dompe UK Ltd) ▼  
**Cenegermin 20 microgram per 1 ml** Oxervate 20micrograms/ml eye drops preservative free | 1 ml [POM] ☒ (Hospital only)

## 1.2a Anterior uveitis

### ANTIMUSCARINICS

#### Antimuscarinics (eye)

- **CAUTIONS** Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber) (in adults) · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) (in children) · neonates at increased risk of systemic toxicity (in neonates)
- **SIDE-EFFECTS** Dizziness · photophobia · skin reactions · tachycardia
- **PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

11  
Eye

#### Atropine sulfate

##### ● INDICATIONS AND DOSE

###### Cycloplegia

- ▶ TO THE EYE USING EYE DROP
- ▶ Adult: (consult product literature)

###### Anterior uveitis

- ▶ TO THE EYE USING EYE DROP
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: atropine
- **SIDE-EFFECTS**
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic side-effects can occur.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

##### Eye drops

- ▶ **Atropine sulfate (Non-proprietary)**  
Atropine sulfate 10 mg per 1 ml Atropine 1% eye drops | 10 ml [PoM](#) | £131.88 DT = £131.87
- ▶ **Atropine sulfate** (Bausch & Lomb UK Ltd)  
Atropine sulfate 10 mg per 1 ml Minims atropine sulfate 1% eye drops 0.5ml unit dose | 20 unit dose [PoM](#) | £15.10 DT = £15.10

#### Cyclopentolate hydrochloride

##### ● INDICATIONS AND DOSE

###### Cycloplegia

- ▶ TO THE EYE
- ▶ Child 3 months-11 years: Apply 1 drop, 30–60 minutes before examination, using 1% eye drops
- ▶ Child 12-17 years: Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops

###### Uveitis

- ▶ TO THE EYE
- ▶ Child 3 months-17 years: Apply 1 drop 2–4 times a day, using 0.5% eye drops (1% for deeply pigmented eyes)

#### Anterior uveitis | Cycloplegia

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: cyclopentolate
- **SIDE-EFFECTS** Abdominal distension (in children) · arrhythmias · behaviour abnormal (in children) · cardio-respiratory distress (in children) · conjunctivitis (on prolonged administration) · constipation · dry mouth · eye oedema (on prolonged administration) · flushing · gastrointestinal disorders · hyperaemia (on prolonged administration) · mydriasis · palpitations · psychotic disorder (in children) · staggering · urinary disorders · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Systemic side-effects can occur, particularly in children and the elderly.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose cyclopentolate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Cyclopentolate hydrochloride** (Bausch & Lomb UK Ltd)  
Cyclopentolate hydrochloride 5 mg per 1 ml Minims cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM](#) | £11.41 DT = £11.41
- ▶ **Cyclopentolate hydrochloride 10 mg per 1 ml** Minims cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoM](#) | £11.68 DT = £11.68
- ▶ **Mydrilate** (Intrapharm Laboratories Ltd)  
Cyclopentolate hydrochloride 5 mg per 1 ml Mydrilate 0.5% solution | 5 ml [PoM](#) | £8.08 DT = £8.08
- ▶ **Cyclopentolate hydrochloride 10 mg per 1 ml** Mydrilate 1% solution | 5 ml [PoM](#) | £8.08 DT = £8.08

#### Homatropine hydrobromide

##### ● INDICATIONS AND DOSE

###### Anterior uveitis

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: homatropine
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: eye drops

## 2 Dry eye conditions

### Dry eye

#### Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren's syndrome) often responds to tear replacement therapy or pilocarpine p. 1183 given by mouth in adults. The severity of the condition and patient preference will often guide the choice of preparation.

Hypromellose p. 1168 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine p. 1167 can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 1168 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 1169, with or without trehalose, are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 1169 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. They are also used to irrigate the eye. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery. Sodium chloride 5% eye drops are used for the short-term treatment of corneal oedema in adults.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

## OCULAR LUBRICANTS

### Acetylcysteine

07-Feb-2017

#### ● INDICATIONS AND DOSE

##### Tear deficiency | Impaired or abnormal mucus production

- ▶ TO THE EYE
- ▶ Adult: Apply 3–4 times a day

#### ● SIDE-EFFECTS Eye discomfort · eye redness

#### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

##### ▶ **lube** (Rayner Pharmaceuticals Ltd)

**Acetylcysteine 50 mg per 1 ml** lube 5% eye drops | 10 ml [PoM] £16.90 DT = £16.90

## Carbomers

### (Polyacrylic acid)

#### ● INDICATIONS AND DOSE

##### Dry eyes including keratoconjunctivitis sicca, unstable tear film

- ▶ TO THE EYE
- ▶ Child: Apply 3–4 times a day or when required
- ▶ Adult: Apply 3–4 times a day or when required

#### ● UNLICENSED USE

- ▶ In children Some preparations not licensed for use in children.

#### ● PRESCRIBING AND DISPENSING INFORMATION Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythrityl.

#### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

##### Eye gel

EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate

##### ▶ **Blephagel** (Thea Pharmaceuticals Ltd)

**Carbomer 3.6 mg per 1 gram** Blephagel 0.36% eye gel preservative free | 30 gram £7.53

##### ▶ **Liquivisc** (Thea Pharmaceuticals Ltd)

**Carbomer 974P 2.5 mg per 1 gram** Liquivisc 0.25% eye gel | 10 gram [P] £4.50 DT = £4.50

##### Eye drops

##### ▶ **GetTears** (Bausch & Lomb UK Ltd)

**Carbomer 980 2 mg per 1 gram** GetTears 0.2% gel | 10 gram [P] £2.80 DT = £2.80

#### ▶ **Viscotears** (Bausch & Lomb UK Ltd)

**Carbomer 980 2 mg per 1 gram** Viscotears 2mg/g liquid gel | 10 gram [P] £1.59 DT = £2.80

Viscotears 2mg/g eye gel 0.6ml unit dose | 30 unit dose [P] £5.42 DT = £5.42

## Carmellose sodium

#### ● INDICATIONS AND DOSE

##### Dry eye conditions

- ▶ TO THE EYE
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

#### ● PRESCRIBING AND DISPENSING INFORMATION Some preparations are contained units which are resealable and may be used for up to 12 hours.

#### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

##### ▶ **Carmellose sodium (Non-proprietary)**

Carmellose 0.5% eye drops | 10 ml £7.49

Evolve Carmellose 0.5% eye drops preservative free | 10 ml £4.99

##### ▶ **Carmellose sodium 5 mg per 1 ml** Carmellose 0.5% eye drops 0.4ml unit dose preservative free | 30 unit dose £5.75 DT = £4.80

##### ▶ **Carmellose** (Aspire Pharma Ltd, Medicom Healthcare Ltd)

PF Drops Carmellose 0.5% eye drops preservative free | 10 ml £7.49

## Soybean oil

**● INDICATIONS AND DOSE****Dry eye conditions**

- ▶ TO THE EYE
- ▶ Child: Apply up to 4 times a day
- ▶ Adult: Apply up to 4 times a day

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- ▶ **Emustil** (Rayner Pharmaceuticals Ltd)  
Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose £6.22

## 3 Eye infections

### Eye, infections

**Eye infections**

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by application of an antibacterial eye ointment to the conjunctival sac or to the lid margins. Systemic treatment may occasionally be required and is usually undertaken after culturing organisms from the lid margin and determining their antimicrobial sensitivity; antibiotics such as the tetracyclines given for 3 months or longer may be appropriate.

Most cases of acute bacterial conjunctivitis are self limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis.

*Corneal ulcer* and *keratitis* require specialist treatment and may call for hospital admission for intensive therapy.

*Endophthalmitis* is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

**Antibacterials for eye infections**

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 1173 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 1172, levofloxacin p. 1172, moxifloxacin p. 1172, and ofloxacin p. 1173; the aminoglycosides, gentamicin p. 1171 and tobramycin p. 1171 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 1171 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphylococcal infections.

Propamidine isetonate p. 1173 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Cefuroxime p. 1171 can be administered by intracameral injection for the prophylaxis of endophthalmitis following cataract surgery.

**With corticosteroids**

Many antibacterial preparations should incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

**Administration**

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) *or* 3–4 times daily (if eye ointment used alone).

**Antifungals for eye infections**

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression can

encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or [www.moorfields.nhs.uk](http://www.moorfields.nhs.uk).

### Antivirals for eye infections

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 1174 or ganciclovir p. 1174. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. See systemic treatment of CMV retinitis.

## 3.1 Bacterial eye infection

### ANTIBACTERIALS > AMINOGLYCOSIDES

F 518

#### Gentamicin

11-Dec-2017

##### ● INDICATIONS AND DOSE

##### Bacterial eye infections

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient
- ▶ Adult: Apply 1 drop at least every 2 hours, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **INTERACTIONS** → Appendix 1: aminoglycosides
  - **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.
  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
- Ear/eye drops solution**
- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [POM] £2.63 DT = £2.47

F 518

#### Tobramycin

22-Nov-2016

##### ● INDICATIONS AND DOSE

##### Local treatment of infections

- ▶ TO THE EYE
- ▶ Child 1–17 years: Apply twice daily for 6–8 days

- ▶ Adult: Apply twice daily for 6–8 days
- Local treatment of infections (severe infection)**
- ▶ TO THE EYE
  - ▶ Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days
  - ▶ Adult: Apply 4 times a day for first day, then apply twice daily for 5–7 days

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **MEDICINAL FORMS** No licensed medicines listed

## ANTIBACTERIALS > QUINOLONES

F 557

### Ciprofloxacin

01-May-2019

#### ● INDICATIONS AND DOSE

##### Superficial bacterial eye infection

- ▶ TO THE EYE USING EYE DROP
- ▶ **Child:** Apply 4 times a day for maximum duration of treatment 21 days
- ▶ **Adult:** Apply 4 times a day for maximum duration of treatment 21 days
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ **Child 1-17 years:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
- ▶ **Adult:** Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

##### Superficial bacterial eye infection (severe infection)

- ▶ TO THE EYE USING EYE DROP
- ▶ **Child:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
- ▶ **Adult:** Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

##### Corneal ulcer

- ▶ TO THE EYE USING EYE DROP
- ▶ **Child:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3-14, maximum duration of treatment 21 days, to be administered throughout the day and night
- ▶ **Adult:** Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3-14, maximum duration of treatment 21 days, to be administered throughout the day and night
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ **Child 1-17 years:** Apply 1.25 centimetres every 1-2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night
- ▶ **Adult:** Apply 1.25 centimetres every 1-2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

- **UNLICENSED USE** Eye ointment not licensed for use in children under 1 year.
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS**
- ▶ **Rare or very rare** Ear pain
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment

#### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Ciloxan** (Novartis Pharmaceuticals UK Ltd)  
**Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml** Ciloxan 0.3% eye drops | 5 ml **[PoM]** £4.70 DT = £4.70

### Levofloxacin

01-May-2019

#### ● INDICATIONS AND DOSE

##### Local treatment of eye infections

- ▶ TO THE EYE
- ▶ **Child 1-17 years:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days
- ▶ **Adult:** Apply every 2 hours for first 2 days, to be applied maximum 8 times a day, then apply 4 times a day for 3 days

● **INTERACTIONS** → Appendix 1: quinolones

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

- EXCIPIENTS: May contain Benzalkonium chloride
- ▶ **Levofloxacin (Non-proprietary)**  
**Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml** Levofloxacin 5mg/ml eye drops | 5 ml **[PoM]** £6.95 DT = £6.95
- ▶ **Oftaquix** (Santen UK Ltd)  
**Levofloxacin (as Levofloxacin hemihydrate) 5 mg per 1 ml** Oftaquix 5mg/ml eye drops 0.3ml unit dose | 30 unit dose **[PoM]** £17.95 DT = £17.95
- Oftaquix 5mg/ml eye drops | 5 ml **[PoM]** £6.95 DT = £6.95

F 557

### Moxifloxacin

#### ● INDICATIONS AND DOSE

##### Local treatment of infections

- ▶ TO THE EYE
- ▶ **Child:** Apply 3 times a day continue treatment for 2-3 days after infection improves; review if no improvement within 5 days
- ▶ **Adult:** Apply 3 times a day continue treatment for 2-3 days after infection improves; review if no improvement within 5 days

● **INTERACTIONS** → Appendix 1: quinolones

● **SIDE-EFFECTS**

- ▶ **Uncommon** Conjunctival haemorrhage
- ▶ **Rare or very rare** Laryngeal pain · nasal discomfort

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

- ▶ **Moxivig** (Novartis Pharmaceuticals UK Ltd)  
**Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml** Moxivig 0.5% eye drops | 5 ml **[PoM]** £9.80 DT = £9.80

F 557

## Ofloxacin

### ● INDICATIONS AND DOSE

#### Local treatment of infections

##### ► TO THE EYE

- Child 1-17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment
- Adult: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

- **CAUTIONS** Corneal ulcer (risk of corneal perforation) · epithelial defect (risk of corneal perforation)
- **INTERACTIONS** → Appendix 1: quinolones
- **SIDE-EFFECTS** Oropharyngeal swelling · tongue swelling
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in *animal* studies).
- **BREAST FEEDING** Manufacturer advises avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ► Exocin (Allergan Ltd)

Ofloxacin 3 mg per 1 ml Exocin 0.3% eye drops | 5 ml [PoM] £2.17 DT = £2.17

## ANTIBACTERIALS > OTHER

## Chloramphenicol

- **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

### ● INDICATIONS AND DOSE

#### Superficial eye infections

##### ► TO THE EYE USING EYE DROP

- Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
- Adult: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

##### ► TO THE EYE USING EYE OINTMENT

- Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone
- Adult: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS** Angioedema · bone marrow disorders · eye stinging · fever · paraesthesia · skin reactions
- **PREGNANCY** Avoid unless essential—no information on *topical* use but risk of 'neonatal grey-baby syndrome' with *oral* use in third trimester.
- **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone-marrow toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol for eye infections [www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0](http://www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0)

- **EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Phenylmercuric acetate

##### ► Chloramphenicol (Non-proprietary)

Chloramphenicol 5 mg per 1 ml Minims chloramphenicol 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.43 DT = £11.43  
Chloramphenicol 0.5% eye drops | 10 ml [PoM] £2.49 DT = £1.55

##### ► Chloromycetin (Advanz Pharma)

Chloramphenicol 5 mg per 1 ml Chloromycetin Redidrops 0.5% | 10 ml [PoM] £0.90 DT = £1.55

##### ► Eykappo (Aspire Pharma Ltd)

Chloramphenicol 5 mg per 1 ml Eykappo 5mg/ml eye drops | 10 ml [PoM] £10.12 DT = £10.12

#### Eye ointment

##### ► Chloramphenicol (Non-proprietary)

Chloramphenicol 10 mg per 1 gram Chloramphenicol 1% eye ointment | 4 gram [PoM] £2.00 DT = £2.00

## Fusidic acid

16-Jun-2017

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

### ● INDICATIONS AND DOSE

#### Staphylococcal eye infections

##### ► TO THE EYE

- Child: Apply twice daily
- Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: fusidic acid

### ● SIDE-EFFECTS

- **Common or very common** Dry eye · eye discomfort · vision blurred
- **Uncommon** Crying on application · skin reactions · watering eye
- **Frequency not known** Angioedema · eye inflammation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Modified-release drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

##### ► Fusidic acid (Non-proprietary)

Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram [PoM] £29.06 DT = £29.06

## ANTIPROTOZOALS > OTHER

## Propamidine isetionate

### ● INDICATIONS AND DOSE

#### Acanthamoeba keratitis infections (specialist use only) |

#### Local treatment of eye infections

- TO THE EYE USING EYE OINTMENT
- Adult: Apply 1–2 times a day
- TO THE EYE USING EYE DROP
- Adult: Apply up to 4 times a day

- **UNLICENSED USE** Not licensed for *acanthamoeba keratitis* infections.

- **SIDE-EFFECTS** Eye discomfort · vision blurred
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- ▶ **Golden Eye (dibrompropamidine)** (Cambridge Healthcare Supplies Ltd)

Dibrompropamidine isetonate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram [P] £3.98 DT = £3.98

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Brolene (Propamidine)** (Sanofi)

Propamidine isetonate 1 mg per 1 ml Brolene 0.1% eye drops | 10 ml [P] £2.80 DT = £2.80

- ▶ **Golden Eye (propamidine)** (Cambridge Healthcare Supplies Ltd)

Propamidine isetonate 1 mg per 1 ml Golden Eye 0.1% drops | 10 ml [P] £3.62 DT = £2.80

potential should be advised to use barrier contraception during and for at least 90 days after treatment.

- **PREGNANCY** Manufacturer advises avoid unless no suitable alternative—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid unless no suitable alternative—limited information available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye gel**

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Virgan** (Thea Pharmaceuticals Ltd)

Ganciclovir 1.5 mg per 1 gram Virgan 0.15% eye gel | 5 gram [PoM] £19.99 DT = £19.99

## 3.2 Viral eye infection

### 3.2a Ophthalmic herpes simplex

#### ANTIVIRALS > NUCLEOSIDE ANALOGUES

### Aciclovir

(Acyclovir)

**● INDICATIONS AND DOSE****Herpes simplex infection (local treatment)**

- ▶ TO THE EYE USING EYE OINTMENT

▶ Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

▶ Adult: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

- **INTERACTIONS** → Appendix 1: aciclovir

**● SIDE-EFFECTS**

- ▶ **Common or very common** Eye inflammation · eye pain

**● PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections [www.medicinesforchildren.org.uk/aciclovir-eye-ointment-herpes-simplex-infection-0](http://www.medicinesforchildren.org.uk/aciclovir-eye-ointment-herpes-simplex-infection-0)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**

- ▶ **Zovirax** (GlaxoSmithKline UK Ltd)

Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram [PoM] £9.34 DT = £9.34

### Ganciclovir

31-May-2018

**● INDICATIONS AND DOSE****Acute herpetic keratitis**

- ▶ TO THE EYE

▶ Adult: Apply 5 times a day until healing complete, then apply 3 times a day for a further 7 days, treatment does not usually exceed 21 days

- **INTERACTIONS** → Appendix 1: ganciclovir

**● SIDE-EFFECTS**

- ▶ **Common or very common** Eye stinging · punctate keratitis

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

- **CONCEPTION AND CONTRACEPTION** As teratogenicity and impaired fertility observed in animal studies with *oral* and *intravenous* ganciclovir, manufacturer advises women of childbearing potential should use effective contraception during treatment; men with partners of childbearing

## 4 Eye procedures

### Mydriatics and cycloplegics

**Overview**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Longer-acting options include cyclopentolate hydrochloride 1% p. 1166 (action up to 24 hours) or atropine sulfate p. 1166 (action up to 7 days).

Phenylephrine hydrochloride p. 1175 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 1166 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

**Other drugs used for Eye procedures** Apraclonidine, p. 1187

#### ANTIMUSCARINICS

P 1166

### Tropicamide

**● INDICATIONS AND DOSE****Funduscopy**

- ▶ TO THE EYE

▶ Child: 0.5% eye drops to be applied 20 minutes before examination

▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: tropicamide

- **SIDE-EFFECTS** Eye erythema · eye irritation (on prolonged administration) · eye pain · headache · hypotension · nausea · syncope · vision blurred

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

- ▶ **Mydriacyl** (Alcon Eye Care Ltd)

Tropicamide 10 mg per 1 ml Mydriacyl 1% eye drops | 5 ml [PoM] £1.60

- ▶ **Tropicamide** (Bausch & Lomb UK Ltd)  
**Tropicamide 5 mg per 1 ml** Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.18  
**Tropicamide 10 mg per 1 ml** Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.31

Combinations available: *Phenylephrine with tropicamide*, p. 1176 · *Tropicamide with phenylephrine and lidocaine*, p. 1176

## ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

### Povidone-iodine

#### ● INDICATIONS AND DOSE

**Cutaneous peri-ocular and conjunctival antiseptics before ocular surgery**

- ▶ TO THE EYE
- ▶ Adult: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

- **CONTRA-INDICATIONS** Concomitant use of ocular antimicrobial drugs · concomitant use of ocular formulations containing mercury-based preservatives · preterm neonates
- **SIDE-EFFECTS**
  - ▶ Rare or very rare Eye erythema · punctate keratitis
  - ▶ Frequency not known Cytotoxicity · eye discolouration
- **BREAST FEEDING** Avoid regular or excessive use.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye lotion  
**Eye drops**
  - ▶ **Povidone iodine** (Bausch & Lomb UK Ltd)  
**Povidone-iodine 50 mg per 1 ml** Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose [PoM] £16.00

## DIAGNOSTIC AGENTS > DYES

### Fluorescein sodium

#### ● INDICATIONS AND DOSE

**Detection of lesions and foreign bodies**

- ▶ TO THE EYE
- ▶ Adult: Use sufficient amount to stain damaged areas

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.  
**Eye drops**
  - ▶ **Fluorescein sodium** (Bausch & Lomb UK Ltd)  
**Fluorescein sodium 10 mg per 1 ml** Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose [P] £9.25  
**Fluorescein sodium 20 mg per 1 ml** Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose [P] £9.25

## MIOTICS > PARASYMPATHOMIMETICS

### Acetylcholine chloride

#### ● INDICATIONS AND DOSE

**Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis**

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

- **CAUTIONS** Asthma · gastro-intestinal spasm · heart failure · hyperthyroidism · parkinsonism · peptic ulcer · urinary-tract obstruction
- **SIDE-EFFECTS** Bradycardia · corneal decompensation · corneal oedema · dyspnoea · flushing · hyperhidrosis · hypotension
- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Avoid unless potential benefit outweighs risk—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Irrigation

- ▶ **Miochol-E** (Bausch & Lomb UK Ltd)  
**Acetylcholine chloride 20 mg** Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM] £7.28
- ▶ **Miphtel** (Farmigea S.p.A.)  
**Acetylcholine chloride 20 mg** Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM] £43.68 (Hospital only)

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Phenylephrine hydrochloride

#### ● INDICATIONS AND DOSE

**Mydriasis**

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
- ▶ Adult: Apply 1 drop, to be administered before procedure, then apply 1 drop after 60 minutes if required, a drop of topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** 10% strength eye drops in children · 10% strength eye drops in elderly · aneurysms · cardiovascular disease · hypertension · thyrotoxicosis
- **CAUTIONS** Asthma · cerebral arteriosclerosis (in adults) · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber · mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · ocular hyperaemia · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Arrhythmias · conjunctivitis allergic · eye discomfort · hypertension · myocardial infarction (usually after use of 10% strength in patients with pre-existing

cardiovascular disease) · palpitations · periorbital pallor (in children) · vision disorders

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

- ▶ **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)

**Phenylephrine hydrochloride 25 mg per 1 ml** Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose Ⓜ £11.87

**Phenylephrine hydrochloride 100 mg per 1 ml** Minims phenylephrine hydrochloride 10% eye drops 0.5ml unit dose | 20 unit dose Ⓜ £11.87

## Phenylephrine with tropicamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, phenylephrine hydrochloride p. 1175, tropicamide p. 1174.

#### ● INDICATIONS AND DOSE

##### Pre-operative mydriasis | Diagnostic procedures when monotherapy insufficient

- ▶ TO THE EYE

- ▶ **Adult:** One insert to be applied into the lower conjunctival sac up to max. 2 hours before procedure; remove insert within 30 minutes of satisfactory mydriasis, and within 2 hours of application

- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor · tropicamide
- **DIRECTIONS FOR ADMINISTRATION** Patients with severe dry eyes may require a drop of saline to improve insert tolerance.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ophthalmic insert

- ▶ **Mydrisert** (Thea Pharmaceuticals Ltd)

**Tropicamide 28 mg, Phenylephrine hydrochloride 5.4 mg** Mydrisert 5.4mg/0.28mg ophthalmic inserts | 20 insert Ⓜ £84.00

## Tropicamide with phenylephrine and lidocaine

17-Aug-2017

#### ● INDICATIONS AND DOSE

##### Mydriasis and intraocular anaesthesia during cataract surgery

- ▶ BY INTRACAMERAL INJECTION

- ▶ **Adult:** 0.2 mL for 1 dose, to be injected slowly at the start of the surgical procedure

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 0.2 mL dose of *Mydrane*<sup>®</sup> solution for injection contains 0.04 mg of tropicamide, 0.62 mg of phenylephrine hydrochloride and 2 mg of lidocaine hydrochloride.

- **CONTRA-INDICATIONS** Cataract surgery combined with vitrectomy · history of acute, narrow-angle glaucoma · shallow anterior chamber

- **CAUTIONS** Conditions where systemic exposure to phenylephrine or lidocaine could be harmful (consult product literature) · risk of floppy iris syndrome (consult product literature)

- **INTERACTIONS** → Appendix 1: antiarrhythmics · sympathomimetics, vasoconstrictor · tropicamide

#### ● SIDE-EFFECTS

- ▶ **Uncommon** Headache · hyperaemia · hypertension · keratitis

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with known hypersensitivity to amide-type anaesthetics or atropine derivatives.

- **PREGNANCY** Manufacturer advises avoid (systemic uptake after administration cannot be excluded)—insufficient data available for phenylephrine and tropicamide in pregnancy; lidocaine crosses the placenta but is not known to be harmful in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no data available for phenylephrine or tropicamide; lidocaine present in milk in small amount.

- **PRE-TREATMENT SCREENING** Manufacturer advises patients must have demonstrated, at a previous visit, a satisfactory pupil dilation with topical mydriatic treatment.

#### ● PATIENT AND CARER ADVICE

- ▶ **Driving and skilled tasks** Manufacturer advises patients should be counselled about the effects on driving and skilled tasks.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Disodium edetate

- ▶ **Mydrane** (Thea Pharmaceuticals Ltd)

**Tropicamide 200 microgram per 1 ml, Phenylephrine hydrochloride 3.1 mg per 1 ml, Lidocaine hydrochloride 10 mg per 1 ml** Mydrane 0.2mg/ml / 3.1mg/ml / 10mg/ml solution for injection 0.6ml ampoules | 20 ampoule Ⓜ £119.95

## 4.1 Post-operative pain and inflammation

### Eye, surgical and peri-operative drug use

#### Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Cefuroxime p. 526, administered by intra-ocular injection into the anterior chamber of the eye (intracameral use), is used for the prophylaxis of endophthalmitis after cataract surgery.

Non-steroidal anti-inflammatory eye drops such as diclofenac sodium p. 1178, flurbiprofen p. 1178, ketorolac trometamol p. 1178, and nepafenac p. 1161, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Bromfenac p. 1177 is used for the treatment of postoperative inflammation following cataract surgery. Diclofenac sodium and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine p. 1187, an alpha<sub>2</sub>-adrenoreceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control

increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intraocular pressure prior to surgery.

Acetylcholine chloride p. 1175, administered into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged action is required, it can be applied again.

Intra-ocular sodium hyaluronate p. 1169 and balanced salt solution are used during surgical procedures on the eye.

Povidone-iodine p. 1175 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

### Ocular local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine below are widely used topical local anaesthetics. Proxymetacaine hydrochloride below causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride and fluorescein sodium p. 1177 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 222, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

## ANAESTHETICS, LOCAL

### Fluorescein with lidocaine

#### ● INDICATIONS AND DOSE

##### Local anaesthesia

- ▶ TO THE EYE
- ▶ Adult: Apply as required

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)  
Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml. Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.69

### Oxybuprocaine hydrochloride

(Benoxinate hydrochloride)

#### ● INDICATIONS AND DOSE

##### Local anaesthetic

- ▶ TO THE EYE
- ▶ Adult: Apply as required

● **CONTRA-INDICATIONS** Avoid in preterm neonates

● **INTERACTIONS** → Appendix 1: anaesthetics, local

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Oxybuprocaine hydrochloride** (Bausch & Lomb UK Ltd)  
Oxybuprocaine hydrochloride 4 mg per 1 ml. Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.56

## Proxymetacaine hydrochloride

#### ● INDICATIONS AND DOSE

##### Local anaesthetic

- ▶ TO THE EYE
- ▶ Adult: Apply as required

● **CONTRA-INDICATIONS** Avoid in preterm neonates

● **INTERACTIONS** → Appendix 1: anaesthetics, local

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Proxymetacaine** (Bausch & Lomb UK Ltd)  
Proxymetacaine hydrochloride 5 mg per 1 ml. Minims proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.12

## Tetracaine

(Amethocaine)

#### ● INDICATIONS AND DOSE

##### Local anaesthetic

- ▶ TO THE EYE
- ▶ Adult: Apply as required

● **INTERACTIONS** → Appendix 1: anaesthetics, local

● **SIDE-EFFECTS** Dermatitis · eye disorders · eye inflammation · paraesthesia

**SIDE-EFFECTS, FURTHER INFORMATION** The systemic toxicity of local anaesthetics mainly involves the central nervous system; systemic side effects unlikely as minimal absorption following topical application.

● **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

- ▶ **Tetracaine** (Bausch & Lomb UK Ltd)  
Tetracaine hydrochloride 5 mg per 1 ml. Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.57 DT = £10.57  
Tetracaine hydrochloride 10 mg per 1 ml. Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.57 DT = £10.57

**Other drugs used for Post-operative pain and inflammation** Diclofenac sodium, p. 1178

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Bromfenac

#### ● INDICATIONS AND DOSE

##### Postoperative inflammation following cataract surgery

- ▶ TO THE EYE
- ▶ Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: NSAIDs

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sulfites

► **Yellox** (Bausch & Lomb UK Ltd)

► **Bromfenac (as Bromfenac sodium sesquihydrate)**

900 microgram per 1 ml Yellox 900micrograms/ml eye drops | 5 ml [PoM] £8.50 DT = £8.50

**Diclofenac sodium**

22-Sep-2016

● **INDICATIONS AND DOSE**

**Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) | Postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty | Pain in corneal epithelial defects after photorefractive keratotomy, radial keratotomy or accidental trauma | Seasonal allergic conjunctivitis**

► TO THE EYE

► Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- **Common or very common** Oedema · skin reactions
- **Rare or very rare** Asthma exacerbated · eye disorders · eye inflammation · hypersensitivity
- **Frequency not known** Dyspnoea · eye discomfort · rhinitis · vision blurred

**SIDE-EFFECTS, FURTHER INFORMATION** Topical application of large amounts of diclofenac can result in systemic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, propylene glycol

► **Voltarol Ophtha** (Thea Pharmaceuticals Ltd)

**Diclofenac sodium 1 mg per 1 ml** Voltarol Ophtha 0.1% eye drops 0.3ml unit dose | 5 unit dose [PoM] £4.00 DT = £4.00 | 40 unit dose [PoM] £32.00 DT = £32.00

► **Voltarol Ophtha Multidose** (Thea Pharmaceuticals Ltd)

**Diclofenac sodium 1 mg per 1 ml** Voltarol Ophtha Multidose 0.1% eye drops | 5 ml [PoM] £6.68 DT = £6.68

**Flurbiprofen**

06-Sep-2016

● **INDICATIONS AND DOSE**

**Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated**

► TO THE EYE

► Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- **Common or very common** Eye discomfort · haemorrhage
- **Frequency not known** Eye disorders

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

► **Ocufen** (Allergan Ltd)

**Flurbiprofen sodium 300 microgram per 1 ml** Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose [PoM] £37.15

**Ketorolac trometamol**

13-Aug-2018

● **INDICATIONS AND DOSE**

**Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery**

► TO THE EYE

► Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: NSAIDs

● **SIDE-EFFECTS**

- **Common or very common** Eye discomfort · eye disorders · eye infection · eye inflammation · headache · hypersensitivity · keratic deposits · paraesthesia · retinal haemorrhage · vision disorders
- **Uncommon** Dry eye
- **Frequency not known** Asthma exacerbated · bronchospasm

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► **Ketorolac trometamol (Non-proprietary)**

**Ketorolac trometamol 5 mg per 1 ml** Ketorolac 0.5% eye drops | 5 ml [PoM] £3.00-£9.99 DT = £3.00

► **Acular** (Allergan Ltd)

**Ketorolac trometamol 5 mg per 1 ml** Acular 0.5% eye drops | 5 ml [PoM] £3.00 DT = £3.00

**CORTICOSTEROIDS****Loteprednol etabonate**

21-Dec-2017

● **INDICATIONS AND DOSE**

**Treatment of post-operative inflammation following ocular surgery**

► TO THE EYE

► Adult: Apply 4 times a day for maximum duration of treatment of 14 days, to be started 24 hours after surgery

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

● **SIDE-EFFECTS**

- **Common or very common** Dry eye · eye discomfort · eye disorders · headaches
- **Uncommon** Conjunctival oedema · vision disorders
- **Rare or very rare** Breast neoplasm · face oedema · muscle twitching · taste altered

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Lotemax** (Bausch & Lomb UK Ltd)

**Loteprednol etabonate 5 mg per 1 ml** Lotemax 0.5% eye drops | 5 ml [PoM] £5.50 DT = £5.50

## 5 Glaucoma and ocular hypertension

### Glaucoma and ocular hypertension

11-Apr-2018

#### Description of condition

Glaucoma is a group of eye disorders characterised by a loss of visual field associated with pathological cupping of the optic disc and optic nerve damage. While glaucoma is generally linked to raised intra-ocular pressure, which is the main treatable risk factor, it can also occur when the intra-ocular pressure is within the normal range. Other risk factors include age, family history, ethnicity, corticosteroid use, myopia, type 2 diabetes mellitus, cardiovascular disease, and hypertension.

The most common form of glaucoma is chronic open-angle glaucoma (also known as primary open-angle glaucoma) where drainage of the aqueous humour through the trabecular meshwork is restricted, and the angle between the iris and the cornea is normal. Initially, this condition tends to be asymptomatic, however, as glaucoma progresses, patients may present with irreversible sight loss or visual field defects. Patients with ocular hypertension (an intra-ocular pressure greater than 21 mmHg) are at high risk of developing chronic open-angle glaucoma. The diagnosis, monitoring, and management of patients with ocular hypertension, suspected chronic open-angle glaucoma, or chronic open-angle glaucoma should be carried out by a specialist.

Acute angle-closure glaucoma is less common and occurs when the outflow of aqueous humour from the eye is totally obstructed by bowing of the iris against the trabecular meshwork. It is characterised by its abrupt onset of symptoms, and it is a sight-threatening medical emergency that requires urgent reduction of intra-ocular pressure to prevent loss of vision.

#### Aims of treatment

The aim of treatment is to control intra-ocular pressure to prevent the development or progression of glaucoma and subsequent visual field damage, or sight loss.

#### Ocular hypertension

**EvGr** A topical prostaglandin analogue, such as latanoprost p. 1184, tafluprost p. 1185, travoprost p. 1186, or bimatoprost p. 1184 (a synthetic prostamide), is recommended as first-line treatment in patients with an intra-ocular pressure of 24 mmHg or greater and who are at risk of visual impairment within their lifetime. When assessing patient's risk of future visual impairment, the level of intra-ocular pressure, central corneal thickness measurement, family history, and life expectancy should be taken into consideration. Patients who are not at risk of visual impairment in their lifetime do not require treatment but should be monitored regularly.

If initial treatment with a topical prostaglandin analogue is not tolerated, an alternative prostaglandin analogue should be tried before switching to a topical beta-blocker such as betaxolol p. 1180, levobunolol hydrochloride p. 1180,

or timolol maleate p. 1180). If treatment is still not tolerated, alternative options include carbonic anhydrase inhibitors such as brinzolamide p. 1181 or dorzolamide p. 1182, a topical sympathomimetic such as apraclonidine p. 1187 [unlicensed use] or brimonidine tartrate p. 1187, or a topical miotic such as pilocarpine p. 1183 [unlicensed use], given either as monotherapy or as combination therapy.

Alternatives as either monotherapy or combination therapy with drugs from different therapeutic classes (topical beta-blockers, carbonic anhydrase inhibitors, or topical sympathomimetics), should also be offered to patients with an intra-ocular pressure of 24 mmHg or more whose current treatment is not reducing intra-ocular pressure sufficiently to prevent the risk of progression to sight loss. The patient's adherence and drop instillation technique should also be checked. If drug treatment still does not sufficiently reduce intra-ocular pressure to a satisfactory level, patients should be referred to a consultant ophthalmologist to discuss other options.

Preservative free eye drops should be used in patients who are allergic to preservatives, or those who have clinically significant ocular surface disease and are at high risk of conversion to chronic open-angle glaucoma. **A**

*Note: based on cost-effective analysis, NICE guidelines 81 recommend treatment with generic prostaglandin analogues as first-line, and non-generic prostaglandin analogues as third-line if topical beta-blocker treatment is ineffective.*

#### Suspected chronic open-angle glaucoma

**EvGr** In patients with suspected chronic open-angle glaucoma and an intra-ocular pressure of 24 mmHg or greater, the same treatment recommendations as for the management of ocular hypertension should be followed. Patients with an intra-ocular pressure below 24 mmHg do not require drug treatment, but should be regularly monitored for changes in intra-ocular pressure and visual impairment. **A**

#### Chronic open-angle glaucoma

**EvGr** Topical prostaglandin analogues such as latanoprost p. 1184, tafluprost p. 1185, travoprost p. 1186, or bimatoprost p. 1184 (a synthetic prostamide), are used first-line in patients with confirmed chronic open-angle glaucoma. If first-line treatment does not sufficiently reduce intra-ocular pressure and the patient's adherence to treatment and eye drop instillation technique are both satisfactory, treatment with either a topical beta-blocker such as betaxolol p. 1180, levobunolol hydrochloride p. 1180, and timolol maleate p. 1180, a carbonic anhydrase inhibitor such as brinzolamide p. 1181 or dorzolamide p. 1182, a topical sympathomimetic such as apraclonidine p. 1187 or brimonidine tartrate p. 1187, or a combination of these, should be offered. When a particular drug is not tolerated, another drug from a different therapeutic class can be tried. Preservative free eye drops should be used in patients who are allergic to preservatives, or those who have clinically significant ocular surface disease. Alternative treatment options are laser trabeculoplasty or surgery with pharmacological augmentation (with mitomycin p. 919 [unlicensed indication]).

Patients with *advanced chronic open-angle glaucoma* should be offered surgery with pharmacological augmentation (with mitomycin p. 919 [unlicensed indication]). Treatment with a topical prostaglandin analogue should be initiated and continued until surgery takes place.

If surgery fails to adequately reduce the intra-ocular pressure, alternative options include drug treatment (a combination of topical drugs from different therapeutic classes may be needed), further surgery, laser trabeculoplasty, or cyclodiode laser treatment. **A**

**BETA-ADRENOCEPTOR BLOCKERS****Betaxolol****INDICATIONS AND DOSE****Primary open-angle glaucoma**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia · heart block
- **CAUTIONS** Patients with corneal disease  
**CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- **INTERACTIONS** → Appendix 1: beta blockers, selective
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Eye discomfort · eye disorders · vision disorders
  - ▶ **Uncommon** Dry eye · eye inflammation · rhinitis
  - ▶ **Rare or very rare** Cataract · rhinorrhoea · skin reactions
  - ▶ **Frequency not known** Angioedema · hypersensitivity**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose betaxolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betopic** (Novartis Pharmaceuticals UK Ltd)

**Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml** Betopic

0.25% suspension eye drops | 5 ml [PoM] £2.66 DT = £2.66

Betopic 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose [PoM] £13.77 DT = £13.77

**Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml** Betopic  
 0.5% eye drops | 5 ml [PoM] £1.90 DT = £1.90

**Levobunolol hydrochloride****INDICATIONS AND DOSE****Primary open-angle glaucoma**

- ▶ TO THE EYE
- ▶ Adult: Apply 1–2 times a day

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia · heart block
- **CAUTIONS** Patients with corneal disease  
**CAUTIONS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Eye discomfort · eye inflammation
  - ▶ **Frequency not known** Dry eye · eye disorders · vision blurred

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- ▶ **Betagan** (Allergan Ltd)

**Levobunolol hydrochloride 5 mg per 1 ml** Betagan 0.5% eye drops

| 5 ml [PoM] £1.85 DT = £1.85

Betagan Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit

dose [PoM] £9.98 DT = £9.98

**Timolol maleate****INDICATIONS AND DOSE****Reduction of intra-ocular pressure in primary open-angle glaucoma**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

**TIMOPTOL-LA**®

**Reduction of intra-ocular pressure in primary open-angle glaucoma**

- ▶ TO THE EYE
- ▶ Adult: Apply once daily

**TIOPEX**®

**Reduction of intra-ocular pressure in primary open-angle glaucoma**

- ▶ TO THE EYE
- ▶ Adult: Apply once daily, to be applied in the morning

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia · heart block
- **CAUTIONS** Consider also cautions listed for systemically administered beta blockers · patients with corneal disease
- **INTERACTIONS** → Appendix 1: beta blockers, non-selective
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Eye discomfort · eye disorders · eye inflammation · vision disorders
  - ▶ **Rare or very rare** Angioedema

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

- **BREAST FEEDING** Manufacturer advises avoidance.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**TIOPEX**®  
**Scottish Medicines Consortium (SMC) decisions**
  - ▶ When used by eye The *Scottish Medicines Consortium* has advised (February 2014) that timolol gel eye drops (*Tiopex*®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

- ▶ **Timoptol-LA** (Santen UK Ltd)

**Timolol (as Timolol maleate) 2.5 mg per 1 ml** Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT = £3.12

**Timolol (as Timolol maleate) 5 mg per 1 ml** Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT = £3.12

### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- ▶ **Timolol maleate (Non-proprietary)**

**Timolol (as Timolol maleate) 2.5 mg per 1 ml** Timolol 0.25% eye drops | 5 ml [PoM] £0.98 DT = £0.98

**Timolol (as Timolol maleate) 5 mg per 1 ml** Timolol 0.5% eye drops | 5 ml [PoM] £1.00 DT = £1.00

- ▶ **Eysano** (Aspire Pharma Ltd)

**Timolol (as Timolol maleate) 2.5 mg per 1 ml** Eysano 2.5mg/ml eye drops | 5 ml [PoM] £8.45 DT = £8.45

**Timolol (as Timolol maleate) 5 mg per 1 ml** Eysano 5mg/ml eye drops | 5 ml [PoM] £9.65 DT = £9.65

- ▶ **Timoptol** (Santen UK Ltd)

**Timolol (as Timolol maleate) 2.5 mg per 1 ml** Timoptol 0.25% eye drops | 5 ml [PoM] £3.12 DT = £0.98

**Timolol (as Timolol maleate) 5 mg per 1 ml** Timoptol 0.5% eye drops | 5 ml [PoM] £3.12 DT = £1.00

- ▶ **Tiopex** (Thea Pharmaceuticals Ltd)

**Timolol (as Timolol maleate) 1 mg per 1 gram** Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT = £7.49

Combinations available: **Bimatoprost with timolol**, p. 1184 · **Brimonidine with timolol**, p. 1188 · **Brinzolamide with timolol**, p. 1182 · **Dorzolamide with timolol**, p. 1183 · **Latanoprost with timolol**, p. 1185 · **Tafuprost with timolol**, p. 1186 · **Travoprost with timolol**, p. 1187

## CARBONIC ANHYDRASE INHIBITORS

### Acetazolamide

11-Sep-2018

- **INDICATIONS AND DOSE**

**Reduction of intra-ocular pressure in open-angle glaucoma** | **Reduction of intra-ocular pressure in secondary glaucoma** | **Reduction of intra-ocular pressure perioperatively in angle-closure glaucoma**

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

#### Glaucoma

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Adult: 250–500 mg daily

#### Epilepsy

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 0.25–1 g daily in divided doses, intramuscular injection preferably avoided because of alkalinity

- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma

- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · elderly · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi
- **INTERACTIONS** → Appendix 1: acetazolamide

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Haemorrhage · metabolic acidosis · nephrolithiasis · sensation abnormal
- ▶ **Uncommon** Bone marrow disorders · depression · dizziness · electrolyte imbalance · hearing impairment · hepatic

disorders · leucopenia · nausea · renal colic · renal impairment · renal lesions · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus · urinary tract discomfort · urine abnormalities · vomiting

- ▶ **Rare or very rare** Anaphylactic reaction · appetite disorder · confusion · diarrhoea · fatigue · fever · flushing · headache · irritability · libido decreased · paralysis · photosensitivity reaction · seizure
- ▶ **Frequency not known** Agranulocytosis · drowsiness · myopia · polyuria · taste altered · thirst

#### SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With oral use Osteomalacia
- ▶ **Rare or very rare**
- ▶ With oral use Ataxia · hyperglycaemia · hypoglycaemia · renal tubular necrosis
- ▶ **Frequency not known**
- ▶ With oral use Agitation

**SIDE-EFFECTS, FURTHER INFORMATION** Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally — patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering bicarbonate.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in animal studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Acetazolamide (Non-proprietary)**

**Acetazolamide 250 mg** Acetazolamide 250mg tablets | 112 tablet [PoM] £75.36 DT = £12.81

#### Powder for solution for injection

- ▶ **Diamox** (Advanz Pharma)

**Acetazolamide 500 mg** Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial [PoM] £14.76

#### Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Diamox SR** (Advanz Pharma)

**Acetazolamide 250 mg** Diamox SR 250mg capsules | 30 capsule [PoM] £16.66 DT = £16.66

- ▶ **Eytazox** (Teva UK Ltd)

**Acetazolamide 250 mg** Eytazox 250mg modified-release capsules | 30 capsule [PoM] £16.60 DT = £16.66

### Brinzolamide

12-Jun-2018

- **INDICATIONS AND DOSE**

**Reduction of intra-ocular pressure in ocular hypertension and open-angle glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone in patients unresponsive to beta-blockers or beta-blockers contra-indicated**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily, then increased if necessary up to 3 times a day

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis

- **CAUTIONS** Renal tubular immaturity or abnormality · systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1: brinzolamide
- **SIDE-EFFECTS**
- ▶ **Common or very common** Eye discomfort · eye disorders · taste altered · vision disorders
- ▶ **Uncommon** Arrhythmias · asthenia · cardio-respiratory distress · chest discomfort · cough · depression · diarrhoea · dizziness · dry eye · dry mouth · dyspnoea · epistaxis · eye deposit · eye inflammation · feeling abnormal · foreign body in eye · gastrointestinal discomfort · gastrointestinal disorders · headache · increased risk of infection · memory loss · motor dysfunction · muscle complaints · nasal complaints · nausea · nervousness · oral disorders · oropharyngeal pain · pain · palpitations · renal pain · scleral discolouration · sensation abnormal · sexual dysfunction · skin reactions · sleep disorders · throat complaints · vomiting
- ▶ **Rare or very rare** Alopecia · angina pectoris · drowsiness · irritability · optic nerve disorder · respiratory disorders · tinnitus
- ▶ **Frequency not known** Appetite decreased · arthralgia · asthma · hypertension · malaise · peripheral oedema · tremor · urinary frequency increased · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

#### ▶ Brinzolamide (Non-proprietary)

Brinzolamide 10 mg per 1 ml Brinzolamide 10mg/ml eye drops | 5 ml [PoM] £6.92 DT = £2.18

#### ▶ Azopt (Novartis Pharmaceuticals UK Ltd)

Brinzolamide 10 mg per 1 ml Azopt 10mg/ml eye drops | 5 ml [PoM] £6.92 DT = £2.18

## Brinzolamide with brimonidine

27-Sep-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1181, brimonidine tartrate p. 1187.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma and in ocular hypertension when monotherapy is inadequate**

▶ TO THE EYE

▶ Adult: Apply 1 drop twice daily

- **INTERACTIONS** → Appendix 1: brimonidine · brinzolamide

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

CAUTIONARY AND ADVISORY LABELS 3

EXCIPIENTS: May contain Benzalkonium chloride, propylene glycol

#### ▶ Simbrinza (Novartis Pharmaceuticals UK Ltd)

Brimonidine tartrate 2 mg per 1 ml, Brinzolamide 10 mg per 1 ml Simbrinza 10mg/ml / 2mg/ml eye drops | 5 ml [PoM] £9.23 DT = £9.23

## Brinzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, brinzolamide p. 1181, timolol maleate p. 1180.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma or ocular hypertension when beta-blocker alone not adequate**

▶ TO THE EYE

▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · brinzolamide

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

#### ▶ Azarga (Novartis Pharmaceuticals UK Ltd)

Timolol (as Timolol maleate) 5 mg per 1 ml, Brinzolamide 10 mg per 1 ml Azarga 10mg/ml / 5mg/ml eye drops | 5 ml [PoM] £11.05 DT = £11.05

## Dorzolamide

10-Mar-2017

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in ocular hypertension used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Open-angle glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated | Pseudo-exfoliative glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated**

▶ TO THE EYE

▶ Adult: Apply 3 times a day

**Raised intra-ocular pressure in ocular hypertension as adjunct to beta-blocker | Open-angle glaucoma as adjunct to beta-blocker | Pseudo-exfoliative glaucoma as adjunct to beta-blocker**

▶ TO THE EYE

▶ Adult: Apply twice daily

- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Chronic corneal defects · history of intra-ocular surgery · history of renal calculi · low endothelial cell count · systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1: dorzolamide
- **SIDE-EFFECTS**
- ▶ **Common or very common** Asthenia · eye discomfort · eye disorders · eye inflammation · headache · nausea · paraesthesia · taste bitter · vision disorders
- ▶ **Rare or very rare** Angioedema · bronchospasm · dizziness · dry mouth · dyspnoea · epistaxis · local reaction · pain · severe cutaneous adverse reactions (SCARs) · skin reactions · throat irritation · urolithiasis
- SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption can cause sulfonamide-like side-effects and may require discontinuation if severe.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Dorzolamide (Non-proprietary)

**Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Dorzolamide 20mg/ml eye drops | 5 ml [PoM] £5.69 DT = £2.38

##### ▶ Eydello (Aspire Pharma Ltd)

**Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Eydello 20mg/ml eye drops | 5 ml [PoM] £12.09 DT = £12.09

##### ▶ Trusopt (Santen UK Ltd)

**Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Trusopt 20mg/ml eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £24.18 DT = £24.18  
Trusopt 20mg/ml eye drops | 5 ml [PoM] £6.33 DT = £2.38

## Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide p. 1182, timolol maleate p. 1180.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in ocular hypertension when beta-blockers alone not adequate | Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate | Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate**

▶ TO THE EYE

▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective · dorzolamide

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Dorzolamide with timolol (Non-proprietary)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Dorzolamide 20mg/ml / Timolol 5mg/ml eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £28.50-£28.59 DT = £28.59

Dorzolamide 20mg/ml / Timolol 5mg/ml eye drops | 5 ml [PoM] £27.16 DT = £2.04

##### ▶ Cosopt (Santen UK Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Cosopt 20mg/ml / 5mg/ml eye drops 0.2ml unit dose preservative free | 60 unit dose [PoM] £28.59 DT = £28.59

Cosopt 20mg/ml / 5mg/ml eye drops | 5 ml [PoM] £10.05 DT = £2.04

##### ▶ Cosopt iMulti (Santen UK Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Cosopt iMulti 20mg/ml / 5mg/ml eye drops preservative free | 10 ml [PoM] £28.00

##### ▶ Eylamdo (Aspire Pharma Ltd)

**Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml** Eylamdo 20mg/ml / 5mg/ml eye drops | 5 ml [PoM] £14.29 DT = £14.29

## MIOTICS > PARASYMPATHOMIMETICS

### Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

#### ● INDICATIONS AND DOSE

**Primary angle-closure glaucoma | Some secondary glaucomas**

▶ TO THE EYE

▶ Adult: Apply up to 4 times a day

- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)

- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · marked vasomotor instability · Parkinson's disease · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction

- **INTERACTIONS** → Appendix 1: pilocarpine

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea · headache · hyperhidrosis · hypersalivation · nausea · skin reactions · vision disorders · vomiting
- ▶ **Frequency not known** Bradycardia · bronchospasm · conjunctival vascular congestion · eye disorder (long term use) · eye disorders · hypotension · lens changes (long term use) · pain · paraesthesia · pulmonary oedema · sensitisation · vitreous haemorrhage

- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.

- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● PATIENT AND CARER ADVICE

**Driving and skilled tasks** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ Pilocarpine (Non-proprietary)

**Pilocarpine hydrochloride 10 mg per 1 ml** Pilocarpine hydrochloride 1% eye drops | 10 ml [PoM] £22.20 DT = £22.20

**Pilocarpine hydrochloride 20 mg per 1 ml** Pilocarpine hydrochloride 2% eye drops | 10 ml [PoM] £22.77 DT = £22.77

**Pilocarpine hydrochloride 40 mg per 1 ml** Pilocarpine hydrochloride 4% eye drops | 10 ml [PoM] £28.40 DT = £28.40

- ▶ **Pilocarpine nitrate** (Bausch & Lomb UK Ltd)  
**Pilocarpine nitrate 20 mg per 1 ml** Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose [PoM] £12.47 DT = £12.47

## PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

### Bimatoprost

08-Jun-2018

#### ● INDICATIONS AND DOSE

##### **Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

###### ▶ TO THE EYE

- ▶ Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · predisposition to bradycardia · predisposition to hypotension · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dry eye · eye discolouration · eye discomfort · eye disorders · eye inflammation · headache · hypertension · hypertrichosis · skin reactions · vision disorders
- ▶ **Uncommon** Asthenia · dizziness · madarosis · nausea · retinal haemorrhage
- ▶ **Frequency not known** Asthma · bradycardia · dyspnoea · hypotension · reactivation of infection

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate-to-severe impairment—no information available.

- **RENAL IMPAIRMENT** Use with caution—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose bimatoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● PATIENT AND CARER ADVICE

Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **LUMIGAN®**

##### **Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (March 2013) that bimatoprost 300 micrograms/mL preservative-free eye drops (*Lumigan®* single-dose eye drops) are accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in chronic open-angle glaucoma and ocular hypertension (as monotherapy or as adjunctive therapy to beta-blockers) in

adults who have proven sensitivity to benzalkonium chloride.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ **Bimatoprost (Non-proprietary)**

**Bimatoprost 300 microgram per 1 ml** Bimatoprost 300micrograms/ml eye drops | 3 ml [PoM] £10.30 DT = £10.30

##### ▶ **Eyreida (Aspire Pharma Ltd)**

**Bimatoprost 300 microgram per 1 ml** Eyreida 0.3mg/ml eye drops | 3 ml [PoM] £11.71 DT = £11.71

##### ▶ **Lumigan (Allergan Ltd)**

**Bimatoprost 100 microgram per 1 ml** Lumigan 100micrograms/ml eye drops | 3 ml [PoM] £11.71 DT = £11.71 | 9 ml [PoM] £35.13

**Bimatoprost 300 microgram per 1 ml** Lumigan 300micrograms/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £13.75 DT = £13.75

##### ▶ **Sturiban (Actavis UK Ltd)**

**Bimatoprost 300 microgram per 1 ml** Sturiban 0.3mg/ml eye drops | 3 ml [PoM] £9.27 DT = £10.30 | 9 ml [PoM] £27.81

## Bimatoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, bimatoprost above, timolol maleate p. 1180.

#### ● INDICATIONS AND DOSE

##### **Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

###### ▶ TO THE EYE

- ▶ Adult: Apply once daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **GANFORT® SINGLE USE**

##### **Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (October 2013) that *Ganfort®* unit dose eye drops are accepted for restricted use within NHS Scotland for the reduction of intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension insufficiently responsive to topical beta-blockers or prostaglandin analogues who have proven sensitivity to preservatives.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ **Ganfort (Allergan Ltd)**

**Bimatoprost 300 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Ganfort 0.3mg/ml / 5mg/ml eye drops | 3 ml [PoM] £14.16 DT = £14.16 | 9 ml [PoM] £38.15  
Ganfort 0.3mg/ml / 5mg/ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £17.94 DT = £17.94

## Latanoprost

#### ● INDICATIONS AND DOSE

##### **Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

###### ▶ TO THE EYE

- ▶ Adult: Apply once daily, to be administered preferably in the evening

#### ● IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)**

Following reformulation of *Xalatan®*, to allow for long-term storage at room temperature, there has been an

increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Angle-closure glaucoma (no experience of use) · aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · do not use within 5 minutes of thiomersal-containing preparations · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · peri-operative period of cataract surgery · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye discolouration · eye discomfort · eye disorders · eye inflammation · vision disorders
- ▶ **Uncommon** Dry eye · rash
- ▶ **Rare or very rare** Asthma · chest pain · dyspnoea · unstable angina
- ▶ **Frequency not known** Arthralgia · dizziness · headache · myalgia · ophthalmic herpes simplex · palpitations
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

#### ● PATIENT AND CARER ADVICE

Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### MONOPOST®

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (June 2013) that *Monopost*® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ **Latanoprost (Non-proprietary)**

**Latanoprost 50 microgram per 1 ml** Latanoprost 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £7.92

##### ▶ **Medizol (Medicom Healthcare Ltd)**

**Latanoprost 50 microgram per 1 ml** Medizol 0.005% eye drops | 2.5 ml [PoM] DT = £7.92

- ▶ **Monopost** (Thea Pharmaceuticals Ltd)

**Latanoprost 50 microgram per 1 ml** Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £8.49 DT = £8.49 | 90 unit dose [PoM] £25.47 DT = £25.47

- ▶ **Xalatan** (Pfizer Ltd)

**Latanoprost 50 microgram per 1 ml** Xalatan 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT = £7.92

## Latanoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, latanoprost p. 1184, timolol maleate p. 1180.

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

- ▶ TO THE EYE
- ▶ Adult: Apply once daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

##### ▶ **Latanoprost with timolol (Non-proprietary)**

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Latanoprost 50micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml [PoM] £14.32 DT = £6.57

##### ▶ **Fixapost** (Thea Pharmaceuticals Ltd)

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Fixapost 50micrograms/ml / 5mg/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £13.49

##### ▶ **Medox** (Medicom Healthcare Ltd)

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Medox 50micrograms/ml / 5mg/ml eye drops | 2.5 ml [PoM] DT = £6.57

##### ▶ **Xalacomp** (Pfizer Ltd)

**Latanoprost 50 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml** Xalacomp eye drops | 2.5 ml [PoM] £14.32 DT = £6.57

## Tafuprost

#### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma | Ocular hypertension**

- ▶ TO THE EYE
- ▶ Adult: Apply once daily, to be administered preferably in the evening

- **CAUTIONS** Angle-closure glaucoma (no experience of use)

· aphakia · asthma · chronic obstructive pulmonary disease · compromised respiratory function · congenital glaucoma (no experience of use) · contact lens wearers · history of significant ocular viral infections · inflammatory ocular conditions (no experience of use) · narrow-angle glaucoma (no experience of use) · neovascular glaucoma (no experience of use) · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis

- **SIDE-EFFECTS**

- ▶ **Common or very common** Dry eye · eye discolouration · eye discomfort · eye disorders · eye inflammation · headache · vision disorders
- ▶ **Uncommon** Hypertrichosis
- ▶ **Frequency not known** Asthma exacerbated · dyspnoea
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tafluprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**  
Changes to eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

## Travoprost with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, travoprost p. 1186, timolol maleate p. 1180.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate**

- ▶ TO THE EYE
- ▶ Adult: Apply once daily

### ● INTERACTIONS → Appendix 1: beta blockers, non-selective

### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Propylene glycol

#### ▶ Travoprost with timolol (Non-proprietary)

Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml Travoprost 40micrograms/ml / Timolol 5mg/ml eye drops | 2.5 ml [PoM] £13.95 DT = £13.95

#### ▶ DuoTrav (Novartis Pharmaceuticals UK Ltd)

Travoprost 40 microgram per 1 ml, Timolol (as Timolol maleate) 5 mg per 1 ml DuoTrav 40micrograms/ml / 5mg/ml eye drops | 2.5 ml [PoM] £13.95 DT = £13.95 | 7.5 ml [PoM] £39.68

## SYMPATHOMIMETICS > ALPHA<sub>2</sub>-ADRENOCEPTOR AGONISTS

### Apraclonidine

28-May-2018

### ● DRUG ACTION Apraclonidine is an alpha<sub>2</sub>-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

### ● INDICATIONS AND DOSE

**Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery**

- ▶ TO THE EYE
- ▶ Adult: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

**Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug**

- ▶ TO THE EYE
- ▶ Adult: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

### ● CONTRA-INDICATIONS History of severe or unstable and uncontrolled cardiovascular disease

### ● CAUTIONS Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Parkinson's syndrome · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangitis obliterans · vasovagal attack

### ● INTERACTIONS → Appendix 1: apraclonidine

### ● SIDE-EFFECTS

- ▶ **Common or very common** Eye disorders
- ▶ **Uncommon** Bradycardia · conjunctival haemorrhage · diarrhoea · dry eye · eye discomfort · eye inflammation · gastrointestinal discomfort · irritability · libido decreased · nasal dryness · palpitations · postural hypotension · sensation abnormal · sleep disorders · syncope · vision disorders · vomiting
- ▶ **Rare or very rare** Chest pain · dry mouth · fatigue · headache · hyperhidrosis · pain in extremity · pruritus · taste altered · temperature sensation altered

**SIDE-EFFECTS, FURTHER INFORMATION** Since absorption may follow topical application, systemic effects may occur— see clonidine hydrochloride p. 145.

**Ocular intolerance** Manufacturer advises withdrawal if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution and monitor, including close monitoring of cardiovascular parameters—no information available.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor intra-ocular pressure and visual fields.
  - ▶ Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

### ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

#### Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

#### ▶ Iopidine (Novartis Pharmaceuticals UK Ltd)

Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml Iopidine 5mg/ml eye drops | 5 ml [PoM] £10.88 DT = £10.88

Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose [PoM] £77.85 DT = £77.85

## Brimonidine tartrate

12-Jul-2017

### ● DRUG ACTION Brimonidine, an alpha<sub>2</sub>-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

### ● INDICATIONS AND DOSE

**Raised intra-ocular pressure in open-angle glaucoma in patients for whom beta-blockers are inappropriate | Ocular hypertension in patients for whom beta-blockers are inappropriate | Adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy**

- ▶ TO THE EYE
- ▶ Adult: Apply twice daily

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- **INTERACTIONS** → Appendix 1: brimonidine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Asthenia · dizziness · drowsiness · dry eye · dry mouth · eye discomfort · eye disorders · eye inflammation · gastrointestinal disorder · headache · hyperaemia · hypersensitivity · pulmonary reaction · sensation of foreign body · skin reactions · taste altered · vision disorders
  - ▶ **Uncommon** Arrhythmias · nasal dryness · palpitations
  - ▶ **Rare or very rare** Dyspnoea · hypertension · hypotension · insomnia · syncope
  - ▶ **Frequency not known** Face oedema · vasodilation
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Brimonidine tartrate (Non-proprietary)****Brimonidine tartrate 2 mg per 1 ml** Brimonidine 2mg/ml eye drops

| 5 ml [PoM] [N] DT = £3.04

Brimonidine 0.2% eye drops | 5 ml [PoM] £3.98 DT = £3.04

▶ **Alphagan** (Allergan Ltd)**Brimonidine tartrate 2 mg per 1 ml** Alphagan 0.2% eye drops |

5 ml [PoM] £6.85 DT = £3.04

▶ **Brymont** (Blumont Pharma Ltd)**Brimonidine tartrate 2 mg per 1 ml** Brymont 2mg/ml eye drops |

5 ml [PoM] £1.50 DT = £3.04

Combinations available: **Brinzolamide with brimonidine**, p. 1182**Brimonidine with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, brimonidine tartrate p. 1187, timolol maleate p. 1180.

● **INDICATIONS AND DOSE**

**Raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate**

▶ TO THE EYE

▶ Adult: Apply twice daily

- **INTERACTIONS** → Appendix 1: beta blockers, non-selective • brimonidine

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Combigan** (Allergan Ltd)**Brimonidine tartrate 2 mg per 1 ml, Timolol (as Timolol maleate)****5 mg per 1 ml** Combigan eye drops | 5 ml [PoM] £10.00 DT = £10.00

| 15 ml [PoM] £27.00

## 6 Retinal disorders

### 6.1 Macular degeneration

#### Age-related macular degeneration

25-Apr-2018

**Description of condition**

Age-related macular degeneration is a progressive eye condition that affects the central area of the retina (macula). It occurs mainly in people aged 55 years and over and is a common cause of vision loss. The progressive loss of central vision affects the patient's ability to see well enough to recognise faces, drive, and to read and write. Although the exact cause is unknown, known risk factors in addition to increasing age include smoking and a family history of age-related macular degeneration.

There are two types of age-related macular degeneration—dry and wet. Dry (non-neovascular) age-related macular

degeneration progresses slowly as extensive wasting of macula cells occurs. Whereas, with wet (neovascular) age-related macular degeneration, new blood vessels develop beneath and within the retina, and can lead to a rapid deterioration of vision. Wet age-related macular degeneration is further classified as *wet-active* (neovascular lesions that may benefit from treatment) and *wet-inactive* (neovascular disease with irreversible structural change).

**Aims of treatment**

The aim of treatment is to slow down the progression of age-related macular degeneration and central vision loss; treatment is initiated under specialist care.

**Treatment**

Treatment is dependent on the stage and type of age-related macular degeneration, with drug treatment only recommended in patients with *wet-active* age-related macular degeneration. Counselling and support, advice on Smoking cessation p. 497, and use of visual aids is recommended in all patients with age related macular degeneration as appropriate.

[EvG] An intravitreal anti-vascular endothelial growth factor (anti-VEGF), such as aflibercept p. 1008, ranibizumab p. 1190, or bevacizumab p. 862 [unlicensed use], is first-line treatment for patients with *wet-active* age-related macular degeneration who have a visual acuity between 6/12 and 6/96. If visual acuity is less than 6/96, anti-VEGF treatment should only be given if the patient's overall visual function is likely to improve (e.g. if the affected eye is the patient's better-seeing eye). Anti-VEGF treatment should only be administered by healthcare professionals experienced in the use of intravitreal injections. See also National funding/access decisions for aflibercept p. 1008 and ranibizumab p. 1190.

Treatment should be stopped if the patient develops severe, progressive loss of visual acuity despite treatment, or if the patient's age-related macular degeneration develops into *wet-inactive* with no prospect of visual function improvement. A treatment-free period can be considered in patients whose age-related macular degeneration appears to be stable.

Photodynamic therapy alone should not be given to patients with *wet-active* age-related macular degeneration. It can be given as an adjunct to anti-VEGF treatment as a second-line option in the context of a randomised controlled trial. Intravitreal corticosteroids are not recommended in combination with anti-VEGF treatment because there is limited evidence of benefit to a patient's visual acuity.

Patients should be advised to attend routine sight tests, self-monitor, and to report any changes in vision such as appearance of grey patches or blurred vision, straight lines appearing distorted, and objects appearing smaller than normal. 

**Useful Resources**

Age-related macular degeneration. National Institute for Health and Care Excellence. NICE guideline 82. January 2018.

## ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

### Aflibercept

06-Dec-2017

- **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels.

#### ● INDICATIONS AND DOSE

##### Neovascular (wet) age-related macular degeneration (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 2 mg once a month for 3 months, then 2 mg every 2 months, review treatment frequency after 12 months

##### Macular oedema secondary to retinal vein occlusion (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 2 mg once a month until maximum visual acuity is achieved or there are no signs of disease activity (discontinue treatment if no improvement in visual and anatomic outcomes)

##### Diabetic macular oedema (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: Initially 2 mg once a month for 5 months, then maintenance 2 mg every 2 months, review treatment frequency after 12 months (discontinue treatment if no improvement in visual and anatomic outcomes)

##### Myopic choroidal neovascularisation (specialist use only)

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 2 mg for 1 dose, if visual or anatomic outcomes indicate that disease persists, additional doses may be administered; the interval between 2 doses should be greater than 1 month

- **CONTRA-INDICATIONS** Clinical signs of irreversible ischaemic visual function loss · ocular or periocular infection · severe intra-ocular inflammation
- **CAUTIONS** Active systemic infection · diabetic patients with uncontrolled hypertension · discontinue treatment if stage 3 or 4 macular holes develop—consult product literature for full details · discontinue treatment in the event of a retinal break—consult product literature for full details · discontinue treatment in the event of rhegmatogenous retinal detachment—consult product literature for full details · patients at risk of retinal pigment epithelial tear · poorly controlled glaucoma · recent history of myocardial infarction · recent history of stroke · recent history of transient ischaemic attack
- CAUTIONS, FURTHER INFORMATION** Aflibercept is given by intravitreal injection by specialists experienced in the management of this condition. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors. Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **INTERACTIONS** → Appendix 1: aflibercept

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Cataract · eye discomfort · eye disorders · eye inflammation · haemorrhage · retinal pigment epithelial tear · vision disorders
- ▶ **Uncommon** Lens opacity

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE decisions

- ▶ **Aflibercept solution for injection for treating wet age-related macular degeneration (July 2013)** NICE TA294  
Aflibercept solution for injection is recommended as an option for treating wet age-related macular degeneration only if:
  - it is used in accordance with the recommendations for ranibizumab in NICE TA 155 **and**
  - the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme  
[www.nice.org.uk/guidance/TA294](http://www.nice.org.uk/guidance/TA294)
- ▶ **Aflibercept for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion (February 2014)** NICE TA305  
Aflibercept solution for injection is recommended as an option for treating visual impairment caused by macular oedema secondary to central retinal vein occlusion only if the manufacturer provides aflibercept solution for injection with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/TA305](http://www.nice.org.uk/guidance/TA305)
- ▶ **Aflibercept for treating diabetic macular oedema (July 2015)** NICE TA346  
Aflibercept solution for injection is recommended as an option for treating visual impairment caused by diabetic macular oedema only if:
  - the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
  - the manufacturer provides aflibercept with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/TA346](http://www.nice.org.uk/guidance/TA346)
- ▶ **Aflibercept for treating visual impairment caused by macular oedema after branch retinal vein occlusion (September 2016)** NICE TA409  
Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment in adults caused by macular oedema after branch retinal vein occlusion, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/TA409](http://www.nice.org.uk/guidance/TA409)
- ▶ **Aflibercept for treating choroidal neovascularisation (November 2017)** NICE TA486  
Aflibercept is recommended, within its marketing authorisation, as an option for treating visual impairment because of myopic choroidal neovascularisation in adults, only if the manufacturer provides aflibercept with the discount agreed in the patient access scheme.  
If patients and their clinicians consider both aflibercept and ranibizumab to be suitable treatments, the least costly should be used, taking into account anticipated administration costs, dosage and price per dose.  
[www.nice.org.uk/guidance/TA486](http://www.nice.org.uk/guidance/TA486)

#### Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (October 2016) that aflibercept (*Eylea*®) is accepted for use within

NHS Scotland in adults for the treatment of visual impairment due to myopic choroidal neovascularisation. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Eylea (Bayer Plc)

Aflibercept 40 mg per 1 ml Eylea 2mg/50microlitres solution for injection vials | 1 vial [PoM] £816.00

## Ranibizumab

24-Aug-2018

### ● INDICATIONS AND DOSE

**Neovascular (wet) age-related macular degeneration (specialist use only) | Diabetic macular oedema (specialist use only) | Macular oedema secondary to retinal vein occlusion (specialist use only) | Choroidal neovascularisation (specialist use only)**

#### ► BY INTRAVITREAL INJECTION

- Adult: Initially 500 micrograms once a month, to be administered into the affected eye, until maximum visual acuity is achieved or there are no signs of disease activity, for continued treatment and subsequent dose intervals—consult product literature, discontinue treatment if no improvement in visual and anatomic outcomes

**Concomitant treatment of diabetic macular oedema, or macular oedema secondary to branch retinal vein occlusion, with laser photocoagulation (specialist use only)**

#### ► BY INTRAVITREAL INJECTION

- Adult: 500 micrograms, to be administered at least 30 minutes after laser photocoagulation

- **CONTRA-INDICATIONS** Ocular or periocular infection · severe intra-ocular inflammation · signs of irreversible ischaemic visual function loss in patients with retinal vein occlusion

- **CAUTIONS** Active systemic infection · diabetic macular oedema due to type 1 diabetes (limited information available) · diabetic patients with HbA<sub>1c</sub> over 12% · history of stroke · history of transient ischaemic attack · patients at risk of retinal pigment epithelial tear · previous intravitreal injections · proliferative diabetic retinopathy · retinal detachment or macular hole (discontinue treatment if rhegmatogenous retinal detachment or stage 3 or 4 macular holes develop) · uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION** Ranibizumab is given by intravitreal injection by specialists. There is a potential risk of arterial thromboembolic events and non-ocular haemorrhage following the intravitreal injection of vascular endothelial growth factor inhibitors.

Endophthalmitis can occur after intravitreal injections—patients should be advised to report any signs of infection immediately.

- **INTERACTIONS** → Appendix 1: ranibizumab

#### ● SIDE-EFFECTS

- **Common or very common** Anaemia · anxiety · arthralgia · cataract · cough · dry eye · eye discomfort · eye disorders · eye inflammation · haemorrhage · headache · hypersensitivity · increased risk of infection · lens opacity · nausea · retinal pigment epithelial tear · vision disorders
- **Uncommon** Corneal deposits
- **Frequency not known** Arterial thromboembolism

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends women use effective contraception during and for at least 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

#### ● MONITORING REQUIREMENTS

- Manufacturer advises monitor intra-ocular pressure, perfusion of the optic nerve head, and for signs of ocular infection following injection.
- Manufacturer advises monitor visual acuity.

- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- Ranibizumab for treating choroidal neovascularisation associated with pathological myopia (November 2013) NICE TA298

Ranibizumab is recommended as an option for treating visual impairment due to choroidal neovascularisation secondary to pathological myopia when the manufacturer provides ranibizumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta298](http://www.nice.org.uk/guidance/ta298)

- Ranibizumab for the treating visual impairment caused by macular oedema secondary to retinal vein occlusion (May 2013) NICE TA283

Ranibizumab is recommended as an option for treating visual impairment caused by macular oedema:

- following central retinal vein occlusion **or**
- following branch retinal vein occlusion only if treatment with laser photocoagulation has not been beneficial, or when laser photocoagulation is not suitable because of the extent of macular haemorrhage **and**
- only if the manufacturer provides ranibizumab with the discount agreed in the patient access scheme revised in the context of NICE technology appraisal guidance 274.

Patients currently receiving ranibizumab whose disease does not meet the criteria listed above should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta283](http://www.nice.org.uk/guidance/ta283)

- Ranibizumab for treating diabetic macular oedema (February 2013) NICE TA274

Ranibizumab is recommended as an option for the treatment of visual impairment due to diabetic macular oedema only if:

- the eye has a central retinal thickness of 400 micrometres or more at the start of treatment **and**
- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Patients currently receiving ranibizumab for treating visual impairment due to diabetic macular oedema whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta274](http://www.nice.org.uk/guidance/ta274)

- Ranibizumab and pegaptanib for the treatment of age-related macular degeneration (updated May 2012) NICE TA155
- Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent presumed disease progression;

- the manufacturer provides ranibizumab with the discount agreed in the patient access scheme (as revised in 2012).

Ranibizumab should only be continued in patients who maintain adequate response to therapy.

[www.nice.org.uk/guidance/ta155](http://www.nice.org.uk/guidance/ta155)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 381/07

The *Scottish Medicines Consortium* has advised (June 2007) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of neovascular (wet) age-related macular degeneration.

SMC No. 711/11

The *Scottish Medicines Consortium* has advised (December 2012) that ranibizumab (*Lucentis*®) is accepted for restricted use within NHS Scotland for the treatment of visual impairment due to diabetic macular oedema in adults with best corrected visual acuity 75 Early Treatment Diabetic Retinopathy Study letters or less at baseline. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 732/11

The *Scottish Medicines Consortium* has advised (May 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of macular oedema secondary to branch or central retinal vein occlusion in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

SMC No. 907/13

The *Scottish Medicines Consortium* has advised (November 2013) that ranibizumab (*Lucentis*®) is accepted for use within NHS Scotland for the treatment of visual impairment due to choroidal neovascularisation secondary to pathologic myopia in adults. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

#### All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3233

The *All Wales Medicines Strategy Group* has advised (June 2018) that ranibizumab (*Lucentis*®) is recommended as an option for use within NHS Wales for the treatment of visual impairment in adults due to choroidal neovascularisation not due to pathological myopia or wet age-related macular degeneration. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Lucentis** (Novartis Pharmaceuticals UK Ltd)

**Ranibizumab 10 mg per 1 ml** Lucentis 2.3mg/0.23ml solution for injection vials | 1 vial [PoM] £551.00 (Hospital only)

Lucentis 1.65mg/0.165ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £551.00

## PHOTOSENSITISERS

### Verteporfin

06-Feb-2019

- **DRUG ACTION** Following intravenous non-infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives.

#### ● INDICATIONS AND DOSE

**Photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 6 mg/m<sup>2</sup>, dose to be given over 10 minutes

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058

- **CAUTIONS** Avoid extravasation · biliary obstruction · photosensitivity

- **INTERACTIONS** → Appendix 1: verteporfin

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Asthenia · dizziness · dyspnoea · headache · hypercholesterolaemia · hypersensitivity · infusion related chest pain · infusion related reaction · nausea · photosensitivity reaction · syncope · vision disorders

- ▶ **Uncommon** Eye inflammation · fever · haemorrhage · hyperaesthesia · hypertension · pain · retinal detachment · skin reactions

- ▶ **Rare or very rare** Malaise · retinal ischaemia

- ▶ **Frequency not known** Myocardial infarction · retinal pigment epithelial tear

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (teratogenic in *animal* studies).

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment and avoid in severe impairment (no information available).

- **DIRECTIONS FOR ADMINISTRATION** For information on administration and light activation, consult product literature.

For *intravenous infusion* (*Visudyne*®), give intermittently in Glucose 5%; reconstitute each 15 mg with 7 ml water for injections to produce a 2 mg/ml solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion.

- **PATIENT AND CARER ADVICE** Photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

EXCIPIENTS: May contain Butylated hydroxytoluene

- ▶ **Visudyne** (Novartis Pharmaceuticals UK Ltd)

**Verteporfin 15 mg** Visudyne 15mg powder for solution for infusion vials | 1 vial [PoM] £850.00 (Hospital only)

## 6.2 Macular oedema

**Other drugs used for Macular oedema** Aflibercept, p. 1008  
· Dexamethasone, p. 675 · Ranibizumab, p. 1190

## CORTICOSTEROIDS

F 672

## Fluocinolone acetonide

08-Feb-2019

## ● INDICATIONS AND DOSE

**Treatment of visual impairment associated with chronic diabetic macular oedema which is insufficiently responsive to available therapies (specialist use only)**

- ▶ BY INTRAVITREAL INJECTION
- ▶ Adult: 190 micrograms, to be administered into the affected eye

- **CONTRA-INDICATIONS** Active or suspected ocular infection
  - active or suspected peri-ocular infection
  - pre-existing glaucoma

- **CAUTIONS** Raised baseline intra-ocular pressure

- **INTERACTIONS** → Appendix 1: fluocinolone

● **SIDE-EFFECTS**

- ▶ **Common or very common** Cataract · eye discomfort · glaucoma · haemorrhage · vision blurred
- ▶ **Uncommon** Eye disorders · headache
- ▶ **Frequency not known** Thromboembolism

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless essential.

● **MONITORING REQUIREMENTS**

- ▶ Monitor for raised intra-ocular pressure (particularly if raised at baseline), retinal detachment, endophthalmitis, vitreous haemorrhage or detachment within 2–7 days following the procedure.
- ▶ Monitor intra-ocular pressure at least every 3 months thereafter (for approximately 36 months).

- **DIRECTIONS FOR ADMINISTRATION** Concurrent administration to both eyes not recommended. For further information on administration and repeat dosing, consult product literature.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Fluocinolone acetonide intravitreal implant for treating chronic diabetic macular oedema after an inadequate response to prior therapy (November 2013) NICE TA301** Fluocinolone acetonide intravitreal implant (*Iluvien*<sup>®</sup>) is recommended as an option for treating chronic diabetic macular oedema that is insufficiently responsive to available therapies only if:

- the implant is to be used in an eye with an intra-ocular (pseudophakic lens), and
- the manufacturer provides fluocinolone acetonide intravitreal implant with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/ta301](http://www.nice.org.uk/guidance/ta301)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 864/13

The *Scottish Medicines Consortium* has advised (February 2014) that fluocinolone acetonide intravitreal implant (*Iluvien*<sup>®</sup>) is recommended for restricted use within NHS Scotland for the treatment of vision impairment associated with chronic diabetic macular oedema, considered insufficiently responsive to available therapies, only in patients in whom the affected eye is pseudophakic (has an artificial lens after cataract surgery), and retreatment would take place only if the patient had previously responded to treatment with fluocinolone acetonide and subsequently best corrected visual acuity had deteriorated to less than 20/32. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Implant**

- ▶ **Iluvien** (Alimera Sciences Ltd)

**Fluocinolone acetonide 190 microgram** ILUVIEN 190microgram intravitreal implant in applicator | 1 device [POM] £5,500.00

## 6.3 Optic neuropathy

## DRUGS FOR METABOLIC DISORDERS &gt;

## ANTIOXIDANTS

## Idebenone

31-May-2017

- **DRUG ACTION** Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

● **INDICATIONS AND DOSE**

**Leber's Hereditary Optic Neuropathy (initiated by a specialist)**

- ▶ BY MOUTH
- ▶ Adult: 300 mg 3 times a day

● **SIDE-EFFECTS**

- ▶ **Common or very common** Cough · diarrhoea · increased risk of infection · pain
- ▶ **Frequency not known** Agranulocytosis · anaemia · anxiety · appetite decreased · azotaemia · delirium · dizziness · dyspepsia · hallucination · headache · hepatitis · leucopenia · malaise · movement disorders · nausea · neutropenia · porioniama · seizure · skin reactions · stupor · thrombocytopenia · urine discolouration · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** The metabolites of idebenone may cause red-brown discolouration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises use with caution—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (May 2017) that idebenone (*Raxone*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber's Hereditary Optic Neuropathy (LHON) who are not yet blind i.e. they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

CAUTIONARY AND ADVISORY LABELS 14, 21

- ▶ **Raxone** (Santhera (UK) Ltd) ▼

**Idebenone 150 mg** Raxone 150mg tablets | 180 tablet [POM] £6,364.00

## 6.4 Vitreomacular traction

### RECOMBINANT PROTEOLYTIC ENZYMES

#### Ocriplasmin

##### ● INDICATIONS AND DOSE

**Treatment of vitreomacular traction, including when associated with a macular hole of diameter less than or equal to 400 microns (specialist use only)**

##### ▶ BY INTRAVITREAL INJECTION

- ▶ Adult: 125 micrograms for 1 dose, to be administered into the affected eye, concurrent administration to both eyes is not recommended

- **CONTRA-INDICATIONS** Active or suspected ocular or periocular infection · aphakia · exudative age-related macular degeneration · high myopia · history of rhegmatogenous retinal detachment · ischaemic retinopathies · large diameter macular hole (> 400 microns) · lens zonule instability · proliferative diabetic retinopathy · recent intra-ocular injection (including laser therapy) · recent ocular surgery · retinal vein occlusions · vitreous haemorrhage
- **CAUTIONS** History of uveitis (including severe active inflammation) · non-proliferative diabetic retinopathy · significant eye trauma
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dry eye · eye discomfort · eye disorders · eye inflammation · haemorrhage · retinal pigment epitheliopathy · vision disorders
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor intra-ocular pressure, visual acuity, and for signs of intra-ocular inflammation or infection following injection.
- **DIRECTIONS FOR ADMINISTRATION** For further information on administration, consult product literature.

##### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **NICE decisions**

- ▶ **Ocriplasmin for treating vitreomacular traction (October 2013)** NICE TA297

Ocriplasmin is recommended as an option for treating vitreomacular traction in adults, only if:

- an epiretinal membrane is not present **and**
- they have a stage II full-thickness macular hole with a diameter of 400 microns or less **and/or**
- they have severe symptoms.

[www.nice.org.uk/TA297](http://www.nice.org.uk/TA297)

##### **Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (July 2014) that ocriplasmin (*Jetrea*®) is accepted for restricted use within NHS Scotland for the treatment of patients with vitreomacular traction plus macular hole, regardless of whether they have epiretinal membrane formation, and in patients with vitreomacular traction alone (no epiretinal membrane and no macular hole).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for injection**

##### ▶ *Jetrea* (Oxurion N.V.)

**Ocriplasmin 1.25 mg per 1 ml** *Jetrea* 0.375mg/0.3ml solution for injection vials | 1 vial [PoM] £2,500.00 (Hospital only)

## Ear

### Ear

03-Sep-2018

#### Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 1199. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 1196 or **clioquinol**) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 1196 may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in patients with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in patients with chronic suppurative otitis media and when other measures have failed for otitis externa; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;

- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an antiinflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*<sup>®</sup> spray) is on sale to the public.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 444 or ibuprofen p. 1141, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 554 is the drug of choice; ciprofloxacin p. 1196 (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. A topical corticosteroid cream or ointment is then required, but prolonged use should be avoided.

#### Otitis media

##### Acute otitis media

Acute otitis media is a self-limiting condition that mainly affects children. It is characterised by inflammation in the middle ear associated with effusion and accompanied by the rapid onset of signs and symptoms of an ear infection. The infection can be caused by viruses or bacteria; often both are present simultaneously.

Children with acute otitis media usually present with symptoms such as ear pain, rubbing of the ear, fever, irritability, crying, poor feeding, restlessness at night, cough, or rhinorrhoea. Symptoms usually resolve within 3 to 7 days without antibacterial drugs. The use of antibacterials generally does not prevent common complications of acute otitis media such as short-term hearing loss, perforated eardrum, or recurrent infection. Acute complications such as mastoiditis, meningitis, intracranial abscess, sinus thrombosis, and facial nerve paralysis, are rare.

**EVG†** Children and their carers should be given advice about the usual duration of acute otitis media, self-care of

symptoms such as pain and fever with paracetamol or ibuprofen p. 1141, and when to seek medical help. In children aged 3 years and over who do not have a perforated eardrum, pain can be relieved with anaesthetic ear drops in addition to oral analgesics [unlicensed use]. Children and their carers should be reassured that antibacterial drugs are usually not required.

An immediate antibacterial drug should be given if the child is systemically very unwell, has signs or symptoms of a more serious illness, or is at high risk of complications such as significant heart, lung, renal, liver or neuromuscular disease, immunosuppression, cystic fibrosis, or young children who were born prematurely. An immediate antibacterial drug can also be considered if otorrhoea is present, or in children under 2 years of age with bilateral otitis media. See *Antibacterial therapy for otitis media* in Ear infections, antibacterial therapy p. 511.

Children with acute otitis media associated with a severe systemic infection or acute complications should be referred to hospital. 

#### Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Systemic antibacterials are not usually required. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

#### Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal and middle ear may be followed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 1199; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin p. 548 (or erythromycin p. 539 if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 1196 or ofloxacin eye drops p. 1173 used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in patients with chronic suppurative otitis media and a perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- patients should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such

circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

#### Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax can be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 1200 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 1200 or urea hydrogen peroxide p. 1200 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in patients unable to cooperate with the procedure, in those with otitis media in the last six weeks, in otitis externa, in patients with cleft palate, a history of ear drum perforation, or previous ear surgery. A person who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

## 1 Otitis externa

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Framycetin sulfate

##### ● INDICATIONS AND DOSE

##### Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Perforated tympanic membrane

- **CAUTIONS** Avoid prolonged use

- **SIDE-EFFECTS** Local reaction

- **MEDICINAL FORMS** No licensed medicines listed.

Combinations available: *Dexamethasone with framycetin sulfate and gramicidin*, p. 1164

 518

#### Gentamicin

11-Dec-2017

##### ● INDICATIONS AND DOSE

##### Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)
- ▶ Adult: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)

- **CAUTIONS** Avoid prolonged use

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Benzalkonium chloride

▶ **Gentamicin (Non-proprietary)**

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.63 DT = £2.47

**Gentamicin with hydrocortisone**

21-Dec-2017

● **INDICATIONS AND DOSE****Eczematous inflammation in otitis externa**

- ▶ TO THE EAR
- ▶ Child: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)
- ▶ Adult: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local reaction

- **INTERACTIONS** → Appendix 1: chloramphenicol
- **SIDE-EFFECTS** Blood disorder · bone marrow depression

### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol ear drops for ear infections (otitis externa) [www.medicinesforchildren.org.uk/chloramphenicol-ear-drops-ear-infections-otitis-externa-0](http://www.medicinesforchildren.org.uk/chloramphenicol-ear-drops-ear-infections-otitis-externa-0)

### ● LESS SUITABLE FOR PRESCRIBING

Chloramphenicol ear drops are less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ear drops

EXCIPIENTS: May contain Propylene glycol

#### ▶ Chloramphenicol (Non-proprietary)

Chloramphenicol 50 mg per 1 ml Chloramphenicol 5% ear drops | 10 ml [PoM] £110.97 DT = £90.73

Chloramphenicol 100 mg per 1 ml Chloramphenicol 10% ear drops | 10 ml [PoM] £94.26 DT = £85.77

## ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

### Clotrimazole

#### ● INDICATIONS AND DOSE

##### Fungal infection in otitis externa

###### ▶ TO THE EAR

- ▶ Child: Apply 2–3 times a day continue for at least 14 days after disappearance of infection
- ▶ Adult: Apply 2–3 times a day continue for at least 14 days after disappearance of infection

#### ● INTERACTIONS

→ Appendix 1: antifungals, azoles

#### ● SIDE-EFFECTS

Local reaction

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Clotrimazole for fungal infections [www.medicinesforchildren.org.uk/clotrimazole-fungal-infections](http://www.medicinesforchildren.org.uk/clotrimazole-fungal-infections)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Liquid

##### ▶ Canesten (clotrimazole) (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P] £2.53 DT = £2.53

## CORTICOSTEROIDS

672

### Betamethasone

21-Dec-2017

#### ● DRUG ACTION

Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

#### ● INDICATIONS AND DOSE

##### BETNESOL<sup>®</sup>

##### Ecematous inflammation in otitis externa

###### ▶ TO THE EAR

- ▶ Adult: Apply 2–3 drops every 2–3 hours, reduce frequency when relief obtained

##### VISTAMETHASONE<sup>®</sup>

##### Ecematous inflammation in otitis externa

###### ▶ TO THE EAR

- ▶ Adult: Apply 2–3 drops every 3–4 hours, reduce frequency when relief obtained

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

#### ● CONTRA-INDICATIONS

Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

#### ● CAUTIONS

Avoid prolonged use

#### ● INTERACTIONS

→ Appendix 1: corticosteroids

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

##### ▶ Betnesol (RPH Pharmaceuticals AB)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT = £2.32

##### ▶ Vistamethasone (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £1.02 | 10 ml [PoM] £1.16 DT = £2.32

Combinations available: *Betamethasone with neomycin*, p. 1164

## Flumetasone pivalate with clioquinol

21-Dec-2017

#### ● INDICATIONS AND DOSE

##### Ecematous inflammation in otitis externa | Mild bacterial or fungal infections in otitis externa

###### ▶ TO THE EAR

- ▶ Child 2–17 years: 2–3 drops twice daily for 7–10 days, to be instilled into the ear
- ▶ Adult: 2–3 drops twice daily for 7–10 days, to be instilled into the ear

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

#### ● CONTRA-INDICATIONS

Iodine sensitivity

#### ● CAUTIONS

Avoid prolonged use - manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

#### ● SIDE-EFFECTS

Paraesthesia - skin reactions

#### ● PATIENT AND CARER ADVICE

Clioquinol stains skin and clothing

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Ear drops

##### ▶ Flumetasone pivalate with clioquinol (Non-proprietary)

Flumetasone pivalate 200 microgram per 1 ml, Clioquinol 10 mg per 1 ml Flumetasone 0.02% / Clioquinol 1% ear drops | 7.5 ml [PoM] £11.34 DT = £11.34 | 10 ml [PoM] £15.13 DT = £15.13

## Prednisolone

21-Dec-2017

#### ● DRUG ACTION

Prednisolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effects.

#### ● INDICATIONS AND DOSE

##### Ecematous inflammation in otitis externa

###### ▶ TO THE EAR

- ▶ Child: Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained
- ▶ Adult: Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained

#### ● CONTRA-INDICATIONS

Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

#### ● CAUTIONS

Avoid prolonged use

#### ● INTERACTIONS

→ Appendix 1: corticosteroids

#### ● SIDE-EFFECTS

Local reaction

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

#### Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Predsol** (RPH Pharmaceuticals AB)

Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 10 ml [PoM] £2.00 DT = £2.00

## CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

### Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1197, neomycin sulfate p. 1196.

#### ● INDICATIONS AND DOSE

##### Eczematous inflammation in otitis externa

- ▶ TO THE EAR USING EAR DROPS
- ▶ Child: Apply 2–3 drops 3–4 times a day
- ▶ Adult: Apply 2–3 drops 3–4 times a day

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)

- **CAUTIONS** Avoid prolonged use

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT = £2.39

### Ciprofloxacin with dexamethasone

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 675, ciprofloxacin p. 1196.

#### ● INDICATIONS AND DOSE

##### Acute otitis media in patients with tympanostomy tubes

- ▶ TO THE EAR
- ▶ Adult: Apply 4 drops twice daily for 7 days

##### Acute otitis externa

- ▶ TO THE EAR
- ▶ Adult: Apply 4 drops twice daily for 7 days

- **CONTRA-INDICATIONS** Fungal ear infections · viral ear infections

- **CAUTIONS** Avoid prolonged use

- **INTERACTIONS** → Appendix 1: corticosteroids · quinolones

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Ear discomfort
- ▶ **Uncommon** Ear infection fungal · flushing · irritability · malaise · otorrhoea · paraesthesia · skin reactions · taste altered · vomiting
- ▶ **Rare or very rare** Dizziness · headache · hearing loss · tinnitus

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **PATIENT AND CARER ADVICE** Manufacturer advises counselling on administration.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (July 2017) that dexamethasone with ciprofloxacin (*Cilodex*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of acute otitis media in patients with tympanostomy tubes (AOMT).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ear drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Cilodex** (Novartis Pharmaceuticals UK Ltd)

Dexamethasone 1 mg per 1 ml, Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Cilodex ear drops | 5 ml [PoM] £6.12 DT = £6.12

### Ciprofloxacin with fluocinolone acetoneide

08-Dec-2018

The properties listed below are those particular to the combination only. For the properties of the components please consider, ciprofloxacin p. 1196.

#### ● INDICATIONS AND DOSE

##### Acute otitis externa | Acute otitis media in patients with tympanostomy tubes

- ▶ TO THE EAR
- ▶ Adult: Apply 0.25 mL twice daily for 7 days

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Each 0.25 mL dose contains 0.75 mg ciprofloxacin and 0.0625 mg of fluocinolone acetoneide.

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **CONTRA-INDICATIONS** Fungal ear infections · viral ear infections

- **INTERACTIONS** → Appendix 1: fluocinolone · quinolones

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Ear discomfort · taste altered
- ▶ **Uncommon** Crying · dizziness · fatigue · flushing · headache · hearing impairment · increased risk of infection · irritability · otorrhoea · paraesthesia · skin reactions · tinnitus · tympanic membrane disorder · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Manufacturer advises caution.

- **PATIENT AND CARER ADVICE** Manufacturer advises counselling on administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Ear drops

EXCIPIENTS: May contain Polysorbates

- ▶ **Cetraxal Plus** (Aspire Pharma Ltd)  
Fluocinolone acetonide 25 mg per 1 ml, Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml Cetraxal Plus 3mg/ml + 0.25mg/ml ear drops 0.25ml unit dose | 15 unit dose [PoM] £6.01

## Dexamethasone with framycetin sulfate and gramicidin

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 675, framycetin sulfate p. 1195.

### ● INDICATIONS AND DOSE

#### Eczematous inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Child: 2–3 drops 3–4 times a day
- ▶ Adult: 2–3 drops 3–4 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: corticosteroids
- **LESS SUITABLE FOR PRESCRIBING** *Sofradex*® is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Ear/Eye drops

EXCIPIENTS: May contain Polysorbates

- ▶ **Sofradex** (Sanofi)  
Gramicidin 50 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml, Dexamethasone 500 microgram per 1 ml Sofradex ear/eye drops | 8 ml [PoM] £7.50

## Dexamethasone with glacial acetic acid and neomycin sulfate

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 675, neomycin sulfate p. 1196.

### ● INDICATIONS AND DOSE

#### Eczematous inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Child 2–17 years: Apply 1 spray 3 times a day
- ▶ Adult: Apply 1 spray 3 times a day

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 1194) · perforated tympanic membrane (although may be used by specialists, see Ear p. 1194)
- **CAUTIONS** Avoid prolonged use
- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **SIDE-EFFECTS** Paraesthesia · skin reactions · vision blurred

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Spray

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Otomize** (Teva UK Ltd)  
Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram, Acetic acid glacial 20 mg per 1 gram Otomize ear spray | 5 ml [PoM] £3.27

## Hydrocortisone with neomycin and polymyxin B sulfate

21-Dec-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 676, neomycin sulfate p. 1196.

### ● INDICATIONS AND DOSE

#### Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child 3–17 years: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)
- ▶ Adult: Apply 3 drops 3–4 times a day for 7 days (review treatment if there is no clinical improvement)

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

See Corticosteroids, general use p. 670.

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin · polymyxins
- **RENAL IMPAIRMENT** Manufacturer advises avoid prolonged, unsupervised use.
- **Dose adjustments** Manufacturer advises reduce dose.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Ear drops

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

- ▶ **Otosporin** (Phoenix Labs Ltd)  
Hydrocortisone 10 mg per 1 ml, Neomycin sulfate 3400 unit per 1 ml, Polymyxin B sulfate 10000 unit per 1 ml Otosporin ear drops | 10 ml [PoM] £7.45

## DERMATOLOGICAL DRUGS > ASTRINGENTS

## Aluminium acetate

### ● INDICATIONS AND DOSE

#### Inflammation in otitis externa

- ▶ TO THE EAR
- ▶ Adult: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

- **DIRECTIONS FOR ADMINISTRATION** For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.
- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ear drops

## 2 Removal of earwax

### BICARBONATE

#### Sodium bicarbonate

##### ● INDICATIONS AND DOSE

##### Removal of earwax (with 5% ear drop solution)

- ▶ TO THE EAR
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: sodium bicarbonate

- **SIDE-EFFECTS** Dry ear

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Ear drops

- ▶ **Sodium bicarbonate (Non-proprietary)**

Sodium bicarbonate 50 mg per 1 ml Sodium bicarbonate 5% ear drops | 10 ml £1.23-£1.25

- ▶ **KliarVax Sodium Bicarbonate** (Essential-Healthcare Ltd)

Sodium bicarbonate 50 mg per 1 ml KliarVax Sodium Bicarbonate ear drops | 10 ml £0.97

### SOFTENING DRUGS

#### Almond oil

##### ● INDICATIONS AND DOSE

##### Removal of earwax

- ▶ TO THE EAR
- ▶ Child: Allow drops to warm to room temperature before use (consult product literature)
- ▶ Adult: Allow drops to warm to room temperature before use (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

- ▶ **Almond oil (Non-proprietary)**

Almond oil 1 ml per 1 ml Almond oil liquid | 50 ml £0.95 DT = £0.95 | 70 ml £0.85 | 200 ml £2.68

#### Docusate sodium

20-Apr-2016

##### (Diocetyl sodium sulphosuccinate)

##### ● INDICATIONS AND DOSE

##### Removal of ear wax

- ▶ TO THE EAR
- ▶ Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: docusate sodium

- **SIDE-EFFECTS** Skin reactions

- **LESS SUITABLE FOR PRESCRIBING** Ear drops less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Ear drops

EXCIPIENTS: May contain Propylene glycol

- ▶ **Molcer** (Wallace Manufacturing Chemists Ltd)

Docusate sodium 50 mg per 1 ml Molcer ear drops | 15 ml [P] £5.60

- ▶ **Waxsol** (Meda Pharmaceuticals Ltd)

Docusate sodium 5 mg per 1 ml Waxsol ear drops | 10 ml [P] £1.95 DT = £1.95

### Olive oil

##### ● INDICATIONS AND DOSE

##### Removal of earwax

- ▶ TO THE EAR
- ▶ Child: Apply twice daily for several days (if wax is hard and impacted)
- ▶ Adult: Apply twice daily for several days (if wax is hard and impacted)

- **DIRECTIONS FOR ADMINISTRATION** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Spray

- ▶ **Earol** (HL Healthcare Ltd)

Earol olive oil ear spray | 10 ml [S]

##### Ear drops

- ▶ **Olive oil (Non-proprietary)**

Olive oil ear drops | 10 ml £1.35-£1.42

- ▶ **Arjun** (Arjun Products Ltd)

Arjun ear drops | 10 ml £1.26

- ▶ **Cerumol (olive oil)** (Thornton & Ross Ltd)

Cerumol olive oil ear drops | 10 ml [S]

- ▶ **KliarVax Olive Oil** (Essential-Healthcare Ltd)

KliarVax Olive Oil ear drops | 10 ml £0.97

- ▶ **Oleax** (JR Biomedical Ltd)

Oleax ear drops | 15 ml £1.40

- ▶ **Olive oil** (Thornton & Ross Ltd)

Care olive oil ear drops | 10 ml £1.42

- ▶ **St George's** (St Georges Medical Ltd)

Olive oil ear drops | 10 ml £1.40 | 20 ml £2.70

### Urea hydrogen peroxide

##### ● INDICATIONS AND DOSE

##### Softening and removal of earwax

- ▶ TO THE EAR
- ▶ Adult: (consult product literature)

- **PATIENT AND CARER ADVICE** The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

- **LESS SUITABLE FOR PRESCRIBING** Urea-hydrogen peroxide ear drops are less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Ear drops

- ▶ **Exterol** (Dermal Laboratories Ltd)

Urea hydrogen peroxide 50 mg per 1 gram Exterol 5% ear drops | 8 ml [P] £1.75 DT = £2.89

- ▶ **Otex** (Dendron Ltd)

Urea hydrogen peroxide 50 mg per 1 gram Otex 5% ear drops | 8 ml [P] £2.89 DT = £2.89

# Nose

## Nose

31-Oct-2017

### Rhinitis

Rhinitis is often self-limiting. There are few indications for nasal sprays and drops except in allergic rhinitis and perennial rhinitis. Many nasal preparations contain sympathomimetic drugs which may damage the nasal cilia. Sodium chloride 0.9% solution p. 1040 may be used as a douche or 'sniff' following endonasal surgery.

### Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 277) or topical **nasal corticosteroids**; systemic nasal decongestants are of doubtful value. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms and nasal congestion can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 1208 is an alternative, but may be less effective. The topical antihistamine azelastine hydrochloride p. 1204 is useful for controlling breakthrough symptoms in allergic rhinitis. Topical antihistamines are considered less effective than topical corticosteroids but probably more effective than cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous treatment may be required for years in perennial rhinitis.

Montelukast p. 269 is less effective than topical nasal corticosteroids; montelukast can be used in patients with seasonal allergic rhinitis and concomitant asthma.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide can reduce watery rhinorrhoea.

Very disabling symptoms occasionally justify the use of **systemic corticosteroids** for short periods, for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

### Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

### Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the patient in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

### Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclomethasone dipropionate p. 1205, budesonide p. 1206, fluticasone p. 1206, or sodium cromoglicate may be considered.

### Topical nasal decongestants

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx causes some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions.

Inhalation of **warm moist air** may be useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (see under Aromatic inhalations, cough preparations and systemic nasal decongestants p. 296).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events. Ephedrine hydrochloride p. 1202 nasal drops is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 1203 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide p. 1205.

### Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis; see elimination of nasal staphylococci.

### Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 1204 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

# 1 Nasal congestion

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Ephedrine hydrochloride

#### ● INDICATIONS AND DOSE

##### Nasal congestion | Sinusitis affecting the maxillary antrum

###### ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12–17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops
- ▶ Adult: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril

#### IMPORTANT SAFETY INFORMATION

##### CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute urinary retention) (in adults)
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anxiety · headache · insomnia · nausea
  - ▶ **Frequency not known** Appetite decreased · arrhythmia · circulation impaired · dermatitis · dizziness · drug dependence · dry mouth · dyspnoea · hallucination · hyperglycaemia · hyperhidrosis · hypersalivation · hypertension · hypokalaemia · hypotension · irritability · muscle weakness · mydriasis · pain · palpitations · paranoia · priorection · rebound congestion · syncope · thirst · tremor · urinary disorders · vasoconstriction · vasodilation · vomiting
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**

##### Dental practitioners' formulary

Ephedrine nasal drops may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops
 

##### Nasal drops

  - ▶ **Ephedrine hydrochloride (Non-proprietary)**
    - ▶ **Ephedrine hydrochloride 5 mg per 1 ml** Ephedrine 0.5% nasal drops | 10 ml **P** | £1.90–£1.94 DT = £1.90

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml **P** | £1.94–£2.01 DT = £1.94

## Pseudoephedrine hydrochloride

#### ● INDICATIONS AND DOSE

##### Congestion of mucous membranes of upper respiratory tract

###### ▶ BY MOUTH

- ▶ Child 6–11 years: 30 mg 3–4 times a day
- ▶ Child 12–17 years: 60 mg 3–4 times a day
- ▶ Adult: 60 mg 3–4 times a day

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (in adults) · raised intra-ocular pressure (in children) · susceptibility to angle-closure glaucoma (in adults)
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angle closure glaucoma · anxiety · arrhythmias · circulation impaired · dry mouth · hallucination · headache · hypertension · irritability · nausea · palpitations · psychotic disorder · skin reactions · sleep disorders · tremor · urinary retention · vomiting
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*<sup>®</sup> and *Sudafed*<sup>®</sup> can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
 

##### Oral solution

EXCIPIENTS: May contain Alcohol

  - ▶ **Galpseud** (Thornton & Ross Ltd)
    - ▶ **Pseudoephedrine hydrochloride 6 mg per 1 ml** Galpseud 30mg/5ml linctus sugar-free | 2000 ml **PoM** | £14.00

##### Tablet

  - ▶ **Galpseud** (Thornton & Ross Ltd)
    - ▶ **Pseudoephedrine hydrochloride 60 mg** Galpseud 60mg tablets | 24 tablet **PoM** | £2.25 | 100 tablet **PoM** | £5.42 DT = £5.42

## Xylometazoline hydrochloride

● **DRUG ACTION** Xylometazoline is a sympathomimetic.

### ● INDICATIONS AND DOSE

#### Nasal congestion

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- ▶ Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- ▶ Adult: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- ▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- ▶ Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril
- ▶ Adult: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

### IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease (in children) · diabetes mellitus · elderly (in adults) · hypertension · hyperthyroidism · ischaemic heart disease (in adults) · prostatic hypertrophy (risk of acute retention)(in adults) · rebound congestion
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Rebound congestion Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Cardiovascular effects · headache · hypersensitivity · nasal dryness · nausea · paraesthesia · visual impairment
- SIDE-EFFECTS, FURTHER INFORMATION** Use of decongestants in infants and children under 6 years has been associated with agitated psychosis, ataxia, hallucinations, and even death—avoid.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Spray

- ▶ **Otrivine** (GlaxoSmithKline Consumer Healthcare)  
**Xylometazoline hydrochloride 1 mg per 1 ml** Otrivine Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.05 DT = £2.18  
Otrivine Adult Measured Dose Sinusitis spray | 10 ml [GSL] £2.62 DT = £2.18  
Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.62 DT = £2.18  
Otrivine Adult nasal spray | 10 ml [GSL] £2.18 DT = £2.18

Otrivine Adult Metered Dose 0.1% nasal spray | 10 ml [GSL] £2.62 DT = £2.18

- ▶ **Sudafed Congestion Relief** (McNeil Products Ltd)  
**Xylometazoline hydrochloride 1 mg per 1 ml** Sudafed Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.46 DT = £2.18
- ▶ **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)  
**Xylometazoline hydrochloride 1 mg per 1 ml** Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.76
- ▶ **Sudafed Sinus-Ease** (McNeil Products Ltd)  
**Xylometazoline hydrochloride 1 mg per 1 ml** Sudafed Sinus-Ease 0.1% nasal spray | 15 ml [GSL] £2.80

#### Nasal drops

- ▶ **Otrivine** (GlaxoSmithKline Consumer Healthcare)  
**Xylometazoline hydrochloride 500 microgram per 1 ml** Otrivine Child nasal drops | 10 ml [P] £1.91 DT = £1.91  
**Xylometazoline hydrochloride 1 mg per 1 ml** Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT = £2.18

## 2 Nasal infection

### Sinusitis (acute)

31-Oct-2017

#### Description of condition

Sinusitis is an inflammation of the mucosal lining of the paranasal sinuses. Acute sinusitis (rhinosinusitis) is a self-limiting condition usually triggered by a viral upper-respiratory tract infection such as the 'common cold'. Occasionally, acute sinusitis may become complicated by a bacterial infection (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 513).

Patients with acute sinusitis usually present with symptoms of nasal blockage or congestion, nasal discharge, dental or facial pain or pressure, and reduction or loss of the sense of smell.

Symptoms usually improve within 2 to 3 weeks without requiring treatment.

Rarely, acute sinusitis may lead to orbital, intracranial or skeletal complications (e.g. periorbital cellulitis, symptoms or signs of meningitis).

#### Aims of treatment

Treatment is aimed at managing symptoms including pain, fever, and nasal congestion as well as treatment of bacterial infection if present.

#### Treatment

**[EvGr]** Patients presenting with symptoms for around 10 days or less, should be given advice about the usual duration of acute sinusitis, self-care of pain or fever with paracetamol p. 444 or ibuprofen p. 1141, and when to seek medical help. Patients should be reassured that antibiotics are usually not required. Some patients may try nasal saline or nasal decongestants, however there is limited evidence to show they help to relieve nasal congestion.

Patients presenting with symptoms for around 10 days or more with no improvement could be considered for treatment with a high-dose nasal corticosteroid, such as mometasone furoate p. 1207 [unlicensed use] or fluticasone p. 1206 [unlicensed use] for 14 days. Supply of a back-up antibiotic prescription could be considered and used if symptoms do not improve within 7 days, or if they worsen rapidly or significantly.

If the patient is systemically very unwell, has signs and symptoms of a more serious illness or condition, or is at high-risk of complications, an immediate antibiotic should be given. **[A]** (see *Antibacterial therapy for acute sinusitis* in Nose infections, antibacterial therapy p. 513).

**[EvGr]** Patients presenting with symptoms of acute sinusitis associated with a severe systemic infection or with orbital or intracranial complications should be referred to hospital. **[A]**

**Useful Resources**

Sinusitis (acute): antimicrobial prescribing. National Institute for Health and Care Excellence. NICE guideline 79. October 2017.

[www.nice.org.uk/guidance/ng79](http://www.nice.org.uk/guidance/ng79)

**ANTIBACTERIALS** > AMINOGLYCOSIDES**Chlorhexidine with neomycin**● **INDICATIONS AND DOSE****Eradication of nasal carriage of staphylococci**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 4 times a day for 10 days
- ▶ Adult: Apply 4 times a day for 10 days

**Preventing nasal carriage of staphylococci**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)

Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram PoM £1.99 DT = £1.99

**ANTIBACTERIALS** > OTHER**Mupirocin**● **INDICATIONS AND DOSE**

BACTROBAN NASAL<sup>®</sup>

**For eradication of nasal carriage of staphylococci, including methicillin-resistant *Staphylococcus aureus* (MRSA)**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril
- ▶ Adult: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

● **SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Nasal mucosal disorder
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Nasal ointment**

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% nasal ointment | 3 gram PoM £4.24 DT = £4.24

**CORTICOSTEROIDS** > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES**Betamethasone with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 674, neomycin sulfate p. 520.

● **INDICATIONS AND DOSE****Nasal infection**

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril
- ▶ Adult: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **INTERACTIONS** → Appendix 1: corticosteroids · neomycin
- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (RPH Pharmaceuticals AB)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml PoM £2.39 DT = £2.39

**3 Nasal inflammation, nasal polyps and rhinitis**

**Other drugs used for Nasal inflammation, nasal polyps and rhinitis** Desloratadine, p. 280 · Fexofenadine hydrochloride, p. 280 · Ketotifen, p. 286 · Rupatadine, p. 282

**ANTIHISTAMINES** > NON-SEDATING**Azelastine hydrochloride**● **INDICATIONS AND DOSE****Allergic rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 6–17 years: 1 spray twice daily, to be administered into each nostril
- ▶ Adult: 1 spray twice daily, to be administered into each nostril

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 1 spray equivalent to 140 micrograms.

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

● **SIDE-EFFECTS**

- ▶ **Common or very common** Taste bitter (if applied incorrectly)
- ▶ **Uncommon** Epistaxis · nasal complaints

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- ▶ **Rhinolast** (Meda Pharmaceuticals Ltd)

Azelastine hydrochloride 140 microgram per 1 actuation Rhinolast 140micrograms/dose nasal spray | 22 ml PoM £10.50 DT = £10.50

Combinations available: *Fluticasone with azelastine*, p. 1207

## ANTIMUSCARINICS

245

## Ipratropium bromide

25-Jul-2018

## ● INDICATIONS AND DOSE

**Rhinorrhoea associated with allergic and non-allergic rhinitis**

## ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12-17 years: 2 sprays 2-3 times a day, dose to be sprayed into each nostril
- ▶ Adult: 2 sprays 2-3 times a day, dose to be sprayed into each nostril

## DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · prostatic hyperplasia (in adults) · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: ipratropium

● **SIDE-EFFECTS**

- ▶ **Common or very common** Epistaxis · gastrointestinal motility disorder · headache · nasal complaints · throat complaints
- ▶ **Uncommon** Corneal oedema · eye disorders · eye pain · nausea · respiratory disorders · stomatitis · vision disorders
- ▶ **Rare or very rare** Palpitations

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.

- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

**Driving and skilled tasks** Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness and vision disorders.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rinatec** (Sanofi)

Ipratropium bromide 21 microgram per 1 dose Rinatec  
21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT = £6.54

## CORTICOSTEROIDS

## Corticosteroids (intranasal)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periorcular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

**CAUTIONS, FURTHER INFORMATION**

- ▶ Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Altered smell sensation · epistaxis · headache · nasal complaints · taste altered · throat irritation
  - ▶ **Rare or very rare** Glaucoma · nasal septum perforation (more common following nasal surgery) · vision blurred
- SIDE-EFFECTS, FURTHER INFORMATION** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

● **MONITORING REQUIREMENTS**

- ▶ In children The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

above

## Beclometasone dipropionate

04-Jan-2016

## (Beclomethasone dipropionate)

● **INDICATIONS AND DOSE****Prophylaxis and treatment of allergic and vasomotor rhinitis**

## ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day
- ▶ Adult: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

- **INTERACTIONS** → Appendix 1: corticosteroids

● **EXCEPTIONS TO LEGAL CATEGORY**

- ▶ In adults Preparations of beclometasone dipropionate can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 20 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- ▶ **Beclometasone dipropionate (Non-proprietary)**

**Beclometasone dipropionate 50 microgram per**

**1 dose** Beclometasone 50micrograms/dose nasal spray | 200 dose [PoM] [N] DT = £3.02

- ▶ **Beconase** (GlaxoSmithKline UK Ltd, Omega Pharma Ltd)

**Beclometasone dipropionate 50 microgram per 1 dose** Beconase  
Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £2.63 DT = £3.02

▶ **Nasobec** (Teva UK Ltd)

**Beclomethasone dipropionate 50 microgram per 1 dose** Nasobec  
Aqueous 50micrograms/dose nasal spray | 200 dose [PoM] £3.06 DT =  
£3.02

F 1205

**Betamethasone**

21-Dec-2017

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

● **INDICATIONS AND DOSE****BETNESOL**®**Non-infected inflammatory conditions of nose**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

**VISTAMETHASONE**®**Non-infected inflammatory conditions of nose**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: Apply 2–3 drops twice daily, dose to be applied into each nostril

- **INTERACTIONS** → Appendix 1: corticosteroids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ **Betnesol** (RPH Pharmaceuticals AB)

**Betamethasone sodium phosphate 1 mg per 1 ml** Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT = £2.32

▶ **Vistamethasone** (Martindale Pharmaceuticals Ltd)

**Betamethasone sodium phosphate 1 mg per 1 ml** Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £1.02 | 10 ml [PoM] £1.16 DT = £2.32

F 1205

**Budesonide**

21-Dec-2017

- **DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

● **INDICATIONS AND DOSE****Allergic rhinitis | Nasal polyps**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 6–17 years: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved
- ▶ Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered to each nostril, reduce dose when control achieved

**Prophylaxis and treatment of allergic and vasomotor rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved
- ▶ Adult: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved

**Nasal polyps**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril
- ▶ Adult: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

**RHINOCORT AQUA**®**Rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to 64 micrograms once daily when control achieved. Use for maximum 3 months, doses to be administered into each nostril

**Nasal polyps**

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Adult: 64 micrograms twice daily for up to 3 months, dose to be administered into each nostril

- **INTERACTIONS** → Appendix 1: corticosteroids

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Adrenal suppression

● **EXCEPTIONS TO LEGAL CATEGORY**

- ▶ In adults Preparations of budesonide can be sold to the public for nasal administration as a nasal spray if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Disodium edetate, polysorbates, potassium sorbate

▶ **Budesonide (Non-proprietary)**

**Budesonide 64 microgram per 1 dose** Budesonide 64micrograms/dose nasal spray | 120 dose [PoM] £4.77 DT = £4.77

▶ **Budeflam (Imported (South Africa))**

**Budesonide 100 microgram per 1 dose** Budeflam Aquanase 100micrograms/dose nasal spray | 150 dose [PoM] [S]

Aircort 100micrograms/dose nasal spray | 200 dose [PoM] [S]

▶ **Benacort** (McNeil Products Ltd)

**Budesonide 64 microgram per 1 dose** Benacort 64micrograms nasal spray | 120 dose [P] £5.83 DT = £4.77

▶ **Rhinocort** (Johnson & Johnson Ltd)

**Budesonide 64 microgram per 1 dose** Rhinocort Aqua 64 nasal spray | 120 dose [PoM] £3.77 DT = £4.77

F 1205

**Fluticasone**

21-Dec-2017

● **INDICATIONS AND DOSE****Prophylaxis and treatment of allergic rhinitis and perennial rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- ▶ Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- ▶ Child 12–17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved
- ▶ Adult: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to

50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

### Nasal polyps

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child 16–17 years: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)
- ▶ Adult: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

### AVAMYS® SPRAY

#### Prophylaxis and treatment of allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 6–11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- ▶ Child 12–17 years: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- ▶ Adult: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ With intranasal use
- ▶ 1 spray equivalent to 27.5 micrograms.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Adrenal suppression

**SIDE-EFFECTS, FURTHER INFORMATION** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

- **EXCEPTIONS TO LEGAL CATEGORY**

- ▶ With intranasal use in adults Preparations of fluticasone propionate can be sold to the public for nasal administration (other than by pressurised nasal spray) if supplied for the prevention and treatment of allergic rhinitis in adults over 18 years, subject to max. single dose of 100 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. 3 months, and a pack size of 3 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

- ▶ **Avamys** (GlaxoSmithKline UK Ltd)

**Fluticasone furoate 27.5 microgram per 1 dose** Avamys 27.5micrograms/dose nasal spray | 120 dose [PoM] £6.44 DT = £6.44

- ▶ **Flixonase** (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)

**Fluticasone propionate 50 microgram per 1 dose** Flixonase 50micrograms/dose aqueous nasal spray | 150 dose [PoM] £11.01 DT = £7.26

**Fluticasone propionate 50 microgram per 1 dose** Nasofan 50micrograms/dose aqueous nasal spray | 150 dose [PoM] £8.04 DT = £7.26

### Nasal drops

EXCIPIENTS: May contain Polysorbates

- ▶ **Flixonase** (GlaxoSmithKline UK Ltd)

**Fluticasone propionate 400 microgram** Flixonase Nasule 400microgram/unit dose nasal drops | 28 unit dose [PoM] £12.99 DT = £12.99

## Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 1206, azelastine hydrochloride p. 1204.

### ● INDICATIONS AND DOSE

**Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 12–17 years: 1 spray twice daily, dose to be administered into each nostril
- ▶ Adult: 1 spray twice daily, dose to be administered into each nostril

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating - corticosteroids

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Spray

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- ▶ **Dymista** (Meda Pharmaceuticals Ltd)

**Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation** Dymista 137micrograms/dose / 50micrograms/dose nasal spray | 120 dose [PoM] £14.80 DT = £14.80

£ 1205

21-Dec-2017

## Mometasone furoate

### ● INDICATIONS AND DOSE

**Prophylaxis and treatment of seasonal allergic or perennial rhinitis**

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Child 3–11 years: 50 micrograms daily, dose to be sprayed into each nostril
- ▶ Child 12–17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril
- ▶ Adult: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

### Nasal polyps

- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Adult: Initially 100 micrograms daily for 5–6 weeks, dose to be sprayed into each nostril, then increased if necessary to 100 micrograms twice daily, dose to be sprayed into each nostril, consider alternative treatment if no improvement after further 5–6 weeks, reduce to the lowest effective dose when control achieved

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION** Nasal ulceration occurs commonly with preparations containing mometasone furoate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ **Mometasone furoate (Non-proprietary)**

**Mometasone furoate 50 microgram per 1 dose** Mometasone 50micrograms/dose nasal spray | 140 dose [PoM] £7.30 DT = £1.71

▶ **Nasonex** (Merck Sharp & Dohme Ltd)

**Mometasone furoate 50 microgram per 1 dose** Nasonex 50micrograms/dose nasal spray | 140 dose [PoM] £7.68 DT = £1.71

F 1205

**Triamcinolone acetonide**

21-Dec-2017

- **DRUG ACTION** Triamcinolone exerts predominantly glucocorticoid effects with minimal mineralocorticoid effect.

● **INDICATIONS AND DOSE****Prophylaxis and treatment of allergic rhinitis**▶ **BY INTRANASAL ADMINISTRATION**

- ▶ **Child 6-11 years:** 55 micrograms once daily, dose to be sprayed into each nostril, increased if necessary to 110 micrograms once daily, dose to be sprayed into each nostril; reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved; maximum duration of treatment 3 months
- ▶ **Child 12-17 years:** 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved
- ▶ **Adult:** 110 micrograms once daily, dose to be sprayed into each nostril, reduced to 55 micrograms once daily, dose to be sprayed into each nostril, reduce dose when control achieved

- **INTERACTIONS** → Appendix 1: corticosteroids
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ In adults Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-pressurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to maximum daily dose of 110 micrograms per nostril for maximum 3 months, and a pack size of 3.575 mg.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

▶ **Nasacort** (Sanofi)

**Triamcinolone acetonide 55 microgram per 1 dose** Nasacort 55micrograms/dose nasal spray | 120 dose [PoM] £7.39 DT = £7.39

25-Jul-2018

**(Sodium cromoglycate)**● **INDICATIONS AND DOSE****Prophylaxis of allergic rhinitis**▶ **BY INTRANASAL ADMINISTRATION**

- ▶ **Child:** 1 spray 2–4 times a day, to be administered into each nostril
- ▶ **Adult:** 1 spray 2–4 times a day, to be administered into each nostril

● **UNLICENSED USE**

- ▶ In children Licensed for use in children (age range not specified by manufacturers).

● **SIDE-EFFECTS**

- ▶ **Rare or very rare** Bronchospasm (transient)
- ▶ **Frequency not known** Local reaction

- **MEDICINAL FORMS** No licensed medicines listed.

**Oropharynx****1 Dry mouth****Treatment of dry mouth****Overview**

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

**Artificial saliva** can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, *Aquoral*<sup>®</sup>, *Biotène Oralbalance*<sup>®</sup> gel or *Xerotin*<sup>®</sup> can be used for any condition giving rise to a dry mouth. *BioXtra*<sup>®</sup>, *Glandosane*<sup>®</sup>, *Saliva Orthana*<sup>®</sup>, and *Saliveze*<sup>®</sup>, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. *Salivix*<sup>®</sup> pastilles, which act locally as salivary stimulants, are also available for any condition leading to a dry mouth and SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts).

Pilocarpine tablets p. 1210 are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

**LUBRICANTS****Artificial saliva products**● **ARTIFICIAL SALIVA PRODUCTS****AS SALIVA ORTHANA<sup>®</sup> LOZENGES**

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

● **INDICATIONS AND DOSE**

**Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)**

▶ **BY MOUTH**

- ▶ **Adult:** 1 lozenge as required, allow to dissolve slowly in the mouth

- **PRESCRIBING AND DISPENSING INFORMATION** *AS Saliva Orthana*<sup>®</sup> lozenges do not contain fluoride.

**AS Saliva Orthana lozenges** (A S Pharma Ltd)  
30 lozenge(ACBS) • NHS indicative price = £3.50 • Drug Tariff (Part VIII A Category C) price = £3.50

**AS SALIVA ORTHANA® SPRAY**

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

**● INDICATIONS AND DOSE****Symptomatic treatment of dry mouth**

- ▶ BY MOUTH
- ▶ Adult: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

**● PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary  
*AS Saliva Orthana®* Oral Spray may be prescribed.

**BIOXTRA® GEL**

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

**● INDICATIONS AND DOSE****Dry mouth as a result of having (or having undergone) radiotherapy | Dry mouth as a result of sicca syndrome**

- ▶ BY MOUTH
- ▶ Adult: Apply as required, apply to oral mucosa

**● PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary  
*BioXtra®* Gel may be prescribed.

**BioXtra Dry Mouth oral gel** (R.I.S. Products Ltd)  
40 ml • NHS indicative price = £3.94 • Drug Tariff (Part IXa)

**BIOTENE ORALBALANCE®**

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

**● INDICATIONS AND DOSE****Symptomatic treatment of dry mouth**

- ▶ BY MOUTH
- ▶ Adult: Apply as required, apply to gums and tongue

**● PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).**● PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary  
*Biotene Oralbalance®* Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

**Biotene Oralbalance dry mouth saliva replacement gel** (GlaxoSmithKline Consumer Healthcare) **Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg** 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

**GLANDOSANE®**

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

**● INDICATIONS AND DOSE****Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)**

- ▶ BY MOUTH
- ▶ Adult: Apply as required, spray onto oral and pharyngeal mucosa

**ORALIEVE MOISTURISING MOUTH SPRAY**

aqua, glycerin, xylitol, poloxamer 407, sodium benzoate, monosodium phosphate, xanthan gum, aroma, disodium phosphate, benzoic acid, whey protein, lactoferrin, lactoperoxidase, potassium thiocyanate, glucose oxidase, SLS free, alcohol free, pH 5.8

**● INDICATIONS AND DOSE****Dry mouth**

- ▶ BY MOUTH
- ▶ Adult: 1 spray as required, on the inside of each cheek, gums and tongue

**Oralieve moisturising mouth spray** (Oralieve UK)

50 ml • NHS indicative price = £4.95 • Drug Tariff (Part IXa)

**ORALIEVE GEL****● INDICATIONS AND DOSE****Symptomatic treatment of dry mouth**

- ▶ BY MOUTH
- ▶ Adult: Apply as required, particularly at night, to oral mucosa

**● PRESCRIBING AND DISPENSING INFORMATION** Contains traces of milk protein and egg white protein.**SST®**

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

**● INDICATIONS AND DOSE****Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts**

- ▶ BY MOUTH
- ▶ Adult: 1 tablet as required, allow tablet to dissolve slowly in the mouth

**● PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary  
May be prescribed as Saliva Stimulating Tablets.

**SALIVEZE®**

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

**● INDICATIONS AND DOSE****Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)**

- ▶ BY MOUTH
- ▶ Adult: Apply 1 spray as required, spray onto oral mucosa

**● PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary  
*Saliveze®* Oral Spray may be prescribed.

**Saliveze mouth spray** (Wyvern Medical Ltd)  
50 ml • NHS indicative price = £3.50 • Drug Tariff (Part IXa)

**SALIVIX®**

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

**● INDICATIONS AND DOSE****Symptomatic treatment of dry mouth**

- ▶ BY MOUTH USING PASTILLES
- ▶ Adult: 1 unit as required, suck pastille

### PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

*Salivix*® Pastilles may be prescribed as Artificial Saliva Pastilles.

#### Salivix pastilles (Galen Ltd)

50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

#### XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

### INDICATIONS AND DOSE

#### Symptomatic treatment of dry mouth

► BY MOUTH

► Adult: 1 spray as required

### PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

*Xerotin*® Oral Spray may be prescribed as Artificial Saliva Oral Spray.

#### Xerotin spray (SpePharm UK Ltd)

100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

## PARASYMPATHOMIMETICS

### Pilocarpine

### INDICATIONS AND DOSE

#### Xerostomia following irradiation for head and neck cancer

► BY MOUTH

► Adult: 5 mg 3 times a day for 4 weeks, then increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with or immediately after meals (last dose always with evening meal), maximum therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months

#### Dry mouth and dry eyes in Sjögren's syndrome

► BY MOUTH

► Adult: 5 mg 4 times a day; increased if tolerated to up to 30 mg daily in divided doses if required, dose to be taken with meals and at bedtime, discontinue if no improvement after 2–3 months

- **CONTRA-INDICATIONS** Acute iritis • chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance) • uncontrolled asthma (increased bronchial secretions and increased airways resistance) • uncontrolled cardiorenal disease

- **CAUTIONS** Asthma (avoid if uncontrolled) • biliary-tract disease • cardiovascular disease (avoid if uncontrolled) • cholelithiasis • chronic obstructive pulmonary disease (avoid if uncontrolled) • cognitive disturbances • maintain adequate fluid intake to avoid dehydration associated with excessive sweating • peptic ulceration • psychiatric disturbances • risk of increased renal colic • risk of increased urethral smooth muscle tone • susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: pilocarpine

### SIDE-EFFECTS

- **Common or very common** Asthenia • conjunctivitis • constipation • diarrhoea • dizziness • excessive tearing • eye pain • flushing • gastrointestinal discomfort • headache • hyperhidrosis • hypersalivation • hypersensitivity • hypertension • increased risk of infection • nausea • palpitations • skin reactions • urinary disorders • vision disorders • vomiting
- **Uncommon** Gastrointestinal disorders
- **Frequency not known** Affective disorder • agitation • arrhythmias • atrioventricular block • chills • confusion •

hallucination • hypotension • memory loss • psychiatric disorder • respiratory distress • shock • tremor

- **PREGNANCY** Avoid—smooth muscle stimulant; toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe cirrhosis.  
**Dose adjustments** Manufacturer advises initial dose reduction in moderate to severe cirrhosis.
- **RENAL IMPAIRMENT** Manufacturer advises caution with tablets.
- **PATIENT AND CARER ADVICE**  
**Driving and skilled tasks** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Tablet

## 2 Oral hygiene

### Mouthwashes and other preparations for oropharyngeal use

#### Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

#### Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 1212 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 1212, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine p. 1211 is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed.

Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled.

Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

There is no convincing evidence that gargles are effective in adults.

## ANTISEPTICS AND DISINFECTANTS

### Chlorhexidine

#### ● INDICATIONS AND DOSE

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers**

► BY MOUTH USING MOUTHWASH

- Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
- Adult: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

**Denture stomatitis**

► MOUTHWASH

- Adult: Cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

**Oral hygiene and plaque inhibition and gingivitis**

► BY MOUTH USING DENTAL GEL

- Child: Apply 1–2 times a day, to be brushed on the teeth
- Adult: Apply 1–2 times a day, to be brushed on the teeth

**Oral candidiasis | Management of aphthous ulcers**

► BY MOUTH USING DENTAL GEL

- Child: Apply 1–2 times a day, to affected areas
- Adult: Apply 1–2 times a day, to affected areas

**Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers**

► BY MOUTH USING OROMUCOSAL SPRAY

- Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
- Adult: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

**Bladder irrigation and catheter patency solutions**

► BY INTRAVESICAL INSTILLATION

- Adult: (consult product literature)

- **UNLICENSED USE** *Corsodyl*<sup>®</sup> not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

#### ● SIDE-EFFECTS

► Common or very common

- With oromucosal use Dry mouth · hypersensitivity · oral disorders · taste altered · tongue discolouration · tooth discolouration

**SIDE-EFFECTS, FURTHER INFORMATION** If desquamation occurs with mucosal irritation, discontinue treatment.

#### ● PATIENT AND CARER ADVICE

- With oral (topical) use Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

#### ● PROFESSION SPECIFIC INFORMATION

**Dental practitioners' formulary**

*Corsodyl*<sup>®</sup> dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*<sup>®</sup> mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*<sup>®</sup> oral spray may be prescribed as Chlorhexidine Oral Spray.

### Hexetidine

06-Aug-2018

#### ● INDICATIONS AND DOSE

**Oral hygiene**

► BY MOUTH USING MOUTHWASH

- Child 12–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted
- Adult: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

#### ● SIDE-EFFECTS

- Rare or very rare Anaesthesia · taste altered
- Frequency not known Cough · dry mouth · dysphagia · dyspnoea · nausea · salivary gland enlargement · vomiting

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Mouthwash**

► *Oraldene* (McNeil Products Ltd)

**Hexetidine 1 mg per 1 ml** *Oraldene* 0.1% mouthwash peppermint sugar-free | 200 ml **GSL** £2.92 DT = £2.92

## Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

### ● INDICATIONS AND DOSE

#### Oral hygiene (with hydrogen peroxide 6%)

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
- ▶ Adult: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

#### PEROXYL®

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime
- ▶ Adult: Rinse or gargle 10 mL up to 4 times a day for about 1 minute, to be used after meals and at bedtime

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Hydrogen Peroxide Mouthwash may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Mouthwash

- ▶ Peroxyl (Colgate-Palmolive (UK) Ltd)  
Hydrogen peroxide 15 mg per 1 mL Peroxyl 1.5% mouthwash sugar-free | 300 mL (GSL) £2.94 DT = £2.94

## Sodium bicarbonate with sodium chloride

### ● INDICATIONS AND DOSE

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Compound sodium chloride mouthwash may be prescribed.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: mouthwash

## Sodium chloride

### ● INDICATIONS AND DOSE

#### Oral hygiene

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Child: Rinse or gargle as required
- ▶ Adult: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

- ▶ In children The RCPCH and NPPG recommend that, when a liquid special of sodium chloride is required, the following strength is used: 5 mmol/mL.

### ● PROFESSION SPECIFIC INFORMATION

#### Dental practitioners' formulary

Compound Sodium Chloride Mouthwash may be prescribed.

- **MEDICINAL FORMS** No licensed medicines listed.

## 2.1 Dental caries

### Fluoride imbalance

#### Overview

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

## VITAMINS AND TRACE ELEMENTS

## Sodium fluoride

## ● INDICATIONS AND DOSE

**Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion**

- ▶ BY MOUTH USING TABLETS
- ▶ Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Adult: 1 mg daily, doses expressed as fluoride ion (F<sup>-</sup>)

**Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3-0.7 parts per million) of fluoride ion**

- ▶ BY MOUTH USING TABLETS
- ▶ Child 3-5 years: 250 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Child 6-17 years: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)
- ▶ Adult: 500 micrograms daily, doses expressed as fluoride ion (F<sup>-</sup>)

**Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion**

- ▶ Child 6 months-17 years: Supplements not advised
- ▶ Adult: Supplements not advised

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: Rinse or gargle 10 mL daily

## DOSE EQUIVALENCE AND CONVERSION

- ▶ Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- ▶ These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6-7).

## COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

**Prophylaxis of dental caries**

- ▶ BY MOUTH USING PASTE
- ▶ Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush
- ▶ Adult: Apply 1 centimetre twice daily, to be applied using a toothbrush

## COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

**Prophylaxis of dental caries**

- ▶ BY MOUTH USING PASTE
- ▶ Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush
- ▶ Adult: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

## EN-DE-KAY® FLUORINSE

**Prophylaxis of dental carries for individuals who are caries prone or medically compromised**

- ▶ BY MOUTH USING MOUTHWASH
- ▶ Adult: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated

- **SIDE-EFFECTS** Dental fluorosis

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ With oral use Tablets should be sucked or dissolved in the mouth and taken preferably in the evening.
- ▶ With oral (topical) use For mouthwash, rinse mouth for 1 minute and then spit out.

## COLGATE DURAPHAT® 5000PPM FLUORIDE

**TOOTHPASTE** Brush teeth for 3 minutes before spitting out.

## COLGATE DURAPHAT® 2800PPM FLUORIDE

**TOOTHPASTE** Brush teeth for 1 minute before spitting out.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

● **PATIENT AND CARER ADVICE**

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

## COLGATE DURAPHAT® 5000PPM FLUORIDE

**TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

## COLGATE DURAPHAT® 2800PPM FLUORIDE

**TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste.

Avoid drinking or rinsing mouth for 30 minutes after use.

● **PROFESSION SPECIFIC INFORMATION****Dental practitioners' formulary**

Tablets may be prescribed as Sodium Fluoride Tablets.

Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

**Dental information**

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

## COLGATE DURAPHAT® 5000PPM FLUORIDE

**TOOTHPASTE DENTAL PRACTITIONERS' FORMULARY**

May be prescribed as Sodium Fluoride Toothpaste 1.1%.

## COLGATE DURAPHAT® 2800PPM FLUORIDE

**TOOTHPASTE DENTAL PRACTITIONERS' FORMULARY**

May be prescribed as Sodium Fluoride Toothpaste 0.619%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## 3 Oral ulceration and inflammation

### Oral ulceration and inflammation

#### Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also *Chemotherapy induced mucositis and myelosuppression* under Cytotoxic drugs p. 888). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer.

#### Simple mouthwashes

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

#### Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of a chlorhexidine mouthwash p. 1211 is often beneficial and may accelerate healing of recurrent aphthae.

#### Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase.

Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 1216 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 257 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 1216 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 1153), is reserved for severe conditions such as pemphigus vulgaris.

#### Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. The main indication for a topical local analgesic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine hydrochloride 5% ointment p. 1214 or lozenges containing a

local anaesthetic are applied to the ulcer. Lidocaine hydrochloride 10% solution as spray can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Preparations on sale to the public:** many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a local anaesthetic. To identify the active ingredients in such preparations, consult the product literature of the manufacturer—the correct proprietary name should be ascertained as many products have very similar names but different active ingredients.

Benzylamine hydrochloride p. 1215 and flurbiprofen p. 1216 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat.

Choline salicylate p. 1217 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration.

#### Other preparations

Doxycycline p. 564 rinsed in the mouth may be of value for recurrent aphthous ulceration.

#### Periodontitis

Low-dose doxycycline (*Periostat*®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal infections, antibacterial therapy p. 1217. See also Mouthwashes and other preparations for oropharyngeal use p. 1210 for mouthwashes used for oral hygiene and plaque inhibition.

## ANAESTHETICS, LOCAL

### Lidocaine hydrochloride

#### (Lignocaine hydrochloride)

##### ● INDICATIONS AND DOSE

#### Dental practice

- ▶ BY BUCCAL ADMINISTRATION USING OINTMENT
- ▶ Adult: Rub gently into dry gum

#### Relief of pain in oral lesions

- ▶ TO THE LESION USING OINTMENT
- ▶ Adult: Apply as required, rub sparingly and gently on affected areas

#### LARYNGOJET®

#### Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: 40–200 mg, to be given as a single dose sprayed, instilled (if a cavity), or applied with a swab (reduce dose according to size, age and condition of patient); usual dose 160 mg

**XYLOCAINE®****Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation**

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: Up to 20 doses

**Dental practice**

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: 1–5 doses

**Maxillary sinus puncture**

- ▶ TO MUCOUS MEMBRANES
- ▶ Adult: 3 doses

**Relief of pain in oral lesions**

- ▶ TO THE LESION
- ▶ Adult: Apply thinly to the ulcer using a cotton bud

- **UNLICENSED USE** Spray not licensed for the relief of pain in oral lesions.
- **CAUTIONS** Avoid anaesthesia of the pharynx before meals—risk of choking · can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **ALLERGY AND CROSS-SENSITIVITY**
  - ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners' formulary Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%
- **XYLOCAINE® DENTAL PRACTITIONERS' FORMULARY** May be prescribed as lidocaine spray 10%.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- ▶ **Xylocaine** (Aspen Pharma Trading Ltd) Lidocaine 10 mg per 1 actuation Xylocaine 10mg/dose spray sugar-free | 50 ml Ⓜ £6.29 DT = £6.29

## CORTICOSTEROIDS

F 672

## Beclometasone dipropionate (Beclomethasone dipropionate)

04-Jan-2016

- **INDICATIONS AND DOSE**

### Management of oral ulceration

- ▶ TO THE LESION

- ▶ Adult: 50-100 micrograms twice daily, administered using an inhaler device

- **UNLICENSED USE** Use of soluble tablets and inhaler unlicensed in oral ulceration.
- **INTERACTIONS** → Appendix 1: corticosteroids
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. For preparations, see inhaled beclometasone, p. 257

## Betamethasone

21-Dec-2017

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

- **INDICATIONS AND DOSE**

### Oral ulceration

- ▶ TO THE LESION USING SOLUBLE TABLETS

- ▶ Child 12-17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
- ▶ Adult: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE**

- ▶ With oral (topical) use in children Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.

- **CONTRA-INDICATIONS** Untreated local infection

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (administration).

- **PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary** Betamethasone Soluble Tablets 500 micrograms may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21 (not for use as mouthwash for oral ulceration)

- ▶ **Betamethasone (Non-proprietary)**

**Betamethasone (as Betamethasone sodium phosphate)**

**500 microgram** Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [PoM] £65.18 DT = £58.15

## Hydrocortisone

21-Dec-2017

- **DRUG ACTION** Hydrocortisone has equal glucocorticoid and mineralocorticoid activity.

- **INDICATIONS AND DOSE**

### Oral and perioral lesions

- ▶ TO THE LESION USING BUCCAL TABLET

- ▶ Child 1 month-11 years: Only on medical advice
- ▶ Child 12-17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer
- ▶ Adult: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE**

- ▶ With buccal use in children *Hydrocortisone mucoadhesive buccal tablets* licensed for use in children (under 12 years—on medical advice only).

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: HYDROCORTISONE MUCO-ADHESIVE BUCCAL TABLETS: SHOULD NOT BE USED OFF-LABEL FOR ADRENAL INSUFFICIENCY IN CHILDREN DUE TO SERIOUS RISKS (DECEMBER 2018)

The MHRA has received reports of off-label use of hydrocortisone muco-adhesive buccal tablets for adrenal insufficiency in children. Healthcare professionals are advised that:

- hydrocortisone muco-adhesive buccal tablets are indicated only for local use in the mouth for aphthous ulceration and should not be used to treat adrenal insufficiency;
- substitution of licensed oral hydrocortisone formulations with muco-adhesive buccal tablets can result in insufficient cortisol absorption and, in stress situations, life-threatening adrenal crisis;
- only hydrocortisone products licensed for adrenal replacement therapy should be used.

- **CONTRA-INDICATIONS** Untreated local infection

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PROFESSION SPECIFIC INFORMATION**

**Dental practitioners' formulary**

Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Muco-adhesive buccal tablet

- ▶ **Hydrocortisone (Non-proprietary)**

Hydrocortisone (as Hydrocortisone sodium succinate)

2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet **P** £7.94 DT = £7.80

## SALICYLIC ACID AND DERIVATIVES

### Choline salicylate

- **INDICATIONS AND DOSE**

#### Mild oral and perioral lesions

- ▶ TO THE LESION

- ▶ Child 16-17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours
- ▶ Adult: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years
- CONTRA-INDICATIONS, FURTHER INFORMATION**
- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.
- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)
- **INTERACTIONS** → Appendix 1: choline salicylate
- **SIDE-EFFECTS** Bronchospasm
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
Choline Salicylate Dental Gel may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- Oromucosal gel**
- ▶ **Bonjela** (Reckitt Benckiser Healthcare (UK) Ltd)  
Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free | 15 gram **GSL** £3.55 DT = £2.91  
Bonjela Original gel sugar-free | 15 gram **GSL** £2.91 DT = £2.91

### Salicylic acid with rhubarb extract

- **INDICATIONS AND DOSE**

#### Mild oral and perioral lesions

- ▶ TO THE LESION

- ▶ Child 16-17 years: Apply 3-4 times a day maximum duration 7 days
- ▶ Adult: Apply 3-4 times a day maximum duration 7 days

- **CONTRA-INDICATIONS** Children under 16 years
- CONTRA-INDICATIONS, FURTHER INFORMATION**
- ▶ **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.
- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning · not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures (in adults)
- **SIDE-EFFECTS**
- ▶ **Common or very common** Oral discolouration · tooth discolouration

- **PATIENT AND CARER ADVICE** May cause temporary discolouration of teeth and oral mucosa.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Paint

EXCIPIENTS: May contain Ethanol

- ▶ **Pyralvex** (Meda Pharmaceuticals Ltd)

Salicylic acid 10 mg per 1 ml, Rhubarb extract 50 mg per 1 ml Pyralvex solution | 10 ml **P** £3.25

## 4 Oropharyngeal bacterial infections

### Oropharyngeal infections, antibacterial therapy

#### Pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 542, or *alternatively*, amoxicillin p. 548
- ▶ *Suggested duration of treatment* 3 days or until symptoms resolve.

#### Gingivitis (acute necrotising ulcerative)

Antibacterial required only if systemic features of infection.

- Metronidazole, or *alternatively*, amoxicillin
- ▶ *Suggested duration of treatment* 3 days or until symptoms resolve.

#### Abscess (periapical or periodontal)

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or *alternatively*, metronidazole
- ▶ *Suggested duration of treatment* 5 days.

#### Periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or *alternatively in adults and children over 12 years*, doxycycline p. 564

#### Sore throat (acute)

Acute sore throat is usually triggered by a viral infection and is self-limiting. Symptoms can last for around 1 week, and most people will improve within this time without treatment with antibiotics, regardless of the cause.

**[EvGr]** Antibacterial therapy is required only in patients with severe systemic symptoms, signs and symptoms of a more serious illness or condition, or those at high risk of complications. Patients with severe systemic infection or severe suppurative complications such as peri-tonsillar abscess (quinsy), acute otitis media, acute sinusitis or cellulitis should be referred to hospital. **[A]**

- Phenoxymethylpenicillin p. 548
- ▶ *Suggested duration of treatment* 5 to 10 days.
- *If penicillin-allergic*, clarithromycin p. 538 (or erythromycin p. 539)
- ▶ *Suggested duration of treatment* 5 days.

## ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

F 564

01-May-2019

### Doxycycline

#### ● INDICATIONS AND DOSE

##### Treatment of recurrent aphthous ulceration

###### ▶ BY MOUTH USING SOLUBLE TABLETS

- ▶ Child 12–17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed
- ▶ Adult: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed

● **UNLICENSED USE** Doxycycline may be used as detailed below, although these situations are considered outside the scope of its licence:

- recurrent aphthous ulceration.

● **CAUTIONS** Alcohol dependence

● **INTERACTIONS** → Appendix 1: tetracyclines

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dyspnoea · hypotension · peripheral oedema · tachycardia
- ▶ **Uncommon** Gastrointestinal discomfort
- ▶ **Rare or very rare** Antibiotic associated colitis · anxiety · arthralgia · flushing · intracranial pressure increased with papilloedema · Jarisch-Herxheimer reaction · myalgia · photoonycholysis · severe cutaneous adverse reactions (SCARs) · skin hyperpigmentation (long term use) · tinnitus · vision disorders

● **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

● **PATIENT AND CARER ADVICE** Counselling on administration advised.  
Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13

###### ▶ Vibramycin-D (Pfizer Ltd)

Doxycycline (as Doxycycline monohydrate) 100 mg Vibramycin-D 100mg dispersible tablets sugar-free | 8 tablet PoM £4.91 DT = £4.91

such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 1219 or miconazole p. 1219 may be needed. Fluconazole p. 595 is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

#### Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

#### Denture stomatitis

Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

Miconazole oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

#### Chronic hyperplastic candidiasis

Chronic hyperplastic candidiasis (candidal leucoplakia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole to eliminate candidal overlay. Patients should avoid the use of tobacco.

#### Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. A reduction in facial height related to ageing and tooth loss with maceration in the deep occlusive folds that may subsequently arise, predisposes to such infection. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 571; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 1252 can be used.

#### Immunocompromised patients

See advice on prevention of fungal infections in *Immunocompromised patients* under Antifungals, systemic use p. 591.

#### Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. Fluconazole is given by mouth for infections that do not respond to topical therapy or when topical therapy cannot be used. It is reliably absorbed and effective. Itraconazole p. 597 can be used for fluconazole-resistant infections.

## 5 Oropharyngeal fungal infections

### Oropharyngeal fungal infections

#### Overview

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

#### Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient's partner may also require treatment to prevent reinfection.

Antiseptic mouthwashes are used in the prevention of oral candidiasis in immunocompromised patients and in the treatment of denture stomatitis.

## ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

### Miconazole

02-Apr-2019

#### ● INDICATIONS AND DOSE

##### Oral candidiasis

###### ► BY MOUTH USING ORAL GEL

- Child 2-17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)
- Adult: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

##### Intestinal candidiasis

###### ► BY MOUTH USING ORAL GEL

- Child 4 months-17 years: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared
- Adult: 5 mg/kg 4 times a day (max. per dose 250 mg) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

● **CONTRA-INDICATIONS** Infants with impaired swallowing reflex

● **CAUTIONS** Avoid in Acute porphyrias p. 1058

● **INTERACTIONS** → Appendix 1: antifungals, azoles

● **SIDE-EFFECTS**

► **Common or very common** Skin reactions (in adults)

► **Frequency not known** Angioedema

● **PREGNANCY** Manufacturer advises avoid if possible— toxicity at high doses in *animal* studies.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid.

● **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Miconazole Oromucosal Gel may be prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Oromucosal gel

CAUTIONARY AND ADVISORY LABELS 9

► **Daktarin** (Johnson & Johnson Ltd, Janssen-Cilag Ltd)

### Nystatin

15-Feb-2017

#### ● INDICATIONS AND DOSE

##### Oral candidiasis

###### ► BY MOUTH

- Child: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved
- Adult: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved

● **CAUTIONS** Contact with eyes and mucous membranes should be avoided

● **SIDE-EFFECTS** Abdominal distress · angioedema · diarrhoea · face oedema · nausea · sensitisation · skin reactions · Stevens-Johnson syndrome · vomiting

● **PATIENT AND CARER ADVICE** Counselling advised with oral suspension (use of pipette, hold in mouth, after food). Medicines for Children leaflet: Nystatin for Candida infection [www.medicinesforchildren.org.uk/nystatin-candida-infection](http://www.medicinesforchildren.org.uk/nystatin-candida-infection)

#### ● PROFESSION SPECIFIC INFORMATION

##### Dental practitioners' formulary

Nystatin Oral Suspension may be prescribed.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

#### Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

EXCIPIENTS: May contain Ethanol

► **Nystatin (Non-proprietary)**

**Nystatin 100000 unit per 1 ml** Nystatin 100,000units/ml oral suspension | 30 ml **[POM]** £2.43 DT = £2.03

## 6 Oropharyngeal viral infections

### Oropharyngeal viral infections

#### Management

Viral infections are the most common cause of a sore throat. They do not benefit from anti-infective treatment.

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of benzydamine hydrochloride p. 1215. The use of chlorhexidine mouthwash p. 1211 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir p. 633 is required. Valaciclovir p. 636 and famciclovir p. 635 are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme.

## Skin conditions, management

### Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at [www.bad.org.uk/specials](http://www.bad.org.uk/specials).

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

**Applications** are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

**Collodions** are painted on the skin and allowed to dry to leave a flexible film over the site of application.

**Creams** are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

**Gels** consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

**Lotions** have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

**Ointments** are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic and lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

**Pastes** are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

**Dusting powders** are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

### Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

### Suitable quantities for prescribing

#### Suitable quantities of dermatological preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments	Lotions
Face	15-30 g	100 ml
Both hands	25-50 g	200 ml
Scalp	50-100 g	200 ml
Both arms or both legs	100-200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15-25 g	100 ml

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations **do not apply** to corticosteroid preparations. For suitable quantities of corticosteroid preparations, see relevant table.

## Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided. The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

# 1 Dry and scaling skin disorders

## Emollient and barrier preparations

### Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

### Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis. The choice of an appropriate emollient will depend on the severity of the condition, patient preference, and the site of application. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

### Emollient bath and shower preparations

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less

should be used for a child-size bath or a washbasin; recommended bath additive quantities for children reflect this.

### MHRA/CHM advice (updated December 2018): Emollients: new information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients

Emollients are an important and effective treatment for chronic dry skin disorders and people should continue to use these products. However, healthcare professionals must ensure that patients and their carers understand the fire risk associated with the build-up of residue on clothing and bedding and can take action to minimise the risk. There is a fire risk with all paraffin-containing emollients, regardless of paraffin concentration, and it cannot be excluded with paraffin-free emollients. A similar risk may apply to products that are applied to the skin over large body areas, or in large volumes for repeated use for more than a few days.

Healthcare professionals should advise patients not to smoke or go near naked flames because clothing, bedding, dressings, and other fabrics that have been in contact with an emollient or emollient-treated skin can rapidly ignite. Washing these materials at high temperature may reduce emollient build-up but not totally remove it.

### Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 1236 or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations are not a substitute for adequate nursing care.

### Nappy rash

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 1247 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids. If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 1232 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

## DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

### Barrier creams and ointments

#### ● INDICATIONS AND DOSE

##### For use as a barrier preparation

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Ointment

EXCIPIENTS: May contain Woolfat and related substances (including lanolin)

### ► Barrier creams and ointments (Non-proprietary)

- Cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram Zinc and Castor oil ointment | 500 gram [GSL] £5.14-£5.19 DT = £5.19  
Zinc and Castor oil cream | 100 gram [GSL] £1.46
- **Metanium** (Thornton & Ross Ltd)  
Titanium salicylate 30 mg per 1 gram, Titanium peroxide 50 mg per 1 gram, Titanium dioxide 200 mg per 1 gram Metanium Nappy Rash ointment | 30 gram [GSL] £2.24 DT = £2.24

### Spray

#### CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), woolfat and related substances (including lanolin)

- **Sprilon** (J M Lovridge Ltd)  
Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram Sprilon aerosol spray | 115 gram [GSL] £8.90 DT = £8.90

### Cream

EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, woolfat and related substances (including lanolin)

- **Conotrane** (LEO Pharma)  
Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram Conotrane cream | 100 gram [GSL] £0.88 DT = £0.88 | 500 gram [GSL] £3.51
- **Drapolene** (Supra Enterprises Ltd)  
Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram Drapolene cream | 100 gram [GSL] £1.76 | 200 gram [GSL] £2.86 | 350 gram [GSL] £4.28
- **Siopel** (Derma UK Ltd)  
Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram Siopel cream | 50 gram [GSL] £4.65
- **Sudocrem** (Teva UK Ltd)  
Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrous 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram Sudocrem antiseptic healing cream | 30 gram [GSL] £1.45 | 60 gram [GSL] £1.45 | 125 gram [GSL] £2.15 | 250 gram [GSL] £3.67 | 400 gram [GSL] £5.25

## DERMATOLOGICAL DRUGS > EMOLLIENTS

### Emollient bath and shower products, antimicrobial-containing

31-Aug-2016

#### ● INDICATIONS AND DOSE

##### DERMOL<sup>®</sup> 200 SHOWER EMOLLIENT

#### Dry and pruritic skin conditions including eczema and dermatitis

- TO THE SKIN
- Child: To be applied to the skin or used as a soap substitute
- Adult: To be applied to the skin or used as a soap substitute

##### DERMOL<sup>®</sup> 600 BATH EMOLLIENT

#### Dry and pruritic skin conditions including eczema and dermatitis

- TO THE SKIN
- Child 1-23 months: 5–15 mL/bath, not to be used undiluted
- Child 2-17 years: 15–30 mL/bath, not to be used undiluted
- Adult: Up to 30 mL/bath, not to be used undiluted

##### DERMOL<sup>®</sup> WASH EMULSION

#### Dry and pruritic skin conditions including eczema and dermatitis

- TO THE SKIN
- Child: To be applied to the skin or used as a soap substitute
- Adult: To be applied to the skin or used as a soap substitute

### EMULSIDERM<sup>®</sup>

#### Dry skin conditions including eczema and ichthyosis

- TO THE SKIN
- Child 1-23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- Child 2-17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- Adult: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

### OILATUM<sup>®</sup> PLUS

#### Topical treatment of eczema, including eczema at risk from infection

- TO THE SKIN
- Child 6-11 months: 1 mL/bath, not to be used undiluted
- Child 1-17 years: 1–2 capfuls/bath, not to be used undiluted
- Adult: 1–2 capfuls/bath, not to be used undiluted

### IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Bath additive

##### CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Acetylated lanolin alcohols, isopropyl palmitate, polysorbates

- **Dermol 600** (Dermal Laboratories Ltd)  
Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram Dermol 600 bath emollient | 600 ml [P] £7.55
- **Emulsiderm** (Dermal Laboratories Ltd)  
Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram Emulsiderm emollient | 300 ml [P] £3.85 | 1000 ml [P] £12.00
- **Oilatam Plus** (GlaxoSmithKline Consumer Healthcare)  
Triclosan 20 mg per 1 gram, Benzalkonium chloride 60 mg per 1 gram, Liquid paraffin light 525 mg per 1 gram Oilatam Plus bath additive | 500 ml [GSL] £7.22

#### Liquid

##### CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Dermol 200** (Dermal Laboratories Ltd)  
Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol 200 shower emollient | 200 ml [P] £3.55
- **Dermol Wash** (Dermal Laboratories Ltd)  
Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol Wash cutaneous emulsion | 200 ml [P] £3.55

## Emollient bath and shower products, paraffin-containing

EXCIPIENTS: May contain Isopropyl palmitate, polysorbates

- **Psoriderm** (Dermal Laboratories Ltd)

Coal tar distilled 400 mg per 1 ml Psoriderm Emulsion 40% bath additive | 200 ml P £2.74 DT = £2.74

## Emollient creams and ointments, antimicrobial-containing

17-Aug-2016

### ● INDICATIONS AND DOSE

#### Dry and pruritic skin conditions including eczema and dermatitis

###### ► TO THE SKIN

- Child: To be applied to the skin or used as a soap substitute
- Adult: To be applied to the skin or used as a soap substitute

### IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise

the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **PRESCRIBING AND DISPENSING INFORMATION**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Dermol** (Dermal Laboratories Ltd)

Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 100 mg per 1 gram, Liquid paraffin 100 mg per 1 gram Dermol cream | 100 gram P £2.86 | 500 gram P £6.63

#### Liquid

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- **Dermol 500** (Dermal Laboratories Ltd)

Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram Dermol 500 lotion | 500 ml P £6.04

## Emollient creams and ointments, colloidal oatmeal-containing

15-Jan-2019

### ● INDICATIONS AND DOSE

#### Endogenous and exogenous eczema | Xeroderma | Ichthyosis

###### ► TO THE SKIN

- Child: (consult product literature)
- Adult: (consult product literature)

#### Senile pruritus (pruritus of the elderly) associated with dry skin

###### ► TO THE SKIN

- Elderly: (consult product literature)

## Emollients, urea-containing

15-Jan-2019

- **DRUG ACTION** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

● **INDICATIONS AND DOSE**

**AQUADRATE**®

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply twice daily, to be applied thinly
- ▶ Adult: Apply twice daily, to be applied thinly

**BALNEUM**® CREAM

**Dry skin conditions**

▶ TO THE SKIN

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

**BALNEUM**® PLUS CREAM

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

**CALMURID**®

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs
- ▶ Adult: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

**DERMATONICS ONCE HEEL BALM**®

**Dry skin on soles of feet**

▶ TO THE SKIN

- ▶ Child 12–17 years: Apply once daily
- ▶ Adult: Apply once daily

**E45**® ITCH RELIEF CREAM

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

**EUCERIN**® INTENSIVE CREAM

**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

▶ TO THE SKIN

- ▶ Child: Apply twice daily, to be applied thinly and rubbed into area
- ▶ Adult: Apply twice daily, to be applied thinly and rubbed into area

**EUCERIN**® INTENSIVE LOTION

**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

▶ TO THE SKIN

- ▶ Child: Apply twice daily, to be applied sparingly and rubbed into area
- ▶ Adult: Apply twice daily, to be applied sparingly and rubbed into area

**FLEXITOL**®

**Dry skin on soles of feet and heels**

▶ TO THE SKIN

- ▶ Child 12–17 years: Apply 1–2 times a day
- ▶ Adult: Apply 1–2 times a day

**HYDROMOL**® INTENSIVE

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply twice daily, to be applied thinly
- ▶ Adult: Apply twice daily, to be applied thinly

**IMUDERM**® EMOLLIENT

**Dry skin conditions including eczema, psoriasis or dermatitis**

▶ TO THE SKIN

- ▶ Adult: Apply to skin or use as a soap substitute

**NUTRAPLUS**®

**Dry, scaling, and itching skin**

▶ TO THE SKIN

- ▶ Child: Apply 2–3 times a day
- ▶ Adult: Apply 2–3 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

• **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

► **Dermatonics Once** (Dermatonics Ltd)

Dermatonics Once Heel Balm | 75 ml £3.60 | 200 ml £8.50

► **Flexitol** (Thornton & Ross Ltd)

Flexitol 25% Urea Heel Balm | 40 gram £2.75 | 75 gram £3.80 | 200 gram £9.40 | 500 gram £14.75

fusidic acid p. 571; mupirocin p. 1232 should be used only to treat meticillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as flucloxacillin p. 554 (or clarithromycin p. 538 in penicillin allergy) should be used. Mild antiseptics can be used to soften crusts.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygienic measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be **avoided on leg ulcers** unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin sulfate p. 1230, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin p. 519. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins p. 1231), particularly in children, in the elderly, and in those with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic such as povidone-iodine p. 1276, chlorhexidine p. 1277, or alcohol can be used; their use should be discussed with the local microbiologist.

Tedizolid p. 573 is licensed for the treatment of acute bacterial skin and skin structure infections.

Silver sulfadiazine p. 1231 is used in the treatment of infected burns.

#### Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 1218 for further information on angular cheilitis.

Metronidazole p. 1230 is used topically for rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

#### Antifungal preparations for the skin

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated, or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

#### Dermatophytoses

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum),

## 2 Infections of the skin

### Skin infections

#### Antibacterial preparations for the skin

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis.

*Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

In the community, acute *impetigo* on small areas of the skin may be treated by short-term topical application of

foot (tinea pedis, athlete's foot), or nail (tinea unguium). Scalp infection requires systemic treatment; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations (including shampoos). The imidazole antifungals clotrimazole p. 1232, econazole nitrate p. 1232, ketoconazole p. 1233, and miconazole p. 1233 are all effective. Terbinafine p. 1234 cream is also effective but it is more expensive. Other topical antifungals include griseofulvin p. 1234 and the **undecenoates**. **Compound benzoic acid ointment** (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Topical preparations for athlete's foot containing **tolnaftate** are on sale to the public.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of amorolfine p. 1234 or tioconazole p. 1233 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

#### Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo. Alternatively, **selenium sulfide** shampoo [unlicensed indication] can be used as a lotion (diluting with a small amount of water can reduce irritation) and left on the affected area for 10 minutes before rinsing off; it should be applied once daily for 7 days, and the course repeated if necessary.

Topical imidazole antifungals such as clotrimazole, econazole nitrate, ketoconazole, and miconazole, or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal. Relapse is common, especially in the immunocompromised.

#### Candidiasis

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole nitrate, ketoconazole, or miconazole; topical terbinafine is an alternative. Topical application of nystatin p. 1219 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 595; systemic treatment with terbinafine is **not appropriate** for refractory candidiasis.

#### Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

#### Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 1247) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm.

Combination of a mild corticosteroid with either an imidazole or nystatin p. 1219 may be of use in the treatment of intertrigo associated with candida.

#### Antiviral preparations for the skin

Aciclovir cream p. 1238 is licensed for the treatment of initial and recurrent labial and genital *herpes simplex infections*; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for *herpes zoster (shingles)*.

#### Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth.

#### Parasitocidal preparations for the skin

##### Suitable quantities of parasitocidal preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	
These amounts are usually suitable for an adult for single application.			

#### Scabies

Permethrin p. 1237 is used for the treatment of *scabies (Sarcoptes scabiei)*; malathion p. 1237 can be used if permethrin is inappropriate.

Benzyl benzoate p. 1236 is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 604 (available on a named patient basis from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone; further doses may be required.

#### Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

#### Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 1265 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was

not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

#### Head lice

Dimeticone p. 1236 is effective against head lice (*Pediculus humanus capitis*). It coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs and not recommended for use in children. Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated simultaneously.

**MHRA/CHM advice:** *Head lice eradication products: risk of serious burns if treated hair is exposed to open flames or other sources of ignition (March 2018)*

Some products for the eradication of head lice infestations are combustible/flammable when on the hair and can ignite and cause serious harm in the presence of an open flame or other source of ignition such as when lighting cigarettes.

Patients and carers should be advised on the safe and correct use of head lice eradication treatments and if appropriate, should be advised that they should not smoke around treated hair and that it should be kept away from open flames or other sources of ignition, including in the morning after overnight application until hair is washed.

#### Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
- Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)
- Scottish Drug Tariff: [www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

#### Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Phthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

## 2.1 Bacterial skin infections

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Neomycin sulfate

##### ● INDICATIONS AND DOSE

##### Bacterial skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply up to 3 times a day, for short-term use only
- ▶ Adult: Apply up to 3 times a day, for short-term use only

##### ● UNLICENSED USE

- ▶ In children *Neomycin Cream BPC*—no information available.

##### ● CONTRA-INDICATIONS

- Neonates
- **CAUTIONS** If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.

##### ● INTERACTIONS

- Appendix 1: neomycin
- **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)
- **RENAL IMPAIRMENT** Ototoxicity may be a hazard if large areas of skin are treated.
- **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

##### ● MEDICINAL FORMS

- Forms available from special-order manufacturers include: cream

### ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

#### Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

##### ● INDICATIONS AND DOSE

##### ACEA<sup>®</sup>

##### Acute inflammatory exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8 weeks, to be applied thinly

##### ANABACT<sup>®</sup>

##### Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

##### METROGEL<sup>®</sup>

##### Acute inflammatory exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

##### Malodorous fungating tumours

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

##### METROSA<sup>®</sup>

##### Acute exacerbation of rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for up to 8 weeks, to be applied thinly

ROSICED<sup>®</sup>**Inflammatory papules and pustules of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 6 weeks (longer if necessary)

ROZEX<sup>®</sup> CREAM**Inflammatory papules, pustules and erythema of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

ROZEX<sup>®</sup> GEL**Inflammatory papules, pustules and erythema of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 3–4 months

ZYOMET<sup>®</sup>**Acute inflammatory exacerbation of rosacea**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily for 8–9 weeks, to be applied thinly

- **CAUTIONS** Avoid exposure to strong sunlight or UV light
- **INTERACTIONS** → Appendix 1: metronidazole
- **SIDE-EFFECTS**
- ▶ **Common or very common** Skin reactions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, disodium edetate, hydroxybenzoates (parabens), propylene glycol

- ▶ **Acnea** (Ferndale Pharmaceuticals Ltd)  
Metronidazole 7.5 mg per 1 gram Acnea 0.75% gel | 40 gram [PoM]  
£9.95 DT = £22.63
- ▶ **Anabact** (Cambridge Healthcare Supplies Ltd)  
Metronidazole 7.5 mg per 1 gram Anabact 0.75% gel |  
15 gram [PoM] £4.47 DT = £4.47 | 30 gram [PoM] £7.89 |  
40 gram [PoM] £15.89 DT = £22.63
- ▶ **Metrogel** (Galderma (UK) Ltd)  
Metronidazole 7.5 mg per 1 gram Metrogel 0.75% gel |  
40 gram [PoM] £22.63 DT = £22.63
- ▶ **Metrosa** (M & A Pharmachem Ltd)  
Metronidazole 7.5 mg per 1 gram Metrosa 0.75% gel |  
30 gram [PoM] £12.00 | 40 gram [PoM] £19.90 DT = £22.63
- ▶ **Rozex** (Galderma (UK) Ltd)  
Metronidazole 7.5 mg per 1 gram Rozex 0.75% gel | 30 gram [PoM]  
£6.60 | 40 gram [PoM] £9.88 DT = £22.63
- ▶ **Zyomet** (Advanz Pharma)  
Metronidazole 7.5 mg per 1 gram Zyomet 0.75% gel |  
30 gram [PoM] £12.00

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, isopropyl palmitate, propylene glycol

- ▶ **Rosiced** (Pierre Fabre Dermo-Cosmetique)  
Metronidazole 7.5 mg per 1 gram Rosiced 0.75% cream |  
30 gram [PoM] £6.60 DT = £6.60
- ▶ **Rozex** (Galderma (UK) Ltd)  
Metronidazole 7.5 mg per 1 gram Rozex 0.75% cream |  
30 gram [PoM] £6.60 DT = £6.60 | 40 gram [PoM] £9.88 DT = £9.88

## ANTIBACTERIALS &gt; POLYMYXINS

**Polymyxins**● **INDICATIONS AND DOSE****Bacterial skin infections**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily, may be applied more frequently if required

- **CAUTIONS** If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment.
- **INTERACTIONS** → Appendix 1: polymyxins

- **SIDE-EFFECTS** Sensitisation
- **MEDICINAL FORMS** No licensed medicines listed.

## ANTIBACTERIALS &gt; SULFONAMIDES

**Silver sulfadiazine**● **INDICATIONS AND DOSE****Prophylaxis and treatment of infection in burn wounds**

- ▶ TO THE SKIN
- ▶ Child: Apply daily, may be applied more frequently if very exudative
- ▶ Adult: Apply daily, may be applied more frequently if very exudative

**For conservative management of finger-tip injuries**

- ▶ TO THE SKIN
- ▶ Child: Apply every 2–3 days, consult product literature for details
- ▶ Adult: Apply every 2–3 days, consult product literature for details

**Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**Adjunct to short-term treatment of infection in pressure sores**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days

**As an adjunct to short-term treatment of infection in leg ulcers**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily or on alternate days, not recommended if ulcer is very exudative

● **UNLICENSED USE**

- ▶ In children No age range specified by manufacturer.
- **CONTRA-INDICATIONS** Not recommended for neonates

● **CAUTIONS** G6PD deficiency

**CAUTIONS, FURTHER INFORMATION** Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

● **INTERACTIONS** → Appendix 1: silver sulfadiazine● **SIDE-EFFECTS**

- ▶ **Common or very common** Leucopenia · skin reactions
- ▶ **Rare or very rare** Argyria (following treatment of large areas of skin or long term use) · renal failure

**SIDE-EFFECTS, FURTHER INFORMATION** Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in significant hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.
- **MONITORING REQUIREMENTS** Monitor for leucopenia.
- **DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Flamazine** (Smith & Nephew Healthcare Ltd)

**Sulfadiazine silver 10 mg per 1 gram** Flamazine 1% cream | 20 gram [PoM] £2.91 | 50 gram [PoM] £3.85 DT = £3.85 | 250 gram [PoM] £10.32 DT = £10.32 | 500 gram [PoM] £18.27 DT = £18.27

**ANTIBACTERIALS > OTHER****Mupirocin**● **INDICATIONS AND DOSE**

**Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)**

- ▶ TO THE SKIN

▶ Child: Apply up to 3 times a day for up to 10 days  
▶ Adult: Apply up to 3 times a day for up to 10 days

● **UNLICENSED USE**

- ▶ In children Mupirocin ointment licensed for use in children (age range not specified by manufacturer). *Bactroban*<sup>®</sup> cream not recommended for use in children under 1 year.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Skin reactions
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- ▶ **Mupirocin (Non-proprietary)**

**Mupirocin 20 mg per 1 gram** Mupirocin 2% ointment | 15 gram [PoM] £12.50 DT = £5.26

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

**Mupirocin 20 mg per 1 gram** Bactroban 2% ointment | 15 gram [PoM] £5.26 DT = £5.26

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)

**Mupirocin (as Mupirocin calcium) 20 mg per 1 gram** Bactroban 2% cream | 15 gram [PoM] £5.26 DT = £5.26

- **SIDE-EFFECTS** Oedema · pain · paraesthesia · skin reactions · syncope

- **PREGNANCY** Minimal absorption from skin; not known to be harmful.

- **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

● **PATIENT AND CARER ADVICE**

## Ketoconazole

02-Apr-2019

### ● INDICATIONS AND DOSE

#### Tinea pedis

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply twice daily

#### Fungal skin infection (not Tinea pedis)

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1–2 times a day

#### Treatment of seborrhoeic dermatitis and dandruff

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

#### Prophylaxis of seborrhoeic dermatitis and dandruff

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

#### Treatment of pityriasis versicolor

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

#### Prophylaxis of pityriasis versicolor

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing
- ▶ Adult: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058
- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Alopecia · angioedema · excessive tearing · folliculitis · hair changes
- ▶ **Rare or very rare** Eye irritation · taste altered
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions** *Nizoral*® cream is not prescribable in NHS primary care except for the treatment of seborrhoeic dermatitis and pityriasis versicolor; endorse prescription 'SLS'.
- **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is available for sale to the public for the treatment of tinea pedis, tinea cruris, and candidal intertrigo.  
Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- Cream**
- EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol
- ▶ **Nizoral** (Janssen-Cilag Ltd)  
Ketoconazole 20 mg per 1 gram Nizoral 2% cream | 30 gram [PoM]  
£4.24 DT = £4.24

### Shampoo

EXCIPIENTS: May contain Imidurea

- ▶ **Ketoconazole (Non-proprietary)**  
Ketoconazole 20 mg per 1 gram Ketoconazole 2% shampoo | 120 ml [PoM] £3.36 DT = £3.36
- ▶ **Dandrazol** (Transdermal Ltd)  
Ketoconazole 20 mg per 1 gram Dandrazol Anti-dandruff 2% shampoo | 120 ml [PoM] £3.39 DT = £3.36

Ketoconazole 20 mg per 1 gram Nizoral 2% shampoo | 120 ml [PoM] £3.59 DT = £3.36

## Miconazole

02-Apr-2019

### ● INDICATIONS AND DOSE

#### Fungal skin infections

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily continuing for 10 days after lesions have healed
- ▶ Adult: Apply twice daily continuing for 10 days after lesions have healed

#### Fungal nail infections

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day
- ▶ Adult: Apply 1–2 times a day

### ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Avoid in Acute porphyrias p. 1058 · contact with eyes and mucous membranes should be avoided
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
- ▶ **Common or very common** Skin reactions
- ▶ **Frequency not known** Angioedema
- **PREGNANCY** Absorbed from the skin in small amounts; manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **PROFESSION SPECIFIC INFORMATION**
- Dental practitioners' formulary**  
Miconazole cream may be prescribed.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- NHS restrictions** *Daktarin*® powder and *Daktarin*® cream 15 g is not prescribable in NHS primary care.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Butylated hydroxyanisole

- ▶ **Daktarin** (McNeil Products Ltd, Janssen-Cilag Ltd, Johnson & Johnson Ltd)  
Miconazole nitrate 20 mg per 1 gram Daktarin 2% cream | 15 gram [P] £2.51 | 30 gram [P] £1.82 DT = £1.82

#### Powder

- ▶ **Daktarin** (McNeil Products Ltd)  
Miconazole nitrate 20 mg per 1 gram Daktarin 2% powder | 20 gram [P] £2.95 DT = £2.95

## Tioconazole

### ● INDICATIONS AND DOSE

#### Fungal nail infection

- ▶ **BY TRANSUNGUAL APPLICATION**
- ▶ Child: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin
- ▶ Adult: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

### ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS** Contact with eyes and mucous membranes should be avoided · use with caution if child likely to suck affected digits (in children)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Peripheral oedema
  - ▶ **Uncommon** Skin reactions
  - ▶ **Frequency not known** Nail disorder · pain · paraesthesia · periorbital oedema
- **PREGNANCY** Manufacturer advises avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Paint

- ▶ **Tioconazole (Non-proprietary)**  
**Tioconazole 283 mg per 1 ml** Tioconazole 283mg/ml medicated nail lacquer | 12 ml [PoM] £27.38-£28.74 DT = £28.74
- ▶ **Trosyl** (Pfizer Ltd)  
**Tioconazole 283 mg per 1 ml** Trosyl 283mg/ml nail solution | 12 ml [PoM] £27.38 DT = £28.74

## ANTIFUNGALS > OTHER

### Amorolfine

#### ● INDICATIONS AND DOSE

##### Fungal nail infections

- ▶ BY TRANSUNGUAL APPLICATION
- ▶ Child 12-17 years: Apply 1-2 times a week for 6 months to treat finger nails and for toe nails 9-12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- ▶ Adult: Apply 1-2 times a week for 6 months to treat finger nails and for toe nails 9-12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- **CAUTIONS** Avoid contact with ears · avoid contact with eyes and mucous membranes · use with caution in child likely to suck affected digits
- **SIDE-EFFECTS**
  - ▶ **Rare or very rare** Nail discolouration · skin reactions
- **PATIENT AND CARER ADVICE** Avoid nail varnish or artificial nails during treatment.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ In adults Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytes, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Medicated nail lacquer

##### CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Amorolfine (Non-proprietary)**

### Griseofulvin

01-Aug-2018

#### ● INDICATIONS AND DOSE

##### Tinea pedis

- ▶ TO THE SKIN
- ▶ Adult: Apply 400 micrograms once daily, apply to an area approximately 13 cm<sup>2</sup>; increased if necessary to 1.2 mg once daily for maximum treatment duration of 4 weeks, allow each spray to dry between application

- **CAUTIONS** Avoid contact with eyes and mucous membranes
- **INTERACTIONS** → Appendix 1: griseofulvin
- **SIDE-EFFECTS** Paraesthesia · skin irritation
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Spray

##### CAUTIONARY AND ADVISORY LABELS 15

##### EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Grisol AF** (Transdermal Ltd)  
**Griseofulvin 10 mg per 1 gram** Grisol AF 1% spray | 20 ml [P] £4.00

### Terbinafine

23-Apr-2018

#### ● INDICATIONS AND DOSE

##### Tinea pedis

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for up to 1 week, to be applied thinly
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 2-6 weeks

##### Tinea corporis

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for up to 1-2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 4 weeks

##### Tinea cruris

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for up to 1-2 weeks, to be applied thinly, review treatment after 2 weeks
- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 2-4 weeks

##### Dermatophyte infections of the nails

- ▶ BY MOUTH USING TABLETS
- ▶ Adult: 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

##### Cutaneous candidiasis | Pityriasis versicolor

- ▶ TO THE SKIN USING CREAM
- ▶ Adult: Apply 1-2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

- **CAUTIONS**
  - ▶ With oral use autoimmune disease (risk of lupus-erythematosus-like effect) · psoriasis (risk of exacerbation)
  - ▶ With topical use contact with eyes and mucous membranes should be avoided
- **INTERACTIONS** → Appendix 1: terbinafine
- **SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
  - ▶ **Common or very common** Skin reactions

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With oral use Appetite decreased · arthralgia · diarrhoea · gastrointestinal discomfort · gastrointestinal disorder · headache · myalgia · nausea
- ▶ **Uncommon**
- ▶ With oral use Taste altered · weight decreased
- ▶ With topical use Pain
- ▶ **Rare or very rare**
- ▶ With oral use Agranulocytosis · alopecia · cutaneous lupus erythematosus · dizziness · hepatic disorders · malaise · neutropenia · photosensitivity reaction · sensation abnormal · severe cutaneous adverse reactions (SCARs) · systemic lupus erythematosus (SLE) · thrombocytopenia · vertigo
- ▶ **Frequency not known**
- ▶ With oral use Anaemia · anxiety · depressive symptom · fatigue · fever · hearing impairment · influenza like illness · pancreatitis · pancytopenia · rhabdomyolysis · serum sickness-like reaction · smell altered · tinnitus · vasculitis · vision disorders
- ▶ With topical use Hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** **Liver toxicity** With oral use; discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

**Serious skin reactions** With oral use; discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).

**● PREGNANCY**

- ▶ With topical use Manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects.
- ▶ With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

**● BREAST FEEDING**

- ▶ With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest.
- ▶ With oral use Avoid—present in milk.

**● HEPATIC IMPAIRMENT**

- ▶ With oral use Manufacturer advises avoid (risk of increased exposure).

**● RENAL IMPAIRMENT**

**Dose adjustments** ▶ With oral use Use half normal dose if eGFR less than 50 mL/minute/1.73 m<sup>2</sup> and no suitable alternative available.

**● MONITORING REQUIREMENTS**

- ▶ With oral use Monitor hepatic function before treatment and then periodically after 4–6 weeks of treatment—discontinue if abnormalities in liver function tests.

**● PATIENT AND CARER ADVICE**

- ▶ With oral use Manufacturer advises that patients should immediately report any signs or symptoms suggestive of liver dysfunction such as pruritus, unexplained persistent nausea, decreased appetite, anorexia, jaundice, vomiting, fatigue, right upper abdominal pain, dark urine, or pale stools. Patients with these symptoms should discontinue taking terbinafine and the patient's liver function should be immediately evaluated.

**● EXCEPTIONS TO LEGAL CATEGORY**

- ▶ With topical use Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30g gel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Undecenoic acid 20 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram** Mycota powder | 70 gram [GSL] £3.04

## ANTISEPTICS AND DISINFECTANTS &gt; OTHER

## Chlorhexidine with nystatin

## ● INDICATIONS AND DOSE

**Skin infections due to *Candida* spp.**

## ▶ TO THE SKIN

- ▶ Child: Apply 2–3 times a day, continuing for 7 days after lesions have healed
- ▶ Adult: Apply 2–3 times a day, continuing for 7 days after lesions have healed

## ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).

## ● CAUTIONS Avoid contact with eyes and mucous membranes

## ● SIDE-EFFECTS Hypersensitivity · skin reactions

## ● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

## ▶ Chlorhexidine with nystatin (Non-proprietary)

Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin

100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine hydrochloride 1% cream | 30 gram [PoM] £4.99 DT = £4.99

## BENZOATES

## Benzoic acid with salicylic acid

## ● INDICATIONS AND DOSE

**Ringworm (tinea)**

## ▶ TO THE SKIN

- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

## ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).

## ● CAUTIONS Avoid broken or inflamed skin · avoid contact with eyes · avoid contact with mucous membranes

## CAUTIONS, FURTHER INFORMATION

- ▶ Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin.

## ● SIDE-EFFECTS Hypersensitivity · skin burning sensation (mild) · skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION** Treatment should be discontinued if side effects are severe.

## ● PRESCRIBING AND DISPENSING INFORMATION Benzoic Acid Ointment, Compound, BP has also been referred to as Whitfield's ointment.

## ● MEDICINAL FORMS Forms available from special-order manufacturers include: cream, ointment

## 2.3 Parasitic skin infections

**Other drugs used for Parasitic skin infections** Ivermectin, p. 604

## PARASITICIDES

## Benzyl benzoate

## ● INDICATIONS AND DOSE

**Scabies**

## ▶ TO THE SKIN

- ▶ Adult: Apply over the whole body; repeat without bathing on the following day and wash off 24 hours later; a third application may be required in some cases

## ● CAUTIONS Avoid contact with eyes and mucous membranes · children (not recommended) · do not use on broken or secondarily infected skin

## ● SIDE-EFFECTS Skin burning sensation (especially on genitalia and excoriations) · skin reactions

## ● BREAST FEEDING Suspend feeding until product has been washed off.

## ● PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Benzyl Benzoate Application, BP consists of benzyl benzoate 25% in an emulsion basis.

Some manufacturers recommend application to the body but to exclude the head and neck. However, application should be extended to the scalp, neck, face, and ears. Note—dilution to reduce irritant effect also reduces efficacy.

## ● LESS SUITABLE FOR PRESCRIBING Benzyl benzoate is less suitable for prescribing.

## ● MEDICINAL FORMS Forms available from special-order manufacturers include: liquid

## Dimeticone

06-Apr-2018

## ● INDICATIONS AND DOSE

**Head lice**

## ▶ TO THE SKIN

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In patients with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 1253) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. See *Wound management products and elasticated garments* for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 1240 for the role of topical pimecrolimus p. 1255 and tacrolimus p. 1256 in atopic eczema.

##### Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs**. Antibacterial drugs should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid and a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema and treatment with a systemic antiviral drug is indicated.

##### Management of other features of eczema

*Lichenification*, which results from repeated scratching is treated initially with a potent corticosteroid. Bandages containing ichthammol **paste** p. 1252 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of *chronic eczema*.

A *non-sedating antihistamine* may be of some value in relieving severe itching or urticaria associated with eczema. A *sedating antihistamine* can be used if itching causes sleep disturbance.

*Exudative ('weeping') eczema* requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 1276 can be used in exudating

## 3 Inflammatory skin conditions

### 3.1 Eczema and psoriasis

#### Eczema

##### Types and management

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic eczema. *Atopic eczema* is the most common type and it usually involves dry skin as well as infection and lichenification.

eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

### Severe refractory eczema

*Severe refractory eczema* is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system. Alitretinoin p. 1262 is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

### Seborrhoeic dermatitis

*Seborrhoeic dermatitis (seborrhoeic eczema)* is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 1233 or coal tar p. 1253) and combinations of mild corticosteroids with suitable antimicrobials are used.

## Psoriasis

### Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp.

Occasionally, psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

**Emollients**, in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis, and may be the only treatment necessary for mild psoriasis. They are particularly useful in *inflammatory psoriasis* and in *plaque psoriasis of palms and soles*, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for *chronic stable plaque psoriasis* on extensor surfaces of trunk and limbs involves the use of **vitamin D analogues**, coal tar p. 1253, dithranol p. 1253, and the retinoid tazarotene p. 1262. However, they can irritate the skin and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

*Scalp psoriasis* is usually scaly, and the scale may be thick and adherent; this will require softening with an emollient cream, ointment, or oil. A tar-based shampoo is first-line treatment for scalp psoriasis; a keratolytic, such as salicylic acid, should also be used if there is significant scaling, to allow other treatments to work.

Some preparations prescribed for psoriasis affecting the scalp, combine salicylic acid with coal tar or sulfur. The product should be applied generously, and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing off. The use of scalp preparations containing a potent corticosteroid or a vitamin D analogue, either alone or in combination, can also be helpful.

*Facial, flexural and genital psoriasis* can be managed with short-term use of a mild or moderate potency topical corticosteroid (a mild potency topical corticosteroid is preferred for the initial treatment of facial psoriasis). Calcitriol p. 1263 or tacalcitol p. 1264 can be used for longer-term treatment, or if the response to mild or moderate potency topical corticosteroids is inadequate; calcipotriol p. 1263 is more likely to cause irritation. Low strength tar preparations can also be used. Pimecrolimus p. 1255 or

tacrolimus p. 1256 by topical application [unlicensed indication] can be used short-term, under specialist supervision, in patients whose condition has not responded adequately to other treatments, or who are intolerant of them.

Widespread *unstable psoriasis* of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute *inflammatory psoriasis* with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used first-line for the long-term treatment of plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

**Coal tar** has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatients tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes ('short contact'). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

Tazarotene, a retinoid, has a similar efficacy to vitamin D and its analogues, but is associated with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin; application to the face and in flexures should also be avoided. Tazarotene does not stain and is odourless.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis) on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures (with a mild or moderate corticosteroid), and psoriasis of the scalp, palms, and soles (with a potent corticosteroid). Very potent corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. *Eczema* co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

**Phototherapy**

**Phototherapy** is available in specialist centres under the supervision of a dermatologist. **Ultraviolet B (UVB)** radiation is usually effective for *chronic stable psoriasis* and for *guttate psoriasis*. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including *localised palmoplantar pustular psoriasis*. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment**

**Systemic treatment** is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (such as ciclosporin p. 838 and methotrexate p. 913).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

Acitretin p. 1261, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is *psoriasis*, but it is also used in disorders of keratinisation such as *severe Darier's disease* (keratosis follicularis), and some forms of *ichthyosis*. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective).

**Topical treatment**

The vitamin D and analogues, calcipotriol p. 1263, calcitriol p. 1263, and tacalcitol p. 1264 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

**Eczema and psoriasis, drugs affecting the immune response****Overview**

Drugs affecting the immune response are used for eczema and psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

Pimecrolimus p. 1255 by topical application is licensed for *mild to moderate atopic eczema*. Tacrolimus p. 1256 is licensed for topical use in *moderate to severe atopic eczema*. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment of atopic eczema with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in managing the condition. Topical tacrolimus and pimecrolimus have a role in the treatment of psoriasis.

A short course of a systemic corticosteroid can be given for eczema flares that have not improved despite appropriate topical treatment.

Ciclosporin p. 838 by mouth can be used for *severe psoriasis* and for *severe eczema*. Azathioprine p. 836 or mycophenolate mofetil p. 846 are used for severe refractory eczema [unlicensed indication]. Dupilumab p. 1257 is licensed for the treatment of moderate to severe atopic eczema in patients requiring systemic therapy. Dimethyl fumarate p. 853 is licensed for the treatment of moderate to severe plaque psoriasis.

Methotrexate p. 913 can be used for *severe psoriasis*, the dose being adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 1025 should be given to reduce the possibility of side-effects associated with methotrexate. Folic acid can be given once weekly [unlicensed indication], on a different day from the methotrexate; alternative regimens of folic acid may be used in some settings.

Etanercept p. 1113, adalimumab p. 1108, and infliximab p. 1116 inhibit the activity of tumour necrosis factor (TNF $\alpha$ ). They are used for *severe plaque psoriasis* either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications; while either etanercept or adalimumab is considered to be the first choice in stable disease, infliximab or adalimumab may be useful when rapid disease control is required. Secukinumab p. 1100 and ixekizumab p. 1259 inhibit the activity of interleukin-17A, brodalumab p. 1257 inhibits the activity of interleukin-17RA and guselkumab p. 1258 inhibits the activity of interleukin-23. They are used for *moderate to severe plaque psoriasis* in patients who are candidates for systemic therapy. Secukinumab is also licensed for psoriatic arthritis and ankylosing spondylitis. Ustekinumab p. 1103 (a monoclonal antibody that inhibits interleukins 12 and 23) can be used for *severe plaque psoriasis* that has not responded to at least 2 standard systemic treatments and photochemotherapy, or when these treatments cannot be used because of intolerance or contra-indications. Adalimumab is also licensed for the treatment of active moderate to severe hidradenitis suppurativa (acne inversa) in patients who have had inadequate response to conventional systemic therapy. Adalimumab, etanercept, infliximab, ixekizumab and ustekinumab are also licensed for psoriatic arthritis.

**Other drugs used for Eczema and psoriasis** Apremilast, p. 1119 • Certolizumab pegol, p. 1111

## CORTICOSTEROIDS

### Topical corticosteroids

#### Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are **not** recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in *psoriasis* because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). See the role of topical corticosteroids in the treatment of psoriasis.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as *chronic discoid lupus erythematosus*, *lichen simplex chronicus*, *hypertrophic lichen planus*, and *palmoplantar pustulosis*. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as *keloid scars*, *hypertrophic lichen planus*, or *localised alopecia areata*.

#### Perioral lesions

Hydrocortisone cream 1% p. 1247 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 1252 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include *Candida* spp. and many Gram-positive bacteria including streptococci and staphylococci.

#### Choice of formulation

Water-miscible corticosteroid *creams* are suitable for moist or weeping lesions whereas *ointments* are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. *Lotions* may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. *Occlusive polythene* or *hydrocolloid dressings* increase absorption, but also increase the risk of side effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF publications topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the **least potent** preparation which is effective should be chosen but dilution should be avoided whenever possible.

#### Absorption through the skin

*Mild* and *moderately potent* topical corticosteroids are associated with few side-effects but care is required in the

use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing's syndrome, depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from intertriginous areas; it is increased by occlusion.

#### Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

Area of body	Creams and Ointments
Face and neck	15 to 30 g
Both hands	15 to 30 g
Scalp	15 to 30 g
Both arms	30 to 60g
Both legs	100 g
Trunk	100 g
Groins and genitalia	15 to 30 g

These amounts are usually suitable for an adult for a single daily application for 2 weeks

#### Compound preparations

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid p. 1286 facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

#### Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

##### Mild

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

##### Mild with antimicrobials

- Canesten HC
- Daktacort
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

##### Moderate

- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralenum Plain

##### Moderate with antimicrobials

- Trimovate

##### Moderate with urea:

- Alphaderm

**Potent**

- Beclomethasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Bettamousse
- Betnovate
- Cutivate
- Diprosone
- Elocon
- Hydrocortisone butyrate
- Locoid
- Locoid Crelo
- Metosyn
- Mometasone furoate 0.1%
- Nerisone
- Synalar

**Potent with antimicrobials**

- Aureocort
- Betamethasone and clioquinol
- Betamethasone and neomycin
- Fucibet
- Lotriderm
- Synalar C
- Synalar N

**Potent with salicylic acid**

- Diprosalic

**Very potent**

- Clarelux
- Dermovate
- Etrivex
- Nerisone Forte

**Very potent with antimicrobials**

- Clobetasol with neomycin and nystatin

**Use in children**

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 0.5% or 1% is useful for treating nappy rash and hydrocortisone 1% for atopic eczema in childhood. A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Carers of young children should be advised that treatment should **not** necessarily be reserved to 'treat only the worst areas' and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient's condition.

should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

- **CONTRA-INDICATIONS** Acne · perioral dermatitis · potent corticosteroids in widespread plaque psoriasis · rosacea (in adults) · untreated bacterial, fungal or viral skin lesions

- **CAUTIONS** Avoid prolonged use (particularly on the face) · cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use · dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) (in children) · infection · keep away from eyes · use potent or very potent topical corticosteroids under specialist supervision (in children) · use potent or very potent topical corticosteroids under specialist supervision in psoriasis (can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity) (in adults)

**SIDE-EFFECTS**

- ▶ **Uncommon** Skin reactions · telangiectasia
- ▶ **Rare or very rare** Adrenal suppression · hypertrichosis · skin depigmentation (may be reversible)
- ▶ **Frequency not known** Local reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use. In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

- **DIRECTIONS FOR ADMINISTRATION** Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a *finger tip unit* (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

- ▶ In children 'Wet-wrap bandaging' increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

- **PRESCRIBING AND DISPENSING INFORMATION** The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

**Corticosteroids (topical)****IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: CORTICOSTEROIDS: RARE RISK OF CENTRAL SEROUS CHORIORETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients

## Alclometasone dipropionate

21-Dec-2017

### ● INDICATIONS AND DOSE

#### Inflammatory skin disorders such as eczemas

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

- ▶ Alclometasone dipropionate cream 0.05%: moderate

### ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).

### ● SIDE-EFFECTS

Vasodilation

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of alclometasone dipropionate cream.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

#### ▶ **Betamethasone dipropionate (Non-proprietary)**

Alclometasone dipropionate 500 microgram per 1 gram Boots  
Derma Care Eczema & Dermatitis Flare-Up 0.05% cream |  
15 gram [P] [S]

F 1242

## Beclometasone dipropionate

04-Jan-2016

### (Beclomethasone dipropionate)

### ● INDICATIONS AND DOSE

#### Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

- ▶ Beclometasone dipropionate cream and ointment 0.025%: potent.

### ● UNLICENSED USE

- ▶ In children Not licensed for use in children under 1 year.

### ● INTERACTIONS

→ Appendix 1: corticosteroids

### ● SIDE-EFFECTS

Vasodilation · vision blurred

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

#### ▶ **Beclometasone dipropionate (Non-proprietary)**

Beclometasone dipropionate 250 microgram per  
1 gram Beclometasone 0.025% cream | 30 gram [PoM] £68.00 DT =  
£68.00

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

## Betamethasone

21-Dec-2017

- **DRUG ACTION** Betamethasone has very high glucocorticoid activity and insignificant mineralocorticoid activity.

### ● INDICATIONS AND DOSE

#### Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

- ▶ Betamethasone valerate 0.025% cream and ointment: moderate. Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent. Betamethasone valerate 0.12% foam: potent. Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

### ● UNLICENSED USE

- ▶ In children *Betacop*<sup>®</sup>, *Betnovate*<sup>®</sup> and *Betnovate-RD*<sup>®</sup> are not licensed for use in children under 1 year. *Betamousse*<sup>®</sup> is not licensed for use in children under 6 years.

- **CAUTIONS** Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

### ● INTERACTIONS

→ Appendix 1: corticosteroids

### ● SIDE-EFFECTS

Vasodilation

- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

#### Foam

F 1242

**Clobetasol propionate**

21-Dec-2017

● **INDICATIONS AND DOSE**

**Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids | Psoriasis**

▶ **TO THE SKIN**

▶ **Child 1–17 years:** Apply 1–2 times a day for up to 4 weeks, to be applied thinly

▶ **Adult:** Apply 1–2 times a day for up to 4 weeks, to be applied thinly, maximum 50 g of 0.05% preparation per week

**POTENCY**

- ▶ Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

**ETRIVEX®****Moderate scalp psoriasis****▶ TO THE SKIN**

- ▶ Adult: Apply once daily maximum duration of treatment 4 weeks, to be applied thinly then rinsed off after 15 minutes; frequency of application should be reduced after clinical improvement

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

**Shampoo****CAUTIONARY AND ADVISORY LABELS 28**

- ▶ **Etrivex** (Galderma (UK) Ltd)

## Fludroxycortide (Flurandrenolone)

21-Dec-2017

### ● INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas**

► TO THE SKIN

► Child: Apply 1–2 times a day, to be applied thinly

► Adult: Apply 1–2 times a day, to be applied thinly

#### POTENCY

► Fludroxycortide 0.0125% cream and ointment: moderate

#### HAELAN<sup>®</sup> TAPE

**Chronic localised recalcitrant dermatoses (but not acute or weeping)**

► TO THE SKIN

► Child: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

► Adult: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

### ● UNLICENSED USE

► In children Licensed for use in children (age range not specified by manufacturer).

● **SIDE-EFFECTS** Cushing's syndrome · increased risk of infection · vasodilation

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of fludroxycortide cream and ointment.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

### Betamethasone with clioquinol

18-Nov-2015

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

#### ▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

- ▶ Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

### ● UNLICENSED USE

- ▶ In children Betamethasone and clioquinol preparations is not licensed for use in children under 1 year.

### ● INTERACTIONS

→ Appendix 1: corticosteroids

- **PATIENT AND CARER ADVICE** Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Betamethasone with clioquinol (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram** Betamethasone valerate 0.1% / Clioquinol 3% ointment | 30 gram [PoM] £38.88 DT = £38.88

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Betamethasone with clioquinol (Non-proprietary)**

**Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Clioquinol 30 mg per 1 gram** Betamethasone valerate 0.1% / Clioquinol 3% cream | 30 gram [PoM] £38.88 DT = £38.88

## Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243, clotrimazole p. 1232.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

- ▶ Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

### ● UNLICENSED USE

- ▶ In children *Lotriderm*<sup>®</sup> not licensed for use in children under 12 years.

● **INTERACTIONS** → Appendix 1: antifungals, azoles · corticosteroids

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

▶ *Lotriderm* (Merck Sharp & Dohme Ltd)

Betamethasone dipropionate 640 microgram per 1 gram,

Clotrimazole 10 mg per 1 gram *Lotriderm* cream | 30 gram [PoM]

£6.34 DT = £6.34

## Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243, fusidic acid p. 571.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

### POTENCY

- ▶ Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

### ● UNLICENSED USE

- ▶ In children *Fucibet*<sup>®</sup> *Lipid Cream* is not licensed for use in children under 6 years.

● **INTERACTIONS** → Appendix 1: corticosteroids · fusidic acid

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)

▶ *Fucibet* (LEO Pharma)

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,

Fusidic acid 20 mg per 1 gram *Fucibet* cream | 30 gram [PoM]

£6.38 DT = £6.38 | 60 gram [PoM] £12.76 DT = £12.76

*Fucibet* lipid cream | 30 gram [PoM] £6.74 DT = £6.38

▶ *Xemacort* (Mylan)

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,

Fusidic acid 20 mg per 1 gram *Xemacort* cream | 30 gram [PoM]

£6.05 DT = £6.38 | 60 gram [PoM] £12.45 DT = £12.76

## Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243, neomycin sulfate p. 1230.

### ● INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN USING OINTMENT, OR TO THE SKIN USING CREAM
- ▶ Child 2–17 years: Apply 1–2 times a day, to be applied thinly
- ▶ Adult: Apply 1–2 times a day, to be applied thinly

### POTENCY

- ▶ Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

● **INTERACTIONS** → Appendix 1: corticosteroids · neomycin

● **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Ointment

CAUTIONARY AND ADVISORY LABELS 28

▶ *Betamethasone with neomycin (Non-proprietary)*

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,

Neomycin sulfate 5 mg per 1 gram *Betamethasone valerate 0.1% /*

*Neomycin 0.5% ointment* | 30 gram [PoM] £38.88 DT = £31.36 |

100 gram [PoM] £97.00 DT = £104.52

### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

▶ *Betamethasone with neomycin (Non-proprietary)*

Betamethasone (as Betamethasone valerate) 1 mg per 1 gram,

Neomycin sulfate 5 mg per 1 gram *Betamethasone valerate 0.1% /*

*Neomycin 0.5% cream* | 30 gram [PoM] £38.88 DT = £31.36 |

100 gram [PoM] £97.00 DT = £104.52

## Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 1243, salicylic acid p. 1286.

### ● INDICATIONS AND DOSE

#### DIPROSALIC<sup>®</sup> OINTMENT

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, max. 60 g per week
- ▶ Adult: Apply 1–2 times a day, max. 60 g per week

### POTENCY

- ▶ Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

#### DIPROSALIC<sup>®</sup> SCALP APPLICATION

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, apply a few drops
- ▶ Adult: Apply 1–2 times a day, apply a few drops

continued →

**POTENCY**

- ▶ Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PATIENT AND CARER ADVICE**
- **DIPROSALIC® OINTMENT** Patients or carers should be counselled on application of betamethasone and salicylic acid preparations.
- **DIPROSALIC® SCALP APPLICATION** Patients or carers should be counselled on application of betamethasone and salicylic acid scalp application.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Diprosalic** (Merck Sharp & Dohme Ltd)  
Betamethasone (as Betamethasone dipropionate)  
500 microgram per 1 gram, Salicylic acid 30 mg per  
1 gram Diprosalic 0.05%/3% ointment | 30 gram [PoM] £3.18 DT =  
£3.18 | 100 gram [PoM] £9.14 DT = £9.14

**Liquid**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Disodium edetate

- ▶ **Diprosalic** (Merck Sharp & Dohme Ltd)  
Betamethasone (as Betamethasone dipropionate)  
500 microgram per 1 ml, Salicylic acid 20 mg per 1 ml Diprosalic  
0.05%/2% scalp application | 100 ml [PoM] £10.10 DT = £10.10

## Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 1244, neomycin sulfate p. 1230.

**● INDICATIONS AND DOSE**

**Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**POTENCY**

- ▶ Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

- **INTERACTIONS** → Appendix 1: neomycin
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**  
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g ointment | 30 gram [PoM] £87.00 DT = £87.00

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Clobetasol propionate with neomycin sulfate and nystatin (Non-proprietary)**  
Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram Clobetasol 500microgram / Neomycin 5mg / Nystatin 100,000units/g cream | 30 gram [PoM] £87.00 DT = £87.00

## Clobetasone butyrate with nystatin and oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasone butyrate p. 1245, oxytetracycline p. 567.

**● INDICATIONS AND DOSE**

**Steroid-responsive dermatoses where candidal or bacterial infection is present**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**POTENCY**

- ▶ Clobetasone butyrate 0.05% with nystatin and oxytetracycline cream: moderate.

- **INTERACTIONS** → Appendix 1: tetracyclines
- **PATIENT AND CARER ADVICE** Stains clothing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, sodium metabisulfite

- ▶ **Trimovate** (Ennogen Healthcare Ltd)  
Clobetasone butyrate 500 microgram per 1 gram,  
Oxytetracycline (as Oxytetracycline calcium) 30 mg per 1 gram,  
Nystatin 100000 unit per 1 gram Trimovate cream |  
30 gram [PoM] £12.45 DT = £12.45

## Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1246.

**● INDICATIONS AND DOSE**

**Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**

- ▶ Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

- **INTERACTIONS** → Appendix 1: fluocinolone
- **PATIENT AND CARER ADVICE** Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, woolfat and related substances (including lanolin)

- ▶ **Synalar C** (Reig Jofre UK Ltd)  
Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram Synalar C ointment | 15 gram [PoM] £2.66 DT = £2.66

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

- ▶ **Synalar C** (Reig Jofre UK Ltd)  
Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram Synalar C cream | 15 gram [PoM] £2.66 DT = £2.66

## Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 1246, neomycin sulfate p. 1230.

### ● INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection**

#### ▶ TO THE SKIN

- ▶ Child 1–17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- ▶ Adult: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

#### POTENCY

- ▶ Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

- **INTERACTIONS** → Appendix 1: fluocinolone · neomycin
- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, woolfat and related substances (including lanolin)

- ▶ **Synalar N** (Reig Jofre UK Ltd)

Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram Synalar N ointment | 30 gram [PoM] £4.36

## Hydrocortisone with benzalkonium chloride, dimeticone and nystatin

15-Mar-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, dimeticone p. 1236.

### ● INDICATIONS AND DOSE

**Mild inflammatory skin disorders such as eczemas associated with infection**

#### ▶ TO THE SKIN

- ▶ Child: Apply 3 times a day until lesion has healed, to be applied thinly
- ▶ Adult: Apply 3 times a day until lesion has healed, to be applied thinly

#### POTENCY

- ▶ Benzalkonium with dimeticone, hydrocortisone acetate 0.5%, and nystatin cream: mild.

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of benzalkonium with dimeticone and hydrocortisone and nystatin preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sodium metabisulfite, sorbic acid

- ▶ **Timodine** (Alliance Pharmaceuticals Ltd)

Benzalkonium chloride 1 mg per 1 gram, Hydrocortisone 5 mg per 1 gram, Dimeticone 350 100 mg per 1 gram, Nystatin 100000 unit per 1 gram Timodine cream | 30 gram [PoM] £3.37

## Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, chlorhexidine p. 1277.

### ● INDICATIONS AND DOSE

**Mild inflammatory skin disorders such as eczemas**

#### ▶ TO THE SKIN

- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

#### POTENCY

- ▶ Hydrocortisone 0.5% with chlorhexidine hydrochloride 1% and nystatin cream: mild
- ▶ Hydrocortisone 1% with chlorhexidine hydrochloride 1% and nystatin ointment: mild

- **INTERACTIONS** → Appendix 1: corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Chlorhexidine acetate 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine acetate 1% / Hydrocortisone 1% ointment | 30 gram [PoM] £5.29 DT = £5.29

#### Cream

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Hydrocortisone with chlorhexidine hydrochloride and nystatin (Non-proprietary)**

Hydrocortisone 5 mg per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystatin 100,000units/g / Chlorhexidine hydrochloride 1% / Hydrocortisone 0.5% cream | 30 gram [PoM] £5.29 DT = £5.29

## Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, clotrimazole p. 1232.

### ● INDICATIONS AND DOSE

**Mild inflammatory skin disorders such as eczemas (associated with fungal infection)**

#### ▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

#### POTENCY

- ▶ Clotrimazole with hydrocortisone 1% cream: mild

- **INTERACTIONS** → Appendix 1: antifungals, azoles · corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.
- **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube is on sale to the public for the treatment of athlete's foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Canesten HC** (Bayer Plc)

Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram  
Canesten HC cream | 30 gram [PoM] £2.42 DT = £2.42

## Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, fusidic acid p. 571.

- **INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**

▶ TO THE SKIN

- ▶ Child: To be applied thinly (consult product literature)
- ▶ Adult: To be applied thinly (consult product literature)

**POTENCY**

- ▶ Hydrocortisone with fusidic acid cream: mild

- **INTERACTIONS** → Appendix 1: corticosteroids · fusidic acid
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, potassium sorbate

- ▶ **Fucidin H (Fusidic acid / Hydrocortisone)** (LEO Pharma)

Hydrocortisone acetate 10 mg per 1 gram, Fusidic acid 20 mg per 1 gram  
Fucidin H cream | 30 gram [PoM] £6.02 DT = £6.02 | 60 gram [PoM] £12.05 DT = £12.05

## Hydrocortisone with miconazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, miconazole p. 1233.

- **INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas associated with infections**

▶ TO THE SKIN

- ▶ Adult: (consult product literature)

**POTENCY**

- ▶ Hydrocortisone 1% with miconazole cream and ointment: mild

- **INTERACTIONS** → Appendix 1: antifungals, azoles · corticosteroids
- **PATIENT AND CARER ADVICE** Patients or carers should be advised on application of hydrocortisone with miconazole preparations.
- **PROFESSION SPECIFIC INFORMATION**  
Dental practitioners' formulary  
May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.
- **EXCEPTIONS TO LEGAL CATEGORY** A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete's foot and candidal intertrigo.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Daktacort** (Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram  
Daktacort ointment | 30 gram [PoM] £2.50 DT = £2.50

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxyanisole, disodium edetate

- ▶ **Daktacort** (McNeil Products Ltd, Janssen-Cilag Ltd)

Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram  
Daktacort 2%/1% cream | 30 gram [PoM] £2.49 DT = £2.49

## Hydrocortisone with oxytetracycline

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 1247, oxytetracycline p. 567.

- **INDICATIONS AND DOSE**

**Mild inflammatory skin disorders such as eczemas**

▶ TO THE SKIN

- ▶ Child 12-17 years: (consult product literature)
- ▶ Adult: (consult product literature)

**POTENCY**

- ▶ Hydrocortisone 1% with oxytetracycline ointment: mild.

- **CONTRA-INDICATIONS** Children under 12 years
- **INTERACTIONS** → Appendix 1: corticosteroids · tetracyclines
- **PREGNANCY** Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child's teeth.
- **BREAST FEEDING** Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **PATIENT AND CARER ADVICE** Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

- ▶ **Terra-Cortril** (Intrapharm Laboratories Ltd)

Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram  
Terra-Cortril ointment | 30 gram [PoM] £5.01 DT = £5.01

## DERMATOLOGICAL DRUGS > ANTI-INFECTIVES

### Ichthammol

- **INDICATIONS AND DOSE**

**Chronic lichenified eczema**

▶ TO THE SKIN

- ▶ Child 1-17 years: Apply 1-3 times a day
- ▶ Adult: Apply 1-3 times a day

- **UNLICENSED USE**

- ▶ In children No information available.

- **SIDE-EFFECTS** Skin irritation

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste  
**Liquid**

- ▶ **Ichthammol (Non-proprietary)**

Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram [GSL]  
£12.86 DT = £12.86 | 500 gram [GSL] £41.47

## Ichthammol with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol p. 1252.

- **INDICATIONS AND DOSE**

**Chronic lichenified eczema**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Impregnated dressing**

- ▶ **Ichthopaste** (Evolan Pharma AB)  
Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.78

## DERMATOLOGICAL DRUGS > ANTRACEN DERIVATIVES

### Dithranol

(Anthralin)

- **INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: (consult product literature)

**DITHROCREAM®**

**Subacute and chronic psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL®**

**Subacute and chronic psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **CONTRA-INDICATIONS** Acute and pustular psoriasis · hypersensitivity
- **CAUTIONS** Avoid sensitive areas of skin · avoid use near eyes
- **SIDE-EFFECTS** Skin reactions
- **PREGNANCY** No adverse effects reported.
- **BREAST FEEDING** No adverse effects reported.
- **DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

**MICANOL®** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

- **PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as

dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

- **PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Cream**

CAUTIONARY AND ADVISORY LABELS 28  
EXCIPIENTS: May contain Cetearyl alcohol (including cetyl and stearyl alcohol), chlorocresol

- ▶ **Dithrocream** (Dermal Laboratories Ltd)

Dithranol 1 mg per 1 gram Dithrocream 0.1% cream | 50 gram [P]  
£3.77 DT = £3.77

Dithranol 2.5 mg per 1 gram Dithrocream 0.25% cream | 50 gram [P]  
£4.04 DT = £4.04

Dithranol 5 mg per 1 gram Dithrocream 0.5% cream | 50 gram [P]  
£4.66 DT = £4.66

Dithranol 10 mg per 1 gram Dithrocream 1% cream | 50 gram [P]  
£5.42 DT = £5.42

Dithranol 20 mg per 1 gram Dithrocream 2% cream | 50 gram [PoM] £6.79 DT = £6.79

Combinations available: *Coal tar with dithranol and salicylic acid*, p. 1254

## Dithranol with salicylic acid and zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above, salicylic acid p. 1286.

- **INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: (consult local protocol)

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment, paste

## DERMATOLOGICAL DRUGS > TARS

### Coal tar

- **INDICATIONS AND DOSE**

**Psoriasis | Chronic atopic eczema**

- ▶ TO THE SKIN USING PASTE
- ▶ Child: Apply 1–3 times a day, start application with low-strength preparations
- ▶ Adult: Apply 1–3 times a day, start application with low-strength preparations
- ▶ TO THE SKIN
- ▶ Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child's bath. Use Coal Tar Solution BP
- ▶ Adult: 100 mL/bath, to be added to an adult sized bath. Use Coal Tar Solution BP

**ALPHOSYL 2 IN 1® SHAMPOO**

**Psoriasis | Seborrhoeic dermatitis | Scaling | Itching**

- ▶ TO THE SKIN
- ▶ Adult: Apply every 2–3 days

**Dandruff**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a week as required continued →

**EXOREX<sup>®</sup> LOTION****Psoriasis**

- ▶ TO THE SKIN
- ▶ Adult: Apply 2–3 times a day, to be applied to skin or scalp; in elderly, lotion can be diluted with a few drops of water before applying

**PSORIDERM<sup>®</sup> SCALP LOTION****Scalp psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply as required
- ▶ Adult: Apply as required

- **CONTRA-INDICATIONS** Avoid broken or inflamed skin · avoid eye area · avoid genital area · avoid mucosal areas · avoid rectal area · infection · sore, acute, or pustular psoriasis

- **CAUTIONS** Application to face · application to skin flexures

- **SIDE-EFFECTS** Photosensitivity reaction · skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION** Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.

- **HANDLING AND STORAGE** Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.

- **PATIENT AND CARER ADVICE** May stain skin, hair and fabric.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

**Cutaneous emulsion**

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- ▶ **Exorex** (Teva UK Ltd)

Coal tar solution 50 mg per 1 gram Exorex lotion | 100 ml [GSL] £8.11 DT = £8.11 | 250 ml [GSL] £16.24 DT = £16.24

**Shampoo**

EXCIPIENTS: May contain Fragrances, hydroxybenzoates (parabens)

- ▶ **Alphosyl 2 in 1** (Omega Pharma Ltd)

Coal tar extract alcoholic 50 mg per 1 gram Alphosyl 2 in 1 shampoo | 250 ml [GSL] £5.49 DT = £5.49

- ▶ **Neutrogena T/Gel Therapeutic** (Johnson & Johnson Ltd)

Coal tar extract 20 mg per 1 gram Neutrogena T/Gel Therapeutic shampoo | 125 ml [GSL] £3.90 DT = £3.90 | 250 ml [GSL] £5.86 DT = £5.86

- ▶ **Polytar Scalp** (GlaxoSmithKline Consumer Healthcare)

Coal tar solution 40 mg per 1 ml Polytar Scalp shampoo | 150 ml [GSL] £3.46 DT = £3.46

- ▶ **Psoriderm** (Dermal Laboratories Ltd)

Coal tar distilled 25 mg per 1 ml Psoriderm scalp lotion | 250 ml [P] £4.74 DT = £4.74

coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment

**Coal tar with coconut oil and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

● **INDICATIONS AND DOSE****Scaly scalp disorders | Psoriasis | Seborrhoeic dermatitis | Dandruff | Cradle cap**

- ▶ TO THE SKIN USING SHAMPOO
- ▶ Child: Apply daily as required
- ▶ Adult: Apply daily as required

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Shampoo**

- ▶ **Capasal** (Dermal Laboratories Ltd)

Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram, Coconut oil 10 mg per 1 gram Casasal Therapeutic shampoo | 250 ml [P] £4.69

**Coal tar with dithranol and salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, dithranol p. 1253, salicylic acid p. 1286.

● **INDICATIONS AND DOSE****Subacute and chronic psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply up to twice daily
- ▶ Adult: Apply up to twice daily

● **UNLICENSED USE**

- ▶ In children *Psorin*<sup>®</sup> is licensed for use in children (age range not specified by manufacturer).

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment

**Coal tar with lecithin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253.

● **INDICATIONS AND DOSE****PSORIDERM<sup>®</sup> CREAM****Psoriasis**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day, cream to be applied to the skin or scalp
- ▶ Adult: Apply 1–2 times a day, cream to be applied to the skin or scalp

**Coal tar with calamine**

15-Jan-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253.

● **INDICATIONS AND DOSE****Psoriasis | Chronic atopic eczema (occasionally)**

- ▶ TO THE SKIN
- ▶ Adult: Apply 1–2 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Calamine and Coal Tar Ointment BP, consists of calamine 12.5 g, strong

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Isopropyl palmitate, propylene glycol

- ▶ **Psoriderm** (Dermal Laboratories Ltd)

**Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram** Psoriderm cream | 225 ml [P] £9.42 DT = £9.42

**Coal tar with salicylic acid**

16-Jan-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

• **INDICATIONS AND DOSE****Psoriasis | Chronic atopic eczema**

- ▶ TO THE SKIN USING OINTMENT
- ▶ Adult: Apply 1–2 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Coal Tar and Salicylic Acid Ointment, BP consists of coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate '80' 4 g, liquid paraffin 7.6 g.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment

**Coal tar with salicylic acid and precipitated sulfur**

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253, salicylic acid p. 1286.

• **INDICATIONS AND DOSE****COCOIS<sup>®</sup> OINTMENT****Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

- ▶ INITIALLY TO THE SKIN USING SCALP OINTMENT
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply once weekly as required, alternatively (to the skin) apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

**SEBCO<sup>®</sup> OINTMENT****Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**

- ▶ TO THE SKIN USING SCALP OINTMENT
- ▶ Child 6–11 years: Medical supervision required
- ▶ Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
- ▶ Adult: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Cocois** (RPH Pharmaceuticals AB)

**Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram** Cocois ointment | 40 gram [GSL] £6.22 | 100 gram [GSL] £11.69

- ▶ **SebcO** (Derma UK Ltd)

**Salicylic acid 20 mg per 1 gram, Sulfur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram** SebcO ointment | 40 gram [GSL] £6.20 | 100 gram [GSL] £11.67

**Coal tar with zinc oxide**

16-Jan-2019

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 1253.

• **INDICATIONS AND DOSE****Psoriasis | Chronic atopic eczema**

- ▶ TO THE SKIN
- ▶ Child: Apply 1–2 times a day
- ▶ Adult: Apply 1–2 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **PRESCRIBING AND DISPENSING INFORMATION** No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: ointment, paste

**IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS****Pimecrolimus**• **INDICATIONS AND DOSE****Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated by a specialist)**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily until symptoms resolve (maximum duration of treatment 4 weeks)

- **UNLICENSED USE** Pimecrolimus is not licensed for short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy.
- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site
- **CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** → Appendix 1: pimecrolimus

### ● SIDE-EFFECTS

- ▶ **Common or very common** Increased risk of infection
- ▶ **Rare or very rare** Skin discolouration
- ▶ **Frequency not known** Skin papilloma
- **PREGNANCY** Manufacturer advises avoid; toxicity in *animal* studies following systemic administration.
- **BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE decisions

- ▶ **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**  
Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years. Pimecrolimus should be used within its licensed indications.

## Tacrolimus

19-Mar-2018

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

### ● INDICATIONS AND DOSE

**Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of conventional therapy (initiated by a specialist)**

- ▶ TO THE SKIN

- ▶ **Adult:** Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows

**Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)**

- ▶ TO THE SKIN

- ▶ **Adult:** Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year

**Short-term treatment of facial, flexural, or genital psoriasis in patients unresponsive to, or intolerant of other topical therapy (initiated under specialist supervision)**

- ▶ TO THE SKIN

- ▶ **Adult:** Apply twice daily until symptoms resolve, 0.1% ointment to be applied thinly, reduce to once daily or switch to 0.03% ointment if condition allows, maximum duration of treatment 4 weeks

- **UNLICENSED USE** Short-term treatment of facial, flexural, or genital psoriasis is unlicensed.
- **CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions · application under

occlusion · avoid contact with eyes · avoid contact with mucous membranes · congenital epidermal barrier defects · generalised erythroderma · immunodeficiency · infection at treatment site

- **CAUTIONS** UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

### ● SIDE-EFFECTS

- ▶ **Common or very common** Alcohol intolerance · increased risk of infection · sensation abnormal · skin reactions
- ▶ **Uncommon** Lymphadenopathy
- ▶ **Frequency not known** Malignancy · neoplasms

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.

- **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in *animal* studies following systemic administration.

- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic failure.

- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light including sunlight.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE decisions

- ▶ **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**

Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical tacrolimus is recommended as an option for the second-line treatment for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

[www.nice.org.uk/guidance/TA82](http://www.nice.org.uk/guidance/TA82)

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2010) that tacrolimus 0.1% ointment (*Protopic*®) is accepted for restricted use within NHS Scotland for the prevention of flares in patients aged 16 years and over with moderate-to-severe atopic eczema in accordance with the licensed indications; initiation of treatment is restricted to doctors (including general practitioners) with a specialist interest and experience in treating atopic eczema with immunomodulatory therapy.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

CAUTIONARY AND ADVISORY LABELS 4, 11, 28

## IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

### Brodalumab

22-Jan-2018

● **DRUG ACTION** Brodalumab is a recombinant human monoclonal antibody that binds with high affinity to interleukin-17RA and blocks the activity of pro-inflammatory cytokines.

#### ● INDICATIONS AND DOSE

**Moderate-to-severe plaque psoriasis (under expert supervision)**

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** 210 mg every week for 3 doses, followed by 210 mg every 2 weeks, consider discontinuing treatment if no response after 16 weeks

● **CONTRA-INDICATIONS** Active Crohn's disease · clinically significant active infection

● **CAUTIONS** Chronic infection · history of Crohn's disease (monitor for exacerbations) · history of depressive disorders (discontinue if new or worsening symptoms develop) · history of recurrent infection · history of suicidal ideation or behaviour (discontinue if new or worsening symptoms develop)

#### CAUTIONS, FURTHER INFORMATION

▶ **Infection** Manufacturer advises to consider anti-tuberculosis therapy for patients with latent tuberculosis before starting treatment with brodalumab.

Manufacturer advises patients should be brought up-to-date with current immunisation schedule before initiating treatment.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

▶ **Common or very common** Arthralgia · diarrhoea · fatigue · headache · increased risk of infection · myalgia · nausea · oropharyngeal pain

▶ **Uncommon** Conjunctivitis

▶ **Frequency not known** Meningitis cryptococcal · suicidal tendencies

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 12 weeks after stopping treatment.

● **PREGNANCY** Manufacturer advises avoid—limited information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are tender, bruised, or affected by psoriasis. Patients may self-administer *Kyntheum*<sup>®</sup>, after appropriate training in subcutaneous injection technique.

● **PRESCRIBING AND DISPENSING INFORMATION** Brodalumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

● **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

● **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be given training in subcutaneous injection technique. Manufacturer advises patients and their carers should seek medical advice if new

or worsening symptoms of depression, suicidal ideation, or behaviour occur; they should also be advised to report signs and symptoms of infection.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

▶ **Brodalumab for treating moderate to severe plaque psoriasis (March 2018)** NICE TA511

Brodalumab is recommended as an option for treating plaque psoriasis in adults, only if:

● the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, and

● the disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated, and

● the manufacturer provides the drug with the discount agreed in the patient access scheme.

Stop brodalumab at 12 weeks if the psoriasis has not responded adequately, defined as:

● a 75% reduction in the PASI score (PASI 75) from when treatment started, or

● a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta511](http://www.nice.org.uk/guidance/ta511)

##### Scottish Medicines Consortium (SMC) decisions

SMC No. 1283/17

The *Scottish Medicines Consortium* has advised (updated May 2018) that brodalumab (*Kyntheum*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis in adults who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

▶ *Kyntheum* (LEO Pharma) ▼

**Brodalumab 140 mg per 1 ml** Kyntheum 210mg/1.5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [POM] £1,280.00

### Dupilumab

15-Aug-2018

● **DRUG ACTION** Dupilumab is a recombinant human monoclonal antibody that inhibits interleukin-4 and interleukin-13 signaling; these cytokines are involved in atopic eczema.

#### ● INDICATIONS AND DOSE

**Moderate-to-severe atopic eczema (specialist use only)**

▶ BY SUBCUTANEOUS INJECTION

● **Adult:** Initially 600 mg, followed by 300 mg every 2 weeks, the initial dose should be administered as two consecutive 300 mg injections at different injection sites, review treatment if no response after 16 weeks

● **CAUTIONS** Asthma—consult product literature · helminth infection

**CAUTIONS, FURTHER INFORMATION**

- ▶ Helminth infection Dupilumab may influence the immune response to helminth infections. Resolve pre-existing infection before initiating treatment; suspend treatment if resistant infection develops during therapy.

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Eosinophilia · eye inflammation · eye pruritus · headache · oral herpes

- ▶ **Rare or very rare** Serum sickness-like reaction

**SIDE-EFFECTS, FURTHER INFORMATION** Side-effects reported with or without concomitant corticosteroids.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to inject into the thigh or abdomen (except for the 5 cm around the navel), or upper arm (if not self-administered); rotate injection site and avoid skin that is tender, damaged or scarred. Patients may self-administer Dupixent® after appropriate training in preparation and administration.

● **PRESCRIBING AND DISPENSING INFORMATION**

Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); pre-filled syringes may be kept at room temperature (max. 25°C) for max. 14 days.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ Dupilumab for treating moderate to severe atopic dermatitis (August 2018) NICE TA534

Dupilumab (Dupixent®) is recommended as an option for treating moderate to severe atopic dermatitis in adults, only if:

- the disease has not responded to at least 1 other systemic therapy, such as ciclosporin, methotrexate, azathioprine, and mycophenolate mofetil, or these are contra-indicated or not tolerated, **and**
- the manufacturer provides dupilumab according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta534](http://www.nice.org.uk/guidance/ta534)

**Scottish Medicines Consortium (SMC) decisions**

SMC No. SMC2011

The *Scottish Medicines Consortium* has advised (September 2018) that dupilumab (Dupixent®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe atopic dermatitis in adults who have had an inadequate response to existing systemic immunosuppressants such as ciclosporin, or in whom such treatment is considered unsuitable. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- ▶ Dupixent (Sanofi) ▼

Dupilumab 150 mg per 1 ml Dupixent 300mg/2ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (PcM) £1,264.89

**Guselkumab**

06-Jul-2018

- **DRUG ACTION** Guselkumab is a recombinant human monoclonal antibody that binds selectively to interleukin-23 and blocks the activity of pro-inflammatory cytokines.

● **INDICATIONS AND DOSE****Moderate-to-severe plaque psoriasis (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 8 weeks, consider discontinuation if no response after 16 weeks

- **CONTRA-INDICATIONS** Clinically significant active infection

- **CAUTIONS** Risk of infection

**CAUTIONS, FURTHER INFORMATION**

- ▶ Risk of infection Manufacturer advises consider anti-tuberculosis therapy before initiation of guselkumab in patients with a past history of latent or active tuberculosis in whom an adequate course of treatment cannot be confirmed.

Manufacturer advises consider completion of appropriate immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of guselkumab).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · diarrhoea · headache · increased risk of infection · urticaria

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 12 weeks after treatment.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid during treatment and for up to 12 weeks after discontinuing treatment—no information available.

- **PRE-TREATMENT SCREENING** Manufacturer advises that patients should be evaluated for tuberculosis infection before treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis. Patients may self-administer Tremfya®, after appropriate training in subcutaneous injection technique.

● **PRESCRIBING AND DISPENSING INFORMATION**

Manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek medical attention if signs or symptoms of infection occur (monitor closely and suspend treatment if infection is clinically significant or unresponsive to treatment).

Self-administration Manufacturer advises patients may self-administer following training in subcutaneous injection technique.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ Guselkumab for treating moderate to severe plaque psoriasis (June 2018) NICE TA521

Guselkumab is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a

Dermatology Life Quality Index (DLQI) of more than 10, and

- the disease has not responded to other systemic therapies, including ciclosporin, methotrexate and PUVA (psoralen and long-wave ultraviolet A radiation), or these options are contra-indicated or not tolerated, and

- the manufacturer provides the drug according to the commercial arrangement.

Stop guselkumab treatment at 16 weeks if the psoriasis has not responded adequately. An adequate response is defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
  - a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1340/18

The *Scottish Medicines Consortium* has advised (June 2018) that guselkumab (*Tremfya*®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe plaque psoriasis in adults who have failed to respond to conventional systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Tremfya (Janssen-Cilag Ltd) ▼

Guselkumab 100 mg per 1 ml Tremfya 100mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £2,250.00

Tremfya 100mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £2,250.00

## Ixekizumab

26-Jun-2017

- DRUG ACTION** Ixekizumab is a human monoclonal antibody that binds to interleukin-17A and inhibits the release of pro-inflammatory cytokines and chemokines.

#### ● INDICATIONS AND DOSE

**Moderate-to-severe plaque psoriasis (under expert supervision) | Psoriatic arthritis with concomitant moderate-to-severe plaque psoriasis (under expert supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: Initially 160 mg for 1 dose, followed by 80 mg after 2 weeks, then 80 mg every 2 weeks for 5 further doses (at weeks 4, 6, 8, 10 and 12), then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

##### **Psoriatic arthritis (under expert supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: Initially 160 mg for 1 dose, then maintenance 80 mg every 4 weeks, consider discontinuation of treatment if no response after 16–20 weeks

- CONTRA-INDICATIONS** Active infections (including active tuberculosis)

- CAUTIONS** Chronic infection—monitor carefully and discontinue if serious, unresponsive infection develops · Crohn's disease · ulcerative colitis

#### CAUTIONS, FURTHER INFORMATION

- Severe hypersensitivity reactions Severe hypersensitivity reactions have been reported—discontinue treatment immediately if symptoms occur.
- Latent tuberculosis Manufacturer advises that patients with latent tuberculosis should complete anti-tuberculosis therapy before starting ixekizumab.
- Inflammatory bowel disease Manufacturer advises to monitor closely for exacerbation.

- INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- Common or very common** Increased risk of infection · nausea · oropharyngeal pain
- Uncommon** Conjunctivitis · neutropenia · skin reactions · thrombocytopenia
- Frequency not known** Angioedema · dyspnoea · hypersensitivity (occasionally late-onset) · inflammatory bowel disease

- CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 10 weeks after treatment in women of childbearing potential.

- PREGNANCY** Manufacturer advises avoid—limited information available.

- BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

- DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to avoid injecting into areas of the skin that show psoriasis; injection sites may be alternated. Patients may self-administer *Taltz*®, after appropriate training in subcutaneous injection technique.

- HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).

#### ● PATIENT AND CARER ADVICE

Self-administration If appropriate, patients and their carers should be given training in subcutaneous injection technique.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ Ixekizumab for treating moderate to severe plaque psoriasis (April 2017) NICE TA442

Ixekizumab (*Taltz*®) is recommended as an option for treating plaque psoriasis only if:

- the disease is severe, defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of 10 or more;
  - the disease has not responded to standard systemic therapies (e.g. ciclosporin, methotrexate and PUVA) or these treatments are contra-indicated or not tolerated, and
  - the manufacturer provides ixekizumab with the discount agreed in the patient access scheme
- Ixekizumab should be discontinued if there is an inadequate response at 12 weeks.

Patients currently receiving ixekizumab, whose disease does not meet the above criteria, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta442](http://www.nice.org.uk/guidance/ta442)

- ▶ Ixekizumab for treating active psoriatic arthritis after inadequate response to DMARDs (August 2018) NICE TA537 Ixekizumab (*Taltz*®) alone, or with methotrexate, is recommended as an option for treating active psoriatic arthritis in adults only if:
  - it is used as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for

the treatment of psoriatic arthritis (TA199 recommendations 1.1 and 1.2), or

- the person has had a tumour necrosis factor (TNF)-alpha inhibitor but their disease has not responded within the first 12 weeks or has stopped responding after the first 12 weeks, or
- TNF-alpha inhibitors are contra-indicated but would otherwise be considered (as described in the NICE technology appraisal guidance on etanercept, infliximab and adalimumab for the treatment of psoriatic arthritis). Ixekizumab is only recommended if the manufacturer provides it according to the commercial arrangement.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta537](http://www.nice.org.uk/guidance/ta537)

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 1223/17

The *Scottish Medicines Consortium* has advised (April 2017) that ixekizumab (*Taltz*®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe plaque psoriasis only in patients who have failed to respond to standard systemic therapies (including ciclosporin, methotrexate and phototherapy), are intolerant to, or have a contra-indication to these treatments. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland, or a list price that is equivalent or lower.

SMC No. SMC2097

The *Scottish Medicines Consortium* has advised (October 2018) that ixekizumab (*Taltz*®) is accepted for restricted use within NHS Scotland, alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults whose disease has not responded adequately to at least two conventional disease-modifying anti-rheumatic drugs given either alone or in combination, and who have had an inadequate response to a tumour necrosis factor inhibitor.

This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPENTS: May contain Polysorbates

- ▶ **Taltz** (Eli Lilly and Company Ltd) ▼

**Ixekizumab 80 mg per 1 ml** Taltz 80mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £1,125.00 (Hospital only)

Taltz 80mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £1,125.00 (Hospital only)

## Tildrakizumab

14-May-2019

- **DRUG ACTION** Tildrakizumab is a recombinant human monoclonal antibody that specifically binds to interleukin-23 and inhibits the release of pro-inflammatory cytokines and chemokines.

#### INDICATIONS AND DOSE

**Moderate-to-severe plaque psoriasis (under expert supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 100 mg, then 100 mg after 4 weeks, then maintenance 100 mg every 12 weeks, consider discontinuation if no response after 28 weeks, in patients with a high disease burden, or with a body weight  $\geq$  90kg, a dose of 200 mg may provide greater efficacy

- **CONTRA-INDICATIONS** Clinically significant active infection

- **CAUTIONS** Chronic infection · history of recurrent infection · recent serious infection

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Risk of infection** Manufacturer advises consider anti-tuberculosis therapy before initiation of tildrakizumab in patients with a history of tuberculosis, in whom an adequate course of treatment cannot be confirmed.

Manufacturer advises consider completion of immunisations according to current guidelines before initiating treatment (consult product literature for appropriate interval between vaccination and administration of tildrakizumab).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

- ▶ **Common or very common** Back pain · diarrhoea · headache · increased risk of infection · nausea

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that women of childbearing potential should use effective contraception during treatment and for at least 17 weeks after stopping treatment.

- **PREGNANCY** Manufacturer advises avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—limited information available.

- **PRE-TREATMENT SCREENING** Manufacturer advises patients should be evaluated for tuberculosis infection before treatment.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of active tuberculosis during and after treatment

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises to take the syringe out of the refrigerator at least 30 minutes before administration, and to avoid injecting into areas of the skin that are affected by psoriasis or are tender, bruised, red, hard, thick, or scaly. Patients may self-administer *Ilumetri*®, after appropriate training in subcutaneous injection technique.

#### PRESCRIBING AND DISPENSING INFORMATION

Tildrakizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C) and protect from light—consult product literature for further information regarding storage outside refrigerator.

- **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be advised to seek medical advice if signs or symptoms of infection occur.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE decisions

- ▶ **Tildrakizumab for treating moderate to severe plaque psoriasis (April 2019)** NICE TA575

Tildrakizumab (*Ilumetri*®) is recommended as an option for treating plaque psoriasis in adults, only if:

- the disease is severe, as defined by a total Psoriasis Area and Severity Index (PASI) of 10 or more and a Dermatology Life Quality Index (DLQI) of more than 10, **and**
- the disease has not responded to other systemic treatments, including ciclosporin, methotrexate and phototherapy, or these options are contra-indicated or not tolerated, **and**
- the manufacturer provides the drug according to the commercial arrangement.

Consider stopping tildrakizumab between 12 weeks and 28 weeks if there has not been at least a 50% reduction in the PASI score from when treatment started.

Stop tildrakizumab at 28 weeks if the psoriasis has not responded adequately. An adequate response is defined as:

- a 75% reduction in the PASI score (PASI 75) from when treatment started, or
  - a 50% reduction in the PASI score (PASI 50) and a 5-point reduction in DLQI from when treatment started.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their NHS clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta575](http://www.nice.org.uk/guidance/ta575)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Polysorbates

#### ▶ Ilumetri (Almirall Ltd) ▼

Tildrakizumab 100 mg per 1 ml Ilumetri 100mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PoM) £3,241.00 | 2 pre-filled disposable injection (PoM) £3,241.00

## RETINOID AND RELATED DRUGS

### Acitretin

11-Sep-2018

- **DRUG ACTION** Acitretin is a metabolite of etretinate.

#### • INDICATIONS AND DOSE

**Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)**

#### ▶ BY MOUTH

- ▶ Adult: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

**Severe Darier's disease (keratosis follicularis) (under expert supervision)**

#### ▶ BY MOUTH

- ▶ Adult: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

- **CONTRA-INDICATIONS** Hyperlipidaemia

- **CAUTIONS** Avoid excessive exposure to sunlight and unsupervised use of sunlamps · diabetes (can alter glucose tolerance—initial frequent blood glucose checks) · do not donate blood during and for 2 years after stopping therapy (teratogenic risk) · in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) · investigate atypical musculoskeletal symptoms

- **INTERACTIONS** → Appendix 1: retinoids

#### • SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · brittle nails · conjunctivitis · diarrhoea · dry mouth · gastrointestinal disorder · haemorrhage · hair texture abnormal · headache · increased risk of infection · mucosal abnormalities · myalgia · nausea · oral disorders · peripheral oedema · skin reactions · thirst · vomiting · xerophthalmia
- ▶ **Uncommon** Dizziness · hepatic disorders · photosensitivity reaction · vision disorders
- ▶ **Rare or very rare** Bone pain · exostosis · idiopathic intracranial hypertension · peripheral neuropathy
- ▶ **Frequency not known** Angioedema · capillary leak syndrome · drowsiness · dysphonia · flushing · glucose tolerance impaired · granuloma · hearing impairment · hyperhidrosis · malaise · pyogenic granuloma · retinoic acid syndrome · taste altered · tinnitus

**SIDE-EFFECTS, FURTHER INFORMATION Exostosis** Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which acitretin is a metabolite) and premature epiphyseal closure in children.

**Benign intracranial hypertension** Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used. **Pregnancy prevention** In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid in severe impairment; increased risk of toxicity.

#### • MONITORING REQUIREMENTS

- ▶ Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
- ▶ Check liver function at start, then every 2–4 weeks for first 2 months and then every 3 months.

#### • PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential Each prescription for acitretin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

- **PATIENT AND CARER ADVICE** Females of child-bearing potential must be advised on pregnancy prevention.

A patient information leaflet should be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Capsule

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

#### ▶ Acitretin (Non-proprietary)

**Acitretin 10 mg** Acitretin 10mg capsules | 60 capsule (PoM) £23.80 DT = £23.80

**Acitretin 25 mg** Acitretin 25mg capsules | 60 capsule (PoM) £55.24 DT = £55.24

#### ▶ Neotigason (Teva UK Ltd)

**Acitretin 10 mg** Neotigason 10mg capsules | 60 capsule (PoM) £17.30 DT = £23.80

**Acitretin 25 mg** Neotigason 25mg capsules | 60 capsule (PoM) £43.00 DT = £55.24

## Alitretinoin

10-Apr-2019

## ● INDICATIONS AND DOSE

**Severe chronic hand eczema refractory to potent topical corticosteroids**

## ▶ BY MOUTH

- ▶ Adult (prescribed by or under supervision of a consultant dermatologist): 30 mg once daily; reduced if not tolerated to 10 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

**Severe chronic hand eczema refractory to potent topical corticosteroids in patients with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease**

## ▶ BY MOUTH

- ▶ Adult (prescribed by or under supervision of a consultant dermatologist): Initially 10 mg once daily, increased if necessary up to 30 mg once daily for 12–24 weeks total duration of treatment, discontinue if no response after 12 weeks, course may be repeated in those who relapse

## DOSE ADJUSTMENTS DUE TO INTERACTIONS

- ▶ Manufacturer advises reduce dose to 10 mg once daily with concurrent use of potent inhibitors of CYP3A4, CYP2C8 and moderate inhibitors of CYP2C9.

- **CONTRA-INDICATIONS** Hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism

- **CAUTIONS** Avoid blood donation during treatment and for at least 1 month after stopping treatment · dry eye syndrome · history of depression

- **INTERACTIONS** → Appendix 1: retinoids

● **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · anaemia · conjunctivitis · depression · dizziness · dry eye · dry mouth · eye irritation · fatigue · flushing · headache · hypercholesterolaemia · hypertension · hypertriglyceridaemia (risk of pancreatitis if triglycerides above 9 mmol/litre) · joint disorders · myalgia · nausea · oral disorders · skin reactions · tinnitus · vomiting
- ▶ **Uncommon** Bone disorders · cataract · dyspepsia · epistaxis · vision disorders

- ▶ **Rare or very rare** Idiopathic intracranial hypertension · nail disorder · photosensitivity reaction · vasculitis

- ▶ **Frequency not known** Inflammatory bowel disease · mood altered · peripheral oedema · suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION** **Dry eyes** Dry eyes may respond to lubricating eye ointment or tear replacement therapy.

**Benign intracranial hypertension** Discontinue treatment if headache, nausea, vomiting, papilloedema, or visual disturbances occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used.

Pregnancy prevention In women of child-bearing potential, exclude pregnancy 1 month before treatment, up to 3 days before treatment, every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle.

Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods.

Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

- **PREGNANCY** Avoid—teratogenic.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—limited information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor serum lipids (more frequently in those with diabetes, history of hyperlipidaemia, or risk factors for cardiovascular disease)—discontinue if uncontrolled hyperlipidaemia.

● **PRESCRIBING AND DISPENSING INFORMATION**

Prescribing for women of child-bearing potential Each prescription for alitretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription.

Alitretinoin is **teratogenic** and must **not** be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

**Conception and contraception** Women of child-bearing potential must be counselled on pregnancy prevention.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE decisions**

- ▶ **Alitretinoin for the treatment of severe chronic hand eczema (August 2009)** NICE TA177

Alitretinoin (*Toctino*<sup>®</sup>) is recommended for the treatment of severe chronic hand eczema in adults that has not responded to potent topical corticosteroids.

Treatment should be stopped as soon as an adequate response has been achieved (hands clear or almost clear), or if the eczema remains severe after 12 weeks, or if an adequate response has not been achieved by 24 weeks.

[www.nice.org.uk/guidance/ta177](http://www.nice.org.uk/guidance/ta177)

£493.72 DT = £493.72

## Tazarotene

● **INDICATIONS AND DOSE****Mild to moderate plaque psoriasis affecting up to 10% of skin area**

## ▶ TO THE SKIN

- ▶ **Adult:** Apply once daily usually for up to 12 weeks, apply in the evening

- **CAUTIONS** Avoid contact with eczematous skin · avoid contact with eyes · avoid contact with face · avoid contact with hair-covered scalp · avoid contact with inflamed skin · avoid contact with intertriginous areas

- **INTERACTIONS** → Appendix 1: retinoids

● **SIDE-EFFECTS**

- ▶ **Common or very common** Paraesthesia · skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION** Local irritation is more common with higher concentration and may require treatment interruption.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **PATIENT AND CARER ADVICE** Avoid excessive exposure to UV light (including sunlight, solariums, PUVA or UVB treatment). Do not apply emollients or cosmetics within 1 hour of application. Wash hands immediately after use.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, disodium edetate, polysorbates

▶ **Zorac** (Allergan Ltd)

**Tazarotene 500 microgram per 1 gram** Zorac 0.05% gel | 30 gram [PoM] £14.09 DT = £14.09

**SALICYLIC ACID AND DERIVATIVES****Salicylic acid with zinc oxide**● **INDICATIONS AND DOSE****Hyperkeratotic skin disorders**

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily

- **CAUTIONS** Avoid broken skin · avoid inflamed skin
- **CAUTIONS, FURTHER INFORMATION**
- ▶ Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.
- **SIDE-EFFECTS** Skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

- **MEDICINAL FORMS** Forms available from special-order manufacturers include: paste

**VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES****Calcipotriol**● **INDICATIONS AND DOSE****Plaque psoriasis**

- ▶ TO THE SKIN USING OINTMENT
- ▶ Adult: Apply 1–2 times a day, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 100 g per week

**Scalp psoriasis**

- ▶ TO THE SKIN USING SCALP LOTION
- ▶ Adult: Apply twice daily, when preparations are used together maximum total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with ointment 30 g or scalp solution 30 mL with ointment 60 g); maximum 60 mL per week

- **CONTRA-INDICATIONS** Calcium metabolism disorders
- **CAUTIONS** Avoid excessive exposure to sunlight and sunlamps · avoid use on face · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)

- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
- ▶ **Common or very common** Skin reactions
- ▶ **Uncommon** Increased risk of infection
- ▶ **Rare or very rare** Hypercalcaemia · hypercalciuria · photosensitivity reaction
- **PREGNANCY** Manufacturers advise avoid unless essential.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment (no information available).
- **PATIENT AND CARER ADVICE**
- Advice on application Patient information leaflet for *Dovonex*® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.

Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Ointment**

EXCIPIENTS: May contain Disodium edetate, propylene glycol

## Tacalcitol

### ● INDICATIONS AND DOSE

#### Plaque psoriasis

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily, preferably at bedtime, maximum 10 g ointment or 10 mL lotion daily, when lotion and ointment used together, maximum total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

- **CONTRA-INDICATIONS** Calcium metabolism disorders
- **CAUTIONS** Avoid eyes · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia) · if used in conjunction with UV treatment

#### CAUTIONS, FURTHER INFORMATION

- ▶ UV treatment If tacalcitol is used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime.
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Skin reactions
  - ▶ **Frequency not known** Hypercalcaemia
- **PREGNANCY** Manufacturer advises avoid unless no safer alternative—no information available.
- **BREAST FEEDING** Manufacturer advises avoid application to breast area; no information available on presence in milk.
- **MONITORING REQUIREMENTS** Monitor serum calcium if risk of hypercalcaemia.
- **PATIENT AND CARER ADVICE** Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

Limited evidence suggests that oxybutynin hydrochloride p. 778 [unlicensed indication] can be used to treat hyperhidrosis in patients whose symptoms are not adequately managed through lifestyle modifications and antiperspirants.

In more severe cases specialists use glycopyrronium bromide below as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas. *Botox*<sup>®</sup> contains botulinum toxin type A complex p. 407 and is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment.

## 5 Pruritus

### Topical local antipruritics

**Overview**

*Pruritus* may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying causes should be treated. An **emollient** may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. Levomenthol **cream** p. 1266 can be used to relieve pruritus; it exerts a cooling effect on the skin. Local antipruritics have a role in the treatment of pruritus in palliative care.

Preparations containing croctamiton below are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% p. 1266 is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine p. 197 is the treatment of choice.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause hypersensitivity. For *insect stings* and *insect bites*, a short course of a topical corticosteroid is appropriate. Short-term treatment with a **sedating antihistamine** may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

Topical local anaesthetics are indicated for the relief of local pain. Preparations may be absorbed, especially through mucosal surfaces, therefore excessive application should be avoided and they should preferably not be used for more than 3 days; not generally suitable for young children and are less suitable for prescribing.

Topical antihistamines should be avoided in eczema and are not recommended for longer than 3 days. They are less suitable for prescribing.

**Other drugs used for Pruritus** Alimemazine tartrate, p. 282 • Cetirizine hydrochloride, p. 279 • Chlorphenamine maleate, p. 283 • Coal tar with calamine, p. 1254 • Hydroxyzine hydrochloride, p. 285 • Levocetirizine hydrochloride, p. 281

## ANTIPRURITICS

### Calamine with zinc oxide

15-Jan-2019

- **INDICATIONS AND DOSE**

**Pruritus**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (UPDATED DECEMBER 2018): EMOLLIENTS: NEW INFORMATION ABOUT RISK OF SEVERE AND FATAL BURNS WITH PARAFFIN-CONTAINING AND PARAFFIN-FREE EMOLLIENTS See Emollient and barrier preparations p. 1221.

- **CONTRA-INDICATIONS** Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Calamine with zinc oxide (Non-proprietary)**

Phenoxyethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram Aqueous calamine cream | 100 gram [GSL] £1.43 DT = £1.43

**Liquid**

- ▶ **Calamine with zinc oxide (Non-proprietary)**

Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Glycerol 50 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 150 mg per 1 ml Calamine lotion | 200 ml [GSL] £0.94-£1.09 DT = £1.09

### Crotamiton

- **INDICATIONS AND DOSE**

**Pruritus (including pruritus after scabies)**

- ▶ TO THE SKIN
- ▶ Child 1 month-2 years (on doctor's advice only): Apply once daily
- ▶ Child 3-17 years: Apply 2-3 times a day
- ▶ Adult: Apply 2-3 times a day

- **CONTRA-INDICATIONS** Acute exudative dermatoses
- **CAUTIONS** Avoid use in buccal mucosa • avoid use near eyes • avoid use on broken skin • avoid use on very inflamed skin • use on doctor's advice for children under 3 years
- **PREGNANCY** Manufacturer advises avoid, especially during the first trimester—no information available.
- **BREAST FEEDING** No information available; avoid application to nipple area.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, hydroxybenzoates (parabens)

- ▶ **Eurax** (GlaxoSmithKline Consumer Healthcare)

**Crotamiton 100 mg per 1 gram** Eurax 10% cream | 30 gram [GSL] £2.50 DT = £2.50 | 100 gram [GSL] £4.35 DT = £4.35

## Doxepin

### INDICATIONS AND DOSE

#### Pruritus in eczema

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day
- ▶ Adult: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

- **CAUTIONS** Avoid application to large areas · cardiac arrhythmias · mania · severe heart disease · susceptibility to angle-closure glaucoma · urinary retention

- **INTERACTIONS** → Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS** Constipation · diarrhoea · dizziness · drowsiness · dry eye · dry mouth · dyspepsia · fever · headache · nausea · paraesthesia · skin reactions · suicidal tendencies · taste altered · urinary retention · vision blurred · vomiting

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).  
Effects of alcohol enhanced.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

## 6 Rosacea and acne

### Rosacea and Acne

#### Acne

Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations. Systemic treatment with oral antibacterials is generally used for *moderate to severe acne* or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol p. 1267 (cyproterone acetate with ethinylestradiol); it is for women only.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin p. 1270 for administration by mouth.

#### Acne: topical preparations

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide p. 1269 or to a topical retinoid. Alternatively, topical application of an antibacterial such as erythromycin p. 539 or clindamycin p. 1268 may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed.

#### Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid p. 1269 has antimicrobial and anticomedonal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

#### Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin p. 939. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause

sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

Some manufacturers of topical antibacterial preparations for acne advise that preparations containing alcohol are not suitable for use with benzoyl peroxide.

#### Topical retinoids and related preparations for acne

Topical tretinoin, its isomer isotretinoin, and adapalene p. 1269 (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne.

#### Other topical preparations for acne

Preparations containing aluminium oxide are not considered beneficial in acne.

A topical preparation of nicotinamide p. 1272 is available for inflammatory acne.

#### Acne: oral preparations

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomedonal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline p. 567 or tetracycline p. 567 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline p. 564 and lymecycline p. 566 are alternatives to tetracycline.

Although minocycline p. 566 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a once or twice daily dose.

Erythromycin in a twice daily dose is an alternative for the management of acne but *propionibacteria* strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim p. 574 may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with trimethoprim may depress haematopoiesis; it should generally be initiated by specialists.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

#### Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is licensed for use in women with moderate to severe acne that has not responded to topical therapy or oral antibacterials, and for moderately severe hirsutism. Although it is an effective hormonal contraceptive, it should not be used solely for contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under

androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

#### Oral retinoid for acne

The retinoid isotretinoin reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials.

Isotretinoin is a toxic drug that should be prescribed **only** by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

Side-effects of isotretinoin include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must **not** be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin p. 1270 use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

#### Rosacea

Rosacea is not comedonal (but may exist with acne which may be comedonal). Brimonidine tartrate p. 1273 is licensed for the treatment of facial erythema in rosacea. The pustules and papules of rosacea respond to topical azelaic acid p. 1269, topical ivermectin p. 1273 or to topical metronidazole p. 1230. Alternatively oral administration of oxytetracycline p. 567 or tetracycline p. 567, or erythromycin p. 539, can be used; courses usually last 6–12 weeks and are repeated intermittently. Doxycycline p. 564 can be used [unlicensed indication] if oxytetracycline or tetracycline is inappropriate (e.g. in renal impairment). A modified-release preparation of doxycycline is licensed in low daily doses for the treatment of facial rosacea. Isotretinoin is occasionally given in refractory cases [unlicensed indication]. Camouflagers may be required for the redness.

## 6.1 Acne

### ANTI-ANDROGENS

#### Co-cyprindiol

02-Mar-2017

##### • INDICATIONS AND DOSE

**Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials | Moderately severe hirsutism**

##### ▶ BY MOUTH

- ▶ Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyrias p. 1058 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of

chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · presence or history of liver tumours · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease or for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia—seek specialist advice · inflammatory bowel disease including Crohn's disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

#### CAUTIONS, FURTHER INFORMATION

- ▶ Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing levonorgestrel, but the risk may be similar to that associated with use of combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.
- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **SIDE-EFFECTS**
  - ▶ **Rare or very rare** Cholelithiasis · photosensitivity reaction · systemic lupus erythematosus (SLE)
  - ▶ **Frequency not known** Abdominal cramps · amenorrhoea (on discontinuation) · breast abnormalities · cervical erosion · chorea · contact lens intolerance · depression · fluid retention · headache · hepatic impairment · hepatic neoplasm · hypertension · irritability · leg cramps · libido disorder · lipid metabolism change · menstrual disorder · nausea · nervousness · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual impairment · vomiting · vulvovaginal disorders
- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (until liver function returns to normal.)
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Co-cyprindiol (Non-proprietary)**

#### Gel

EXCIPIENTS: May contain Fragrances, propylene glycol

- ▶ **Acnecide** (Galderma (UK) Ltd)

**Benzoyl peroxide 50 mg per 1 gram** Acnecide 5% gel | 30 gram [P] £5.44 DT = £5.44 | 60 gram [P] £10.68 DT = £10.68  
Acnecide Wash 5% gel | 50 gram [P] £5.44 DT = £5.44

Combinations available: **Adapalene with benzoyl peroxide**, p. 1270

### Benzoyl peroxide with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzoyl peroxide above, clindamycin p. 1268.

#### ● INDICATIONS AND DOSE

##### Acne vulgaris

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply once daily, dose to be applied in the evening
- ▶ Adult: Apply once daily, dose to be applied in the evening

- **INTERACTIONS** → Appendix 1: clindamycin

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Gel

EXCIPIENTS: May contain Disodium edetate

- ▶ **Duac** (Stiefel Laboratories (UK) Ltd)

**Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram, Benzoyl peroxide 30 mg per 1 gram** Duac Once Daily gel (3% and 1%) | 30 gram [PoM] £13.14 DT = £13.14 | 60 gram [PoM] £26.28  
**Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram, Benzoyl peroxide 50 mg per 1 gram** Duac Once Daily gel (5% and 1%) | 30 gram [PoM] £13.14 DT = £13.14 | 60 gram [PoM] £26.28 DT = £26.28

## DERMATOLOGICAL DRUGS > ANTICOMEDONALS

### Azelaic acid

#### ● INDICATIONS AND DOSE

##### FINACEA®

##### Facial acne vulgaris

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply twice daily, discontinue if no improvement after 1 month
- ▶ Adult: Apply twice daily, discontinue if no improvement after 1 month

##### Papulopustular rosacea

- ▶ TO THE SKIN
- ▶ Adult: Apply twice daily, discontinue if no improvement after 2 months

##### SKINOREN®

##### Acne vulgaris

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply twice daily
- ▶ Adult: Apply twice daily

##### Acne vulgaris in patients with sensitive skin

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply once daily for 1 week, then apply twice daily
- ▶ Adult: Apply once daily for 1 week, then apply twice daily

- **CAUTIONS** Avoid contact with eyes · avoid contact with mouth · avoid contact with mucous membranes

#### ● SIDE-EFFECTS

- ▶ **Uncommon** Skin reactions
- ▶ **Rare or very rare** Asthma exacerbated · cheilitis
- ▶ **Frequency not known** Angioedema · eye swelling

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Propylene glycol

- ▶ **Skinoren** (Bayer Plc)

**Azelaic acid 200 mg per 1 gram** Skinoren 20% cream | 30 gram [PoM] £4.49 DT = £4.49

#### Gel

EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol

- ▶ **Finacea** (Bayer Plc)

**Azelaic acid 150 mg per 1 gram** Finacea 15% gel | 30 gram [PoM] £7.48 DT = £7.48

## RETINOID AND RELATED DRUGS

### Adapalene

#### ● INDICATIONS AND DOSE

##### Mild to moderate acne vulgaris

- ▶ TO THE SKIN
- ▶ Child 12-17 years: Apply once daily, apply thinly in the evening
- ▶ Adult: Apply once daily, apply thinly in the evening

- **UNLICENSED USE**
  - ▶ In children Not licensed for use in infantile acne.
- **CAUTIONS** Avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · caution in sensitive areas such as the neck
- **INTERACTIONS** → Appendix 1: retinoids
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.
- **PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens)

▶ **Adapalene (Non-proprietary)**

Adapalene 1 mg per 1 gram Adapalene 0.1% cream | 45 gram [PoM] £16.43 DT = £16.43

▶ **Differin** (Galderma (UK) Ltd)

Adapalene 1 mg per 1 gram Differin 0.1% cream | 45 gram [PoM] £16.43 DT = £16.43

**Gel**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol

▶ **Adapalene (Non-proprietary)**

Adapalene 1 mg per 1 gram Adapalene 0.1% gel | 45 gram [PoM] £16.43 DT = £16.43

▶ **Differin** (Galderma (UK) Ltd)

Adapalene 1 mg per 1 gram Differin 0.1% gel | 45 gram [PoM] £16.43 DT = £16.43

**Adapalene with benzoyl peroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene p. 1269, benzoyl peroxide p. 1269.

**● INDICATIONS AND DOSE****Acne vulgaris**

## ▶ TO THE SKIN

- ▶ Child 9–17 years: Apply once daily, to be applied thinly in the evening
- ▶ Adult: Apply once daily, to be applied thinly in the evening

- **INTERACTIONS** → Appendix 1: retinoids
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

The *Scottish Medicines Consortium* has advised (March 2014) that *Epiduo*<sup>®</sup> should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 11

EXCIPIENTS: May contain Disodium edetate, polysorbates, propylene glycol

▶ **Epiduo** (Galderma (UK) Ltd)

Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram Epiduo 0.1%/2.5% gel | 45 gram [PoM] £19.53 DT = £19.53

**Isotretinoin**

02-Sep-2018

**● INDICATIONS AND DOSE****Topical treatment of mild to moderate acne**

## ▶ TO THE SKIN

- ▶ Adult: Apply 1–2 times a day, to be applied thinly

**Severe acne (under expert supervision) | Acne which is associated with psychological problems (under expert supervision) | Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) | Acne with scarring (under expert supervision) | Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)**

## ▶ BY MOUTH

- ▶ Adult: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: ISOTRETINOIN (ROACCUTANE<sup>®</sup>): RARE REPORTS OF ERECTILE DYSFUNCTION AND DECREASED LIBIDO (OCTOBER 2017)**

An EU-wide review has concluded that on rare occasions, oral isotretinoin, indicated for severe acne, may cause sexual side-effects, including erectile dysfunction and decreased libido.

**● CONTRA-INDICATIONS**

- ▶ With oral use Hypertlipidaemia · hypervitaminosis A
- ▶ With topical use Perioral dermatitis · rosacea

**● CAUTIONS**

- ▶ With oral use avoid blood donation during treatment and for at least 1 month after treatment · diabetes · dry eye syndrome (associated with risk of keratitis) · history of depression · monitor for depression
- ▶ With topical use allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid · alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) · avoid accumulation in angles of the nose · avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin · avoid exposure to UV light (including sunlight, solariums) · avoid in severe acne involving large areas · avoid use of topical retinoids with abrasive cleansers, comedogenic or astringent cosmetics · caution in sensitive areas such as the neck · personal or familial history of skin cancer

- **INTERACTIONS** → Appendix 1: retinoids

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ Common or very common Skin reactions
- ▶ Rare or very rare Photosensitivity reaction

**SPECIFIC SIDE-EFFECTS**

- ▶ Common or very common
  - ▶ With oral use Alopecia · anaemia · arthralgia · back pain · cheilitis · dry eye · eye discomfort · eye inflammation · haemorrhage · headache · increased risk of infection ·

myalgia · nasal dryness · neutropenia · proteinuria · skin fragility (trauma may cause blistering) · thrombocytopenia · thrombocytosis

► **Rare or very rare**

- With oral use Anxiety · arthritis · behaviour abnormal · bone disorders · bronchospasm · cataract · corneal opacity · depression · diabetes mellitus · dizziness · drowsiness · dry throat · gastrointestinal disorders · glomerulonephritis · hair changes · hearing impairment · hepatitis · hoarseness · hyperhidrosis · hyperuricaemia · idiopathic intracranial hypertension · inflammatory bowel disease · lymphadenopathy · malaise · mood altered · nail dystrophy · nausea · pancreatitis · psychotic disorder · pyogenic granuloma · seizure · suicidal tendencies · tendinitis · vasculitis · vision disorders

► **Frequency not known**

- With oral use Rhabdomyolysis · severe cutaneous adverse reactions (SCARs)

**SIDE-EFFECTS, FURTHER INFORMATION** Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.

Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.

Visual disturbances require expert referral and possible withdrawal.

Psychiatric side-effects could require expert referral.

● **CONCEPTION AND CONTRACEPTION**

Pregnancy prevention

- With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days' treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
- With topical use Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- PREGNANCY** Contra-indicated in pregnancy (teratogenic).
- BREAST FEEDING** Avoid.
- HEPATIC IMPAIRMENT**
- With oral use Manufacturer advises avoid—limited information available.
- RENAL IMPAIRMENT**
- Dose adjustments** ► With oral use In severe impairment, reduce initial dose (e.g. 10 mg daily) and increase gradually up to 1 mg/kg daily as tolerated.
- MONITORING REQUIREMENTS**
- With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).
- PRESCRIBING AND DISPENSING INFORMATION** Isotretinoin is an isomer of tretinoin.

● **PATIENT AND CARER ADVICE**

- With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment. Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.
- With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

- MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

### ANTHELMINTICS

#### Ivermectin

17-May-2017

- **INDICATIONS AND DOSE**
  - Papulopustular rosacea**
    - ▶ TO THE SKIN
    - ▶ Adult: Apply daily for up to 4 months, the treatment course may be repeated; discontinue if no improvement after 3 months
- **INTERACTIONS** → Appendix 1: ivermectin
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Skin reactions
- **PREGNANCY** Manufacturer advises avoid—limited information but toxicity following *oral* use in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—limited information but present in milk following *oral* use.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply thinly to the face only, avoiding contact with eyes, lips and mucosa.
- **PATIENT AND CARER ADVICE** Wash hands immediately after use.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions**  
The *Scottish Medicines Consortium* has advised (December 2015) that ivermectin (*Soolantra*®) is accepted for restricted use within NHS Scotland for the treatment of moderate-to-severe inflammatory lesions of rosacea (papulopustular) where a topical treatment is considered appropriate.
  - All Wales Medicines Strategy Group (AWMSG) decisions**  
The *All Wales Medicines Strategy Group* has advised (April 2016) that ivermectin (*Soolantra*®) is recommended as an option for use within NHS Wales for the topical treatment of inflammatory lesions of rosacea (papulopustular) in adult patients.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Cream**

CAUTIONARY AND ADVISORY LABELS 28  
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, isopropyl palmitate, propylene glycol

    - ▶ **Soolantra** (Galderma (UK) Ltd)  
Ivermectin 10 mg per 1 gram Soolantra 10mg/g cream | 30 gram [PoM] £18.29 DT = £18.29

### SYMPATHOMIMETICS > ALPHA<sub>2</sub>-ADRENOCEPTOR AGONISTS

#### Brimonidine tartrate

12-Jul-2017

- **DRUG ACTION** Brimonidine, an alpha<sub>2</sub>-adrenoceptor agonist, is used to reduce erythema in rosacea by cutaneous vasoconstriction.
- **INDICATIONS AND DOSE**
  - Facial erythema in rosacea**
    - ▶ TO THE SKIN
    - ▶ Adult: Apply once daily until erythema subsides, apply thinly, divide dose over forehead, chin, nose, and cheeks, max. 1 g of gel per day
  - DOSE EQUIVALENCE AND CONVERSION**
    - ▶ 1 g of gel contains 5 mg of brimonidine tartrate (equivalent to 3.3 mg of brimonidine).

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: BRIMONIDINE GEL (MIRVASO®): RISK OF SYSTEMIC CARDIOVASCULAR EFFECTS (JUNE 2017)**

Systemic cardiovascular effects including bradycardia, hypotension, and dizziness have been reported after application of brimonidine gel. To minimise the possibility of systemic absorption, it is important to avoid application to irritated or damaged skin, including after laser therapy.

**MHRA/CHM ADVICE: BRIMONIDINE GEL (MIRVASO®): RISK OF EXACERBATION OF ROSACEA (NOVEMBER 2016)**

Symptom exacerbation has been reported very commonly in patients treated with brimonidine gel. Treatment should be initiated with a small amount of gel (less than the maximum dose) for at least 1 week, then increased gradually, based on tolerability and response. Patients should be counselled on the importance of not exceeding the maximum daily dose, and advised to stop treatment and seek medical advice if symptoms worsen during treatment.

- **CAUTIONS** Cerebral insufficiency · coronary insufficiency · depression · postural hypotension · Raynaud's syndrome · severe cardiovascular disease · thromboangitis obliterans
- **INTERACTIONS** → Appendix 1: brimonidine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Dizziness · dry mouth · flushing · headache · skin reactions
  - ▶ **Uncommon** Angioedema · eyelid oedema · feeling hot · nasal congestion · paraesthesia · peripheral coldness
  - ▶ **Rare or very rare** Bradycardia · hypotension
- **PREGNANCY** Manufacturer advises avoid—limited information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises use with caution.
- **DIRECTIONS FOR ADMINISTRATION** Avoid contact with eyes, mouth, and mucous membranes; avoid use on irritated or damaged skin or open wounds; apply other topical preparations (including cosmetics) only after brimonidine gel has dried on skin.
- **PATIENT AND CARER ADVICE** Patients should be advised on administration of gel.
  - Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (December 2014) that brimonidine (*Mirvaso*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe persistent facial erythema associated with rosacea in adult patients.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Gel

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol

► **Mirvaso** (Galderma (UK) Ltd)

**Brimonidine (as Brimonidine tartrate) 3 mg per 1 gram** Mirvaso 3mg/g gel | 30 gram [PoM] £33.69 DT = £33.69

**Other drugs used for Scalp and hair conditions** Coal tar, p. 1253 · Coal tar with lecithin, p. 1254 · Coal tar with salicylic acid and precipitated sulfur, p. 1255

## ANTISEPTICS AND DISINFECTANTS > UNDECENOATES

### Cetrimide with undecenoic acid

#### ● INDICATIONS AND DOSE

##### Scalp psoriasis | Seborrhoeic dermatitis | Dandruff

- TO THE SKIN
- Child: Apply 3 times a week for 1 week, then apply twice weekly
- Adult: Apply 3 times a week for 1 week, then apply twice weekly

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Shampoo

► **Ceanel** (Alliance Pharmaceuticals Ltd)

**Undecenoic acid 10 mg per 1 ml, Phenylethyl alcohol 75 mg per 1 ml, Cetrimide 100 mg per 1 ml** Ceanel Concentrate shampoo | 150 ml [P] £3.40 | 500 ml [P] £9.80

## ANTISEPTICS AND DISINFECTANTS > OTHER

### Benzalkonium chloride

#### ● INDICATIONS AND DOSE

##### Seborrhoeic scalp conditions associated with dandruff and scaling

- TO THE SKIN
- Child: Apply as required
- Adult: Apply as required

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Shampoo

► **Dermax** (Dermal Laboratories Ltd)

**Benzalkonium chloride 5 mg per 1 ml** Dermax Therapeutic 0.5% shampoo | 250 ml [P] £5.69 DT = £5.69

## VITAMINS AND TRACE ELEMENTS

### Selenium

#### ● INDICATIONS AND DOSE

##### Seborrhoeic dermatitis | Dandruff

- TO THE SKIN USING SHAMPOO
- Child 5-17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required
- Adult: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

##### Pityriasis versicolor

- TO THE SKIN USING SHAMPOO
- Adult: Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

- **UNLICENSED USE** The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

- **INTERACTIONS** → Appendix 1: selenium

- **PATIENT AND CARER ADVICE** Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

## 7 Scalp and hair conditions

### Scalp and hair conditions

#### Overview

*Dandruff* is considered to be a mild form of seborrhoeic dermatitis. Shampoos containing antimicrobial agents such as **pyrithione zinc** (which are widely available) and selenium below may have beneficial effects. Shampoos containing **tar** extracts may be useful and they are also used in *psoriasis*. Ketoconazole shampoo p. 1233 should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

**Corticosteroid** gels and lotions can also be used.

Shampoos containing coal tar with salicylic acid p. 1255 may also be useful. A cream or an ointment containing coal tar with salicylic acid is very helpful in Psoriasis p. 1239 that affects the scalp. Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

*Cradle cap* in infants may be treated with **coconut oil** or **olive oil** applications followed by shampooing.

#### Hirsutism

Hirsutism may result from hormonal disorders or as a side-effect of drugs such as minoxidil p. 1275, corticosteroids, anabolic steroids, androgens, danazol p. 742, and progestogens.

Weight loss can reduce hirsutism in obese women.

Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine p. 1275 an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirsutism in women.

Co-cyprindiol p. 1267 may be effective for moderately severe hirsutism. Metformin hydrochloride p. 692 is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.

#### Androgenetic alopecia

Finasteride p. 787 is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Shampoo

EXCIPIENTS: May contain Fragrances

- ▶ **Selsun** (Chatten (U.K.) Ltd)

Selenium sulfide 25 mg per 1 ml Selsun 2.5% shampoo | 50 ml [P] £1.61 DT = £1.61 | 100 ml [P] £2.15 DT = £2.15 | 150 ml [P] £3.06 DT = £3.06

## 7.1 Alopecia

**Other drugs used for Alopecia** Finasteride, p. 787

### VASODILATORS › VASODILATOR ANTIHYPERTENSIVES

#### Minoxidil

- **INDICATIONS AND DOSE**

**REGAINE® FOR MEN EXTRA STRENGTH FOAM**

#### Androgenetic alopecia

- ▶ TO THE SKIN

- ▶ Adult: Apply 0.5 capful twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 16 weeks

**REGAINE® FOR MEN EXTRA STRENGTH SOLUTION**

#### Androgenetic alopecia

- ▶ TO THE SKIN

- ▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

**REGAINE® FOR WOMEN REGULAR STRENGTH**

#### Androgenetic alopecia

- ▶ TO THE SKIN

- ▶ Adult: Apply 1 mL twice daily, to be applied to the affected areas of scalp; discontinue if no improvement after 1 year

- **CONTRA-INDICATIONS** Pheochromocytoma
- **CAUTIONS** Avoid contact with broken, infected, shaved, or inflamed skin · avoid contact with eyes · avoid contact with mouth · avoid contact with mucous membranes · avoid inhalation of spray mist · avoid occlusive dressings
- CAUTIONS, FURTHER INFORMATION** When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- **INTERACTIONS** → Appendix 1: minoxidil

#### ● **SIDE-EFFECTS**

- ▶ **Common or very common** Hair changes
- ▶ **Uncommon** Hypotension

**SIDE-EFFECTS, FURTHER INFORMATION** When used topically systemic effects unlikely; only about 1–2% absorbed (greater absorption may occur with use on inflamed skin).

- **PREGNANCY** Avoid—possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **PATIENT AND CARER ADVICE** Ensure hair and scalp dry before application. Patients and their carers should be advised to wash hands after application of liquid or foam.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Liquid

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Propylene glycol

- ▶ **Regaine** (McNeil Products Ltd, Johnson & Johnson Ltd)

**Minoxidil 20 mg per 1 ml** Regaine for Women Regular Strength 2% solution | 60 ml [GSL] £15.43

**Minoxidil 50 mg per 1 ml** Regaine for Men Extra Strength 5% scalp solution | 60 ml [GSL] £21.63 | 180 ml [GSL] £43.28

### Foam

CAUTIONARY AND ADVISORY LABELS 15

EXCIPIENTS: May contain Butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- ▶ **Regaine** (McNeil Products Ltd)

**Minoxidil 50 mg per 1 gram** Regaine for Men Extra Strength 5% scalp foam | 60 gram [GSL] £23.33 | 180 gram [GSL] £50.01

## 7.2 Hirsutism

**Other drugs used for Hirsutism** Co-cyprindiol, p. 1267

### ANTIPROTOZOALS

#### Eflornithine

08-Feb-2019

- **DRUG ACTION** An antiprotozoal drug that inhibits the enzyme ornithine decarboxylase in hair follicles.

- **INDICATIONS AND DOSE**

#### Adjunct to laser therapy for facial hirsutism in women

- ▶ TO THE SKIN

- ▶ Adult: Apply twice daily, to be applied thinly, discontinue use if no improvement after 4 months of treatment

- **SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · increased risk of infection · paraesthesia · skin reactions
- ▶ **Uncommon** Face oedema · flushing · hair changes · oral disorders · skin haemorrhage
- ▶ **Rare or very rare** Skin neoplasm
- **PREGNANCY** Toxicity in *animal* studies—manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **PATIENT AND CARER ADVICE** Medicines must be rubbed in thoroughly. Cosmetics may be applied over treated area 5 minutes after eflornithine, do not wash treated area for 4 hours after application.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) decisions

SMC No. 159/05

The *Scottish Medicines Consortium* has advised (September 2005) that eflornithine 11.5% cream (*Vaniqa*®) for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- ▶ **Vaniqa** (Almirall Ltd)

**Eflornithine (as Eflornithine monohydrate chloride) 115 mg per 1 gram** Vaniqa 11.5% cream | 60 gram [POM] £56.87 DT = £56.87

## 8 Skin cleansers, antiseptics and desloughing agents

### Skin cleansers, antiseptics and desloughing agents

#### Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 1277 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Hydrogen peroxide p. 1278, an oxidising agent, can be used in solutions of up to 6% for skin disinfection, such as cleansing and deodorising wounds and ulcers. Hydrogen peroxide is also available as a cream for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate below solution 1 in 10 000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

#### Desloughing agents

Alginate, hydrogel and hydrocolloid dressings are effective at wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised. Gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin sulfate p. 1230 or lanolin.

### ANTISEPTICS AND DISINFECTANTS

#### Potassium permanganate

##### ● INDICATIONS AND DOSE

**Cleansing and deodorising suppurating eczematous reactions and wounds**

▶ TO THE SKIN

▶ Adult: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

● **CAUTIONS** Irritant to mucous membranes

● **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

● **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

##### Tablet for cutaneous solution

▶ **Permitabs** (Alliance Pharmaceuticals Ltd)

**Potassium permanganate 400 mg** Permitabs 400mg tablets for cutaneous solution | 30 tablet £19.25 DT = £19.25

### ANTISEPTICS AND DISINFECTANTS > ALCOHOL DISINFECTANTS

#### Alcohol

##### (Industrial methylated spirit)

##### ● INDICATIONS AND DOSE

**Skin preparation before injection**

▶ TO THE SKIN

▶ Child: Apply as required

▶ Adult: Apply as required

● **CONTRA-INDICATIONS** Neonates

● **CAUTIONS** Avoid broken skin - flammable - patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

● **SIDE-EFFECTS**

**Overdose** Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

For details on the management of poisoning, see Alcohol, under **Emergency treatment of poisoning p. 1359**.

● **PRESCRIBING AND DISPENSING INFORMATION** Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

▶ **Alcohol (Non-proprietary)**

Industrial methylated spirit 70% | 600 ml £6.56-£7.01

### ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

#### Povidone-iodine

##### ● INDICATIONS AND DOSE

**Skin disinfection**

▶ TO THE SKIN

▶ Child: (consult product literature)

▶ Adult: (consult product literature)

**BETADINE® DRY POWDER SPRAY**

**Skin disinfection, particularly minor wounds and infections**

▶ TO THE SKIN

▶ Adult: Not for use in serous cavities (consult product literature)

**VIDENE® SOLUTION**

**Skin disinfection**

▶ TO THE SKIN

▶ Child: Apply undiluted in pre-operative skin disinfection and general antiseptics

▶ Adult: Apply undiluted in pre-operative skin disinfection and general antiseptics

**VIDENE® SURGICAL SCRUB®****Skin disinfection**

- ▶ TO THE SKIN
- ▶ Child: Use as a pre-operative scrub for hand and skin disinfection
- ▶ Adult: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE® TINCTURE****Skin disinfection**

- ▶ TO THE SKIN
- ▶ Adult: Apply undiluted in pre-operative skin disinfection

- **CONTRA-INDICATIONS** Avoid regular use in patients with thyroid disorders (in adults) · concomitant use of lithium · corrected gestational age under 32 weeks · infants body-weight under 1.5 kg · regular use in neonates
- **CAUTIONS** Broken skin · large open wounds
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Large open wounds The application of povidone–iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.
- **VIDENE® TINCTURE** Procedures involving hot wire cauterly and diathermy
- **SIDE-EFFECTS**
  - ▶ Rare or very rare Eye erythema · punctate keratitis
  - ▶ Frequency not known Cytotoxicity · eye discolouration
- **PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.
- **BREAST FEEDING** Avoid regular or excessive use.
- **RENAL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.
- **EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Spray**

- ▶ **Betadine** (Aspire Pharma Ltd)  
Povidone-iodine 25 mg per 1 gram Betadine 2.5% dry powder spray | 100 ml (GSL) £9.95 DT = £9.95

**Liquid**

CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)

- ▶ **Videne** (Ecolab Healthcare Division)  
Povidone-iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution | 500 ml (P) £7.97 DT = £7.97
- ▶ Povidone-iodine 100 mg per 1 ml Videne 10% antiseptic solution | 500 ml (GSL) £7.97 DT = £7.97

**ANTISEPTICS AND DISINFECTANTS > OTHER****Chlorhexidine**● **INDICATIONS AND DOSE****CEPTON® LOTION****For skin disinfection in acne**

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

## 8.1 Minor cuts and abrasions

### Minor cuts and abrasions

#### Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 1278 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony p. 1280) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

#### ANTISEPTICS AND DISINFECTANTS > OTHER

### Glycerol with magnesium sulfate and phenol

- **INDICATIONS AND DOSE**

**Treat carbuncles and boils**

- ▶ TO THE SKIN

▶ Adult: To be applied under dressing

- **DIRECTIONS FOR ADMINISTRATION** Paste should be stirred before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Paste

- ▶ **Glycerol with magnesium sulfate and phenol (Non-proprietary)**

Phenol 5 mg per 1 gram, Magnesium sulfate dried 450 mg per 1 gram, Glycerol 550 mg per 1 gram Magnesium sulfate paste | 25 gram [GSL] £0.76-£1.24 | 50 gram [GSL] £0.91-£2.48 DT = £2.48

## DERMATOLOGICAL DRUGS &gt; COLLODIONS

## Castor oil with collodion and colophony

## ● INDICATIONS AND DOSE

Used to seal minor cuts and wounds that have partially healed

## ▶ TO THE SKIN

- ▶ Child: (consult product literature)
- ▶ Adult: (consult product literature)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Form unstated**

## ▶ Castor oil with collodion and colophony (Non-proprietary)

Castor oil 25 mg per 1 ml, Colophony 25 mg per 1 ml, Collodion methylated 950 microlitre per 1 ml Flexible collodion methylated  
| 100 ml £13.81-£14.09 | 500 ml £29.47

## 9 Skin disfigurement

## Camouflagers

## Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

**Borderline substances**

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

## Camouflages

## ● CAMOUFLAGES

## 10 Sun protection and photodamage

## Sunscreen

## Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as *polymorphic light eruption*, *solar urticaria*, and it provokes the various *cutaneous porphyrias*. It also provokes (or at least aggravates) skin lesions of *rosacea erythematosus* and may aggravate *acne* and some other *dermatoses*. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as *sunburn*) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include *ageing changes* and more importantly the initiation of *skin cancer*.

Solar ultraviolet radiation is approximately 200–400 nm in wavelength. The medium wavelengths (290–320 nm, known as UVB) cause *sunburn*. The long wavelengths (320–400 nm, known as UVA) are responsible for many *photosensitivity reactions* and *photodermatoses*. Both UVA and UVB contribute to long-term *photodamage* and to the changes responsible for *skin cancer* and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of

protection offered against UVB; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UVB for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification. Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Sunscreen preparations may rarely cause allergic reactions.

For optimum photoprotection, sunscreen preparations should be applied **thickly** and **frequently** (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

Ingredient nomenclature in sunscreen preparations	
rINN	INCI
amiloxate	isoamyl <i>p</i> -methoxycinnamate
avobenzene	butyl methoxydibenzoylmethane
bemotrizinol	bis-ethylhexyloxyphenol methoxyphenyl triazine
bisocotrizole	methylene bis-benzotriazolyl tetramethylbutylphenol
ecamsule	terephthalylidene dicamphor sulfonic acid
ensulizole	phenylbenzimidazole sulfonic acid
enzacamene	4-methylbenzylidene camphor
octinoxate	octyl (or ethylhexyl) methoxycinnamate
octocrylene	octocrylene
oxybenzone	benzophenone-3

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNF

### Borderline substances

*Anthelios*® XL SPF 50+ Melt-in cream; *Sunsense*® Ultra; *Uvistat*® Lipscreen SPF 50; and *Uvistat*® Suncream SPF 30 and 50 (see *Borderline substances*) are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity. Preparations with SPF less than 30 should not normally be prescribed

## Photodamage

### Overview

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments can be used for actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac sodium gel below is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream p. 1282 is effective against most types of non-hypertrophic actinic keratosis; a solution containing fluorouracil with salicylic acid p. 1282 is available for the treatment of low or moderately thick hyperkeratotic actinic keratosis. Imiquimod p. 1285 is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac sodium but lesions resolve faster. A short course of ingenol mebutate p. 1282 is licensed for the treatment of non-hypertrophic actinic keratosis; response to treatment can usually be assessed 8 weeks after the course. Photodynamic therapy in combination with methyl-5-aminolevulinic acid (Metvix®; available from Galderma) or 5-aminolaevulinic acid gel (Ameluz®, available from Spirit Healthcare) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinic acid is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

## ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

### Diclofenac sodium

22-Sep-2016

#### ● INDICATIONS AND DOSE

##### SOLARAZE®

#### Actinic keratosis

##### ▶ TO THE SKIN

- ▶ Adult: Apply twice daily for 60–90 days, to be applied thinly; maximum 8 g per day

- **CAUTIONS** Avoid contact with eyes · avoid contact with inflamed or broken skin · avoid contact with mucous membranes · not for use with occlusive dressings · topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported)

- **INTERACTIONS** → Appendix 1: NSAIDS

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis · muscle tone increased · oedema · rash (discontinue) · sensation abnormal · skin reactions · skin ulcer
- ▶ **Uncommon** Abdominal pain · alopecia · diarrhoea · eye pain · haemorrhage · lacrimation disorder · nausea · seborrhoea
- ▶ **Rare or very rare** Acute kidney injury · asthma · hypersensitivity · photosensitivity reaction · rash pustular
- ▶ **Frequency not known** Hair colour changes

**SIDE-EFFECTS, FURTHER INFORMATION** Topical application of large amounts of diclofenac can result in systemic effects.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Patient packs for topical preparations carry a warning to avoid during pregnancy.
- **BREAST FEEDING** Patient packs for topical preparations carry a warning to avoid during breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** For topical preparations, apply with gentle massage only.
- **PATIENT AND CARER ADVICE** For topical preparations, patients and their carers should be advised to wash hands immediately after use.  
Photosensitivity Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Benzyl alcohol, fragrances, propylene glycol

▶ **Solaraze** (Almirall Ltd)

**Diclofenac sodium 30 mg per 1 gram** Solaraze 3% gel | 50 gram [PoM] £38.30 DT = £38.30 | 100 gram [PoM] £76.60

**ANTINEOPLASTIC DRUGS > ANTIMETABOLITES****Fluorouracil**

22-May-2019

**• INDICATIONS AND DOSE****Superficial malignant and pre-malignant skin lesions**▶ **TO THE SKIN USING CREAM**

- ▶ **Adult:** Apply 1–2 times a day for 3–4 weeks (usual duration of initial therapy), apply thinly to the affected area, maximum area of skin 500 cm<sup>2</sup> (e.g. 23 cm × 23 cm) treated at one time, alternative regimens may be used in some settings

- **CAUTIONS** Avoid contact with eyes and mucous membranes · dihydropyrimidine dehydrogenase deficiency · do not apply to bleeding lesions

- **INTERACTIONS** → Appendix 1: fluorouracil

**• SIDE-EFFECTS**

- ▶ **Common or very common** Alopecia · diarrhoea · mucositis · nausea · neutropenia · skin reactions · stomatitis · thrombocytopenia · vomiting

- ▶ **Uncommon** Dizziness · headache

- ▶ **Rare or very rare** Abdominal pain · chills · diarrhoea haemorrhagic · fever · leucocytosis · pancytopenia · skin irritation (use a topical corticosteroid for severe discomfort associated with inflammatory reactions) · skin ulcer

- ▶ **Frequency not known** Conjunctival irritation · excessive tearing · keratitis · taste altered

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 888.

- **PREGNANCY** Manufacturers advise avoid (teratogenic).

- **BREAST FEEDING** Manufacturers advise avoid.

- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol

▶ **Efudix** (Meda Pharmaceuticals Ltd)

**Fluorouracil 50 mg per 1 gram** Efudix 5% cream | 40 gram [PoM] £32.90 DT = £32.90

**Fluorouracil with salicylic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluorouracil above, salicylic acid p. 1286.

**• INDICATIONS AND DOSE****Low or moderately thick hyperkeratotic actinic keratosis**▶ **TO THE SKIN**

- ▶ **Adult:** Apply once daily for up to 12 weeks, reduced to 3 times a week if severe side effects occur and until side-effects improve, to be applied to the affected area, if treating area with thin epidermis, reduce frequency of application and monitor response more often; maximum area of skin treated at one time, 25 cm<sup>2</sup> (e.g. 5 cm × 5 cm)

- **INTERACTIONS** → Appendix 1: fluorouracil

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Cutaneous solution**

CAUTIONARY AND ADVISORY LABELS 15

▶ **Actikerall** (Almirall Ltd)

**Fluorouracil 5 mg/g, Salicylic acid 100 mg/g** Actikerall 5mg/g / 100mg/g cutaneous solution | 25 ml [PoM] £38.30 DT = £38.30

**PROTEIN KINASE C ACTIVATORS****Ingenol mebutate****• INDICATIONS AND DOSE****Actinic keratosis on face and scalp**▶ **TO THE SKIN**

- ▶ **Adult:** Apply once daily for 3 days, use the 150 microgram/g gel

**Actinic keratosis on trunk and extremities**▶ **TO THE SKIN**

- ▶ **Adult:** Apply once daily for 2 days, use the 500 microgram/g gel

- **CAUTIONS** Avoid contact with broken skin · avoid contact with eyes · avoid contact with inside of ears · avoid contact with inside of nostrils · avoid contact with lips · avoid occlusive dressings on treated area

**• SIDE-EFFECTS**

- ▶ **Common or very common** Headache · infection · local reaction · oedema · pain · skin reactions

- ▶ **Uncommon** Paraesthesia · skin ulcer

- **PREGNANCY** Not absorbed from skin, but manufacturer advises avoid.

- **BREAST FEEDING** Not absorbed from skin; ensure infant does not come in contact with treated area for 6 hours after application.

- **DIRECTIONS FOR ADMINISTRATION** One tube covers skin area of 25 cm<sup>2</sup>. Allow gel to dry on treatment area for 15 minutes. Avoid washing or touching the treated area for 6 hours after application; after this time, area may be washed with mild soap and water. Avoid use immediately after shower or less than 2 hours before bedtime.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Gel**

CAUTIONARY AND ADVISORY LABELS 15

▶ **Picato** (LEO Pharma)

**Ingenol mebutate 150 microgram per 1 gram** Picato 150micrograms/g gel | 1.41 gram [PoM] £65.00 DT = £65.00

**Ingenol mebutate 500 microgram per 1 gram** Picato 500micrograms/g gel | 0.94 gram [PoM] £65.00 DT = £65.00

## 11 Superficial soft-tissue injuries and superficial thrombophlebitis

### Topical circulatory preparations

#### Overview

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

#### HEPARINOIDS

### Heparinoid

#### ● INDICATIONS AND DOSE

**Superficial thrombophlebitis | Bruising | Haematoma**

▶ TO THE SKIN

▶ Adult: Apply up to 4 times a day

● **CONTRA-INDICATIONS** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

● **LESS SUITABLE FOR PRESCRIBING** Hirudoid<sup>®</sup> is less suitable for prescribing.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

▶ **Hirudoid** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% cream | 50 gram P  
£3.99 DT = £3.99

#### Gel

EXCIPIENTS: May contain Fragrances, propylene glycol

▶ **Hirudoid** (Genus Pharmaceuticals Ltd)

Heparinoid 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram P £3.99  
DT = £3.99

## 12 Warts and calluses

### Warts and calluses

#### Overview

Warts (verrucae) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid p. 1286, formaldehyde p. 1284, glutaraldehyde p. 1284 or silver nitrate p. 1285 are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line; it is also suitable for the removal of *corns and calluses*. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

#### Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted infections. Podophyllotoxin p. 1284 (the major active ingredient of podophyllum) may be used for *soft, non-keratinised* external anogenital warts. Patients with a limited number of external warts or *keratinised* lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream p. 1285 is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis. Camellia sinensis ointment below is licensed for the treatment of external anogenital warts.

Inosine pranobex p. 633 is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.

#### ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

### Camellia sinensis

03-May-2017

● **DRUG ACTION** Camellia sinensis is an extract from green tea leaves. The exact mechanism of action is not known; non-clinical studies have shown inhibition of the growth of activated keratinocytes, and anti-oxidative effects at the site of application.

#### ● INDICATIONS AND DOSE

**Warts (external genital and perianal) in immunocompetent patients**

▶ TO THE LESION

▶ Adult: Apply up to 250 mg 3 times a day until complete clearance of warts (maximum 16 weeks), do not exceed treatment period even if new warts develop; maximum 750 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

▶ 250 mg is equivalent to 0.5 cm of ointment.

● **CAUTIONS** Avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with mouth · avoid contact with nostrils · avoid inflamed skin · uncircumcised males (risk of phimosis) · vulvar region

#### ● SIDE-EFFECTS

▶ **Uncommon** Balanoposthitis · increased risk of infection · lymphatic abnormalities · necrosis · painful sexual intercourse · phimosis · skin reactions · urinary disorders

▶ **Frequency not known** Urinary tract stenosis · vaginal discharge

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises *Catephen*<sup>®</sup> may weaken condoms and vaginal diaphragms—alternative methods of contraception should be considered.

● **PREGNANCY** Manufacturer advises avoid—toxicity in *animal studies*.

● **BREAST FEEDING** Manufacturer advises risk to infant cannot be excluded—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (limited information available).

● **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises apply to each wart, ensuring a thin layer is left on the wart. It is not necessary to wash off the ointment from the area before next application.

● **PATIENT AND CARER ADVICE** Manufacturer advises the ointment should be washed off before sexual activity. Manufacturer advises female patients using tampons should insert tampon before applying the ointment.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) decisions

The *Scottish Medicines Consortium* has advised (April 2016) that camellia sinensis (green tea) leaf extract (*Catephen*<sup>®</sup>)

is accepted for restricted use within NHS Scotland for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

#### All Wales Medicines Strategy Group (AWMSG) decisions

The *All Wales Medicines Strategy Group* has advised (October 2016) that green tea leaf extract (*camellia sinensis*), (*Catephen*<sup>®</sup>), is recommended for restricted use within NHS Wales for the treatment of external genital and perianal warts in patients not suitable for podophyllotoxin or who have not responded to treatment with podophyllotoxin.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

- ▶ **Catephen** (KoRa Healthcare)  
Camellia sinensis extract 100 mg per 1 gram Catephen 10% ointment | 15 gram [POM] £39.00

## Podophyllotoxin

### ● INDICATIONS AND DOSE

#### CONDYLIN<sup>®</sup>

#### Condylomata acuminata affecting the penis or the female external genitalia

##### ▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm<sup>2</sup> in the male, maximum 50 single applications ('loops') per session (consult product literature)

#### WARTICON<sup>®</sup> CREAM

#### Condylomata acuminata affecting the penis or the female external genitalia

##### ▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm<sup>2</sup>

#### WARTICON<sup>®</sup> LIQUID

#### Condylomata acuminata affecting the penis or the female external genitalia

##### ▶ TO THE LESION

- ▶ Adult: Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm<sup>2</sup>, maximum 50 single applications ('loops') per session (consult product literature)

- **CAUTIONS** Avoid normal skin · avoid open wounds · keep away from face · very irritant to eyes
- **SIDE-EFFECTS** Balanoposthitis · skin irritation
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), sorbic acid

- ▶ **Warticon** (Phoenix Labs Ltd)  
Podophyllotoxin 1.5 mg per 1 gram Warticon 0.15% cream | 5 gram [POM] £17.83 DT = £17.83

#### Liquid

- ▶ **Warticon** (Phoenix Labs Ltd)  
Podophyllotoxin 5 mg per 1 ml Warticon 0.5% solution | 3 ml [POM] £14.86 DT = £14.86

## ANTISEPTICS AND DISINFECTANTS > ALDEHYDES AND DERIVATIVES

### Formaldehyde

#### ● INDICATIONS AND DOSE

#### Warts, particularly plantar warts

- ▶ TO THE LESION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

#### ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · protect surrounding skin and avoid broken skin · significant peripheral neuropathy

- **SIDE-EFFECTS** Asthma · cough · dysphagia · eye irritation · increased risk of infection · laryngospasm · skin reactions

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

#### Liquid

- ▶ **Formaldehyde (Non-proprietary)**  
Formaldehyde 40 mg per 1 ml Formaldehyde (Buffered) 4% solution | 1000 ml £3.90 DT = £3.90  
Formaldehyde 350 mg per 1 gram Formaldehyde solution | 500 ml £7.24 DT = £7.24 | 2000 ml £18.72

### Glutaraldehyde

#### ● INDICATIONS AND DOSE

#### Warts, particularly plantar warts

- ▶ TO THE LESION
- ▶ Child: Apply twice daily
- ▶ Adult: Apply twice daily

#### ● UNLICENSED USE

- ▶ In children Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Not for application to anogenital areas · not for application to face · not for application to mucosa · protect surrounding skin

#### ● SIDE-EFFECTS

- ▶ Rare or very rare Severe cutaneous adverse reactions (SCARs)
- ▶ Frequency not known Rash · skin irritation (discontinue if severe)

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Paint

- ▶ **Glutarol** (Dermal Laboratories Ltd)  
Glutaraldehyde 100 mg per 1 ml Glutarol 10% cutaneous solution | 10 ml [P] £2.07 DT = £2.07

## ANTISEPTICS AND DISINFECTANTS &gt; OTHER

## Silver nitrate

## ● INDICATIONS AND DOSE

**Common warts**

- ▶ TO THE LESION
- ▶ Child: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- ▶ Adult: Apply every 24 hours for up to 3 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

**Verrucas**

- ▶ TO THE LESION
- ▶ Child: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- ▶ Adult: Apply every 24 hours for up to 6 applications, apply moistened caustic pencil tip for 1–2 minutes. Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application

**Umbilical granulomas**

- ▶ TO THE SKIN
- ▶ Child: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin
- ▶ Adult: Apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes, protect surrounding skin with soft paraffin

## ● UNLICENSED USE

- ▶ In children No age range specified by manufacturer.
- ▶ **CAUTIONS** Avoid broken skin · not suitable for application to ano-genital region · not suitable for application to face · not suitable for application to large areas · protect surrounding skin
- ▶ **SIDE-EFFECTS**
- ▶ **Rare or very rare** Argyria · methaemoglobinemia
- ▶ **PATIENT AND CARER ADVICE** Patients should be advised that silver nitrate may stain fabric.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Stick**

- ▶ **Avoca** (Bray Group Ltd)  
Silver nitrate **400 mg per 1 gram** Avoca 40% silver nitrate pencils | 1 applicator [P] £1.13 DT = £1.13

## ANTIVIRALS &gt; IMMUNE RESPONSE MODIFIERS

## Imiquimod

## ● INDICATIONS AND DOSE

## ALDARA®

**Warts (external genital and perianal)**

- ▶ TO THE LESION
- ▶ Adult: Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

**Superficial basal cell carcinoma**

- ▶ TO THE LESION
- ▶ Adult: Apply daily for 5 nights of each week for 6 weeks, to be applied to lesion and 1 cm beyond it, assess response 12 weeks after completing treatment

**Actinic keratosis**

- ▶ TO THE LESION
- ▶ Adult: Apply 3 times a week for 4 weeks, to be applied to lesion at night, assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist, maximum 2 courses

## ZYCLARA®

**Actinic keratosis**

- ▶ TO THE SKIN
- ▶ Adult: Apply once daily for 2 weeks, to be applied at bedtime to lesion on face or balding scalp, repeat course after a 2-week treatment-free interval, assess response 8 weeks after second course; maximum 2 sachets per day

- **CAUTIONS** Autoimmune disease · avoid broken skin · avoid contact with eyes · avoid contact with lips · avoid contact with nostrils · avoid open wounds · immunosuppressed patients · not suitable for internal genital warts · uncircumcised males (risk of phimosis or stricture of foreskin)

● **SIDE-EFFECTS**

- ▶ **Common or very common** Appetite decreased · arthralgia · asthenia · headaches · increased risk of infection · lymphadenopathy · myalgia · nausea · pain
- ▶ **Uncommon** Anorectal disorder · chills · conjunctival irritation · depression · diarrhoea · dizziness · drowsiness · dry mouth · dysuria · erectile dysfunction · eyelid oedema · face oedema · fever · flushing · gastrointestinal discomfort · genital pain · hyperhidrosis · inflammation · influenza like illness · insomnia · irritability · laryngeal pain · malaise · nasal congestion · painful sexual intercourse · paraesthesia · penis disorder · skin reactions · skin ulcer · tinnitus · uterovaginal prolapse · vomiting · vulvovaginal disorders
- ▶ **Rare or very rare** Autoimmune disorder exacerbated
- ▶ **Frequency not known** Alopecia · cutaneous lupus erythematosus · severe cutaneous adverse reactions (SCARs)

- **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.

- **PREGNANCY** No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

- **BREAST FEEDING** No information available.

● **DIRECTIONS FOR ADMINISTRATION**

- ▶ **ZYCLARA®** ▶ **Important** Should be rubbed in and allowed to stay on the treated area for 8 hours, then washed off with mild soap and water.

- ▶ **ALDARA®** ▶ **Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

- **PATIENT AND CARER ADVICE** A patient information leaflet should be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cream

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates

- ▶ **Aldara** (Meda Pharmaceuticals Ltd)

**Imiquimod 50 mg per 1 gram** Aldara 5% cream 250mg sachets | 12 sachet [PoM] £48.60 DT = £48.60

- ▶ **Zyclara** (Meda Pharmaceuticals Ltd)

**Imiquimod 37.5 mg per 1 gram** Zyclara 3.75% cream 250mg sachets | 28 sachet [PoM] £54.75 DT = £54.75

## SALICYLIC ACID AND DERIVATIVES

### Salicylic acid

#### ● INDICATIONS AND DOSE

##### OCCLUSAL<sup>®</sup>

#### Common and plantar warts

##### ▶ TO THE LESION

- ▶ Child: Apply daily, treatment may need to be continued for up to 3 months
- ▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

##### VERRUGON<sup>®</sup>

#### For plantar warts

##### ▶ TO THE LESION

- ▶ Child: Apply daily, treatment may need to be continued for up to 3 months
- ▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

#### ● UNLICENSED USE

- ▶ In children Not licensed for use in children under 2 years.
- **CAUTIONS** Avoid broken skin · impaired peripheral circulation · not suitable for application to anogenital region · not suitable for application to face · not suitable for application to large areas · patients with diabetes at risk of neuropathic ulcers · significant peripheral neuropathy
- **SIDE-EFFECTS** Skin irritation
- **PATIENT AND CARER ADVICE** Advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Ointment

- ▶ **Verrugon** (Optima Consumer Health Ltd)

**Salicylic acid 500 mg per 1 gram** Verrugon complete 50% ointment | 6 gram [P] £4.44 DT = £4.44

#### Liquid

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Occlusal** (Alliance Pharmaceuticals Ltd)

**Salicylic acid 260 mg per 1 ml** Occlusal 26% solution | 10 ml [P] £3.56 DT = £3.56

## Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid above.

#### ● INDICATIONS AND DOSE

##### CUPLEX<sup>®</sup>

#### Plantar and mosaic warts | Corns | Calluses

##### ▶ TO THE LESION

- ▶ Adult: Apply once daily, treatment may need to be continued for up to 3 months

##### DUOFILM<sup>®</sup>

#### Plantar and mosaic warts

##### ▶ TO THE LESION

- ▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

##### SALACTOL<sup>®</sup>

#### Warts, particularly plantar warts | Verrucas | Corns | Calluses

##### ▶ TO THE LESION

- ▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

##### SALATAC<sup>®</sup>

#### Warts | Verrucas | Corns | Calluses

##### ▶ TO THE LESION

- ▶ Adult: Apply daily, treatment may need to be continued for up to 3 months

#### ● PRESCRIBING AND DISPENSING INFORMATION

Preparations of salicylic acid in a colloid basis (*Cuplex<sup>®</sup>* and *Salactol<sup>®</sup>*) are available but some patients may develop an allergy to colophony in the formulation.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Paint

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Duofilm** (GlaxoSmithKline UK Ltd)

**Lactic acid 150 mg per 1 gram, Salicylic acid 167 mg per 1 gram** Duofilm paint | 15 ml [P] £2.25 DT = £2.25

- ▶ **Salactol** (Dermal Laboratories Ltd)

**Lactic acid 167 mg per 1 gram, Salicylic acid 167 mg per 1 gram** Salactol paint | 10 ml [P] £1.71 DT = £1.71

#### Gel

CAUTIONARY AND ADVISORY LABELS 15

- ▶ **Salatac** (Dermal Laboratories Ltd)

**Lactic acid 40 mg per 1 gram, Salicylic acid 120 mg per 1 gram** Salatac gel | 8 gram [P] £2.98 DT = £2.98

## 1 Immunoglobulin therapy

### IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

#### Immunoglobulins

04-Oct-2017

##### Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 1290 and **disease-specific immunoglobulins**.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult [www.ivig.nhs.uk](http://www.ivig.nhs.uk) and *Clinical Guidelines for Immunoglobulin Use*, [www.gov.uk/dh](http://www.gov.uk/dh).

Further information on the use of immunoglobulins is included in Public Health England's *Immunoglobulin Handbook*, [www.gov.uk/phe](http://www.gov.uk/phe), and in the Department of Health's publication, *Immunisation against Infectious Disease*, [www.gov.uk/dh](http://www.gov.uk/dh).

##### Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

**Disease-specific immunoglobulins** are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 1292 which is available from

BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 1292 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 1290 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the *Scottish National Blood Transfusion Service (SNBTS)*.

In Wales all immunoglobulins are available from the *Welsh Blood Service (WBS)*.

In Northern Ireland all immunoglobulins are available from the *Northern Ireland Blood Transfusion Service (NIBTS)*.

##### Normal immunoglobulin

Human normal immunoglobulin ('HNIG') is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

##### Uses

Normal immunoglobulin (containing 10%–18% protein) is administered by *intramuscular injection* for the protection of susceptible contacts against **hepatitis A virus** (infectious hepatitis), **measles** and, to a lesser extent, **rubella**. Injection of immunoglobulin produces immediate protection lasting several weeks.

Normal immunoglobulin (containing 3%–12% protein) for *intravenous administration* is used as *replacement therapy* for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for certain conditions, consult *Clinical Guidelines for Immunoglobulin Use* ([www.gov.uk/dh](http://www.gov.uk/dh)).

##### Hepatitis A

Hepatitis A vaccine p. 1318 is recommended for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for prophylaxis in travellers.

Public Health England recommends the use of normal immunoglobulin in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases

of hepatitis A) who are 60 years of age or over, have chronic liver disease (including chronic hepatitis B or C infection), or HIV infection (with a CD4 count < 200 cells per microlitre), or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts with chronic liver disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

### Measles

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Patients with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 1323 for prophylaxis following exposure to measles.

### Rubella

Intramuscular immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 1323.

### Disease-specific immunoglobulins

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see *Immunoglobulin Handbook* ([www.gov.uk/phe](http://www.gov.uk/phe)).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin p. 1290 is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as post-exposure prophylaxis.

### Hepatitis B immunoglobulin

Disease-specific hepatitis B immunoglobulin p. 1290 ('HBIG') is available for use in association with hepatitis B vaccine p. 1319 for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers. Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and subcutaneous preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

### Rabies immunoglobulin

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 1292 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination).

Rabies vaccine p. 1324 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

### Tetanus immunoglobulin

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 1292 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 542 and wound cleansing, should also be used for the treatment of established cases of tetanus.

### Varicella-zoster immunoglobulin

Varicella-zoster immunoglobulin p. 1292 (VZIG) is recommended for individuals who are at increased risk of severe varicella (neonates, pregnant women and immunosuppressed individuals with varicella-zoster virus immunoglobulin G antibody less than 150 mIU/mL) and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox (varicella) or shingles (herpes zoster) during the infectious period.

Immunosuppressed patients receiving regular intravenous immunoglobulin replacement therapy only require varicella-zoster immunoglobulin if the most recent dose was administered more than 3 weeks before exposure.

Immunosuppressed patients on long term aciclovir p. 633 or valaciclovir p. 636 prophylaxis will require a temporary increase in their dose following exposure; for patients within 12 months of a stem cell transplant, varicella-zoster immunoglobulin should also be considered.

**Important:** for full details consult *Guidance for issuing varicella-zoster immunoglobulin (VZIG) and Immunisation against infectious disease* from Public Health England ([www.gov.uk](http://www.gov.uk)).

### Anti-D (Rh<sub>0</sub>) immunoglobulin

Anti-D (Rh<sub>0</sub>) immunoglobulin p. 1289 is prepared from plasma taken from rhesus-negative donors who have been immunised against the anti-D-antigen. Anti-D (Rh<sub>0</sub>) immunoglobulin is used to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D (Rh<sub>0</sub>) immunoglobulin should be administered to the mother following any sensitising episode (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. Anti-D (Rh<sub>0</sub>) immunoglobulin is also given when significant fetomaternal haemorrhage occurs in rhesus-negative women during delivery. The dose of anti-D (Rh<sub>0</sub>) immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

Use of routine *antenatal* anti-D prophylaxis should be given irrespective of previous anti-D prophylaxis for a

sensitising event early in the same pregnancy. Similarly, *postpartum* anti-D prophylaxis should be given irrespective of previous routine antenatal anti-D prophylaxis or antenatal anti-D prophylaxis for a sensitising event in the same pregnancy.

Anti-D (Rh<sub>0</sub>) immunoglobulin is also given to women of child-bearing potential after the inadvertent transfusion of rhesus-incompatible blood components and is used for the treatment of idiopathic thrombocytopenia purpura.

#### MMR vaccine

Measles, mumps and rubella vaccine, live may be given in the postpartum period with anti-D (Rh<sub>0</sub>) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

## Anti-D (Rh<sub>0</sub>) immunoglobulin

### ● INDICATIONS AND DOSE

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 mL fetal red cells, extra 100–125 units per mL fetal red cells, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks' gestation

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 500 units, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following Rh<sub>0</sub>(D) incompatible blood transfusion

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

#### RHOPHYLAC®

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following birth of rhesus-positive infant

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks' gestation

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, antenatal prophylaxis

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

#### To rhesus-negative woman for prevention of Rh<sub>0</sub>(D) sensitisation, following Rh<sub>0</sub>(D) incompatible blood transfusion

- ▶ BY INTRAVENOUS INJECTION
- ▶ Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- **CONTRA-INDICATIONS** Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients · treatment of idiopathic thrombocytopenia purpura in splenectomised patients
- **CAUTIONS** Immunoglobulin A deficiency · possible interference with live virus vaccines
- CAUTIONS, FURTHER INFORMATION**
  - ▶ MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh<sub>0</sub>) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.
- **INTERACTIONS** → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
  - ▶ **Uncommon** Chills · fever · headache · malaise · skin reactions
  - ▶ **Rare or very rare** Arthralgia · dyspnoea · hypersensitivity · hypotension · nausea · tachycardia · vomiting
  - ▶ **Frequency not known** Intravascular haemolysis

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE decisions**

- ▶ **Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156**  
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.  
[www.nice.org.uk/TA156](http://www.nice.org.uk/TA156)

**Anti-D (RHO) immunoglobulin 500 unit** D-Gam Anti-D immunoglobulin 500unit solution for injection vials | 1 vial [PoM](#) £38.25  
**Anti-D (RHO) immunoglobulin 1500 unit** D-Gam Anti-D immunoglobulin 1,500unit solution for injection vials | 1 vial [PoM](#) £58.00
    - ▶ **Rhopylac** (CSL Behring UK Ltd)  
**Anti-D (RHO) immunoglobulin 750 unit per 1 ml** Rhopylac 1,500units/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM](#) £46.50

## Hepatitis B immunoglobulin

- **INDICATIONS AND DOSE**

- **Prophylaxis against hepatitis B infection**

- ▶ **BY INTRAMUSCULAR INJECTION**
    - ▶ **Adult:** 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure

- **Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material**

- ▶ **BY INTRAVENOUS INFUSION**
    - ▶ **Adult:** Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature)

- **Prevention of hepatitis B in haemodialysed patients**

- ▶ **BY INTRAVENOUS INFUSION**
    - ▶ **Adult:** (consult product literature)

- **Prophylaxis against re-infection of transplanted liver**

- ▶ **BY INTRAVENOUS INFUSION**
    - ▶ **Adult:** (consult product literature)

- **Prevention of hepatitis B re-infection more than 6 months after liver transplantation in stable HBV-DNA negative patients**

- ▶ **BY SUBCUTANEOUS INJECTION**
    - ▶ **Adult** (body-weight up to 75 kg): 500 units once weekly, increased if necessary up to 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin
    - ▶ **Adult** (body-weight 75 kg and above): 1000 units once weekly, dose to be started 2–3 weeks after last dose of intravenous hepatitis B immunoglobulin

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **INTERACTIONS** → Appendix 1: immunoglobulins
- **SIDE-EFFECTS**
- ▶ **Uncommon** Abdominal pain upper · headache

- ▶ **Rare or very rare** Cardiac discomfort · fatigue · hypersensitivity · hypertension · hypotension · muscle spasms · nasopharyngitis · oropharyngeal pain · palpitations · skin reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**

- ▶ **Hepatitis B immunoglobulin (Non-proprietary)**

- ▶ **Hepatitis B immunoglobulin human 200 unit** Hepatitis B immunoglobulin human 200unit solution for injection vials | 1 vial [PoM](#) £200.00
      - ▶ **Hepatitis B immunoglobulin human 500 unit** Hepatitis B immunoglobulin human 500unit solution for injection vials | 1 vial [PoM](#) £400.00
      - ▶ **Zuctetra** (Biotest (UK) Ltd)

## Normal immunoglobulin

06-Sep-2017

- **INDICATIONS AND DOSE**

- **To control outbreaks of hepatitis A**

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
    - ▶ **Adult:** 500 mg

- **Rubella in pregnancy, prevention of clinical attack**

- ▶ **BY DEEP INTRAMUSCULAR INJECTION**
    - ▶ **Females of childbearing potential:** 750 mg

- **Antibody deficiency syndromes**

- ▶ **BY SUBCUTANEOUS INFUSION**
    - ▶ **Adult:** (consult product literature)

- **SUBGAM<sup>®</sup>**

- **Hepatitis A prophylaxis in outbreaks**

- ▶ **BY INTRAMUSCULAR INJECTION**
      - ▶ **Adult:** 750 mg

- **UNLICENSED USE**

**SUBGAM<sup>®</sup>** *Subgam<sup>®</sup>* is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

- **CONTRA-INDICATIONS** Patients with selective IgA deficiency who have known antibody against IgA

**PRIVIGEN**® Hyperprolinaemia (contains L-proline)

**FLEBOGAMMA**® DIF Hereditary fructose intolerance (contains sorbitol)

**HIZENTRA**® Hyperprolinaemia (contains L-proline)

**GAMMAPLEX**® Hereditary fructose intolerance (contains sorbitol)

- **CAUTIONS** Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines

**CAUTIONS, FURTHER INFORMATION**

- ▶ Interference with live virus vaccines Normal immunoglobulin may **interfere with the immune response to live virus vaccines** which should therefore only be given at **least 3 weeks before or 3 months after** an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**OCTAGAM**® Falsely elevated results with blood glucose testing systems (contains maltose)

- **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS**

▶ **Common or very common**

- ▶ With intramuscular use Chills
- ▶ With subcutaneous use Diarrhoea · dizziness · drowsiness · fatigue · gastrointestinal discomfort · headaches · hypotension · local reaction · myalgia · nausea · pain · skin reactions

▶ **Uncommon**

- ▶ With intramuscular use Dizziness · fatigue · feeling hot · headache · nausea · pain · skin reactions

- ▶ With subcutaneous use Paraesthesia

▶ **Rare or very rare**

- ▶ With intramuscular use Abdominal pain · arthralgia · musculoskeletal stiffness · myalgia · peripheral coldness · tremor

▶ **Frequency not known**

- ▶ With intramuscular use Chest discomfort · dyspnoea · facial swelling · fever · flushing · hyperhidrosis · hypertension · hypotension · malaise · oral paraesthesia · pallor · paraesthesia · tachycardia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

- **MONITORING REQUIREMENTS** Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

● **DIRECTIONS FOR ADMINISTRATION**

Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route **not** for patients with thrombocytopenia or other bleeding disorders.

**GAMUNEX**® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**KIOVIG**® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

- **PRESCRIBING AND DISPENSING INFORMATION** Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are **not interchangeable**; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

- ▶ With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

ELECTROLYTES: May contain Sodium

- ▶ **Hizentra** (CSL Behring UK Ltd)

**Normal immunoglobulin human 200 mg per 1 ml** Hizentra 2g/10ml solution for injection pre-filled syringes | 1 vial [PoM](#) £75.00

Privilgen 2.5g/25ml solution for infusion vials | 1 vial [PoM] £135.00

## Rabies immunoglobulin

### ● INDICATIONS AND DOSE

#### Post-exposure prophylaxis against rabies infection

- BY LOCAL INFILTRATION, OR BY INTRAMUSCULAR INJECTION
- Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)
- Adult: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● **INTERACTIONS** → Appendix 1: immunoglobulins

#### ● SIDE-EFFECTS

► **Rare or very rare** Arthralgia · chills · fatigue · fever · headache · hypersensitivity · hypotension · influenza like illness · malaise · nausea · skin reactions · tachycardia · vomiting

● **PRESCRIBING AND DISPENSING INFORMATION** The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Rabies immunoglobulin (Non-proprietary)

**Rabies immunoglobulin human 500 unit** Rabies immunoglobulin human 500unit solution for injection vials | 1 vial [PoM] £800.00

## Tetanus immunoglobulin

### ● INDICATIONS AND DOSE

#### Post-exposure prophylaxis

► BY INTRAMUSCULAR INJECTION

- Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns
- Adult: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

#### Treatment of tetanus infection

► BY INTRAMUSCULAR INJECTION

- Child: 150 units/kg, dose may be given over multiple sites
- Adult: 150 units/kg, dose may be given over multiple sites

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● **INTERACTIONS** → Appendix 1: immunoglobulins

#### ● SIDE-EFFECTS

► **Rare or very rare** Anaphylactic reaction · hypotension  
 ► **Frequency not known** Arthralgia · chest pain · dizziness · dyspnoea · face oedema · oral disorders · tremor

● **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

● **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Tetanus immunoglobulin (Non-proprietary)

**Tetanus immunoglobulin human 250 unit** Tetanus immunoglobulin human 250unit solution for injection vials | 1 vial [PoM] £170.00

## Varicella-zoster immunoglobulin

### (Antivaricella-zoster immunoglobulin)

### ● INDICATIONS AND DOSE

#### Prophylaxis against varicella infection

► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease

● **CAUTIONS** IgA deficiency · interference with live virus vaccines

● **INTERACTIONS** → Appendix 1: immunoglobulins

● **SIDE-EFFECTS** Arthralgia · chills · fever · headache · hypersensitivity · hypotension · malaise · nausea · skin reactions · tachycardia · vomiting

- **DIRECTIONS FOR ADMINISTRATION** Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.
- **PRESCRIBING AND DISPENSING INFORMATION** Available from selected Public Health England and NHS laboratories (also from BPL).
- **HANDLING AND STORAGE** Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Varicella-Zoster** (Bio Products Laboratory Ltd)

**Varicella-Zoster immunoglobulin human 250 mg** Varicella-Zoster immunoglobulin human 250mg solution for injection vials | 1 vial [PoM] £600.00

## 2 Post-exposure prophylaxis

### IMMUNE SERA AND IMMUNOGLOBULINS > ANTITOXINS

#### Bezlotoxumab

18-Aug-2017

- **DRUG ACTION** Bezlotoxumab is a human monoclonal antitoxin antibody; it binds to *Clostridium difficile* toxin B and neutralises its activity, preventing recurrence of *Clostridium difficile* infection.

#### ● INDICATIONS AND DOSE

**Prevention of recurrence of *Clostridium difficile* infection in patients at high risk of reinfection**

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** 10 mg/kg for 1 dose, to be administered during the course of antibacterial therapy for *Clostridium difficile* infection

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · dyspnoea · fatigue · fever · headache · hypertension · infusion related reaction · nausea

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intravenous infusion* (Zinplava®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute requisite dose to a concentration of 1–10 mg/mL with infusion fluid; give over 60 minutes via a central venous catheter or peripheral catheter using a low-protein binding filter (0.2–5 micron).

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage conditions outside refrigerator and after preparation of the infusion.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- ▶ **Zinplava** (Merck Sharp & Dohme Ltd) ▼

**Bezlotoxumab 25 mg per 1 ml** Zinplava 1g/40ml concentrate for solution for infusion vials | 1 vial [PoM] £2,470.00

## Botulism antitoxin

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

#### ● INDICATIONS AND DOSE

**Post exposure prophylaxis of botulism**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** (consult product literature)

- **SIDE-EFFECTS** Hypersensitivity

**SIDE-EFFECTS, FURTHER INFORMATION** It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc.

- **PRE-TREATMENT SCREENING** All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).
- **PRESCRIBING AND DISPENSING INFORMATION** Available from local designated centres, for details see TOXBASE (requires registration) [www.toxbase.org](http://www.toxbase.org). For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank.

The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

- **MEDICINAL FORMS** No licensed medicines listed.

## Diphtheria antitoxin

(Dip/Ser)

#### ● INDICATIONS AND DOSE

**Passive immunisation in suspected cases of diphtheria**

- ▶ BY INTRAVENOUS INFUSION

- ▶ **Adult:** Dose should be given without waiting for bacteriological confirmation (consult product literature)

- **CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

- ▶ Hypersensitivity Hypersensitivity is common after administration; resuscitation facilities should be available. Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Hypersensitivity

- **PRE-TREATMENT SCREENING** Diphtheria antitoxin is derived from horse serum and reactions are common; tests for hypersensitivity should be carried out before use.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Diphtheria antitoxin (Non-proprietary)**

Diphtheria antitoxin 1000 unit per 1 ml Antidiphtheria serum  
10,000units/10ml solution for injection ampoules |  
1 ampoule [PoM] [X]

## 3 Tuberculosis diagnostic test

### DIAGNOSTIC AGENTS

#### Tuberculin purified protein derivative

(Tuberculin PPD)

- **INDICATIONS AND DOSE**

##### Mantoux test

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 2 units for one dose
- ▶ Adult: 2 units for one dose

##### Mantoux test (if first test is negative and a further test is considered appropriate)

- ▶ BY INTRADERMAL INJECTION
- ▶ Child: 10 units for 1 dose
- ▶ Adult: 10 units for 1 dose

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 2 units is equivalent to 0.1 mL of 20 units/mL strength.
- ▶ 10 units is equivalent to 0.1 mL of 100 units/mL strength.

- **CAUTIONS**

##### CAUTIONS, FURTHER INFORMATION

- ▶ Mantoux test Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

- **PRESCRIBING AND DISPENSING INFORMATION** Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### Solution for injection

- ▶ **Tuberculin purified protein derivative (Non-proprietary)**

Tuberculin purified protein derivative 20 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 20 tuberculin units/ml solution for injection 1.5ml vials | 1 vial [X]

Tuberculin purified protein derivative 100 tuberculin unit per 1 ml Tuberculin PPD RT 23 SSI 100 tuberculin units/ml solution for injection 1.5ml vials | 1 vial [X]

## 4 Vaccination

### Vaccination, general principles

#### Active immunity

Active immunity can be acquired by natural disease or by vaccination. **Vaccines** stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a *live attenuated* form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- *inactivated* preparations of the virus (e.g. influenza vaccine) or bacteria, or
- *detoxified exotoxins* produced by a micro-organism (e.g. tetanus vaccine), or
- *extracts* of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

**Live attenuated vaccines** usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

**Inactivated vaccines** may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

#### Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired; use of normal immunoglobulin should be considered after exposure to measles), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; varicella-zoster immunoglobulin should be considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:
  - anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis, rabies, tetanus, tick-borne encephalitis, typhoid (injection).
- HIV-positive individuals should **not** receive:
- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).

The above advice differs from that for other immunocompromised patients; *Immunisation Guidelines for HIV-infected Adults* issued by *British HIV Association* (BHIVA) are available at [www.bhiva.org](http://www.bhiva.org) and, *Immunisation of HIV-infected Children* issued by *Children's HIV Association* (CHIVA) are available at [www.chiva.org.uk](http://www.chiva.org.uk)

#### Vaccines and asplenia

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type b with meningococcal group C vaccine p. 1314;
- Influenza vaccine p. 1322;
- Meningococcal groups A with C and W135 and Y vaccine p. 1315 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 1314;

**Routine immunisation schedule**

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Neonates at risk only	<ul style="list-style-type: none"> <li>▶ Bacillus Calmette-Guérin vaccine p. 1313 (at birth, see <i>BCG vaccine</i> p. 1297)</li> <li>▶ Hepatitis B vaccine p. 1319 (at birth, see <i>Hepatitis B vaccine</i> p. 1300)</li> </ul>
8 weeks	<ul style="list-style-type: none"> <li>▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (<i>Infanrix hexa</i><sup>®</sup>). First dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 1314 (<i>Bexsero</i><sup>®</sup>). First dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 1316 (<i>Prevenar 13</i><sup>®</sup>). First dose</li> <li>▶ Rotavirus vaccine p. 1325 (<i>Rotarix</i><sup>®</sup>). First dose</li> </ul>
12 weeks	<ul style="list-style-type: none"> <li>▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (Infanrix hexa<sup>®</sup>). Second dose</li> <li>▶ Rotavirus vaccine (Rotarix<sup>®</sup>). Second dose</li> </ul>
16 weeks	<ul style="list-style-type: none"> <li>▶ Diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine (Infanrix hexa<sup>®</sup>). Third dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (<i>Bexsero</i><sup>®</sup>). Second dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (<i>Prevenar 13</i><sup>®</sup>). Second dose</li> </ul>
1 year (on or after first birthday)	<ul style="list-style-type: none"> <li>▶ Measles, mumps and rubella vaccine, live p. 1323 (<i>MMR VaxPRO</i><sup>®</sup> or <i>Priorix</i><sup>®</sup>). First dose</li> <li>▶ Meningococcal group B vaccine (rDNA, component, adsorbed) (<i>Bexsero</i><sup>®</sup>). Single booster dose</li> <li>▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) (<i>Prevenar 13</i><sup>®</sup>). Single booster dose</li> <li>▶ Haemophilus influenzae type b with meningococcal group C vaccine p. 1314 (<i>Menitorix</i><sup>®</sup>). Single booster dose</li> </ul>
2-10 years on 31st August 2019 (including children in reception class and school years 1, 2, 3, 4, 5, and 6)	<ul style="list-style-type: none"> <li>▶ Influenza vaccine p. 1322 each year from September. <b>Note:</b> live attenuated influenza nasal spray is recommended (<i>Fluenz Tetra</i><sup>®</sup>). If contra-indicated and child is in clinical risk group, use inactivated influenza vaccine (see <i>Influenza vaccine</i> p. 1301)</li> </ul>
3 years and 4 months, or soon after	<ul style="list-style-type: none"> <li>▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 1311 (<i>Repevax</i><sup>®</sup>). Single booster dose.</li> <li>▶ Measles, mumps and rubella vaccine, live (<i>MMR VaxPRO</i><sup>®</sup> or <i>Priorix</i><sup>®</sup>). Second dose</li> </ul>
11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-13 years of age in Scotland. For females aged 15 years and older, see <i>Human papillomavirus vaccine</i> p. 1300.	<ul style="list-style-type: none"> <li>▶ Human papillomavirus vaccines p. 1321 (<i>Gardasil</i><sup>®</sup>). 2 doses; second dose 6-24 months after first dose. If a 3-dose course of HPV vaccine has been started, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). Only <i>Gardasil</i><sup>®</sup> is offered as part of the national immunisation programme. Therefore for those females who started the schedule with <i>Cervarix</i><sup>®</sup>, but did not complete the vaccination course, the course can be completed with <i>Gardasil</i><sup>®</sup>. Ideally one vaccine should be used for the entire course.</li> </ul>
13-15 years	<ul style="list-style-type: none"> <li>▶ Meningococcal groups A with C and W135 and Y vaccine p. 1315 (<i>Nimenrix</i><sup>®</sup> or <i>Menveo</i><sup>®</sup>). Single booster dose</li> </ul>
13-18 years	<ul style="list-style-type: none"> <li>▶ Diphtheria with poliomyelitis and tetanus vaccine p. 1312 (<i>Revaxis</i><sup>®</sup>). Single booster dose. <b>Note:</b> Can be given at the same time as the dose of meningococcal groups A with C and W135 and Y vaccine at 13-15 years of age.</li> </ul>
Females of child-bearing age susceptible to rubella	<ul style="list-style-type: none"> <li>▶ Measles, mumps and rubella vaccine, live females of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, and avoid pregnancy for one month after vaccination.</li> </ul>
Pregnant females	<ul style="list-style-type: none"> <li>▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus (<i>Boostrix-IPV</i><sup>®</sup>). 1 dose from the 16th week of pregnancy, preferably after the fetal anomaly scan (weeks 18-20)</li> <li>▶ Influenza vaccine (inactivated). Single dose administered from September, regardless of the stage of pregnancy (see <i>Influenza vaccine</i> p. 1301)</li> </ul>

**Routine immunisations during adult life**

When to immunise	Vaccine given and dose schedule (for details of dose, see under individual vaccines)
Under 25 years, those entering university who are at risk of meningococcal disease	<ul style="list-style-type: none"> <li>▶ Meningococcal groups A with C and W135 and Y vaccine (<i>Nimenrix</i><sup>®</sup> or <i>Menveo</i><sup>®</sup>). Single dose. <b>Note:</b> Should be offered to those aged under 25 years entering university who have not received the meningococcal groups A with C and W135 and Y vaccine over the age of 10 years</li> </ul>
During adult life, if not previously immunised or 5 dose course is incomplete	<ul style="list-style-type: none"> <li>▶ Diphtheria with poliomyelitis and tetanus vaccine</li> </ul>
65 years	<ul style="list-style-type: none"> <li>▶ Pneumococcal polysaccharide vaccine p. 1316</li> </ul>
From 65 years	<ul style="list-style-type: none"> <li>▶ Influenza vaccine (inactivated) Each year from September (see <i>Influenza vaccine</i> p. 1301)</li> </ul>
70 years	<ul style="list-style-type: none"> <li>▶ Varicella-zoster vaccine p. 1326 Single dose</li> </ul>

- pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type b with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type b with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

### Vaccines and antisera availability

Anthrax vaccine p. 1312 and yellow fever vaccine, live p. 1327, botulism antitoxin p. 1293, diphtheria antitoxin p. 1293, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Poisoning, emergency treatment p. 1359.

Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department  
Public Health England  
Wellington House  
133–155 Waterloo Road  
London  
SE1 8UG  
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre  
University Hospital of Wales  
Cardiff  
CF14 4XW  
(029) 2074 2979

In Northern Ireland:

Pharmacy and Medicines Management Centre  
Northern Health and Social Care Trust  
Beech House  
Antrim Hospital Site  
Bush Road  
Antrim  
BT41 2RL  
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Immunisation schedule

23-Apr-2019

### Routine immunisations, sources of information

The following recommendations reflect advice produced by Public Health England. Recommendations specific to each vaccine can be found in *Immunisation against infectious disease* – the ‘Green Book’. Public Health England at: [www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

The immunisation schedule reflects advice from ‘The complete routine immunisation schedule’ produced by Public Health England (2018). For the most up to date immunisation schedule see: [www.gov.uk/government/publications/the-complete-routine-immunisation-schedule](http://www.gov.uk/government/publications/the-complete-routine-immunisation-schedule)

The Influenza immunisation recommendations reflect advice from the ‘National flu immunisation programme plan 2019/2020’ produced by Public Health England, Department of Health and Social Care, and NHS England. For the most up-to-date letter, see: [www.gov.uk/government/publications/national-flu-immunisation-programme-plan](http://www.gov.uk/government/publications/national-flu-immunisation-programme-plan)

Vaccines for the immunisation schedule should be obtained from ImmForm at: [www.immform.dh.gov.uk](http://www.immform.dh.gov.uk)

### Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks gestational age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for respiratory complications for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring.

### Individuals with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

For advice on dosing schedules for missed vaccinations, and the immunisation of individuals coming to the UK, consult Chapter 11, The UK immunisation schedule, in *Immunisation against infectious disease* – ‘The Green Book’. Public Health England, available at: [www.gov.uk/government/publications/immunisation-schedule-the-green-book-chapter-11](http://www.gov.uk/government/publications/immunisation-schedule-the-green-book-chapter-11)

### Immunisations for healthcare and laboratory staff

Vaccine-preventable diseases that can be transmitted from person to person are a risk for staff and patients in healthcare environments, and staff in laboratory environments. Therefore, all staff must be up-to-date with their routine immunisations. In addition, specific immunisations are recommended for certain staff groups due to the risk of acquiring or passing on infection. For detailed recommendations, consult Chapter 12,

Immunisation of healthcare and laboratory staff in *Immunisation against infectious disease* – 'The Green Book'. Public Health England, available at: [www.gov.uk/government/publications/immunisation-of-healthcare-and-laboratory-staff-the-green-book-chapter-12](http://www.gov.uk/government/publications/immunisation-of-healthcare-and-laboratory-staff-the-green-book-chapter-12)

## Anthrax vaccine

31-Oct-2018

### Overview

Anthrax vaccine p. 1312 is made from antigens from inactivated *Bacillus anthracis* adsorbed onto an adjuvant. Anthrax immunisation is indicated for individuals who handle infected animals or process infected animal products where there is a potential risk of occupational exposure to *B. anthracis*. It is also recommended for occupations where workers are at risk of one-off high level exposures to anthrax (e.g. following a deliberate or accidental release of spores).

A 4-dose regimen is used for primary immunisation; a single booster dose should be given at 10-year intervals on up to 3 occasions to workers at potential continuous low level risk of exposure to anthrax. In those with potential intermittent high level exposure, a single booster dose should be offered just before entering situations with a specific high exposure risk. If such opportunities do not arise, a single booster dose should be given at 10-year intervals on up to 3 occasions to sustain protection.

In the event of proven or high probability of exposure to anthrax spores, a single booster dose should be given, in addition to antibacterial prophylaxis, except when a dose has been given in the preceding 12 months.

Advice on the treatment of previously unvaccinated individuals with a proven or high probability of exposure to anthrax spores can be found at: [www.gov.uk/government/publications/chemical-biological-radiological-and-nuclear-incidents-recognise-and-respond](http://www.gov.uk/government/publications/chemical-biological-radiological-and-nuclear-incidents-recognise-and-respond).

All suspected cases of anthrax must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

### Useful Resources

Recommendations reflect Chapter 13, Anthrax, in *Immunisation against infectious disease* – 'The Green Book'. Public Health England. February 2017. [www.gov.uk/government/publications/anthrax-the-green-book-chapter-13](http://www.gov.uk/government/publications/anthrax-the-green-book-chapter-13)

## BCG vaccine

### Overview

*Bacillus Calmette-Guérin* vaccine p. 1313 should be given intradermally by operators skilled in the technique.

The expected reaction to successful *Bacillus Calmette-Guérin* vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out and they are negative for tuberculo-protein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;

- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active respiratory tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years (there is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients) at occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

List of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at [www.gov.uk/phe](http://www.gov.uk/phe)

Bladder instillations of BCG are licensed for the management of bladder carcinoma.

See also Tuberculosis p. 578 for advice on chemoprophylaxis; for the treatment of infection following vaccination, seek expert advice.

### Tuberculosis Diagnostic Agents

The *Mantoux test* is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of tuberculin purified protein derivative p. 1294 (PPD).

The *Heaf test* (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: *QuantIFERON<sup>®</sup> TB Gold* and *T-SPOT<sup>®</sup> TB*. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.gov.uk/phe](http://www.gov.uk/phe).

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Botulism antitoxin

### Overview

A polyvalent botulism antitoxin p. 1293 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Cholera vaccine

07-Nov-2018

### Overview

Oral cholera vaccine p. 1313 contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for adults and children from 2 years of age who are travelling to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least one week before potential exposure. However, there is no requirement for cholera vaccination for international travel. After a full risk assessment, immunisation can be considered for the following individuals:

- relief or disaster aid workers;
- persons with remote itineraries in areas where cholera epidemics are occurring and there is limited access to medical care;
- travellers to potential cholera risk areas, for whom vaccination is considered potentially beneficial;
- individuals at occupational risk, such as laboratory workers who may be regularly exposed to cholera.

For dosing schedule, see cholera vaccine.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

All suspected cases of cholera must be notified to the local health protection unit. Where there is a community level outbreak, specialist advice should be sought from Public Health England (tel. 020 8200 4400) or, in Scotland, Health Protection Scotland (tel. 0140 300 1191).

### Contacts

Contacts of patients with cholera should maintain high standards of personal hygiene to avoid becoming infected. Cholera vaccine should not be used in the management of contacts of cases or in controlling the spread of infection.

### Useful Resources

Recommendations reflect Chapter 14, Cholera, in *Immunisation against infectious disease* – 'The Green Book'. Public Health England, December 2013.  
[www.gov.uk/government/publications/cholera-the-green-book-chapter-14](http://www.gov.uk/government/publications/cholera-the-green-book-chapter-14)

## Diphtheria vaccine

### Overview

Diphtheria-containing vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antibody. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as 'high dose' or 'low dose'. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years, vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (*Infranrix hexa*<sup>®</sup>) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine**.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive **either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria** [low dose], **tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine**. Individuals aged over 10 years should receive **adsorbed diphtheria** [low dose], **tetanus, and poliomyelitis (inactivated) vaccine**.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

### Diphtheria-containing vaccines for children over 10 years and adults

A **low dose** of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

### Travel

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of **adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** should be administered.

### Contacts

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with *C. diphtheriae* or *C. ulcerans* should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. **Adsorbed diphtheria** [low dose], **tetanus and poliomyelitis (inactivated) vaccine** is used for this purpose; immunity should be checked by

antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. See advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual.

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Haemophilus influenzae type B conjugate vaccine

### Overview

**Haemophilus influenzae type b (Hib) vaccine** is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae type b vaccine* immunisation is given in combination with diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis vaccine (*Infanrix hexa*<sup>®</sup>), as a component of the primary course of childhood immunisation (see Immunisation schedule). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae type b* component with an interval of 1 month between doses. A booster dose of *Haemophilus influenzae type b* vaccine (combined with meningococcal group C conjugate vaccine) should be given at 1 year of age, on or after the child's first birthday.

Children 1–10 years who have not been immunised against *Haemophilus influenzae type b* need to receive only 1 dose of *Haemophilus influenzae type b* vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, children born before August 2017 should be given 3 doses of the combined vaccine they were started on. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

*Haemophilus influenzae type b* vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae type b* disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

### Invasive Haemophilus influenzae type b disease

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of *haemophilus influenzae type b* vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of *haemophilus influenzae type b* vaccine (combined

with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

See also use of rifampicin p. 582 in the prevention of secondary cases of *Haemophilus influenzae type b* disease.

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Hepatitis A vaccine

### Overview

Hepatitis A vaccine p. 1318 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:

- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia or other conditions treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas;
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

For rapid protection against hepatitis A after exposure or during an outbreak, in adults a single dose of a monovalent vaccine is recommended; for children under 16 years, a single dose of the combined vaccine *Ambirix*<sup>®</sup> can also be used.

Public Health England recommends the use of intramuscular normal immunoglobulin p. 1290 in addition to hepatitis A vaccine for prevention of infection in close contacts (of confirmed cases of hepatitis A) who are 60 years of age or over, have chronic liver disease, or HIV infection, or who are immunosuppressed. For further guidance, see *Immunoglobulins* p. 1287.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

## Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Hepatitis B vaccine

### Overview

Hepatitis B vaccine p. 1319 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed onto an adjuvant. It is made biosynthetically using recombinant DNA technology.

From August 2017, vaccination against hepatitis B is recommended as part of the **routine immunisation schedule**. Primary immunisation (see *Routine immunisation schedule*) requires 3 doses, administered at intervals of 1 month from the age of 2 months, to be given as part of the combined diphtheria with tetanus, pertussis, hepatitis B, poliomyelitis and haemophilus influenzae type b vaccine p. 1312 (*Infanrix hexa*®).

As part of the **selective neonatal immunisation programme**, vaccination is recommended for neonates whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers). Hepatitis B vaccination is started immediately after birth with a dose of the monovalent hepatitis B vaccine (no later than 24 hours after delivery), followed by a second dose at 4 weeks; the routine immunisation combination vaccine (*Infanrix hexa*®) at weeks 8, 12 and 16; and a further dose of the monovalent hepatitis B vaccine at one year of age.

Neonates born to highly infectious mothers should also receive hepatitis B immunoglobulin p. 1290 at the same time as the first dose of monovalent hepatitis B vaccine, but administered at a different site—more detailed guidance is given in the handbook *Immunisation against Infectious Disease* ([www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18](http://www.gov.uk/government/publications/hepatitis-b-the-green-book-chapter-18)).

Following **significant exposure to hepatitis B** (e.g. through needle–stick injury or unprotected sex) and for **pre-exposure prophylaxis in high-risk groups**, an ‘accelerated schedule’ using the single, monovalent hepatitis B vaccine is recommended immediately, with the second dose given 1 month after the initial dose, and the third dose given 2 months after the initial dose. For those at continued high risk following exposure, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the handbook *Immunisation against Infectious Disease*.

Specific hepatitis B immunoglobulin can also be indicated for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. If hepatitis B immunoglobulin is indicated, it should be given as soon as possible, ideally at the same time or within 24 hours of the first dose of vaccine, but not after seven days have elapsed since exposure. See also *Hepatitis B immunoglobulin* in Immunoglobulins p. 1287.

In the UK, groups at high-risk of hepatitis B include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or individual with chronic hepatitis B infection;

- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Following a primary course of immunisation, most people do not require a reinforcing dose of a hepatitis B-containing vaccine. A single booster dose should be offered to healthcare workers approximately five years after primary immunisation, to patients on renal dialysis with anti-HBs levels below 10mIU/mL, and at the time of a subsequent significant exposure.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at [www.dh.gov.uk/](http://www.dh.gov.uk/)). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

A combined hepatitis A and B vaccine p. 1317 is also available.

### Useful Resources

Advice reflects that in the handbook *Immunisation against Infectious Disease* (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates. Chapters from the handbook (including updates since 2013) are available at:

[www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book](http://www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book)

## Human papillomavirus vaccine

### Overview

Human papillomavirus vaccine is available as a bivalent vaccine (*Cervarix*®) or a quadrivalent vaccine (*Gardasil*®). Since 2012, only *Gardasil*® is offered as part of the national immunisation programme. *Cervarix*® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil* is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against

disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6–24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females receiving their first dose aged 15 years or older require a 3-dose schedule (see *Cervarix*<sup>®</sup> and *Gardasil*<sup>®</sup>), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.
