Since 1949 the British National Formulary (BNF) has been the UK’s most trusted and authoritative healthcare resource, helping to ensure the safe and effective use of medicines at the point of care.

Now, as part of our anniversary celebrations, we want to showcase the rigorous editorial process that goes into creating the content that you rely on for your everyday practice. We will also go behind the scenes at the BNF in our ‘A day in the life’ articles. To find out more visit bnf.org

We really appreciate the support you have given the BNF for our first 70 years - including the launch of the first edition of the BNF for Children in 2005, created to meet the needs of healthcare professionals working with children.

If you have a story to tell about how the BNF has been pivotal in your healthcare journey, we would love to hear about it on social media, just use hashtag #BNF70years

Find out more about the BNF’s first 70 years at bnf.org
Access the BNF your way

The British National Formulary (BNF) and BNF for Children are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest medicines information.

**ONLINE**

**BNF on MedicinesComplete**
Access BNF and BNF for Children on MedicinesComplete and receive the very latest drug information through monthly online updates.

**FormularyComplete**
Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and BNF for Children.

**BNF on Evidence Search**
Search the BNF and BNF for Children alongside other authoritative clinical and non-clinical evidence and best practice at www.evidence.nhs.uk from NICE.

**PRINT**

Eligible healthcare professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email BNF@wilmingtonhealthcare.com.

**PRINT SUBSCRIPTION**

**BNF subscription** – Take advantage of our print subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNF for Children) are available. Discounted pricing is also available on bulk sales.

**MOBILE**

**BNF app** – Stay up to date anywhere with the BNF app available for iOS and Android.
**BNF eBook** – Available as an ePDF. See www.pharmpress.com/bnf.
**BNF on MedicinesComplete** – Now mobile responsive.

**How to purchase**

**Buy direct from Pharmaceutical Press** by visiting www.pharmpress.com/bnf
For enquiries about the BNF or BNF for Children in print, contact direct@macmillan.co.uk

BNFC is available as a mobile app, online (bnf.nice.org.uk) and also through MedicinesComplete; a PDA version is also available. In addition, BNFC content can be integrated into a local formulary by using BNFC on FormularyComplete; see www.bnf.org for details.

Distribution of printed BNFCs
In England, NICE purchases print editions of BNFC for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/about/what-we-do/evidence-services/british-national-formulary. If you are entitled to a shared copy of the BNFC, please call (0)1268 495 609 or email: BNF@wilmingtonhealthcare.com.

In Scotland, email: nss.psd-bnf@nhs.net

In Wales, email: nwssp-primarycareservices@wales.nhs.uk

In Northern Ireland, email: ni.bnf@hscni.net

About BNFC content
The BNFC for Children is for rapid reference by UK health professionals engaged in prescribing, dispensing, and best administering medicines to children. BNFC for Children has been constructed using robust procedures for gathering, assessing and assimilating information on paediatric drug treatment, but may not always include all the information necessary for prescribing and dispensing. It is expected that the reader will be relying on appropriate professional knowledge and expertise to interpret the contents in the context of the circumstances of the individual child. BNFC for Children should be used in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice. Information is also available from Medicines Information Services.

Special care is required in managing childhood conditions with unlicensed medicines or with licensed medicines for unlicensed uses. Responsibility for the appropriate use of medicines lies solely with the individual health professional.

Please refer to digital versions of BNFC for Children for the most up-to-date content. BNFC for Children is published in print but interim updates are issued and published in the digital versions of BNFC for Children. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNFC for Children’s accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check www.bnf.org for information about key updates and corrections.

Pharmaid
Numerous requests have been received from developing countries for BNFCs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFCs to certain Commonwealth countries. For more information on this scheme see commonwealthpharmacy.org/what-we-do/pharmaid/.

If you would like to donate your copy email: admin@commonwealthpharmacy.org
Preface

**BNF for Children** aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information on the use of medicines for treating children.

A joint publication of the British Medical Association, the Royal Pharmaceutical Society, the Royal College of Paediatrics and Child Health, and the Neonatal and Paediatric Pharmacists Group, **BNF for Children** (‘BNFC’) is published under the authority of a Paediatric Formulary Committee which comprises representatives of these bodies, the Department of Health for England, and the Medicines and Healthcare products Regulatory Agency.

Many areas of paediatric practice have suffered from inadequate information on effective medicines. BNFC addresses this significant knowledge gap by providing practical information on the use of medicines in children of all ages from birth to adolescence. Information in BNFC has been validated against emerging evidence, best-practice guidelines, and crucially, advice from a network of clinical experts.

Drawing information from manufacturers’ literature where appropriate, BNFC also includes a great deal of advice that goes beyond marketing authorisations (product licences). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy; local paediatric formularies, clinical literature and national information resources have been invaluable in this process.

BNFC has been designed for rapid reference and the information presented has been carefully selected to aid decisions on prescribing, dispensing and administration of medicines. Less detail is given on areas such as malignant disease and the very specialist use of medicines generally undertaken in tertiary centres. BNFC should be interpreted in the light of professional knowledge and it should be supplemented as necessary by specialised publications. Information is also available from Medicines Information Services (see inside front cover).

It is **important** to use the most recent BNFC information for making clinical decisions. The print edition of **BNF for Children** is updated in September each year. Monthly updates are provided online via the BNF Publications website [www.bnf.org](http://www.bnf.org), MedicinesComplete and the NHS Evidence portal.

The more important changes listed under Changes p. xvii are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The website ([www.bnf.org](http://www.bnf.org)) includes additional information of relevance to healthcare professionals. Other digital formats of BNFC—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

Acknowledgements

The Paediatric Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF for Children (BNFC).

Contributors for this update were:

Valuable advice has been provided by the following expert groups: Advisory Committee on Malaria Prevention, Association of British Neurologists, British Association of Dermatologists’ Therapy & Guidelines Sub-committee, British Geriatrics Society, British Society of Gastroenterology, British Society of Paediatric Gastroenterology, Hepatology and Nutrition, Faculty of Sexual and Reproductive Healthcare, Neonatal and Paediatric Pharmacists Group, Royal College of Anaesthetists, Royal College of Obstetricians and Gynaecologists, Royal College of Psychiatrists, Vascular Society.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNFC.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

The BNF team are grateful for the support and access to in-house expertise at Pharmaceutical Press and acknowledge the assistance of A. Lourie, J. Macdonald, N. Potter and their teams.

M. D’Souza, D. Isaacson, A. Iqbal, N. Kaur, R.K. Khonsoorkh, I. Lowings, E. Richardson and T.T. Sham provided considerable assistance during the production of this update of BNFC.

How BNF Publications are constructed

Overview

The BNF for Children (BNFC) is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals involved in the care of children. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately. Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xvii.

BNFC is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information.

Information in BNFC has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. BNFC includes a great deal of advice that goes beyond marketing authorisations (product licences or summaries of product characteristics). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy.

Validation of information follows a standardised process. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Paediatric Formulary Committee

The Paediatric Formulary Committee (PFC) is responsible for the content of BNFC. The PFC comprises pharmacy, medical and nursing representatives with a paediatric background, and lay representatives who have worked with children or acted as a carer of a paediatric patient; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the Department of Health for England. The PFC decides on matters of policy and reviews amendments to BNFC in the light of evidence and expert advice.

Dental Advisory Group

The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group

The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers

BNFC uses about 80 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that BNFC remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on the use of unlicensed medicines or of licensed medicines for unlicensed uses ('off-label' use);
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, neonatal care, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, BNFC calls on other clinical specialists for specific developments when particular expertise is required.

BNFC also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and for assimilation into BNFC.

Editorial team

BNFC clinical writers have all worked as pharmacists or possess a pharmacy degree and further, relevant post-graduate qualification, and have a sound understanding of how drugs are used in clinical practice. A number of the clinical writers have specific experience of paediatric practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNFC content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNFC over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review.

Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production.

Sources of BNFC information

BNFC uses a variety of sources for its information; the main ones are shown below.

Summary of product characteristics

BNFC reviews the summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are a key source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (BNFC is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into BNFC using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature

Clinical writers monitor core medical, paediatric, and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in BNFC and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Paediatric Formulary Committee. BNFC enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify ‘triggers’ for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.
Consensus guidelines
The advice in BNFC is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to BNFC; it is therefore possible to ensure that a consistent message is disseminated. BNFC routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources
Paediatric formularies and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNFC team works closely with the editorial team that produces Martindale: The Complete Drug Reference. BNFC has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review
Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Paediatric Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice. Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information
BNFC routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that BNFC complies with the relevant sections of the Human Medicines Regulations 2012.

BNFC maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in BNFC as are guidelines from bodies such as the Royal College of Paediatrics and Child Health.

Medicines and devices
NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in BNFC.

Comments from readers
Readers of BNFC are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that BNFC provides practical and clinically relevant information. Many changes in the presentation and scope of BNFC have resulted from comments sent in by users.

Comments from industry
Close scrutiny of BNFC by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNFC’s presentation of the role of various drugs; this is yet another check on the balance of BNFC advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research
Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence
From January 2016, recommendations made in BNFC have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNFC aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

Grading system
The BNFC has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence
- **Level 1++**: High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**: Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1**: Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2+++**: High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2++**: Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2+**: Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**: Non-analytic studies, e.g. case reports, case series.
- **Level 4**: Expert advice or clinical experience from respected authorities.

Grades of recommendation
- **Grade A: High strength**
  NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.
- **Grade B: Moderate strength**
  A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.
- **Grade C: Low strength**
  A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.
- **Grade D: Very low strength**
  Evidence level 3; or extrapolated evidence from studies rated as 2+; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.
- **Grade E: Practice point**
  Evidence level 4.
How to use the BNFC Publications in print

How to use the BNF for Children in print

This edition of the BNFC (BNFC) continues to display the fundamental change to the structure of the content that was first shown in BNFC 2015-2016. The changes were made to bring consistency and clarity to BNFC content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

— Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.

— Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 339), a drug class monograph has been created to contain the common information.

— Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.

— Section numbering – the BNFC section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNFC and BNF, where drugs had different therapeutic uses in children.

— Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 17.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNFC effectively, and keep up to date with significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

 Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. Asthma, acute p. 152), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta 2-agonist bronchodilators) and then alphabetically within each classification (e.g. Formoterol fumarate, Salbutamol, Salmeterol, Terbutaline sulfate).

Appendices, covering interactions, borderline substances, and cautionary and advisory labels.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers’ contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNFC for Children

The contents page provides the high-level layout of information within the BNFC; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

• an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 736),

• a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 105),

• an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 100, or Malaria, prophylaxis p. 401).

In order to select safe and effective medicines for individual children, information in the treatment summaries must be
used in conjunction with other prescribing details about the drugs and knowledge of the child’s medical and drug history.

**Monographs Overview**

In earlier editions (i.e. before BNFC 2015-2016), a systematically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 283 was found in chapter 1, for its antimiotoility effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 283 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol p. 368, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 49) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

**Indication and dose**

User feedback has highlighted that one of the main uses of the BNFC is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the child should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. neonates) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

**Selecting the dose**

The dose of a drug may vary according to different indications, routes of administration, age, body-weight, and body surface area. The right dose should be selected for the right age and body-weight (or body surface area) of the child, as well as for the right indication, route of administration, and preparation.

In earlier editions of the BNFC, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a child is considered to be 11 up until the point of their 12th birthday, meaning that an age range of child 12 to 17 years is applicable to a child from the day of their 12th birthday until the day before their 18th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a child up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a child as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

A pragmatic approach should be applied to these cut-off points depending on the child’s physiological development, condition, and if weight is appropriate for the child’s age.

For some drugs (e.g. vancomycin p. 335) the neonatal dose varies according to the corrected gestational age of the neonate. Corrected gestational age is the neonate’s total age expressed in weeks from the start of the mother’s last menstrual period. For example, a 3 week old baby born at 27 weeks gestation is treated as having a corrected gestational age of 30 weeks. A term baby has a corrected gestational age of 37–42 weeks when born. For most other drugs, the dose can be based on the child’s actual date of birth irrespective of corrected gestational age. However, the degree of prematurity, the maturity of renal and hepatic function, and the clinical properties of the drug need to be considered on an individual basis.

Many children’s doses in BNFC are standardised by body-weight. To calculate the dose for a given child the weight-standardised dose is multiplied by the child’s weight (or occasionally by the child’s ideal weight for height). The calculated dose should not normally exceed the maximum recommended dose for an adult. For example, if the dose is 8 mg/kg (max. 300 mg), a child of 10 kg body-weight should receive 80 mg, but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg). Calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, the dose should be calculated from an ideal weight for height.

Occasionally, some doses in BNFC are standardised by body surface area because many physiological phenomena correlate better with body surface area. In these cases, to calculate the dose for a given child, the body-surface area-standardised dose is multiplied by the child’s body surface area. The child’s body surface area can be estimated from his or her weight using the tables for Body surface area in children (image) p. 1180.

Wherever possible, doses are expressed in terms of a definite frequency (e.g. if the dose is 1 mg/kg twice daily, a child of body-weight 9 kg would receive 9 mg twice daily).
Typical layout of a monograph and associated medicinal forms

1 **Class Monographs and drug monographs**
   In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle:

   Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:

   The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2 **Drug classifications**
   Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3 **Review date**
   The date of last review of the content

4 **Specific preparation name**
   If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name
Pregnancy advice on the use of a drug during pregnancy.

Breast feeding advice on the use of a drug during breast feeding.

Hepatic impairment advice on the use of a drug in hepatic impairment.

Renal impairment advice on the use of a drug in renal impairment.

Pre-treatment screening covers one-off tests required to assess the suitability of a patient for a particular drug.

Monitoring requirements specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index.

Effects on laboratory tests for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests.

Treatment cessation specifies whether further monitoring or precautions are advised when the drug is withdrawn.

Directions for administration practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration.

Prescribing and dispensing information practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary.

Handling and storage includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions.

Patient and carer advice for drugs with a special need for counselling.

Profession specific information provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS.

National funding/access decisions details of NICE Technology Appraisals, SMC advice and AWMSG advice.

Less suitable for prescribing preparations that are considered by the Paediatric Formulary Committee to be less suitable for prescribing.

Exception to legal category advice and information on drugs which may be sold without a prescription under specific conditions.

Medicinal forms

Form

Cautionary and advisory labels if applicable.

Excipients clinically important but not comprehensive [consult manufacturer information for full details].

Electrolytes if clinically significant quantities occur.

Preparation name (Manufacturer/Non-proprietary) Drug name and strength pack sizes. Prices.

Combinations available this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation.

Evidence grading

Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A B C D E are displayed next to the recommendations within the text, and are preceded by the symbol: E

For further information, see How BNF Publications are constructed.

Legal categories

This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

These symbols indicate that the preparations are subject to the prescription requirements of the Misuse of Drugs Act.

For regulations governing prescriptions for such preparations, see Controlled Drugs and Drug Dependence.

Not all monographs include all possible sections; sections are only included when relevant information has been identified.
Occasionally, it is necessary to include doses in the total daily dose format (e.g. 10 mg/kg daily in 3 divided doses); in these cases the total daily dose should be divided into individual doses (in this example a child of body-weight 9 kg would receive 30 mg 3 times daily).

Most drugs can be administered at slightly irregular intervals during the day. Some drugs, e.g. antimicrobials, are best given at regular intervals. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime.

Special care should be taken when converting doses from one metric unit to another, and when calculating infusion rates or the volume of a preparation to administer. Where possible, doses should be rounded to facilitate administration of suitable volumes of liquid preparations, or an appropriate strength of tablet or capsule.

Other information relevant to Indication and dose
The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNFC includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNFC recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety
The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug — if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a child who has constipation, it may be preferable to avoid a drug that frequently causes constipation.

The Important safety advice section in the BNFC, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

Use of drugs in specific patient populations
Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 18, and Prescribing in renal impairment p. 18. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. fluconazole p. 389).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 20 and Prescribing in breast-feeding p. 20. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma, acute p. 152). Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 389).

A new section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 780) has been included.

Administration and monitoring
When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir p. 431). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 286) and further details, such as masking the bitter taste of some medicines.

Whenever possible, intramuscular injections should be avoided in children because they are painful.

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 171). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 595), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 103); these are covered under Treatment cessation.

Choice and supply
The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (see Taking Medicines to Best Effect). Taking the time to explain to the child (and the child’s carer if appropriate) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 364, or recognising signs of blood, liver, or
skin disorders with carbamazepine p. 200); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products are not interchangeable e.g. modified-release theophylline p. 171), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 122), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 51).

**Medicinal forms**

In the BNFC, preparations follow immediately after the monograph for the drug that is their main ingredient. In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 37).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of ‘Medicinal Form’ that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNFC Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of “Modified release capsule” will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNFC, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in earlier BNFC versions, e.g. sodium acid phosphatase, is now sodium dihydrogen phosphate anhydrous.

Children should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

Earlier editions of the BNFC only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if

the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautonary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 1094. These labels have now been applied at the level of the dose form.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

**Prices in the BNFC**

Basic NHS net prices are given in the BNFC to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.nhsbsa.nhs.uk/pharmacies-gp-practices-and-appliance-contractors/dictionary-medicines-and-devices-dmd). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (apps.nhsbsa.nhs.uk/DMDBrowser/DMDBrowser.do). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect wholesale dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNFC as prices vary between different manufacturers.

BNFC prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.npaa.org.uk/pda/edt_intro.htm), Scotland (www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.

**Drug class monographs**

In earlier editions of the BNFC, information relating to a class of drug sharing the same properties (e.g. tetracyclines p. 364), was contained within the prescribing notes. In the updated structure, drug class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. beta-adrenoceptor blockers (systemic) p. 165). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol tartrate p. 109). Within this flag, the page number of the drug class monograph is provided (e.g. 1234), to help navigate the user to this information. This is particularly useful where occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the drug class monograph (e.g. sotalol hydrochloride p. 81).
Evidence grading
The BNF has adopted a five level evidence grading system (see How BNF Publications are constructed p. viii). Recommendations that are evidence graded can be identified by a symbol appearing immediately before the recommendation. The evidence grade is displayed at the end of the recommendation.

Other content
Nutrition
Appendix 2 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

Other useful information
Finding significant changes in the BNFC
- Changes, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNFC, as well as a list of preparations that have been discontinued and removed from the BNFC. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNFC, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently;
- Changes to the Dental Practitioners’ Formulary, are located at the end of the Dental List;
- E-newsletter, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to

www.bnf.org.
- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at

www.cppe.ac.uk.

Using other sources for medicines information
The BNFC is designed as a digest for rapid reference. Less detail is given on areas such as malignant disease and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. The BNFC should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.
Changes

Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**

Significant changes that appear in the print edition of BNF for Children 2019–2020:

- Side-effects and their further information sections have been reviewed against the current product literature and terms used to define these have been standardised across all drug monographs.
- Attention deficit hyperactivity disorder p. 231: updated guidance on management.
- Carboximazole p. 501: increased risk of congenital malformations; strengthened advice on contraception [MHRA/CHM advice].
- Carboximazole p. 501: risk of acute pancreatitis [MHRA/CHM advice].
- Controlled drugs and drug dependence p. 10: reclassification of gabapentin p. 204 and pregabalin as Class C and Schedule 3 Controlled Drugs.
- Darunavir boosted with cobicistat: avoid use in pregnancy due to risk of treatment failure and maternal-to-child transmission of HIV-1 [MHRA/CHM advice].
- Diabetic complications p. 466: updated guidance.
- Dinutuximab beta p. 547 for treating neuroblastoma [NICE guidance].
- Dolasetravir p. 427 (Tivacox® Triumeq® Juluca®): signal of increased risk of neural tube defects; do not prescribe to women seeking to become pregnant; exclude pregnancy before initiation and advise use of effective contraception [MHRA/CHM advice].
- Doxycline p. 364: license extension into children aged 8 to 11 years.
- Dyslipidaemias p. 130: updated guidance on familial hypercholesterolaemia.
- Eltrombopag p. 602 (Revolade®): reports of interference with bilirubin and creatinine test results [MHRA/CHM advice].
- Elvitegravir boosted with cobicistat: avoid use in pregnancy due to risk of treatment failure and maternal-to-child transmission of HIV-1 [MHRA/CHM advice] (see elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide p. 440).
- Emollients (see Emollient and barrier preparations p. 737): new information about risk of severe and fatal burns with paraffin-containing and paraffin-free emollients [MHRA/CHM advice].
- Fluoroquinolone antibiotics (ciprofloxacin p. 361): new restrictions and precautions for use due to very rare reports of disabling and potentially long-lasting or irreversible side effects [MHRA/CHM advice].
- Gabapentin p. 204 (Neurontin®): and risk of abuse and dependence: new scheduling requirements from 1 April [MHRA/CHM advice].
- Gentamicin p. 548 for untreated acute myeloid leukaemia [NICE guidance].
- Heavy menstrual bleeding p. 495: updated guidance on management.
- Hydrocortisone p. 456 muco-adhesive buccal tablets: should not be used off-label for adrenal insufficiency in children due to serious risks [MHRA/CHM advice].
- Ipilimumab p. 549 (Yervoy®): reports of cytomegalovirus (CMV) gastrointestinal infection or reactivation [MHRA/CHM advice].
- Lyme disease p. 374: updated guidance on management.
- Meningococcal vaccine p. 808: updated guidance for Meningococcal group B vaccines.
- Nusinersen p. 671 (Spinraza®): reports of communicating hydrocephalus not related to meningitis or bleeding [MHRA/CHM advice].
- Oropharyngeal infections, antibacterial therapy p. 733: updated guidance on sore throat (acute).
- Parenteral amphotericin B p. 387: reminder of risk of potentially fatal adverse reaction if formulations confused [MHRA/CHM advice].
- Prescribing in pregnancy p. 20: Medicines with teratogenic potential, what is effective contraception and how often is pregnancy testing needed? [MHRA/CHM advice].
- Quinolones p. 374: new guidance on management of Cough, acute.
- Respiratory system infections, antibacterial therapy p. 318: new guidance for acute exacerbations of Bronchiectasis (non-cystic fibrosis).
- Respiratory system infections, antibacterial therapy p. 318: new guidance on management of Cough, acute.
- Smoking cessation p. 204: updated guidance.
- Systemic and inhaled fluoroquinolones (ciprofloxacin p. 361): small increased risk of aortic aneurysm and dissection; advice for prescribing in high-risk patients [MHRA/CHM advice].
- Tapentadol p. 295 (Palexia®): risk of seizures and reports of serotonin syndrome when co-administered with other medicines [MHRA/CHM advice].
- Transdermal fentanyl p. 286 patches: life-threatening and fatal opioid toxicity from accidental exposure, particularly in children [MHRA/CHM advice].

Valproate medicines and serious harms in pregnancy: new Annual Risk Acknowledgement Form and clinical guidance from professional bodies to support compliance with the Pregnancy Prevention Programme [MHRA/CHM advice] (see sodium valproate p. 213 and valproic acid p. 219).

Valproate medicines (see sodium valproate p. 213 and valproic acid p. 219): are you in action in compliance with the pregnancy prevention measures? [MHRA/CHM advice].

Venous thromboembolism p. 90: updated guidance on prophylaxis.

Yellow fever vaccine, live p. 829 (Stamaril®) and fatal adverse reactions: extreme caution needed in people who may be immunosuppressed [MHRA/CHM advice].

Dose changes

Changes in dose statements that appear in the print edition of BNF for Children 2019—2020:

- Adalimumab p. 665 [maintenance dosing updated].
- Adenosine p. 80 [dose clarification for neonate and children under 12 years for termination of supraventricular tachycardias and diagnosis of supraventricular arrhythmias].
- Amoxicillin p. 351 [update to indications and doses for Lyme Disease].
- Anakinra p. 662 [dosing in severe renal impairment].
- Azithromycin p. 339 [update to indication and doses for Lyme Disease].
- Budenofalk® [deletion of dosing information for collagenous colitis and update on advice on reducing dose following treatment in Crohn’s disease].
- Caffeine citrate p. 194 [maintenance dosing].
- Canakinumab p. 543.  
- Ceftriaxone p. 332 [update to indications and doses for Lyme Disease].
- Clarithromycin p. 340 [dosing recommendation for Lyme Disease deleted in line with updated guidance].
- Colistimethate sodium p. 358 [dosing recommendations for inhalation ofobilised solution and for intravenous use].
- Doxycycline p. 364 [update to indications and doses for Lyme Disease].
- Erythromycin p. 341 [dosing recommendation for Lyme Disease deleted in line with updated guidance].
- Glycerol phenylbutyrate p. 637 [dose rounding recommendation for children under 2 years].
- Haloperidol p. 252.
- Hexetidine p. 728 [update to age-range].
- Hydroxycobalamin p. 595 [frequency of maintenance dosing for macrocytic anaemia without neurological involvement].
- Imipenem with cilastatin p. 325 [dosing recommendation in renal impairment updated].
- Influenza vaccine p. 825 [update to indication of annual immunisation against seasonal influenza (for children in clinical risk groups who have not received seasonal influenza vaccine previously)].
- Japanese encephalitis vaccine p. 826 [dosing schedule updated].
- Levonorgestrel p. 527 [update to timings of administration of intra-uterine devices and advice on additional contraceptive precautions].
- Malarone® Paediatric (atovaquone with proguanil hydrochloride p. 409) [update to weight ranges for prophylaxis of falciparum malaria].
- Mometasone furoate p. 166 [prophylaxis and treatment of seasonal allergic or perennial rhinitis—age range extended].
-Raltegravir p. 427 [directions for administration for granules for oral suspension deleted as available packs may contain conflicting advice; see individual packs for instructions for reconstitution].
- Rufinamide p. 212 [update to age range for use in children and dosing information for use with valproate].
- Stripectent p. 217 [updated dosing information].
- Vancomycin p. 335 [deletion of the statement recommending the use of ideal body-weight to calculate intravenous doses in obese patients].

New preparations

New preparations that appear in the print edition of BNF for Children 2019—2020:

- Blincyto® [blinatumomab p. 546].
- Cetuxan Plus® [ciprofloxacin with fluocinolone acetonide p. 716].
- Crysvita® [burosumab p. 621].
- FiraPy® [icatibant p. 186].
- Ivenmend® [fosaprepitant p. 270].
- Kineret® [anakinra p. 662].
- MAVIRET® [glecaprevir with pibrentasvir p. 418].
- Nplate® [romiplostim p. 603].
- Nucala® [mepolizumab p. 167].
- Palexia® oral solution [tapentadol p. 295].
- Qarziba® [dinizutumab beta p. 547].
- Silentyo® [melatonin p. 303].
- Sprycl® [dasatinib p. 579].
- Symkevi® [tezacaftor with ivacaftor p. 190].
- Typacil® [tigecycline p. 367].
- Verkaz® eye drops [ciclosporin p. 537].
- Xgeva® [denosumab p. 488].
- Zebinix® [eslicarbazepine acetate p. 202].
- Zemplar® [paricalcitol p. 657].
Guidance on prescribing

General guidance
Medicines should be given to children only when they are necessary, and in all cases the potential benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the child and the child’s carer. In particular, the child and the child’s carer should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, this should be highlighted.

Prescribing competency framework The Royal Pharmaceutical Society has published a Prescribing Competency Framework that includes a common set of competencies that form the basis for prescribing, regardless of professional background. The competencies have been developed to help healthcare professionals be safe and effective prescribers with the aim of supporting patients to get the best outcomes from their medicines. It is available at www.rpharms.com/resources/frameworks/prescribers-competency-framework.

Multimorbidity
The presence of two or more long-term health conditions in a child (multimorbidity) is generally associated with reduced quality of life, higher mortality, higher rates of adverse drug reactions, greater use of the health service, and a higher treatment burden (due to polypharmacy or multiple appointments). Treatment decisions should involve consideration of the child’s needs, preferences for treatment, health priorities, and lifestyle with the aim of improving quality of life by reducing treatment burden, adverse events, and unplanned or uncoordinated care. All clinicians involved (including primary and secondary care) should work together to minimise the risk of harm. The use of a care plan within a multidisciplinary team with an identified clinical lead, is recommended. Prescribers should consider the risks and benefits of treatments recommended in guidance for single health conditions, when applied to children with multimorbidity; evidence for these recommendations is commonly drawn from children without multimorbidity or who are taking fewer prescribed regular medicines. Treatments intended to relieve symptoms should be reviewed for clinical response, including reducing or stopping treatment that is no longer effective or necessary. Alternatively, non-pharmacological treatments may be offered or treatments of limited benefit can be considered for discontinuation.

Transitional services for chronic conditions
The process of moving from paediatric to adult services can lead to a loss of continuity in care and provoke anxiety in children and their carers. Practitioners should start planning for adult care when the child reaches the age of 13 or 14 at the latest and a child-centred approach should be taken. Consider designating a named practitioner among those providing care to the child to take a coordinating role and to act as an advocate for the child, maintaining a link between the various practitioners involved in care (including a named GP).

Deprescribing
Discontinuing or reducing the dose of medicines, under supervision, should be considered regularly to improve outcomes and reduce burden. Deprescribing should be undertaken as part of routine clinical care involving careful counselling alongside shared decision-making with the child and their carers.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors that contribute to poor compliance with prescribed medicines include:

- difficulty in taking the medicine (e.g. inability to swallow the medicine);
- unattractive formulation (e.g. unpleasant taste);
- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- carers’ or child’s perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear.

The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs of the child’s family that can affect acceptance of medicines. Taking the time to explain to the child (and carers) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team can be important. Giving advice on the management of adverse effects and the possibility of alternative treatments may encourage carers and children to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken, but at the expense of the ability to titrate individual doses.

Advanced Pharmacy Services
Advanced Services are provided as part of the NHS Community Pharmacy Contractual Framework, and include services such as the New Medicines Service and Medicines Use Review service. These services are provided by accredited community pharmacists, with the aim of targeting specific children to help manage their medicines more effectively, improve adherence, and reduce medicines wastage.

New Medicines Service The New Medicines Service (NMS) provides education and support to children who are newly prescribed a medicine to manage a long-term condition. The service is split into three stages; patient engagement, intervention and follow-up. As of 2018, this service is available for children living in England who have either been prescribed a new medicine for one of the following conditions – asthma, type 2 diabetes, or hypertension, or have been prescribed a new antiplatelet or anticoagulant. Children can be offered the service by prescriber referral, or opportunistically by the community pharmacy. For further information, see: psnc.org.uk/services-commissioning/advanced-services/nms.
Medicines Use Review  The Medicines Use Review (MUR) service consists of structured adherence-centred reviews with children on multiple medicines, particularly those receiving medicines for long-term conditions. The service is undertaken periodically, or when there is a need to make an adherence-focused intervention due to a problem identified while providing the dispensing service. The pharmacist providing the service is required to ensure that at least 70% of all MURs undertaken in a year are for children who fall into one or more of the national target groups. The national target groups for MURs in England are:

- children taking high-risk medicines (NSAIDs, anticoagulants (including low molecular weight heparin), antiplatelets, or diuretics);
- children recently discharged from hospital who have had changes made to their medicines;
- children prescribed certain respiratory medicines;
- children with, or at risk of cardiovascular disease, and are regularly prescribed at least four medicines.

For further information, see: <www.psc.org.uk/services-commissioning/advanced-services/murs/>

In Wales, Northern Ireland, and Scotland there are variations on this service, including different national target groups. In Wales, see <www.cpwales.org.uk/Contract-support-and-1T/Advanced-Services/Medicines-Use-review-MUR.aspx>

In Northern Ireland, see <www.hscbusiness.hscni.net/services/2427.htm>

In Scotland, see <www.communitypharmacyscotland.org.uk/nhs-care-services/services/chronic-medication-service/>

Drug treatment in children
Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care; the risk of toxicity is increased by a reduced rate of drug clearance and differing target organ sensitivity. The terms infant, child and adolescent are used inconsistently in the literature. However, for reference purposes only, the terms generally used to describe the paediatric stages of development are:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preterm neonate</td>
<td>Born at &lt; 37 weeks gestation</td>
</tr>
<tr>
<td>Term neonate</td>
<td>Born at 37 to 42 weeks gestation</td>
</tr>
<tr>
<td>Post-term neonate</td>
<td>Born at ≥ 42 weeks gestation</td>
</tr>
<tr>
<td>Neonate</td>
<td>From 0 up to 28 days of age (or first 4 weeks of life)</td>
</tr>
<tr>
<td>Infant</td>
<td>From 28 days up to 24 months of age</td>
</tr>
<tr>
<td>Child</td>
<td>From 2 years up to 12 years of age</td>
</tr>
<tr>
<td>Adolescent</td>
<td>From 12 years up to 18 years of age</td>
</tr>
</tbody>
</table>

In <BNF for Children>, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Administration of medicines to children
Children should be involved in decisions about taking medicines and encouraged to take responsibility for using them correctly. The degree of such involvement will depend on the child’s age, understanding, and personal circumstances.

Occasionally a medicine or its taste has to be disguised or masked with small quantities of food. However, unless specifically permitted (e.g. some formulations of pancreatin p. 74), a medicine should not be mixed with large quantities of food because the full dose might not be taken and the child might develop an aversion to food if the medicine imparts an unpleasant taste. Medicines should not be mixed or administered in a baby’s feeding bottle.

Children under 5 years (and some older children) find a liquid formulation more acceptable than tablets or capsules. However, for long-term treatment it may be possible for a child to be taught to take tablets or capsules.

An oral syringe should be used for accurate measurement and controlled administration of an oral liquid medicine. The unpleasant taste of an oral liquid can be disguised by flavouring it or by giving a favourite food or drink immediately afterwards, but the potential for food-drug interactions should be considered.

Advice should be given on dental hygiene to those receiving medicines containing saccharin sugars for long-term treatment; sugar-free medicines should be provided whenever possible.

Children with nasal feeding tubes in place for prolonged periods should be encouraged to take medicines by mouth if possible; enteric feeding should generally be interrupted before the medicine is given (particularly if enteral feeds reduce the absorption of a particular drug). Oral liquids can be given through the tube provided that precautions are taken to guard against blockage; the dose should be washed down with warm water. When a medicine is given through a nasogastric tube to a neonate, sterile water must be used to accompany the medicine or to wash it down.

The intravenous route is generally chosen when a medicine cannot be given by mouth; reliable access, often a central vein, should be used for children whose treatment involves irritant or inotropic drugs or who need to receive the medicine over a long period or for home therapy. The subcutaneous route is used most commonly for insulin administration. Intramuscular injections should preferably be avoided in children, particularly neonates, infants, and young children. However, the intramuscular route may be advantageous for administration of single doses of medicines when intravenous cannulation would be more problematic or painful to the child. Certain drugs, e.g. some vaccines, are only administered intramuscularly.

The intrathecal, epidural and intraosseous routes should be used only by staff specially trained to administer medicines by these routes. Local protocols for the management of intrathecal injections must be in place.

Managing medicines in school
Administration of a medicine during schooltime should be avoided if possible; medicines should be prescribed for once or twice-daily administration whenever practicable. If the medicine needs to be taken in school, this should be discussed with parents or carers and the necessary arrangements made in advance; where appropriate, involvement of a school nurse should be sought. Managing Medicines in Schools and Early Years Settings produced by the Department of Health provides guidance on using medicines in schools (<www.dh.gov.uk>.

Patient information leaflets
Manufacturers’ patient information leaflets that accompany a medicine, cover only the licensed use of the medicine. Therefore, when a medicine is used outside its licence, it may be appropriate to advise the child and the child’s parent or carer that some of the information in the leaflet might not apply to the child’s treatment. Where necessary, inappropriate advice in the patient information leaflet should be identified and reassurance provided about the correct use in the context of the child’s condition.

Biological medicines
Biological medicines are medicines that are made by or derived from a biological source using biotechnology processes, such as recombinant DNA technology. The size and complexity of biological medicines, as well as the way
they are produced, may result in a degree of natural variability in molecules of the same active substance, particularly in different batches of the medicine. This variation is maintained within strict acceptable limits. Examples of biological medicines include insulin and monoclonal antibodies. Biological medicines must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

**Biosimilar medicines**

A biosimilar medicine is a biological medicine that is highly similar and clinically equivalent (in terms of quality, safety, and efficacy) to an existing biological medicine that has already been authorised in the European Union (known as the reference biological medicine or originator medicine). The active substance of a biosimilar medicine is similar, but not identical, to the originator biological medicine. Once the patent for a biological medicine has expired, a biosimilar medicine may be authorised by the European Medicines Agency (EMA). A biosimilar medicine is not the same as a generic medicine, which contains a simpler molecular structure that is identical to the originator medicine.

**Therapeutic equivalence**

Biosimilar medicines should be considered to be therapeutically equivalent to the originator biological medicine within their authorised indications. Biosimilar medicines are usually licensed for all the indications of the originator biological medicine, but this depends on the evidence submitted to the EMA for authorisation and must be scientifically justified on the basis of demonstrated or extrapolated equivalence.

**Prescribing and dispensing**

The choice of whether to prescribe a biosimilar medicine or the originator biological medicine rests with the clinician in consultation with the patient. Biological medicines (including biosimilar medicines) must be prescribed by brand name and the brand name specified on the prescription should be dispensed in order to avoid inadvertent switching. Automatic substitution of brands at the point of dispensing is not appropriate for biological medicines.

**Safety monitoring**

Biosimilar medicines are subject to a black triangle status at the time of initial authorisation. It is important to report suspected adverse reactions using the Yellow Card Scheme (see Adverse reactions to new medicines). For all biological medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

**National funding/access decisions**

The Department of Health has confirmed that, in England, NICE can decide to apply the same remit, and the resulting technology appraisal guidance, to relevant biosimilar medicines which appear on the market subsequent to their originator biological medicine. In other circumstances, where a review of the evidence for a particular biosimilar medicine is necessary, NICE will consider producing an evidence summary (see Evidence summary: new medicines, www.nice.org.uk/about/what-we-do/our-programmes/nice-advice/evidence-summaries-new-medicines).

**National information**

**BNF for Children and marketing authorisation**

Where appropriate the doses, indications, cautions, contraindications, and side effects in BNF for Children reflect those in the manufacturers’ Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). BNF for Children does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, BNF for Children reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisation. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

As far as possible, medicines should be prescribed within the terms of the marketing authorisation. However, many children require medicines not specifically licensed for paediatric use. Although medicines cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 do not prohibit the use of unlicensed medicines.

**BNF for Children includes advice involving the use of unlicensed medicines or of licensed medicines for unlicensed uses (‘off-label’ use). Such advice reflects careful consideration of the options available to manage a given condition and the weight of evidence and experience of the unlicensed intervention. Where the advice falls outside a drug’s marketing authorisation, BNF for Children shows the licensing status in the drug monograph. However, the limitations of the marketing authorisation should not preclude unlicensed use where clinically appropriate.**

**Prescribing unlicensed medicines**

Prescribing unlicensed medicines or medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the...
patient or the patient’s carer that the prescribed medicine is unlicensed.

**Drugs and skilled tasks**

Prescribers and other healthcare professionals should advise children and their carers if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amphetamines, cannabis, cocaine, and ketamine p. 246, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/driver-driving.

**Oral syringes**

An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5- mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5- mL spoon is used for doses of 5 mL (or multiples thereof).

**Excipients**

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in BNF for Children. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since they do not cause dental caries. Children receiving medicines containing cariogenic sugars, or their carers, should be advised of dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible, particularly if treatment is required for a long period. Where information on the presence of alcohol, aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in BNF for Children against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on selected preservatives and excipients in eye drops and injections. The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in BNF for Children. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in BNF for Children; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with metronidazole p. 344.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant children. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

**Important** In the absence of information on excipients in BNF for Children and in the product literature (available at www.medicines.org.uk/emc/), contact the manufacturer if it is essential to check details.

**Health and safety**

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Care is required to avoid sources of heat (including hair dryers) when flammable substances are used on the skin or hair. Substances, such as corticosteroids, some antimicrobials, phenothiazines, and many cytoxics, are irritant or very potent and should be handled with caution; contact with the skin and inhalation of dust should be avoided. Healthcare professionals and carers should guard against exposure to sensitizing, toxic or irritant substances if it is necessary to crush tablets or open capsules.

**EEA and Swiss prescriptions**

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

**Security and validity of prescriptions**

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible;
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

**Patient group direction (PGD)**

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific child. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit the child’s care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some...
Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

**NICE, Scottish Medicines Consortium and All Wales Medicines Strategy Group**

Advice issued by the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC) and the All Wales Medicines Strategy Group (AWMSG) is included in *BNF for Children* when relevant. Details of the advice together with updates can be obtained from: www.nice.org.uk, www.scottishmedicines.org.uk and www.awmsg.org.
Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements
Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements. Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m² body-surface area e.g. mg/m² where this would reduce error.

The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other zero.
- Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘mL’ and ‘ml’ are recognised SI abbreviations.
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
  - Adult Mixtures (10-mL dose), 200 or 300 mL
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL
  - The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
  - The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
  - Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used.

**Number of days’ treatment**

5

**Endings**

Ampicillin oral suspension

125mg/5mL sugar-free

12mg three times daily

Supply 100mL

No more items on this prescription

**Abbreviation of titles**

In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

**Non-proprietary titles**

Where non-proprietary (‘generic’) titles are given, they should be used for prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the child should always receive the same brand; in such cases, the brand name or the manufacturer should be stated.

**Non-proprietary names of compound preparations**

Non-proprietary names of compound preparations which appear in BNF for Children are those that have been compiled...
by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients. Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted. Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained. Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different duration of action.
Supply of medicines

Overview
When supplying a medicine for a child, the pharmacist should ensure that the child and the child’s carer understand the nature and identity of the medicine and how it should be used. The child and the carer should be provided with appropriate information (e.g. how long the medicine should be taken for and what to do if a dose is missed or the child vomits soon after the dose is given).

Safety in the home
Carers and relatives of children must be warned to keep all medicines out of the reach and sight of children. Tablets, capsules and oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:
- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the child’s carer will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a pharmacy for destruction.

Labelling of prescribed medicines
There is a legal requirement for the following to appear on the label of any prescribed medicine:
- name of the patient;
- name and address of the supplying pharmacy;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:
- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Unlicensed medicines
A drug or formulation that is not covered by a marketing authorisation may be obtained from a pharmaceutical company, imported by a specialist importer, manufactured by a commercial or hospital licensed manufacturing unit, or prepared extemporaneously against a prescription.

The safeguards that apply to products with marketing authorisation should be extended, as far as possible, to the use of unlicensed medicines. The safety, efficacy, and quality (including labelling) of unlicensed medicines should be assured by means of clear policies on their prescribing, purchase, supply, and administration. Extra care is required with unlicensed medicines because less information may be available on the drug and any formulation of the drug.

The following should be agreed with the supplier when ordering an unlicensed or extemporaneously prepared medicine:
- the specification of the formulation;
- documentation confirming the specification and quality of the product supplied (e.g. a certificate of conformity or of analysis);
- for imported preparations product and licensing information should be supplied in English.

Extemporaneous preparations
A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. Every effort should be made to ensure that an extemporaneously prepared product is stable and that it delivers the requisite dose reliably; the child should be provided with a consistent formulation regardless of where the medicine is supplied to minimise variations in quality. Where there is doubt about the formulation, advice should be sought from a medicines information centre, the pharmacy at a children’s hospital, a hospital production unit, a hospital quality control department, or the manufacturer.

In many cases it is preferable to give a licensed product by an unlicensed route (e.g. an injection solution given by mouth) than to prepare a special formulation. When tablets or capsules are cut, dispersed, or used for preparing liquids immediately before administration, it is important to confirm uniform dispersal of the active ingredient, especially if only a portion of the solid content (e.g. a tablet segment) is used or if only an aliquot of the liquid is to be administered. In some cases the child’s clinical condition may require a dose to be administered in the absence of full information on the method of administration. It is important to ensure that the appropriate supporting information is available at the earliest opportunity.

Preparation of products that produce harmful dust (e.g. cytotoxic drugs, hormones, or potentially sensitising drugs such as neomycin sulfate p. 714) should be avoided or undertaken with appropriate precautions to protect staff and carers.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

- that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
  - that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
  - that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
  - as to the dose that it would be appropriate for the person to take;
- that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital p. 223, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:
  - insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
  - an oral contraceptive when a full cycle may be supplied;
  - an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
- that an entry shall be made by the pharmacist in the prescription book stating:
  - the date of supply;
  - the name, quantity and, where appropriate, the pharmaceutical form and strength;
  - the name and address of the patient;
  - the nature of the emergency;
- that the container or package must be labelled to show:
  - the date of supply;
  - the name, quantity and, where appropriate, the pharmaceutical form and strength;
  - the name of the patient;
  - the name and address of the pharmacy;
  - the words ‘Emergency supply’;
  - the words ‘Keep out of the reach of children’ (or similar warning);
- that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 223 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

- that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
- that the prescriber has undertaken to furnish a prescription within 72 hours;
- that the medicine is supplied in accordance with the directions of the prescriber requesting it;
- that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 223 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Royal Pharmaceutical Society’s guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London, Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

Regulations and classification
The Misuse of Drugs Act, 1971 as amended prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession (except where permitted by the 2001 Regulations or under licence from the Secretary of State). The penalties applicable to offences involving the different drugs are graded broadly according to the harmlessness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

- **Class C** includes: certain drugs related to the amfetamines such as benzphetamine and chlorphentermine, buprenorphine p. 281, mazindol, methyprylon, pemoline, pipiradrol, most benzodiazepines, tramadol hydrochloride p. 296, zaleplon, zolpidem tartrate, zopiclone, androjenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human chorionic gonadotrophin, somatropin, somatrem, and somatropin p. 492. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are subject to the full Controlled Drugs (Safe Custody) Regulations. Records in registers do not need to be kept (except in the case of Sativex®).

Schedule 4 includes in Part I drugs that are subject to minimal control, such as benzodiazepines (except temazepam p. 847 and midazolam p. 229, which are in Schedule 3), non-benzodiazepine hypnotics (zaleplon, zolpidem tartrate, and zopiclone) and Sativex®. Part II includes androjenic and anabolic steroids, clenbuterol, choric gonadotrophin (HCG), non-human chorionic gonadotrophin, somatropin, somatrem, and somatropin p. 492. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are subject to safe custody requirements. Records in registers do not need to be kept (except in the case of Sativex®).

Schedule 5 includes preparations of certain Controlled Drugs (such as codeine, pholcodine p. 192 or morphine p. 290) which due to their low strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years. Since the Responsible Pharmacist Regulations were published in 2008, standing operation procedures for the management of Controlled Drugs, are required in registered pharmacies. The Health Act 2006 introduced the concept of the ‘accountable officer’ with responsibility for the management of Controlled Drugs and related governance issues in their organisation. Most recently, in 2013 The Controlled Drugs (Supervision of Management and Use) Regulations were published to ensure good governance concerning the safe management and use of Controlled Drugs in England and Scotland.

Prescriptions
Preparations in Schedules 1, 2, 3, 4 and 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>For Preparations in Schedule 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>(01)</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>(03)</td>
<td></td>
</tr>
<tr>
<td>(04-1)</td>
<td>For Preparations in Schedule 4 (Part I)</td>
</tr>
<tr>
<td>(04-2)</td>
<td>For Preparations in Schedule 4 (Part II)</td>
</tr>
<tr>
<td>(05)</td>
<td>For Preparations in Schedule 5</td>
</tr>
</tbody>
</table>

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance at www.gov.uk/dh).

**Prescription requirements**
Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible, must be signed by the prescriber, include the date on which they
were signed, and specify the prescriber’s address (must be within the UK). A machine-written prescription is acceptable, but the prescriber’s signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to the prescription requirements must always state:

- the name and address of the patient (use of a PO Box is not acceptable);
- in the case of a preparation, the form (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus, or whether only one form is available), and, where appropriate, the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified); to avoid ambiguity, where a prescription requests multiple strengths of a medicine, each strength should be prescribed separately (i.e. separate dose, total quantity, etc);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units (tablets, capsules, ampoules), state the total number (in both words and figures) of dosage units to be supplied (e.g. 10 tablets [of 10 mg] rather than 100 mg total quantity);
- the dose, which must be clearly defined (i.e. the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not); it is not necessary that the dose is stated in both words and figures;
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (e.g. name, date, signature and GPhC registration number). The prescription should be marked with the date of supply at the time the Controlled Drug supply is made.

The Department of Health and the Scottish Government have issued a strong recommendation that the maximum quantity of Schedule 2, 3 or 4 Controlled Drugs prescribed should not exceed 30 days; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes.

A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the prescription; the start date may also be specified in the body of the prescription). Schedule 5 prescriptions are valid for 6 months from the appropriate date.

Medicines that are not Controlled Drugs should not be prescribed on the same form as a Schedule 2 or 3 Controlled Drug.

See sample prescription:

![Sample Prescription Image]

**Instalments and repeatable prescriptions** Prescriptions for Schedule 2 or 3 Controlled Drugs can be dispensed by instalments. An instalment prescription must have an instalment direction including both the dose and the instalment amount specified separately on the prescription, and it must also state the interval between each time the medicine can be supplied.

The first instalment must be dispensed within 28 days of the appropriate day (i.e. date of signing unless the prescriber indicates a date before which the Controlled Drug should not be dispensed) and the remainder should be dispensed in accordance with the instructions on the prescription. The prescription must be marked with the date of each supply. The instalment direction is a legal requirement and needs to be complied with, however, for certain situations (e.g. if a pharmacy is closed on the day an instalment is due) the Home Office has approved specific wording which provides pharmacists some flexibility for supply. For details, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition) or see Home Office approved wording for instalment prescribing (Circular 027/2015), available at www.gov.uk/.

Repeatable prescriptions are prescriptions which contain a direction that they can be dispensed more than once (e.g. repeat × 3). Only Schedule 4 and 5 Controlled Drugs are permitted on repeatable prescriptions.

**Private prescriptions** Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms which are provided by local NHS England area teams in England (form FP10PCD), local NHS Health Boards in Scotland (form PPCD) and Wales (form W10PCD); in addition, prescriptions must specify the prescriber’s identification number (or a NHS prescriber code in Scotland).
Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

**Dependence and misuse**

The most common drugs of addiction are crack cocaine and opioids, particularly diamorphine hydrochloride p. 284 (heroin). For arrangements for prescribing of diamorphine hydrochloride, dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts below.

Along with traditional stimulants, such as amphetamine and cocaine, there has been an emerging use of methamphetamine and a range of psychoactive substances with stimulant, depressant or hallucinogenic properties such as lysergide (lysergic acid diethylamide, LSD), ketamine or gamma-hydroxybutyrate (sodium oxybate, GHB).

**Benzodiazepines and z-drugs** (i.e. zopiclone, zolpidem tartrate) have their own potential for misuse and dependence and are often taken in combination with opiates or stimulants.

Cannabis-based products for medicinal use are Schedule 2 Controlled Drugs and can be prescribed only by clinicians listed on the Specialist Register of the General Medical Council. Cannabis with no approved medicinal use is a Schedule 1 Controlled Drug and cannot be prescribed. It remains the most frequently used illicit drug by young people and dependence can develop in around 10% of users. Cannabis use can exacerbate depression and it may cause an acute short-lived toxic psychosis which resolves with cessation, however paranoid symptoms may persist in chronic users; withdrawal symptoms can occur in some users and these can contribute to sleep problems, agitation and risk of self-harm.

**Supervised consumption**

Supervised consumption is not a legal requirement under the 2001 Regulations. Nevertheless, when supervised consumption is directed on the prescription, the Department of Health recommends that any deviation from the prescriber’s intended method of supply should be documented and the justification for this recorded. Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment. It is good practice for pharmacists to alert the prescriber when a patient has missed consecutive daily doses.

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a patient for the first time.
- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.

Prescribers are responsible for the security of prescription forms once issued to them. The stealing and misuse of prescription forms could be minimised by the following precautions:

- records of serial numbers received and issued should be retained for at least three years;
- blank prescriptions should never be pre-signed;
- prescription forms should not be left unattended and should be locked in a secure drawer, cupboard, or carrying case when not in use;
- doctors’, dentists’ and surgery stamps should be kept in a secure location separate from the prescription forms;
- alterations are best avoided but if any are made and the prescription is to be used, best practice is for the prescriber to cross out the error, initial and date the error, then write the correct information;
- if an error made in a prescription cannot be corrected, best practice for the prescriber is to put a line through the script and write ‘spoiled’ on the form, or destroy the form and start writing a new prescription;
- prescribers and pharmacists dispensing drugs prone to abuse should ensure compliance with all relevant legal requirements specially when dealing with prescriptions for Controlled Drugs (see Prescription requirements and Instalments above);
- at the time of dispensing, prescriptions should be stamped with the pharmacy stamp and endorsed by the pharmacist or pharmacy technician with what has been supplied; where loss or theft is suspected, the police should be informed immediately.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) for self-administration and Schedule 5 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are not subject to export or import licensing. A personal import/export licence is required for patients travelling abroad with Schedules 2, 3, or 4 Part I (CD Benz) and Part II (CD Anab) Controlled Drugs if, they are carrying more than 3 months’ supply or are travelling for 3 calendar months or more. A Home Office licence is required for any amount of a Schedule 1 Controlled Drug imported into the UK for personal use regardless of the duration of travel. Further details can be obtained at www.gov.uk/guidance/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting DFLU.ie@homeoffice.gsi.gov.uk. In cases of emergency, telephone (020) 7035 6230.

Applications for obtaining a licence must be supported by a cover letter signed by the prescribing doctor or drug worker, which must confirm:

- the patient’s name and address;
- the travel itinerary;
- the names of the prescribed Controlled Drug(s), doses and total amounts to be carried.

Applications for licences should be sent to the Home Office, Drugs & Firearms Licensing Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to DFLU.ie@homeoffice.gsi.gov.uk. A minimum of 10 days should be allowed for processing the application. Patients travelling for less than 3 months or carrying less than 3 months supply of Controlled Drugs do not require a
personal export/import licence, but are advised to carry a
cover letter signed by the prescribing doctor or drug worker.
Those travelling for more than 3 months are advised to make
arrangements to have their medication prescribed by a
practitioner in the country they are visiting.
Doctors who want to take Controlled Drugs abroad while
accompanying patients may similarly be issued with
licences. Licences are not normally issued to doctors who
want to take Controlled Drugs abroad solely in case a family
emergency should arise.
Personal export/import licences do not have any legal status
outside the UK and are issued only to comply with the
Misuse of Drugs Act 2001 and to facilitate passage through
UK Customs and Excise control. For clearance in the country
to be visited it is necessary to approach that country’s
consulate in the UK.

Notification of patients receiving structured
drug treatment for substance dependence
In England, doctors should report cases where they are
providing structured drug treatment for substance
dependence to their local National Drug Treatment
Monitoring System (NDTMS) Team. General information
about NDTMS can be found at www.gov.uk/government/
collections/alcohol-and-drug-misuse-prevention-and-treatment-
guidance.
Enquiries about NDTMS, and how to submit data, should
initially be directed to:
EvidenceApplicationteam@phe.gov.uk
In Scotland, doctors should report cases to the Substance
Drug Misuse Database. General information about the
Scottish Drug Misuse Database can be found in
www.isdscotland.org/Health-Topics/Drugs-and-Alcohol-Misuse/
Drugs-Misuse/Scottish-Drug-Misuse-Database/. Enquiries about
reporting can be directed to:
nss.isdsubstancemisuse@nhs.net
In Northern Ireland, the Misuse of Drugs (Notification of
and Supply to Addicts) (Northern Ireland) Regulations 1973
require doctors to send particulars of persons whom they
consider to be addicted to certain Controlled Drugs to the
Chief Medical Officer of the Ministry of Health and Social
Services. The Northern Ireland contact is:
Public Health Information & Research Branch
Department of Health
Annexe 2, Castle Buildings, Stormont, Belfast BT4 3SQ
028 9052 2340
phirb@health-ni.gov.uk
Public Health Information & Research Branch also
maintains the Northern Ireland Drug Misuse Database
(NIDMD) which collects detailed information on those
presenting for treatment, on drugs misused and injecting
behaviour; participation is not a statutory requirement.
In Wales, doctors should report cases where they are
providing structured drug treatment for substance
dependence on the Welsh National Database for Substance
Misuse; enquiries should be directed to: substancemisuse-
queries@wales.nhs.uk.

Prescribing of diamorphine (heroin),
dipipanone, and cocaine for addicts
The Misuse of Drugs (Supply to Addicts) Regulations 1997
require that only medical practitioners who hold a special
licence issued by the Home Secretary (or Scottish
Government’s Chief Medical Officer) may prescribe,
administer, or supply diamorphine hydrochloride p. 284,
dipipanone, or cocaine for the treatment of drug addiction.
Medical prescribers, pharmacists independent prescribers,
nurses independent prescribers and supplementary
prescribers do not require a special licence for prescribing
diamorphine hydrochloride p. 284, dipipanone, or cocaine
for patients (including addicts) for relieving pain from
organic disease or injury.
Adverse reactions to drugs

Yellow card scheme
Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of BNF for Children.

Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:
- serious, medically significant or result in harm.
- serious events are fatal, life-threatening, a congenital abnormality, disabling or incapacitating, or resulting in hospitalisation;
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:
- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs. A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

**Yellow Card Centre Northwest**
2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF
Tel: (0151) 794 8122

**Yellow Card Centre Wales**
All Wales Therapeutics and Toxicology Centre, Academic Building, University Hospital Llandough, Penlan Road, Penarth, Vale of Glamorgan, CF64 2XX
Tel: (029) 2074 5831

**Yellow Card Centre Northern & Yorkshire**
Regional Drug and Therapeutics Centre, 16/17 Framlington Place, Newcastle upon Tyne, NE2 4AB
Tel: (0191) 213 7855

**Yellow Card Centre West Midlands**
City Hospital, Dudley Road, Birmingham, B18 7QH
Tel: (0121) 507 5672

**Yellow Card Centre Scotland**
CARDS, Royal Infirmary of Edinburgh, 51 Little France Crescent, Old Dalkeith Road, Edinburgh, EH16 4SA
Tel: (0131) 242 2919

**YCCScotland@luht.scot.nhs.uk**

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

**MHRA Drug Safety Update** Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.gov.uk/drug-safety-update.

**Self-reporting**
Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patients can contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

**Prescription-event monitoring**
In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsu.org.

**Newer drugs and vaccines**
Only limited information is available from clinical trials on the safety of new medicines. Further understanding about
the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaﬂets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Medication errors
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens ﬂuids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF for Children
The BNF for Children includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF for Children. Recognising that hypersensitivity reactions (including anaphylactic and anaphylactoid reactions) can occur with virtually all drugs, this effect is not generally listed, unless the drug carries an increased risk of such reactions or speciﬁc management advice is provided by the manufacturer. Administration site reactions have been omitted from the BNF for Children (e.g. pain at injection site). The BNF for Children also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Drugs that are applied locally or topically carry a theoretical or low risk of systemic absorption and therefore systemic side-effects for these drugs are not listed in the BNF for Children unless they are associated with a high risk to patient safety. Infections are a known complication of treatment with drugs that affect the immune system (e.g. corticosteroids or immunosuppressants); this side-effect is listed in the BNF for Children as ‘increased risk of infection’. Symptoms of drug withdrawal reactions are not individually listed, but are collectively termed ‘withdrawal syndrome’.

### Description of the frequency of side-effects

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Very common</td>
<td>greater than 1 in 10</td>
</tr>
<tr>
<td>Common</td>
<td>1 in 100 to 1 in 10</td>
</tr>
<tr>
<td>Uncommon [formerly ‘less commonly’ in BNF publications]</td>
<td>1 in 1000 to 1 in 100</td>
</tr>
<tr>
<td>Rare</td>
<td>1 in 10 000 to 1 in 100</td>
</tr>
<tr>
<td>Very rare</td>
<td>less than 1 in 10 000</td>
</tr>
<tr>
<td>Frequency not known</td>
<td>frequency is not defined by product literature or the side-effect has been reported from post-marketing surveillance data</td>
</tr>
</tbody>
</table>

For consistency, the terms used to describe side-effects are standardised using a deﬁned vocabulary across all of the drug monographs in the BNF for Children (e.g. postural hypotension is used for the term orthostatic hypotension).

### Special problems

**Symptoms** Children may be poor at expressing the symptoms of an adverse drug reaction and parental opinion may be required.

**Delayed drug effects** Some reactions (e.g. cancers and effects on development) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**Congenital abnormalities** When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

### Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the child has had previous reactions to the drug or formulation;
- prescribe as few drugs as possible and give very clear instructions to the child, parent, or carer;
- whenever possible use a familiar drug; with a new drug be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- obtain a full drug history including asking if the child is already taking other drugs including over-the-counter medicines; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, particularly in neonates, which can affect the potential for adverse effects. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effects of the drug;
- warn the child, parent, or carer if serious adverse reactions are liable to occur.

### Drug allergy (suspected or conﬁrmed)

Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the child was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The child has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present. The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

- **Immediate, rapidly-evolving reactions** (onset usually less than 1 hour after drug exposure)
  - Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also Antihistamines, allergen immunotherapy and allergic emergencies p. 174
  - Urticaria or angioedema without systemic features
Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

**Non-immediate reactions, without systemic involvement** (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

**Non-immediate reactions, with systemic involvement** (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

**Suspected drug allergy information** should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Children and parents or carers should be given information about which drugs and drug-classes to avoid and encouraged to share the drug allergy status.

If a drug allergy is suspected, consider stopping the suspected drug and advising the child and parent or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Children presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Children presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Children presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient children). For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

**Defective medicines**

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre

Guidance on intravenous infusions

Intravenous infusions for neonatal intensive care

Intravenous policy  A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards. The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion syringe should be labelled with the neonate’s name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
- Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination  The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility  Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities  Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed. A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

Blood  Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated). If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsion  These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® may be added to appropriate intravenous fat emulsions.

Other infusions  Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Method

Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5).

When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. Potassium chloride is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the
formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service. Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. sodium nitroprusside.

**Drugs given by continuous intravenous infusion to neonates**
The information provided in *BNF for Children* covers dilution with *Glucose intravenous infusion 5%* and *10% Sodium chloride intravenous infusion 0.9%*. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided, therefore care should be taken if water for injections is used.

### Prescribing in hepatic impairment

**Overview**
Children have a large reserve of hepatic metabolic capacity and modification of the choice and dosage of drugs is usually unnecessary even in apparently severe liver disease. However, special consideration is required in the following situations:

- liver failure characterised by severe derangement of liver enzymes and profound jaundice; the use of sedative drugs, opioids, and drugs such as diuretics and amphotericin p. 387 which produce hypokalaemia may precipitate hepatic encephalopathy;
- impaired coagulation, which can affect response to oral anticoagulants;
- in cholestatic jaundice elimination may be impaired of drugs such as fusidic acid p. 371 and rifampicin p. 379 which are excreted in the bile;
- in hypoproteinaemia, the effect of highly protein-bound drugs such as phenytoin p. 211, prednisolone p. 458, warfarin sodium p. 99, and benzodiazepines may be increased;
- use of hepatotoxic drugs is more likely to cause toxicity in children with liver disease; such drugs should be avoided if possible;
- in neonates, particularly preterm neonates, and also in infants metabolic pathways may differ from older children and adults because liver enzyme pathways may be immature.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in *BNF for Children*.

### Prescribing in renal impairment

**Issues encountered in renal impairment**
The use of drugs in children with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may produce toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by children with renal impairment;
- some drugs are not effective when renal function is reduced;
- neonates, particularly preterm, may have immature renal function.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

**Principles of dose adjustment in renal impairment**
The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity. For many drugs with only minor or no dose-related side-effects, very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient. For more toxic drugs with a small safety margin dose regimens based on glomerular filtration rate should be used. When both efficacy and toxicity are closely related to
plasma–drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma–drug concentration. The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentration. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment, it can take many doses at the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same as the initial dose for a child with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in children with renal disease because the consequences of nephrotoxicity are likely to be more serious when the renal reserve is already reduced. Glomerular filtration rate is low at birth and increases rapidly during the first 6 months. Thereafter, glomerular filtration rate increases gradually to reach adult levels by 1–2 years of age, when standardised to a typical adult body surface area (1.73 m²). In the first weeks after birth, serum creatinine falls; a single measure of serum creatinine provides only a crude estimate of renal function and observing the change over days is of more use. In the neonate, a sustained rise in serum creatinine or a lack of the expected postnatal decline, is indicative of a reduced glomerular filtration rate.

Dose recommendations are based on the severity of renal impairment. This is expressed in terms of glomerular filtration rate (mL/minute/1.73 m²).

The following equations provide a guide to glomerular filtration rate.

Child over 1 year:
Estimated glomerular filtration rate (mL/minute/1.73 m²) = 40 × height (cm)/serum creatinine (micromol/litre)

Neonate:
Estimated glomerular filtration rate (mL/minute/1.73 m²) = 30 × height (cm)/serum creatinine (micromol/litre)

The values used in these formulas may differ according to locality or laboratory.

The serum-creatinine concentration is sometimes used as a measure of renal function but is only a rough guide even when corrected for age, weight, and sex.

Important The information on dose adjustment in *BNF for Children* is expressed in terms of estimated glomerular filtration rate. Renal function in adults is increasingly being reported as estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m²; however, eGFR is derived from the MDRD (Modification of Diet in Renal Disease) formula which is not validated for use in children. eGFR derived from the MDRD formula should not be used to adjust drug doses in children with renal impairment. In *BNF for Children*, values for measures of renal function are included where possible. However, where such values are not available, the *BNF for Children* reflects the terms used in the published information.

### Degrees of renal impairment defined using estimated glomerular filtration rate (eGFR)

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR¹ mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal: Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild: Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate¹: Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe: Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure: Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

¹. Estimated glomerular filtration rate (eGFR) derived from the Modification of Diet in Renal Disease (MDRD) formula for use in patients over 18 years

Drug prescribing should be kept to the minimum in all children with severe renal disease.
If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.
Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in *BNF for Children*.

### Dialysis
For prescribing in children on renal replacement therapy consult specialist literature.

### Advanced Pharmacy Services
Children with renal impairment may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see *Advanced Pharmacy Services* in Guidance on prescribing p. 1.
Prescribing in pregnancy

Overview
Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may from animal

BNF for Children require adjustment during pregnancy due to changes in the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Important
Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org.

Tel: 0344 892 0909 (09.00–17:00 Monday to Friday; urgent enquiries only outside these hours).

MHRA/CHM advice: Medicines with teratogenic potential: what is effective contraception and how often is pregnancy testing needed? (March 2019)
Guidance is available on contraceptive methods and frequency of pregnancy testing to reduce inadvertent exposures during pregnancy in a woman taking a medicine of teratogenic potential. When using these medicines, a woman should be advised of the risks and encouraged to use the most effective contraceptive method taking into account her personal circumstances. The likelihood of pregnancy should be assessed before each prescription of a medicine with known teratogenic potential, by performing a pregnancy test. If pregnancy cannot be excluded, the decision to start or continue treatment will depend on individual circumstances, such as the urgency for treatment and alternative treatment options. If feasible, treatment with a medicine with teratogenic potential should be delayed until pregnancy has been excluded by a repeat test.

Prescribing in breast-feeding

Overview
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds. Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Most medicines given to a mother cause no harm to breast-fed infants and there are few contra-indications to breast-feeding when maternal medicines are necessary. However, administration of some drugs to nursing mothers can harm the infant. In the first week of life, some such as preterm or jaundiced infants are at a slightly higher risk of toxicity. Toxicity to the infant can occur if the drug enters the milk in pharmacologically significant quantities. The concentration in milk of some drugs (e.g. fluvastatin p. 134) may exceed the concentration in maternal plasma so that therapeutic doses in the mother can cause toxicity to the infant. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 223) while others can affect lactation (e.g. bromocriptine). Drugs in breast milk may, at least theoretically, cause hypersensitivity in the infant even when concentration is too low for a pharmacological effect. BNF for Children identifies drugs:

- which should be used with caution or which are contra-indicated in breast-feeding for the reasons given above;
- which, on present evidence, may be given to the mother during breast-feeding, because they may appear in milk in amounts which are too small to be harmful to the infant;
- which are not known to be harmful to the infant although they are present in milk in significant amounts.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF for Children.

Important
For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Overview
Palliative care is the active and total approach to the care of children and young adults with life-limiting and life-threatening conditions, embracing physical, emotional, social, and spiritual elements of their care. It focuses on enhancing the quality of life for the child and support for their family, and includes the management of distressing symptoms, provision of respite, and care following death and bereavement.

Effective palliative care requires a broad multidisciplinary approach that includes the whole family, and ideally should start as soon as possible after diagnosis or recognition of a life-threatening condition.

Drug treatment
The number of drugs should be as few as possible. Oral medication is usually appropriate unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary. For further information on the use of medicines in paediatric palliative care, see the Association for Paediatric Palliative Medicine (APPM) Master Formulary available at www.appm.org.uk/10.html.

Pain
Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 278, NSAID), opioid (e.g. codeine phosphate p. 283 ‘weak’, morphine p. 290 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly. Paracetamol p. 278 or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate p. 283 or tramadol hydrochloride p. 296 can be considered for moderate pain. If these preparations do not control the pain then morphine p. 290 is the most useful opioid analgesic. Alternatives to morphine p. 290, including transdermal buprenorphine p. 281, transdermal fentanyl p. 286, hydromorphone hydrochloride p. 289, methadone hydrochloride p. 307, or oxycodone hydrochloride p. 292, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases
In addition to the above approach, radiotherapy and bisphosphonates may be useful for pain due to bone metastases.

Neuropathic pain
Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant, most commonly amitriptyline hydrochloride p. 245, for several weeks. An antiepileptic such as carbamazepine p. 200, may be added or substituted if pain persists. Ketamine p. 846 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 455, which reduces oedema around the tumour, thus reducing compression. Nerve blocks can be considered when pain is localised to a specific area. Transcutaneous electrical nerve stimulation (TENS) may also help.

Pain management with opioids

Oral route
Treatment with morphine p. 290 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment or frailty. The dose is given either as an immediate-release preparation 4-hourly (for starting doses, see Morphine), or as a 12-hourly modified-release preparation, in addition to rescue doses. If replacing a weaker opioid analgesic (such as codeine phosphate p. 283), starting doses are usually higher. If pain occurs between regular doses of morphine p. 290 (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine p. 290 should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each child should be assessed on an individual basis. Formulations of fentanyl p. 286 that are administered nasally, buccally or sublingually are not licensed for use in children; their usefulness in children is also limited by dose availability.

Children often require a higher dose of morphine p. 290 in proportion to their body-weight compared to adults. Children are more susceptible to certain adverse effects of opioids such as urinary retention (which can be eased by bethanechol chloride), and opioid-induced pruritus.

When adjusting the dose of morphine p. 290, the number of rescue doses required and the response to them should be taken into account; increments of morphine p. 290 should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine p. 290 stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

One of the pain is controlled, children started on 4-hourly immediate-release morphine p. 290 can be transferred to the same total 24-hour dose of morphine p. 290 given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 290. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 292 can be used in children who require an opioid but cannot tolerate morphine p. 290. If the child is already receiving an opioid, oxycodone hydrochloride p. 292 should be started at a dose equivalent to the current analgesic. Oxycodone hydrochloride p. 292 immediate-release preparations can be given for breakthrough pain.
Equivalent doses of opioid analgesics

This table is only an approximate guide (doses may not correspond with those given in clinical practice); children should be carefully monitored after any change in medication and dose titration may be required.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

Parenteral route Diamorphine hydrochloride p. 284 is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose is approximately a third of the oral dose of morphine p. 290. Subcutaneous infusion of diamorphine hydrochloride p. 284 via a continuous infusion device can be useful (for details, see Continuous Subcutaneous Infusions). If the child can resume taking medicines by mouth, then oral morphine p. 290 may be substituted for subcutaneous infusion of diamorphine hydrochloride p. 284. See the table Approximate Equivalent doses of Morphine and Diamorphine.

Rectal route Morphine p. 290 is also available for rectal administration as suppositories.

Transdermal route Transdermal preparations of fentanyl p. 286 and buprenorphine p. 281 [not licensed for use in children] are available; they are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under fentanyl p. 286) because inappropriate use has caused fatalities. The following 24-hour oral doses of morphine p. 290 are considered to be approximately equivalent to the buprenorphine and fentanyl p. 286 patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

</tr>
</tbody>
</table>

Formulations of transdermal patches are available as 72-hourly, 96-hourly and 7-day patches, for further information see buprenorphine in BNF. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

72-hour Fentanyl patches are approximately equivalent to the following 24-hour doses of oral morphine

Symptom control

Unlicensed indications or routes Several recommendations in this section involve unlicensed indications or routes.

Anorexia Anorexia may be helped by prednisolone p. 458 or dexamethasone p. 455.

Anxiety Anxiety can be treated with a long-acting benzodiazepine such as diazepam p. 226, or a continuous infusion of the short-acting benzodiazepine midazolam p. 229. Interventions for more acute episodes of anxiety (such as panic attacks) include short-acting benzodiazepines such as lorazepam p. 228 given sublingually or midazolam p. 229 given subcutaneously. Temazepam p. 847 provides useful night-time sedation in some children.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid p. 83 by mouth; treatment is usually continued for one week after the bleeding has stopped but it can be continued at a reduced dose if bleeding persists. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 83 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 138 can be applied to the affected area.

Vitamin K Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K should be considered.

Constipation Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives. Suitable laxatives include osmotic laxatives (such as lactulose p. 43 or macrogols), stimulant laxatives (such as co-danthramer p. 47 and senna p. 48) or the combination of lactulose p. 43 and a senna p. 48 preparation. Naloxone hydrochloride p. 869 given by mouth may help relieve opioid-induced constipation; it is poorly absorbed but opioid withdrawal reactions have been reported.

Convulsions Convulsions are relatively common in children dying from non-malignant conditions. Phenobarbital p. 223 by mouth or as a continuous subcutaneous infusion may be beneficial; continuous infusion of midazolam p. 229 is an alternative. Both cause drowsiness, but this is rarely a concern in the context of intractable seizures. For breakthrough convulsions diazepam p. 226 given rectally (as a solution), buccal midazolam p. 229, or paraldehyde p. 228 as an enema may be appropriate. See Continuous subcutaneous infusions, below, for the use of midazolam p. 229 by subcutaneous infusion using a continuous infusion device.

Dry mouth Dry mouth may be caused by certain medications including opioid analgesics, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics;
Prescribing in palliative care

Muscle spasm

The pain of muscle spasm can be helped by a preparation incorporating an antacid with an antiulcent and a prokinetic such as domperidone before meals.

Dysphagia

A corticosteroid such as dexamethasone p. 455 may help, temporarily, if there is an obstruction due to tumour. See also Dry mouth, above.

Dyspnoea

Breathlessness at rest may be relieved by regular oral morphine p. 290 in carefully titrated doses. Diazepam p. 226 may be helpful for dyspnoea associated with anxiety. Sublingual lorazepam p. 228 or subcutaneous or buccal midazolam p. 229 are alternatives. A nebulised short-acting beta, agonist or a corticosteroid, such as dexamethasone p. 455 or prednisolone p. 458, may also be helpful for bronchospasm or partial obstruction.

Excessive respiratory secretion

Excessive respiratory secretion (death rattle) may be reduced by hyoscine hydrobromide p. 273 patches or by subcutaneous or intravenous injection of hyoscine hydrobromide p. 273, however, care must be taken to avoid the discomfort of dry mouth. Alternatively, glycopyrronium bromide p. 838 may be given.

Hyoscine hydrobromide p. 273 can be administered by subcutaneous or intravenous infusion using a continuous infusion device.

Fungating tumours

Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 344 is often required to reduce malodour, but topical metronidazole p. 746 is also used.

Gastro-intestinal pain

The pain of bowel colic may be reduced by loperamide hydrochloride p. 51. Hyoscine hydrobromide p. 273 may also be helpful in reducing the frequency of spasms; it is given sublingually as Kwells® tablets and also by subcutaneous infusion.

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone before meals.

Hiccup

Hiccup due to gastric distension may be helped by a preparation incorporating an antacid with an antiulcent.

Insomnia

Children with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 847, may be useful.

Intractable cough

Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 290 every 4 hours. Methadone hydrochloride p. 307 linctus should be avoided because it has a long duration of action and tends to accumulate.

Mucosal bleeding

Mucosal bleeding from the mouth and nose occurs commonly in the terminal phase, particularly in a child suffering from haemopoietic malignancy. Bleeding from the nose caused by a single bleeding point can be arrested by cauterisation or by dressing it. Tranexamic acid p. 83 may be effective applied topically or given systemically.

Muscle spasm

The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 226 or baclofen p. 673.

Nausea and vomiting

Nausea and vomiting are common in children with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. Nausea and vomiting with opioid therapy are less common in children than in adults but may occur particularly in the initial stages and can be prevented by giving an antiemetic. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide hydrochloride p. 269 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not therefore be used concurrently.

Haloperidol p. 252 is used by mouth or by continuous intravenous or subcutaneous infusion for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 266 is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Ondansetron p. 271 is most effective when the vomiting is due to damaged or irritated gut mucosa (e.g. after chemotherapy or radiotherapy). Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine p. 275 can be used if first-line antiemetics are inadequate. Dexamethasone p. 455 by mouth can be used as an adjunct.

See Continuous subcutaneous infusions, below, for the administration of antiemetics by subcutaneous infusion using a continuous infusion device.

Pruritus

Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. Ondansetron p. 271 may be effective in some children. Where opioid analgesics cause pruritus it may be appropriate to review the dose or to switch to an alternative opioid analgesic. In the case of obstructive jaundice, further measures include administration of colestyramine p. 131.

Raised intracranial pressure

Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 455, for 4 to 5 days, subsequently reduced if possible; dexamethasone p. 455 should be given before 6 p.m. to reduce the risk of insomnia. Treatment of headache and of associated nausea and vomiting should also be considered.

Restlessness and confusion

Restlessness and confusion may require treatment with haloperidol p. 252. Levomepromazine p. 275 is also used occasionally for restlessness.

Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control symptoms in palliative care, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections should be avoided in children, particularly if cachectic. This has led to the use of portable continuous infusion devices such as syringe drivers to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:

- inability to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma;
- malignant bowel obstruction for which surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- refusal by the child to take regular medication by mouth.

Syringe driver rate settings

Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.
**Bowel colic and excessive respiratory secretions** Hyoscine hydrobromide p. 273 effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a *subcutaneous* or *intravenous infusion*. Glycopyrronium bromide p. 838 may also be used.

Hyoscine butylbromide p. 64 is effective in bowel colic, is less sedative than hyoscine hydrobromide p. 273, but is not always adequate for the control of respiratory secretions; it is given by *subcutaneous infusion* (**important**: hyoscine butylbromide p. 64 must not be confused with *hyoscine hydrobromide* p. 273, above).

**Confusion and restlessness** Haloperidol p. 252 has little sedative effect. Levomepromazine p. 275 has a sedative effect. Midazolam p. 229 is a sedative and an antiepileptic that may be suitable for a very restless patient.

**Convulsions** If a child has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 229 is the benzodiazepine antiepileptic of choice for *continuous subcutaneous infusion*.

**Nausea and vomiting** Levomepromazine p. 275 causes sedation in about 50% of patients. Haloperidol p. 252 has little sedative effect. Cyclizine p. 266 is particularly likely to precipitate if mixed with diamorphine hydrochloride p. 284 or other drugs (see under *Mixing and compatibility*); it is given by *subcutaneous infusion*.

**Pain control** Diamorphine hydrochloride p. 284 is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under *Mixing and compatibility*). The table shows approximate equivalent doses of morphine p. 290 and diamorphine hydrochloride p. 284.

**Mixing and compatibility** The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 251, prochlorperazine p. 275, and diazepam p. 226 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 266 and levomepromazine p. 275 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride p. 610 0.9%) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1−0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

**Compatibility with diamorphine** Diamorphine can be given by *subcutaneous infusion* in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either *water for injections or physiological saline* (sodium chloride 0.9%) is a suitable diluent—above that strength only *water for injections* is used (to avoid precipitation).

The following can be mixed with diamorphine:
- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.

---

If breakthrough pain occurs give a subcutaneous injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. With an intermittent subcutaneous injection absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Drugs and sport

Anti-doping
UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. Information regarding the use of medicines in sport is available from:
UK Anti-doping
Fleetbank House
2-6 Salisbury Square
London
EC4Y 8AE
(020) 7842 3450
ukad@ukad.org.uk
www.ukad.org.uk

Information about the prohibited status of specific medications based on the current World Anti-Doping Agency Prohibited List is available from Global Drug Reference Online: www.globaldro.com/UK/search

General Medical Council’s advice
Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.

Prescribing in dental practice

General guidance
Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections.

The following is a list of topics of particular relevance to dentists.

Prescribing by dentists, see Prescription writing p. 6
Oral side-effects of drugs, see Adverse reactions to drugs p. 14
Medical emergencies in dental practice, see BNF
Medical problems in dental practice, see BNF

Drug management of dental and oral conditions

1 Chronic bowel disorders

1.1 Coeliac disease

Coeliac disease

Description of condition

Coeliac disease is an autoimmune condition which is associated with chronic inflammation of the small intestine. Dietary proteins known as gluten, which are present in wheat, barley and rye, activate an abnormal immune response in the intestinal mucosa, which can lead to malabsorption of nutrients.

Aims of treatment

The management of coeliac disease is aimed at eliminating symptoms (such as diarrhoea, bloating and abdominal pain) and reducing the risk of complications, including those resulting from malabsorption.

Non-drug treatment

The only effective treatment for coeliac disease is a strict, life-long, gluten-free diet. A range of gluten-free products is available for prescription (see Borderline substances).

Drug treatment

Children who have coeliac disease are at an increased risk of malabsorption of key nutrients (such as calcium and vitamin D). Supplementation of key nutrients may be required if dietary intake is insufficient.

Carers of children who have coeliac disease should be advised not to medicate with over-the-counter vitamin or mineral supplements. Initiation of supplementation should involve a discussion with a member of the child’s healthcare team in order to identify the individual needs of the patient and to allow for appropriate ongoing monitoring.

Useful Resources

ulceration and fissuring of the mucosa, and the presence of granulomas; affected areas may occur in any part of the gastro-intestinal tract, interspersed with areas of relatively normal tissue. Crohn’s disease may present as recurrent attacks, with acute exacerbations combined with periods of remission or less active disease. Symptoms depend on the site of disease but may include abdominal pain, diarrhoea, fever, weight loss, and rectal bleeding.

Complications of Crohn’s disease include intestinal strictures, abscesses in the wall of the intestine or adjacent structures, fistulae, anaemia, malnutrition, colorectal and small bowel cancers, and growth failure and delayed puberty in children. Crohn’s disease may also be associated with extra-intestinal manifestation: the most common are arthritis and abnormalities of the joints, eyes, liver and skin. Crohn’s disease is also a cause of secondary osteoporosis and those at greatest risk should be monitored for osteopenia and assessed for the risk of fractures.

Up to a third of patients with Crohn’s disease are diagnosed before the age of 21 years but there is a lack of evidence regarding treatment for children. Paediatric practice is often based on extrapolation from adult studies.

**Fistulating Crohn’s disease**

Fistulating Crohn’s disease is a complication that involves the formation of a fistula between the intestine and adjacent structures, such as perianal skin, bladder, and vagina. It occurs in about one quarter of patients, mostly when the disease involves the ileocolonic area.

**Aims of treatment**

Treatment is largely directed at the induction and maintenance of remission and the relief of symptoms. Active treatment of acute Crohn’s disease should be distinguished from preventing relapse. The aims of drug treatment are to reduce symptoms and maintain or improve quality of life, while minimising toxicity related to drugs over both the short and long term. Drug treatment should always be initiated by a paediatric gastroenterologist.

In fistulating Crohn’s disease, surgery and medical treatment aim to close and maintain closure of the fistula.

**Non-drug treatment**

**Drug treatment**

**Treatment of acute disease**

**Monotherapy**

A corticosteroid (either prednisolone p. 458 or methylprednisolone p. 458 or intravenous hydrocortisone p. 456), is used to induce remission in children with a first presentation or a single inflammatory exacerbation of Crohn’s disease in a 12-month period.

Enteral nutrition is an alternative to a corticosteroid when there is concern about growth or side effects.

In children with distal ileal, ileocaecal or right-sided colonic disease, in whom a conventional corticosteroid is unsuitable or contra-indicated, budesonide p. 34 [unlicensed] may be considered. Budesonide is less effective but may cause fewer side-effects than other corticosteroids, as systemic exposure is limited. Aminosalicylates (such as sulfasalazine p. 33 and mesalazine p. 31) are an alternative option in these children. They are less effective than a corticosteroid or budesonide [unlicensed], but may be preferred because they have fewer side-effects. Aminosalicylates and budesonide are not appropriate for severe presentations or exacerbations.

**Add-on treatment**

Add on treatment is prescribed if there are two or more inflammatory exacerbations in a 12-month period, or the corticosteroid dose cannot be reduced.

Azathioprine p. 536 or mercaptopurine p. 562 [unlicensed indications] can be added to a corticosteroid or budesonide to induce remission. In children who cannot tolerate azathioprine or mercaptopurine or in whom thiopurine methyltransferase (TPMT) activity is deficient, methotrexate p. 563 can be added to a corticosteroid.

Under specialist supervision, monoclonal antibody therapies, adalimumab p. 565 and infliximab p. 35, are options for the treatment of severe, active Crohn’s disease, following inadequate response to conventional therapies or in those who are intolerant of or have contra-indications to conventional therapy. See also National funding/access decisions for adalimumab and infliximab.

Adalimumab and infliximab can be used as monotherapy or combined with an immunosuppressant, although there is uncertainty about the comparative effectiveness. There are concerns about the long-term safety of adalimumab and infliximab in children; malignancies, including hepatosplenic T-cell lymphoma, have been reported.

**Maintenance of remission**

Children, and their parents or carers, should be made aware of the risk of relapse with and without drug treatment, and symptoms that may suggest a relapse (most frequently unintended weight loss, abdominal pain, diarrhoea and general ill-health). For those who choose not to receive maintenance treatment during remission, a suitable follow up plan should be agreed upon and information provided on how to access healthcare if a relapse should occur.

Azathioprine or mercaptopurine [unlicensed indications] as monotherapy can be used to maintain remission when previously used with a corticosteroid to induce remission. They may also be used in children who have not previously received these drugs (particularly those with adverse prognostic factors such as early age of onset, perianal disease, corticosteroid use at presentation, and severe presentations). Methotrexate [unlicensed] can be used to maintain remission only in children who required methotrexate to induce remission, or who are intolerant of or are not suitable for azathioprine or mercaptopurine for maintenance. Corticosteroids or budesonide should not be used.

**Maintaining remission following surgery**

Azathioprine or mercaptopurine can be considered to maintain remission after surgery in children with adverse prognostic factors such as more than one resection, or previously complicated or debilitating disease (for example, abscess, involvement of adjacent structures, fistulating or penetrating disease). Aminosalicylates can also be considered as an option, however budesonide or enteral nutrition should not be used.

**Other treatments**

Loperamide hydrochloride p. 51 can be used to manage diarrhoea associated with Crohn’s disease in children who do not have colitis. Colestyramine p. 131 is licensed for the relief of diarrhoea associated with Crohn’s disease. See also Diarrhoea (acute) p. 43.

**Fistulating Crohn’s disease**

Perianal fistulae are the most common occurrence in children with fistulating Crohn’s disease. Treatment may not be necessary for simple, asymptomatic perianal fistulae. When fistulae are symptomatic, local drainage and surgery may be required in conjunction with medical therapy.

Metronidazole p. 344 or ciprofloxacin p. 361 [unlicensed indications], alone or in combination, can improve symptoms of fistulating Crohn’s disease but complete
healing occurs rarely. Metronidazole should be given for at least 6 weeks but no longer than 3 months because of concerns about peripheral neuropathy. Other antibacterials should be given if specifically indicated (e.g. in sepsis associated with fistulare and perianal disease) and for managing bacterial overgrowth in the small bowel.

Either azathioprine p. 538 or mercaptopurine p. 562 (unlicensed indications) is used to control the inflammation in perianal and enterocutaneous fistulating Crohn’s disease and they are continued for maintenance.

Infliximab p. 35 is recommended for children with perianal and enterocutaneous active fistulating Crohn’s disease who have not responded to conventional therapy (including antibacterials, drainage and immunosuppressive treatments), or who are intolerant of or have contraindications to conventional therapy. Infliximab should be used after ensuring that all sepsis is actively draining.

Abscess drainage, fistulotomy, and seton insertion may be appropriate, particularly before infliximab treatment.

Azathioprine, mercaptopurine or infliximab should be continued as maintenance treatment for at least one year.

For the management of non-perianal fistulating Crohn’s disease (including entero-gynaecological and enterovesical fistulae) surgery is the only recommended approach.

www.nice.org.uk/guidance/cg152

**Ulcerative colitis**

**Description of condition**

Ulcerative colitis is a chronic inflammatory condition, characterised by diffuse mucosal inflammation—it has a relapsing–remitting pattern. It is a life-long disease that is associated with significant morbidity. Ulcerative colitis is more common in adults; however, in children it predominately presents between the ages of 5 and 16 years.

The pattern of inflammation is continuous, extending from the rectum upwards to a varying degree. Inflammation of the rectum is referred to as proctitis, and inflammation of the rectum and sigmoid colon as proctosigmoiditis. **Left-sided colitis** refers to disease involving the colon distal to the splenic flexure. **Extensive colitis** affects the colon proximal to the splenic flexure, and includes pan-colitis, where the whole colon is involved. Child–onset ulcerative colitis is classified as extensive in 60–80% of all cases. Common symptoms of active disease or relapse include bloody diarrhoea, an urgent need to defaecate, and abdominal pain.

Ulcerative colitis is classified as **subacute** if it is moderate–to-severe active disease which can be managed in an outpatient setting, and does not require hospitalisation or consideration of urgent surgical intervention.

Complications associated with ulcerative colitis include an increased risk of colorectal cancer, secondary osteoporosis, venous thromboembolism and toxic megacolon. Growth and pubertal development can be affected in children.

**Aims of treatment**

Treatment is focussed on treating active disease to manage symptoms and to induce and maintain remission.

**Drug treatment**

**Overview**

Management of ulcerative colitis is dependent on factors such as clinical severity, extent of disease, and the child’s preference. As limited distal disease is uncommon in children, paediatric treatment strategy depends mainly on disease severity rather than the extent of disease. Clinical and laboratory investigations are used to determine the extent and severity of disease and to guide treatment.

Severity is classified as mild, moderate or severe (or in remission) by using the Paediatric Ulcerative Colitis Activity Index to assess bowel movement, limitations on daily activity and the presence of abdominal pain or melaena—see the NICE guideline for Ulcerative Colitis for further information (Useful resources below).

The extent of disease should be considered when choosing the route of administration for aminosalicylates and corticosteroids; whether oral treatment, topical treatment or both are to be used.

If the inflammation is distal, a rectal preparation is adequate, but if the inflammation is extended, systemic medication is required. Either suppositories or enemas can be offered, taking into account the child’s preferences.

Rectal foam preparations and suppositories can be used when children have difficulty retaining liquid enemas.

Diarrhoea that is associated with active ulcerative colitis is sometimes treated with anti-diarrhoeal drugs (such as loperamide hydrochloride p. 51 [unlicensed under 4 years]) on the advice of a specialist; however their use is contraindicated in acute ulcerative colitis as they can increase the risk of toxic megacolon.

A macrogol-containing osmotic laxative (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44) may be useful for proximal faecal loading in proctitis.

Oral aminosalicylates for the treatment of ulcerative colitis are available in different preparations and release forms. The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the patient. When used to maintain remission, single daily doses of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

**Treatment of acute mild-to-moderate ulcerative colitis**

Acute treatment to induce remission generally consists of an aminosalicylate with or without a corticosteroid.

**Aminosalicylates** are recommended as first-line treatment for children at first presentation or with an exacerbation. Oral aminosalicylates (balsalazide sodium p. 31 [unlicensed], mesalazine p. 31 [unlicensed under 6 years], olsalazine sodium p. 33 [unlicensed under 12 years] or sulfasalazine p. 33 [unlicensed under 2 years]) are recommended as first line except in children with proctitis or proctosigmoiditis where a rectal aminosalicylate (mesalazine or sulfasalazine [both unlicensed under 6 years]) is more effective. A rectal corticosteroid (budesonide p. 34 [unlicensed], hydrocortisone p. 456 [unlicensed under 2 years] or prednisolone p. 458) or oral prednisolone [unlicensed under 2 years] alone can be considered in children with proctitis or proctosigmoiditis who are intolerant to or decline treatment with aminosalicylates, or in whom aminosalicylates are contra-indicated.

Addition of oral beclometasone dipropionate [unlicensed] or a rectal aminosalicylate to oral aminosalicylate treatment may also be considered in children with left-sided or extensive disease. Oral prednisolone [unlicensed under 2 years] alone is recommended for children who cannot tolerate or who decline aminosalicylates, or in whom aminosalicylates are contra-indicated.

Oral prednisolone [unlicensed under 2 years] should be considered for the treatment of children with subacute proctitis or proctosigmoiditis.

In all extents of disease, if there are no improvements within four weeks of initial treatment or if symptoms worsen, addition of oral prednisolone to aminosalicylate therapy can be considered (discontinue beclometasone dipropionate if adding oral prednisolone). If there is still no response after 2–4 weeks of treatment with prednisolone,
consider adding oral tacrolimus p. 540 [unlicensed indication] to prednisolone to induce remission. Alternatively, on specialist advice, infliximab p. 35 [unlicensed indication; can be used in children over 6 years] or intravenous tacrolimus [unlicensed indication] can be added, if there is no response after 2–4 weeks of treatment with prednisolone.

Evaluation of response should be done early to allow tapering of corticosteroids and ongoing treatment. Unnecessary corticosteroid exposure is to be avoided to minimise growth retardation and other corticosteroid-related side effects.

Treatment of acute severe ulcerative colitis

Acute severe ulcerative colitis of any extent can be life-threatening and is regarded as a medical emergency. Immediate hospital admission is required for treatment. Intravenous corticosteroids (such as hydrocortisone or methylprednisolone p. 458) should be given to induce remission in children with acute severe ulcerative colitis (whether it is a first presentation or an inflammatory exacerbation) while assessing the need for surgery. If intravenous corticosteroids are contra-indicated, declined or cannot be tolerated, then intravenous ciclosporin p. 537 [unlicensed indication], or surgery should be considered. A combination of intravenous ciclosporin with intravenous corticosteroids, or surgery is second line therapy for children who have little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid.

Alternatively, infliximab can be used on specialist advice in children over 6 years. If there is little or no improvement within 72 hours of starting intravenous corticosteroids or in children whose symptoms worsen despite treatment with a corticosteroid.

In patients who experience an initial response to steroids followed by deterioration, stool cultures should be taken to exclude pathogens; cytomegalovirus activation should be considered.

Infliximab for ulcerative colitis

Infliximab p. 35 can be used to treat acute severe active ulcerative colitis in children over 6 years who have had an inadequate response to conventional treatment (including corticosteroids and azathioprine p. 536 or mercaptopurine p. 562) or if conventional treatment is not tolerated or contra-indicated. Treatment with these agents is continued into the maintenance phase if effective and tolerated. See also National funding/access decisions for infliximab.

Infliximab can also be used to treat acute exacerbations of severely active ulcerative colitis in children over 6 years, if ciclosporin p. 537 is contra-indicated or clinically inappropriate.

Maintaining remission in mild, moderate or severe ulcerative colitis

To reduce the chances of relapse occurring, maintenance therapy with an aminosalicylate is recommended in most children. Corticosteroids are not suitable for maintenance treatment because of their side-effects. After a mild-to-moderate inflammatory exacerbation of proctitis or proctosigmoiditis, a rectal aminosalicylate can be started alone or in combination with an oral aminosalicylate, administered daily or as part of an intermittent regimen (such as twice to three times weekly or the first seven days of each month). An oral aminosalicylate can be used alone in children who prefer not to use enemas or suppositories, although, this may not be as effective.

A low dose of oral aminosalicylate is given to maintain remission in children after a mild-to-moderate inflammatory exacerbation of left-sided or extensive ulcerative colitis.

Oral aminosalicylates are available in different preparations and release forms. The preparation and dosing schedule should be chosen taking into account the delivery characteristics and suitability for the child. When used to maintain remission single daily dosing of oral aminosalicylates can be more effective than multiple daily dosing, but may result in more side-effects.

Oral azathioprine or mercaptopurine [unlicensed indications] can be considered to maintain remission, if there has been two or more inflammatory exacerbations in a 12-month period that require treatment with systemic corticosteroids or if remission is not maintained by aminosalicylates, or following a single acute severe episode.

There is no evidence to support the use of methotrexate p. 563 to induce or maintain remission in ulcerative colitis though its use is common in clinical practice.

Non-drug treatment

Surgery may be necessary as emergency treatment for severe ulcerative colitis that does not respond to drug treatment. Patients can also choose to have elective surgery for unresponsive or frequently relapsing disease that is affecting their quality of life.

  - Respiratory disorders

- Frequency not known
  - Angioedema
  - Eosinophilia
  - Haemolytic anaemia
  - Neutropenia
  - Urticarial disorders
  - Ulcerative colitis aggravated

SIDE-EFFECTS, FURTHER INFORMATION

A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

→ ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in salicylate hypersensitivity.

→ RENAL IMPAIRMENT

Monitoring

Renal function should be monitored more frequently in renal impairment.

→ MONITORING REQUIREMENTS

Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment.

→ PATIENT AND CARER ADVICE

Blood disorders

Patients receiving aminosalicylates, and their carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment.
Balsalazide sodium

**INDICATIONS AND DOSE**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 12-17 years: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 12-17 years: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

**UNLICENSED USE**

Not licensed for use in children under 18 years.

**CAUTIONS**

History of asthma

**INTERACTIONS**

Blood disorder - cholelithiasis - lupus-like syndrome

**SIDE-EFFECTS**

Diarrhoea may develop in the infant.

Manufacturer advises avoid.

**PREGNANCY**

Manufacturer advises caution; avoid in severe impairment (no information available).

**RENAL IMPAIRMENT**

Manufacturer advises avoid in moderate to severe impairment.

**MENICIAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**CAPSULE**

Colazide (Almirall Ltd)

Balsalazide disodium 750 mg Colazide 750mg capsules | 130 capsule | £30.42 DT = £30.42

Mesalazine

**INDICATIONS AND DOSE**

**DOSE EQUIVALENCE AND CONVERSION**

There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

**ASACOL® MR 400MG TABLETS**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 12-17 years: 800 mg 3 times a day

Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis

- **BY MOUTH**
  - Child 12-17 years: 400–800 mg 2–3 times a day

**ASACOL® FOAM ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- **BY RECTUM**
  - Child 12-17 years: 2 g once daily for 4–6 weeks, to be administered into the rectum

**ASACOL® SUPPOSITORIES**

Treatment and maintenance of remission of ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 250–500 mg 3 times a day, last dose to be administered at bedtime

**OCTASA®**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 2.4–4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 1.2–2 g once daily, alternatively daily in divided doses

**PENTASA® GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 2 g once daily

**PENTASA® RETENTION ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 1 g once daily, dose to be administered at bedtime

**PENTASA® SUPPOSITORIES**

Treatment of acute attack, ulcerative proctitis

- **BY RECTUM**
  - Child 12-17 years: 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis

- **BY RECTUM**
  - Child 12-17 years: 1 g daily

**PENTASA® TABLETS**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3 divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 2 g once daily
SALOFALK® ENEMA
Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission
▶ BY RECTUM
  • Child 12-17 years: 2 g once daily, dose to be administered at bedtime
SALOFALK® GRANULES
Treatment of mild to moderate ulcerative colitis, acute attack
▶ BY MOUTH
  • Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
  • Child 5-17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
Maintenance of remission of ulcerative colitis
▶ BY MOUTH
  • Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  • Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
SALOFALK® RECTAL FOAM
Treatment of mild ulcerative colitis affecting sigmoid colon and rectum
▶ BY RECTUM
  • Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
SALOFALK® SUPPOSITORIES
Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon
▶ BY RECTUM
  • Child 12-17 years: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories
SALOFALK® TABLETS
Treatment of mild to moderate ulcerative colitis, acute attack
▶ BY MOUTH
  • Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  • Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
Maintenance of remission of ulcerative colitis
▶ BY MOUTH
  • Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  • Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
▶ Rare or very rare Cheilitis exacerbated · drug fever · flatulence · nephritis
SPECIFIC SIDE-EFFECTS
▶ Rare or very rare
  • With rectal use: Constipation
PREGNANCY
Negligible quantities cross placenta.
BREAST FEEDING
Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.
Monitoring
Monitor breast-fed infant for diarrhoea.
HEPATIC IMPAIRMENT
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.
RENAL IMPAIRMENT
Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
PENTASA® TABLETS
Tablets may be halved, quartered, or dispersed in water, but should not be chewed.
PENTASA® GRANULES
Granules should be placed on tongue and washed down with water or orange juice without chewing.
Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.
SALOFALK® GRANULES
Granules should be placed on tongue and washed down with water without chewing.

PRESCRIBING AND DISPENSING INFORMATION
There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.
Flavours of granule formulations of Salofalk® may include vanilla.

PATIENT AND CARER ADVICE
If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

Medicines for Children leaflet: Mesalazine (oral) for inflammatory bowel disease www.medicinesforchildren.org.uk/mesalazine-oral-inflammatory-bowel-disease

MEDICINAL FORMS

**Sulfasalazine**

(Sulphasalazine)

**INDICATIONS AND DOSE**

- Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn's disease
  - **BY MOUTH**
    - Child 2-11 years: 10–15 mg/kg 4–6 times a day (max. per dose 1 g) until remission occurs; increased if necessary up to 60 mg/kg daily in divided doses
    - Child 12-17 years: 1–2 g 4 times a day until remission occurs
  - **BY RECTUM**
    - Child 5–7 years: 500 mg twice daily
    - Child 8–11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
    - Child 12–17 years: 0.5–1 g twice daily

- Maintenance of remission of mild to moderate and severe ulcerative colitis
  - **BY MOUTH**
    - Child 2-11 years: 5–7.5 mg/kg 4 times a day (max. per dose 500 mg)
    - Child 12-17 years: 500 mg 4 times a day
  - **BY RECTUM**
    - Child 5–7 years: 500 mg twice daily
    - Child 8–11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
    - Child 12–17 years: 0.5–1 g twice daily

**Juvenile idiopathic arthritis**

- **BY MOUTH**
  - Child 2-11 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 2 g per day
  - Child 12–17 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 3 g per day

**UNLICENSED USE**

- Not licensed for use in children under 12 years.

**INTERACTIONS**

- Appendix 1: olsalazine

**SIDE-EFFECTS**

- Uncommon Paresthesia - tachycardia

**FREQUENCY NOT KNOWN**

- Palpitations - vision blurred

**PREGNANCY**

- Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

- Monitoring Monitor breast-fed infants for diarrhoea.

**RENAI IMPAIRMENT**

- Use with caution; manufacturer advises avoid in significant impairment.

**DIRECTIONS FOR ADMINISTRATION**

- Capsules can be opened and contents sprinkled on food.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- CAUTIONARY AND ADVISORY LABELS
  - Olsalazine sodium (Non-proprietary)
  - Olsalazine sodium 500 mg Olsalazine 500mg tablets | 60 tablet (Pos) £161.00 DT = £161.00

**Capsule**

- CAUTIONARY AND ADVISORY LABELS
  - Olsalazine sodium (Non-proprietary)
  - Olsalazine sodium 250 mg Olsalazine 250mg capsules | 112 capsule (Pos) £144.00 DT = £144.00

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

- Sulphasalazine has been confused with sulfadiazine; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**

- Child under 2 years of age

**CAUTIONS**

- Acute porphyrias p. 624 • G6PD deficiency - history of allergy - history of asthma - maintain adequate fluid intake • risk of haematological toxicity • risk of hepatic toxicity • slow acetylator status

---

**BNFC 2019–2020**
**Budesonide**

**DRUG ACTION** Budesonide is a glucocorticoid, which exerts significant local anti-inflammatory effects.

**INDICATIONS AND DOSE**

**BUDENOFALK® CAPSULES**
- **Mild to moderate Crohn’s disease affecting the ileum or ascending colon**
  - **BY MOUTH**
    - Child 12-17 years: 3 mg 3 times a day for up to 8 weeks, reduce dose gradually over 2 weeks following treatment

**ENTOCORT® CAPSULES**
- **Mild to moderate Crohn’s disease affecting the ileum or ascending colon**
  - **BY MOUTH**
    - Child 12-17 years: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning

**ENTOCORT® ENEMA**
- **Ulcereative colitis involving rectal and recto-sigmoid disease**
  - **BY RECTUM**
    - Child 12-17 years: 1 enema daily for 4 weeks, to be administered at bedtime

**UNLICENSED USE**
- Not licensed for use in children for Crohn’s disease or ulcerative colitis.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**
- Common or very common
  - Insomnia • stomatitis • taste altered • tinnitus • urine abnormalities
- Uncommon
  - Face oedema • seizure • vasculitis • vertigo

**FREQUENCY NOT KNOWN**
- Anaemia • appetite decreased • ataxia • cyanosis • encephalopathy • haematuria • hallucination • hepatic failure • hypoprothrombinemia • lymphadenopathy • macrocytosis • meningitis aseptic • methaemoglobinemia • nephrotic syndrome • parotitis • periorbital oedema • pseudomembranous enterocolitis • serum sickness • severe cutaneous adverse reactions (SCARs) • smell disorders • systemic lupus erythematosus (SLE) • yellow discoloration of body fluids

**SIDE-EFFECTS, FURTHER INFORMATION**
- Incidence of side-effects increases with higher doses.
- **Blood disorders** Haematological abnormalities occur usually in the first 3 to 6 months of treatment—discontinue if these occur.

**PREGNANCY**
- Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

**BREAST FEEDING**
- Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution.

**RENAL IMPAIRMENT**
- Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**
- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.

**PATIENT AND CARER ADVICE**
- Contact lenses Some soft contact lenses may be stained.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**

**INFLAMMATORY BOWEL DISEASE**

**INFliximAB**

**Indications and dose**

**Severe active Crohn’s disease**
- **by intravenous infusion**
  - Child <6 months: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, then 5 mg/kg after 4 weeks, then maintenance 5 mg/kg every 8 weeks, interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial dose

**Fistulating Crohn’s disease**
- **by intravenous infusion**
  - Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

**Severe active ulcerative colitis**
- **by intravenous infusion**
  - Child 6–17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 8 weeks of initial dose

**Unlicensed use**
- Not licensed for fistulating Crohn’s disease in children.

**Important Safety Information**

Adequate resuscitation facilities must be available when infliximab is used.

**Contra-indications**

- Moderate or severe heart failure
- Severe infections

**Cautions**

- Demyelinating disorders (risk of exacerbation)
- Dermatomyositis (development of malignancy)
- Hepatitis B virus—monitor for active infection
- History of malignancy
- History of prolonged immunosuppressant or PUVA treatment in patients with psoriasis
- Mild heart failure (discontinue if symptoms develop or worsen)
- Predisposition to infection (discontinue if new serious infection develops)
- Risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)

**Caution, further information**

- Infection
  - Manufacturer advises patients should be up-to-date with current immunisation schedule before initiating treatment.
  - Tuberculosis
    - Manufacturer advises patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. Patients at high risk of tuberculosis cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).
  - Hypersensitivity reactions
    - Hyper-sensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.

**Interactions**

- **Appendix 1: monoclonal antibodies**

**Side-effects**

- **Common or very common**
  - Abcess, alopecia, anaemia, arthralgia, chest pain, chills, constipation, decreased leucocytes, depression, diarrhoea, dizziness, dyspnoea, eye inflammation, fatigue, fever, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, headache, hepatic disorders, hyperhidrosis, hypotension, hypertension, increased risk of infection, infusion related reaction, insomnia, lymphenadenopathy, myalgia, nausea, neutropenia, oedema, pain, palpitations, respiratory disorders, sensation abnormal, sepsis, skin reactions, vasodilatation, vertigo
- **Uncommon**
  - Anxiety, chelitis, cholecystitis, confusion, drowsiness, healing impaired, heart failure, hyperventilation, lupus-like syndrome, lymphocytosis, memory loss, neutropenia, nerve disorders, pancreatitis, peripheral ischaemia, pulmonary oedema, seborrhoea, seizure, syncope, thrombocytopenia, thrombophlebitis
- **Rare or very rare**
  - Agranulocytosis, circulatory collapse, cyanosis, demyelinating disorders, granuloma, haemolytic anaemia, hepatitis B reactivation, meningitis, pneumonia, peripheral effusion, sarcoidosis, severe cutaneous adverse reactions (SCARs), transverse myelitis, vasculitis, vasospasm
- **Frequency not known**
  - Bone fracture, dermatomyositis, exacerabated, hepatosplenic T-cell lymphoma (increased risk in inflammatory bowel disease), myocardial infarction, myocardial ischaemia, ulcerative colitis aggravated, vision loss

**Conception and contraception**

- Manufacturer advises adequate contraception during and for at least 6 months after last dose.

**Pregnancy**

- Use only if essential.

**Breast feeding**

- Amount probably too small to be harmful.

**Pre-treatment screening**

- Tuberculosis
  - Manufacturer advises patients should be evaluated for tuberculosis before treatment.

**Monitoring requirements**

- Monitor for infection before, during, and for 6 months after treatment.
- All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).
- Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.
- Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

**Directions for administration**

- For **intravenous infusion** reconstitute each 100-mg vial of powder with 10 mL Water for Injections; to dissolve, gently swirl vial without shaking; allow to stand for 5 minutes; dilute required dose with Sodium Chloride 0.9% to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours; start infusion within 3 hours of reconstitution.

**Prescribing and dispensing information**

- Infliximab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.
1.3 Irritable bowel syndrome

Irritable bowel syndrome

24-Feb-2016

Description of condition

Irritable bowel syndrome (IBS) is a gastrointestinal disorder characterised by abdominal pain or discomfort that may be relieved by defaecation. It can also be associated with the passage of mucus, bloating, and disordered defaecation; either diarrhoea, constipation, or alternating diarrhoea and constipation. Constipation presents with straining, urgency, and a sensation of incomplete evacuation. Before a diagnosis of IBS is made, the symptoms should be present at least once per week for at least 2 months and other potential pathological causes of the symptoms should be excluded. IBS symptoms are often aggravated by psychological factors, such as anxieties, emotional stress, and fear.

Aims of treatment

Treatment of IBS is focused on symptom control in order to improve quality of life, including minimising abdominal pain and normalising the frequency and consistency of stools.

Non-drug treatment

There is no evidence of the effectiveness of any form of dietary advice or increased fibre intake in children and it is not known whether dietary advice recommended to adult patients is of benefit to children.

Eating regularly, limiting fresh fruit intake, and, reducing intake of ‘resistant starch’ and insoluble fibre (e.g. bran) can be recommended. If an increase in dietary fibre is required, soluble fibre such as oats, ispaghula husk p. 42, or sterculia p. 43 can be recommended. Ensuring a sufficient intake of fluids can also be recommended.

Drug treatment

Clinicians should only prescribe drugs for children with IBS in cases of severe symptoms that have not responded to non-drug approaches. Treatment options include laxatives, antimitotility drugs or antispasmodic drugs.

A laxative can be used to treat abdominal pain if the underlying cause is suspected to be constipation. An osmotic laxative, such as a macrogol or lactulose p. 43, is preferred; lactulose may cause flatulence during the first few days of treatment. Loperamide hydrochloride p. 51 may relieve diarrhoea and antispasmodic drugs may relieve pain.

ANTISPASMODICS

Mebeverine with ispaghula husk

04-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 65, ispaghula husk p. 42.

• INDICATIONS AND DOSE

Irritable bowel syndrome

• BY MOUTH

• Child 12-17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

• DIRECTIONS FOR ADMINISTRATION

Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.
ensuring adequate nutrition and drug absorption, thereby

Aims of treatment

Methods of short bowel syndrome focuses on

1.4 Short bowel syndrome

Description of condition

Children with a shortened bowel due to large surgical

Aims of treatment

The management of short bowel syndrome focuses on

Drug treatment

Nutritional deficiencies

Children with a short bowel may require replacement of

Diarrhoea and high output stomas

Diarrhoea is a common symptom of short bowel syndrome

Antimotility drugs

Loperamide hydrochloride p. 51 reduces intestinal

Colestyramine

In children with an intact colon and less than

Antisecretory drugs

Use of a proton pump inhibitor alone does not eliminate the

Growth factors

Growth factors can be used to facilitate intestinal adaptation

Drug absorption

For Prescribing in children with stoma see Stoma care p. 75.
Many drugs are incompletely absorbed by children with a short bowel and may need to be prescribed in much higher doses than usual (such as levothyroxine, warfarin, oral contraceptives, and digoxin) or may need to be given intravenously.

Several factors can alter the absorption of drugs taken by mouth in children with a compromised gastrointestinal system. The most important factors are the length of intestine available for drug absorption, and which section system. The most important factors are the length of mouth in children with a compromised gastrointestinal

SIDE-EFFECTS

Colo-rectal polyps

CAUTIONS

CONTRA-INDICATIONS

AMINO ACIDS AND DERIVATIVES

Teduglutide

DRUG ACTION Teduglutide is an analogue of human glucagon-like peptide-2 (GLP-2), which preserves mucosal integrity by promoting growth and repair of the intestine.

INDICATIONS AND DOSE

Short bowel syndrome (initiated under specialist supervision)

BY SUBCUTANEOUS INJECTION

Child 1-17 years: 0.05 mg/kg once daily, dose to be administered to alternating quadrants of the abdomen; alternatively the thigh can be used, for optimal injection volume per body weight, consult product literature. Review treatment after 12 weeks

CONTRA-INDICATIONS Active or suspected malignancy · history of gastro-intestinal malignancy (in previous 5 years)

CAUTIONS Abrupt withdrawal of parental support (reduce gradually with concurrent monitoring of fluid status) · cardiac insufficiency · cardiovascular disease · colo-rectal polyps · hypertension

CAUTIONS, FURTHER INFORMATION

Colo-rectal polyps. Manufacturer recommends faecal occult blood testing in children before initiation of treatment and yearly thereafter. Manufacturer also advises colonoscopy or sigmoidoscopy in children aged 12 years and older before initiation of treatment, after 1 year of treatment and then every 5 years thereafter. Colonoscopy or sigmoidoscopy should be performed in all children with unexplained blood in stool.

SIDE-EFFECTS

Common or very common Anxiety · appetite decreased · congestive heart failure · cough · dyspnoea · fluid imbalance · gallbladder disorders · gastrointestinal discomfort · gastrointestinal disorders · gastrointestinal stoma complication · headache · influenza like illness · insomnia · nausea · pancreatitis · peripheral oedema · respiratory tract infection · vomiting

Uncommon Syncope

ALLERGY AND CROSS-SENSITIVITY Manufacturer advises caution in patients with tetracycline hypersensitivity.

PREGNANCY Specialist sources indicate use if necessary—no human data available.

BREAST FEEDING Manufacturer advises avoid—toxicity in animal studies.

RENAL IMPAIRMENT

Dose adjustments Manufacturer advises use half the daily dose in moderate or severe impairment and end-stage renal disease.

MONITORING REQUIREMENTS Manufacturer advises monitoring of small bowel function, gall bladder, bile ducts and pancreas during treatment.

TREATMENT CESSATION Caution when discontinuing treatment—risk of dehydration.

PATIENT AND CARER ADVICE Patients with cardiovascular disease should seek medical attention if they notice sudden weight gain, swollen ankles or dyspnoea—may indicate increased fluid absorption.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1139/16

The Scottish Medicines Consortium has advised (April 2018) that teduglutide (Revestive®) is accepted for restricted use within NHS Scotland for the treatment of short bowel syndrome, initiated in paediatric patients aged 1 to 17 years. Patients should be stable following a period of intestinal adaptation after surgery. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

Teduglutide 1.25 mg Revestive 1.25 mg powder and solvent for solution for injection vials | 28 vial £7307.70

Teduglutide 5 mg Revestive 5 mg powder and solvent for solution for injection vials | 28 vial £14615.39

2 Constipation and bowel cleansing

2.1 Bowel cleansing

Other drugs used for Bowel cleansing Bisacodyl, p. 47 · Docusate sodium, p. 46 · Magnesium sulfate, p. 618

DIAGNOSTIC AGENTS > RADIOGRAPHIC CONTRAST MEDIA

Meglumine amidotrizoate with sodium amidotrizoate

(Diatrizoates)

DRUG ACTION Meglumine amidotrizoate with sodium amidotrizoate is a radiological contrast medium with high osmolality.

INDICATIONS AND DOSE

Uncomplicated meconium ileus

BY RECTUM

Neonate: 15–30 mL for 1 dose.
Bowel cleansing

**Distal intestinal obstruction syndrome in children with cystic fibrosis**
- **BY MOUTH, OR BY RECTUM**
  - Child 1-2 months: 15–30 mL for 1 dose
  - Child (body-weight 15-25 kg): 50 mL for 1 dose
  - Child (body-weight 26 kg and above): 100 mL for 1 dose

**Radiological investigations**
- Child: Dose to be recommended by radiologist

**SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**
- With oral use Oral blistering
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to iodine.
- **PREGNANCY** Manufacturer advises caution.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous prehydration is essential in neonates and infants. Fluid intake should be encouraged for 3 hours after administration. By mouth, for child bodyweight under 25 kg, dilute Gastrografin® with 3 times its volume of water or fruit juice; for child bodyweight over 25 kg, dilute Gastrografin® with twice its volume of water or fruit juice. By rectum, administration must be carried out slowly under radiological supervision to ensure required site is reached. For child under 5 years, dilute Gastrografin® with 5 times its volume of water; for child over 5 years dilute Gastrografin® with 4 times its volume of water.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- **Oral solution**
  - **Excipients:** May contain Disodium edetate
  - **Gastrografin** (Bayer Plc)
    - Sodium amidotrizoate 100 mg per 1 ml, Meglumine amidotrizoate 660 mg per 1 ml Gastrografin oral solution sugar-free | 1000 mL | £175.00

**LAXATIVES** > Osmotic laxatives

**Citric acid with magnesium carbonate**
*Formulated as a bowel cleansing preparation*

**INDICATIONS AND DOSE**
- **Bowel evacuation for surgery, colonoscopy or radiological examination**
  - **BY MOUTH**
  - Child 5-9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
  - Child 10-17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure

**CONTRA-INDICATIONS** Acute severe colitis - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - toxic megacolon

**CAUTIONS** Children - colitis (avoid if acute severe colitis) - debilitated - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration - patients with fluid and electrolyte disturbances

**CAUTIONS, FURTHER INFORMATION** Adequate hydration should be maintained during treatment.

**INTERACTIONS** > Appendix 1: bowel cleansing preparations

**SIDE-EFFECTS**
- Common or very common Gastrointestinal discomfort - nausea - vomiting
- Uncommon Dehydration - dizziness - electrolyte imbalance - headache

** Specific side-effects, further information** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

**PREGNANCY** Use with caution.

**BREAST FEEDING** Use with caution.

**RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² - risk of hypermagnesaemia.

**MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION** One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

**PRESCRIBING AND DISPENSING INFORMATION**
Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺.

Flavours of oral powders may include lemon and lime.

**PATIENT AND CARER ADVICE** Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Effervescent powder**
- **CAUTIONARY AND ADVISORY LABELS** 13, 10
- **ELECTROLYTES:** May contain Magnesium
  - Citramag (Sanochemia Diagnostics UK Ltd)
    - Magnesium carbonate heavy 11.57 gram, Citric acid anhydrous 17.79 gram Citramag effervescent powder sachets sugar-free | 10 sachet | £20.50

**BNFC 2019-2020**

Gastro-intestinal system
Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride
(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  - Bowel cleansing before radiological examination, colonoscopy, or surgery
    - **INITIALLY BY MOUTH**
    - **Child 12-17 years:** Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed
  - **Distal intestinal obstruction syndrome**
    - **BY MOUTH, OR BY NASOGASTRIC TUBE, OR BY GASTROSTOMY TUBE**
    - **Child 1-17 years:** 10 mL/kilogram/hour for 30 minutes, then increased to 20 mL/kilogram/hour for 30 minutes, then increased if tolerated to 25 mL/kilogram/hour, max. 100 mL/kg (or 4 litres) over 4 hours, repeat 4 hour treatment if necessary

- **UNLICENSED USE** Klean-Prep® not licensed for use in children.
- **CONTRA-INDICATIONS** Acute severe colitis - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - gastro-intestinal ulceration - toxic megacolon
- **CAUTIONS** Children - colitis (avoid if acute severe colitis) - debilitated patients - fluid and electrolyte disturbances - heart failure - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gastro-intestinal disorders - impaired rectal or vaginal absorption - impaired rectal or vaginal absorption - impaired rectal or vaginal absorption - impaired rectal or vaginal absorption
- **INTERACTIONS** → Appendix 1: bowel cleansing preparations
- **SIDE-EFFECTS** Angioedema - arrhythmia - chills - confusion - dehydration - dizziness - dyspnea - electrolyte imbalance - fever - flatulence - gastro-intestinal discomfort - headache - malaise - nausea - palpitations - seizure - skin reactions - thirst - vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.
- **PREGNANCY** Manufacturers advise use only if essential—no information available.
- **BREAST FEEDING** Manufacturers advise use only if essential—no information available.
- **MONITORING REQUIREMENTS** Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.
- **DIRECTIONS FOR ADMINISTRATION** 1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.
- **PRESCRIBING AND DISPENSING INFORMATION** Each Klean-Prep® sachet provides Na+ 125 mmol, K+ 10 mmol, Cl− 35 mmol and HCO3− 20 mmol when reconstituted with 1 litre of water.
- **PATIENT AND CARER ADVICE** Solid food should not be taken for 2 hours before starting treatment. Adequate hydration should be maintained during treatment.

Treatment can be stopped if bowel motions become watery and clear.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - **Powder**
    - **CAUTIONARY AND ADVISORY LABELS 10, 13**
    - **EXCIPIENTS:** May contain Aspartame

    - Potassium chloride 742.5 mg, Sodium chloride 1.465 gram, Sodium bicarbonate 1.685 gram, Sodium sulfate anhydrous 5.685 gram, Polyethylene glycol 3350 59 gram Klean-Prep oral powder 60g sachets sugar-free | 4 sachet £ 110.48

LAXATIVES > STIMULANT LAXATIVES

Magnesium citrate with sodium picosulfate
(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  - **PICOLAX® SACHETS**
    - Bowel evacuation on day before radiological procedure, endoscopy, or surgery
      - **BY MOUTH**
      - **Child 1 year:** 0.25 sachet taken before 8 a.m, then 0.25 sachet after 6–8 hours
      - **Child 2-3 years:** 0.5 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
      - **Child 4-8 years:** 1 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours
      - **Child 9-17 years:** 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

- **CONTRA-INDICATIONS** Acute severe colitis - ascites - congestive cardiac failure - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - gastro-intestinal ulceration - toxic megacolon
- **CAUTIONS** Cardiac disease (avoid in congestive cardiac failure) - children - colitis (avoid if acute severe colitis) - debilitated patients - fluid and electrolyte disturbances - hyponatraemia (should be corrected before administration) - impaired rectal or vaginal absorption - impaired rectal or vaginal absorption - impaired rectal or vaginal absorption
- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal discomfort - headache - nausea
  - **Uncommon** Confusion - electrolyte imbalance - gastrointestinal disorders - seizures - skin reactions - vomiting
- **PREGNANCY** Caution.
- **BREAST FEEDING** Caution.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.
- **DIRECTIONS FOR ADMINISTRATION** One sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.
- **PICOLAX® SACHETS** One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include lemon.
Stimulant laxatives include bisacodyl p.

Bulk-forming laxatives include bran, ispaghula husk p.

Laxatives

The child
can occur at any age and is infrequent stools, diffuse stool passage, or seemingly complete defaecation. It can occur at any age and is common in childhood.

Overview

Before prescribing laxatives it is important to be sure that the child is constipated and that the constipation is not secondary to an underlying undiagnosed complaint. Early identification of constipation and effective treatment can improve outcomes for children. Without early diagnosis and treatment, an acute episode of constipation can lead to anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipid pneumonia on aspiration.

Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with. Lactulose p. 43 is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy. Macrogols (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44) are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydration effect sometimes seen with osmotic laxatives. 

Macrogols are an effective non-traumatic means of evacuation in children with faecal impaction and can be used in the long-term management of chronic constipation.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents; examples include macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride p. 40, citric acid with magnesium carbonate p. 39, magnesium citrate with sodium picosulfate p. 40 and sodium acid phosphate with sodium phosphate p. 45. Bowel cleansing preparations are not treatments for constipation.

Management

The first-line treatment for children with constipation requires the use of a laxative in combination with dietary modification or with behavioural interventions. Diet modification alone is not recommended as first-line treatment.

In children, an increase in dietary fibre, adequate fluid intake and exercise is advised. Diet should be balanced and contain fruits, vegetables, high-fibre bread, baked beans and wholegrain breakfast cereals. Unprocessed bran (which may cause bloating and flatulence and reduces the absorption of micronutrients) is not recommended.

If faecal impaction is not present (or has been treated), the child should be treated promptly with a laxative. A macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is preferred as first-line management. If the response is inadequate, add a stimulant laxative or change to a stimulant laxative if the first-line therapy is not tolerated. If stools remain hard, lactulose or another laxative with softening effects, such as docusate sodium can be added.

In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

A shorter duration of laxative treatment may be possible in some children with a short history of constipation. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

Faecal softeners

Faecal softeners are claimed to act by decreasing surface tension and increasing penetration of intestinal fluid into the faecal mass. Docusate sodium, and glycerol suppositories p. 48 have softening properties. Enemas containing arachis oil p. 46 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement. Liquid paraffin has also been used as a lubricant for the passage of stool but manufacturer advises that it should be used with caution because of its adverse effects, which include anal seepage and the risks of granulomatous disease of the gastro-intestinal tract or of lipid pneumonia on aspiration.
Faecal impaction

Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing a macrogol (such as macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride) is used to clear faecal mass and to establish and maintain soft well-formed stools, using an escalating dose regimen depending on symptoms and response. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added or if stools are hard, used in combination with an osmotic laxative such as lactulose. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

Suppositories and enemas should not be used in primary care unless all oral medications have failed and preferably only then following specialist advice. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate enema p. 46 can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A sodium acid phosphate with sodium phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid. Children undergoing disimpaction should be reviewed within one week. Maintenance treatment should be started as soon as the bowel is disimpacted.

LAXATIVES > BULK-FORMING LAXATIVES

Ispaghula husk

24-Feb-2016

DRUG ACTION

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

INDICATIONS AND DOSE

Constipation

BY MOUTH

- Child 1 month–5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
- Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
- Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening

DOSE EQUIVALENCE AND CONVERSION

- 1 sachet equivalent to 2 level 5 mL spoonfuls.

CONTRA-INDICATIONS

Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility

CAUTIONS

Adequate fluid intake should be maintained to avoid intestinal obstruction

SIDE-EFFECTS

Abdominal distension · bronchospasm · conjunctivitis · gastrointestinal disorders · hypersensitivity · rhinitis · skin reactions

DIRECTIONS FOR ADMINISTRATION

Dose to be taken with at least 150 mL liquid.

Methylcellulose

DRUG ACTION

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

INDICATIONS AND DOSE

Constipation | Diarrhoea

BY MOUTH USING TABLETS

- Child 7–11 years: 2 tablets twice daily
- Child 12–17 years: 3–6 tablets twice daily

UNLICENSED USE

No age limit specified by manufacturer.

CONTRA-INDICATIONS

Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction

CAUTIONS

Adequate fluid intake should be maintained to avoid intestinal obstruction

SIDE-EFFECTS

Abdominal distension · gastrointestinal disorders

DIRECTIONS FOR ADMINISTRATION

In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

PATIENT AND CARER ADVICE

Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid

PRESCRIBING AND DISPENSING INFORMATION

Flavours of soluble granules formulations may include plain, lemon, or orange.

HANDLING AND STORAGE

Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

PATIENT AND CARER ADVICE

Manufacturer advises that preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer Ispaghula husk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent granules

CAUTIONARY AND ADVISORY LABELS

Tablet
- Celevac (Advanz Pharma)

Methycellulose "450" 500 mg Celevac 500mg tablets | 112 tablet GSK £3.22 DT + £3.22

Sterculia
19-Feb-2016

● DRUG ACTION Sterculia is a bulk-forming laxative. It relieves constipation by increasing faecal mass which stimulates peristalsis.

● INDICATIONS AND DOSE
  Constipation
  ▶ BY MOUTH
  - Child 6-11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5-ml spoonful once or twice a day; washed down without chewing with plenty of liquid after meals
  - Child 12-17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5-ml spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals

● CONTRA-INDICATIONS Colonic atony · difficulty in swallowing · faecal impaction · intestinal obstruction
● CAUTIONS Adequate fluid intake should be maintained to avoid intestinal obstruction
● SIDE-EFFECTS Diarrhoea · gastrointestinal discomfort · gastrointestinal disorders · nausea
● DIRECTIONS FOR ADMINISTRATION May be mixed with soft food (e.g. yoghurt) before swallowing, followed by plenty of liquid.

● PATIENT AND CARER ADVICE Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Granules
- Normacol Plus (Forum Health Products Ltd)

Fragula 80 mg per 1 gram Sterculia 620 mg per 1 gram Normacol Plus granules 7g sachets | 60 sachet GSK £7.12 DT = £7.12
Normacol Plus granules | 500 gram GSK £8.45 DT + £8.45

Lactulose

● INDICATIONS AND DOSE
  Constipation
  ▶ BY MOUTH
  - Child 1-11 months: 2.5 ml twice daily, adjusted according to response
  - Child 1-4 years: 2.5–10 ml twice daily, adjusted according to response
  - Child 5-17 years: 5–20 ml twice daily, adjusted according to response

Hepatic encephalopathy (portal systemic encephalopathy)
  ▶ BY MOUTH
  - Child 12-17 years: Adjusted according to response to 30–50 mL 3 times a day, subsequently adjusted to produce 2–3 soft stools per day

PHARMACOKINETICS
  - Lactulose may take up to 48 hours to act.

● UNLICENSED USE Not licensed for use in children for hepatic encephalopathy.

● CONTRA-INDICATIONS Galactosaemia · intestinal obstruction

● CAUTIONS Lactose intolerance

● SIDE-EFFECTS
  - Common or very common Abdominal pain · diarrhoea · flatulence · nausea · vomiting
  - Uncommon Electrolyte imbalance

● PREGNANCY Not known to be harmful.

● PATIENT AND CARER ADVICE

Sterculia with frangula

The properties listed below are those particular to the combination only. For the properties of the components please consider, sterulcia above.

● INDICATIONS AND DOSE
  Constipation
  ▶ BY MOUTH
  - Child 6-11 years: 0.5–1 sachet 1–2 times a day, alternatively, 0.5–1 heaped 5-ml spoonful once or twice a day; washed down without chewing with plenty of liquid after meals
  - Child 12-17 years: 1–2 sachets 1–2 times a day, alternatively, 1–2 heaped 5-ml spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals

● PREGNANCY Manufacturer advises avoid.
● BREAST FEEDING Manufacturer advises avoid.
Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride

18-Apr-2018

• INDICATIONS AND DOSE

Chronic constipation (dose for 'paediatric' sachets) | Prevention of faecal impaction (dose for 'paediatric' sachets)
▶ BY MOUTH
- Child 1-11 months: 0.5–1 sachet daily
- Child 12-23 months: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 2-5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 6-11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

Faecal impaction (dose for 'paediatric' sachets)
▶ BY MOUTH
- Child 1-11 months: 0.5–1 sachet daily
- Child 12-23 months: 2 sachets on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy
- Child 2-4 years: 2 sachets on first day, then 4 sachets daily for 2 days, then 6 sachets daily for 2 days, then 8 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy
- Child 5-11 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

Chronic constipation (dose for 'half-strength' sachets)
▶ BY MOUTH
- Child 12-17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

Faecal impaction (dose for 'half-strength' sachets)
▶ BY MOUTH
- Child 12-17 years: 8 sachets on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 16 sachets per day

Chronic constipation (dose for 'full-strength' sachets)
▶ BY MOUTH
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

Faecal impaction (dose for 'full-strength' sachets)
▶ BY MOUTH
- Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

DOSE EQUIVALENT AND CONVERSION
- Each 'paediatric' sachet contains 6.563 g of macrogol 3350; each 'half-strength' sachet contains 6.563 g of macrogol 3350; each 'full-strength' sachet contains 13.125 g of macrogol 3350.

MOVICOL ® READY TO TAKE SACHETS
Chronic constipation
▶ BY MOUTH
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

Faecal impaction
▶ BY MOUTH
- Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period; patients should also take an additional 1 litre of fluid daily, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

MOVICOL ® LIQUID
Chronic constipation
▶ BY MOUTH
- Child 12-17 years: 25 ml 1–3 times a day usually for up to 2 weeks; maintenance 25 ml 1–2 times a day

• UNLICENSED USE

Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride may be used as detailed below, although these situations are considered outside the scope of its licence:

- Use of 'paediatric' sachets for faecal impaction in impaired cardiovascular function (no information available)
- Use of 'paediatric' sachets for faecal impaction in impaired atulence
- Use of 'paediatric' sachets for faecal impaction in impaired intestinal perforation
- Use of 'paediatric' sachets for faecal impaction in impaired cardiovascular conditions of the intestinal tract (including Crohn’s disease, ulcerative colitis and toxic megacolon)

• CAUTIONS

Cardiovascular impairment (should not take more than 2 'full-strength' sachets or 4 'half-strength' sachets in any one hour) - impaired consciousness (with high doses) - impaired gag reflex (with high doses) - reflux oesophagitis (with high doses)

• SIDE-EFFECTS

Electrolyte imbalance (discontinue if symptoms occur) - flatulence - gastrointestinal discomfort - nausea - vomiting

• PREGNANCY

Manufacturers advise may be used—limited data available.

• RENAL IMPAIRMENT

Manufacturers advise avoid use of 'paediatric' sachets for faecal impaction—no information available.

• DIRECTIONS FOR ADMINISTRATION

Manufacturers advise dissolve contents of each 'half-strength' sachet of oral powder in 62.5 mL of water, and each 'full-strength' sachet of oral powder in 125 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

Manufacturers advise dissolve contents of each 'paediatric' sachet of oral powder in 62.5 mL of water; after reconstitution the solution should be kept in a refrigerator—for further information consult product literature.

MOVICOL ® LIQUID

Manufacturer advises dilute 25 mL of oral concentrate with 100 mL of water; after dilution the solution should be discarded if unused after 24 hours.

• PATIENT AND CARER ADVICE

Patients or carers should be counselled on how to take the oral powder and oral solution.

Medicines for Children leaflet: Movicol for constipation

www.medicinesforchildren.org.uk/movicol-constipation
Magnesium hydroxide

**INDICATIONS AND DOSE**

**Constipation**
- **By Mouth**
  - Child 3–11 years: 5–10 mL as required, dose to be given mixed with water at bedtime
  - Child 12–17 years: 30–45 mL as required, dose to be given mixed with water at bedtime

**CONTRA-INDICATIONS**
- Acute gastro-intestinal conditions

**INTERACTIONS**
- Appendix 1: magnesium

**HEPATIC IMPAIRMENT**
- Avoid in hepatic coma if risk of renal failure.

**RENAL IMPAIRMENT**
- Increased risk of toxicity in renal impairment.

**Dose adjustments**
- Avoid or reduce dose.

**PRESCRIBING AND DISPENSING INFORMATION**
- When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

### Oral solution

**CAUTIONARY AND ADVISORY LABELS**
- 13 ELECTROLYTES: May contain Bicarbonate, chloride, potassium, sodium

**PRESCRIBING AND DISPENSING INFORMATION**
- When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

**CONTRA-INDICATIONS**
- Conditions associated with increased colonic absorption - gastro-intestinal obstruction - inflammatory bowel disease

**CAUTIONS**
- Ascites - congestive heart failure - electrolyte disturbances - uncontrolled hypertension

**INTERACTIONS**
- Appendix 1: bowel cleansing preparations

Sodium acid phosphate with sodium phosphate

**INDICATIONS AND DOSE**

**Constipation (using Phosphates Enema BP Formula B)**
- **By Rectum**
  - Child 3–6 years: 45–65 mL once daily
  - Child 7–11 years: 65–100 mL once daily
  - Child 12–17 years: 100–128 mL once daily

**FLEET® READY-TO-USE ENEMA**
- **Constitution**
  - Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)
  - By Rectum
    - Child 3–6 years: 40–60 mL once daily
    - Child 7–11 years: 60–90 mL once daily
    - Child 12–17 years: 90–118 mL once daily

**CONTRA-INDICATIONS**
- Conditions associated with increased colonic absorption - gastro-intestinal obstruction - inflammatory bowel disease

**CAUTIONS**
- Ascites - congestive heart failure - electrolyte disturbances - uncontrolled hypertension

**INTERACTIONS**
- Appendix 1: bowel cleansing preparations
Gastro-intestinal system

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Enema**
- Sodium acid phosphate with sodium phosphate (Non-proprietary)
- Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml
- Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml
- Phosphates enema (Formula B)

**Indications and Dose**

### Sodium citrate

**MICROLETTE**
- Constipation
  - By Rectum
  - Child 3-17 years: 5–10 mL for 1 dose

**MICRALAX**
- Constipation
  - By Rectum
  - Child 3-17 years: 5 mL for 1 dose

**RELAXIT**
- Constipation
  - By Rectum
  - Child 1 month–2 years: 5 mL for 1 dose, insert only half the nozzle length
  - Child 3-17 years: 5 mL for 1 dose

**Contraindications**
- Acute gastro-intestinal conditions

**Caution**
- Sodium and water retention in susceptible individuals

**Interactions**
- Appendix 1: sodium citrate

**Side-effects**
- Polyuria

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Enema**
- Microlette Micro-enema (Pinewood Healthcare)
- Sodium citrate 90 mg per 1 ml
- Micralax Micro-enema (RPH Pharmaceuticals AB)
- Sodium citrate 90 mg per 1 ml
- Relaxit (Supra Enterprises Ltd)
- Sodium citrate 90 mg per 1 ml

## Laxatives

### Softening Laxatives

#### Arachis oil

**Indications and Dose**
- To soften impacted faeces
  - By Rectum
  - Child 3-6 years (under close medical supervision): 45–65 mL as required
  - Child 7-11 years (under close medical supervision): 65–100 mL as required
  - Child 12-17 years (under close medical supervision): 100–130 mL as required

**Unlicensed use**
- Licensed for use in children (age range not specified by manufacturer).

**Contra-indications**
- Inflammatory bowel disease

**Caution**
- Hypersensitivity to soya - intestinal obstruction

**Allergy and Cross-sensitivity**
- Contra-indicated if history of hypersensitivity to arachis oil or peanuts.

**Directions for Administration**
- Warm enema in warm water before use.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Enema**
- Arachis oil (Non-proprietary)
  - Arachis oil 1 ml per 1 ml
  - Arachis oil 130 ml enema

**Side-effects**
- Not known to be harmful—manufacturer advises caution.

#### Docusate sodium

(Dioctyl sodium sulphonate) 20-Apr-2016

**Indications and Dose**
- Chronic constipation
  - By Mouth
  - Child 6 months-1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
  - Child 2-11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
  - Child 12-17 years: Up to 500 mg daily in divided doses, adjusted according to response
  - By Rectum
  - Child 12-17 years: 120 mg for 1 dose

**Adjunct in abdominal radiological procedures**
- By Mouth
- Child 12-17 years: 400 mg, to be administered with barium meal
- By Rectum
- Child 12-17 years: 120 mg for 1 dose

**Pharmacokinetics**
- Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

**Unlicensed use**
- Adult oral solution and capsules not licensed for use in children under 12 years.

**Contra-indications**
- Avoid in intestinal obstruction

**Caution**
- Do not give with liquid paraffin - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - rectal preparations not indicated if haemorrhoids or anal fissure

**Interactions**
- Appendix 1: docusate sodium

**Side-effects**
- Rare or very rare
- With oral use Abdominal cramps - nausea - rash

**Pregnancy**
- Not known to be harmful—manufacturer advises caution.
**LAXATIVES > STIMULANT LAXATIVES**

### Bisacodyl

#### Indications and Dose

**Constipation**
- **By Mouth**
  - Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
- **By Rectum**
  - Child 2–17 years: 5–10 mg once daily, adjusted according to response

**Bowel clearance before radiological procedures and surgery**
- **Initially by mouth**
  - Child 4–9 years: 5 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 5 mg if required, dose to be administered 1 hour before procedure
  - Child 10–17 years: 10 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 10 mg if required, dose to be administered 1 hour before procedure

**Pharmacokinetics**
- Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

#### Unlicensed Use

- With rectal use **Bisacodyl** may be used in children aged under 10 years for the management of constipation, **but the higher dose option is not licensed in this age group.**
- With oral use **Bisacodyl** may be used in children for the management of constipation, **but the higher dose option is not licensed.**

#### Contra-indications

- Acute abdominal conditions, acute inflammatory bowel disease, intestinal obstruction, severe dehydration

#### Cautions

- Excessive use of stimulant laxatives can cause diarrhea and related effects such as hypokalaemia, risk of electrolyte imbalance with prolonged use

### Co-danthramer

#### Indications and Dose

**Constipation in palliative care (standard strength capsules)**
- **By Mouth Using Capsules**
  - Child 6–11 years: 1 capsule once daily, dose should be taken at night
  - Child 12–17 years: 1–2 capsules once daily, dose should be taken at night

**Constipation in palliative care (strong capsules)**
- **By Mouth Using Capsules**
  - Child 12–17 years: 1–2 capsules once daily, dose should be given at night

**Constipation in palliative care (standard strength suspension)**
- **By Mouth Using Oral Suspension**
  - Child 2–11 years: 2.5–5 mL once daily, dose should be taken at night
  - Child 12–17 years: 5–10 mL once daily, dose should be taken at night

**Constipation in palliative care (strong suspension)**
- **By Mouth Using Oral Suspension**
  - Child 12–17 years: 5 mL once daily, dose should be taken at night

#### Dose Equivalence and Conversion

- Co-danthramer (standard strength) capsules contain dantron 25 mg with poloxamer 188® 200 mg per capsule.
- Co-danthramer (standard strength) oral suspension contains dantron 25 mg with poloxamer 188® 200 mg per 5 mL.
- Co-danthramer strong capsules contain dantron 37.5 mg with poloxamer 188® 500 mg.
- Co-danthramer strong oral suspension contains dantron 75 mg with poloxamer 188® 1 g per 5 mL.
- Co-danthramer suspension 5 mL = one co-danthramer capsule, **but strong co-danthramer suspension 5 mL = two strong co-danthramer capsules.**
CONTRA-INDICATIONS
Acute abdominal conditions - acute inflammatory bowel disease - intestinal obstruction - severe dehydration.

CAUTIONS
Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - may cause local irritation - rodent studies indicate potential carcinogenic risk.

CAUTIONS, FURTHER INFORMATION
Local irritation. Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies - risk of irritation and excoriation).

SIDE-EFFECTS
Abdominal cramps - asthenia - gastrointestinal disorders - hypermagnesaemia - skin reactions - urine red.

PREGNANCY
Manufacturers advise avoid – limited information available.

BREAST FEEDING
Manufacturers advise avoid – no information available.

PRESCRIBING AND DISPENSING INFORMATION
Palliative care. For further information on the use of co-danthramer in palliative care, see www.medicinescomplete.com/#/content/palliative/stimulant-laxatives.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral suspension
CAUTIONARY AND ADVISORY LABELS 14 (urine orange)

- Co-danthramer (Non-proprietary)
  - Dantron 10 mg per 1 ml, Docusate sodium 12 mg per 1 ml Co-danthramer 50mg/60mg/5ml oral suspension sugar free sugar-free
  - 200 ml £154.40 DT = £154.40

- Co-danthrusate (Non-proprietary)
  - Dantron 10 mg per 1 ml, Docusate sodium 12 mg per 1 ml Co-danthrusate 50mg/60mg/5ml oral suspension sugar free sugar-free

- Gastrointestinal disorders
- Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies - risk of irritation and excoriation).

INDICATIONS AND DOSE
Constipation
- By mouth using oral suspension
  - Child 6–11 years: 5 ml once daily, to be taken at night
  - Child 12–17 years: 5–15 ml once daily, to be taken at night

DOSAGE EQUIVALENCE AND CONVERSION
- Co-danthrusate suspension contains dantron 50 mg and docusate sodium 60 mg per 5 ml.

CONTRA-INDICATIONS
Acute abdominal conditions - acute inflammatory bowel disease - intestinal obstruction - severe dehydration.

CAUTIONS
Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - may cause local irritation - rodent studies indicate potential carcinogenic risk.

CAUTIONS, FURTHER INFORMATION
Local irritation. Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies - risk of irritation and excoriation).

INTERACTIONS
Appendix 1: docusate sodium

SIDE-EFFECTS
Gastrointestinal disorders - skin reactions - urine orange.

PREGNANCY
Manufacturers advise avoid – limited information available.

BREAST FEEDING
Manufacturers advise avoid – no information available.

UNLICENSED USE
Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

Doses in BNFC adhere to national guidelines and may differ from those in product literature.
## Sodium picosulfate

(Sodium picosulphate)

**Drug action** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

### Indications and dose

**Constitution**

- **By mouth**
  - Child 1 month-3 years: 2.5–10 mg once daily, adjusted according to response
  - Child 4-17 years: 2.5–20 mg once daily, adjusted according to response

**Pharmacokinetics**

- Onset of action 6–12 hours.

### Unlicensed use

Sodium picosulfate doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

### Contra-Indications

Intestinal obstruction - undiagnosed abdominal pain.

### Interactions

† Appendix 1: sodium picosulfate

### Side-effects

- Common or very common: Diarrhoea
- Uncommon: Nausea, vomiting

**Frequency not known** Angioedema - skin reactions - syncope

**Side-effects, Further information** Prolonged or excessive use can cause diarrhoea and related effects such as hypokalaemia.

### Pregnancy

Manufacturer states evidence limited but not known to be harmful.

### Breast feeding

Specialist sources indicate suitable for use in breast-feeding in infants over 1 month.** (b)

### Patient and carer advice

Medicines for Children leaflet: Sodium picosulfate for constipation

www.medicinesforchildren.org.uk/sodium-picosulfate-constipation

---

### Senna with ispaghula husk

24-Feb-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, senna p. 48, ispaghula husk p. 42.

#### Indications and dose

**Constipation**

- **By mouth**
  - Child 12-17 years: 5-10 g once daily, to be taken at night, 5 g equivalent to one level spoonful of granules

**Pregnancy**

Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.

**Directions for administration**

Take at night with at least 150 ml liquid.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

#### Oral solution

- **Senna** (Non-proprietary)
  - Sennoside B (as Sennosides) 1.5 mg per 1 ml
  - Senna 7.5mg/5ml
  - Sennoside B (as Sennosides) 7.5 mg
  - Senna Max Strength 15mg tablets

- **Senokot** (Forum Health Products Ltd, Reckitt Benckiser Healthcare (UK) Ltd)
  - Senna 7.5mg/5ml
  - Sennoside B (as Sennosides) 15 mg

- **Senokot** (Sanofi) 300 mg/100 ml sugar-free oral solution

**Sodium picosulfate**

- **Sodium picosulfate 1 mg per 1 ml**
  - Sodium picosulfate 1 mg per 1 ml
  - Sodium picosulfate 5mg/5ml oral solution sugar free sugar-free
  - Sodium picosulfate 5mg/5ml sugar-free

**Laxoberal** (Sanofi)

**Sodium picosulfate 1 mg per 1 ml**

- Duicolar Pico 5mg/5ml liquid sugar-free

**INDICATIONS AND DOSE**

- Constipation
  - By mouth
  - Child 1 month-3 years: 2.5–10 mg once daily, adjusted according to response
  - Child 4-17 years: 2.5–20 mg once daily, adjusted according to response

**PHARMACOKINETICS**

- Onset of action 6–12 hours.

### Unlicensed use

Sodium picosulfate doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

### Contra-Indications

Intestinal obstruction - undiagnosed abdominal pain.

### Interactions

† Appendix 1: sodium picosulfate

### Side-effects

- Common or very common: Diarrhoea
- Uncommon: Nausea, vomiting

**Frequency not known** Angioedema - skin reactions - syncope

**Side-effects, Further information** Prolonged or excessive use can cause diarrhoea and related effects such as hypokalaemia.

### Pregnancy

Manufacturer states evidence limited but not known to be harmful.

### Breast feeding

Specialist sources indicate suitable for use in breast-feeding in infants over 1 month.** (b)

### Diarrhoea

**Diarrhoea (acute)**

01-Aug-2017

**Description of condition**

Diarrhoea is the abnormal passing of loose or liquid stools, with increased frequency, increased volume, or both. Acute diarrhoea is that which lasts less than 14 days, but symptoms usually spontaneously resolve within 2–4 days. It can result from infection, as a side-effect of a drug, or as an acute symptom of a chronic gastro-intestinal disorder (such as Inflammatory bowel disease p. 27 or Irritable bowel syndrome p. 36). It may also occur when intestinal motility or morphology is altered.
Prompt investigation is required to identify or exclude any serious underlying cause if the child has any red flag symptoms as such unexplained weight loss, rectal bleeding, persistent diarrhoea, a systemic illness, has received recent hospital treatment or antibiotic treatment, or following foreign travel (other than to Western Europe, North America, Australia or New Zealand).

**Aims of treatment**
The priority in acute diarrhoea treatment, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion and the management of dehydration when it is present. This is particularly important in infants, when excessive water and electrolyte loss and dehydration can be life-threatening.

**Treatment**
Most episodes of acute diarrhoea will settle spontaneously without the need for any medical treatment. Oral rehydration therapy (ORT), such as disodium hydrogen, citrate with glucose, potassium chloride and sodium chloride p. 612; potassium chloride with sodium chloride p. 609; potassium chloride with rice powder, sodium chloride and sodium citrate p. 612) is the mainstay of treatment to prevent or correct diarrhoeal dehydration and to maintain the appropriate fluid intake once rehydration is achieved—see Fluids and electrolytes p. 604.

However, in children with severe dehydration and in those unable to drink, immediate admission to hospital and urgent replacement treatment with an intravenous rehydration fluid is recommended—see Fluids and electrolytes p. 604. ORT is recommended for children at increased risk of dehydration and for those with clinical dehydration (including hypernatraemic dehydration). If the child is unable to drink the ORT, or vomits persistently, consider giving the solution via a nasogastric tube.

In infants, after rehydration, encourage breast-feeding, other milk feeds and fluid intake. In older children, after rehydration, give full-strength milk straight away, reintroduce the child’s usual solid food, and avoid giving fruit juices and carbonated drinks until the diarrhoea has stopped.

In children with gastroenteritis, but without clinical dehydration, encourage fluid intake, continue breast-feeding and other milk feeds, and discourage the drinking of fruit juices and carbonated drinks.

In general, antimicrobial drugs have no practical benefit for children with acute or persistent diarrhoea and their use is generally not recommended (side-effects include drowsiness, abdominal distension and ileus).

**Antibacterial drugs for acute diarrhoea**

**Related drugs**
Other drugs used for diarrhoea: codeine phosphate p. 283, co-phenotrope below, methylcellulose p. 42.
## Loperamide hydrochloride

### INDICATIONS AND DOSE

**Symptomatic treatment of acute diarrhoea**

- **By Mouth**
  - Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
  - Child 8–11 years: 2 mg 4 times a day for up to 5 days
  - Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

### Chronic diarrhoea

- **By Mouth**
  - Child 1–11 months: 100–200 micrograms/kg twice daily, to be given 30 minutes before feeds; increased if necessary up to 2 mg/kg daily in divided doses
  - Child 1–11 years: 100–200 micrograms/kg 3–4 times a day (max. per dose 2 mg), increased if necessary up to 1.25 mg/kg daily in divided doses; maximum 16 mg per day
  - Child 12–17 years: 2–4 mg 2–4 times a day; maximum 16 mg per day

### UNLICENSED USE

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM Advice: Reports of Serious Cardiac Adverse Reactions with High Doses of Loperamide Associated with Abuse or Misuse (September 2017)**

Serious cardiovascular events (such as QT prolongation, torsades de points, and cardiac arrest), including fatalities, have been reported in association with large overdoses of loperamide. Healthcare professionals are reminded that if symptoms of overdose occur, naloxone can be given as an antidote. The duration of action of loperamide is longer than that of naloxone ([an antidote](https://www.medicinesforchildren.org.uk/loperamide-diarrhoea)). The duration of action of loperamide is longer than that of naloxone ([an antidote](https://www.medicinesforchildren.org.uk/loperamide-diarrhoea)). In the event of overdose, treatment with naloxone might be indicated; patients should be monitored closely for at least 48 hours to detect possible CNS depression. Pharmacists should remind patients not to take more than the recommended dose on the label.

### CONTRA-INDICATIONS

Active ulcerative colitis • antibiotic-associated colitis • conditions where abdominal distension develops • conditions where inhibition of peristalsis should be avoided

### CAUTIONS

Not recommended for children under 12 years

### INTERACTIONS

→ Appendix 1: Loperamide

### SIDE-EFFECTS

- **Common or very common**
  - Gastrointestinal disorders • headache • nausea
- **Uncommon**
  - Dizziness • drowsiness • dry mouth • gastrointestinal discomfort • skin reactions • vomiting
- **Rare or very rare**
  - Angioedema • consciousness impaired • coordination abnormal • fatigue • miosis • muscle tone increased • severe cutaneous adverse reactions (SCARs) • urinary retention

### PREGNANCY

Manufacturers advise avoid—no information available.

### BREAST FEEDING

Amount probably too small to be harmful.

### HEPATIC IMPAIRMENT

Manufacturer advises caution—risk of reduced first pass metabolism leading to central nervous system toxicity.

### PATIENT AND CARER ADVICE

Medicines for Children leaflet: Loperamide for diarrhoea

[www.medicinesforchildren.org.uk/loperamide-diarrhoea](http://www.medicinesforchildren.org.uk/loperamide-diarrhoea)

## Loperamide with simeticone

### INDICATIONS AND DOSE

**Acute diarrhoea with abdominal colic**

- **By Mouth**
  - Child 12–17 years: Initially 1 tablet, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day

### INTERACTIONS

→ Appendix 1: Loperamide

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - Loperamide hydrochloride (Non-proprietary) 2 mg Loperamide 2 mg tablets | 30 tablet £2.93 DT = £1.83
  - Norimode (Tillotomed Laboratories Ltd) Loperamide hydrochloride 2 mg Norimode 2 mg tablets | 30 tablet £2.15 DT = £1.83

- **Oral solution**
  - Imodium (Janssen-Cilag Ltd) Loperamide hydrochloride 200 microgram per 1 ml | 100 ml £1.17 DT = £1.17

- **Capsule**
  - Loperamide hydrochloride (Non-proprietary) Loperamide hydrochloride 2 mg Loperamide 2 mg capsules | 30 capsule £2.99 DT = £0.92
  - Norimode (McNeil Products Ltd) Loperamide hydrochloride 2 mg Loperamide 2 mg capsules | 12 capsule £3.55

- **Orodispersible tablet**
  - Imodium (McNeil Products Ltd) Loperamide hydrochloride 2 mg Loperamide 2 mg orodispersible tablets sugar-free | 12 tablet £4.38 sugar-free | 18 tablet £5.85

### Antidiarrhoeals

**Enkephalinase inhibitors**

**Racecadotril**

### INDICATIONS AND DOSE

**Adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea**

- **By Mouth Using Granules**
  - Child 3 months–17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
  - Child 3 months–17 years (body-weight 9–12 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
Disorders of gastric acid and ulceration

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

Dyspepsia

Overview

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration, gastro-oesophageal reflux disease, gastritis, and upper gastrointestinal motility disorders, but most commonly it is of uncertain origin.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, Smoking cessation p. 304, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

A compound alginate preparation may provide relief from dyspepsia; persistent dyspepsia requires investigation. Treatment with a H₂-receptor antagonist or a proton pump inhibitor should be initiated only on the advice of a hospital specialist.

*Helicobacter pylori* may be present in children with dyspepsia. *H. pylori* eradication therapy should be considered for persistent dyspepsia if it is ulcer-like. However, most children with functional (investigated, non-ulcer) dyspepsia do not benefit symptomatically from *H. pylori* eradication.

ANTACIDS

Antacids

Overview

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in *ulcer dyspepsia* and in non-erosive gastro-oesophageal reflux; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain.

Aluminium- and magnesium-containing antacids, being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.

Complexes such as *hydrotalcite* confer no special advantage.

*Calcium-containing* antacids can induce rebound acid secretion; with modest doses the clinical significance of this is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis.

Simeticone

Simeticone p. 54 (activated dimeticone) is used to treat infantile colic, but the evidence of benefit is uncertain.

Simeticone is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginates

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux. Alginate-containing preparations are used in the management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

ANTACIDS > ALGINATE

Alginic acid

- **INDICATIONS AND DOSE**
  - **GAVISCON INFANT® POWDER SACHETS**
  - **Management of gastro-oesophageal reflux disease**
    - **BY MOUTH**
      - Neonate (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day.
      - Neonate (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day.
MEDICINAL FORMS

PRESCRIBING AND DISPENSING INFORMATION

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 619, magnesium hydroxide p. 45.

Antacids > Aluminium and Magnesium

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 619, magnesium hydroxide p. 45.

CONTRA-INDICATIONS

Hypophosphataemia - infants - neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.

RENAL IMPAIRMENT

Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.

Sodium alginate with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 52.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include aniseed or peppermint.
Simeticone with aluminium hydroxide and magnesium hydroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone below, aluminium hydroxide p. 619.

**INDICATIONS AND DOSE**

**Dyspepsia**
- **BY MOUTH**
  - Child 2-4 years: 5 ml 3 times a day
  - Child 5-11 years: 5–10 mL 3–4 times a day
  - Child 12-17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

**INTERACTIONS** → Appendix 1: antacids

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- **Altacite Plus** (Peckforton Pharmaceuticals Ltd) Simeticone 25 mg per 1 ml, Hydrotalcite 100 mg per 1 ml Altacite Plus oral suspension sugar-free | 100 ml £4.00 sugar-free | 500 ml £5.20 DT + £5.20

**ANTACIDS** > **MAGNESIUM**

Magnesium trisilicate with magnesium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium trisilicate, magnesium carbonate, sodium bicarbonate p. 607.

**INDICATIONS AND DOSE**

**Dyspepsia**
- **BY MOUTH**
  - Child 5-11 years: 5–10 mL 3 times a day, alternatively as required, dose to be made up with water
  - Child 12-17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water

**CONTRA-INDICATIONS**

- Hypophosphataemia • Severe renal failure

**CAUTIONS**

- Heart failure • hypermagnesaemia • hyperton • metabolic alkalosis • respiratory alkalosis

**INTERACTIONS** → Appendix 1: antacids - sodium bicarbonate

**HEPATIC IMPAIRMENT** In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**RENAL IMPAIRMENT**

Magnesium trisilicate and magnesium carbonate mixtures have high sodium content; avoid in patients with fluid retention.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary)
  - Magnesium carbonate light 50 mg per 1 ml, Magnesium trisilicate 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml Magnesium trisilicate oral suspension | 200 ml £1.65 DT + £1.65

**ANTIFOAMING DRUGS**

Simeticone

(Activated dimeticone)

**DRUG ACTION**

Simeticone (activated dimeticone) is an antifoaming agent.

**INDICATIONS AND DOSE**

**DENTINOX®**

Colic | Wind pains
- **BY MOUTH**
  - Neonate: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day.
  - Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day

**INFACOL®**

Colic | Wind pains
- **BY MOUTH**
  - Neonate: 0.5–1 mL, to be taken before feeds.
  - Child 1 month–1 year: 0.5–1 mL, to be taken before feeds

**PRESCRIBING AND DISPENSING INFORMATION**

**DENTINOX®** The brand name Dentinox® is also used for other preparations including teething gel.

**PATIENT AND CARER ADVICE**

**INFACOL®** Patients or carers should be given advice on use of the Infacol® dropper.

**LESS SUITABLE FOR PRESCRIBING**

**INFACOL®** Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**DENTINOX®** Dentinox® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- **Infacol®** (Teva UK Ltd)
  - Infacol 40 mg per 1 ml Infacol 40mg/ml oral suspension sugar-free | 50 mL £2.71 DT + £2.71 sugar-free | 55 mL £3.20 sugar-free | 85 mL £4.66

**Oral drops**
- **Dentinox Infant** (Dendron Ltd)
  - Simeticone 8.4 mg per 1 ml Dentinox Infant colic drops | 100 mL £1.80 DT + £1.80

**Combinations available:** Co-simalcite, p. 53 • Simeticone with aluminium hydroxide and magnesium hydroxide, above
4.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, Smoking cessation p. 304 and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces the recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of H. pylori should be confirmed before starting eradication treatment. If possible, the antibacterial sensitivity of the organism should be established at the time of endoscopy and biopsy. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

Treatment to eradicate H. pylori infection in children should be initiated under specialist supervision. One week triple-therapy regimens that comprise omeprazole p. 60, amoxicillin p. 351, and either clarithromycin p. 340 or metronidazole p. 344 are recommended. Resistance to clarithromycin or to metronidazole is much more common than to amoxicillin and can develop during treatment. A regimen containing amoxicillin and clarithromycin is therefore recommended for initial therapy and one containing amoxicillin and metronidazole is recommended for eradication failure or for a child who has been treated with a macrolide for other infections. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist); however, if the ulcer is large, or complicated by haemorrhage or perforation then antisecretory treatment is continued for a further 3 weeks. Lansoprazole p. 59 may be considered if omeprazole is unsuitable. Treatment failure usually indicates antibacterial resistance or poor compliance.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial produce low rates of H. pylori eradication and are not recommended.

See under NSAID-associated ulcers for the role of H. pylori eradication therapy in children starting or taking NSAIDs.

Test for Helicobacter pylori

C-Urea breath test kits are available for confirming the presence of gastro-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of C-Urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific C-Urea breath test kit for children is available (Helicobacter Test INFAl for children of the age 3–11). However the appropriateness of testing for H. pylori infection in children has not been established. Breath, saliva, faecal, and urine tests for H. pylori are frequently unreliable in children; the most accurate method of diagnosis is endoscopy with biopsy.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. Whenever possible, NSAIDs should be withdrawn if an ulcer occurs.

Children at high risk of developing gastro-intestinal complications with a NSAID include those with a history of peptic ulcer disease or serious upper gastro-intestinal complication, those taking other medicines that increase the risk of upper gastro-intestinal side-effects, or those with serious co-morbidity. In children at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; high dose ranitidine p. 56 is an alternative. NSAID use and H. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In children already taking a NSAID, eradication of H. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in children about to start long-term NSAID treatment who are H. pylori positive and have dyspepsia or a history of gastric or duodenal ulcer, eradication of H. pylori may reduce the overall risk of ulceration.

If the NSAID can be discontinued in a child who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing; alternatively the ulcer can be treated with an H₂-receptor antagonist.

If NSAID treatment needs to continue, the ulcer is treated with a proton pump inhibitor.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Sucralfate

Sucralfate below is a complex of aluminium hydroxide and sulfated sucrose that appears to act by protecting the mucosa from acid-pepsin attack; it has minimal antacid properties.

**CAUTIONS, FURTHER INFORMATION**
- **Bezoar formation** Following reports of bezoar formation associated with sucralfate, caution is advised in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying.
- **INTERACTIONS** → Appendix 1: sucralfate
- **SIDE-EFFECTS**
  - **Common or very common** Constipation
  - **Uncommon** Dry mouth · nausea
  - **Rare or very rare** Bezoar · rash
  - **Frequency not known** Back pain · bone disorders · diarrhoea · dizziness · drowsiness · encephalopathy · flatulence · headache · vertigo
- **PREGNANCY** No evidence of harm; absorption from gastrointestinal tract negligible.
- **PARENTERAL** Amount probably too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; aluminium is absorbed and may accumulate.
- **DIRECTIONS FOR ADMINISTRATION** Administration of sucralfate and enteral feeds should be separated by 1 hour and for administration by mouth, sucralfate should be given 1 hour before meals. Oral suspension blocks fine- bore feeding tubes. Crushed tablets may be dispersed in water.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed and caramel.

**H₂-RECEPTOR ANTAGONISTS**

**H₂-receptor antagonists**

**Overview**

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of dyspepsia and *gastric·oesophageal reflux disease*. H₂-receptor antagonists should not normally be used for *Zollinger–Ellison syndrome* because proton pump inhibitors are more effective.

Maintenance treatment with low doses has largely been replaced in *Helicobacter pylori* positive children by eradication regimens. H₂-receptor antagonist therapy can promote healing of *NSAID-associated ulcers*.

**H₂-receptor antagonists**

- **SIDE-EFFECTS**
  - **Common or very common** Constipation · diarrhoea · dizziness · fatigue · headache · myalgia · skin reactions
  - **Uncommon** Confusion · depression · erectile dysfunction · gynaecomastia · hallucination · hepatic disorders · leucopenia · nausea · tachycardia
  - **Rare or very rare** Agranulocytosis · alopecia · arthralgia · atrioventricular block · fever · galactorrhoea · pancreatitis · thrombocytopenia · vasculitis

**Ranitidine**

**INDICATIONS AND DOSE**

**Benign gastric ulceration** | **Duodenal ulceration**
---|---
**BY MOUTH**
- Neonate: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.
- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months-2 years: 2–4 mg/kg twice daily
- Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night

**Prophylaxis of stress ulceration**
- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Neonate: 0.5–1 mg/kg every 6–8 hours.
- Child 1 month-11 years: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour
**UNLICENSED USE** Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months.

**INTERACTIONS** → Appendix 1: H2 receptor antagonists

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare or very rare Bone marrow depression - bradycardia - breast conditions - dyskinesia - nethritis acute intestinal - pancreatitis acute - vision blurred
- Frequency not known Dyspnoea

**SPECIFIC SIDE-EFFECTS**

- Rare or very rare
  - With parenteral use Anaphylactic shock - cardiac arrest
- **PREGNANCY**
  - Manufacturer advises avoid unless essential, but not known to be harmful.
- **BREAST FEEDING**
  - Significant amount present in milk, but not known to be harmful.
- **RENAL IMPAIRMENT**
  - Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous injection dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.
- **PATIENT AND CARER ADVICE** In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement. Medicines for Children leaflet: Ranitidine for acid reflux [www.medicinesforchildren.org.uk/ranitidine-acid-reflux](http://www.medicinesforchildren.org.uk/ranitidine-acid-reflux)

**EXCEPTIONS TO LEGAL CATEGORY** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

**Tablet**

- **Ranitidine (Non-proprietary)**
  - Ranitidine (as Ranitidine hydrochloride) 150 mg Ranitidine 150mg tablets | 60 tablet (£0.72) DT = £0.07
  - Ranitidine (as Ranitidine hydrochloride) 300 mg Ranitidine 300mg tablets | 60 tablet (£0.72) DT = £0.08
  - Zantac (Omega Pharma Ltd, GlaxoSmithKline UK Ltd)
  - Ranitidine (as Ranitidine hydrochloride) 75 mg Zantac 75 tablets | 24 tablet (£0.16) DT = £0.75
  - Ranitidine (as Ranitidine hydrochloride) 150 mg Zantac 150mg tablets | 60 tablet (£1.30 DT + £0.07
  - Ranitidine (as Ranitidine hydrochloride) 300 mg Zantac 300mg tablets | 30 tablet (£0.10 DT + £0.08

**Solution for Injection**

- **Ranitidine (Non-proprietary)**
  - Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml Ranitidine 50mg/2ml solution for injection ampoules | 5 amppule (£0.69–£0.050 DT = £0.96
  - Zantac (GlaxoSmithKline UK Ltd)
  - Ranitidine (as Ranitidine hydrochloride) 25 mg per 1 ml Ranitidine 50mg/2ml solution for injection ampoules | 5 amppule (£0.82 DT = £2.96

**Effervescent tablet**

**CAUTIONARY AND ADVISORY LABELS** 13

**ELECTROLYTES**
- May contain Sodium

**PROTON PUMP INHIBITORS**

**Proton pump inhibitors**

**Overview**

Omeprazole p. 60 is an effective short-term treatment for *gastric and duodenal ulcers*; it is also used in combination with antibacterials for the eradication of *Helicobacter pylori*. An initial short course of omeprazole is the treatment of choice in *gastro-oesophageal reflux disease* with severe symptoms; children with endoscopically confirmed erosive, ulcerative, or strictureing *oesophagitis* usually need to be maintained on omeprazole.

Omeprazole is also used for the prevention and treatment of NSAID-associated ulcers. In children who need to continue NSAID treatment after an ulcer has healed, the dose of omeprazole should not normally be reduced because asymptomatic ulcer deterioration may occur.

Omeprazole is effective in the treatment of the *Zollinger–Ellison syndrome* (including cases resistant to other treatment). It is also used to reduce the degradation of pancreatic enzyme supplements in children with cystic fibrosis.

Lansoprazole p. 59 is not licensed for use in children, but may be considered when the available formulations of omeprazole are unsuitable.
Esomeprazole below can be used for the management of gastro-oesophageal reflux disease when the available formulations of omeprazole and lansoprazole are unsuitable.

**Proton pump inhibitors**

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

**IMPORTANT SAFETY INFORMATION**

MHRA ADVICE: PROTON PUMP INHIBITORS (PPIs): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SEPTEMBER 2015)

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug.

If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:
- Advise them to avoid exposing the skin to sunlight.
- Consider SCLE as a possible diagnosis.
- Consider discontinuing PPI treatment if it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another.
- In most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, constipation, diarrhoea, dizziness, dry mouth, gastrointestinal disorders, headache, insomnia, nausea, skin reactions, vomiting
- **Rare or very rare** Agranulocytosis, alopecia, gynaecomastia, hallucination, hepatic disorders, hyperhidrosis, hypotension, nephritis tubulointerstitial, pancytopenia, photosensitivity reaction, severe cutaneous adverse reactions (SCARs), stomatitis, taste altered
- **Frequency not known** Hypomagnesaemia (more common after 1 year of treatment, but sometimes after 3 months of treatment), subacute cutaneous lupus erythematosus

**MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

**PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

---

**Esomeprazole**

- **INDICATIONS AND DOSE**
  - **Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)**
    - **BY MOUTH**
      - Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
      - Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
      - Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 1–11 years (body-weight up to 20 kg): 10 mg once daily, injection to be given over at least 3 minutes
      - Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily, injection to be given over at least 3 minutes
      - Child 12–17 years: 40 mg daily, injection to be given over at least 3 minutes
  - **Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis)**
    - **BY MOUTH**
      - Child 1–11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
      - Child 12–17 years: 20 mg once daily for up to 4 weeks
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 1–11 years: 10 mg once daily, injection to be given over at least 3 minutes
      - Child 12–17 years: 20 mg once daily, injection to be given over at least 3 minutes

- **UNLICENSED USE** Tablets and capsules not licensed for use in children 1–11 years.
- **INTERACTIONS** → Appendix 1: proton pump inhibitors
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Uncommon** Encephalopathy
    - **Rare or very rare** Aggression, agitation, bronchospasm, increased risk of infection, muscle weakness
  - **SPECIFIC SIDE-EFFECTS**
    - **Rare or very rare**
      - With parenteral use Renal failure
      - **Frequency not known**
        - With parenteral use Electrolyte imbalance, vitamin B12 deficiency
      - **PREGNANCY** Manufacturer advises caution—no information available.
      - **BREAST FEEDING** Manufacturer advises avoid—no information available.
      - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - **Dose adjustments** Manufacturer advises in children 1–11 years, max. 10 mg daily in severe impairment.
  - **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%; give over 10–30 minutes.
  - With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few

Eomesrprazole (as Esomeprazole sodium) 40 mg Esomeprazole 40 mg powder for solution for injection vials | 1 vial (BNF) £3.07–£3.13 (Hospital only)

Nexium (AstraZeneca UK Ltd)

Eomesrprazole (as Esomeprazole sodium) 40 mg Nexium IV 40 mg powder for solution for injection vials | 1 vial (BNF) £4.25 (Hospital only)

Gastro-resistant granules

CAUTIONARY AND ADVISORY LABELS 25

Nexium (AstraZeneca UK Ltd)

Eomesrprazole (as Esomeprazole magnesium trihydrate)

10 mg Nexium 10 mg gastro-resistant granules sachets | 28 sachet (BNF) £25.19 DT + £25.19

PATIENT AND CARER ADVICE

Counselling on administration of orodispersible tablet advised.

Medicines for Children leaflet: Lansoprazole for gastro-oesophageal reflux disease (GORD) and ulcers

www.medicinesforchildren.org.uk/lansoprazole-gastrooesophageal-reflux-disease-gord-and-ulcers

Duodenal ulcer

BY MOUTH

Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

NSAID-associated duodenal ulcer / NSAID-associated gastric ulcer

BY MOUTH

Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

Gastro-oesophageal reflux disease

BY MOUTH

Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

Acid-related dyspepsia

BY MOUTH

Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis

BY MOUTH

Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

UNLICENSED USE

Not licensed for use in children.

INTERACTIONS

Appendix 1: proton pump inhibitors

SIDE-EFFECTS

Common or very common Dry throat - fatigue

Uncommon Anaemia - angioedema - appetite decreased - erectile dysfunction - fever - glossitis - oesophageal candidiasis - pancreatitis - restlessness - tremor

RARE or very RARE Anaemia - angioedema - appetite decreased - erectile dysfunction - fever - glossitis - oesophageal candidiasis - pancreatitis - restlessness - tremor

PREGNANCY

Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments

Manufacturer advises dose reduction of 50% in moderate to severe impairment.

DIRECTIONS FOR ADMINISTRATION

Orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

PATIENT AND CARER ADVICE

Counselling on administration of orodispersible tablet advised.

    - Lansoprazole 30 mg Zoton FastTab 30 mg 28 tablet (POD) £5.50 DT = £4.26

**Omeprazole**

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

- **BY MOUTH**
  - Child 1-5 years: 1–2 mg/kg once daily (max. per dose 40 mg)
  - Child 6–11 years: 1–2 mg/kg once daily (max. per dose 40 mg)
  - Child 12–17 years: 40 mg once daily

**Treatment of duodenal ulcers including those complicating NSAID therapy / Treatment of benign gastric ulcers including those complicating NSAID therapy**

- **BY MOUTH**
  - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
  - Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
  - Child 2–7 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
  - Child 2–7 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month-1 year: 700 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
    - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

**Zollinger-Ellison syndrome**

- **BY MOUTH**
  - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
  - Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
  - Child 2–7 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
  - Child 2–7 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month-1 year: 700 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
    - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

**by intravenous injection, or by intravenous infusion**

- Child 1 month-1 year: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
- Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

**Gastro-oesophageal reflux disease**

- **BY MOUTH**
  - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
  - Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
  - Child 2–7 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily, in severe ulcerating reflux oesophagitis, maximum 12 weeks at higher dose
  - Child 2–7 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily, in severe ulcerating reflux oesophagitis, maximum 12 weeks at higher dose
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month-1 year: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
    - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

**Acid-related dyspepsia**

- **BY MOUTH**
  - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
  - Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
  - Child 2–7 years (initiated by a specialist) (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
  - Child 2–7 years (initiated by a specialist) (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month-1 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
    - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes

**Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis**

- **BY MOUTH**
  - Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
  - Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
  - Child 2–7 years (body-weight 10–19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
  - Child 2–7 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child 1 month-1 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
    - Child 12–17 years: 40 mg once daily, injection to be given over 5 minutes
● **UNLICENSED USE** Capsules and tablets not licensed for use in children except for severe ulcerating reflux oesophagitis in children over 1 year. Injection not licensed for use in children under 12 years.

● **INTERACTIONS** → Appendix 1: proton pump inhibitors

● **SIDE-EFFECTS**
  ▶ Rare or very rare
  - Aggression - agitation - bronchospasm - encephalopathy - gastrointestinal candidiasis - muscle weakness

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Present in milk but not known to be harmful.

● **HEPATIC IMPAIRMENT**

  Dose adjustments

  No more than 700 micrograms/kg (max. 20 mg) once daily.

● **DIRECTIONS FOR ADMINISTRATION**

  For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.

  For administration through an enteral feeding tube, use Losec MUPS® or the contents of a capsule containing omeprazole dispersed in a large volume of water, or in 10 mL Sodium Bicarbonate 8.4% (1 mmol/mL). Allow to stand for 10 minutes before administration.

  For intermittent intravenous infusion, dilute reconstituted solution to a concentration of 400 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

  The RCPCH and NPPG recommend that, when a liquid special of omeprazole is required, the following strength is used: 20 mg/5 mL.

● **PATIENT AND CARER ADVICE**

  ▶ With oral use

  Counselling on administration advised. Medicines for Children leaflet: Omeprazole for gastro-oesophageal reflux disease (GORD) www.medicinesforchildren.org.uk/omeprazole-gastro-oesophageal-reflux-disease-gord

● **PROFESSIONAL SPECIFIC INFORMATION**

  Dental practitioners’ formulary

  Gastro-resistant omeprazole capsules may be prescribed.

● **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**4.3 Gastro-oesophageal reflux disease**

**Gastro-oesophageal reflux disease**

**Management**

Gastro-oesophageal reflux disease includes non-erosive gastro-oesophageal reflux and erosive oesophagitis. Uncomplicated gastro-oesophageal reflux is common in infancy and most symptoms, such as intermittent vomiting or repeated, effortless regurgitation, resolve without treatment between 12 and 18 months of age. Older children with gastro-oesophageal reflux disease may have heartburn, acid regurgitation and dysphagia. Oesophageal inflammation (oesophagitis), ulceration or stricture formation may develop in early childhood; gastro-oesophageal reflux disease may also be associated with chronic respiratory disorders including asthma.

Parents and carers of neonates and infants should be reassured that most symptoms of uncomplicated gastro-oesophageal reflux resolve without treatment. An increase in the frequency and a decrease in the volume of feeds may reduce symptoms. A feed thickener or pre-thickened formula feed can be used on the advice of a dietician. If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. A thickening agent should be tried for up to 2 weeks before considering other treatment.

**Older children** should be advised about life-style changes such as weight reduction if overweight, Smoking cessation p. 304, and the avoidance of alcohol. An alginate-containing antacid can be used to relieve symptoms.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital. On the advice of a paediatrician, a histamine H2-receptor antagonist can be used to relieve symptoms of gastro-oesophageal reflux disease, promote mucosal healing and permit reduction in antacid consumption. A proton pump inhibitor can be used for the treatment of moderate, non-erosive oesophagitis that is unresponsive to an H2-receptor antagonist. Endoscopically confirmed erosive, ulcerative, or stricture disease in children is usually treated with a proton pump inhibitor. Reassessment is necessary if symptoms persist despite 4–6 weeks of treatment; long-term use of an H2-receptor antagonist or proton pump inhibitor should not be undertaken without full assessment of the underlying condition. For endoscopically confirmed erosive, ulcerative,
Gastro-intestinal system

PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

please consider, alginic acid p. 607. The properties listed below are those particular to the oesophageal reflux disease.

Pregnancy

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 56 can be tried. Omeprazole p. 60 is reserved for women with severe or complicated reflux disease.

Other drugs used for Gastro-oesophageal reflux disease

Esomeprazole, p. 58 - Lansoprazole, p. 59

ANTACIDS > ALGINATE

Sodium alginate with calcium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 52, sodium bicarbonate p. 607, calcium carbonate p. 613.

INDICATIONS AND DOSE

Mild symptoms of gastro-oesophageal reflux disease

BY MOUTH

Child 6-11 years: 5–10 mL, to be taken after meals and at bedtime

Child 12-17 years: 10–20 mL, to be taken after meals and at bedtime

INTERACTIONS

Appendix 1: calcium salts - sodium bicarbonate

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include aniseed or peppermint.

5 Food allergy

Food allergy

Description of condition

Food allergy is an adverse immune response to a food, commonly associated with cutaneous and gastro-intestinal reactions, and less frequently associated with respiratory reactions and anaphylaxis. It is distinct from food intolerance which is non-immunological. Cow’s milk, hen’s eggs, soy, wheat, peanuts, tree nuts, fish, and shellfish are the most common allergens. Cross-reactivity between similar foods can occur (e.g. allergy to other mammalian milk in patients with cow’s milk allergy).

Management of food allergy

Allergy caused by specific foods should be managed by strict avoidance of the causative food. Sodium cromoglicate p. 169 is licensed as an adjunct to dietary avoidance in children with food allergy. Educating the child or their carer about appropriate nutrition, food preparation, and the risks of accidental exposure is recommended, such as food and drinks to avoid, ensuring adequate nutritional intake, and interpreting food labels. For children in whom elimination diets might affect growth, a consultation with a nutritionist is recommended to identify alternative dietary sources.

Drug treatment

There is low quality evidence to support the use of antihistamines to treat acute, non-life-threatening
stimulates gastric emptying and small intestinal transit, and Domperidone is a dopamine receptor antagonist which enhances the strength of oesophageal sphincter contraction. The MHRA/CHM has issued restrictions on its use because domperidone is associated with a small increased risk of serious cardiac side effects.

A low dose of erythromycin p. 341 stimulates gastrointestinal motility and may be used on the advice of a paediatric gastroenterologist to promote tolerance of enteral feeds; erythromycin may be less effective as a prokinetic drug in preterm neonates than in older children.

**6 Gastro-intestinal smooth muscle spasm**

### Antispasmodics

**Antimuscarinics**

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome. Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are occasionally used for the management of irritable bowel syndrome.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amine dicycloverine hydrochloride below and the quaternary ammonium compounds propantheline bromide p. 64 and hyoscine butylbromide p. 64. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood-brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride, may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection may be useful in endoscopy and radiology.

Other indications for antimuscarinic drugs include asthma and airways disease, motion sickness, urinary frequency and enuresis, mydriasis and cycloplegia, premedication, palliative care and as an antidote to organophosphorus poisoning.

**Other antispasmodics**

Alverine citrate p. 65, mebeverine hydrochloride p. 65, and peppermint oil p. 37 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome, and primary dysmenorrhoea. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

**Motility stimulants**

Domperidone is a dopamine receptor antagonist which stimulates gastric emptying and small intestinal transit, and
Gastro-intestinal smooth muscle spasms

**Hyoscine butylbromide** 13-Mar-2017

**INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- **BY MOUTH**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–5 years: 5 mg 3–4 times a day
  - Child 6–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

Acute spasm | Spasm in diagnostic procedures
---|---
- **INITIALLY BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 2–5 years: 5 mg, then (by intramuscular injection or by slow intravenous injection) 5 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 15 mg/day
  - Child 6–11 years: 5–10 mg, then (by intramuscular injection or by intravenous injection) 5–10 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 30 mg/day
  - Child 12–17 years: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 80 mg/day

**Excessive respiratory secretions in palliative care**

- **BY MOUTH**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

**Mydriasis**

- With intramuscular use or intravenous use

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS** Dyspnoea
  - **SPECIFIC SIDE-EFFECTS**
    - With parenteral use: Mydriasis
  - **PREGNANCY** Manufacturer advises avoid.
  - **BREAST FEEDING** Amount too small to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use: For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- With intravenous use: For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care: For further information on the use of hyoscine butylbromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-butylbromide.

**EXCEPTIONS TO LEGAL CATEGORY** Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

**MEDIKL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- **Kolanticon** (Peckforton Pharmaceuticals Ltd)
  - Dicycloverine hydrochloride 500 microgram per 1 ml, Simeticone 4 mg per 1 ml, Magnesium oxide light 20 mg per 1 ml, Aluminium hydroxide dried 40 mg per 1 ml Kolanticon gel sugar-free | 200 ml (£4.00 sugar-free | 500 ml (£6.00)

**Propantheline bromide** 13-Mar-2017

**INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- **BY MOUTH**
  - Child 1 month–11 years: 300 micrograms/kg 3–4 times a day (max. per dose 15 mg), dose to be taken at least one hour before food
Antispasmodics

**Mebeverine hydrochloride**

**INDICATIONS AND DOSE**
Adjunct in gastrointestinal disorders characterised by smooth muscle spasm

- **By mouth** using immediate-release medicines
  - Child 3 years: 25 mg 3 times a day, dose preferably taken 20 minutes before meals
  - Child 4-7 years: 50 mg 3 times a day, dose preferably taken 20 minutes before meals
  - Child 8-9 years: 100 mg 3 times a day, dose preferably taken 20 minutes before meals
  - Child 10-17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

**Irritable bowel syndrome**
- **By mouth** using modified-release medicines
  - Child 12-17 years: 200 mg twice daily

**SIDE-EFFECTS**
- By mouth: Immediate-release capsules
  - Child 12-17 years: 60–120 mg 1–3 times a day

**INTERACTIONS**
- Medicated dosage forms may affect performance on skilled tasks (e.g. driving).

**CONTRA-INDICATIONS**
- Paralytic ileus
- Angioedema – face oedema – skin reactions

**PREGNANCY**
- Not known to be harmful – manufacturers advise avoid.

**BREAST FEEDING**
- Manufacturers advise avoid — no information available.

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension.

**BNFC**
- 2019
- Page 65

**INDICATIONS AND DOSE**
Symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

- **By mouth**
  - Child 12-17 years: 60–120 mg 1–3 times a day

**SIDE-EFFECTS**
- Intestinal obstruction – paralytic ileus

**PREGNANCY**
- Manufacturer advises avoid — limited information available

**BREAST FEEDING**
- Manufacturer advises avoid — limited information available

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks: Dizziness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per capsule
  - 60 mg capsules | 100 capsule (Mylan) £0.30 DT + £6.90
  - 120 mg capsules | 60 capsule (Mylan) £0.49 DT + £6.90

**Tablet**
- Mebeverine hydrochloride 200 mg
  - Mebeverine 200 mg modified-release capsules | 60 capsule (Mylan) £8.29
  - Mebeverine 200 mg
  - Mebeverine hydrochloride 315 mg
  - Mebeverine 315 mg tablets | 100 tablet (Mylan) £4.30

**Suspension**
- Mebeverine hydrochloride 10 mg per ml
  - 50 mg/5 ml oral suspension sugar free sugar-free | 300 ml (Mylan) £187.00 DT + £187.00

**Oral suspension**
- Mebeverine hydrochloride (as Mebeverine pamoate) 10 mg per ml
  - 100 mg/5 ml oral suspension sugar free sugar-free | 150 ml (Mylan) £187.00 DT + £187.00

**McNeils Mebeverine hydrochloride 200 mg**
- Mebeverine 200 mg

**Gastro-intestinal system**

**Alverine citrate**

**INDICATIONS AND DOSE**
Symptomatic relief of gastrointestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

- **By mouth**
  - Child 12-17 years: 60–120 mg 1–3 times a day

**SIDE-EFFECTS**

7 Liver disorders and related conditions

7.1 Biliary disorders

Cholestasis

Description of condition
Cholestasis is an impairment of bile formation and/or bile flow, which may clinically present with fatigue, pruritus, dark urine, pale stools and, in its most overt form, jaundice and signs of fat soluble vitamin deficiencies.

Treatment
Ursodeoxycholic acid p. 67 [unlicensed] and colestyramine p. 131 [unlicensed under 6 years] are used to relieve cholestatic pruritus in children, even if evidence to support their use is limited.

Colestyramine is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves pruritus by forming an insoluble complex in the intestine with bile acids and other compounds—the reduction of serum bile acid levels reduces excess deposition in the dermal tissue with a resultant decrease in pruritus.

Under specialist supervision, other drugs which may be used as an alternative treatment for intractable cholestatic pruritus include rifampicin p. 379 [unlicensed indication], phenobarbital p. 223 [unlicensed indication] and opioid antagonists [unlicensed indication]. However, they should be used with caution and under expert guidance as these children usually have severe liver disease—careful monitoring is required.

Inborn errors of primary bile acid synthesis

Description of condition
Inborn errors of primary bile acid synthesis are a group of diseases in which the liver does not produce enough primary bile acids due to enzyme deficiencies. These acids are the main components of the bile, and include cholic acid and chenodeoxycholic acid.

Treatment
Cholic acid p. 67 is licensed for the treatment of inborn errors of primary bile acid synthesis due to an inborn deficiency of two specific liver enzymes. It acts by replacing some of the missing bile acids, therefore relieving the symptoms of the disease.

Chenodeoxycholic acid below is licensed for the treatment of inborn errors of primary bile acid synthesis due to a deficiency of one specific enzyme in the bile acid synthesis pathway when presenting as cerebrotendinous xanthomatosis.

Ursodeoxycholic acid p. 67 [unlicensed indication] has been used to treat inborn errors in primary bile acid synthesis, but there is an absence of evidence to recommend its use.

Primary biliary cholangitis

Description of condition
Primary biliary cholangitis (or primary biliary cirrhosis) is a chronic cholestatic disease which develops due to progressive destruction of small and intermediate bile ducts within the liver, subsequently evolving to fibrosis and cirrhosis.

Treatment
Ursodeoxycholic acid p. 67 is recommended for the management of primary biliary cholangitis, including those with asymptomatic disease. It slows disease progression, but the effect on overall survival is uncertain.

Smith-Lemli-Opitz syndrome

Description of condition
Smith-Lemli-Opitz syndrome is an inborn error of cholesterol synthesis. It is characterised by multiple congenital anomalies, intellectual deficit, growth delay, microcephaly, and behavioural problems. The disease is present at birth, but may be detected in later childhood or adulthood in mild forms. Hypoglycaemia due to adrenal insufficiency can present as an acute manifestation.

Aims of treatment
There is currently no cure for Smith-Lemli-Opitz syndrome. Management is aimed at symptom relief and alleviation of functional disabilities.

Treatment
Children with Smith-Lemli-Opitz syndrome are treated with dietary cholesterol supplementation, including high cholesterol foods (such as egg yolks) or a suspension of pharmaceutical grade cholesterol p. 68 (available from Special-order manufacturers p. 1107 or specialist importing companies) to help improve growth failure and photosensitivity. However, it is not clear who will benefit most from cholesterol treatment or how long it should continue.

In some cases bile acid supplements, such as chenodeoxycholic acid below [unlicensed] and ursodeoxycholic acid p. 67 [unlicensed indication] have been also used for this condition, but their use is not generally recommended.

Bile acids

Chenodeoxycholic acid

† INDICATIONS AND DOSE
Cerebrotendinous xanthomatosis (specialist use only)
† BY MOUTH
Child: Initially 5 mg/kg daily in 3 divided doses, adjusted according to response; maximum 15 mg/kg per day; maximum 1000 mg per day

Defective synthesis of bile acid (specialist use only)
† BY MOUTH
Neonate: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day.

Child: Initially 5 mg/kg 3 times a day, reduced to 2.5 mg/kg 3 times a day

Smith-Lemli-Opitz syndrome (specialist use only)
† BY MOUTH
Neonate: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses.

Child: 7 mg/kg once daily, alternatively 7 mg/kg daily in divided doses

† UNLICENSED USE Not licensed for defective synthesis of bile acid. Not licensed for Smith-Lemli-Opitz syndrome.

† CONTRA-INDICATIONS Non-functioning gall bladder - radio-opaque stones
Biliary disorders

**Cholic acid**

**Indications and Dose**

**Cholestasis**
- **By mouth**
  - Child (body-weight up to 10 kg): 50 mg daily, then increased in steps of 50 mg daily in divided doses; usual dose 5–15 mg/kg daily in divided doses, dose to be given with food at the same time each day
  - Child (body-weight 10 kg and above): Usual dose 5–15 mg/kg daily; increased in steps of 50 mg daily in divided doses if required, dose to be given with food at the same time each day; Usual maximum 500 mg/24 hours

**Side-effects**
- Cholelithiasis (long term use), diarrhoea, pruritus

**Interactions**
- Appendix 1: cholic acid
- Appendix 1: ursodeoxycholic acid

**Side-effects, further information**
- Patients presenting with pruritus and/or persistent diarrhoea should be investigated for potential overdose by a serum and/or urine bile acid assay.

**Pregnancy**
- Limited data available—known not to be harmful, manufacturer advises continue treatment.

**Monitoring**
- Manufacturer advises monitor patient parameters more frequently in pregnancy.

**Breast feeding**
- Present in milk but not known to be harmful.

**Hepatic impairment**
- Manufacturer advises caution and stop treatment if there are signs of severe hepatic failure—limited information available (no experience with impairment from causes not related to inborn errors of primary bile acid synthesis).

**Dose adjustments**
- Manufacturer advises adjust dose as the degree of impairment improves during treatment.

**Monitoring requirements**
- Manufacturer advises monitor serum and/or urine bile-acid concentrations every 3 months for the first year, then every 6 months for three years, then annually; monitor liver function tests at the same or greater frequency.

**Directions for administration**
- Manufacturer advises capsules may be opened and the content added to infant formula, juice, fruit compote, or yoghurt for administration.

**Patient and carer advice**
- Counselling advised on administration.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- **Chenodeoxycholic acid (non-proprietary)**
  - Chenodeoxycholic acid 250 mg, capsules | 100 capsule (BNF) £14.000

**Ursodeoxycholic acid**

**Indications and dose**

**Cholestasis**
- **By mouth**
  - Neonate: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response.
  - Child 1–23 months: 5 mg/kg 3 times a day (max. per dose 10 mg/kg 3 times a day), adjusted according to response
  - Child 24 months–7 years: 5 mg/kg 3 times a day, total daily dose may alternatively be given in 3 divided doses

**Cholestasis associated with total parenteral nutrition**
- **By mouth**
  - Neonate: 10 mg/kg 3 times a day.
  - Child: 10 mg/kg 3 times a day

**Sclerosing cholangitis**
- **By mouth**
  - Child: 5–10 mg/kg 2–3 times a day (max. per dose 15 mg/kg 3 times a day), adjusted according to response

**Unlicensed use**
- Not licensed for use in children for the treatment of cholestasis, sclerosing cholangitis, cholestasis associated with total parenteral nutrition or the improvement of hepatic metabolism of essential fatty acids and bile flow in cystic fibrosis.

**Contra-indications**
- Non-functioning gall bladder - radio-opaque stones

**Interactions**
- Appendix 1: ursodeoxycholic acid

**Side-effects**
- Common or very common: Diarrhoea, pale faeces
- Rare or very rare: Cholelithiasis calcification - skin reactions
- Frequency not known: Nausea, vomiting

**Pregnancy**
- No evidence of harm but manufacturer advises avoid.

**Breast feeding**
- Not known to be harmful but manufacturer advises avoid.

**Hepatic impairment**
- Avoid in chronic liver disease (but used in primary biliary cirrhosis).
7.2 Oesophageal varices

Other drugs used for Oesophageal varices Vasopressin, p. 69

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

Terlipressin acetate

INDICATIONS AND DOSE

GLYPRESSIN® INJECTION

Adjunct in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)

BY INTRAVENOUS INJECTION

- Child 12–17 years (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
- Child 12–17 years (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

VARIQUEL® INJECTION

Adjunct in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)

BY INTRAVENOUS INJECTION

- Child 12–17 years (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Child 12–17 years (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
- Child 12–17 years (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

UNLICENSED USE

Unlicensed for use in children.

CAUTIONS

Arrhythmia · electrolyte and fluid disturbances · heart disease · history of QT-interval prolongation · respiratory disease · septic shock · uncontrolled hypertension · vascular disease

SIDE-EFFECTS

- Common or very common Abdominal cramps · arrhythmias · diarrhoea · headache · hypertension · hypotension · pallor · peripheral ischaemia · vasoconstriction
- Uncommon Chest pain · cyanosis · fluid overload · heart failure · hot flush · hyponatraemia · intestinal ischaemia · ischaemic heart disease · lymphangitis · myocardial infarction · nausea · pulmonary oedema · respiratory disorders · seizure · skin necrosis · uterine disorders · vomiting
- Rare or very rare Dyspnoea · hyperglycaemia · stroke

PREGNANCY

Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

BREAST FEEDING

Avoid unless benefits outweigh risk—no information available.

RENAI IMPAIRMENT

Use with caution in chronic renal failure.

LIPIDS > STEROLS

Cholesterol

INDICATIONS AND DOSE

Smith–Lemli–Opitz syndrome

BY MOUTH

- Neonate: 5–10 mg/kg 3–4 times a day.
- Child: 5–10 mg/kg 3–4 times a day, doses up to 15 mg/kg 4 times daily have been used

UNLICENSED USE

Not licensed.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications, consult product literature.

CAUTIONS

CAUTIONS, FURTHER INFORMATION

For advice on cautions, consult product literature.

DIRECTIONS FOR ADMINISTRATION

Cholesterol powder can be mixed with a vegetable oil before administration.

DIRECTIONS FOR ADMINISTRATION

Cholesterol powder can be mixed with a vegetable oil before administration.

UNLICENSED USE

Not licensed.
Obesity

8  Obesity

Description of condition
Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, and obstructive sleep apnoea syndrome. It can also contribute to psychological and psychiatric morbidities.

In children and adolescents, body mass index (BMI) should be used as a practical estimation of body fat. However, it should be interpreted with caution as it is not a direct measure of adiposity. Assessing the BMI of children is more complicated than for adults because it changes as they grow and mature, with different growth patterns seen between boys and girls.

Public Health England advises that the British 1990 (UK90) growth reference charts should be used to determine the weight status of children. A child ≥ the 91st centile is classified as overweight, and as obese if ≥ the 98th centile. Waist circumference is not recommended as a routine measure, but should be used as an additional predictor for risk of developing other long-term health problems. Children who are overweight or obese and have significant comorbidities or complex needs should be considered for specialist referral.

Aims of treatment
Children who are overweight or obese and are no longer growing taller will ultimately need to lose weight and maintain weight loss to improve their BMI. However, preventing further weight gain while making lifestyle changes, may be an appropriate short-term aim.

Overview
The goals of management of obesity should be agreed together with the child and their parents or carers; parents or carers should be encouraged to take responsibility for lifestyle changes of their children. Referral to a specialist can be considered for children who are overweight or obese and have significant comorbidities or complex needs (e.g. learning disabilities). Children should be assessed for comorbidities such as hypertension, hyperinsulinaemia, dyslipidaemia, type 2 diabetes, psychosocial dysfunction, and exacerbation of conditions such as asthma.

An initial assessment should consider potential underlying causes (e.g. hypothryoidism) and a review of the appropriateness of current medications, which are known to cause weight gain, e.g. atypical antipsychotics, beta-adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), sodium valproate, and tricyclic antidepressants.

Lifestyle changes
Obese children should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity and improve diet and eating behaviour. These changes should be encouraged within the whole family. Any dietary changes should be age appropriate and consistent with healthy eating recommendations. Surgical intervention is not generally recommended in children or adolescents.

Drug treatment
Drug treatment is not generally recommended for children younger than 12 years, unless there are exceptional circumstances, such as if severe comorbidities are present. In children over 12 years, drug treatment is only recommended if physical comorbidities, such as orthopaedic problems or sleep apnoea, or severe psychological comorbidities are present. Drug treatment should never be used as the sole element of treatment and should be used as part of an overall weight management plan. Orlistat p. 70 [unlicensed use] is the only drug currently available in the UK that is recommended specifically for the treatment of obesity; it acts by reducing the absorption of dietary fat. Treatment should be started and monitored in a specialist paediatric setting by experienced multidisciplinary teams. An initial 6–12 month trial is recommended, with regular review to assess effectiveness, adverse effects and adherence.

Treatment may also be used to maintain weight loss rather than to continue to lose weight. A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for younger children who need vitamins and minerals for growth and development.
Rectal and anal disorders

Useful Resources

PERIPHERALLY ACTING ANTI OBESITY PRODUCTS > LIPASE INHIBITORS

Orlistat

- DRUG ACTION Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

- INDICATIONS AND DOSE
  Adjunct in obesity
  - BY MOUTH
  - Child 12-17 years (initiated by a specialist): 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only under specialist supervision, if a meal is missed or contains no fat, the dose of orlistat should be omitted

- UNLICENSED USE Not licensed for use in children.

- CONTRA-INDICATIONS Cholestasis - chronic malabsorption syndrome

- CAUTIONS Chronic kidney disease - may impair absorption of fat-soluble vitamins - volume depletion

- INTERACTIONS → Appendix 1: orlistat

- SIDE-EFFECTS
  - Common or very common Abdominal pain (may be minimised by reduced fat intake) - anxiety - diarrhoea - gastrointestinal disorders
  - Frequency not known Anorectal haemorrhage - bullous dermatitis - cholelithiasis - diverticulitis - hepatitis - oxalate nephropathy - pancreatitis - renal failure

- PREGNANCY Use with caution.

- BREAST FEEDING Avoid—no information available.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.
  Capsule
    - Orlistat (Non-proprietary)
      - Orlistat 120 mg Orlistat 120mg capsules | 84 capsule | £35.43 DT = £26.56
      - Alli (GlaxoSmithKline Consumer Healthcare)
      - Orlistat 60 mg Alli 60mg capsules | 84 capsule | £30.70 DT = £30.70
      - Orlos (Crescent Pharma Ltd)
      - Orlistat 60 mg Orlos 60mg capsules | 84 capsule | £16.95 DT = £30.70
      - Xenical (Cheplapharm Arzneimittel GmbH)
      - Orlistat 120 mg Xenical 120mg capsules | 84 capsule | £31.63 DT = £26.56

9 Rectal and anal disorders

9.1 Anal fissures

Description of condition
An anal fissure is a tear or ulcer in the lining of the anal canal, immediately within the anal margin. Clinical features of anal fissure include bleeding and persistent pain on defecation, and a linear split in the anal mucosa.

Constipation (passage of hard stools) is the most common cause in children. The majority of anal fissures are posterior, and an underlying cause should be considered (secondary anal fissure) if fissures are multiple, occur laterally, and are refractory to treatment.

EGG Suspect sexual abuse if a child has an anal fissure, and if constipation, Crohn’s disease or passing hard stools have been excluded as the cause (see also Useful resources below).

Aims of treatment
The aim of treatment is to relieve pain and promote healing of the fissure.

Drug treatment

EGG Initial management of acute anal fissures should focus on ensuring that stools are soft and easily passed. Osmotic laxatives, such as lactulose p. 43 or macrogols (macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride p. 44), are recommended. A simple analgesic such as paracetamol p. 278 or ibuprofen p. 679, may be offered for prolonged burning pain following defecation.

Children should be referred to a paediatric specialist if the anal fissure has not healed following two weeks of initial management, or earlier if there is significant pain.

Useful Resources

9.2 Haemorrhoids

Haemorrhoids

Description of condition
Haemorrhoids, or piles, are abnormal swellings of the vascular mucosal anal cushions around the anus. Internal haemorrhoids arise above the dentate line and are usually painless unless they become strangulated. External haemorrhoids originate below the dentate line and can be itchy or painful. Haemorrhoids in children are rare but may occur in infants with portal hypertension.

Aims of treatment
The aims of treatment are to reduce the symptoms (pain, bleeding and swelling), promote healing, and prevent recurrence.
Non-drug treatment

Stools should be kept soft and easy to pass (to minimise straining) by increasing dietary fibre and fluid intake. Advice about perianal hygiene is helpful to aid healing and reduce irritation and itching.

Drug treatment

If constipation is present, it should be treated, see Constipation p. 41.

A simple analgesic, such as paracetamol p. 278, can be used for pain relief. NSAIDs should be avoided if rectal bleeding is present.

Symptomatic treatment with a locally applied preparation is appropriate for short periods. Manufacturer advises preparations containing local anaesthetics (lidocaine, cinchocaine, and pramocaine [unlicensed]) should only be used for a few days as they may cause sensitisation of the anal skin—local anaesthetic ointments can be absorbed through the rectal mucosa (with a theoretical risk of systemic effects) and very rarely may cause increased irritation; excessive application should be avoided in infants and children.

Topical preparations combining corticosteroids with local anaesthetics and soothing agents are available for the management of haemorrhoids. Manufacturer advises long-term use of corticosteroid creams can cause ulceration and permanent damage due to thinning of the perianal skin and should be avoided. Continuous or excessive use carries a risk of adrenal suppression and systemic corticosteroid effects (particularly in infants).

Topical preparations containing corticosteroids must not be used if infection is present (such as perianal streptococcal infection, herpes simplex or perianal thrush). Recurrent symptoms, should be referred to secondary care for further investigation and management.

Related drugs

Topical preparations used for haemorrhoids: lidocaine hydrochloride p. 852, benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide below, cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate below, cinchocaine with hydrocortisone p. 72, cinchocaine with prednisolone p. 72.

CORTICOSTEROIDS

Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

Cinchaconine hydrochloride with fluocortolone caproate and fluocortolone pivalate

Haemorrhoids | Pruritus ani

BY RECTUM USING OINTMENT

Child 12-17 years: Apply twice daily for no longer than 7 days, to be inserted after a bowel movement, then 1 suppository daily on alternate days for 1 week.

Haemorrhoids (severe cases) | Pruritus ani (severe cases)

BY RECTUM USING OINTMENTS

Child 12-17 years: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week.

Cautions

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants). Local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days).

Prescribing and dispensing information

A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Ointment

Anusol-Hc (Church & Dwight UK Ltd)

Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram

Anusol HC ointment 30 grammes £2.49

Suppository

Anusol-Hc (Church & Dwight UK Ltd)

Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg

Anusol HC suppositories 12 suppository £1.74

No licensed medicines listed.

**Reduced exocrine secretions**

**10 Reduced exocrine secretions**

**Exocrine pancreatic insufficiency**

14-Dec-2016

**Description of condition**

Exocrine pancreatic insufficiency is characterised by reduced secretion of pancreatic enzymes into the duodenum. The main clinical manifestations are malabsorption and malnutrition, associated with low circulating levels of micronutrients, fat-soluble vitamins and lipoproteins. Children also present with gastrointestinal symptoms, such as diarrhoea, abdominal cramps and steatorrhoea.

Exocrine pancreatic insufficiency can result from cystic fibrosis, coeliac disease, Zollinger-Ellison syndrome, and gastrointestinal or pancreatic surgical resection.

**Aims of treatment**

The aim of treatment is to relieve gastrointestinal symptoms and to achieve a normal nutritional status.

**Drug treatment**

Pancreatic enzyme replacement therapy with pancreatin p. 74 is the mainstay of treatment for children with exocrine pancreatic insufficiency.

Pancreatin contains the three main groups of digestive enzymes: lipase, amylase and protease. These enzymes respectively digest fats, carbohydrates and proteins into their basic components so that they can be absorbed and utilised by the body. Pancreatin should be administered with meals and snacks. The dose should be adjusted, as necessary, to the lowest effective dose according to the symptoms of malabsorption and malnutrition.

Fibrosing colonopathy has been reported in children with cystic fibrosis taking high dose pancreatic enzyme replacement therapy (in excess of 10 000 units/kg/day of lipase). Possible risk factors are gender (boys are at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years. Manufacturers of Pancrease HL® and Nutrizym 22® recommend that the total dose of pancreatin used in patients with cystic fibrosis should not usually exceed 10 000 units/kg/day of lipase. Manufacturers recommend that if a patient taking pancreatin develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

There is limited evidence that acid suppression may improve the effectiveness of pancreatin. Acid-suppressing drugs (proton pump inhibitors or H₂-receptor antagonists) may be trialled in children who continue to experience symptoms despite high doses of pancreatin.

Levels of fat-soluble vitamins and micronutrients (such as zinc and selenium) should be routinely assessed and supplementation recommended whenever necessary.

**Non-drug treatment**

Dietary advice should be provided. Food intake should be distributed between three main meals per day, and two or three snacks. Food that is difficult to digest should be avoided, such as legumes (peas, beans, lentils) and high-fibre foods. Alcohol should be avoided completely. Reduced fat diets are not recommended.

Medium-chain triglycerides (see MCT oil, in Borderline substances), which are directly absorbed by the intestinal mucosa, were thought to be useful in some children. However evidence has shown that MCT-enriched preparations offer no advantage over a normal balanced diet.
PANCREATIC ENZYMES

**Pancreatin**

- **Drug Action**: Supplements of pancreatin are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

- **Indications and Dose**
  - **CREON**: 30000
    - **Pancreatic insufficiency**: by mouth
      - Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal eaten together with or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - **CREON**: 25000
    - **Pancreatic insufficiency**: by mouth
      - Child 2–17 years: Initially 1–2 capsules, dose to be taken with each meal eaten together with or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  - **CREON**: 40000
    - **Pancreatic insufficiency**: by mouth
      - Neonate: Initially 100 mg, for administration advice, see Directions for administration.

- **Dose Equivalence and Conversion**
  - For Creon® Micro: 100 mg granules = one measured scoopful (scoop supplied with product).
  
- **Nutrizym 22® Gastro-Resistant Capsules**
  - **Pancreatic insufficiency**: by mouth
    - Child 15–17 years: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water, or mixed with acidic fluid or soft food (then swallowed immediately without chewing)
  
- **Pancrease HL®**
  - **Pancreatic insufficiency**: by mouth
    - Child 15–17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

- **Pancrex® V**
  - **Pancreatic insufficiency**: by mouth
    - Child 1–11 months: 1–2 capsules, contents of capsule to be mixed with feeds
    - Child 1–17 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

**CONTRA-INDICATIONS**

- **Pancrease HL®**: Should not be used in children aged 15 years or less with cystic fibrosis
- **Nutrizym 22® Gastro-Resistant Capsules**: Should not be used in children aged 15 years or less with cystic fibrosis
- **Caution**: Can irritate the perioral skin and buccal mucosa if retained in the mouth—excessive doses can cause perianal irritation

**Interactions** → Appendix 1: Pancreatin

**Side-effects**

- Common or very common Abdominal distension · constipation · nausea · vomiting
- Uncommon: Skin reactions
- Frequency not known: Fibrosing colonopathy
- Pregnancy: Not known to be harmful

**Directions for Administration** Pancreatin is inactivated by gastric acid therefore manufacturer advises pancreatin preparations are best taken with food (or immediately before or after food). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; manufacturer advises the resulting mixtures should not be kept for more than one hour and any left-over food or liquid containing pancreatin should be discarded. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Manufacturer advises gastro-resistant granules should be mixed with slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. For infants, Creon® Micro granules can be mixed with a small amount of milk on a spoon and administered immediately—granules should not be added to the baby’s bottle. Manufacturer advises Pancrex® V powder may be administered via nasogastric tube or gastrostomy tube—consult local and national official guidelines.

**Prescribing and Dispensing Information**

Preparations may contain pork pancreatin—consult product literature.

**Handling and Storage** Hypersensitivity reactions occur occasionally and may affect those handling the powder.

**Patient and Carer Advice**

Patients or carers should be given advice on administration. It is important to ensure
adequate hydration at all times in patients receiving higher-strength pancreatic preparations. Medicines for Children leaflet: Pancreatin for pancreatic insufficiency www.medicinesforchildren.org.uk/pancreatin-pancreatic-insufficiency

> **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

11 Stoma care

Stoma care 24-Feb-2016

**Description of condition**

A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejunostomy, dudodeno-stomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient’s pharmaceutical needs correctly.

**Overview**

Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants. Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

**Analgesics**

Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analgesics may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

**Antacids**

The tendency to diarrhea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

**Antisecretory drugs**

The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 483) are often used to reduce this risk.

**Antidiarrhoeal drugs**

Loperamide hydrochloride p. 51 and codeine phosphate p. 283 reduce intestinal motility and decrease water and sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

**Dignox**

Children with a stoma are particularly susceptible to hypokalaemia. This predisposes children on digoxin p. 82 to digoxin toxicity; potassium supplements or a potassium-sparing diuretic may be advisable.

**Diuretics**

Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

**Iron preparations**

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

**Laxatives**

Laxatives should be used in children with stoma only under specialist supervision; they should be prescribed with caution for those with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible it should be treated by increasing fluid intake or dietary fibre. If a laxative is required, it should generally be used for short periods only.

**Care of stoma**

Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.
Chapter 2
Cardiovascular system

1 Arrhythmias

Overview
Management of an arrhythmia requires precise diagnosis of the type of arrhythmia; electrocardiography and referral to a paediatric cardiologist is essential; underlying causes such as heart failure require appropriate treatment.

Bradyarrhythmias
Adrenaline/epinephrine p. 138 is useful in the treatment of symptomatic bradycardia in an infant or child.

Supraventricular tachycardia
In supraventricular tachycardia adenosine p. 80 is given by rapid intravenous injection. If adenosine is ineffective, intravenous amiodarone hydrochloride p. 79, flecainide acetate p. 78, or a beta-blocker (such as esmolol hydrochloride p. 108) can be tried; verapamil hydrochloride p. 111 can also be considered in children over 1 year. Atenolol p. 106, sotalol hydrochloride p. 81 and flecainide acetate are used for the prophylaxis of paroxysmal supraventricular tachycardias.

The use of d.c. shock and vagal stimulation also have a role in the treatment of supraventricular tachycardia.

Syndromes associated with accessory conducting pathways
Amiodarone hydrochloride, flecainide acetate, or a beta-blocker is used to prevent recurrence of supraventricular tachycardia in infants and young children with these syndromes (e.g. Wolff-Parkinson-White syndrome).

Atrial flutter
In atrial flutter without structural heart defects, sinus rhythm is restored with d.c. shock or cardiac pacing; drug treatment is usually not necessary. Amiodarone hydrochloride is used in atrial flutter when structural heart defects are present or after heart surgery. Sotalol hydrochloride may also be considered.

Atrial fibrillation
Atrial fibrillation is very rare in children. To restore sinus rhythm d.c. shock is used; beta-blockers, alone or together with digoxin p. 82 may be useful for ventricular rate control.

Ecotopic tachycardia
Intravenous amiodarone hydrochloride is used in conjunction with body cooling and synchronized pacing in postoperative junctional ecotopic tachycardia. Oral amiodarone hydrochloride or flecainide acetate are used in congenital junctional ecotopic tachycardia.

Amiodarone hydrochloride, flecainide acetate, or a beta-blocker are used in atrial ecotopic tachycardia; amiodarone hydrochloride is preferred in those with poor ventricular function.

Ventricular tachycardia and ventricular fibrillation
Pulseless ventricular tachycardia or ventricular fibrillation require resuscitation, see Paediatric Advanced Life Support algorithm. Amiodarone hydrochloride is used in resuscitation for pulseless ventricular tachycardia or ventricular fibrillation unresponsive to d.c. shock; lidocaine hydrochloride p. 852 can be used as an alternative only if amiodarone hydrochloride is not available.

Amiodarone hydrochloride is also used in a haemodynamically stable child when drug treatment is required; lidocaine hydrochloride can be used as an alternative only if amiodarone hydrochloride is not available.

Torsade de pointes
Torsade de pointes is a form of ventricular tachycardia associated with long QT syndrome, which may be congenital or drug induced. Episodes may be self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous magnesium sulfate can be used to treat torsade de pointes (dose recommendations vary—consult local guidelines). Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Anti-arrhythmic drugs
Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:
Arrhythmias 77

ANTIARRHYTHMICS › CLASS IB

Lidocaine hydrochloride
(Lignocaine hydrochloride)

INDICATIONS AND DOSE
Ventricular arrhythmias | Pulseless ventricular tachycardia | Ventricular fibrillation

› INITIALLY BY INTRAVENOUS INJECTION, OR BY INTRAOSSEOUS INJECTION

- Neonate: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.
- Child 1 month–11 years: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.
- Child 12–17 years: Initially 50–100 mg, followed by (by intravenous infusion) 120 mg, dose to be given over 30 minutes, then (by intravenous infusion) 240 mg, dose to be given over 2 hours, then (by intravenous infusion) 60 mg/hour, reduce dose further if infusion is continued beyond 24 hours, if infusion not immediately available following initial injection, the initial injection dose may be repeated at intervals of not less than 5 minutes (to a maximum 300 mg dose in 1 hour) until infusion can be initiated

Neonatal seizures
› BY INTRAVENOUS INFUSION

- Neonate: Initially 2 mg/kg, dose to be given over 10 minutes, followed by 6 mg/kg/hour for 6 hours; reduced to 4 mg/kg/hour for 12 hours, then reduced to 2 mg/kg/hour for a further 12 hours, preterm neonates may require lower doses.

UNLICENSED USE | Not licensed for use in children under 1 year.

CONTRA-INDICATIONS | All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

CAUTIONS | Acute porphyrias p. 624 (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)

INTERACTIONS | Appendix 1: antiarrhythmics

SIDE-EFFECTS | Anxiety - arrhythmias - atrioventricular block - cardiac arrest - circulatory collapse - confusion - dizziness - drowsiness - euphoric mood - headache - hypotension (may lead to cardiac arrest) - loss of consciousness - methaemoglobinaemia - muscle twitching - myocardial contractility decreased - nausea - neurological effects - nystagmus - pain - psychosis - respiratory disorders - seizure - sensation abnormal - temperature sensation altered - tinnitus - tremor - vision blurred - vomiting

ANTIARRHYTHMICS ▶ CLASS III

Amiodarone hydrochloride

INDICATIONS AND DOSE
Supraventricular and ventricular arrhythmias (initiated in hospital or under specialist supervision)

BY MOUTH

Neonate: Initially 5–10 mg/kg twice daily for 7–10 days, then reduced to 5–10 mg/kg daily.

Child 1 month–11 years: Initially 5–10 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, then reduced to 5–10 mg/kg once daily; maximum 200 mg per day

Child 12–17 years: 200 mg 3 times a day for 1 week, then 200 mg twice daily for 1 week, then usually 200mg daily adjusted according to response

INITIALLY BY INTRAVENOUS INFUSION

Neonate: Initially 5 mg/kg, then (by intravenous infusion) 5 mg/kg every 12–24 hours, dose to be given over 30 minutes.

Child: Initially 5–10 mg/kg, dose to be given over 20 minutes to 2 hours, then (by continuous intravenous infusion) 300 micrograms/kg/hour, adjusted according to response; (by continuous intravenous infusion) increased if necessary up to 1.5 mg/kg/hour; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation (for cardiopulmonary resuscitation)

INITIALLY BY INTRAVENOUS INJECTION

Neonate: 5 mg/kg, dose to be given over at least 3 minutes.

Child: 5 mg/kg (max. per dose 300 mg), dose to be given over at least 3 minutes

UNLICENSED USE
Not licensed for use in children under 3 years.

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
Avoid in severe conduction disturbances (unless pacemaker fitted) - avoid in sinus node disease (unless pacemaker fitted) - avoid rapid loading after cardiac surgery - iodine sensitivity - sino-atrial heart block (except in cardiac arrest) - sinus bradyarrhythmia (except in cardiac arrest) - thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS
With intravenous use
Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypotension - avoid in severe respiratory failure

CAUTIONS
GENERAL CAUTIONS
Acute porphyrias p. 624 - conduction disturbances (in excessive dosage) - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS
With intravenous use
Avoid benzyl alcohol containing injections in neonates - moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS ▶ Appendix 1: antiarrhythmics

SIDE-EFFECTS
GENERAL SIDE-EFFECTS

Common or very common
Arrhythmias - hepatic disorders - hyperthyroidism - nausea - respiratory disorders - skin reactions

Rare or very rare
Bronchospasm (in patients with severe respiratory failure) - headache - idiopathic intracranial hypertension - nerve disorders - SIADH

Frequency not known
Angioedema - confusion - delirium - pancreatitis - severe cutaneous adverse reactions (SCARs)

SIDE-EFFECTS, FURTHER INFORMATION
Corneal microdeposits Patients taking amiodarone may develop corneal microdeposits (reversible on withdrawal of treatment). However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

Pulmonary toxicity Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

PREGNANCY
Possible risk of neonatal goitre; use only if no alternative.
ANTIARRHYTHMICS > OTHER

Adenosine

- INDICATIONS AND DOSE
  Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate
  - BY INTRAVENOUS INFUSION
  - Child: (consult product literature)

Termination of supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) Diagnosis of supraventricular arrhythmias
  - BY RAPID INTRAVENOUS INJECTION
  - Neonate: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 300 micrograms/kg given.
  - Child 1-11 months: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 500 micrograms/kg given.
  - Child 1-11 years: Initially 100 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes if required, dose to be repeated until tachycardia terminated or maximum single dose of 500 micrograms/kg (max.12 mg) given.
  - Child 12-17 years: Initially 3 mg, followed by 6 mg after 1–2 minutes if required, followed by 12 mg after 1–2 minutes if required, in some children over 12 years 3 mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with heart transplant are very sensitive to the effects of adenosine, and should not receive higher initial doses

- UNLICENSED USE Adenocor® licensed for treatment of paroxysmal supraventricular tachycardia in children; not licensed for diagnosis in children; Adenoscan® not licensed in children.

- CONTRA-INDICATIONS Asthma • decompensated heart failure • long QT syndrome • second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted) • severe hypotension

- CAUTIONS Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase) • atrial flutter with accessory pathway (conduction down anomalous pathway may increase) • autonomic dysfunction • bundle branch block • first-degree AV block • heart transplant • left main coronary artery stenosis • left to right shunt • pericardial effusion • pericarditis • QT-interval prolongation • recent myocardial infarction • severe heart failure • stenotic carotid artery disease with cerebrovascular insufficiency • stenotic valvular heart disease • uncorrected hypovolaemia

- INTERACTIONS Appendix 1: antiarrhythmics

- SIDE-EFFECTS
  - Common or very common Abdominal discomfort • arrhythmias • atrioventricular block • chest discomfort • chest pain (discontinue) • dizziness • dry mouth • dyspnoea • flushing • headache • hypotension (discontinue if severe) • pain • paraesthesia • thirst • discomfort
  - Uncommon Asthena • back discomfort • bradycardia (discontinue if asystole or severe bradycardia occur) • hyperhidrosis • limb discomfort • nervousness • taste metallic
### Arrhythmias

**Sotalol hydrochloride**

**Indications and Dose**

**Life-threatening arrhythmias including ventricular tachyarrhythmias**
- **By mouth**
- Child 12–17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, then increased up to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days.
- Neonate: Initially 1 mg/kg twice daily, increased if necessary up to 4 mg/kg twice daily, dose to be increased at intervals of 3–4 days.

**Atrial flutter, ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)**
- **By mouth**
  - Child 1 month–11 years: Initially 1 mg/kg twice daily, then increased if necessary up to 4 mg/kg twice daily (max. per dose 80 mg twice daily), dose to be increased at intervals of 2–3 days.
  - Child 12–17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Beta-adrenoceptor blockers**

**Non-selective**

**BNFC 2019–2020**

- Rare or very rare: Drowsiness, nasal congestion, nipple tenderness, respiratory disorders, respiratory failure (discontinue), tinnitus, tremor, urinary urgency, vision blurred.
- Frequency not known: Apnoea, cardiac arrest, loss of consciousness, nausea, seizure, syncope, vomiting.
- **Pregnancy**: Large doses may produce fetal toxicity; manufacturer advises use only if potential benefit outweighs risk.
- **Breast feeding**: No information available—unlikely to be present in milk owing to short half-life.
- **Monitoring Requirements**: Monitor ECG and have resuscitation facilities available.
- **Directions for Administration**: For rapid intravenous injection: give over 2 seconds into central or large peripheral vein followed by rapid Sodium Chloride 0.9% flush; injection solution may be diluted with Sodium Chloride 0.9% if required.

**Unlicensed Use**: Not licensed for use in children under 12 years.

**Important Safety Information**

Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias. **Important**: particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use. Reduce dose or discontinue if corrected QT interval exceeds 550 msec.

**Contra-indications**: Long QT syndrome (congenital or acquired) - torsade de pointes.

**Cautions**: Diarrhoea (severe or prolonged).

**Interactions**: + Appendix 1: beta-blockers, non-selective.

**Side-effects**

- Common or very common: Anxiety, arrhythmia, chest pain, dyspepsia, fever, flatulence, hearing impairment, mood altered, muscle spasm, oedema, palpitations, sexual dysfunction, taste altered, torsade de pointes (increased risk in females).

**Breast feeding**: Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

**Renal Impairment**: Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Dose adjustments: Halve normal dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use one-quarter normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².

**Monitoring Requirements**: Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**: For administration by mouth, tablets may be crushed and dispersed in water.

**Medicinal Forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.
CARDIAC GLYCOSIDES

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Poisoning, emergency treatment p. 859). Digoxin-specific antibody p. 868 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradycardia unresponsive to atropine sulfate p. 837 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

Digoxin

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation. Digoxin has a limited role in children with chronic heart failure.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate, even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In children with heart failure who are in sinus rhythm, a loading dose may not be required.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. The plasma-digoxin concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin.

Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

Digoxin

**DRUG ACTION** Digoxin is a cardiac glycoside that increases conductivity within the atrioventricular (AV) node.

**INDICATIONS AND DOSE**

**Supraventricular arrhythmias | Chronic heart failure**

**BY MOUTH**

- Neonate (body-weight up to 1.5 kg): Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 1.5–2.5 kg): Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

**CONTRA-INDICATIONS**

- Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction— but use with caution) • hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure— but use with caution) • intermittent complete heart block • myocarditis • second degree AV block • supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) • ventricular tachycardia or fibrillation

**CAUTIONS** Avoid hypercalcaemia (risk of digitalis toxicity) • avoid hypokalaemia (risk of digitalis toxicity) • avoid hypomagnesaemia (risk of digitalis toxicity) • avoid hypoxia (risk of digitalis toxicity) • severe respiratory disease • sick sinus syndrome • thyroid disease

DOSE ADJUSTMENTS DUE TO INTERACTIONS

- Manufacturer advises reduce dose by half with concurrent use of amiodarone, dronedarone and quinine.

DOSE EQUIVALENCE AND CONVERSION

- Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks.

- When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

**UNLICENSED USE** Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

Neonate (body-weight 2.6 kg and above): Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

Child 1 month–1 year: Initially 45 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

Child 2–4 years: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

Child 5–9 years: Initially 25 micrograms/kg in 3 divided doses (max. per dose 750 micrograms) for 24 hours, then 6 micrograms/kg daily in 1–2 divided doses; maximum 250 micrograms per day.

Child 10–17 years: Initially 0.75–1.5 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses; higher doses may be necessary.

**BY INTRAVENOUS INFUSION**

- Neonate (body-weight up to 1.5 kg): Initially 20 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 1.5–2.5 kg): Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 2.6 kg and above): Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 1 month–1 year: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 2–4 years: Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 5–9 years: Initially 25 micrograms/kg in 3 divided doses (max. per dose 750 micrograms) for 24 hours, then 6 micrograms/kg daily in 1–2 divided doses; maximum 250 micrograms per day.

- Child 10–17 years: Initially 0.5–1 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses; higher doses may be necessary.

- BY MOUTH

- Neonate (body-weight up to 1.5 kg): Initially 20 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 1.5–2.5 kg): Initially 30 micrograms/kg in 3 divided doses for 24 hours, then 4–6 micrograms/kg daily in 1–2 divided doses.

- Neonate (body-weight 2.6 kg and above): Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 1 month–1 year: Initially 35 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 2–4 years: Initially 25 micrograms/kg in 3 divided doses for 24 hours, then 10 micrograms/kg daily in 1–2 divided doses.

- Child 5–9 years: Initially 25 micrograms/kg in 3 divided doses (max. per dose 750 micrograms) for 24 hours, then 6 micrograms/kg daily in 1–2 divided doses; maximum 250 micrograms per day.

- Child 10–17 years: Initially 0.5–1 mg in 3 divided doses for 24 hours, then 62.5–250 micrograms daily in 1–2 divided doses; higher doses may be necessary
Bleeding disorders

Antifibrinolytic drugs and haemostatics

Overview
Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemorrhage) and in the management of menorrhagia; it may also be used in hereditary angioedema, epistaxis, and thrombolytic overdose. Tranexamic acid can also be used in cardiac surgery to reduce blood loss and to reduce the need for use of blood products. Desmopressin p. 448 is used in the management of mild to moderate haemorrhage and von Willebrand’s disease. It is also used for fibrinolytic response testing.

ANTIHAEMORRHAGICS  🔄 ANTIFIBRINOLYTICS

Tranexamic acid

26-Apr-2017

INDICATIONS AND DOSE

Inhibition of fibrinolysis
- **By mouth**
  - Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g)
  - **By slow intravenous injection**
    - Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
  - **By continuous intravenous infusion**
    - Child: 45 mg/kg, dose to be given over 24 hours

Menorrhagia
- **By mouth**
  - Child 12–17 years: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema
- **By mouth**
  - Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g), for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards
  - **By slow intravenous injection**
    - Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
  - **By continuous intravenous infusion**
    - Child: 45 mg/kg, dose to be given over 24 hours

Prevention of excessive bleeding after dental procedures (e.g. in haemophilia)
- **By intravenous injection**
  - Child 6–17 years: 10 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively
  - **By mouth**
    - Child 6–17 years: 15–25 mg/kg (max. per dose 1.5 g), dose to be given pre-operatively, then continued →
15–25 mg/kg 2–3 times a day (max. per dose 1.5 g) for up to 8 days, dose to be given postoperatively. 

Prevention of excessive bleeding after dental procedures (e.g. in haemophilia) with mouthwash 5% solution (specialist use only)

▶ BY MOUTH
Child 6-17 years 5–10 mL 4 times a day for 2 days, rinse mouth with solution; the solution should not be swallowed.

Reduction of blood loss during cardiac surgery
▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
Child: (consult local protocol)

UNLICENSED USE Not licensed for reduction of blood loss during cardiac surgery; injection not licensed for use in children under 1 year or for administration by intravenous infusion.

CONTRA-INDICATIONS Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) - history of convulsions - thromboembolic disease

CAUTIONS Irregular menstrual bleeding (establish cause before initiating therapy) - massive haematuria (avoid if risk of ureteric obstruction) - patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION

▪ MENORRHAGIA Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

▪ INTERACTIONS → Appendix 1: tranexamic acid

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
▌ Common or very common Diarrhoea (reduce dose) - nausea - vomiting
▌ Uncommon Allergic dermatitis
▌ Rare or very rare Colour vision change (discontinue) - embolism and thrombosis
▌ Frequency not known Seizure (more common at high doses) - visual impairment (discontinue)

SPECIFIC SIDE-EFFECTS
▌ With intravenous use Hypotension - malaise (on rapid intravenous injection)
▌ PREGNANCY No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
▌ BREAST FEEDING Small amount present in milk—antifibrinolytic effect in infant unlikely.
▌ RENAL IMPAIRMENT Avoid in severe impairment.
Dose adjustments Reduce dose in mild to moderate impairment.
▌ MONITORING REQUIREMENTS Regular liver function tests in long-term treatment of hereditary angioedema.
▌ DIRECTIONS FOR ADMINISTRATION For intravenous administration, dilute with Glucose 5% or Sodium chloride 0.9%.
▌ PATIENT AND CARER ADVICE
Medicines for Children leaflet: Tranexamic acid for heavy bleeding during periods www.medicinesforchildren.org.uk/tranexamic-acid-heavy-bleeding-during-periods
Medicines for Children leaflet: Tranexamic acid for the treatment or prevention of bleeding www.medicinesforchildren.org.uk/tranexamic-acid-treatment-or-prevention-bleeding

▪ MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
TLab
▌ Tranexamic acid (Non-proprietary)
Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet (Hospital) £32.10 DT = £5.42
▌ Cyklokapron (Meda Pharmaceuticals Ltd)
Tranexamic acid 500 mg Cyklokapron 500mg tablets | 60 tablet (Hospital) £14.30 DT = £5.42

Solution for injection
▌ Tranexamic acid (Non-proprietary)
Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 3 ampoule (Hospital) £7.50 DT = £7.50 (Hospital only) | 10 ampoule (Hospital) £15.47 DT = £15.47 (Hospital only)
▌ Cyklokapron (Pfizer Ltd)
Tranexamic acid 100 mg per 1 ml Cyklokapron 500mg/5ml solution for injection ampoules | 10 ampoule (Hospital) £15.47 DT = £15.47

ANTIHAEMORRHAGICS > HAEMOSTATICS

Emicizumab 09-May-2018
▌ DRUG ACTION Emicizumab is a monoclonal antibody that bridges activated factor IX and factor X to restore function of missing activated factor VIII, which is needed for haemostasis.

▌ INDICATIONS AND DOSE
Prophylaxis of haemorrhage in patients with haemophilia A (initiated by a specialist)
▶ BY SUBCUTANEOUS INJECTION
Child: Initially 3 mg/kg once weekly for 4 weeks, then maintenance 1.5 mg/kg once weekly, administer into the thigh, abdomen or upper arm

▪ CAUTIONS Children under 1 year - concomitant bypassing agent - risk factors for thrombotic microangiopathy

▪ CAUTIONS, FURTHER INFORMATION
Concomitant bypassing agent Manufacturer advises discontinue bypassing agents the day before starting emicizumab; if a bypassing agent is required—consult product literature.

▪ SIDE-EFFECTS
▌ Common or very common Arthralgia - diarrhoea - fever - headache - myalgia - thrombotic microangiopathy
▌ Uncommon Cavernous sinus thrombosis - skin necrosis - thrombophlebitis

▪ CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for 6 months after treatment in women of childbearing potential.

▪ PREGNANCY Manufacturer advises use only if potential benefit outweighs risk—no information available.

▪ BREAST FEEDING Manufacturer advises avoid—no information available.

▪ EFFECT ON LABORATORY TESTS Manufacturer advises to avoid intrinsic pathway clotting-based laboratory tests or use with caution as results may be misinterpreted—consult product literature.

▪ DIRECTIONS FOR ADMINISTRATION Manufacturer advises max. 2 mL per injection site; rotate injection site and avoid skin that is tender, damaged or scarred. Patients or their caregivers may self-administer Hemlibra® after appropriate training.

▪ PRESCRIBING AND DISPENSING INFORMATION Emicizumab is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1; manufacturer advises to record the brand name and batch number after each administration.
Coagulation factor deficiencies

2.1 Coagulation factor deficiencies

BLOOD AND RELATED PRODUCTS

Dried prothrombin complex

(Human prothrombin complex)

15-Mar-2017

INDICATIONS AND DOSE

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available

Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

BY INTRAVENOUS INFUSION

Child: (consult haematologist)

CONTRA-INDICATIONS

Angina - history of heparin induced thrombocytopenia - recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)

CAUTIONS

Disseminated intravascular coagulation - history of myocardial infarction or coronary heart disease - postoperative use - risk of thrombosis - vaccination against hepatitis A and hepatitis B may be required

SIDE-EFFECTS

Rare or very rare

Fever - headache - hypersensitivity

Frequency not known

Disseminated intravascular coagulation - nephrotic syndrome - thromboembolism

HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of thromboembolic complications).

Monitoring

Monitor closely in hepatic impairment (risk of thromboembolic complications).

PRESCRIBING AND DISPENSING INFORMATION

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.

Available from CSL Behring (Beriplex® P/N), Octapharma (Octaplex®).

MEDICINAL FORMS

No licensed medicines listed.

Factor VIII fraction, dried

(Human coagulation factor VIII, dried)

INDICATIONS AND DOSE

Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency / Von Willebrand’s disease

BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION

Child: (consult haematologist)

CAUTIONS

Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates - vaccination against hepatitis A and hepatitis B may be required (not necessary with recombinant preparation)

SIDE-EFFECTS

Uncommon

Angioedema - cardiac discomfort - chills - flushing - headache - hypersensitivity - hypotension - lethargy - nausea - paraesthesia - restlessness - skin reactions - tachycardia - vomiting - wheezing

Rare or very rare

Fever

MONITORING REQUIREMENTS

Monitor for development of factor VIII inhibitors.
PRESCRIBING AND DISPENSING INFORMATION
Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. Optivate®, Fanhdi®, and Octanate® are not indicated for use in von Willebrand’s disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand’s disease.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solution for solution for injection**
- **Factor VIII fraction, dried (Non-proprietary)**
  - Factor VIII 500 unit: Dried Factor VIII Fraction type B 500 unit powder and solvent for solution for injection vials | 1 vial | £210.00
  - Advate (Baxalta UK Ltd)
    - Octocog alfa 250 unit: Advate 250 unit powder and solvent for solution for injection vials | 1 vial | £355.00
  - Octocog alfa 500 unit: Advate 500 unit powder and solvent for solution for injection vials | 1 vial | £710.00
  - Octocog alfa 2000 unit: Advate 2000 unit powder and solvent for solution for injection vials | 1 vial | £1,420.00
- Alphanate (Grifols UK Ltd)
  - Factor VIII high purity 1000 unit, von Willebrand factor
    - 1200 unit: Alphanate 1200 unit powder and solvent for solution for injection vials | 1 vial | £495.00
    - 1500 unit: Alphanate 1500 unit powder and solvent for solution for injection vials | 1 vial | £530.00
  - Electa (Swedish Orphan Biovitrum Ltd)
    - Efmorocog alfa 250 unit: Electa 250 unit powder and solvent for solution for injection vials | 1 vial | £177.50
    - Efmorocog alfa 500 unit: Electa 500 unit powder and solvent for solution for injection vials | 1 vial | £355.00
    - Efmorocog alfa 1000 unit: Electa 1000 unit powder and solvent for solution for injection vials | 1 vial | £710.00
    - Efmorocog alfa 1500 unit: Electa 1500 unit powder and solvent for solution for injection vials | 1 vial | £1,140.00
    - Efmorocog alfa 2000 unit: Electa 2000 unit powder and solvent for solution for injection vials | 1 vial | £1,420.00
    - Efmorocog alfa 3000 unit: Electa 3000 unit powder and solvent for solution for injection vials | 1 vial | £2,000.00
- Fanhdi (Grifols UK Ltd)
  - Factor VIII high purity 500 unit, von Willebrand factor
    - 500 unit: Fanhdi 500 unit powder and solvent for solution for injection vials | 1 vial | £1,165.00
  - Factor VIII high purity 1000 unit, von Willebrand factor
    - 1000 unit: Fanhdi 1000 unit powder and solvent for solution for injection vials | 1 vial | £2,330.00
  - Haemocin (Biotest UK Ltd)
    - Factor VIII high purity 250 unit
      - 250 unit: Haemocin 250 unit powder and solvent for solution for injection vials | 1 vial | £150.00
  - Factor VIII high purity 500 unit, von Willebrand factor
    - 500 unit: Haemocin 500 unit powder and solvent for solution for injection vials | 1 vial | £300.00
  - Factor VIII high purity 1000 unit, von Willebrand factor
    - 1000 unit: Haemocin 1000 unit powder and solvent for solution for injection vials | 1 vial | £600.00
- Kogenate (Bayer Plc)
  - Octocog alfa 2000 unit
    - 2000 unit: Kogenate Bayer 2000 unit powder and solvent for solution for injection vials | 1 vial | £1,260.00
  - Kogenate Bayer (Bayer Plc)
    - Octocog alfa 250 unit
      - 250 unit: Kogenate Bayer 250 unit powder and solvent for solution for injection vials | 1 vial | £157.50
  - Octocog alfa 500 unit
    - 500 unit: Kogenate Bayer 500 unit powder and solvent for solution for injection vials | 1 vial | £315.00
  - Octocog alfa 1000 unit
    - 1000 unit: Kogenate Bayer 1000 unit powder and solvent for solution for injection vials | 1 vial | £630.00
- Nuwiq (Octapharma Ltd)
  - Simoctocog alfa 250 unit
    - 250 unit: Nuwiq 250 unit powder and solvent for solution for injection vials | 1 vial | £130.00
  - Simoctocog alfa 500 unit
    - 500 unit: Nuwiq 500 unit powder and solvent for solution for injection vials | 1 vial | £380.00

Simoctocog alfa 1000 unit: Nuwiq 1000 unit powder and solvent for solution for injection vials | 1 vial | £760.00
Simoctocog alfa 2000 unit: Nuwiq 2000 unit powder and solvent for solution for injection vials | 1 vial | £1,520.00

**Octanate LV (Octapharma Ltd)**
- Factor VIII high purity 500 unit
  - Octanate LV 500 unit powder and solvent for solution for injection vials | 1 vial | £300.00 (Hospital only)

- Factor VIII high purity 1000 unit
  - Octanate LV 1000 unit powder and solvent for solution for injection vials | 1 vial | £600.00 (Hospital only)

- ReFacto (Pfizer Ltd)
  - Moroctocog alfa 250 unit
    - ReFacto AF 250 unit powder and solvent for solution for injection vials | 1 vial | £125.55 (Hospital only)
    - ReFacto AF 500 unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection | £251.10 (Hospital only)
    - ReFacto AF 250 unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection | £502.20 (Hospital only)

Moroctocog alfa 500 unit
- ReFacto AF 500 unit powder and solvent for solution for injection vials | 1 vial | £251.10 (Hospital only)

- Moroctocog alfa 1000 unit
  - ReFacto AF 1000 unit powder and solvent for solution for injection vials | 1 vial | £506.20 (Hospital only)
  - ReFacto AF 1000 unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection | £502.20 (Hospital only)

Moroctocog alfa 2000 unit
- ReFacto AF 2000 unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection | £1,044.40 (Hospital only)
- ReFacto AF 2000 unit powder and solvent for solution for injection vials | 1 vial | £1,044.40 (Hospital only)

Moroctocog alfa 3000 unit
- ReFacto AF 3000 unit powder and solvent for solution for injection pre-filled syringes | 1 pre-filled disposable injection | £1,506.60 (Hospital only)

- Vonceno (CSL Behring UK Ltd)
  - Factor VIII 5000 unit, von Willebrand factor 1200 unit
    - Vonceno 5000 unit powder and solvent for solution for injection vials | 1 vial | £385.00
    - Vonceno 1000 unit powder and solvent for solution for injection vials | 1 vial | £260.00

Factor VIII high purity products
- Factor VIII high purity 1000 unit, von Willebrand factor
  - 1000 unit powder and solvent for solution for injection vials | 1 vial | £506.00 (Hospital only)
  - Factor VIII high purity 1500 unit, von Willebrand factor
  - 1500 unit powder and solvent for solution for injection vials | 1 vial | £506.00 (Hospital only)

Powder and solution for solution for infusion
- Advate (Baxalta UK Ltd)
  - Octocog alfa 1500 unit
    - Advate 1500 unit powder and solvent for solution for infusion vials | 1 vial | £1,065.00
  - Octocog alfa 3000 unit
    - Advate 3000 unit powder and solvent for solution for infusion vials | 1 vial | £2,130.00

- Kogenate (Bayer Plc)
  - Octocog alfa 3000 unit
    - Kogenate Bayer 3000 unit powder and solvent for solution for injection vials | 1 vial | £1,890.00
  - Optivate (Bio Products Laboratory Ltd)
  - Factor VIII 250 unit, von Willebrand factor 430 unit
    - Optivate 250 unit powder and solvent for solution for infusion vials | 1 vial | £385.00

- Wilate 1000 (Octapharma Ltd)
  - Factor VIII 1000 unit, von Willebrand factor 1000 unit
    - Wilate 1000 powder and solvent for solution for infusion vials | 1 vial | £500.00

- Wilate 500 (Octapharma Ltd)
  - Factor VIII 500 unit, von Willebrand factor 500 unit
    - Wilate 500 powder and solvent for solution for infusion vials | 1 vial | £250.00

Factor IX fraction, dried

INDICATIONS AND DOSE
Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)
- By intravenous injection, or by continuous intravenous infusion
- Child: (consult haematologist)

CONTRA-INDICATIONS
Disseminated intravascular coagulation

CAUTIONS
Risk of thrombosis—primarily with former low purity products · vaccination against hepatitis A and
Coagulation factor deficiencies

**Fibrinogen, dried**

*Human fibrinogen*

- **INDICATIONS AND DOSE**
  - Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: (consult haematologist)

- **CAUTIONS**
  - Risk of thrombosis

- **SIDE-EFFECTS**
  - Common or very common Fever, thromboembolism
  - Rare or very rare Angioedema, headache

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Fibrinogen is prepared from human plasma.

**Protein C concentrate**

- **INDICATIONS AND DOSE**
  - Congenital protein C deficiency
  - **BY INTRAVENOUS INJECTION**
  - Child: (consult haematologist)

- **CAUTIONS**
  - Hypersensitivity to heparins - vaccination against hepatitis A and hepatitis B may be required

- **SIDE-EFFECTS**
  - Rare or very rare Dizziness, fever, skin reactions
  - Frequency not known Haemothorax, hyperhidrosis, restlessness

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Protein C is prepared from human plasma.

**Factor XIII fraction, dried**

*Human fibrin-stabilising factor, dried*

- **INDICATIONS AND DOSE**
  - Congenital factor XIII deficiency
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: (consult haematologist)

- **CAUTIONS**
  - Vaccination against hepatitis A and hepatitis B may be required

- **SIDE-EFFECTS**
  - Rare or very rare Anaphylactoid reaction, dyspnoea, skin reactions

- **PRESCRIBING AND DISPENSING INFORMATION**
  - There can be variation in the licensing of different medicines containing the same drug.

**Factor VIII inhibitor bypassing fraction**

- **INDICATIONS AND DOSE**
  - Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child: (consult haematologist)

- **CONTRA-INDICATIONS**
  - Disseminated intravascular coagulation

---

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **AlphaNine** (Grifols UK Ltd)
  - Factor IX high purity 1000 unit
  - Alphanine 1,000 unit powder and solvent for solution for injection vials | 1 vial (P:R) £130.00

- **Haemonine** (Biotest (UK) Ltd)
  - Factor IX high purity 500 unit
  - Haemonine 500 unit powder and solvent for solution for injection vials | 1 vial (P:R) £100.00 (Hospital only)

- **Replene-VF** (Bio Products Laboratory Ltd)
  - Factor IX high purity 500 unit
  - Replene-VF 500 unit powder and solvent for solution for injection vials | 1 vial (P:R) £64.00 (Hospital only)

**Powder and solvent for solution for infusion**

- **BeneFIX** (Pfizer Ltd)
  - Nonacog alfa 250 unit
  - BeneFit 250 unit powder and solvent for solution for infusion vials | 1 vial (P:R) £131.30 (Hospital only)

- **Nonacog alfa 500 unit**
  - BeneFit 500 unit powder and solvent for solution for infusion vials | 1 vial (P:R) £303.60 (Hospital only)

- **Nonacog alfa 1000 unit**
  - BeneFit 1,000 unit powder and solvent for solution for infusion vials | 1 vial (P:R) £607.20 (Hospital only)

- **Nonacog alfa 2000 unit**
  - BeneFit 2,000 unit powder and solvent for solution for infusion vials | 1 vial (P:R) £1,214.40 (Hospital only)

- **Nonacog alfa 3000 unit**
  - BeneFit 3,000 unit powder and solvent for solution for infusion vials | 1 vial (P:R) £1,821.60 (Hospital only)

---

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Ristap** (CSL Behring UK Ltd)
  - Fibrinogen 1 gram
  - Ristap 1g powder for solution for infusion vials | 1 vial (P:R) £400.00

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Ceprotin** (Baxalta UK Ltd)
  - Protein C 500 unit
  - Ceprocin 500 unit powder and solvent for solution for injection vials | 1 vial (P:R) £2,000.00

- **Protein C 1000 unit**
  - Ceprotin 1000 unit powder and solvent for solution for injection vials | 1 vial (P:R) £1,000.00

---

**BREAST FEEDING**

Manufacturers advise avoid—no information available.

**PRESCRIBING AND DISPENSING INFORMATION**

- Haemostatic products

- There can be variation in the licensing of different medicines containing the same drug.
Bleeding disorders

2.2 Subarachnoid haemorrhage

CALCIUM-CANAL BLOCKERS

Nimodipine

07-Feb-2018

- **DRUG ACTION** Nimodipine is a dihydropyridine calcium-channel blocker.

- **INDICATIONS AND DOSE**

  Treatment of vasospasm following subarachnoid haemorrhage (specialist use only)

  - **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: Initially 15 micrograms/kg/hour (max. per dose 50 micrograms/hour), increased after 2 hours if no severe decrease in blood pressure; increased to 30 micrograms/kg/hour (max. per dose 2 mg/hour), continue for at least 5 days (max. 14 days), use initial dose of 7.5 micrograms/kg/hour if blood pressure unstable
  - Child 12–17 years (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)
  - Child 12–17 years (body-weight 70 kg and above): Initially up to 1 mg/hour, use dose if blood pressure stable; increased after 2 hours if no severe decrease in blood pressure; increased to 1–2 mg/hour, continue for at least 5 days (max. 14 days)

- **Prevention of vasospasm following subarachnoid haemorrhage**

  - **BY MOUTH**
  - Child: 0.9–1.2 mg/kg 6 times a day (max. per dose 60 mg), started within 4 days of haemorrhage and continued for 21 days

- **UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Nimodipine has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS**

  - Cerebral oedema · Hypotension · Severely raised intracranial pressure

- **INTERACTIONS** → Appendix 1: calcium channel blockers

- **SIDE-EFFECTS**

  - Uncommon Thrombocytopenia · Vasodilation

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **RENAI IMPAIRMENT** Monitoring → With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Avoid concomitant administration of nimodipine infusion and tablets.
Blood clots

3.1 Blocked catheters and lines

ANTITHROMBOTIC DRUGS > TISSUE PLASMINOGEN ACTIVATORS

Fibrinolytic drugs

Overview
Alteplase below, streptokinase p. 90 and urokinase p. 90 are used in children to dissolve intravascular thrombi and unblock occluded arteriovenous shunts, catheters, and indwelling central lines blocked with fibrin clots. Treatment should be started as soon as possible after a clot has formed and discontinued once a pulse in the affected limb is detected, or the shunt or catheter unblocked.

The safety and efficacy of treatment remains uncertain, especially in neonates. A fibrinolytic drug is probably only appropriate where arterial occlusion threatens ischaemic and discontinued once a pulse in the affected limb is detected, or the shunt or catheter unblocked.

Alteplase is the preferred fibrinolytic in children and neonates; there is less risk of adverse effects including allergic reactions.

Fibrinolytics

- **DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.
- **CONTRA-INDICATIONS** Acute pancreatitis • aneurysm • arteriovenous malformation • bacterial endocarditis • bleeding diatheses • coagulation defects • neoplasm with risk of haemorrhage • pericarditis • recent haemorrhage • recent surgery (including dental extraction) • recent trauma • severe hypertension
- **CAUTIONS** Conditions with an increased risk of haemorrhage • hypertension • risk of bleeding (including that from venepuncture or invasive procedures)
- **SIDE-EFFECTS**
  - **Common or very common** Anaphylactic reaction • angina pectoris • cardiac arrest • cardiogenic shock • chills • CNS haemorrhage • ecchymosis • fever • haemorrhage • haemorrhagic stroke • heart failure • hypotension • ischaemia recurrent (when used in myocardial infarction) • nausea • pericarditis • pulmonary oedema • vomiting
  - **Uncommon** Aphasia • mitral valve incompetence • myocardial rupture • pericardial disorders • reperfusion arrhythmia (when used in myocardial infarction) • seizure

SIDE-EFFECTS, FURTHER INFORMATION
Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs.

- **PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.
- **HEPATIC IMPAIRMENT** Manufacturers advise avoid in severe impairment.

Alteplase
(rt-PA; Tissue-type plasminogen activator)

- **INDICATIONS AND DOSE**
  - **Intravascular thrombosis**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment (consult local protocol).
      - Child: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment; maximum 100 mg per day
  - **ACTILYSE CATHTHLO®**
    - Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)
      - **BY INTRAVENOUS INJECTION**
      - Child: (consult product literature)
  - **UNLICENSED USE** Actilyse® not licensed for use in children.
  - **CONTRA-INDICATIONS** Oesophageal varices • recent delivery • recent ulcerative gastro-intestinal disease • stroke
  - **INTERACTIONS** → Appendix 1: alteplase
  - **SIDE-EFFECTS**
    - **Uncommon** Haemothorax
    - **Rare or very rare** Agitation • confusion • delirium • depression • epilepsy • psychosis • speech disorder
    - **Frequency not known** Brain oedema (caused by reperfusion)
  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Actilyse®), dissolve in Water for Injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute further in Sodium Chloride 0.9% to a concentration of not less than 200 micrograms/mL; not to be diluted in Glucose.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Solution for infusion**
    - Nimotop (Bayer Plc) Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial [P] £68.00 (Hospital only)
  - **Tablet**
    - Nimotop (Bayer Plc) Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet [P] £40.00

Powder and solvent for solution for injection

- **Actilyse (Boehringer Ingelheim Ltd)**
  - **Alteplase 10 mg** Actilyse 10mg powder and solvent for solution for injection vials | 1 vial [P] £172.80
  - **Alteplase 20 mg** Actilyse 20mg powder and solvent for solution for injection vials | 1 vial [P] £259.20

Powder and solvent for solution for infusion

- **Actilyse (Boehringer Ingelheim Ltd)**
  - **Alteplase 50 mg** Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial [P] £432.00
Streptokinase

- INDICATIONS AND DOSE
  - Intravascular thrombosis
    - Initially by intravenous infusion
    - Child 1 month–11 years: Initially 2500–4000 units/kg, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 500–1000 units/kg/hour for up to 3 days until reperfusion occurs
    - Child 12–17 years: Initially 250 000 units, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 100 000 units/hour for up to 3 days until reperfusion occurs

- CONTRA-INDICATIONS
- CAUTIONS
- SIDE-EFFECTS
- ALLERGY AND CROSS-SENSITIVITY

Urokinase

- INDICATIONS AND DOSE
  - Occluded arteriovenous shunts, catheters, and indwelling central lines
    - To the device as a flush
    - Neonate: 5000–25 000 units, inject directly into occluded catheter or central line, dilute dose in sodium chloride 0.9% to fill catheter dead space only. Leave for 20–60 minutes then aspirate the lysate and flush with sodium chloride 0.9%.
    - Child: 5000–25 000 units, inject directly into occluded catheter or central line, dilute dose in sodium chloride 0.9% to fill catheter dead space only. Leave for 20–60 minutes then aspirate the lysate and flush with sodium chloride 0.9%

- CONTRA-INDICATIONS

Venous thromboembolism

### 3.2 Thromboembolism

#### Venous thromboembolism prophylaxis

Low-dose heparin (unfractionated) p. 97 by subcutaneous injection is used to prevent thrombotic episodes in ‘high-risk’ patients; laboratory monitoring of APTT or anti-Factor Xa concentration is also required in prophylactic regimens in children. Low molecular weight heparins, aspirin p. 93 (antiplatelet dose), and warfarin sodium p. 99 can also be used for prophylaxis.

The following guidance on reducing the risk of venous thromboembolism applies to children over 16 years and is based on NICE guideline 89 (www.nice.org.uk/guidance/ng89).

- All children over 16 years old should undergo a risk assessment to identify their risk of venous thromboembolism and bleeding on admission to hospital.
  - Commonly used risk assessment tools can be found at www.nice.org.uk/guidance/ng89/resources. Children over 16 years old considered to be at high risk of venous thromboembolism include those who are anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism and thrombophilic disorder. Pregnancy and the postpartum period are also risk factors for venous thromboembolism.

There are two methods of thromboprophylaxis: mechanical and pharmacological. Options for mechanical prophylaxis are anti-embolism stockings that provide graduated compression and produce a calf pressure of 14–15 mmHg, and intermittent pneumatic compression.

- Anti-embolism stockings should be worn day and night until the child is sufficiently mobile; they should not be offered to children over 16 years old admitted with conditions such as severe leg oedema, or local conditions (e.g. gangrene, dermatitis). When using pharmacological prophylaxis, in most cases, it should start as soon as possible or within 14 hours of admission. Children over 16 years of age with risk factors for bleeding (e.g. thrombocytopenia, acquired or untreated inherited bleeding disorders) should only receive

---
pharmacological prophylaxis when their risk of venous thromboembolism outweighs their risk of bleeding. Children over 16 years of age receiving anticoagulant therapy who are at high risk of venous thromboembolism should be considered for prophylaxis if their anticoagulant therapy is interrupted, for example during the peri-operative period.

**Surgical patients**
- To reduce the risk of venous thromboembolism in surgical patients over 16 years old, regional anaesthesia over general anaesthesia should be used if possible.
- Mechanical prophylaxis (e.g. anti-embolism stockings or intermittent pneumatic compression) should be offered to children over 16 years old with major trauma, or undergoing cranial, abdominal, bariatic, thoracic, maxillofacial, ear, nose, and throat, cardiac or elective spinal surgery.
- Prophylaxis should continue until the child is sufficiently mobile or discharged from hospital (or for 30 days in spinal injury, elective spinal surgery or cranial surgery).
- Choice of mechanical prophylaxis depends on factors such as the type of surgery, suitability for the child, and their condition.
- Pharmacological prophylaxis should be considered in children over 16 years old undergoing general or orthopaedic surgery when the risk of venous thromboembolism outweighs the risk of bleeding.
- The choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy.
- A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) is preferred in patients with renal impairment. Fondaparinux sodium [unlicensed] is an option for children over 16 years old undergoing abdominal, bariatic, thoracic or cardiac surgery, or for patients with lower limb immobilisation or fragility fractures of the pelvis, hip or proximal femur.
- Pharmacological prophylaxis in general surgery should usually continue for at least 7 days post-surgery, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen, and to 30 days in spinal surgery.
- Mechanical prophylaxis with intermittent pneumatic compression should be considered when pharmacological prophylaxis is contra-indicated in children over 16 years old undergoing lower limb amputation, or those with major trauma or fragility fractures of the pelvis, hip or proximal femur.

**Medical patients**
- The choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy.
- Acutely ill medical patients over 16 years old who are at high risk of venous thromboembolism should be offered pharmacological prophylaxis. Children over 16 years old should be given either a low molecular weight heparin as a first-line option, or fondaparinux sodium [unlicensed] as an alternative, for a minimum of 7 days. Children over 16 years old with renal impairment should be given either a low molecular weight heparin or heparin (unfractionated) and the dose should be adjusted as necessary.
- Mechanical prophylaxis can be considered when pharmacological prophylaxis is contra-indicated; their use should be continued until the child is sufficiently mobile.

**Thromboprophylaxis in pregnancy**
- All pregnant young women over 16 years old (who are not in active labour), or young women over 16 years old who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, with a risk of venous thromboembolism that outweighs the risk of bleeding should be considered for pharmacological prophylaxis with a low molecular weight heparin during hospital admission. In pregnant young women over 16 years old, prophylaxis should be continued until there is no longer a risk of venous thromboembolism, or until discharge from hospital. Young women over 16 years old who have given birth, had a miscarriage or termination of pregnancy during the past 6 weeks, should start thromboprophylaxis with a low molecular weight heparin 4–8 hours after the event, unless contra-indicated, and continue for a minimum of 7 days.
- Additional mechanical prophylaxis should be considered for young women over 16 years old who are likely to be immobilised or have significantly reduced mobility and continued until the young woman is sufficiently mobile or discharged from hospital. Intermittent pneumatic compression should be used as the first-line option and antithrombotic stockings as an alternative.

**Treatment of venous thromboembolism**
- For the initial treatment of thrombotic episodes heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection; the use of intermittent intravenous injection is no longer recommended. Alternatively, a low molecular weight heparin may be given for initial treatment. If an oral anticoagulant (usually warfarin sodium) is also required, it may be started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring of coagulation activity, preferably on a daily basis, involves determination of the activated partial thromboplastin time (APTT) (for heparin (unfractionated) p. 97 only) or of the anti-Factor Xa concentration (for low molecular weight heparins). Local guidelines on recommended APTT for neonates and children should be followed; monitoring of APTT should be discussed with a specialist prior to treatment for thrombotic episodes in neonates.

**Treatment of venous thromboembolism in pregnancy**
- Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 96, enoxaparin sodium p. 96 and tinzaparin sodium p. 98; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

**Extracorporeal circuits**
- Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

**Haemorrhage**
- If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin (unfractionated), but if rapid reversal of the effects of the heparin (unfractionated) is required, protamine sulfate p. 868 is a specific antidote (but only partially reverses the effects of low molecular weight heparin (unfractionated)).

**Advanced Pharmacy Services**
- Children with, or at risk of venous thromboembolism may be eligible for the New Medicines Service / Medicines Use. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.
Oral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Oral anticoagulants antagonise the effects of vitamin K and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

Uses

Warfarin sodium, p. 99 is the drug of choice for the treatment of systemic thromboembolism in children (not neonates) after initial heparinisation. It may also be used occasionally for the treatment of intravascular or intracardiac thrombi.

Warfarin sodium is used prophylactically in those with chronic atrial fibrillation, dilated cardiomyopathy, certain forms of reconstructive heart surgery, mechanical prosthetic heart valves, and some forms of hereditary thrombophilia (e.g. homozygous protein C deficiency).

Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants below) is usually preferred for the prophylaxis of venous thromboembolism in children undergoing surgery; alternatively warfarin sodium can be continued in selected children currently taking warfarin sodium and who are at a high risk of thromboembolism (seek expert advice).

Dose

The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

An induction dose is usually given over 4 days. The subsequent maintenance dose depends on the prothrombin time, reported as INR (international normalised ratio) and should be taken at the same time each day.

Target INR

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:

- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprothetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction
- INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2;
- Mechanical prosthetic heart valves:
- the recommended target INR depends on the type and location of the valve, and patient-related risk factors
- consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytonadione p. 659 (vitamin K₃) by slow intravenous injection; give dried prothrombin complex p. 85 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K₃) by slow intravenous injection; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytonadione (vitamin K₃) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytonadione (vitamin K₃) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding— withhold 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology

Advanced Pharmacy Services

Children taking oral anticoagulants may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Parenteral anticoagulants

Anticoagulants

Although thrombotic episodes are uncommon in childhood, anticoagulants may be required in children with congenital heart disease; in children undergoing haemodialysis; for
preventing thrombosis in children requiring chemotherapy and following surgery; and for systemic venous thrombembolism secondary to inherited thrombophilias, systemic lupus erythematosus, or indwelling central venous catheters.

**Heparin**

Heparin initiates anticoagulation rapidly but has a short duration of action. It is now often referred to as being **standard** or heparin (unfractionated) p. 97 to distinguish it from the **low molecular weight heparins**, which have a longer duration of action. For children at high risk of bleeding, heparin (unfractionated) is more suitable than low molecular weight heparin because its effect can be terminated rapidly by stopping the infusion.

Heparins are used in both the treatment and prophylaxis of thrombembolms, mainly to prevent further clotting rather than to lyse existing clots—surgery or a thrombolytic drug may be necessary if a thrombus obstructs major vessels.

**Low molecular weight heparins**

Dalteparin sodium p. 96, enoxaparin sodium p. 96, and tinzaparin sodium p. 98 are low molecular weight heparins used for treatment and prophylaxis of thrombotic episodes in children. Their duration of action is longer than that of heparin (unfractionated) and in adults and older children **once-daily subcutaneous** dosage is sometimes possible; however, younger children require relatively higher doses (possibly due to larger volume of distribution, altered heparin pharmacokinetics, or lower plasma concentrations of antithrombin) and twice daily dosage is sometimes necessary. Low molecular weight heparins are convenient to use, especially in children with poor venous access.

**Heparinoids**

Danaparoid sodium p. 95 is a heparinoid that has a role in children who develop heparin-induced thrombocytopenia, providing they have no evidence of cross-reactivity.

**Heparin flushes**

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

**Epoprostenol**

Epoprostenol p. 120 (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is a potent vasodilator and therefore its side-effects include flushing, headache and hypotension.

**Aspirin**

*(Acetylsalicylic Acid)*

**INDICATIONS AND DOSE**

**Antiplatelet | Prevention of thrombus formation after cardiac surgery**

- **Neonate**: 1–5 mg/kg once daily.
- **Child 1 month-11 years**: 1–5 mg/kg once daily (max. per dose 75 mg)
- **Child 12-17 years**: 75 mg once daily

**Kawasaki disease**

Initial treatment is with high dose aspirin and a single dose of intravenous normal immunoglobulin; this combination has an additive anti-inflammatory effect resulting in faster resolution of fever and a decreased incidence of coronary artery complications. After the acute phase, when the patient is afebrile, aspirin is continued at a lower dose to prevent coronary artery abnormalities.

**Advanced Pharmacy Services**

Children taking antiplatelet drugs may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**CONTRA-INDICATIONS**

- Active peptic ulceration
- Uncontrolled hypertension
- Severe cardiac failure
- Previous peptic ulceration
- Active bleeding
- Allergic disease
- Anaemia
- Asthma
- Dehydration
- Glyceraldehyde-3-phosphate dehydrogenase deficiency
- Anaemia
- Dehydration
- G6PD deficiency
- Preferably avoid during fever or viral infection in children (risk of Reye’s syndrome)
- Hypertension
- Thrombolytic drug use
- Previous peptic ulceration

**OTHER ANTITHROMBOTIC DRUGS**

- **Dipyridamole p. 94** is also used as an antiplatelet drug to prevent clot formation after cardiac surgery and may be used with specialist advice for treatment of persistent coronary artery aneurysms in Kawasaki disease.

**BNFC 2019 – 2020**

Cardiovascular system

Thromboembolism 93
INTERACTIONS → Appendix 1: aspirin

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Rare or very rare Asthmatic attack · bronchospasm

SPECIFIC SIDE-EFFECTS
- Common or very common Dyspepsia · haemorrhage
- Uncommon Dyspnoea · rhinitis · severe cutaneous adverse reactions (SCARs) · skin reactions
- Rare or very rare Aplastic anaemia · erythema nodosum · gastrointestinal haemorrhage · granulocytosis · haemorrhagic vasculitis · intracranial haemorrhage · menorrhagia · nausea · thrombocytopenia · vomiting
- Frequency not known Fluid retention · gastrointestinal disorders · headache · hearing loss · hepatic failure · hyperuricaemia · iron deficiency anaemia · renal impairment · sodium and water retention · deterioration in vitamin K stores low.

Allergy and cross-sensitivity
- Uncommon
- Common or very common

SIDE-EFFECTS

suspension, oral solution

Nu-Seals
- ▶ 5, 25, 32

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25, 32
- Aspirin (Non-proprietary)
  - Aspirin 75 mg Aspirin 75mg gastro-resistant tablets | 28 tablet £0.71 DT = £0.71 | 56 tablet £1.42 DT = £1.66
  - Aspirin 300 mg Aspirin 300mg gastro-resistant tablets | 100 tablet £25.28 DT = £25.21

Dipyriramole

INDICATIONS AND DOSE

Kawasaki disease (initiated under specialist supervision)
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1 month–11 years: 1 mg/kg 3 times a day

Prevention of thrombus formation after cardiac surgery
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1 month–11 years: 2.5 mg/kg twice daily
  - Child 12–17 years: 100–200 mg 3 times a day

UNLICENSED USE
Not licensed for use in children.

CAUTION
Aortic stenosis · coagulation disorders · heart failure · hypotension · left ventricular outflow obstruction · may exacerbate migraine · myasthenia gravis (risk of exacerbation)

INTERACTIONS → Appendix 1: dipyriramole

SIDE-EFFECTS
- Common or very common Angina pectoris · diarrhoea · dizziness · headache · myalgia · nausea · skin reactions · vomiting
- Frequency not known Angioedema · bronchospasm · haemorrhage · hot flush · hypotension · tachycardia · thrombocytopenia
- PREGNANCY
Not known to be harmful.

BREAST FEEDING
Manufacturers advise use only if essential—small amount present in milk.

DIRECTIONS FOR ADMINISTRATION
Injection solution can be given orally.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral suspension
- Dipyriramole (Non-proprietary)
  - Dipyriramole 10 mg per 1 ml Dipyriramole 50mg/5ml oral suspension sugar free sugar-free | 150 ml £39.40 DT = £39.40
  - Dipyriramole 40 mg per 1 ml Dipyriramole 200mg/5ml oral suspension sugar free sugar-free | 150 ml £133.53 DT = £133.53

Tablet

CAUTIONARY AND ADVISORY LABELS 22
- Dipyriramole (Non-proprietary)
  - Dipyriramole 25 mg Dipyriramole 25mg tablets | 84 tablet £9.40 DT = £9.40
  - Dipyriramole 100 mg Dipyriramole 100mg tablets | 84 tablet £12.50 DT = £4.66
ANTITHROMBOTIC DRUGS > HEPARINOIDS

Danaparoid sodium

24-Jul-2018

- INDICATIONS AND DOSE
  Thromboembolic disease in patients with history of heparin-induced thrombocytopenia
  - INITIALLY BY INTRAVENOUS INJECTION
    - Neonate: Initially 30 units/kg, then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity
    - Child 1 month–15 years (body-weight up to 55 kg): Initially 30 units/kg (max. per dose 1250 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity
    - Child 1 month–15 years (body-weight 55 kg and above): Initially 30 units/kg (max. per dose 2500 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity
    - Child 16–17 years (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity
    - Child 16–17 years (body-weight 55–90 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity
    - Child 16–17 years (body-weight 91 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

- UNLICENSED USE
  Not licensed for use in children.

- CONTRA-INDICATIONS
  Active peptic ulcer (unless this is the reason for operation) • acute bacterial endocarditis • diabetic retinopathy • epidural anaesthesia (with treatment doses) • haemophilia and other haemorrhagic disorders • peptic ulcer • recent cerebral haemorrhage • recent surgery to nervous system • severe hypertension • spinal anaesthesia with treatment doses • thrombocytopenia (including history of heparin-induced thrombocytopenia)

- CAUTIONS
  Antibodies to heparins (risk of antibody-induced thrombocytopenia) • body-weight over 90 kg • recent bleeding • risk of bleeding

- INTERACTIONS
  Appendix 1: danaparoid

- SIDE-EFFECTS
  - Common or very common
    - Haemorrhage • heparin-induced thrombocytopenia • skin reactions • thrombocytopenia
  - Uncommon
    - Post procedural haemostasia
  - Rare or very rare
    - Anastomotic haemorrhage

- PREGNANCY
  Manufacturer advises avoid—limited information available but not known to be harmful.

- BREAST FEEDING
  Amount probably too small to be harmful but manufacturer advises avoid.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in moderate impairment with impaired haemostasis—increased risk of bleeding; avoid in severe hepatic failure unless patient has heparin-induced thrombocytopenia and no alternative available.

- RENAL IMPAIRMENT
  Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

  Monitoring
  Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

- MONITORING REQUIREMENTS
  Monitor anti factor Xa activity in patients with body-weight over 90 kg.

- DIRECTIONS FOR ADMINISTRATION
  For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Danaparoid sodium (Non-proprietary)
    - Danaparoid sodium 1250 unit per 1 ml
      - Danaparoid sodium 750 units/0.6ml solution for injection ampoules
      - 10 ampoule £59.99

ANTITHROMBOTIC DRUGS > HEPARINS

Heparins

- CONTRA-INDICATIONS
  Acute bacterial endocarditis • after major trauma • epidural anaesthesia with treatment doses • haemophilia and other haemorrhagic disorders • peptic ulcer • recent cerebral haemorrhage • recent surgery to eye • recent surgery to nervous system • severe hypertension • spinal anaesthesia with treatment doses • thrombocytopenia (including history of heparin-induced thrombocytopenia)

- SIDE-EFFECTS
  - Common or very common
    - Haemorrhage • heparin-induced thrombocytopenia • skin reactions • thrombocytopenia • thrombocytosis
  - Uncommon
    - CNS haemorrhage
  - Rare or very rare
    - Alopecia • hyperkalaemia • osteoporosis • priapism
  - Frequency not known
    - Hypoaldosteronism

SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhage
  If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia
  Clinically important heparin-induced thrombocytopenia is immune-mediated and can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia
  Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

- ALLERGY AND CROSS-SENSITIVITY
  Hypersensitivity to unfractionated or low molecular weight heparin.

- MONITORING REQUIREMENTS
  Heparin-induced thrombocytopenia
    - Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-

> Hyperkalaemia  Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

### Dalteparin sodium

#### INDICATIONS AND DOSE

**Treatment of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg twice daily.
  - Child 1 month-11 years: 100 units/kg twice daily
  - Child 12-17 years: 200 units/kg once daily (max. per dose 18 000 units); reduced to 100 units/kg twice daily, dose reduced if increased risk of bleeding

**Treatment of venous thromboembolism in pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12-17 years (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12-17 years (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12-17 years (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

**Prophylaxis of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg once daily.
  - Child 1 month-11 years: 100 units/kg once daily
  - Child 12-17 years: 2500–5000 units twice daily

#### UNLICENSED USE

Not licensed for use in children.

#### INTERACTIONS

→ Appendix 1: low molecular-weight heparins

#### SIDE-EFFECTS

Epidural haematoma - prosthetic cardiac valve thrombosis

#### PREGNANCY

Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

#### BREAST FEEDING

Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

#### HEPATIC IMPAIRMENT

Manufacturer advises caution in severe impairment (increased risk of bleeding complications).

- **Dose adjustments**  Manufacturer advises consider dose reduction in severe impairment.

#### RENAL IMPAIRMENT

Use of unfractionated heparin may be preferable.

- **Dose adjustments**  Risk of bleeding may be increased—dose reduction may be required.

#### MONITORING REQUIREMENTS

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

### Enoxaparin sodium

#### INDICATIONS AND DOSE

**Treatment of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 1.5–2 mg/kg twice daily.
  - Child 1 month: 1.5 mg/kg twice daily
  - Child 2 months-17 years: 1 mg/kg twice daily

**Treatment of venous thromboembolism in pregnancy**

- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
  - Child 12-17 years (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
  - Child 12-17 years (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
  - Child 12-17 years (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

**Prophylaxis of thrombotic episodes**

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 750 micrograms/kg twice daily.
  - Child 1 month: 750 micrograms/kg twice daily
  - Child 2 months-17 years: 500 micrograms/kg twice daily; maximum 40 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

- 1 mg equivalent to 100 units.

#### UNLICENSED USE

Not licensed for treatment of venous thromboembolism in pregnancy.

Not licensed for use in children.

#### INTERACTIONS

→ Appendix 1: low molecular-weight heparins

#### SIDE-EFFECTS

Common or very common  Hypersensitivity

Frequency not known  Cutaneous vasculitis - eosinophilia - haemorrhagic anaemia - headache - hepatic disorders

#### PREGNANCY

Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—avoid.
**MONITORING REQUIREMENTS**

- **RENAL IMPAIRMENT**
  - Risk of bleeding increased; use of unfractionated heparin may be preferable. Consult specialist sources.

**PRESCRIBING AND DISPENSING INFORMATION**

Enoxaparin sodium is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

**EXCipients:** May contain Benzyl alcohol

- **Arovi** (ROVI Biotech Ltd)
  - **Enoxaparin sodium 100 mg per 1 ml**
    - **Inhixa** 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £15.65 DT = £20.86
    - **Arrovi** 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £29.45 DT = £39.26
    - **Arrovi** 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £22.79 DT = £30.37
    - **Arrovi** 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £41.35 DT = £55.13
    - **Arovi** 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £54.23 DT = £72.30

- **Enoxaparin sodium 150 mg per 1 ml**
  - **Inhixa** 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £18.92 DT = £24.99

**Clexane (Sanofi)**

- **Enoxaparin sodium 100 mg per 1 ml**
  - **Clexane** 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £39.26 DT = £52.26
  - **Clexane** 300mg/3ml solution for injection multidose vials | 1 vial (PVS) £21.32 DT = £27.62
  - **Clexane** 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £55.13 DT = £72.17
  - **Clexane** 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £30.27 DT = £39.67
  - **Clexane** 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £72.30 DT = £90.39
  - **Clexane** 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £20.86 DT = £27.82

- **Enoxaparin sodium 150 mg per 1 ml**
  - **Clexane Forte** 120mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £99.91 DT = £122.99
  - **Clexane Forte** 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £99.91 DT = £122.99

- **Inhixa** (Techdow Pharma England Ltd)
  - **Enoxaparin sodium 100 mg per 1 ml**
    - **Inhixa** 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £24.22 DT = £30.27
    - **Inhixa** 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £44.10 DT = £55.13
    - **Inhixa** 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £31.41 DT = £39.26
    - **Inhixa** 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £57.84 DT = £72.30
    - **Inhixa** 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £16.69 DT = £21.66

- **Enoxaparin sodium 150 mg per 1 ml**
  - **Inhixa** 120mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PFS) £79.14 DT = £97.93

### Indications and Dose

- **Prevention of clotting in extracorporeal circuits**
  - **To the device as a flush**
  - **Child:** (consult product literature)

- **Maintenance of neonatal umbilical arterial catheter**
  - **By intravenous infusion**
  - **Neonate:** 0.5 unit/hour.

**Treatment of thrombotic episodes**

- **By intravenous injection**
  - **Neonate up to 35 weeks corrected gestational age:** Initially 50 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.
  - **Child 1-11 months:** Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT
  - **Child 1-7 years:** Initially 75 units/kg, then (by continuous intravenous infusion) 20 units/kg/hour, adjusted according to APTT
  - **By subcutaneous injection**
    - **Child:** 250 units/kg twice daily, adjusted according to APTT

**Prophylaxis of thrombotic episodes**

- **By subcutaneous injection**
  - **Child:** 100 units/kg twice daily (max. per dose 5000 units), adjusted according to APTT

**Maintenance of cardiac shunts and critical stents**

- **To the device as a flush**
  - **Child:** (consult local protocol)

### Unlicensed Use

- **Check product literature for licensed use in children.**

### Interactions

- **Appendix 1: heparin (unfractionated)**

### Side-Effects

- **Adrenal insufficiency. hypokalaemia. rebound hyperlipidaemia**

### Pregnancy

- **Does not cross the placenta: maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.**

### Breast Feeding

- **Not excreted into milk due to high molecular weight.**

### Heparin Impairment

- **Manufacturer advises caution; consider avoiding in severe impairment (increased risk of bleeding complications).**

### Dose Adjustments

- **Manufacturer advises consider dose reduction if used in severe impairment.**

### Renal Impairment

- **Dose adjustments**
  - **Risk of bleeding increased in severe impairment—dose may need to be reduced.**

### Directions for Administration

- **For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.**

- **In neonates**
  - **For maintenance of neonatal umbilical arterial catheter,** dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour. **For neonatal intensive care (treatment of thrombosis),** dilute 1250 units/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous
infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

  **Solution for injection**

  **EXCIPIENTS:** May contain Benzyl alcohol  
  - Heparin (unfractionated) (Non-proprietary)  
  - Heparin sodium 1000 unit per 1 mL Heparin sodium 1,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £14.85 DT = £14.85  
  - Heparin sodium 5,000 units/mL solution for injection vials | 10 vial (Pre) £16.50–£37.41 DT = £16.50  
  - Heparin sodium 20,000 units/mL solution for injection vials | 10 ampoule (Pre) £70.86 DT = £70.86  
  - Heparin sodium 5,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £37.47 DT = £37.47  
  - Heparin sodium 10,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £65.59 DT = £65.59  
  - Heparin sodium 5000 unit per 1 mL | 10 ampoule (Pre) £29.04 DT = £29.04  
  - Heparin sodium 25,000 units/mL solution for injection vials | 10 vial (Pre) £45.00–£84.60 DT = £45.00  
  - Heparin sodium 25,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £75.76 DT = £75.76  
  - Heparin calcium 2500 unit per 1 mL Heparin calcium 5,000 units/0.2 mL solution for injection ampoules | 10 ampoule (Pre) £44.70 DT = £44.70  
  - Heparin sodium 25,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £76.95 DT = £76.95  
  - Heparin sodium 5,000 units/mL solution for injection ampoules | 10 ampoule (Pre) £37.35 DT = £37.35

- **Intravenous flush**

  **EXCIPIENTS:** May contain Benzyl alcohol  
  - Heparin (unfractionated) (Non-proprietary)  
  - Heparin sodium 10 unit per 1 mL Heparin sodium 50 units/5 mL patency solution ampoules | 10 ampoule (Pre) £14.96 DT = £14.96  
  - Heparin sodium 50 units/5 mL I.V. flush solution ampoules | 10 ampoule (Pre) £14.96 DT = £14.96  
  - Heparin sodium 100 unit per 1 mL Heparin sodium 200 units/2 mL I.V. flush solution ampoules | 10 ampoule (Pre) £15.68 DT = £15.68  
  - Heparin sodium 200 units/2 mL patency solution ampoules | 10 ampoule (Pre) £15.68 DT = £15.68

- **Infusion**

  **EXCIPIENTS:** May contain Benzyl alcohol  
  - Heparin (unfractionated) (Non-proprietary)  
  - Heparin sodium 2 unit per 1 mL Heparin sodium 1,000 units/500 mL infusion Viaflex bags | 1 bag (Pre) £15  
  - Heparin sodium 2,000 units/1 litre infusion Viaflex bags | 1 bag (Pre) £25  
  - Heparin sodium 5 unit per 1 mL Heparin sodium 5,000 units/1 litre infusion Viaflex bags | 1 bag (Pre) £45

---

**Tinzaparin sodium**

06-Aug-2018

- **INDICATIONS AND DOSE**

  **Treatment of thrombotic episodes**  
  - **BY SUBCUTANEOUS INJECTION**  
    - Child 1 month: 275 units/kg once daily  
    - Child 2-11 months: 250 units/kg once daily  
    - Child 1-4 years: 240 units/kg once daily  
    - Child 5-9 years: 200 units/kg once daily  
    - Child 10-17 years: 175 units/kg once daily

  **Treatment of venous thromboembolism in pregnancy**  
  - **BY SUBCUTANEOUS INJECTION**  
    - Child 12-17 years: 175 units/kg once daily, dose based on early pregnancy body-weight

- **Prophylaxis of thrombotic episodes**  
  - **BY SUBCUTANEOUS INJECTION**  
    - Child: 50 units/kg once daily

- **INTERACTIONS**  
  → Appendix 1: low molecular-weight heparins

  **SIDE-EFFECTS**

  - Common or very common Anaemia  
  - Rare or very rare Angioedema • Stevens-Johnson syndrome

  **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

  **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however, manufacturer advise avoid.

  **RENAL IMPAIRMENT** Risk of bleeding may be increased. Unfractionated heparin may be preferable. Manufacturer advises caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

  **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**

  **EXCIPIENTS:** May contain Benzyl alcohol, sulfites  
  - Tinzaparin sodium (Non-proprietary)  
    - Tinzaparin sodium 10,000 unit per 1 mL Tinzaparin sodium 3,500 units/0.35 mL solution for injection pre-filled syringes | 10 pre-filled disposable injection (Pre) £27.71 DT = £27.71  
    - Tinzaparin sodium 4,500 units/0.45 mL solution for injection pre-filled syringes | 10 pre-filled disposable injection (Pre) £35.63 DT = £35.63  
    - Tinzaparin sodium 2,500 units/0.25 mL solution for injection pre-filled syringes | 10 pre-filled disposable injection (Pre) £19.80 DT = £19.80  
    - Innohep (LEO Pharma)  
      - Tinzaparin sodium 10,000 unit per 1 mL Innohep 20,000 units/2 ml solution for injection vials | 10 vial (Pre) £105.66 DT = £105.66  
      - Tinzaparin sodium 20,000 unit per 1 mL Innohep 18,000 units/0.9 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (Pre) £64.25 DT = £64.25  
      - Innohep 40,000 units/2 ml solution for injection vials | 1 vial (Pre) £107.08 DT = £107.08  
      - Innohep 8,000 units/0.4 ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Pre) £28.56 DT = £28.56  
      - Innohep 16,000 units/0.8 ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Pre) £57.12 DT = £57.12  
      - Innohep 40,000 units/2 ml solution for injection vials | 1 vial (Pre) £34.20 DT = £34.20  
      - Innohep 16,000 units/0.8 ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Pre) £83.30 DT = £83.30  
      - Innohep 10,000 units/0.5 ml solution for injection pre-filled syringes | 6 pre-filled disposable injection (Pre) £59.50 DT = £59.50

**ANTITHROMBOTIC DRUGS**

**VITAMIN K ANTAGONISTS**

**IMIMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: DIRECT-ACTING ANTIVIRALS TO TREAT CHRONIC HEPATITIS C: RISK OF INTERACTION WITH VITAMIN K ANTAGONISTS AND CHANGES IN INR (JANUARY 2017)

A EU-wide review has identified that changes in liver function, secondary to hepatitis C treatment with direct-acting antivirals, may affect the efficacy of vitamin K antagonists; the MHRA has advised that INR should be...
monitored closely in patients receiving concomitant treatment.

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum · haemorrhagic stroke · significant bleeding
- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) · conditions in which risk of bleeding is increased · history of gastrointestinal bleeding · hyperthyroidism · hypothyroidism · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension

- **SIDE-EFFECTS**
  - Common or very common Haemorrhage
  - Rare or very rare Alopecia · nausea · vomiting
  - Frequency not known Blue toe syndrome · CNS haemorrhage · diarrhoea · fever · haemothorax · jaundice · pancreatitis · skin necrosis (increased risk in patients with protein C or protein S deficiency) · skin reactions

- **CONCEPTION AND CONTRA-CONCEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.

- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.

- **HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment.

- **MONITORING REQUIREMENTS**
  - The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
  - It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
  - Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.

- **PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112 CP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@spsl.uk.com. In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders.DPPAS@apsgroup.co.uk or by fax on (0131) 6299 967. Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

### Warfarin sodium

#### INDICATIONS AND DOSE

**Treatment and prophylaxis of thrombotic episodes (induction)**

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: WARFARIN: REPORTS OF CALCIPHYLAXIS (JULY 2016)**

An EU-wide review has concluded that on rare occasions, warfarin use may lead to calciphylaxis—patients should be advised to consult their doctor if they develop a painful skin rash; if calciphylaxis is diagnosed, appropriate treatment should be started and consideration should be given to stopping treatment with warfarin. The MHRA has advised that calciphylaxis is most commonly observed in patients with known risk.
Factors such as end-stage renal disease, however, cases have also been reported in patients with normal renal function.

- **INTERACTIONS** → Appendix 1: coumarins
- **SIDE-EFFECTS** Calciphylaxis - hepatic function abnormal
- **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K₁).
- **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. Monitoring In severe renal impairment, monitor INR more frequently.
- **PRESCRIBING AND DISPENSING INFORMATION** Dietary differences. Infant formula is supplemented with vitamin K₁, which makes formula-fed infants resistant to warfarin; they may therefore need higher doses. In contrast breast milk contains low concentrations of vitamin K making breast-fed infants more sensitive to warfarin.

- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral suspension**

**Blood pressure conditions**

**4.1 Hypertension**

**Hypertension**

**Overview**

Hypertension in children and adolescents can have a substantial effect on long-term health. Possible causes of hypertension (e.g. congenital heart disease, renal disease and endocrine disorders) and the presence of any complications (e.g. left ventricular hypertrophy) should be established. Treatment should take account of contributory factors and any factors that increase the risk of cardiovascular complications.

Serious hypertension is rare in neonates but it can present with signs of congestive heart failure; the cause is often renal and can follow embolic arterial damage.

Children (or their parents or carers) should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include weight reduction (in obese children), reduction of dietary salt, reduction of total and saturated fat, increasing exercise, increasing fruit and vegetable intake, and not smoking.

Indications for antihypertensive therapy in children include symptomatic hypertension, secondary hypertension, hypertensive target-organ damage, diabetes mellitus, persistent hypertension despite lifestyle measures, and pulmonary hypertension. The effect of antihypertensive treatment on growth and development is not known; treatment should be started only if benefits are clear.

Antihypertensive therapy should be initiated with a single drug at the lowest recommended dose; the dose can be increased until the target blood pressure is achieved. Once the highest recommended dose is reached, or sooner if the patient begins to experience side effects, a second drug may be added if blood pressure is not controlled. If more than one drug is required, these should be given as separate products to allow dose adjustment of individual drugs, but fixed-dose combination products may be useful in adolescents if compliance is a problem.

Acceptable drug classes for use in children with hypertension include ACE inhibitors, beta-blockers, calcium-channel blockers, and thiazide diuretics. There is limited information on the use of angiotensin-II receptor antagonists in children. Diuretics and beta-blockers have a long history of safety and efficacy in children. The newer classes of antihypertensive drugs, including ACE inhibitors and calcium-channel blockers have been shown to be safe and effective in short-term studies in children. Refractory hypertension may require additional treatment with agents such as minoxidil p. 119 or clonidine hydrochloride p. 103.

**Cardiovascular risk reduction**

Aspirin p. 93 may be used to reduce the risk of cardiovascular events; however, concerns about an increased risk of bleeding and Reye’s syndrome need to be considered.

A statin can be of benefit in older children who have a high risk of cardiovascular disease and have hypercholesterolaemia.

**Hypertension in diabetes**

Hypertension can occur in type 2 diabetes and treatment prevents both macrovascular and microvascular complications. ACE inhibitors may be considered in children with diabetes and microalbuminuria or proteinuric renal disease. Beta-blockers are best avoided in children with, or at a high risk of developing, diabetes, especially when combined with a thiazide diuretic.

**Hypertension in renal disease**

ACE inhibitors may be considered in children with microalbuminuria or proteinuric renal disease. High doses of loop diuretics may be required. Specific cautions apply to the use of ACE inhibitors in renal impairment, but ACE inhibitors may be effective. Dihydropyridine calcium-channel blockers may be added.

**Hypertension in pregnancy**

High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. Methyl dopa is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of nifedipine p. 111 [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of labetalol hydrochloride p. 105 can be used to control hypertensive crises; alternatively hydralazine hydrochloride p. 118 can be given by the intravenous route.
Hypertensive emergencies

Hypertensive emergencies in children may be accompanied by signs of hypertensive encephalopathy, including seizures. Controlled reduction in blood pressure over 72–96 hours is essential; rapid reduction can cause perfusion leading to organ damage. Treatment should be initiated with intravenous drugs; once blood pressure is controlled, oral therapy can be started. It may be necessary to infuse fluids particularly during the first 12 hours to expand plasma volume should the blood pressure drop too rapidly.

Controlled reduction of blood pressure is achieved by intravenous administration of labetalol hydrochloride or sodium nitroprusside p. 120. Esmolol hydrochloride p. 108 is useful for short-term use and has a short duration of action. Nicardipine hydrochloride p. 110 can be administered as a continuous intravenous infusion for life-threatening hypertension in paediatric intensive care settings. In less severe cases, nifedipine capsules can be used.

Other antihypertensive drugs which can be given intravenously include hydralazine hydrochloride and clonidine hydrochloride.

Hypertension in acute nephritis occurs as a result of sodium and water retention; it should be treated with sodium and fluid restriction, and with furosemide p. 142; antihypertensive drugs may be added if necessary.

Also see advice on short-term management of hypertensive episodes in pheochromocytoma.

Phaeochromocytoma

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors. Alpha-blockers are used in the short-term management of hypertensive episodes in pheochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred. There is no nationwide consensus on the optimal drug regimen or doses used for the management of pheochromocytoma.

Phenoxybenzamine hydrochloride p. 119, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects.

Pulmonary hypertension

Only pulmonary arterial hypertension is currently suitable for drug treatment. Pulmonary arterial hypertension includes persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension in children, and pulmonary hypertension related to congenital heart disease and cardiac surgery.

Some types of pulmonary hypertension are treated with vasodilator antihypertensive therapy and oxygen. Diuretics may also have a role in children with right-sided heart failure.

Initial treatment of persistent pulmonary hypertension of the newborn involves the administration of nitric oxide; epoprostenol p. 120 can be used until nitric oxide is available. Oral sildenafil p. 122 may be helpful in less severe cases. Epoprostenol and sildenafil can cause profound systemic hypotension. In rare circumstances either tolazoline p. 123 or magnesium sulfate p. 618 can be given by intravenous infusion when nitric oxide and epoprostenol have failed.

Treatment of idiopathic pulmonary arterial hypertension is determined by acute vasodilator testing; drugs used for treatment include calcium-channel blockers (usually nifedipine), long-term intravenous epoprostenol, nebulised iloprost p. 121, bosentan p. 121, or sildenafil.

Anticoagulation (usually with warfarin sodium p. 99) may also be required to prevent secondary thrombosis.

Inhaled nitric oxide is a potent and selective pulmonary vasodilator. It acts on cyclic guanosine monophosphate (cGMP) resulting in smooth muscle relaxation. Inhaled nitric oxide is used in the treatment of persistent pulmonary hypertension of the newborn, and may also be useful in other forms of arterial pulmonary hypertension. Dependency can occur with high doses and prolonged use; to avoid rebound pulmonary hypertension the drug should be withdrawn gradually, often with the aid of sildenafil p. 122.

Excess nitric oxide can cause methaemoglobinaemia; therefore, methaemoglobin concentration should be measured regularly, particularly in neonates.

Nitric oxide increases the risk of haemorrhage by inhibiting platelet aggregation, but it does not usually cause bleeding.

Epoprostenol p. 120 (prostacyclin) is a prostaglandin and a potent vasodilator. It is used in the treatment of persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension, and in the acute phase following cardiac surgery. It is given by continuous 24-hour intravenous infusion.

Epoprostenol is a powerful inhibitor of platelet aggregation and there is a possible risk of haemorrhage. It is sometimes used as an antiplatelet in renal dialysis when heparins are unsuitable or contra-indicated. It can also cause serious systemic hypotension and, if withdrawn suddenly, can cause pulmonary hypertensive crisis.

Children on prolonged treatment can become tolerant to epoprostenol, and therefore require an increase in dose.

Iloprost p. 121 is a synthetic analogue of epoprostenol and is efficacious when nebulised in adults with pulmonary arterial hypertension, but experience in children is limited. It is more stable than epoprostenol and has a longer half-life.

Bosentan p. 121 is a dual endothelin receptor antagonist used orally in the treatment of pulmonary arterial hypertension. The concentration of endothelin, a potent vasoconstrictor, is raised in sustained pulmonary hypertension.

Sildenafil, a vasodilator developed for the treatment of erectile dysfunction, is also used for pulmonary arterial hypertension. It is used either alone or as an adjunct to other drugs.

Sildenafil is a selective phosphodiesterase type-5 inhibitor. Inhibition of this enzyme in the lungs enhances the vasodilatory effects of nitric oxide and promotes relaxation of vascular smooth muscle.

Sildenafil has also been used in pulmonary hypertension for weaning children off inhaled nitric oxide following cardiac surgery, and less successfully in idiopathic pulmonary arterial hypertension.

Tolazoline p. 123 is now rarely used to correct pulmonary artery vasospasm in pulmonary hypertension of the newborn as better alternatives are available. Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

Advanced Pharmacy Services

Children with hypertension may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Antihypertensive drugs

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: see Hypertension (hypertensive emergencies) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 118 is given by mouth as an adjunct to other antihypertensives for the treatment of
resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. Sodium nitroprusside p. 120 is given by intravenous infusion to control severe hypertensive crisis when parental treatment is necessary. At low doses it reduces systemic vascular resistance and increases cardiac output; at high doses it can produce profound systemic hypotension—continuous blood pressure monitoring is therefore essential. Sodium nitroprusside may also be used to control paradoxical hypertension after surgery for coarctation of the aorta.

Minoxidil p. 119 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and children develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 142, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females. Prazosin p. 103 and doxazosin p. 509 have alpha-blocking and vasodilator properties.

**Centrally acting antihypertensive drugs**

Methyldopa, a centrally acting antihypertensive, is of little value in the management of refractory sustained hypertension in infants and children. On prolonged use it is associated with fluid retention (which may be alleviated by concomitant use of diuretics).

Methyldopa is also effective for the management of hypertension in pregnancy.

Clonidine hydrochloride p. 103 is also a centrally acting antihypertensive but has the disadvantage that sudden withdrawal may cause a hypertensive crisis. Clonidine hydrochloride is also used under specialist supervision for pain management, sedation, and opioid withdrawal, attention deficit hyperactivity disorder, and Tourette syndrome.

**Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use in adults and are rarely used in children.

**Alpha-adrenoceptor blocking drugs**

Doxazosin and prazosin have post-synaptic alpha-blocking and vasodilator properties and rarely cause tachycardia. They can, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.

### Drugs affecting the renin-angiotensin system

#### Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. The main indications of ACE inhibitors in children are shown below. In infants and young children, captopril p. 114 is often considered first.

**Initiation under specialist supervision**

Treatment with ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in children.

**Heart failure**

ACE inhibitors have a valuable role in all grades of heart failure, usually combined with a loop diuretic. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. Profound first-dose hypotension can occur when ACE inhibitors are introduced to children with heart failure who are already taking a high dose of a loop diuretic. Temporary withdrawal of the loop diuretic reduces the risk, but can cause severe rebound pulmonary oedema.

**Hypertension**

ACE inhibitors may be considered for hypertension when thiazides and beta-blockers are contra-indicated, not tolerated, or fail to control blood pressure; they may be considered for hypertension in children with type 1 diabetes with nephropathy. ACE inhibitors can reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors also have a role in the management of diabetic nephropathy.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below are present). Hyperkalaemia and other side-effects of ACE inhibitors are more common in children with impaired renal function and the dose may need to be reduced.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In children with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore contra-indicated in children known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in children with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in those with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If they are used in these circumstances renal function needs to be monitored.

ACE inhibitors should also be used with particular caution in children who may have undiagnosed and clinically silent renovascular disease. ACE inhibitors are useful for the management of hypertension and proteinuria in children with nephritis. They are thought to have a beneficial effect by reducing intra-glomerular hypertension and protecting the glomerular capillaries and membrane.

**ACE inhibitors in combination with other drugs**

**Concomitant diuretics**

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted children; treatment should therefore be initiated with very low doses. In some children the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

**Angiotensin-II receptor antagonists**

Candesartan cilostelit p. 117, losartan potassium p. 117 and valsartan p. 118 are specific angiotensin-II receptor blockers.
antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for children who have to discontinue an ACE inhibitor because of persistent cough.

Candesartan cilexetil, losartan potassium or valsartan can be used as an alternative to an ACE inhibitor in the management of hypertension.

Renal effects
Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

Neonates
The neonatal response to treatment with ACE inhibitors is very variable, and some neonates develop profound hypotension with even small doses; a test-dose should be used initially and increased cautiously. Adverse effects such as apnoea, seizures, renal failure, and severe unpredictable hypotension are very common in the first month of life and it is therefore recommended that ACE inhibitors are avoided whenever possible, particularly in preterm neonates.

Other drugs used for Hypertension

### ALPHA-ADRENOCOCEPTOR BLOCKERS

#### Prazosin

- **INDICATIONS AND DOSE**

  **Hypertension**
  - Child 1 month–11 years: Initially 10–15 micrograms/kg 2–4 times a day, initial dose to be taken at bedtime, then increased to 500 micrograms/kg daily in divided doses, dose to be increased gradually; maximum 20 mg per day
  - Child 12–17 years: Initially 500 micrograms 2–3 times a day for 3–7 days, initial dose to be taken at bedtime, then increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses, dose should be increased gradually

  **Congestive heart failure (rarely used)**
  - **BY MOUTH**
    - Child 1 month–11 years: 5 micrograms/kg twice daily, initial dose to be taken at bedtime, then increased to 100 micrograms/kg daily in divided doses, doses should be increased gradually
    - Child 12–17 years: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

- **UNLICENSED USE** Not licensed for use in children under 12 years.

- **CONTRA-INDICATIONS** History of mitrurition syncope - history of postural hypotension - not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) - first dose hypotension

- **INTERACTIONS** → Appendix 1: alpha blockers

- **SIDE-EFFECTS**
  - Common or very common Asthenia - constipation - depression - diarrhoea - dizziness - dryness - dry mouth - dyspnoea - headache - nasal congestion - nausea - nervousness - oedema - palpitations - postural hypotension - sexual dysfunction - skin reactions - syncope - urinary disorders - vertigo - vision blurred - vomiting
  - Uncommon Angina pectoris - arrhythmias - arthralgia - epistaxis - eye pain - eye redness - gastrointestinal discomfort - hyperhidrosis - paraesthesia - sleep disorders - tinnitus
  - Rare or very rare Alopecia - fever - flushing - gynaecomastia - hallucination - hepatic function abnormal - pain - pancreatitis - vasculitis

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (no information available).

- **Dose adjustments** In children 12 years and above, manufacturer advises initial dose reduction to 500 micrograms daily; increased with caution.

- **RENAL IMPAIRMENT** Dose adjustments Start with low doses in moderate to severe impairment; increase with caution.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be dispersed in water.

- **PATIENT AND CARER ADVICE** First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Driving and skilled tasks May affect performance of skilled tasks e.g. driving.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

  **Tablet**
  - Prazosin (Non-proprietary)
    - Prazosin (as Prazosin hydrochloride) 2 mg Minipress 2mg tablets
    - 100 tablet [PS](£)
    - Prazosin (as Prazosin hydrochloride) 5 mg Minipress 5mg tablets
    - 100 tablet [PS](£)
    - Hypovase (Pfizer Ltd)
    - Prazosin (as Prazosin hydrochloride) 500 microgram Hypovase 500microgram tablets | 60 tablet [PS](£) £2.69 DT = £2.69
    - Prazosin (as Prazosin hydrochloride) 1 mg Hypovase 1mg tablets
    - 60 tablet [PS](£) £3.46 DT = £3.46

### ANTIHYPERTENSIVES, CENTRALLY ACTING

#### Clonidine hydrochloride

- **INDICATIONS AND DOSE**

  **Severe hypertension**
  - **BY MOUTH**
    - Child 2–7 years: Initially 0.5–1 microgram/kg 3 times a day, then increased if necessary up to 25 micrograms/kg daily in divided doses, increase dose gradually; maximum 1.2 mg per day
    - **BY SLOW INTRAVENOUS INJECTION**
      - Child 2–7 years: 2–6 micrograms/kg (max. per dose 300 micrograms) for 1 dose

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Severe bradyarrhythmia secondary to second- or third-degree AV block or sick sinus syndrome

- **CAUTIONS** Cerebrovascular disease - constipation - heart failure - history of depression - mild to moderate bradyarrhythmia - polynuropathy - Raynaud’s syndrome or other occlusive peripheral vascular disease

- **INTERACTIONS** → Appendix 1: clonidine
iali N D S

Common or very common Constipation; depression; dizziness; dry mouth; fatigue; headache; nausea; postural hypotension; salivary gland pain; sedation; sexual dysfunction; sleep disorders; vomiting

Uncommon Delusions; hallucination; malaise - paraesthesia; Raynaud’s phenomenon; skin reactions

Rare or very rare Alopecia; atrioventricular block; dry eye; gynaecomastia; intestinal pseudo-obstruction; nasal dryness

Frequent not known Accommodation disorder; arrhythmias; confusion

Pregnancy May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.

Breast-feeding Avoid—present in milk.

Renal impairment Use with caution.

Treatment cessation Must be withdrawn gradually to avoid hypertensive crisis.

Directions for administration
- With intravenous use For intravenous injection, give over 10–15 minutes; compatible with Sodium Chloride 0.9% or Glucose 5%.
- With oral use For administration by mouth, tablets may be crushed and dissolved in water.

Patient and carer advice
Medicines for Children leaflet: Clonidine for Tourette’s syndrome, ADHD and sleep-onset disorder
- Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

Less suitable for prescribing Clonidine is less suitable for prescribing.

Medicinal forms There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

Clonidine hydrochloride 10 microgram per 1 ml Catapres 10 microgram tablets | 100 tablet PBN £8.04 DT = £8.04

Solution for injection
- Catapres (Boehringer Ingelheim Ltd)

Clonidine hydrochloride 150 microgram per 1 ml Catapres 150 micrograms/1ml solution for injection ampoules | 5 ampoule PBN £2.09

Oral solution
- Clonidine hydrochloride (Non-proprietary)

Clonidine hydrochloride 10 microgram per 1 ml Clonidine 50 micrograms/5ml oral solution sugar free-sugar-free | 100 ml PBN £66.80 DT = £66.80

Beta-adrenoceptor blockers

Overview
Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are available but experience in children is limited to the use of only a few.

Differences between beta-blockers may affect choice. The water-soluble beta-blockers, atenolol p. 108 and sotalol hydrochloride p. 81, are less likely to enter the brain and may therefore cause less sleep disturbance and nightmares.

Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Some beta-blockers, such as atenolol, have an intrinsically longer duration of action and need to be given only once daily. Carvedilol p. 127 and labetalol hydrochloride p. 105 are beta-blockers which have, in addition, an arteriolar vasodilating action and thus lower peripheral resistance. Although carvedilol and labetalol hydrochloride possess both alpha- and beta-blocking properties, these drugs have no important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in children with second- or third-degree heart block.

Beta-blockers can precipitate asthma and should usually be avoided in children with a history of asthma or bronchospasm. If there is no alternative, a child with well-controlled asthma can be treated for a co-existing condition (e.g. arrhythmia) with a cardioselective beta-blocker, which should be initiated with caution at a low dose by a specialist and the child monitored closely for adverse effects. Atenolol and metoprolol tartrate p. 109 have less effect on the beta1 (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardioselective; they have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities, and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism causing hypoglycaemia or hyperglycaemia in children with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (e.g. atenolol and metoprolol tartrate) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia.

Hypertension
Beta-blockers are effective for reducing blood pressure, but their mode of action is not understood; they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action. Blood pressure can usually be controlled with relatively few side-effects. In general the dose of beta-blocker does not have to be high.

Labetalol hydrochloride may be given intravenously for hypertensive emergencies in children; however, care is needed to avoid dangerous hypotension or beta-blockade, particularly in neonates. Esmolol hydrochloride p. 108 is also used intravenously for the treatment of hypertension particularly in the peri-operative period.

Beta-blockers can be used to control the pulse rate in children with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis; phenoxybenzamine hydrochloride p. 119 should always be used together with the beta-blocker.

Arrhythmias
In arrhythmias, beta-blockers act principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used alone or in conjunction with digoxin p. 82 to control the ventricular rate in atrial fibrillation. Beta-blockers are also useful in the management of supraventricular tachycardias and ventricular tachycardias particularly to prevent recurrence of the tachycardia.
Esmolol hydrochloride is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias and sinus tachycardia, particularly in the peri-operative period.

Sotalol hydrochloride is a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity. Atenolol and sotalol hydrochloride suppress ventricular ectopic beats and non-sustained ventricular tachycardia. However, the pro-arrhythmic effects of sotalol hydrochloride, particularly in children with sick sinus syndrome, may prolong the QT interval and induce torsade de pointes.

Heart failure
Beta-blockers may produce benefit in heart failure by blocking sympathetic activity and the addition of a beta-blocker such as carvedilol to other treatment for heart failure may be beneficial. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis
Beta-blockers are used in the management of thyrotoxicosis including neonatal thyrotoxicosis; propranolol hydrochloride p. 106 can reverse clinical symptoms within 4 days. Beta-blockers are also used for the pre-operative preparation for thyroidectomy; the thyroid gland is rendered less vascular, thus facilitating surgery.

Other uses
In tetralogy of Fallot, esmolol hydrochloride or propranolol hydrochloride may be given intravenously in the initial management of cyanotic spells; propranolol hydrochloride is given by mouth for preventing cyanotic spells. If a severe cyanotic spell in a child with congenital heart disease persists despite optimal use of 100% oxygen, propranolol hydrochloride is given by intravenous infusion. If cyanosis is still present after 10 minutes, sodium bicarbonate intravenous infusion p. 607 is given in a dose to correct acidosis (or dose calculated according to arterial blood gas results); sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year. If blood-glucose concentration is less than 3 mmol/litre, glucose 10% intravenous infusion is given, followed by intravenous or intramuscular administration of morphine p. 290.

Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 705, levobunolol hydrochloride p. 706, and timolol maleate p. 706 are used topically in glaucoma.

**Beta-adrenoceptor blockers**

**Contra-indications** Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - phaeochromocytoma (apart from specific use with alpha-blockers) - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

**Contra-indications, further information**

- Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

**Contra-indications** Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously) - myasthenia gravis - portal hypertension (risk of deterioration in liver function) - psoriasis - symptoms of thyrotoxicosis may be masked

**Side-effects**

- **Common or very common** Abdominal discomfort - bradycardia - confusion - depression - diarrhoea - dizziness - dry eye (reversible on discontinuation) - dyspnoea - erectile dysfunction - fatigue - headache - heart failure - nausea - paraesthesia - peripheral coldness - peripheral vascular disease - rash (reversible on discontinuation) - sleep disorders - syncope - visual impairment - vomiting
- **Uncommon** Atrialventricular block - bronchospasm
- **Rare or very rare** Hallucination

**Side-effects, further information** With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

**Overdose** Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate.

For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 859.

**Allergy and cross-sensitivity** Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).

**Pregnancy** Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.

**Breast-feeding** With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.

**Treatment requirements** Monitor lung function (in patients with a history of obstructive airway disease).

**Treatment cessation** Avoid abrupt withdrawal.

**Beta-adrenoceptor blockers (systemic)**

**Indications and dose**

- **Hypertensive emergencies**
  - **By intravenous infusion**
    - Neonate: Initially 0.5 mg/kg/hour (max. per dose 4 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes.
    - Child 1 month–11 years: Initially 0.5–1 mg/kg/hour (max. per dose 3 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes
    - Child 12–17 years: Initially 20–120 mg/hour, dose to be adjusted according to response at intervals of at least 15 minutes

- **Hypertension**
  - **By mouth**
    - Child 1 month–11 years: 1–2 mg/kg 3–4 times a day
    - Child 12–17 years: Initially 50–100 mg twice daily, dose to be increased if required at intervals of 3–14 days; usual dose 200–400 mg twice daily, higher continued
**Blood pressure conditions**

**DIRECTIONS FOR ADMINISTRATION**

**Liver damage**

**REPAIRAL REQUIREMENTS**

**Renal impairment**

**Hepatic impairment**

**With oral use**

**Rare or very rare**

**SIDE-EFFECTS**

**INTERACTIONS**

**Apppendix 1: beta blockers, non-selective**

**INTERACTIONS**

**GENEAL SIDE-EFFECTS**

**Frequency not known**

**Allopoeia - cyanosis - hyperhidrosis - hyperkalaemia - interstitial lung disease - lethargy - muscle cramps - nasal congestion - peripheral oedema - postural hypotension - psychosis - skin reactions - thrombocytopenia**

**Specific side-effects**

**With intravenous use**

**With oral use**

**Photosensitivity reaction**

**Pregnancy**

**Breast feeding**

**Hepatic impairment**

**Manufacturer advises caution (risk of slow metabolism).**

**Dose adjustments**

**Manufacturer advises consider dose reduction.**

**Renal impairment**

**Dose adjustments**

**Dose reduction may be required.**

**Monitoring requirements**

**Liver damage**

**Severe hepatocellular damage reported after both short-term and long-term treatment.**

**Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.**

**Effect on laboratory tests**

**Interferes with laboratory tests for catecholamines.**

**DIRECTIONS FOR ADMINISTRATION**

**With intravenous use**

**For intravenous infusion, dilute to a concentration of 1 mg/mL in Glucose 5% or Sodium Chloride and Glucose 5%, if fluid restricted may be given undiluted, preferably through a central venous catheter. Avoid upright position during and for 3 hours after intravenous administration.**

**With oral use**

**For administration by mouth, injection may be given orally with squash or juice.**

**106 Unlicensed use**

Not licensed for use in children.

**Important safety information**

**With intravenous use**

**Consult local guidelines.**

In hypertensive encephalopathy reduce blood pressure to normotensive level over 24–48 hours (more rapid reduction may lead to cerebral infarction, blindness, and death). If child fitting, reduce blood pressure rapidly, but not to normal levels.

**Cautions**

Liver damage

**Child 12**
- **BY INTRAVENOUS INJECTION**
  - Initially 500 micrograms/kg every 6–8 hours (max. per dose 20 mg).

**DIRECTIONS FOR ADMINISTRATION**
- For slow intravenous injection, give over at least 3–5 minutes; rate of administration should not exceed 1 mg/minute. May be diluted with Sodium Chloride 0.9% or Glucose 5%.
- Incompatible with bicarbonate.

**PRESCRIBING AND DISPENSING INFORMATION**
- Modified-release preparations can be used for once daily administration.

**Medication system**
- Includes: oral suspension, oral modified-release capsules.

**Precautions**
- Not licensed for treatment of hypertension in children under 12 years.

**IMPORTANT SAFETY INFORMATION**
- Propranolol has been confused with prednisolone; care must be taken to ensure the correct drug is prescribed and dispensed.

**INTERACTIONS**
- Appendix 1: beta blockers, non-selective

**SIDE-EFFECTS**
- Rare or very rare: Alopecia, memory loss, mood altered, neuromuscular dysfunction, postural hypotension, psychosis, skin reactions, thrombocytopenia
- Frequency not known: Hypoglycaemia

**HEPATIC IMPAIRMENT**
- Reduced oral dose.

**RENAL IMPAIRMENT**
- Reduced oral dose.

**SAFE PRACTICE**
- Care must be taken to ensure the correct drug is prescribed and dispensed.

**Memory loss**
- Mood altered
- Thrombocytopenia

**Migraine prophylaxis**
- **BY MOUTH**
  - Child 2–11 years: Initially 200–500 micrograms/kg twice daily; usual dose 10–20 mg twice daily (max. per dose 2 mg/kg twice daily).
  - Child 12–17 years: Initially 80 mg twice daily; then increased if necessary up to 160–320 mg daily, dose should be increased at weekly intervals, slow-release preparations may be used for once daily administration.

**Arrhythmias**
- **BY MOUTH**
  - Neonate: 250–500 micrograms/kg 3 times a day, then increased if necessary up to 2 mg/kg 3 times a day.

**Child 1 month–11 years**
- Initially 0.25–1 mg/kg 3 times a day, then increased to 5 mg/kg daily in divided doses, dose should be increased at weekly intervals.
- Child 12–17 years: Initially 80 mg twice daily, then increased if necessary up to 160–320 mg daily, dose should be increased at weekly intervals, slow-release preparations may be used for once daily administration.

**Tetralogy of Fallot**
- **BY MOUTH**
  - Neonate: 0.25–1 mg/kg 2–3 times a day (max. per dose 2 mg/kg 3 times a day).
  - Child 1 month–11 years: 0.25–1 mg/kg 3–4 times a day, maximum dose to be given in divided doses; maximum 5 mg/kg per day.

**CAUTIONARY AND ADVISORY LABELS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**OCTOBER 2011 2019 P**

**Propranolol hydrochloride 80 mg**
- Bedranol SR 80 mg tablets
- Bedranol 160 mg tablets

**Propranolol hydrochloride 160 mg**
- Bedranol 160 mg capsules
- Bedranol SR 160 mg capsules

**Propranolol hydrochloride 2 mg per 1 ml**
- Propranolol hydrochloride 2 mg per 1 ml oral solution sugar-free

**Propranolol hydrochloride 1 mg per 1 ml**
- Propranolol hydrochloride 1 mg per 1 ml oral solution sugar-free

**Propranolol hydrochloride 40 mg per 5 ml**
- Propranolol hydrochloride 40 mg per 5 ml oral solution sugar-free

**Propranolol hydrochloride 10 mg per 1 ml**

- Bedranol 80 mg capsules
- Bedranol 160 mg capsules
- Bedranol SR 160 mg capsules

**Beta-Propranol (Actavis UK Ltd, Teva UK Ltd, Tillomed Laboratories Ltd)**
- Propranolol hydrochloride 160 mg
- Propranolol hydrochloride 80 mg

**Tablet**
- Propranolol hydrochloride 10 mg
- Propranolol hydrochloride 40 mg
Esmolol hydrochloride

**INDICATIONS AND DOSE**

**Arrhythmias | Hypertensive emergencies**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child: Loading dose 500 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) maintenance 50 micrograms/kg/minute for 4 minutes (rate reduced if low blood pressure or low heart rate), if inadequate response, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 100 micrograms/kg/minute for 4 minutes, if response still inadequate, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 150 micrograms/kg/minute for 4 minutes, if response still inadequate, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 200 micrograms/kg/minute for 4 minutes, doses over 300 micrograms/kg/minute not recommended

**Tetralogy of Fallot**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 600 micrograms/kg, dose to be given over 1–2 minutes, then (by intravenous infusion) 300–900 micrograms/kg/minute if required.

**UNLICENSED USE** Not licensed for use in children.

**INTERACTIONS** Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorder
- **Rare or very rare** Alopecia · dry mouth · hepatic disorders · mood altered · postural hypotension · psychosis · skin reactions · thrombocytopenia
- **Frequency not known** Hypersensitivity · lupus-like syndrome

**BREAST FEEDING** Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.

**RENAL IMPAIRMENT** Dose adjustments Initially use 50% of usual dose if estimated glomerular filtration rate 10–35 mL/minute/1.73 m², initially use 30–50% of usual dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Atenolol for hypertension www.medicinesforchildren.org.uk/atenolol-hypertension-0

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Esmolol hydrochloride (Non-proprietary)**
  - Esmolol hydrochloride 10 mg per 1 mL Esmolol hydrochloride 100mg/10mL solution for injection vials | 10 vial £100.00 (Hospital only)

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**
  - Neonate: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.
  - Child 1 month–11 years: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses, doses higher than 50 mg daily are rarely necessary
  - Child 12–17 years: 25–50 mg once daily, dose may be given in 2 divided doses, higher doses are rarely necessary

**Arrhythmias**

- **BY MOUTH**
  - Neonate: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.
  - Child 1 month–11 years: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses; maximum 100 mg per day
  - Child 12–17 years: 50–100 mg once daily, dose may be given in 2 divided doses

**UNLICENSED USE** Not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Atenolol has been confused with amlodipine; care must be taken to ensure the correct drug is prescribed and dispensed.

**INTERACTIONS** Appendix 1: beta blockers, selective

**SIDE-EFFECTS**

- **Common or very common** Gastrointestinal disorder
- **Rare or very rare** Alopecia · dry mouth · hepatic disorders · mood altered · postural hypotension · psychosis · skin reactions · thrombocytopenia

Metoprolol tartrate

- **INDICATIONS AND DOSE**
  
  **Hypertension**
  - By mouth using immediate-release medicines
  - Child 1 month–11 years: Initially 1 mg/kg twice daily, increased if necessary up to 8 mg/kg daily in 2–4 divided doses (max. per dose 400 mg)
  - Child 12–17 years: Initially 50–100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely necessary; maximum 400 mg per day
  - By mouth using modified-release medicines
  - Child 12–17 years: 200 mg once daily
  
  **Arrhythmias**
  - By mouth using immediate-release medicines
  - Child 12–17 years: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses
  
- **SIDE-EFFECTS**
  
  - Common or very common: Postural disorders
  - Rare or very rare: Alertness decreased, alopecia, arrhythmia, arthritis, auditory disorder, chest pain, constipation, drowsiness, dry mouth, dystrophic skin lesion, eye irritation, gangrene, hyperhidrosis, muscle cramps, oedema, palpitations, personality disorder, rhinitis, sexual dysfunction, skin reactions, thrombocytopenia, weight increased
  
- **Hepatic impairment**
  - Reduce dose in severe impairment.
  
- **Medicinal forms**

- **Solution for injection**
  - Betacalo (Astrazeneca UK Ltd) Metoprolol tartrate 1 mg per 1 ml Betacalo IV. 5mg/5ml solution for injection ampoules | 5 ampoule (Brand) £5.02 (Hospital only)

**Calcium-channel blockers**

**Calcium-channel blockers**

- **Overview**
  
  Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 111, diltiazem hydrochloride p. 146, and the dihydropyridine calcium-channel blockers (amlodipine p. 110, nicardipine hydrochloride p. 110, nifedipine p. 111, and nimodipine p. 88). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

  Verapamil hydrochloride is used for the treatment of hypertension and arrhythmias. However, it is no longer first-line treatment for arrhythmias in children because it has been associated with fatal collapse especially in infants under 1 year; adenosine p. 80 is now recommended for first-line use.

  Verapamil hydrochloride is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atriorentricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers. Constipation is the most common side-effect.

  Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine may be used if a modified-release preparation delivering the appropriate dose is not available or if a child is unable to swallow (a liquid preparation may be prepared using capsules). Nifedipine may also be used for the management of angina due to coronary artery disease in Kawasaki disease or progeria and in the management of Raynaud’s syndrome.

  Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility; it should only be used for the treatment of life-threatening hypertension in paediatric intensive care settings and in postoperative hypertension.

  Amlodipine also resembles nifedipine and nicardipine hydrochloride in its effects and does not reduce myocardial contractility or produce clinical deterioration in heart failure. It has a longer duration of action and can be given once daily. Nifedipine and amlodipine are used for the treatment of hypertension. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

  Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

  Diltiazem hydrochloride is a peripheral vasodilator and also has mild depressor effects on the myocardium. It is used in the treatment of Raynaud’s syndrome.

**Calcium-channel blockers**

- **Drug action**
  
  Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

- **Side-effects**
  
  - Common or very common: Dizziness, flushing, headache, nausea, palpitations, peripheral oedema, rash, tachycardia, vomiting
  - Uncommon: Gingival hyperplasia
Amlodipine

**INDICATIONS AND DOSE**  
Amlodipine is a dihydropyridine calcium-channel blocker.

- **Hypertension**
  - **BY MOUTH**
    - Child 1 month–11 years: Initially 100–200 micrograms/kg once daily; increased if necessary up to 400 micrograms/kg once daily, adjusted at intervals of 1–2 weeks; maximum 10 mg per day
    - Child 12–17 years: Initially 5 mg once daily, then increased if necessary up to 10 mg once daily, adjusted at intervals of 1–2 weeks

- **DOSE EQUIVALENT AND CONVERSION**
  - Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

- **UNLICENSED USE**
  - Not licensed for use in children under 6 years.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**
Amlodipine has been confused with nimodipine and atenolol; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**
Cardiogenic shock - significant aortic stenosis

**INTERACTIONS**
Appendix 1: calcium channel blockers

**SIDE-EFFECTS**
- **Common or very common**
  - Asthenia
  - Constipation
  - Diarrhoea
  - Drowsiness
  - Dry mouth
  - Erectile dysfunction
  - Gynaecomastia
  - Hyperhidrosis
  - Hypotension
  - Insomnia
  - Malaise
  - Mood alteration
  - Rhinitis
  - Sensation abnormal
  - Skin reactions: Syncope
  - Taste alteration
  - Tinnitus
  - Tremor
  - Urinary disorders
  - Weight changes
- **Rare or very rare**
  - Angioedema
  - Confusion
  - Hepatic disorders
  - Hyperglycaemia
  - Hypersensitivity
  - Leucopenia
  - Muscle tone increased
  - Myocardial infarction
  - Pancreatitis
  - Peripheral neuropathy
  - Photosensitivity reaction
  - Stevens-Johnson syndrome
  - Thrombocytopenia
  - Vasculitis
- **Frequency not known**
  - Extrapyramidal symptoms
  - Pulmonary oedema

**PREGNANCY**
No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

**SIDE-EFFECTS, FURTHER INFORMATION**
Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

Nicardipine hydrochloride

**INDICATIONS AND DOSE**
Nicardipine is a dihydropyridine calcium-channel blocker.

- **Life-threatening hypertension (specialist use only)**
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - Neonate: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute
    - Child: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute (max. per dose 250 micrograms/minute)

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 624 - avoid within 8 days of myocardial infarction - cardiogenic shock - compensatory hypertension - significant or advanced aortic stenosis

- **CAUTIONS**
  - Congestive heart failure - elevated intracranial pressure - increased risk of serious hypotension - portal hypertension - pulmonary oedema - significantly impaired left ventricular function - stroke

- **INTERACTIONS**
  - Appendix 1: calcium channel blockers

- **SIDE-EFFECTS**
  - **Common or very common**
    - Hypotension
  - **Frequency not known**
    - Attrioventricular block - erythema - hepatic disorders - ischaemic heart disease - paralytic ileus - pulmonary oedema - thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.
**INDICATIONS AND DOSE**

Hypertensive crisis | Acute angina in Kawasaki disease or progeria

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child: Initially 250–500 micrograms/kg (max. per dose 10 mg), then repeat once if necessary, may cause unpredictable and severe reduction of blood pressure—monitor closely following administration; if ineffective consider alternative treatment and seek specialist advice

Hypertension | Angina in Kawasaki disease or progeria

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1 month–11 years: 200–300 micrograms/kg (max. per dose 10 mg), then repeat once if necessary, may cause unpredictable and severe reduction of blood pressure—monitor closely following administration; if ineffective consider alternative treatment and seek specialist advice
  - Child 12–17 years: 5–20 mg 3–4 times a day, dose frequency depends on preparation used; maximum 90 mg per day

**Raynaud’s syndrome**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2–17 years: 2.5–10 mg 2–4 times a day, start with low doses at night and increase gradually to avoid postural hypotension, dose frequency depends on preparation used

**Persistent hyperinsulinaemic hypoglycaemia**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Neonate: 100–200 micrograms/kg 4 times a day (max. per dose 600 micrograms/kg).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

- **Nifedipine hydrochloride (Non-proprietary)**
  - Nifedipine hydrochloride 1 mg per 1 ml
  - Nifedipine hydrochloride 2.5 mg per 1 ml

**Verapamil hydrochloride**

**INDICATIONS AND DOSE**

Treatment of supraventricular arrhythmias

- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1–7 years (administered on expert advice): 100–300 micrograms/kg (max. per dose 5 mg) for 1 dose, to be given over 2–3 minutes (with ECG and blood-pressure monitoring), dose can be repeated after 30 minutes if necessary
## Cardiovascular system

### MEDICINAL FORMS

#### DIRECTIONS FOR ADMINISTRATION

- **Frequency not known**
- **With intravenous use**
  - Uncommon

#### SIDE-EFFECTS

- **Hypotension**
  - Common or very common
- **Bradycardia**
  - Common or very common
- **With intravenous use**
  - Bradyarrhythmias
  - Brachyarrhythmias
- **Frequency not known**
  - Arrhythmias

#### INTERACTIONS

- First-degree AV block
- **SIDE-EFFECTS**
  - Bradycardia
- **Frequency not known**
  - With intravenous use
  - Bradycardia
  - Abdominal pain

#### CAUTIONS

- **CONTRA-INDICATIONS**
  - Acute porphyrinas p. 624.
  - Atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome).
  - Bradycardia
  - Cardiogenic shock
  - History of heart failure (even if controlled by therapy)
  - History of significantly impaired left ventricular function
  - Hypotension
  - Second- and third-degree AV block
  - Sinus arrhythmias
  - Abdominal pain
  - Abdominal pain

#### CONTRA-INDICATIONS

- Addisons disease
- Hypercalcaemia
- Hypomotriaemia
- Refractory hypokalaemia
- Symptomatic hyperuricaemia

#### CAUTIONS

- Diabetes
- Gout
- Hyperaldosteronism
- Malnourishment
- Nephrotic syndrome
- Systemic lupus erythematosus

#### CAUTIONS,FURTHER INFORMATION

- Potassium loss
- Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

#### DIURETICS

### Thiazides and related diuretics

#### CONTRA-INDICATIONS

- Addison’s disease
- Hypercalcaemia
- Hypomotriaemia
- Refractory hypokalaemia
- Symptomatic hyperuricaemia

#### CAUTIONS

- Diabetes
- Gout
- Hyperaldosteronism
- Malnourishment
- Nephrotic syndrome
- Systemic lupus erythematosus

#### CAUTIONS,FURTHER INFORMATION

- Potassium loss
- Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

#### MONITORING REQUIREMENTS

- Electrolytes should be monitored in renal impairment.
- Electrolytes should be monitored in renal impairment.
- Electrolytes should be monitored in renal impairment.

#### Solution for injection

- **Securon (Mylan)**
  - Verapamil hydrochloride 2.5 mg per 1 ml
  - Securon IV 5mg/2ml
  - Solution for injection ampoules
  - 5 ampoules £0.84

#### Oral solution

- **Verapamil hydrochloride (Non-proprietary)**
  - Verapamil hydrochloride 8 mg per 1 ml
  - Verapamil 40mg/5ml oral solution sugar free sugar-free
  - 150 ml £41.00 D = £41.00

#### MONITORING REQUIREMENTS

- Electrolytes should be monitored in renal impairment.
- Electrolytes should be monitored in renal impairment.
- Electrolytes should be monitored in renal impairment.

### Cardiovascular system

#### Hypertension

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-23 months (administered on expert advice): 20 mg 2–3 times a day
  - Child 2-17 years (administered on expert advice): 40–120 mg 2–3 times a day

#### Prophylaxis of supraventricular arrhythmias (administered on expert advice)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-23 months: 20 mg 2–3 times a day
  - Child 2-17 years: 40–120 mg 2–3 times a day

#### CONTRA-INDICATIONS

- Acute porphyrinas p. 624.
- Atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome).
- Bradycardia
- Cardiogenic shock
- History of heart failure (even if controlled by therapy)
- History of significantly impaired left ventricular function
- Hypotension
- Second- and third-degree AV block
- Sinus arrhythmias

#### CAUTIONS

- First-degree AV block
- **INTERACTIONS**
  - Appendix 1: calcium channel blockers

#### GENERAL SIDE-EFFECTS

- Common or very common
- Hypotension
- **Frequency not known**
  - Bradycardia
  - Extrapyramidal symptoms
  - Stevens-Johnson syndrome
  - Vertigo

#### SPECIFIC SIDE-EFFECTS

- Common or very common
- Bradycardia
- With intravenous use
- Abdominal pain
- **Frequency not known**
  - Cardiac arrest
  - Drowsiness
  - Erythema
  - Hepatic impairment
  - Hyperhidrosis
  - Myocardial contractility decreased
  - Nervousness
  - Seizure
  - With oral use
  - Alopecia
  - Angioedema
  - Atrioventricular block
  - Bradycardia
  - Constipation
  - Diarrhoea
  - Dizziness
  - Fatigue
  - Galactorrhoea
  - Gastrointestinal discomfort
  - Headache
  - Itch
  - Muscle weakness
  - Myalgia
  - Parasthesia
  - Rigidity
  - Nervousness
  - Palmar plaques
  - Photosensitivity reaction
  - Postural hypotension
  - Tremor
  - Photosensitivity reaction

#### OVERDOSE

- In overdosage, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias.

#### PREGNANCY

- May reduce uterine blood flow with fetal hypoxia.
- Manufacturer advises avoid in first trimester unless absolutely necessary.
- May inhibit labour.

#### BREAST FEEDING

- Amount too small to be harmful.

#### HEPATIC IMPAIRMENT

- **Dose adjustments**
  - With oral use
  - Manufacturer advises dose reduction.

#### DIRECTIONS FOR ADMINISTRATION

- For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9.
- Incompatible with solutions of pH greater than 7.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Bendroflumethiazide *(Bendrofluazide)*

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - By mouth
    - Child 1 month: 0.5–10 micrograms/kg daily, adjusted according to response
    - Child 2–11 years: Initially 0.5–40 micrograms/kg daily (max. per dose 10 mg), then maintenance 0.5–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day
    - Child 12–17 years: Initially 5–10 mg once daily or on alternate days, adjusted according to response to dose to be taken as a single dose in the morning; maximum 10 mg per day

- **SIDE-EFFECTS**
  - Blood disorder: cholestatic or cholestasis
  - Gastrointestinal disorder: flatulence, constipation, nausea, vomiting, diarrhea, dizziness, and sometimes peritonitis
  - Hypoglycaemia: anaphylactoid reactions
  - Renal disorder: dehydration
  - Cardiovascular disorder: hypotension, palpitations

- **BREAST FEEDING**
  - The amount present in milk is too small to be harmful. Large doses may suppress lactation.

- **INTERACTIONS**
  - Other thiazides: central nervous system depression
  - Potassium-sparing diuretics: increased risk of hypokalaemia
  - NSAIDs: increased risk of haemorrhage
  - Loop diuretics: additive diuretic effect

- **UNLICENSED USE**
  - Not licensed.

- **CONTRA-INDICATIONS**
  - Bilateral renovascular disease
  - Anaemia
  - Renal impairment

- **CAUTIONS**
  - African-Caribbean patients (may respond less well to ACE inhibitors)
  - Concomitant diuretics: Potentiating the glycaemic effect of diazoxide in the management of chronic hypoglycaemia
  - Concomitant diuretics: Nephrogenic and partial pituitary diabetes insipidus

**Oedema in heart failure, renal disease and hepatic disease/ Pulmonary oedema**

- **BY MOUTH**
  - Child 1 month: 0.5–10 micrograms/kg daily, adjusted according to response
  - Child 2–11 years: Initially 0.5–40 micrograms/kg daily (max. per dose 10 mg), then maintenance 0.5–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day
  - Child 12–17 years: Initially 5–10 mg once daily or on alternate days, adjusted according to response to dose to be taken as a single dose in the morning; maximum 10 mg per day

**CHLOROTHIAZIDE**

- **INDICATIONS AND DOSE**
  - **Heart failure**
  - **Hypertension**
  - **Ascites**
  - **BY MOUTH**
    - Neonate: 10–20 mg/kg twice daily
    - Child 1–5 months: 10–20 mg/kg twice daily
    - Child 6 months–11 years: 10 mg/kg twice daily; maximum 1 g per day
    - Child 12–17 years: 0.25–1 g once daily, alternatively 125–500 mg twice daily

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution.

**Tablet**

- **Bendroflumethiazide** (Non-proprietary)
  - Bendroflumethiazide 2.5 mg: Bendroflumethiazide 2.5 mg tablets
  - 28 tablet [PO] £0.75 DT = £0.54
  - 500 tablet [PO] £21.85

- **Bendroflumethiazide 5 mg**
  - 28 tablet [PO] £0.80 DT = £0.60

- **Neo-Naclex (Advanz Pharma)**
  - Bendroflumethiazide 2.5 mg: Neo-Naclex 2.5 mg tablets
  - 28 tablet [PO] £0.33 DT = £0.54
Captopril

INDICATIONS AND DOSE

Hypertension

BY MOUTH

- Preterm neonate (initiated under specialist supervision): Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate (initiated under specialist supervision): Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 12-17 years: Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Preterm neonate (initiated under specialist supervision): Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate (initiated under specialist supervision): Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 12-17 years: Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated.

Heart failure

BY MOUTH

- Preterm neonate: Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate: Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months: Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 12-17 years: Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated.

Proteinuria in nephritis (under expert supervision)

BY MOUTH

- Preterm neonate: Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Neonate: Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 months: Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 1-11 years (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for 1–2 hours; usual dose 100–300 micrograms/kg 2–3 times a day, then increased if necessary up to 4 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.

- Child 12-17 years: Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, then increased if necessary up to 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated.

SIDE-EFFECTS, FURTHER INFORMATION

In light of reports of cholestatic jaundice, hepatitis, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

- ALLERGY AND CROSS-SENSITIVITY: ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).

- PREGNANCY: ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

- BREAST FEEDING: Information on the use of ACE inhibitors in breast-feeding is limited.

- RENAL IMPAIRMENT

Dose adjustments

Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.

- MONITORING REQUIREMENTS: Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

- DIRECTIONS FOR ADMINISTRATION: For hypertension the first dose should preferably be given at bedtime.
### 150 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

**Diabetic nephropathy in type 1 diabetes mellitus**

- Child 12–17 years (under expert supervision): Test dose 100 micrograms/kg, alternatively test dose 6.25 mg, monitor blood pressure carefully for 1–2 hours; usual dose 12.5–25 mg 2–3 times a day, increased if necessary up to 100 mg daily in divided doses, ongoing doses should only be given if test dose tolerated

- **UNLICENSED USE** Not licensed for proteinuria in nephritis. Captopril doses in BNF Publications differ from product licence.

- **CAUTIONS** Children (efficacy and safety not fully established)

- **INTERACTIONS** → Appendix 1: ACE inhibitors

- **SIDE-EFFECTS**
  - Common or very common Insomnia - peptic ulcer
  - Uncommon Appetite decreased - flushing - malaise - pallor - Raynaud’s phenomenon
  - Rare or very rare Anaemia - aplastic anaemia - autoimmune disorder - cardiac arrest - cardiogenic shock - cerebrovascular insufficiency - depression - gynaecomastia - hepatic disorders - hypoglycaemia - lymphadenopathy - nephrotic syndrome - oral disorders - proteinuria - urinary disorders - vision blurred

- **BREAST FEEDING** Avoid in first few weeks after delivery, particularly in preterm infants - risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

- **DIRECTIONS FOR ADMINISTRATION** Administer under close supervision. Give test dose whilst child supine. Tablets can be dispersed in water.

- **PATIENT AND CARER ADVICE**

  Medicines for Children leaflet: Captopril for heart failure
  www.medicinesforchildren.org.uk/captopril-heart-failure-0

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

#### Tablet

- **Captopril (Non-proprietary)**
  - Captopril 12.5 mg: Captopril 12.5mg tablets | 56 tablet (£0.97 DT + £0.92
  - Captopril 25 mg: Captopril 25mg tablets | 56 tablet (£0.80 DT + £0.80
  - Captopril 50 mg: Captopril 50mg tablets | 56 tablet (£1.52 DT + £1.50

- **Oral solution**

  ELECTROLYTES: May contain Sodium

- **Captopril (Non-proprietary)**
  - Captopril 5 mg per 1 ml Captopril 5mg/5ml oral solution sugar free sugar-free | 100 ml (£93.30–£98.21 DT = £97.23
  - Captopril 5 mg per 1 ml Captopril 25mg/5ml oral solution sugar free sugar-free | 100 ml (£103.49–£108.94 DT = £107.85
  - **Noyada** (Martindale Pharmaceuticals Ltd)
    - Captopril 5 mg per 1 ml Noyada 5mg/5ml oral solution sugar-free | 100 ml (£98.21 DT = £97.23
    - Captopril 5 mg per 1 ml Noyada 25mg/5ml oral solution sugar-free | 100 ml (£108.94 DT = £107.85

---

150 micrograms/kg daily in divided doses, limited information.

- Child 1 month-11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg/day in 1–2 divided doses
- Child 12–17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses
- Child 12–17 years (under expert supervision) (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

**Heart failure**

- **BY MOUTH**

  - Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

  - Child 1 month-11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg/day in 1–2 divided doses
  - Child 12–17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses
  - Child 12–17 years (under expert supervision) (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

**Proteinuria in nephritis (under expert supervision)**

- **BY MOUTH**

**Enalapril maleate**

**INDICATIONS AND DOSE**

**Hypertension**

- **BY MOUTH**

  - Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

- **UNLICENSED USE** Not licensed for use in children for congestive heart failure, proteinuria in nephritis or diabetic nephropathy; not licensed for use in children less than 20 kg for hypertension.

- **INTERACTIONS** → Appendix 1: ACE inhibitors
Blood pressure conditions

SIDE-EFFECTS
- Common or very common: Depression, hypersensitivity, vision blurred.
- Uncommon: Anaemia, appetite decreased, asthma, bone marrow disorders, flushing, gastrointestinal disorders, hoarseness, hypoglycaemia, malaise, muscle cramps, nervousness, proteinuria, rhinorrhea, sleep disorders, throat pain.
- Rare or very rare: Autoimmune disorder, gynaecomastia, hepatic disorders, lymphopenopathy, oral disorders, Raynaud’s phenomenon, toxic epidermal necrolysis.
- Frequency not known: Arthritis, leucocytosis, myositis, serositis, SIADH, vasculitis.

BREATHE FEEDING
Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

HEPATIC IMPAIRMENT
Enalapril is a prodrug.

DIRECTIONS FOR ADMINISTRATION
Tablets may be crushed and suspended in water immediately before use.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Enalapril for high blood pressure
www.medicinesforchildren.org.uk/enalapril-high-blood-pressure

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet
- Enalapril maleate (Non-proprietary)
  - Enalapril maleate 2.5 mg: Enalapril 2.5mg tablets | 28 tablet [PO]
    - £5.63 DT = £5.15
  - Enalapril maleate 5 mg: Enalapril 5mg tablets | 28 tablet [PO]
    - £4.13 DT = £1.74
  - Enalapril maleate 10 mg: Enalapril 10mg tablets | 28 tablet [PO]

      - £12.51 DT = £1.76

Lisinopril

INDICATIONS AND DOSE
Hypertension
- BY MOUTH
  - Child 6–11 years (under expert supervision): Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks.
  - Child 12–17 years (under expert supervision): Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day.
  - Proteinuria in nephritis (under expert supervision)
    - BY MOUTH
      - Child 6–11 years: Initially 70 micrograms/kg once daily (max. per dose 5 mg), increased to up to 600 micrograms/kg once daily, alternatively increased to up to 40 mg once daily, dose to be increased in intervals of 1–2 weeks.
      - Child 12–17 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day.

Diabetic nephropathy (under expert supervision)
- BY MOUTH
  - Child 12–17 years: Initially 5 mg once daily; usual maintenance 10–20 mg once daily; maximum 80 mg per day.

Heart failure (adjunct) (under close medical supervision)
- BY MOUTH
  - Child 12–17 years: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day.

UNLICENSED USE
Not licensed for use in children.

INTERACTIONS
→ Appendix 1: ACE inhibitors.

SIDE-EFFECTS
- Common or very common: Postural disorders.

UNLICENSED USE
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

PRESCRIBING AND DISPENSING INFORMATION
The RCPCH and NPPG recommend that, when a liquid special of lisinopril is required, the following strength is used: 20 mg/5 mL.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Lisinopril for high blood pressure
www.medicinesforchildren.org.uk/lisinopril-high-blood-pressure

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Oral solution
- Lisinopril (Non-proprietary)
  - Lisinopril 1 mg per 1 ml: Lisinopril 1mg/5ml oral solution sugar free
    - 150 ml [PO] £154.11 DT = £154.11

Tablet
- Lisinopril (Non-proprietary)
  - Lisinopril 2.5 mg: Lisinopril 2.5mg tablets | 28 tablet [PO]

      - £4.76 DT = £0.80
    - Lisinopril 20 mg: Zestril 20mg tablets | 28 tablet [PO]
      - £13.02 DT = £0.88

DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM
- ANGIOTENSIN II RECEPTOR ANTAGONISTS

Angiotensin II receptor antagonists
- CAUTIONS
  Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) - aortic or mitral valve
stenois · hypertrophic cardiomyopathy · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · asthenia · back pain · cough · diarrhoea · dizziness · headache · hyperkalaemia · hypotension · nausea · postural hypotension (more common in patients with intravascular volume depletion, e.g. those taking high-dose diuretics) · renal impairment · skin reactions · vertigo · vomiting
- **Uncommon** Angioedema · hepatic function abnormal · myalgia · thrombocytopenia
- **Rare or very rare** Arthralgia

**PREGNANCY** Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

**BREAST FEEDING** Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment (limited information available); avoid in severe impairment (no information available).

**RENAI IMPAIRMENT**
- **Dose adjustments** Use with caution, starting with low dose, and adjust according to response.
- **MONITORING REQUIREMENTS** Monitor plasma-potassium concentration, particularly in children with renal impairment.

### Candesartan cilexetil

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Child 6-17 years (under expert supervision) (body-weight up to 50 kg): Initially 4 mg once daily, adjusted according to response, lower dose may be used in intravascular volume depletion; maximum 8 mg per day
  - Child 6-17 years (under expert supervision) (body-weight 50 kg and above): Initially 4 mg once daily, adjusted according to response, lower dose may be used in intravascular volume depletion; maximum 16 mg per day

**CONTRA-INDICATIONS** Cholestaticis

**INTERACTIONS** → Appendix 1: angiotensin-II receptor antagonists

**SIDE-EFFECTS**
- **Common or very common** Fever · increased risk of infection · oropharyngeal pain · sinus arthrythmia
- **Uncommon** Hypoanaemia
- **Rare or very rare** Agranulocytosis · hepatitis · leucopenia · neutropenia

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or cholestasis.

**Dose adjustments** In adults, manufacturer advises dose reduction—consult product literature.

**RENAI IMPAIRMENT** Use with caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

**Dose adjustments** Reduce initial dose.

**INTERACTIONS**
- **Common or very common** Anaemia · hypoglycaemia · postural disorders
- **Uncommon** Angina pectoris · constipation · drowsiness · dysphonia · oedema · palpitations · sleep disorder
- **Rare or very rare** Atrial fibrillation · hepatitis · hypersensitivity · paraesthesia · stroke · syncope · vasculitis
- **Frequency not known** Depression · erectile dysfunction · hypotension · influenza like illness · malaise · migraine · pancreatitis · photosensitivity reaction · rhabdomyolysis · taste altered · tinnitus · urinary tract infection

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in all degrees of impairment (no information available).

**RENAI IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.
118 Blood pressure conditions

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**
- **Cozaar** (Merck Sharp & Dohme Ltd)

**Tablet**
- **Valsartan (Non-proprietary)**
  - Valsartan 40 mg | 7 tablet (PO) £7.50 DT = £1.17
  - Valsartan 160 mg | 28 tablet (PO) £14.69 DT = £1.46
  - Valsartan 320 mg | 28 tablet (PO) £20.23 DT = £1.93

**Capsule**
- **Valsartan (Non-proprietary)**
  - Valsartan 40 mg | 28 capsule (PO) £13.97 DT = £4.53
  - Valsartan 80 mg | 28 capsule (PO) £13.97 DT = £6.79
  - Valsartan 160 mg | 28 capsule (PO) £18.41 DT = £7.81

**VASODILATORS** → **VASODILATOR ANTHYPERTENSIVES**

**Hydralazine hydrochloride**

29-Mar-2017

**INDICATIONS AND DOSE**

**Resistant hypertension (adjunct)**
- **BY MOUTH**
  - Neonate: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 2–3 mg/kg every 8 hours.

  - Child 1 month–11 years: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 7.5 mg/kg daily; maximum 200 mg per day

  - Child 12–17 years: 25 mg twice daily, increased to 50–100 mg twice daily

  - BY SLOW INTRAVENOUS INJECTION

  - Neonate: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day.

  - Child 1 month–11 years: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day; maximum 60 mg per day

  - Child 12–17 years: 5–10 mg, dose may be repeated if necessary every 4–6 hours

  - BY CONTINUOUS INTRAVENOUS INFUSION

  - Neonate: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 2 mg/kg per day.

  - Child 1 month–11 years: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day

  - Child 12–17 years: 3–9 mg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Acute porphyria p. 624 • cor pulmonale • high output heart failure • idiopathic systemic lupus erythematosus • myoccardial insufficiency due to mechanical obstruction • severe tachycardia

**CAUTIONS** Cerebrovascular disease • occasionally blood pressure reduction too rapid even with low parenteral doses

**INTERACTIONS** → Appendix 1: hydralazine

**SIDE-EFFECTS**
- Common or very common Angina pectoris • diarrhea • dizziness • flushing • gastrointestinal disorders • headache • hypotension • joint disorders • lupus-like syndrome (after long-term therapy (more common in slow acetylator individuals)) • myalgia • nasal congestion • nausea • palpitations • tachycardia • vomiting

  - Rare or very rare Acute kidney injury • agranulocytosis • anaemia • anxiety • appetite decreased • conjunctivitis • depression • dyspnoea • eosinophilia • eye disorders • fever • glomerulonephritis • haematuria • haemolytic anaemia • hallucination • heart failure • hepatic disorders • leucocytosis • leucopenia • lymphadenopathy • malaise • nerve disorders • neutropenia • oedema • pancytopenia • paradoxical pressor response • paraesthesia • pleuritic pain • proteinuria • skin reactions • splenomegaly •
thrombocytopenia • urinary retention • vasculitis • weight decreased

SIDE-EFFECTS, FURTHER INFORMATION The incidence of side-effects is lower if the dose is kept low, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

PREGNANCY Neonatal thrombocytopenia reported, but risk should be balanced against uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

BREAST FEEDING Present in milk but not known to be harmful. Monitoring Monitor infant in breast-feeding.

HEPATIC IMPAIRMENT Present in milk but not known to be harmful.

BREAST FEEDING Present in milk but not known to be harmful.

RENAL IMPAIRMENT Dose adjustments Manufacturer advises adjust dose or dosing interval according to clinical response.

RENAL IMPAIRMENT Dose adjustments Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose, but evidence of clinical value unsatisfactory.

DIRECTIONS FOR ADMINISTRATION

With oral use For administration by mouth, diluted injection may be given orally.

With intravenous use For continuous intravenous infusion, initially reconstitute 20 mg with 1 mL Water for Injections, then dilute with Sodium Chloride 0.9%. Incompatible with Glucose intravenous infusion. For intravenous injection, initially reconstitute 20 mg with 1 mL Water for Injections, then dilute to a concentration of 0.5–1 mg/mL with Sodium Chloride 0.9% and administer over 5–20 minutes.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Table: Lonten (Pfizer Ltd) Minoxidil 2.5 mg Lonten 2.5mg tablets | 60 tablet £8.88 DT £8.88 Minoxidil 5 mg Lonten 5mg tablets | 60 tablet £15.83 DT + £15.83 Minoxidil 10 mg Lonten 10mg tablets | 60 tablet £30.68 DT + £30.68

4.1a Hypertension associated with phaeochromocytoma

Other drugs used for Hypertension associated with phaeochromocytoma Propranolol hydrochloride, p. 106

VASODILATORS > PERIPHERAL VASODILATORS

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE

Hypertension in phaeochromocytoma

BY MOUTH

• Child: 0.5–1 mg/kg twice daily, adjusted according to response

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS History of cerebrovascular accident

CAUTIONS Avoid contact with skin (risk of contact sensitisation) - avoid in Acute porphyrias p. 624 - carcinogenic in animals - cerebrovascular disease - congestive heart failure - severe ischaemic heart disease

SIDE-EFFECTS Abdominal distress • dizziness • ejaculation failure • fatigue • miotic • nasal congestion • postural hypotension • reflex tachycardia

PREGNANCY Hypotension may occur in newborn.

BREAST FEEDING May be present in milk.

RENAI IMPAIRMENT Use with caution.

DIRECTIONS FOR ADMINISTRATION For administration by mouth, capsules may be opened.

HANDLING AND STORAGE Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE

Severe hypertension

BY MOUTH

• Child 1 month–11 years: Initially 200 micrograms/kg daily in 1–2 divided doses, then increased in steps of 100–200 micrograms/kg, increased at intervals of at least 3 days; maximum 1 mg/kg per day

• Child 12–17 years: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg daily, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

Minoxidil

INDICATIONS AND DOSE

Severe hypertension

BY MOUTH

• Child 1 month–11 years: Initially 200 micrograms/kg daily in 1–2 divided doses, then increased in steps of 100–200 micrograms/kg, increased at intervals of at least 3 days; maximum 1 mg/kg per day

• Child 12–17 years: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg daily, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma
4.1b Hypertensive crises

Other drugs used for Hypertensive crises: Hydralazine hydrochloride, p. 118 - Labetalol hydrochloride, p. 105

VASODILATORS > VASODILATOR

ANTITHY HYPERTENSIVES

Sodium nitroprusside

- INDICATIONS AND DOSE
  - Hypertensive emergencies
    - BY CONTINUOUS INTRAVENOUS INFUSION
      - Neonate: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours.
      - Child: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours.

- UNLICENSED USE
- CONTRA-INDICATIONS
- CAUTIONS
- INTERACTIONS ➔ Appendix 1: sodium nitroprusside

SIDE-EFFECTS
  - Abdominal pain - anxiety - chest discomfort - diaphoresis - headache - hypertension - nausea - palpitations - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
  Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.

Overdose
  Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 859).

PREGNANCY
  Avoid prolonged use—potential for accumulation of cyanide in fetus.

BREAST FEEDING
  No information available. Caution advised due to thiocyanate metabolite.

HEPATIC IMPAIRMENT
  Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.

RENAL IMPAIRMENT
  Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.

MONITORING REQUIREMENTS
  Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.

TREATMENT CESSATION
  Avoid sudden withdrawal—terminate infusion over 15–30 minutes.

DIRECTIONS FOR ADMINISTRATION
  For continuous intravenous infusion in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.

MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion
  Sodium nitroprusside dihydrate 50 mg
  Sodium nitroprusside 50 mg
  Powder and solvent for solution for infusion vials | 1 vial P6X

4.1c Pulmonary hypertension

ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

Epoprostenol
  (Prostacyclin)

- DRUG ACTION
  Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

- INDICATIONS AND DOSE
  Persistent pulmonary hypertension of the newborn
  BY CONTINUOUS INTRAVENOUS INFUSION
  - Neonate: Initially 2 nanograms/kg/minute (max. per dose 20 nanograms/kg/minute), adjusted according to response, rarely doses up to 40 nanograms/kg/minute are used.

Idiopathic pulmonary arterial hypertension
  BY CONTINUOUS INTRAVENOUS INFUSION
  - Child: Initially 2 nanograms/kg/minute, increased if necessary up to 40 nanograms/kg/minute

PHARMACOKINETICS
  - Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- UNLICENSED USE
- CONTRA-INDICATIONS
  Pulmonary veno-occlusive disease - severe left ventricular dysfunction

CAUTIONS
  Avoid abrupt withdrawal (risk of rebound pulmonary hypertension/pulmonary hypertensive crisis), haemorrhagic diathesis

INTERACTIONS ➔ Appendix 1: epoprostenol

SIDE-EFFECTS
  - Common or very common
    - Abdominal pain - anxiety - arrhythmias - arthralgia - chest discomfort - diarrhoea - flushing - haemorrhage - headache - intracranial haemorrhage - nausea - pain - rash - sepsis - vomiting
  - Uncommon
    - Dry mouth - hyperhidrosis
  - Rare or very rare
    - Fatigue - hyperthromboid - intravenous catheter occlusion - local infection - pallor
  - Frequency not known
    - Aspites - pulmonary oedema (avoid chronic use if occurs during dose titration), spleen abnormalities

PREGNANCY
  Manufacturer advises caution—no information available.

BREAST FEEDING
  Manufacturer advises avoid—no information available.

MONITORING REQUIREMENTS
  Anticoagulant monitoring required when given with anticoagulants.
  Monitor blood pressure.
**PULMONARY HYPERTENSION**

**121**

---

**Indications and Dose**

**Idiopathic or familial pulmonary arterial hypertension** (initiated under specialist supervision)

- **By Inhalation of Nebulised Solution**
  - Child 8-17 years: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduce to lower maintenance dose if high dose not tolerated.

**Raynaud’s syndrome**

- **Child 12-17 years:** Initially 30 nanograms/kg/hour, increased to 60–120 nanograms/kg/hour daily for 3–5 days, dose to be given over 6 hours, dose increase should be performed gradually.

**Unlicensed Use**

- Not licensed for use in children.

**Contra-indications**

- Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompensated cardiac failure (unless under close medical supervision) - pulmonary veno-occlusive disease - severe arrhythmias - severe coronary heart disease

**Caution**

**General Caution**

- Hypotension (do not initiate if systolic blood pressure below 85 mmHg) - unstable pulmonary hypertension with advanced right heart failure

**Specific Caution**

- When used by inhalation: Acute pulmonary infection - severe asthma

**Interactions**

- Appendix 1: Iloprost

**Side-effects**

- Common or very common: Chest discomfort - cough - diarrhea - dizziness - dyspnoea - haemorrhage - headache - hypotension - nausea - oral disorders - pain - palpitations - rash - syncope - tachycardia - throat complaints - vasodilatation - vomiting

- Frequency not known: Respiratory disorders - taste altered - thrombocytopenia

**Pregnancy**

- When used by inhalation: Use if potential benefit outweighs risk.

**Breast Feeding**

- When used by inhalation: Manufacturer advises avoid—no information available.

**Hepatic Impairment**

- Dose adjustments: When used by inhalation: Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).

- Dose may need to be halved in liver cirrhosis.

**Directions for Administration**

- With intravenous use: For **intravenous infusion** dilute to a concentration of 200 nanograms/mL with Glucose 5% or Sodium Chloride 0.9%; alternatively, may be diluted to a concentration of 2 micrograms/mL and given via syringe driver.

- When used by inhalation: For **inhaled treatment**, to minimise accidental exposure use only with nebulisers listed in Ventavis® product literature in a well ventilated room.

**Prescribing and Dispensing Information**

- When used by inhalation: Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.

- With intravenous use: Concentrate for infusion available on a named patient basis from Bayer Schering in 0.5 mL and 1 mL ampoules.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for Infusion**

- **Iloprost (Non-proprietary):**
  - **Iloprost** (as Iloprost trometamol) 100 microgram per 1 ml
  - **Iloprost** (as Iloprost trometamol) 10 microgram per 1 ml

**Nebuliser Liquid**

- **Ventavis** (Bayer Plc)
  - **Iloprost** (as Iloprost trometamol) 10 microgram per 1 ml
  - **Iloprost** (as Iloprost trometamol) 1 microgram per 1 ml

**Endothelin Receptor Antagonists**

---

**Boventan**

**Indications and Dose**

**Pulmonary arterial hypertension (initiated under specialist supervision)**

- **By Mouth**
  - Child 2-17 years (body-weight 10–20 kg): Initially 31.25 mg once daily for 4 weeks, then increased to 31.25 mg twice daily.
  - Child 2-17 years (body-weight 20–40 kg): Initially 31.25 mg twice daily for 4 weeks, then increased to 62.5 mg twice daily.
  - Child 12-17 years (body-weight 40 kg and above): Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg)

**Contra-indications**

- Acute porphyrias p. 624

**Caution**

- Not to be initiated if systemic systolic blood pressure is below 85 mmHg

**Interactions**

- Appendix 1: Boventan
**SIDE-EFFECTS**
- **Common or very common** Anaemia, diarrhoea, flushing, gastroesophageal reflux disease, headache, nasal congestion, palpitations, skin reactions, syncpe
- **Uncommon** Hepatic disorders, leucopenia, neutropenia, thrombocytopenia
- **Rare or very rare** Angioedema
- **Frequency not known** Vision blurred

**CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

**PREGNANCY** Avoid (teratogenic in animal studies).

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment or if baseline serum transaminases exceed 3 times the upper limit of normal.

**MONITORING REQUIREMENTS**
- Monitor haemoglobin before and during treatment
- Monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment.

**TREATMENT CESSATION** Avoid abrupt withdrawal—withdraw treatment gradually.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Bosentan (Non-proprietary)**
  - Bosentan (as Bosentan monohydrate) 62.5 mg: Bosentan 62.5mg tablets | 56 tablet blister pack £112.50–£1,510.21
  - Bosentan (as Bosentan monohydrate) 125 mg: Bosentan 125mg tablets | 56 tablet blister pack £112.50–£1,510.21
- **Stayveer (Advanz Pharma)**
  - Bosentan (as Bosentan monohydrate) 62.5 mg: Stayveer 62.5mg tablets | 56 tablet blister pack £208.34
  - Bosentan (as Bosentan monohydrate) 125 mg: Stayveer 125mg tablets | 56 tablet blister pack £208.34
- **Tracleer (Actelion Pharmaceuticals UK Ltd)**
  - Bosentan (as Bosentan monohydrate) 62.5 mg: Tracleer 62.5mg tablets | 56 tablet blister pack £1,510.21
  - Bosentan (as Bosentan monohydrate) 125 mg: Tracleer 125mg tablets | 56 tablet blister pack £1,510.21

**PHOSPHODIESTERASE TYPE-5 INHIBITORS**

**Sildenafil**

**INDICATIONS AND DOSE** Pulmonary arterial hypertension (initiated under specialist supervision)

**BY MOUTH**
- Neonate: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
- Child 1–11 months: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
- Child 1–7 years (body-weight up to 20 kg): 10 mg 3 times a day
- Child 1–7 years (body-weight 20 kg and above): 20 mg 3 times a day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**
- Manufacturer advises reduce dose with concurrent use of moderate and potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir)—no specific recommendation made for children.

**UNLICENSED USE** Not licensed for use in children under 1 year.

**CONTRA-INDICATIONS** Hereditary degenerative retinal disorders, history of non-arteritic anterior ischaemic optic neuropathy, recent history of stroke, sickle-cell anaemia

**CAUTIONS** Active peptic ulceration, anatomical deformation of the penis, autonomic dysfunction, bleeding disorders, cardiovascular disease, hypotension (avoid if severe), intravascular volume depletion, left ventricular outflow obstruction, ocular disorders, predisposition to priapism, pulmonary veno-occlusive disease

**INTERACTIONS**
- **Common or very common** Alopecia, anaemia, anxiety, cough, diarrhoea, dizziness, fluid retention, gastrointestinal discomfort, gastrointestinal disorders, headaches, increased risk of infection, insomnia, nasal complaints, nausea, night sweats, pain, skin reactions, tremor, vasodilation, vision disorders
- **Uncommon** Arrhythmias, chest pain, drowsiness, dry eye, dry mouth, eye discomfort, eye disorders, eye inflammation, fatigue, feeling hot, gynaecomastia, haemorrhage, hypertension, hypotension, myalgia, numbness, palpitations, sinus congestion, tinnitus, vertigo, vomiting
- **Rare or very rare** Acute coronary syndrome, arteriosclerotic retinopathy, cerebrovascular insufficiency, glaucoma, haematospermia, hearing impairment, irritability, optic neuropathy (discontinue if sudden visual impairment occurs), oral hypoesthesia, priapism, retinal occlusion, scleral discoulouration, seizure, severe cutaneous adverse reactions (SCARs), sudden cardiac death, syncope, throat tightness

**PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment, consider dose reduction in mild to moderate impairment (no information available).

**Dose adjustments** Manufacturer advises if not tolerated, consider dose reduction in mild to moderate impairment—consult product literature.

**RENAL IMPAIRMENT** Reduce dose if not tolerated.

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Sildenafil for pulmonary hypertension www.medicinesforchildren.org.uk/sildenafil-pulmonary-hypertension
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) decisions
    - The Scottish Medicines Consortium has advised (December 2012) that sildenafil (Revatio®) is accepted for restricted use within NHS Scotland for pulmonary arterial hypertension in children aged 1–17 years; sildenafil should only be prescribed on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.
### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pessary

### Sympathomimetics

#### Overview

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Response to sympathomimetics can also vary considerably in children, particularly neonates. It is important to titrate the dose to the desired effect and to monitor the child closely.

#### Inotropic sympathomimetics

Dopamine hydrochloride p. 125 has a variable, unpredictable, and dose dependent impact on vascular tone. Low dose infusion normally causes vasodilatation, but there is little evidence that this is clinically beneficial; moderate doses increase myocardial contractility and cardiac output in older children, but in neonates moderate doses may cause a reduction in cardiac output. High doses cause vasoconstriction and increase vascular resistance, and should therefore be used with caution following cardiac surgery, or where there is co-existing neonatal pulmonary hypertension.

In neonates the response to inotropic sympathomimetics varies considerably, particularly in those born prematurely; careful dose titration and monitoring are necessary. Isoprenaline injection is available from ‘special-order’ manufacturers or specialist importing companies.

### Shock

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis or myocardial insufficiency should be corrected. Additional treatment is dependent on the type of shock.

**Septic shock** is associated with severe hypovolaemia (due to vasodilation and capillary leak) which should be corrected with crystalloids or colloids. If hypotension persists despite volume replacement, dopamine hydrochloride should be started. For shock refractory to treatment with dopamine hydrochloride, if cardiac output is high and peripheral vascular resistance is low (warm shock), noradrenaline/norepinephrine p. 126 should be added or if cardiac output is low and peripheral vascular resistance is high (cold shock), adrenaline/epinephrine p. 138 should be added. Additionally, in cold shock, a vasodilator such as milrinone p. 129, glyceryl trinitrate p. 137, or sodium nitroprusside p. 120 (on specialist advice only) can be used to reduce vascular resistance.

If the shock is resistant to volume expansion and catecholamines, and there is suspected or proven adrenal insufficiency, low dose hydrocortisone p. 456 can be used. ACTH-stimulated plasma-cortisol concentration should be measured; however, hydrocortisone can be started without such information. Alternatively, if the child is resistant to catecholamines, and vascular resistance is low, vasopressin p. 69 can be added.

**Neonatal septic shock** can be complicated by the transition from fetal to neonatal circulation. Treatment to reverse right ventricular failure, by decreasing pulmonary artery pressures, is commonly needed in neonates with fluid-refractory shock and persistent pulmonary hypertension of the newborn. Rapid administration of fluid in neonates with patent ductus arteriosus may cause left-to-right shunting and congestive heart failure induced by ventricular overload.

In **cardiogenic shock**, the aim is to improve cardiac output and to reduce the afterload on the heart. If central venous pressure is low, cautious volume expansion with a colloid or crystalloid can be used. An inotrope such as adrenaline/epinephrine or dopamine hydrochloride should...
be given to increase cardiac output. Dobutamine below is a peripheral vasodilator and is an alternative if hypotension is not significant.

Methylxanthines have both inotropic and vasodilatory effects and can be used when vascular resistance is high. Alternatively, glyceryl trinitrate or sodium nitroprusside (on specialist advice only) can be used to reduce vasoconstriction. Hypovolaemic shock should be treated with a crystalloid or colloid solution (or whole or reconstituted blood if source of hypovolaemia is haemorrhage) and further steps to improve cardiac output and decrease vascular resistance can be taken, as in cardiogenic shock.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 174.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to cause intense systemic vasoconstriction. Vasoconstrictor sympathomimetics should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 174.

SYMPATHOMIMETICS ▶ INOTROPIC

Dobutamine

• **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta receptors in cardiac muscle, and increases contractility.

• **INDICATIONS AND DOSE** Inotropic support in low cardiac output states, after cardiac surgery, cardiomyopathies, shock

  ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

  • **Neonate**: Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

  • **Child**: Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

• **CONTRA-INDICATIONS** Phaeochromocytoma

• **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · ischaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours

• **INTERACTIONS** → Appendix 1: sympathomimetics, inotropic

• **SIDE-EFFECTS**

  ▶ **Common or very common** Arrhythmias · bronchospasm · chest pain · dyspnoea · eosinophilia · fever · inflammation localised · ischaemic heart disease · nausea · palpitations · platelet aggregation inhibition (on prolonged administration) · skin reactions · urinary urgency · vasoconstriction

  ▶ **Uncommon** Myocardial infarction

  ▶ **Rare or very rare** Atrialventricular block · cardiac arrest · coronary vasospasm · hypertension · hypokalaemia · hypotension

• **FREQUENCY NOT KNOWN** Anxiety · cardiomyopathy · feeling hot · headache · myoclonus · paraesthesia · tremor

• **PREGNANCY** No evidence of harm in animal studies – manufacturers advise use only if potential benefit outweighs risk.

• **BRREST FEEDING** Manufacturers advise avoid—no information available.

• **DIRECTIONS FOR ADMINISTRATION** Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

  For continuous intravenous infusion, using infusion pump, dilute to a concentration of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

  In neonates Neonatal intensive care, dilute 30 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.5 mL/hour provides a dose of 5 micrograms/kg/minute; max. concentration of 5 mg/mL; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

• **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

  **Solution for infusion**

  **EXCIPIENTS**: May contain Sulfites

  ▶ Dobutamine (Non-proprietary)

  **Dobutamine (as Dobutamine hydrochloride)** 5 mg per 1 mL Dobutamine 250mg/50mL solution for infusion vials | 1 vial (PST) £7.50

  **Dobutamine (as Dobutamine hydrochloride)** 12.5 mg per 1 mL Dobutamine 250mg/20mL concentrate for solution for infusion ampoules | 5 ampoule (PST) £12.00-£29.25 | 10 ampoule (PST) £52.50

Blood pressure conditions

Cardiovascular system

BNFC 2019-2020
Dopamine hydrochloride

**DRUG ACTION** Dopamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**INDICATIONS AND DOSE**
To correct the haemodynamic imbalance due to acute hypotension, shock, cardiac failure, adjunct following cardiac surgery

- **BY CONTINUOUS INTRAVENOUS INFUSION**

- **Neonate:** Initially 3 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.

- **Child:** Initially 5 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.

**UNLICENSED USE** Not licensed for use in children under 12 years.

**CONTRA-INDICATIONS** Phaeochromocytoma - tachyarrhythmia

**CAUTIONS** Correct hypovolaemia - hypertension (may raise blood pressure) - hyperthyroidism

**INTERACTIONS** Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS** Angina pectoris - anxiety - arrhythmias - azotaemia - cardiac conduction disorder - dyspnoea - gangrene - headache - hypertension - mydriasis - nausea - palpitations - piloerection - polyuria - tremor - vasoconstriction - vomiting

**PREGNANCY** No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** May suppress lactation—not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION** Dopamine concentrate for intravenous infusion to be diluted before use.

For **continuous intravenous infusion**, dilute to a max. concentration of 3.2 mg/mL with Glucose 5% or Sodium Chloride 0.9%. Infuse higher concentrations through central venous catheter using a syringe pump to avoid extravasation and fluid overload. Incompatible with bicarbonate and other alkaline solutions.

In neonates **Neonatal intensive care**, dilute 30 mg/kg body weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.3 mL/hour provides a dose of 3 micrograms/kg/minute; max. concentration of 3.2 mg/mL; infuse higher concentrations through central venous catheter. Incompatible with bicarbonate and other alkaline solutions.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

- **Dopamine hydrochloride (Non-proprietary)**
  - Dopamine hydrochloride 40 mg per 1 ml Dopamine 200mg/5ml solution for infusion ampoules | 5 ampoule £0.20 (Hospital only) | 5 ampoule £0.20 10 ampoule £0.94
  - Dopamine 200mg/5ml concentrate for solution for infusion ampoules | 10 ampoule £0.34
  - Dopamine hydrochloride 160 mg per 1 ml Dopamine 800mg/5ml solution for infusion ampoules | 10 ampoule £0.34

**SYMPATHOMIMETICS > VASOCONSTRICTOR**

Ephedrine hydrochloride

**INDICATIONS AND DOSE**
Reversal of hypotension from spinal or epidural anaesthesia

- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1-11 years: 500–750 micrograms/kg every 3–4 minutes, adjusted according to response, alternatively 17–25 mg/m² every 3–4 minutes, adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course
  - Child 12-17 years: 3–7.5 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/ml; maximum 30 mg per course

**CAUTIONS** Diabetes mellitus - hypertension - hyperthyroidism - susceptibility to angle-closure glaucoma

**INTERACTIONS** Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**
- **Common or very common** Anxiety - arrhythmias - asthenia - confusion - depression - dyspnoea - headache - hypertension - mydriasis - insomnia - irritability - nausea - palpitations - vomiting
  - **Rare or very rare** Acute urinary retention
  - **Frequency not known** Acute angle closure glaucoma - angina pectoris - appetite decreased - cardiac arrest - dizziness - hypokalaemia - intracranial haemorrhage - psychotic disorder - pulmonary oedema - tremor

**PREGNANCY** Increased fetal heart rate reported with parenteral ephedrine.

**BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

**RENAL IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION** For **slow intravenous injection**, give via central venous catheter using a solution containing ephedrine hydrochloride 3 mg/ml.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Ephedrine hydrochloride (Non-proprietary)**
  - Ephedrine hydrochloride 3 mg per 1 ml Ephedrine 30mg/10ml solution for injection ampoules | 10 ampoule (P) £9.32
  - Ephedrine 30mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £7.59–£9.50 | 12 pre-filled disposable injection £114.00
  - Ephedrine hydrochloride 30 mg per 1 ml Ephedrine 30mg/1ml solution for injection ampoules | 10 ampoule (P) £52.50–£60.28 DT = £60.28

Metaraminol

**INDICATIONS AND DOSE**
**Acute hypotension**

- **BY INTRAVENOUS INJECTION**
  - Child 12-17 years: 15–100 mg, adjusted according to response

**Emergency treatment of acute hypotension**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child 12-17 years: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Hypertension
CAUTIONS Cirrhosis · coronary vascular thrombosis · diabetes mellitus · extravasation at injection site may cause necrosis, following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal’s variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

CAUTIONS, FURTHER INFORMATION
- Hypertensive response Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS
- Common or very common Headache · hypertension
- Rare or very rare Skin exfoliation · soft tissue necrosis
- Frequency not known Abscess · arrhythmias · nausea · palpitations · peripheral ischaemia

PREGNANCY May reduce placental perfusion—manufacturer advises caution—no information available.

BREAST FEEDING Manufacturer advises caution if potential benefit outweighs risk.

DIRECTIONS FOR ADMINISTRATION Monitor blood pressure and rate of flow frequently.

WEBEDRUGS.COM

INTERACTIONS
- Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS
- Anxiety · arrhythmias · dyspnoea · extravasation necrosis · headache · hypertension · hypovolaemia · peripheral ischaemia

PREGNANCY Manufacturer advises use if potential benefit outweighs risk—may reduce placental perfusion and induce fetal bradycardia.

ADVERSE REACTIONS
- Hypertension
- Headache
- Anxiety
- Arrhythmias
- Hypovolaemia
- Extravasation, necrosis
- Peripheral ischaemia
- Hypercapnia
- Hypoxia
- Mesenteric vascular thrombosis
- Peripheral vascular thrombosis
- Prinzmetal’s variant angina
- Susceptibility to angle-closure glaucoma

DOSAGE REQUIREMENTS
- Neonate: 20–100 micrograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response, dilute the 1 mg/mL concentrate for infusion for this dose.

- Child: 20–100 micrograms/kg/minute (max. per dose 1 microgram/kg/minute), adjusted according to response, dilute the 1 mg/mL concentrate for infusion for this dose

DOSE EQUIVALENT AND CONVERSION
- 1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. Doses expressed as the base.

UNLICENSED USE Not licensed for use in children.

IMPORTANT SAFETY INFORMATION
- Association of noradrenaline/norepinephrine 0.08 mg/mL (4 mg in 50 mL) solution for infusion with potential risk of medication errors. Healthcare professionals should be aware of the differences in strength and presentation between noradrenaline/norepinephrine products—manufacturer advises noradrenaline 0.08 mg/mL solution for infusion must not be diluted before use and should only be used

for the on-going treatment of patients already established on noradrenaline therapy, whose dose requirements are clinically confirmed to be escalating.

CONTRA-INDICATIONS Hypertension

CAUTIONS Coronary vascular thrombosis · diabetes mellitus · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal’s variant angina · susceptibility to angle-closure glaucoma · uncorrected hypovolaemia

INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS
- Vasoconstrictor action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

WEBEDRUGS.COM

INTERACTIONS

Phenylephrine hydrochloride

**INDICATIONS AND DOSE**

**Acute hypotension**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-11 years: 100 micrograms/kg every 1–2 hours (max. per dose 5 mg) as required
  - Child 12-17 years: Initially 2–5 mg (max. per dose 5 mg), followed by 1–10 mg, after at least 15 minutes if required
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1-11 years: Initially 5–20 micrograms/kg (max. per dose 500 micrograms), repeated as necessary after at least 15 minutes
  - Child 12-17 years: 100–500 micrograms, repeated as necessary after at least 15 minutes
- **BY INTRAVENOUS INFUSION**
  - Child 1-5 years: Initially 100–500 nanograms/kg/minute, adjusted according to response
  - Child 16-17 years: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

**INTERACTIONS**
- Appendix 1: sympathomimetics, vasoconstrictor

**CAUTIONS**
- Coronary disease • coronary vascular thrombosis • diabetes • extravasation at injection site may cause necrosis • following myocardial infarction • hypercapnia • hyperthyroidism • hypoxia • mesenteric vascular thrombosis • peripheral vascular thrombosis • Prinzmetal’s variant angina • susceptibility to angle-closure glaucoma • uncorrected hypovolaemia

**CAUTIONS, FURTHER INFORMATION**
- Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an increased risk of infection when used in pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

**UNLICENSED USE**
- Not licensed for use in children by intravenous infusion or injection.

**CONTRA-INDICATIONS**
- Hypertension • severe hyperthyroidism

**SIDE-EFFECTS**
- Angina pectoris • arrhythmias • cardiac arrest • dizziness • dyspepsia • flushing • glucose tolerance impaired • headache • hyperhidrosis • hypersalivation • hypotension • intracranial haemorrhage • metabolic change • mydriasis • palpitations • paraesthesia • peripheral coldness • pulmonary oedema • soft tissue necrosis • syncope • urinary disorders • vomiting

**PREGNANCY**
- Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.

**MONITORING REQUIREMENTS**
- Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION**
- For **intravenous injection**, dilute to a concentration of 1 mg/mL with Water for Injections and administer slowly. For **intravenous infusion**, dilute to a concentration of 20 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and administer as a continuous infusion via a central venous catheter using a controlled infusion device.

**PRESCRIBING AND DISPENSING INFORMATION**
- Intraocular pressure

**INTERACTIONS**
- Appendix 1: beta blockers, non-selective

**SIDE-EFFECTS**
- Common or very common • Anaemia • asthma • dyspepsia • eye irritation • fluid imbalance • genital oedema • hypercholesterolaemia • hyperglycaemia • hypoglycaemia • increased risk of infection • oedema • postural hypotension • pulmonary oedema • renal impairment • urinary disorders • weight increased
- Uncommon • Alopecia • angina pectoris • constipation • hyperhidrosis • skin reactions
- Rare or very rare • Dry mouth • hypersensitivity • leucopenia • nasal congestion • severe cutaneous adverse reactions (SCARs) • thrombocytopenia

**PREGNANCY**
- Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

**BETA-ADRENOCEPTOR BLOCKERS**

**ALPHA- AND BETA-ADRENOCEPTOR BLOCKERS**

**Address**

- **BY INTRAVENOUS INFUSION**
  - Child 1-5 years: 100–500 nanograms/kg/minute, adjusted according to response
  - Child 16-17 years: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

**MEDICINAL FORMS**

**Solution for injection**
- **Phenylephrine hydrochloride (Non-proprietary)**
  - Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml Phenylephrine 500micrograms/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £5.00 | 10 pre-filled disposable injection 10 ampoule £50.00
  - Phenylephrine hydrochloride 100 microgram per 1 ml Phenylephrine 1mg/10ml solution for injection ampoules | 10 ampoule £99.12

**5 Heart failure**

**Other drugs used for Heart failure**
- Bendroflumethiazide, p. 113 • Candesartan cilexetil, p. 117 • Captopril, p. 114 • Chlorothiazide, p. 113 • Chlortalidone, p. 144 • Digoxin, p. 82 • Enalapril maleate, p. 115 • Glycerol trinitrate, p. 137 • Hydralazine hydrochloride, p. 118 • Lisinopril, p. 116 • Losartan potassium, p. 117 • Metoprolol tartrate, p. 109 • Prazosin, p. 103 • Sodium nitroprusside, p. 120 • Valsartan, p. 118

**Carvedilol**

**INDICATIONS AND DOSE**

**Adjunct in heart failure (limited information available)**
- **BY MOUTH**
  - Child 2-17 years: Initially 50 micrograms/kg twice daily (max. per dose 3.125 mg) for at least 2 weeks, then increased to 100 micrograms/kg twice daily for at least 2 weeks, then increased to 200 micrograms/kg twice daily, then increased if necessary up to 350 micrograms/kg twice daily (max. per dose 25 mg)

**UNLICENSED USE**
- Not licensed for use in children under 18 years.

**CONTRA-INDICATIONS**
- Acute or decompensated heart failure requiring intravenous inotropes

**INTERACTIONS**
- Appendix 1: beta blockers, non-selective

**SIDE-EFFECTS**
- Common or very common • Anaemia • asthma • dyspepsia • eye irritation • fluid imbalance • genital oedema • hypercholesterolaemia • hyperglycaemia • hypoglycaemia • increased risk of infection • oedema • postural hypotension • pulmonary oedema • renal impairment • urinary disorders • weight increased
- Uncommon • Alopecia • angina pectoris • constipation • hyperhidrosis • skin reactions
- Rare or very rare • Dry mouth • hypersensitivity • leucopenia • nasal congestion • severe cutaneous adverse reactions (SCARs) • thrombocytopenia

**PREGNANCY**
- Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

**BREAST FEEDING**
- Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

**HEPATIC IMPAIRMENT**
- Manufacturer advises dose adjustment may be required in moderate impairment.
Heart failure

DIRECTIONS FOR ADMINISTRATION
Consult product literature. Intravenous injection to be given over at least 3 minutes.

PRESCRIBING AND DISPENSING INFORMATION
Potassium canrenoate injection is available from 'special-order' manufacturers or specialist importing companies.

Medicines for Children leaflet: Carvedilol for heart failure
www.medicinesforchildren.org.uk/carvedilol-heart-failure-0

Monitoring requirements
Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

Patient and carer advice
Medicines for Children leaflet: Carvedilol for heart failure
www.medicinesforchildren.org.uk/carvedilol-heart-failure-0

Monitoring requirements
Monitor electrolytes (discontinue if hyperkalaemia occurs).

Indications and dose
Oedema in heart failure and in ascites | Nephrotic syndrome | Reduction of hypokalaemia induced by diuretics or amphotericin

By mouth

Neonate: Initially 1–2 mg/kg daily in 1–2 divided doses; increased if necessary up to 7 mg/kg daily, in resistant ascites.

Child 1 month–11 years: Initially 1–3 mg/kg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites

Child 12–17 years: Initially 50–100 mg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites; maximum 400 mg per day

Unlicensed use
Not licensed for reduction of hypokalaemia induced by diuretics or amphotericin.

Contra-indications
Addison’s disease - anuria - hyperkalaemia.

Caution
Acute porphyrias p. 624 - potential metabolic products carcinogenic in rodents.

Interactions
Appendix 1: aldosterone antagonists

Side-effects

Pregnancy
Use only if potential benefit outweighs risk—feminisation of male fetus in animal studies.

Breast feeding
Metabolites present in milk, but amount probably too small to be harmful.

Renal impairment
Avoid in acute renal insufficiency or severe impairment. Monitor Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

Monitoring requirements
Monitor electrolytes—discontinue if hyperkalaemia occurs.

Prescribing and dispensing information
The RCPCH and NPPG recommend that, when a liquid special of spironolactone is required, the following strength is used: 50 mg/5 mL.

Patient and carer advice
Medicines for Children leaflet: Spironolactone for heart failure
www.medicinesforchildren.org.uk/spironolactone-heart-failure

Unlicensed use
Not licensed for use in the UK.

Contra-indications
Hyperkalaemia - hypotension - potential metabolic products carcinogenic in rodents.

Interactions
Appendix 1: potassium canrenoate

Side-effects
Common or very common - Ataxia - drowsiness - headache - hyperuricaemia - menstruation irregular.

Uncommon - Electrolyte imbalance - eosinophilia - thrombocytopenia.

Rare or very rare - Agranulocytosis - alopecia - hepatoxicity - hypersensitivity - osteomalacia - skin reactions - voice alteration.

Frequency not known - Acidosis hyperchloraemic - breast pain - confusion (transient; with high doses) - gastrointestinal disorder - gynaecomastia - hirsutism - hypotension.

Pregnancy
Crosses placenta. Feminisation and undescended testes in male fetus in animal studies—manufacturer advises avoid.

Breast feeding
Present in breast milk—manufacturer advises avoid.

Renal impairment
Use with caution if estimated glomerular filtration rate 30–60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Monitoring
Monitor plasma-potassium concentration if estimated glomerular filtration rate 30–60 mL/minute/1.73 m².
PHOSPHODIESTERASE TYPE-3 INHIBITORS

Enoximone

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasoactivity.

**INDICATIONS AND DOSE**

**Congestive heart failure, low cardiac output following cardiac surgery**

**INITIALLY BY SLOW INTRAVENOUS INJECTION**

- **Neonate:** Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion to be given over 24 hours; maximum 24 mg/kg per day.

- **Child:** Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/minute, adjusted according to response, infusion dose to be given over 24 hours; maximum 24 mg/kg per day.

**SIDE-EFFECTS**

- **Common or very common** Headache · hypotension · insomnia
- **Uncommon** Arrhythmias · diarrhoea · dizziness · nausea · vomiting
- **Rare or very rare** Chills · fever · fluid retention · myalgia · oliguria · urinary retention

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**PRESCRIBING AND DISPENSING INFORMATION** Phosphodiesterase type-3 inhibitors possess positive inotropic and vasoactivity and are useful in infants and children with low cardiac output especially after cardiac surgery. Phosphodiesterase type-3 inhibitors should be limited to short-term use because long-term oral administration has been associated with increased mortality in adults with congestive heart failure.

**PATIENT AND CARER ADVICE** Medicines for Children leaflet: Enoximone for pulmonary hypertension [www.medicinesforchildren.org.uk/enoximone-pulmonary-hypertension](http://www.medicinesforchildren.org.uk/enoximone-pulmonary-hypertension)

**MILRINONE**

**DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasoactivity.

**INDICATIONS AND DOSE**

**Congestive heart failure, low cardiac output following cardiac surgery, shock**

**INITIALLY BY INTRAVENOUS INFUSION**

- **Neonate:** Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).

- **Child:** Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion) 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).

**SIDE-EFFECTS**

- **Common or very common** Arrhythmia supraventricular (increased risk in patients with pre-existing arrhythmias) · arrhythmias · headache · hypotension
- **Uncommon** Angina pectoris · chest pain · hypokalaemia · thrombocytopenia · tremor
- **Rare or very rare** Anaphylactic shock · bronchospasm · skin eruption
- **Frequency not known** Intraventricular haemorrhage · renal failure

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**UNLICENSED USE** Not licensed for use in children under 18 years.

**RENAI IMPAIRMENT**

- Dose adjustments Use half to three-quarters normal dose and monitor response if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.
- Monitor renal function.
Dyslipidaemias

Cardiovascular disease risk factors
Atherosclerosis begins in childhood and raised serum cholesterol in children is associated with cardiovascular disease in adulthood. Lowering the cholesterol, without hindering growth and development in children and adolescents, should reduce the risk of cardiovascular disease in later life.

The risk factors for developing cardiovascular disease include raised serum cholesterol concentration, smoking, hypertension, impaired glucose tolerance, male sex, ethnicity, obesity, triglyceride concentration, chronic kidney disease, and a family history of cardiovascular disease.

Heterozygous familial hypercholesterolaemia is the most common cause of raised serum cholesterol in children; homozygous familial hypercholesterolaemia is very rare and its specialised management is not covered in BNF for Children. Familial hypercholesterolaemia can lead to a greater risk of early coronary heart disease and should be managed by a specialist.

Secondary causes of hypercholesterolaemia should be addressed, these include obesity, diet, diabetes mellitus, hypothyroidism, nephrotic syndrome, obstructive biliary disease, glycogen storage disease, and drugs such as corticosteroids.

Management
The aim of management of hypercholesterolaemia is to reduce the risk of atherosclerosis while ensuring adequate growth and development. Children with hypercholesterolaemia (or their carers) should receive advice on appropriate lifestyle changes such as improved diet, increased exercise, weight reduction, and smoking cessation.

Hypothyroidism
Children with hypothyroidism should receive adequate thyroid replacement therapy before their requirement for lipid-regulating treatment is assessed because correction of hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

Heterozygous familial hypercholesterolaemia
In heterozygous familial hypercholesterolaemia, drug treatment is often required as lifestyle modifications alone are unlikely to sufficiently lower cholesterol concentration.

Treatment with lipid-regulating drugs should be considered by the age of 10 years, although the decision to initiate or defer treatment will depend on the child’s age, the age of onset of coronary heart disease within the family, and the presence of other cardiovascular risk factors. Lipid-regulating drug treatment before the age of 10 years, or a higher dose of statin than licensed for use in the appropriate age group, or a combination of lipid-regulating drugs should be considered in children with a family history of coronary heart disease in early adulthood.

Statins are the lipid-regulating drug of choice and treatment should be lifelong. In children who are intolerant to statins, ezetimibe p. 132, fibrates, or bile acid sequestrants should be considered as alternative options. Vitamins A, D and K, and folic acid supplementation can be given to patients on long-term bile acid sequestrants.

Secondary hypercholesterolaemia
Drug treatment may be indicated in children 10 years and older (rarely necessary in younger children) who are at a high risk of developing cardiovascular disease if 6–12 months of dietary and other lifestyle interventions have failed to lower cholesterol concentration adequately.

Lipid-regulating drugs
Experience in the use of lipid-regulating drugs in children is limited and they should be initiated on specialist advice. Statins are more effective than other classes of drugs in lowering LDL-cholesterol but less effective than the fibrates in reducing triglycerides. Statins also increase concentrations of HDL-cholesterol. Statins reduce cardiovascular disease events and total mortality in adults, irrespective of the initial cholesterol concentration. They are the drugs of first choice in children and are generally well tolerated; atorvastatin p. 134 and simvastatin p. 136 are the preferred statins. Other lipid-regulating drugs can be used if statins are ineffective or are not tolerated.

Ezetimibe can be used alone when statins are not tolerated, or in combination with a statin when a high dose statin fails to control cholesterol concentration adequately. Bile acid sequestrants p. 131 are also available but tolerability of and compliance with these drugs is poor, and their use is declining.

Fibrates may reduce the risk of coronary heart disease in those with low HDL-cholesterol or with raised triglycerides. Evidence for the use of a fibrate (bezafibrate p. 132 or fenofibrate p. 133) in children is limited; fibrates should be considered only if dietary intervention and treatment with a statin and a bile acid sequestran is unsuccessful or contra-indicated.

Evolocumab p. 137 is licensed for the treatment of homozygous familial hypercholesterolaemia; it is used in combination with other lipid-lowering therapies.

In hypertriglyceridaemia which cannot be controlled by very strict diet, omega-3 fatty acid compounds can be considered.

Advanced Pharmacy Services
Children with dyslipidaemia may be eligible for the Medicines Use Review service provided by a community
Colestyramine
(Cholestyramine)

- **INDICATIONS AND DOSE**
  - Familial hypercholesterolaemia
    - **BY MOUTH**
    - Child 6–11 years: Initially 4 g once daily, then increased to 4 g up to 3 times a day, adjusted according to response.
    - Child 12–17 years: Initially 4 g once daily, then increased in steps of 4 g every week; increased to 12–24 g daily in 1–4 divided doses, adjusted according to response; maximum 36 g per day

Pruritus associated with partial biliary obstruction and primary biliary cirrhosis
- **BY MOUTH**
  - Child 1–11 months: 1 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 9 g per day.
  - Child 1–5 years: 2 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 18 g per day.
  - Child 6–11 years: 4 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 24 g per day.
  - Child 12–17 years: 4–8 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 36 g per day.

Diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation
- **BY MOUTH**
  - Child 1–11 months: 1 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 9 g per day.
  - Child 1–5 years: 2 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 18 g per day.
  - Child 6–11 years: 4 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses, if no response within 3 days an alternative therapy should be initiated; maximum 24 g per day.
  - Child 12–17 years: 4–8 g once daily, adjusted according to response, total daily dose may alternatively be given in 2–4 divided doses; maximum 36 g per day.

**SIDE-EFFECTS**
- **Common or very common** Constipation, gastrointestinal discomfort, headache, nausea, vomiting
- **Uncommon** Appetite decreased, diarrhoea, gastrointestinal disorders
- **Pregnancy** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.
- **Breast Feeding** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**MONITORING REQUIREMENTS** A child’s growth and development should be monitored.

### Colespirol hydrochloride

**INDICATIONS AND DOSE**
- Familial hypercholesterolaemia
  - **BY MOUTH**
  - Child 12–17 years: Initially 5 g 1–2 times a day, then increased in steps of 5 g every month, total daily dose may be given in 1–2 divided doses or as a single dose if tolerated; maximum 30 g per day

**UNLICENSED USE** Not licensed for use in children.

**INTERACTIONS** → Appendix 1: colespiroil

**SIDE-EFFECTS**
- Angina pectoris, arthralgia, arthritis, asthenia, burping, chest pain, dizziness, dyspnoea, gallbladder disorders, headaches, inflammation, insomnia, pain, peptic ulcer haemorrhage, tachycardia

**DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colespirol hydrochloride granules (avoid other drugs at same time).

**MEDIcINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Granules**
- **CAUTIONARY AND ADVISORY LABELS** 13
  - **Colespital (Pfizer Ltd)**
  - Colespirol hydrochloride 5 gram
    - Colespirol 5g granules sachets plain sugar-free | 30 sachet (PO) £15.05 DT + £15.05
  - Colespital Orange 5g granules sachets sugar-free | 30 sachet (PO) £15.05 DT + £15.05

**Tablet**
- **Colespital (Imported (Canada))**
  - Colespirol hydrochloride 1 gram
    - Colespirol 1g tablets | 120 tablet (PO)

pharmacist. For further information, see **Advanced Pharmacy Services** in Guidance on prescribing p. 1.

**LIPID MODIFYING DRUGS** ➔ **BILE ACID SEQUESTRANTS**

**Bile acid sequestrants**
- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic increased LDL-cholesterol into bile acids; the resultant conversion of LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.
- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).
- **SIDE-EFFECTS**
  - **Common or very common** Constipation, gastrointestinal discomfort, headache, nausea, vomiting
  - **Uncommon** Appetite decreased, diarrhoea, gastrointestinal disorders

**PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

**MONITORING REQUIREMENTS** A child’s growth and development should be monitored.

**Colespital hydrochloride**

**INDICATIONS AND DOSE**
- Familial hypercholesterolaemia
  - **BY MOUTH**
  - Child 12–17 years: Initially 5 g 1–2 times a day, then increased in steps of 5 g every month, total daily dose may be given in 1–2 divided doses or as a single dose if tolerated; maximum 30 g per day

**UNLICENSED USE** Not licensed for use in children.

**INTERACTIONS** → Appendix 1: colespital

**SIDE-EFFECTS**
- Angina pectoris, arthralgia, arthritis, asthenia, burping, chest pain, dizziness, dyspnoea, gallbladder disorders, headaches, inflammation, insomnia, pain, peptic ulcer haemorrhage, tachycardia

**DIRECTIONS FOR ADMINISTRATION** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits ensuring at least 100 mL of liquid is provided.

**PATIENT AND CARER ADVICE** Patient counselling on administration is advised for colespital hydrochloride granules (avoid other drugs at same time).

**MEDIcINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Granules**
- **CAUTIONARY AND ADVISORY LABELS** 13
  - Colespital (Pfizer Ltd)
    - Colespital hydrochloride 5 gram
      - Colespital 5g granules sachets plain sugar-free | 30 sachet (PO) £15.05 DT + £15.05
    - Colespital Orange 5g granules sachets sugar-free | 30 sachet (PO) £15.05 DT + £15.05

**Tablet**
- Colespital (Imported (Canada))
  - Colespital hydrochloride 1 gram
    - Colespital 1g tablets | 120 tablet (PO)
**132 Hyperlipidaemia**

**LIPID MODIFYING DRUGS > CHOLESTEROL ABSORPTION INHIBITORS**

**Ezetimibe**

**DRUG ACTION** Ezetimibe inhibits the intestinal absorption of cholesterol.

**INDICATIONS AND DOSE**
- Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia
- Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia
- Primary hypercholesterolaemia (if statin inappropriate or not tolerated)

**INTERACTIONS** → Appendix 1: ezetimibe

**SIDE-EFFECTS**
- Common or very common: Asthenia, diarrhoea, gastrointestinal discomfort, gastrointestinal disorders
- Uncommon: Appetite decreased, arthralgia, chest pain, cough, hot flush, hypertension, muscle complaints, nausea, pain
- Frequency not known: Constipation, depression, dizziness, dysphoria, hepatitis, myopathy, pancreatitis, paraesthesia, skin reactions, thrombocytopenia
- PREGNANCY: Manufacturer advises avoid—no information available.
- BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT: Manufacturer advises avoid in moderate to severe impairment.

**MEDICINAL FORMS**
- Tablet
  - Ezetimibe (Non-proprietary)
    - Ezetimibe 10 mg: Ezetimibe 10mg tablets | 28 tablet [Pos] £2.08-£26.31 DT + £2.17
  - Ezetrol (Merrick Sharp & Dohme Ltd)
    - Ezetimibe 10 mg: Ezetrol 10mg tablets | 28 tablet [Pos] £26.31 DT + £2.17
- Combinations available: Simvastatin with ezetimibe, p. 136

**MONITORING REQUIREMENTS**
- Consider monitoring of liver function and creatinine kinase when fibrates used in combination with a statin.

**PRESCRIBING AND DISPENSING INFORMATION**
- Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MIXED NUTRITION MODIFICATIONS**
- There may be an increase in the likelihood of nutritional deficiency with ezetimibe, particularly if there is also a statin in use. Monitor blood levels of vitamin D and vitamin B12.

**RECOMMENDATIONS FOR THE PATIENT IN THE HOME**
- Exercise regularly
- Avoid obesity
- Avoid high-fat diet

**MEDICAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- Cautionary and Advisory Labels 21
  - Bezafibrate (Non-proprietary)
    - Bezafibrate 200 mg: Bezafibrate 200mg tablets | 100 tablet [Pos] £8.50 DT + £5.22
    - Bezalip (Teva UK Ltd)
      - Bezafibrate 200 mg: Bezalip 200mg tablets | 100 tablet [Pos] £8.63 DT + £5.22

**FIBRATES**

**Bezafibrate**

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**
- Hyperlipidaemia including familial hypercholesterolaemia (administered on expert advice)
  - By mouth using immediate-release medicines
    - Child 10-17 years: 200 mg once daily (max. per dose 200 mg 3 times a day), adjusted according to response

**UNLICENSED USE**
- Not licensed for use in children.

**CONTRA-INDICATIONS**
- Gall bladder disease
- Hypoalbuminaemia
- Nephrotic syndrome
- Photosensitivity to fibrates

**CAUTIONS**
- Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1: fibrates

**SIDE-EFFECTS**
- Common or very common: Appetite decreased, gastrointestinal disorder
- Uncommon: Acute kidney injury, alopecia, cholestasis, constipation, diarrhoea, dizziness, erectile dysfunction, gastrointestinal discomfort, headache, muscle complaints, muscle weakness, nausea, photosensitivity reaction, skin reactions
- Rare or very rare: Cholelithiasis, depression, insomnia, interstitial lung disease, pancreatitis, pancytopenia, paraesthesia, peripheral neuropathy, rhabdomyolysis (increased risk in renal impairment), severe cutaneous adverse reactions (SCARs), thrombocytopenic purpura

**PREGNANCY**
- Manufacturers advise avoid—no information available.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises avoid in significant impairment (except in fatty liver disease).

**RENAL IMPAIRMENT**
- Avoid immediate-release preparations if eGFR less than 15 mL/minute/1.73 m². Avoid modified-release preparations if eGFR less than 60 mL/minute/1.73 m².
  - Myotoxicity: Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.
  - Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

**Dose adjustments**
- Reduce dose if estimated glomerular filtration rate 15–60 mL/minute/1.73 m².

**REFERENCES**
- The information here is based on the British National Formulary (BNF) and the British National Formulary for Children (BNFC). Consult the latest edition for the most current information.
Fenofibrate

01-Aug-2018

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

Hyperlipidaemias including familial hypercholesterolaemia (administered on expert advice)

- **BY MOUTH USING CAPSULES**
  - Child 4-14 years: One 67 mg (micronised) capsule per 20 kg body-weight daily, maximum four 67 mg capsules daily, or max. three 67 mg capsules daily with concomitant statin
  - Child 15-17 years: Initially 3 capsules daily, then increased if necessary to 4 capsules daily, max. 3 capsules daily with concomitant statin, dose relates to 67 mg (micronised) capsules

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. dose 200 mg daily with concurrent use of a statin—no specific recommendation made for children.

**UNLICENSED USE** 200 mg and 267 mg capsules not licensed in children. Tablets not licensed in children.

**CONTRA-INDICATIONS** Gall bladder disease - pancreatitis (unless due to severe hypertriglyceridaemia) - photosensitivity to ketoprofen

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** → Appendix 1: fibrates

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - diarrhoea - flatulence - nausea - vomiting
- **Uncommon** Cholelithiasis - embolism and thrombosis - headache - muscle complaints - muscle weakness - myopathy - pancreatitis - sexual dysfunction - skin reactions
- **Rare or very rare** Alopecia - hepatic disorders - photosensitivity reaction
- **Frequency not known** Fatigue - interstitial lung disease - rhabdomyolysis (increased risk in renal impairment) - severe cutaneous adverse reactions (SCARs)

**PREGNANCY** Avoid—embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

**Renal Impairment** Manufacturer advises use with caution in mild-to-moderate impairment; avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **Myotoxicity** Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

**Dose adjustments** Manufacturer advises max. 67 mg daily if estimated glomerular filtration rate 30–59 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Manufacturer advises monitor hepatic transaminases every 3 months during the first 12 months of treatment and periodically thereafter—discontinue treatment if levels increase to more than 3 times the upper limit of normal; monitor serum creatinine levels during the first 3 months of treatment and periodically thereafter—interrupt treatment if creatinine level is 50% above the upper limit of normal.

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 21**

- Fenofibrate (Non-proprietary)
- Fenofibrate micronised 67 mg
- Fenofibrate micronised 267 mg capsules | 90 capsule (£33.60 + £33.11)
- Fenofibrate micronised 200 mg capsules | 28 capsule (£61.98 DT + £3.00)
- Fenofibrate micronised 267 mg capsules | 28 capsule (£21.75 DT + £3.58)
- Lipantil Micro (Mylan)
  - Fenofibrate micronised 67 mg Lipantil Micro 67 capsules | 90 capsule (£33.60 + £33.11)
  - Fenofibrate micronised 200 mg Lipantil Micro 200 capsules | 28 capsule (£61.98 DT + £3.00)
  - Fenofibrate micronised 267 mg Lipantil Micro 267 capsules | 28 capsule (£21.75 DT + £3.58)

**LIPID MODIFYING DRUGS > STATINS**

**Statins**

**DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.

**CAUTIONS** High alcohol intake · history of liver disease · hypothyroidism · patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

**CAUTIONS, FURTHER INFORMATION**

- Muscle effects Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

  - In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

- Hypothyroidism Hypothyroidism should be managed adequately before starting treatment with a statin.

**SIDE-EFFECTS**

- **Common or very common** Asthenia · constipation · diarrhoea · dizziness · flatulence · gastrointestinal discomfort · headache · myalgia · nausea · sleep disorders · thrombocytopenia
- **Uncommon** Alopecia · hepatic disorders · memory loss · pancreatitis · paraesthesia · sexual dysfunction · skin reactions · vomiting
- **Rare or very rare** Myopathy · peripheral neuropathy · tendinopathy

**Frequency not known** Depresssion · diabetes mellitus (in those at risk) · interstitial lung disease

**SIDE-EFFECTS, FURTHER INFORMATION** Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity
Hyperlipidaemia

truly attributable to statin use is rare. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely.

Interstitial lung disease  If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

CONCEPTION AND CONTRACEPTION  Adequate contraception is required during treatment and for 1 month afterwards.

PREGNANCY  Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

HEPATIC IMPAIRMENT  In general, manufacturers advise caution (risk of increased exposure); avoid in active disease or unexplained persistent elevations in serum transaminases.

MONITORING REQUIREMENTS

Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.

Liver function  There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease). Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.

Creatine kinase  Creatine kinase concentration should be measured in children before treatment and if unexplained muscle pain occurs.

PATIENT AND CARER ADVICE  Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

INDICATIONS AND DOSE

Hyperlipidaemia including familial hypercholesterolaemia

BY MOUTH  Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be adjusted at intervals of at least 4 weeks

Homozygous familial hypercholesterolaemia

BY MOUTH  Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 80 mg once daily, dose to be adjusted at intervals of at least 4 weeks

DOSE ADJUSTMENTS DUE TO INTERACTIONS  Manufacturer advises if concurrent use of ciclosporin is unavoidable, max. dose cannot exceed 10 mg daily.
**INDICATIONS AND DOSE**

Heterozygous familial hypercholesterolaemia (specialist use only)

- **BY MOUTH**
  - Child 6–9 years: Initially 5 mg once daily, then increased if necessary up to 10 mg once daily, dose to be increased gradually at intervals of at least 4 weeks.
  - Child 10–17 years: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity).

Homozygous familial hypercholesterolaemia (specialist use only)

- **BY MOUTH**
  - Child 6–17 years: Initially 5–10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased gradually at intervals of at least 4 weeks, use lower max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity).

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. 5 mg daily with concurrent use of gliclazide or pioglitazone.

**CAUTIONS**

- Known genetic polymorphisms—consult product literature.

**INTERACTIONS → Appendix 1: statins**

**SIDE-EFFECTS**

- Rare or very rare Articular disease, proteinuria.
- Very rare Nephrotic syndrome, gout, myasthenia, myopathy, rhabdomyolysis, proteinuria, rhabdomyolysis.
- Rare Angioedema, glomerulonephritis, proteinuria, vasculitis.

**Breastfeeding**

Manufacturer advises avoiding—small amount of drug present in breast milk.

**Other**

- Pregnancy: Manufacturer advises avoiding.
- Use in patients with renin–angiotensin system dysfunction.
- Use in patients with severe renal impairment.
- Use in patients with severe hepatic impairment.
- Use in patients with concomitant use of cyclosporin (risk of nephrotoxicity).

**INTERACTIONS → Appendix 1: statins**

**SIDE-EFFECTS**

- Uncommon Hair abnormality, scalp abnormality, urinary disorders, vision disorders.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

- Cadaf XL (Torrent Pharma (UK) Ltd)
  - Fluvastatin (as Fluvastatin sodium) 80 mg | 28 tablet £19.20
- Dorisin XL (Aspire Pharma Ltd)
  - Fluvastatin (as Fluvastatin sodium) 80 mg | 28 tablet £19.20
- Lescol XL (Novartis Pharmaceuticals UK Ltd)
  - Fluvastatin (as Fluvastatin sodium) 80 mg | 28 tablet £19.20
- Nandovar XL (Sandoz Ltd)
  - Fluvastatin (as Fluvastatin sodium) 80 mg | 28 tablet £16.32

**Capsule**

- Fluvastatin (Non-proprietary)
  - Fluvastatin (as Fluvastatin sodium) 20 mg | 28 capsule £6.96
  - Fluvastatin (as Fluvastatin sodium) 40 mg | 28 capsule £7.42

**Hepatic Impairment**

- Manufacturer advises initial dose reduction to 10 mg daily; adjust according to response.

**Renal Impairment**

- Start with lower doses in moderate to severe impairment.

**Patient and carer advice**

- Patient counselling is advised for pravastatin tablets (muscle effects).

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

- Pravastatin sodium (Non-proprietary)
  - Pravastatin sodium 10 mg | 28 tablet £2.08
  - Pravastatin sodium 20 mg | 28 tablet £3.05

- Pravastatin sodium 40 mg | 28 tablet £3.82

**Interactions → Appendix 1: statins**

**SIDE-EFFECTS**

- Rare or very rare Angioedema, nephrotic syndrome, muscle weakness, sensation abnormal, vasculitis.

**Breastfeeding**

Manufacturer advises avoiding—small amount of drug present in breast milk.

**Other**

- Pregnancy: Manufacturer advises avoiding—no information available.
- Use in patients with renin–angiotensin system dysfunction.
- Use in patients with severe renal impairment.
- Use in patients with severe hepatic impairment.
- Use in patients with concomitant use of cyclosporin (risk of nephrotoxicity).

**Interactions → Appendix 1: statins**

**SIDE-EFFECTS**

- Uncommon Hair abnormality, scalp abnormality, urinary disorders, vision disorders.
Simvastatin

**INDICATIONS AND DOSE**

Hyperlipidaemia including familial hypercholesterolaemia

- **BY MOUTH**
  - Child 5–9 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks
  - Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 40 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises max. dose 10 mg daily with concurrent use of bezafibrate—no specific recommendation made for children.
- Manufacturer advises max. dose 20 mg daily with concurrent use of amiodarone or amiodipine—no specific recommendation made for children.
- Manufacturer advises reduce dose with concurrent use of some moderate inhibitors of CYP3A4 (max. 20 mg daily with verapamil and diltiazem)—no specific recommendation made for children.

**UNLICENSED USE**

Not licensed for use in children under 10 years.

**INTERACTIONS**

→ Appendix 1: statins

**SIDE-EFFECTS**

- Rare or very rare: Acute kidney injury, anaemia, muscle cramps
- Frequency not known: Cognitive impairment
- **BREAST FEEDING**: Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT**: Doses above 10 mg daily should be used with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**: Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

**EXCipients**: May contain Propylene glycol

- **Simvastatin (Non-proprietary)**
  - Simvastatin 4 mg per 1 ml Simvastatin 20 mg/5 ml oral suspension sugar free sugar free-
    - 150 ml (BNFC) £161.76 DT = £144.32
  - Simvastatin 8 mg per 1 ml Simvastatin 40 mg/5 ml oral suspension sugar free sugar free-
    - 150 ml (BNFC) £152.00–£247.10 DT = £220.45

**Tablet**

- **Simvastatin (Non-proprietary)**
  - Simvastatin 10 mg Simvastatin 10 mg tablets | 28 tablet (BNFC) £14.42 DT = £0.64
  - Simvastatin 20 mg Simvastatin 20 mg tablets | 28 tablet (BNFC) £23.75 DT = £0.75
  - Simvastatin 40 mg Simvastatin 40 mg tablets | 28 tablet (BNFC) £23.75 DT = £0.87
  - Simvastatin 80 mg Simvastatin 80 mg tablets | 28 tablet (BNFC) £6.00 DT = £1.49
  - Simvastatin (with ezetimibe) Simvastatin 10 mg Simvostat 10 mg tablets | 28 tablet (BNFC) £0.52 DT = £0.64
  - Simvastatin 20 mg Simvostat 20 mg tablets | 28 tablet (BNFC) £0.67 DT = £0.75
  - Simvastatin 40 mg Simvostat 40 mg tablets | 28 tablet (BNFC) £0.65 DT = £0.87
  - Simvastatin 80 mg Simvostat 80 mg tablets | 28 tablet (BNFC) £1.31 DT = £1.49
  - **Zocor** (Merck Sharp & Dohme Ltd)
    - Zocor 10 mg Zocor 10 mg tablets | 28 tablet (BNFC) £18.03 DT
    - 10 mg Zocor 20 mg tablets | 28 tablet (BNFC) £29.69 DT
    - 20 mg Zocor 40 mg tablets | 28 tablet (BNFC) £29.69 DT
    - 80 mg Zocor 80 mg tablets | 28 tablet (BNFC) £29.69 DT

**Simvastatin with ezetimibe**

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin above, ezetimibe p. 132.

**INDICATIONS AND DOSE**

Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone

- **BY MOUTH**
  - Child (initiated by a specialist): consult product literature

**INTERACTIONS**

→ Appendix 1: ezetimibe • statins

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Ezetimibe** (Discovery Pharmaceuticals)
  - Ezetimibe 10 mg, Simvastatin 28 mg Ezetimibe 10 mg, Simvastatin 40 mg | 28 tablet (BNFC) £0.87 DT = £0.98
  - Ezetimibe 10 mg, Simvastatin 80 mg Ezetimibe 10 mg, Simvastatin 100 mg | 28 tablet (BNFC) £75.00 DT = £87.00
  - Ezetimibe 10 mg, Simvastatin 20 mg Ezetimibe 10 mg, Simvastatin 40 mg | 28 tablet (BNFC) £64.00 DT = £75.00
  - Ezetimibe 10 mg, Simvastatin 30 mg Ezetimibe 10 mg, Simvastatin 60 mg | 28 tablet (BNFC) £49.00 DT = £64.00
  - Ezetimibe 10 mg, Simvastatin 40 mg Ezetimibe 10 mg, Simvastatin 80 mg | 28 tablet (BNFC) £33.00 DT = £42.00

- **Inegy** (Merck Sharp & Dohme Ltd)
  - Inegy 10 mg, Simvastatin 10 mg tablets | 28 tablet (BNFC) £0.64 DT = £0.87
  - Inegy 10 mg, Simvastatin 20 mg tablets | 28 tablet (BNFC) £0.64 DT = £0.87
  - Inegy 10 mg, Simvastatin 30 mg tablets | 28 tablet (BNFC) £0.64 DT = £0.87

Nitrates

**CONTRA-INDICATIONS** Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

**CAUTIONS** Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

**CAUTIONS, FURTHER INFORMATION**

- **Tolerance** Children receiving nitrates continuously throughout the day can develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients.

- **SIDE-EFFECTS**
  - **Common or very common** Arthralgia · back pain · increased risk of infection · nausea · skin reactions
  - **Rare or very rare** Angioedema
  - **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (risk of reduced efficacy; no information available in severe impairment).
  - **RENAL IMPAIRMENT** Manufacturer advises caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—no information available.
  - **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for further information regarding storage outside refrigerator.
  - **PATIENT AND CARER ADVICE** Patients and their carers should be given training in subcutaneous injection technique.

**INTERACTIONS**

- **Uncommon** Cardiac disorder · cyanosis
- **Rare or very rare** Methaemoglobinaemia · respiratory disorder · restlessness
- **Frequency not known** Hyperhidrosis
- **PREGNANCY** Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For *continuous intravenous infusion*, dilute to max. concentration of 400 micrograms/mL (but continue infusion at the rate of 0.1–0.3 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute)).

---

**Glyceryl trinitrate**

**INDICATIONS AND DOSE** Hypertension during and after cardiac surgery · Heart failure after cardiac surgery · Coronary vasoconstriction in myocardial ischaemia · Vasodilatation in shock

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - **Neonate:** 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute).
  - **Child:** Initially 0.2–0.5 microgram/kg/minute, adjusted according to response, maintenance 1–3 micrograms/kg/minute (max. per dose 10 micrograms/kg/minute); maximum 200 micrograms/minute

---

**7 Myocardial ischaemia**

**NITRATES**

**Nitrates**

**Overview**

Nitrates are potent coronary vasodilators, but their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially if the child is unusually sensitive to the effects of nitrates or is hypovolaemic. Glyceryl trinitrate below is also used in extravasation.
concentration of 1 mg/ml has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; maximum concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glycerol trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glycerol trinitrate 5 mg/ml to be diluted before use.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  Solution for infusion

  - Excipients: May contain Ethanol, propylene glycol

  - **Glycerol trinitrate (Non-proprietary)**
    - Glycerol trinitrate 1 mg per 1 ml Glycerol trinitrate 50mg/50ml solution for infusion vials | 1 vial £13.90
    - Glycerol trinitrate 5 mg per 1 ml Glycerol trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule £64.90 (Hospital only)
    - Glycerol trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule £32.45 (Hospital only)
  - **Nitrocine (Aspire Pharma Ltd)**
    - Glycerol trinitrate 1 mg per 1 ml Nitrocin 10mg/10ml solution for infusion ampoules | 10 ampoule £58.75 (Hospital only)
  - **Nitronal (Intrapharm Laboratories Ltd)**
    - Glycerol trinitrate 1 mg per 1 ml Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule £18.04
    - Nitronal 50mg/50ml solution for infusion vials | 1 vial £14.76

---

### 7.1 Cardiac arrest

#### Cardiopulmonary resuscitation

**Overview**

The algorithms for cardiopulmonary resuscitation (Life support algorithm) (image) p. 1180 reflect the recommendations of the Resuscitation Council (UK); they cover paediatric basic life support, paediatric advanced life support, and newborn life support. The guidelines are available at [www.resus.org.uk](http://www.resus.org.uk).

**Paediatric advanced life support**

Cardiopulmonary (cardiac) arrest in children is rare and frequently represents the terminal event of progressive shock or respiratory failure. During cardiopulmonary arrest in children without intravenous access, the intraosseous route is used ten times the intravenous route. If circulatory access is not possible, the intraosseous route is chosen because it is the endotracheal route is used ten times the intravenous route. If circulatory access is not possible, the intraosseous route is chosen because it is the preferred route. If the endotracheal route is used ten times the intravenous route.

The effects of nebulised adrenaline for the treatment of acute anaphylaxis (for self-administration) | Angioedema (if laryngeal oedema is present) (under expert supervision) | The effects of nebulised adrenaline for the treatment of acute anaphylaxis (under expert supervision)

- **Acute hypotension**
  - By continuous intravenous infusion
    - Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
    - Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.

- **Croup (when not effectively controlled with corticosteroid treatment)**
  - By inhalation of nebulised solution
    - Child 1 month–11 years: 400 micrograms/kg (max. per dose 5 mg), dose to be repeated after 30 minutes if necessary

**PHARMACOKINETICS**

- **Emergency treatment of acute anaphylaxis (under expert supervision)**: Angioedema (if laryngeal oedema is present) (under expert supervision)
  - By intramuscular injection
    - Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferentially into the anterolateral aspect of the middle third of the thigh
    - Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, into the anterolateral aspect of the middle third of the thigh
    - Child 12–17 years: 500 micrograms, to be injected preferentially into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal

**Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only)**: Angioedema (if laryngeal oedema is present) (specialist use only)

- **By slow intravenous injection**
  - Child: 1 microgram/kg (max. per dose 50 micrograms), using dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained.

**EMERADE® 150 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- For intramuscular injection
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children
EMERADE® 300 MICROGRAMS
Acute anaphylaxis (for self-administration)
▶ By intramuscular injection
▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
EMERADE® 500 MICROGRAMS
Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)
▶ By intramuscular injection
▶ Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
EPIPEN® AUTO-INJECTOR 0.3MG
Acute anaphylaxis (for self-administration)
▶ By intramuscular injection
▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
EPIPEN® JR AUTO-INJECTOR 0.15MG
Acute anaphylaxis (for self-administration)
▶ By intramuscular injection
▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children
JEXT® 150 MICROGRAMS
Acute anaphylaxis (for self-administration)
▶ By intramuscular injection
▶ Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
▶ Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children
JEXT® 300 MICROGRAMS
Acute anaphylaxis (for self-administration)
▶ By intramuscular injection
▶ Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

▶ Unlicensed use
▶ With intramuscular use for acute anaphylaxis Auto-injectors delivering 150-microgram dose of adrenaline may not be licensed for use in children with body-weight under 15 kg.
▶ With intravenous use for acute hypotension Adrenaline 1 in 1000 (1 mg/mL) solution is not licensed for intravenous administration.

Important Safety Information
Safe Practice
▶ With intravenous use
Intravenous route should be used with extreme care by specialists only.
MHRA/CHM Advice: Adrenaline auto-injectors: updated advice after European review (August 2017)
▶ With intramuscular use
Following a European review of all adrenaline auto-injectors approved in the EU, the MHRA recommend that 2 adrenaline auto-injectors are prescribed, which patients should carry at all times. This is particularly important for patients with allergic asthma, who are at increased risk of a severe anaphylactic reaction. Patients with allergies and their carers should be trained to use the particular auto-injector they have been prescribed and encouraged to practise using a trainer device. Patients are advised to check the expiry date of the adrenaline auto-injectors and obtain replacements before they expire.

CAUTIONS
Arrhythmias • cerebrovascular disease • cor pulmonale • diabetes mellitus • hypercalcaemia • hyperreflexia • hypertension • hyperthyroidism • hypokalaemia • ischaemic heart disease • obstructive cardiomyopathy • occlusive vascular disease • organic brain damage • phaeochromocytoma • prostate disorders • psychoneurosis • severe angina • susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION
Cautions listed are only for non-life-threatening situations.

INTERACTIONS
▶ Appendix 1: sympathomimetics, vasoconstrictor

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
▶ Rare or very rare Cardiomyopathy
▶ Frequency not known Angina pectoris • angle closure glaucoma • anxiety • appetite decreased • arrhythmias • asthma • CNS haemorrhage • confusion • dizziness • dry mouth • dyspnoea • headache • hepatic necrosis • hyperglycaemia • hyperhidrosis • hypersalivation • hypertension (increased risk of cerebral haemorrhage) • hypokalaemia • injection site necrosis • insomina • intestinal necrosis • metabolic acidosis • mydriasis • myocardial infarction • nausea • pallor • palpitations • peripheral coldness • psychosis • pulmonary oedema (on excessive dosage or extreme sensitivity) • renal necrosis • soft tissue necrosis • tremor • urinary disorders • vomiting

SPECIFIC SIDE-EFFECTS
▶ With intramuscular use Muscle necrosis • necrotising fasciitis • peripheral ischaemia
▶ With intravenous use Hemiplegia • muscle rigidity

PREGNANCY
▶ With intramuscular use or intravenous use May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

BREAST FEEDING
▶ With intramuscular use or intravenous use Present in milk but unlikely to be harmful as poor oral bioavailability.

RENAL IMPAIRMENT
Manufacturers advise use with caution in severe impairment.

MONITORING REQUIREMENTS
Monitor blood pressure and ECG.

DIRECTIONS FOR ADMINISTRATION
Acute hypotension
▶ With intravenous use For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.
▶ When used by inhalation For nebulisation in croup, adrenaline 1 in 1000 solution may be diluted with sterile sodium chloride 0.9% solution.

PRESCRIBING AND DISPENSING INFORMATION
▶ With intramuscular use It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection. Packs for self-
administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade®, EpiPen®, or Jext®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

**Patient and carer advice**

- With intramuscular use Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance when and how to inject it.
- With intramuscular use The MHRA has produced an advice sheet on the use of adrenaline auto-injectors, which should be provided to patients and their carers. Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-auto-injector-anaphylaxis

**Jext® 300 micrograms** 1.1 ml of the solution remains in the auto–injector device after use.

**Jext® 150 micrograms** 1.25 ml of the solution remains in the auto–injector device after use.

**EpiPen® JR auto-injector 0.15 mg** 1.7 ml of the solution remains in the auto–injector device after use.

**Emerade® 150 micrograms** 0.35 ml of the solution remains in the auto–injector device after use.

**EpiPen® auto-injector 0.3 mg** 1.7 ml of the solution remains in the auto–injector device after use.

**Emerade® 500 micrograms** No solution remains in the auto–injector device after use.

**Emerade® 300 micrograms** 0.2 ml of the solution remains in the auto–injector device after use.

**Exceptions to legal category**

- With intramuscular use POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/ml) for the emergency treatment of anaphylaxis.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- **Emerade®/adrenaline/epinephrine (non-proprietary)**

**8 Oedema**

**Diuretics**

**Overview**

Diuretics are used for a variety of conditions in children including pulmonary oedema (caused by conditions such as respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and hypertension. Hypertension in children is often resistant to therapy and may require the use of several drugs in combination. Maintenance of fluid and electrolyte balance can be difficult in children on diuretics, particularly neonates whose renal function may be immature.

**Loop diuretics** are used for pulmonary oedema, congestive heart failure, and in renal disease.

Thiazides are used less commonly than loop diuretics but are often used in combination with loop diuretics or spironolactone p. 128 in the management of pulmonary oedema and, in lower doses, for hypertension associated with cardiac disease.

Aminophylline infusion p. 170 has been used with inhaeuous furosemide p. 142 to relieve fluid overload in critically ill children.

**Heart failure**

Heart failure is less common in children than in adults; it can occur as a result of congenital heart disease (e.g. septal defects), dilated cardiomyopathy, myocarditis, or cardiac surgery. Drug treatment of heart failure due to left
ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function has not been established.

**Acute heart failure** can occur after cardiac surgery or as a complication in severe acute infections with or without myocarditis. Therapy consists of volume loading, vasodilator or inotropic drugs.

**Chronic heart failure** is initially treated with a **loop diuretic**, usually furosemide supplemented with spironolactone, amiloride hydrochloride p. 144, or potassium chloride p. 623.

If diuresis with furosemide is insufficient, the addition of metolazone p. 145 or a **thiazide diuretic** can be considered. With metolazone the resulting diuresis can be profound and care is needed to avoid potentially dangerous electrolyte disturbance.

If diuretics are insufficient an ACE inhibitor, titrated to the maximum tolerated dose, can be used. **ACE inhibitors** are used for the treatment of all grades of heart failure in adults and can also be useful for children with heart failure. Addition of digoxin p. 82 can be considered in children who remain symptomatic despite treatment with a diuretic and an ACE inhibitor.

Some beta-blockers improve outcome in adults with heart failure, but data on beta-blockers in children are limited. Carvedilol p. 127 has vasodilatory properties and therefore (like ACE inhibitors) also lowers afterload.

In children receiving specialist cardiology care, the phosphodiesterase type-3 inhibitor enoximone p. 129 is sometimes used by mouth for its inotropic and vasodilator effects. Spironolactone is usually used as a potassium-sparing diuretic with a loop diuretic; in adults low doses of spironolactone are effective in the treatment of heart failure. Careful monitoring of serum potassium is necessary if spironolactone is used in combination with an ACE inhibitor.

**Thiazides and related diuretics**

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of **hypertension** a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 113 is licensed for use in children; chlorothiazide p. 113 is also used. Chlortalidone p. 144, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days in younger children.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure) and is most effective when given 30–60 minutes before furosemide profound diuresis can occur and the child should therefore be monitored carefully.

**Loop diuretics**

Loop diuretics inhibit reabsorption of sodium, potassium, and chloride from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

Furosemide and bumetanide p. 142 are similar in activity; they produce dose-related diuresis. Furosemide is used extensively in children. It can be used for pulmonary oedema (e.g. in respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and in renal disease.

**Potassium-sparing diuretics and aldosterone antagonists**

Spironolactone is the most commonly used potassium sparing diuretic in children; it is an aldosterone antagonist and enhances potassium retention and sodium excretion in the distal tubule. Spironolactone is combined with other diuretics to reduce urinary potassium loss. It is also used in nephrotic syndrome, the long-term management of Barter’s syndrome, and high doses can help to control ascites in babies with chronic neonatal hepatitis. The clinical value of spironolactone in the management of pulmonary oedema in preterm neonates with chronic lung disease is uncertain.

Potassium canrenoate p. 128 given intravenously, is an alternative aldosterone antagonist that may be useful if a potassium-sparing diuretic is required and the child is unable to take oral medication. It is metabolised to canrenone, which is also a metabolite of spironolactone.

Amiloride hydrochloride on its own is a weak diuretic. It causes retention of potassium and is therefore given with thiazide or loop diuretics as an alternative to giving potassium supplements.

A potassium-sparing diuretic such as spironolactone or amiloride hydrochloride may also be used in the management of amphotericin-induced hypokalaemia. Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a child receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

**Potassium-sparing diuretics with other diuretics**

Although it is preferable to prescribe diuretics separately in children, the use of fixed combinations may be justified in older children if compliance is a problem. (Some preparations may not be licensed for use in children—consult product literature).

**Other diuretics**

Mannitol p. 143 is used to treat cerebral oedema, raised intracocular pressure, peripheral oedema, and acites. The carbonic anhydrase inhibitor acetazolamide p. 707 is a weak diuretic although it is little used for its diuretic effect. Eye drops of dorzolamide p. 708 and brinzolamide p. 708 inhibit the formation of aqueous humour and are used in glaucoma. Acetazolamide is used in the treatment of epilepsy, and raised intracranial pressure.

**Diuretics with potassium**

Diuretics and potassium supplements should be prescribed separately.

**Advanced Pharmacy Services**

Children taking diuretics may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

**Other drugs used for Oedema**

**Diamorphine hydrochloride**, p. 284

---

**DIURETICS ▶ LOOP DIURETICS**

**Loop diuretics**

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

- **CONTRA-INDICATIONS** Anuria - renal failure due to nephrotic or hepatoxic drugs - severe hypokalaemia - severe hyponatraemia
CAUTIONS
- Can cause acute urinary retention in children with obstruction of urinary outflow, can exacerbate diabetes (but hyperglycaemia less likely than with thiazides), can exacerbate gout, comatose and precomatose states associated with liver cirrhosis, hypokalaemia should be corrected before initiation of treatment, hypovolaemia should be corrected before initiation of treatment.

CAUTIONS, FURTHER INFORMATION
- Potassium loss: Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.
- Hyperkalaemia: Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy. The use of potassium-sparing diuretics avoids the need to take potassium supplements.
- Urinary retention: Loop diuretics can cause acute urinary retention in children with obstruction of urinary outflow, therefore adequate urinary output should be established before initiating treatment.

SIDE-EFFECTS
- Common or very common: Dizziness, electrolyte imbalance, fatigue, headache, metabolic alkalosis, muscle spasms, nausea
- Uncommon: Diarrhoea
- Rare or very rare: Bone marrow depression, photosensitivity reaction
- Frequency not known: Deafness (more common in renal impairment), leucopenia, paraesthesia, rash, severe cutaneous adverse reactions (SCARs), thrombocytopenia, tinnitus (more common with rapid intravenous administration, and in renal impairment), vomiting

HEPATIC IMPAIRMENT
- Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.

RENAL IMPAIRMENT
- High doses or rapid intravenous administration can cause tinnitus and deafness.
- Dose adjustments: High doses of loop diuretics may occasionally be needed in renal impairment.

MONITORING REQUIREMENTS

Bumetanide

INDICATIONS AND DOSE
- Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema
  - BY MOUTH
    - Child 1 month-11 years: 15-50 micrograms/kg 1-4 times a day (max. per dose 2 mg); maximum 5 mg per day
    - Child 12-17 years: Initially 1 mg, dose to be taken in the morning, then 1 mg after 6-8 hours if required

- Oedema in heart failure, renal disease, and hepatic disease (severe cases) | Pulmonary oedema (severe cases)
  - BY MOUTH
    - Child 12-17 years: Initially 5 mg daily, increased in steps of 5 mg every 12-24 hours, adjusted according to response

UNLICENSED USE
- Not licensed for use in children under 12 years.

INTERACTIONS
- Appendix 1: loop diuretics

SIDE-EFFECTS
- Common or very common: Dehydration, hypotension, skin reactions
- Uncommon: Breast pain, chest discomfort, ear pain, vertigo
- Rare or very rare: Hearing impairment
- Frequency not known: Arthralgia, encephalopathy, gastrointestinal discomfort, gynaecomastia, hyperglycaemia, hyperuricaemia, muscle cramps, musculoskeletal pain (with high doses in renal failure)

PREGNANCY
- Bumetanide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

MEDIcINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Oral solution
    - Bumetanide (Non-proprietary)
      - Bumetanide 200 microgram per 1 ml Bumetanide 1mg/5ml oral solution sugar free-sugar-free | 150 ml (PO) £198.00 DT £198.00
  - Tablet
    - Bumetanide (Non-proprietary)
      - Bumetanide 1 mg Bumetanide 1mg tablets | 28 tablet (PO) £7.35 DT £7.31
      - Bumetanide 5 mg Bumetanide 5mg tablets | 28 tablet (PO) £6.98 DT £6.98

Furosemide (Furosemide)

INDICATIONS AND DOSE
- Oedema in heart failure, renal disease, and hepatic disease | Pulmonary oedema
  - BY MOUTH
    - Neonate: 0.5–2 mg/kg every 12–24 hours, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
    - Child 1 month-11 years: 0.5–2 mg/kg 2–3 times a day, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age of under 31 weeks, higher doses may be required in resistant oedema; maximum 80 mg per day; maximum 12 mg/kg per day
    - Child 12-17 years: 20–40 mg daily; increased to 80–120 mg daily, in resistant oedema
    - BY SLOW INTRAVENOUS INJECTION
    - Neonate: 0.5–1 mg/kg every 12–24 hours, alternatively 0.5–1 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
    - Child 1 month-11 years: 0.5–1 mg/kg every 8 hours (max. per dose 40 mg every 8 hours) as required; maximum 6 mg/kg per day
    - Child 12-17 years: 20–40 mg every 8 hours as required, higher doses may be required in resistant cases
    - BY CONTINUOUS INTRAVENOUS INFUSION
    - Child: 0.1–2 mg/kg/hour

- Oedema in heart failure, renal disease, and hepatic disease following cardiac surgery | Pulmonary oedema following cardiac surgery
  - BY CONTINUOUS INTRAVENOUS INFUSION
    - Child: Initially 100 micrograms/kg/hour, dose to be doubled every 2 hours until urine output exceeds 1 ml/kg/hour
Oliguria

- **BY MOUTH**
  - Child 12-17 years: Initially 250 mg daily, then increased in steps of 250 mg every 4–6 hours (max. per dose 2 g) if required
  - **BY INTRAVENOUS INJECTION**
  - Child 1 month-11 years: 2–5 mg/kg up to 4 times a day; maximum 1 g per day
  - Child 12-17 years: Initially 250 mg, dose to be administered over 1 hour, increased to 500 mg, increased dose is given if satisfactory urinary output not obtained; dose administered over 2 hours, then increased to 1 g, increased dose given if satisfactory response not obtained within subsequent hour; dose to be administered over 4 hours. If no response obtained dialysis probably required.; effective dose of up to 1 g given at a maximum rate of 4 mg/minute can be repeated every 24 hours

- **CAUTIONS**
  Effect may be prolonged in neonates - hepatorenal syndrome - hypoproteinaemia may reduce diuretic effect and increase risk of side-effects

- **INTERACTIONS**

- **SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  Agranulocytosis - aplastic anaemia - auditory disorder (more common with rapid intravenous administration, and in renal impairment) - diabetes mellitus - eosinophilia - fever - gout - haemolytic anaemia - hepatic encephalopathy - malaise - mucosal reaction - nephritis tubulointerstitial - pancreatitis acute - shock - skin eruption - tetany - urolithiasis - vasculitis

- **SPECIFIC SIDE-EFFECTS**
  - With oral use Acute kidney injury - hepatic disorders - metabolic acidosis - psychiatric disorder - urinary disorders
  - With parenteral use Acute urinary retention - cholestasis

- **PREGNANCY**
  Furosemide should not be used to treat gestational hypertension because of the maternal hypovolaemia associated with this condition.

- **BREAST FEEDING**
  Amount too small to be harmful. May inhibit lactation.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous injection, give over 5–10 minutes at a usual rate of 100 micrograms/kg/minute (not exceeding 500 micrograms/kg/minute), max. 4 mg/minute; lower rate of infusion may be necessary in renal impairment. For intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 1–2 mg/mL. Glucose solutions unsuitable (infusion pH must be above 5.5).
  - With oral use For administration by mouth, tablets can be crushed and mixed with water or injection solution diluted and given by mouth. Risk of ototoxicity may be reduced by giving high oral doses in 2 or more divided doses.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With oral use Some liquid preparations contain alcohol, caution especially in neonates.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Furosemide (Non-proprietary)**
  - Furosemide 20 mg: Furosemide 20mg tablets | 28 tablet [POM] £2.62 DT = £1.48 | 250 tablet [POM] £5.08-£13.21
  - Furosemide 40 mg: Furosemide 40mg tablets | 28 tablet [POM] £2.84 DT = £2.09 | 250 tablet [POM] £3.50-£18.66 | 1000 tablet [POM] £28.21-£92.15
  - Furosemide 50 mg: Furosemide 500mg tablets | 28 tablet [POM] £70.00 DT = £39.04

**Solution for injection**

- **Furosemide (Non-proprietary)**
  - Furosemide 10 mg per 1 ml: Furosemide 250mg/25ml solution for injection ampoules | 10 ampoule [POM] £30.00-£40.00
  - Furosemide 50mg/5ml solution for injection ampoules | 10 ampoule [POM] £2.38-£5.00
  - Furosemide 20mg/2ml solution for injection ampoules | 10 ampoule [POM] £40.00 DT = £13.42

**Oral solution**

- **EXCIPENTS:** May contain Alcohol
  - **Furosemide (Non-proprietary)**
    - Furosemide 4 mg per 1 ml: Furosemide 20mg/5ml oral solution sugar free sugar-free | 150 ml [POM] £14.81 DT = £14.81
    - Furosemide 8 mg per 1 ml: Furosemide 40mg/5ml oral solution sugar free sugar-free | 150 ml [POM] £19.53 DT = £19.53
    - Furosemide 10 mg per 1 ml: Furosemide 50mg/5ml oral solution sugar free sugar-free | 150 ml [POM] £20.21 DT = £20.21
  - Frusil (Rosemont Pharmaceuticals Ltd)
    - Furosemide 4 mg per 1 ml: Frusol 20mg/5ml oral solution sugar-free | 150 ml [POM] £12.07 DT = £14.81
    - Furosemide 8 mg per 1 ml: Frusol 40mg/5ml oral solution sugar-free | 150 ml [POM] £15.58 DT = £19.53
    - Furosemide 10 mg per 1 ml: Frusol 50mg/5ml oral solution sugar-free | 150 ml [POM] £16.84 DT = £20.21

[DIURETICS] [OSMOTIC DIURETICS]

**Mannitol**

- **INDICATIONS AND DOSE**

  **Cerebral oedema**
  - **BY INTRAVENOUS INFUSION**
    - Child 1 month-11 years: 0.25–1.5 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
    - Child 12-17 years: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

  **Peripheral oedema and ascites**
  - **BY INTRAVENOUS INFUSION**
    - Child: 1–2 g/kg, to be given over 2–6 hours

- **UNLICENSED USE**
  Not licensed for use in children under 12 years.

- **CONTRA-INDICATIONS**
  Anuria - intracranial bleeding (except during craniotomy) - severe cardiac failure - severe dehydration - severe pulmonary oedema

- **CAUTIONS**
  Extravasation causes inflammation and thrombophlebitis

- **SIDE-EFFECTS**
  - Common or very common
    - Cough - headache - vomiting
  - Uncommon
    - Dizziness - fever - malaise - nausea - pain - skin reactions

- **Frequency not known**

- **PREGNANCY**
  Manufacturer advises avoid unless essential – no information available.

- **BREAST FEEDING**
  Manufacturer advises avoid unless essential – no information available.

- **RENAL IMPAIRMENT**
  Use with caution in severe impairment.
DIURETICS

Amiloride hydrochloride

**Indications and Dose**
Adjunct to thiazide or loop diuretics for oedema in heart failure, and hepatic disease (where potassium conservation desirable)

- **By mouth**
  - Neonate: 100–200 micrograms/kg twice daily.
  - Child 1 month–11 years: 100–200 micrograms/kg twice daily; maximum 20 mg per day.
  - Child 12–17 years: 5–10 mg twice daily.

- **Unlicensed Use** Not licensed for use in children.
- **Contra-Indications** Addison’s disease, anuria, hyperkalaemia
- **Caution** Diabetes mellitus
- **Interactions** Appendix 1: potassium-sparing diuretics
- **Side-Effects** Alopecia, angina pectoris, aplastic anaemia, appetite decreased, arrhythmia, arthralgia, asthenia, atrioventricular block exacerbated, bladder spasm, chest pain, confusion, constipation, cough, depression, diarrhoea, dizziness, drowsiness, dry mouth, dyspnoea, dysuria, electrolyte imbalance, encephalopathy, gastrointestinal discomfort, gastrointestinal disorders, gastrointestinal haemorrhage, gout, headache, insomnia, jaundice, muscle cramps, nasal congestion, nausea, nervousness, neutropenia, pain, palpitations, paraesthesia, postural hypotension, sexual dysfunction, skin reactions, tinnitus, tremor, vertigo, visual impairment, vomiting
- **Pregnancy** Not to be used to treat gestational hypertension.
- **Breast-feeding** Manufacturer advises avoid—no information available.
- **Renal Impairment** Manufacturers advise avoid in severe impairment.
- **Monitoring** Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
- **Monitoring Requirements** Monitor electrolytes.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Oral solution**
  - Excipients: May contain Propylene glycol
  - Amiloride hydrochloride (Non-proprietary)
    - Amiloride hydrochloride 1 mg per 1 ml
    - Amiloride 5 mg/5 ml oral solution sugar-free sugar-free | 150 ml
    - £42.35 DT = £42.33
  - Tablet
    - Amiloride hydrochloride (Non-proprietary)
      - Amiloride hydrochloride 5 mg
      - Amiloride 5 mg tablets | 28 tablet
      - £27.68 DT = £3.29

**Chlortalidone** (Chlorthalidone)

**Indications and Dose**
Ascites | Oedema in nephrotic syndrome

- **By mouth**
  - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning.
  - Child 12–17 years: Up to 50 mg daily

**Hypertension**

- **By mouth**
  - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning.
  - Child 12–17 years: 25 mg daily, dose to be taken in the morning, then increased if necessary to 50 mg daily

**Stable Heart Failure**

- **By mouth**
  - Child 5–11 years: 0.5–1 mg/kg every 48 hours (max. per dose 1.7 mg/kg every 48 hours), dose to be taken in the morning.
  - Child 12–17 years: 25–50 mg daily, dose to be taken in the morning, then increased if necessary to 100–200 mg daily, reduce to lowest effective dose for maintenance.

**Interactions** Appendix 1: thiazide diuretics

**Side-Effects**

- Common or very common
  - Appetite decreased, erectile dysfunction, gastrointestinal discomfort, hyperglycaemia, rash

- Uncommon
  - Gout

- Rare or very rare
  - Arrhythmia, diabetes mellitus exacerbated, eosinophilia, glycosuria, hepatic disorders, nephritis tubulointerstitial, paraesthesia, pulmonary oedema, respiratory disorder, vomiting

**Breast-feeding** The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - Chlortalidone (Non-proprietary)
    - Chlortalidone 25 mg
    - Chlortalidone 25 mg tablets | 100 tablet
    - £90.55 DT = £88.04
  - Chlortalidone 50 mg
    - Chlortalidone 50 mg tablets | 30 tablet
    - £115.25 DT = £110.36
Patent ductus arteriosus

9 Patent ductus arteriosus

Drugs affecting the ductus arteriosus

Closure of the ductus arteriosus

Patent ductus arteriosus is a frequent problem in premature neonates with respiratory distress syndrome. Substantial left-to-right shunting through the ductus arteriosus may increase the risk of intraventricular haemorrhage, necrotising enterocolitis, bronchopulmonary dysplasia, and possibly death. Indometacin p. 561 or ibuprofen p. 579 can be used to close the ductus arteriosus. Indometacin has been used for many years and is effective but it reduces cerebral blood flow, and causes a transient fall in renal and gastrointestinal blood flow. Ibuprofen may also be used; it has little effect on renal function (there may be a small reduction in sodium excretion) when used in doses for closure of the ductus arteriosus; gastrointestinal problems are uncommon. If drug treatment fails to close the ductus arteriosus, surgery may be indicated.

Maintenance of patency

In the newborn with duct-dependent congenital heart disease it is often necessary to maintain the patency of the ductus arteriosus whilst awaiting surgery. Alprostadil below (prostaglandin E1) and dinoprostone below (prostaglandin E2) are potent vasodilators that are effective for maintaining the patency of the ductus arteriosus. They are usually given by continuous intravenous infusion, but oral dosing of dinoprostone is still used in some centres. During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature. In the event of complications such as apnoea, profound bradycardia, or severe hypotension, the infusion should be temporarily stopped and the complication dealt with; the infusion should be restarted at a lower dose. Recurrent or prolonged apnoea may require ventilatory support in order for the prostaglandin infusion to continue.

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS

Alprostadil

• INDICATIONS AND DOSE
  Maintaining patency of the ductus arteriosus
  ▶ BY CONTINUOUS INTRAVENOUS INFUSION
  • Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.

Dinoprostone

• INDICATIONS AND DOSE
  Maintaining patency of the ductus arteriosus
  ▶ BY CONTINUOUS INTRAVENOUS INFUSION
  • Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.
### Cardiovascular System

**Peripheral Vascular Disease**

**Classification and Management**

Raynaud’s syndrome, a vasospastic peripheral vascular disease, consists of recurrent, long-lasting, and episodic vasospasm of the fingers and toes often associated with exposure to cold. Management includes avoidance of exposure to cold and smoking cessation. nifedipine p. 111 and diltiazem hydrochloride below are useful for reducing the frequency and severity of vasospastic attacks. In very severe cases, where digital infarction is likely, intravenous infusion of the prostacyclin analogue iloprost p. 121 may be helpful. Vasoconstrictor therapy is not established as being effective for chilblains.

**Advanced Pharmacy Services**

Children with peripheral vascular disease may be eligible for the Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

### Medicinal Forms

- **Prostin E2** (Pfizer Ltd)
  - Dinoprostone 1 mg per 1 ml Prostin E2 750 micrograms/0.75 ml solution for infusion ampoules. 1 ampoule £8.52 (Hospital only)
  - Dinoprostone 10 mg per 1 ml Prostin E2 5 mg/0.5 ml solution for infusion ampoules. 1 ampoule £18.30 (Hospital only)

### Diltiazem hydrochloride

- **Indications and Dose**
  - Raynaud’s syndrome
  - Child 12-17 years: 30–60 mg 2–3 times a day

- **Side-effects**
  - Common or very common Cardiac conduction disorders - constipation, gastrointestinal discomfort, malaise - skin reactions
  - Uncommon Arrhythmias - diaphoresis, insomnia - nervousness - postural hypotension
  - Rare or very rare Dry mouth

- **Contra-indications**
  - Acute porphyrias p. 624 - cardiogenic shock - left ventricular failure with pulmonary congestion - second or third-degree AV block (unless pacemaker fitted) - severe bradycardia - sick sinus syndrome - significant aortic stenosis

- **Cautionary and advisory labels**
  - Pregnancy Avoid
  - Breast Feeding Significant amount present in milk—no evidence of harm but avoid unless no safer alternative

### Renal Impairment

- Manufacturers advise avoid

### Hepatic Impairment

- Not licensed for use in children.

Respiratory system, drug delivery

Inhalation
This route delivers the drug directly to the Airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Children and their carers should be advised to follow manufacturers' instructions on the care and cleansing of inhaler devices.

Inhaler devices
A pressurised metered-dose inhaler is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively, particularly in children under 12 years, a spacer device should also be used (see also NICE guidance). By the age of 3 years, a child can usually be taught to use a spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system. When a pressurised metered-dose inhaler with a spacer is unsuitable or inconvenient, a dry-powder inhaler or breath-activated inhaler may be used instead if the child is able to use the device effectively.

Dry powder inhalers may be useful in children over 5 years, who are unwilling or unable to use a pressurised metered-dose inhaler with a spacer device; breath-activated inhalers may be useful in older children if they are able to use the device effectively. The child or child's carer should be instructed carefully on the use of the inhaler. It is important to check that the inhaler is being used correctly; poor inhalation technique may be mistaken for a lack of response to the drug.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, the child may notice a lack of sensation in the mouth and throat previously associated with each actuation; coughing may occur more frequently following use of a dry-powder inhaler.

CFC-free metered-dose inhalers should be cleaned weekly according to the manufacturer's instructions.

MHRA/CHM advice: Pressurised metered dose inhalers (pMDI): risk of airway obstruction from aspiration of loose objects (July 2018)
The MHRA have received reports of patients who have inhaled objects into the back of the throat—in some cases objects were aspirated, causing airway obstruction. Patients should be reminded to remove the mouthpiece cover fully, shake the device and check that both the outside and inside of the mouthpiece are clear and undamaged before inhaling a dose, and to store the inhaler with the mouthpiece cover on.

Spacer devices
Spacer devices are particularly useful for infants, for children with poor inhalation technique, or for nocturnal asthma, because the device reduces the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Smaller-volume spacers may be more manageable for pre-school children and infants. The spacer device used must be compatible with the prescribed metered-dose inhaler.

Use and care of spacer devices
The suitability of the spacer device should be carefully assessed; opening the one-way valve is dependent on the child’s inspiratory flow. Some devices can be tipped to 45° to open the valve during inhaler actuation and inspiration to assist the child.

Inhalation from the spacer device should follow the actuation as soon as possible because the drug aerosol is very short-lived. The total dose (which may be more than a single puff) should be administered as single actuations (with tidal breathing for 10–20 seconds or 5 breaths for each actuation) for children with good inspiratory flow. Larger doses may be necessary for a child with acute bronchospasm.

The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers
Solutions for nebulisation for use in acute severe asthma are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital.

Children with a severe attack of asthma should preferably have oxygen during nebulisation since beta agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the Airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta, agonist or ipratropium bromide p. 155 to a child with an acute exacerbation of asthma or of airways obstruction;
- to deliver prophylactic medication to a child unable to use other conventional devices;
- to deliver an antibacterial (such as colistimethate sodium p. 358 or tobramycin p. 323) to a child with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide p. 163 to a child with severe croup.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30% it is more frequently close to 10% and...
sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution.

Nebulised bronchodilators are appropriate for children with chronic persistent asthma or those with severe acute asthma. In chronic asthma, nebulised bronchodilators should only be used to relive persistent daily wheeze, however, with the development of spacers with facemasks, it is now unusual for a child to require long-term nebulised asthma therapy. The use of nebulisers in chronic persistent asthma should be considered only:

- after a review of the diagnosis and use of current inhaler devices;
- if the airflow obstruction is significantly reversible by bronchodilators without unacceptable side-effects;
- if the child does not benefit from use of conventional inhaler device, such as pressurised metered-dose inhaler plus spacer;
- if the child is complying with the prescribed dose and frequency of anti-inflammatory treatment including regular use of high-dose inhaled corticosteroid.

When a nebuliser is prescribed, the child or child’s carer must:

- have clear instructions from a doctor, specialist nurse, physiotherapist, or pharmacist on the use of the nebuliser (and on peak-flow monitoring);
- be instructed not to treat acute attacks without also seeking medical help;
- have regular follow up with doctor or specialist nurse.

**Jet nebulisers**

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should always be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use. Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency.

**Safe practice**

The Department of Health has reminded users of the need to use the correct grade of tubing when connecting a nebuliser to a medical gas supply or compressor.

**Nebuliser diluent**

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

In England and Wales nebulisers and compressors are not available on the NHS (but they are free of VAT); some nebulisers (but not compressors) are available on form GP10A in Scotland (for details consult Scottish Drug Tariff).

**Oral**

Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Oral corticosteroids, theophylline p. 171, and leukotriene receptor antagonists are sometimes required for the management of asthma. Oral administration of a beta, agonist is generally not recommended for children, but may be necessary in infants and young children who are unable or unwilling to use an inhaler device.

**Parenteral**

Drugs such as beta, agonists, corticosteroids, and aminophylline p. 170 can be given by injection in acute severe asthma when drug administration by nebulisation is inadequate or inappropriate; in these circumstances the child should generally be treated in a high dependency or intensive care unit.

**Peak flow meters**

Peak flow meters may be used to assess lung function in children over 5 years with asthma, but symptom monitoring is the most reliable assessment of asthma control. They are best used for short periods to assess the severity of asthma and to monitor response to treatment; continuous use of peak flow meters may detract from compliance with inhalers.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from: 3M Security Print and Systems Limited. Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112

GP practices can obtain supplies through their Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com.

In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

**NICE decisions**

**Inhaler devices for children under 5 years with chronic asthma**

(August 2000) NICE TA10

When selecting inhaler devices for children under 5 years with chronic asthma, a child’s needs and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child’s condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered.

www.nice.org.uk/TA10

**Inhaler devices for children 5–15 years with chronic asthma**

(March 2002) NICE TA38

When selecting inhaler devices for children between 5–15 years with chronic asthma, a child’s needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered.

- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- for other inhaled drugs, particularly bronchodilators, a wider range of devices should be considered;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

www.nice.org.uk/TA38

---

**1 Airways disease, obstructive**

**Asthma, chronic**

**Description of condition**

Asthma is a common chronic inflammatory condition of the airways, associated with airway hyperresponsiveness and variable airflow obstruction. The most frequent symptoms of
asthma are cough, wheeze, chest tightness, and breathlessness. Asthma symptoms vary over time and in intensity and can gradually or suddenly worsen, provoking an acute asthma attack that, if severe, may require hospitalisation.

**Aims of treatment**

The aim of treatment is to achieve control of asthma. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, normal lung function (in practical terms forced expiratory volume in 1 second (FEV₁) and/or peak expiratory flow (PEF) > 80% predicted or best), and minimal side-effects from treatment. In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control.

**Lifestyle changes**

Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger of smoking, to themselves and to their children with asthma, and be offered appropriate support to stop smoking. For further information, see Smoking cessation p. 304.

Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment to improve quality of life and reduce symptoms.

**Management**

A stepwise approach aims to stop symptoms quickly and to improve peak flow. Treatment should be started at the level most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and decreasing treatment when control is good. Before initiating a new drug or adjusting treatment consider whether diagnosis is correct, check adherence and inhaler technique, and eliminate trigger factors for acute attacks.

A self-management programme comprising of a written personalised action plan and education should be offered to all patients with asthma (and/or their family or carers). Recommendations on the management of chronic asthma from the National Institute for Health and Care Excellence (NICE)—Asthma: diagnosis, monitoring and chronic asthma management guidelines (NG80, November 2017), and British Thoracic Society (BTS) and Scottish Intercollegiate Guidelines Network (SIGN)—British guideline on the management of asthma (SIGN 153, September 2016) differ significantly. Recommendations in BNF publications are based on NICE guidelines, and differences with BTS/SIGN (2016) have been highlighted.

**Child over 16 years**

NICE (2017) treatment recommendations for child over 16 years apply to patients aged 17 years and over. BTS/SIGN (2016) treatment recommendations for child over 16 years are the same as those for patients over 12 years (see child over 5 years section).

**Intermittent reliever therapy**

Start an inhaled short-acting beta, agonist (such as salbutamol p. 158 or terbutaline sulfate p. 160), to be used as required, in all patients with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Patients using more than one short-acting beta, agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

**Regular preventer (maintenance) therapy**

NICE (2017) define inhaled corticosteroid doses for children over 16 years as low, moderate, or high. BTS/SIGN (2016) instead define inhaled corticosteroid doses for children over 16 years as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

A low dose of inhaled corticosteroid should be started as maintenance therapy in patients who present with any one of the following features: using an inhaled short-acting beta, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. BTS/SIGN (2016) also recommend initiation in patients who have had an asthma attack in the last 2 years, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 164) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand. If asthma is uncontrolled on a low dose of inhaled corticosteroid as maintenance therapy, a leukotriene receptor antagonist (such as montelukast p. 168) should be offered in addition to the inhaled corticosteroid, and the response to treatment reviewed in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta, agonist (LABA—such as salmeterol p. 157 or formoterol fumarate p. 156) as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled.

**Additional add-on therapy**

If asthma is uncontrolled on a low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, a LABA in combination with the inhaled corticosteroid should be offered with or without continued leukotriene receptor antagonist treatment, depending on the response achieved from the leukotriene receptor antagonist.

If asthma remains uncontrolled, offer to change the inhaled corticosteroid and LABA maintenance therapy to a MART regimen (Maintenance And Reliever Therapy—a combination of an inhaled corticosteroid and a fast-acting LABA such as formoterol in a single inhaler), with a low dose of inhaled corticosteroid as maintenance. See budesonide with formoterol p. 164 (not licensed in all age groups).

If asthma remains uncontrolled on a MART regimen with a low dose of inhaled corticosteroid as maintenance with or without a leukotriene antagonist, consider increasing to a moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta₂ agonist as reliever therapy).

If asthma is still uncontrolled in patients on a moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), with or without a leukotriene receptor antagonist, consider the following options:

- increasing the inhaled corticosteroid dose to a high-dose as maintenance (this should only be offered as part of a fixed-dose regimen, with a short-acting beta₂ agonist used as a reliever therapy), or
- a trial of an additional drug, for example, a long-acting muscarinic receptor antagonist (such as tiotropium) or modified-release theophylline p. 171, or
- seek advice from an asthma specialist.
BTS/SIGN (2016) instead recommend that if the patient is gaining some benefit from addition of a LABA but control remains inadequate, that the LABA be continued and the dose of inhaled corticosteroid be increased to a medium-dose, if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a low dose of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or a long-acting muscarinic receptor antagonist, or modified-release theophylline p. 171.

If there is no response to the LABA, discontinue it and increase the dose of the inhaled corticosteroid to a medium-dose, if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a low dose of inhaled corticosteroid and try adding a leukotriene receptor antagonist or a long-acting muscarinic receptor antagonist. 

High-dose inhaled corticosteroids and further add-on treatment

BTS/SIGN (2016) recommend that if control remains inadequate on a combination of short-acting beta2 agonist as required, a medium dose of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:
- increase the inhaled corticosteroid to a high-dose—with high doses of inhaled corticosteroid via a pressurised metered-dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline p. 171, or
- add tiotropium.

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care.

Continuous or frequent use of oral corticosteroids

BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 458) at the lowest dose to provide adequate control (under specialist care) in patients with very severe asthma uncontrolled on high-dose inhaled corticosteroids, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline p. 171.

Monoclonal antibodies and immunosuppressants

BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 563 [unlicensed], and monoclonal antibodies such as omalizumab p. 167 (for severe persistent allergic asthma), and mepolizumab and reslizumab (in adults for severe eosinophilic asthma), may be considered in patients with severe asthma to achieve control and reduce the use of oral corticosteroids. See mepolizumab, omalizumab p. 167, and reslizumab National funding/access decisions.

Child over 5 years

For children over 5 years, NICE (2017) treatment recommendations for children apply to children aged 5–16 years and child over 16 years treatment recommendations apply to those aged 17 years and over. Whereas, for children over 5 years, BTS/SIGN (2016) treatment recommendations for children apply to children aged 5–12 years and child over 16 years treatment recommendations apply to those aged over 12 years.

Intermittent reliever therapy

Start an inhaled short-acting beta2, agonist (such as salbutamol p. 158 or terbutaline sulfate p. 160), to be used as required, in all children with asthma. For those with infrequent short-lived wheeze, occasional use of reliever therapy may be the only treatment required. Children using more than one short-acting beta2, agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroids doses for children (5–16 years) as paediatric low, moderate, or high. BTS/SIGN (2016) instead define inhaled corticosteroids doses for children (5–12 years) as very low, low, medium, and for children over 12 years as low, medium or high (refer to individual guidelines for inhaled corticosteroid dosing information).

A paediatric low dose of inhaled corticosteroid should be started as maintenance therapy in children who present with any one of the following features: using an inhaled short-acting beta2, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week.

BTS/SIGN (2016) instead recommend starting a very low dose (child 5–12 years) or a low dose (child over 12 years) of inhaled corticosteroid in children presenting with any one of the following features: using an inhaled short-acting beta2, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week, or have had an asthma attack in the last 2 years, and starting inhaled corticosteroids at a dose appropriate to the severity of asthma.

BTS/SIGN (2016) recommend that inhaled corticosteroids (except ciclesonide p. 164) should be initially taken twice daily, however, the same total daily dose, taken once a day, can be considered in patients with milder disease if good or complete control of asthma is established. The dose of inhaled corticosteroid should be adjusted over time, to the lowest effective dose at which control of asthma is maintained.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

Initial add-on therapy

If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 168) in addition to the inhaled corticosteroid, and review the response to treatment in 4 to 8 weeks.

BTS/SIGN (2016) instead recommend a long-acting beta2 agonist (LABA—such as salmeterol p. 157 or formoterol fumarate p. 156) in children over 12 years, or a LABA or a leukotriene receptor antagonist in children 5–12 years, as initial add-on therapy to inhaled corticosteroids if asthma is uncontrolled.

Additional add-on therapy

If asthma is uncontrolled on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, consider discontinuation of the leukotriene receptor antagonist and initiation of a LABA in combination with the inhaled corticosteroid.

If asthma remains uncontrolled on a paediatric low dose of inhaled corticosteroid and a LABA as maintenance therapy, consider changing to a MART regimen (Maintenance And Reliever Therapy—a combination of an inhaled corticosteroid and fast-acting LABA such as formoterol in a single inhaler) with a paediatric low dose of inhaled corticosteroid as maintenance. See budesonide with formoterol p. 164 [not licensed in all age groups].

If asthma remains uncontrolled on a MART regimen with a paediatric low dose of inhaled corticosteroid as maintenance, consider increasing to a paediatric moderate dose of inhaled corticosteroid (either continuing a MART regimen or changing to a fixed-dose regimen of an inhaled corticosteroid and a LABA, with a short-acting beta2, agonist as reliever therapy).

If asthma is still uncontrolled on a paediatric moderate dose of inhaled corticosteroid as maintenance with a LABA (either as MART or a fixed-dose regimen), consider seeking advice from an asthma specialist and the following options:
- increasing the inhaled corticosteroid dose to a paediatric high dose as maintenance (this should only be offered as
part of a fixed-dose regimen, with a short-acting beta, agonist as reliever therapy), or

- a trial of an additional drug, such as modified-release theophylline. p. 171.

BTS/SIGN (2016) instead recommend that if the child is gaining some benefit from addition of a LABA but control remains inadequate, continue the LABA and increase the dose of the inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and a LABA and try adding a leukotriene receptor antagonist, or modified-release theophylline. p. 171, or long-acting muscarinic receptor antagonist (in children over 12 years).

If there is no response to the LABA, discontinue it and increase the dose of inhaled corticosteroid to a low-dose (child 5–12 years) or medium-dose (child over 12 years), if not already on this dose. If increasing the dose of inhaled corticosteroid is ineffective, consider continuing on a very low dose (child 5–12 years) or low dose (child over 12 years) of inhaled corticosteroid and try adding a leukotriene receptor antagonist or long-acting muscarinic receptor antagonist (in children over 12 years).

High-dose inhaled corticosteroids and further add-on treatment

BTS/SIGN (2016) recommend that if control remains inadequate on a combination of a short-acting beta, agonist as required, a low dose (child 5–12 years) or medium dose (child over 12 years) of inhaled corticosteroid, plus an additional drug, usually a LABA, to consider the following interventions:

- increase the inhaled corticosteroid to a medium-dose (child 5–12 years) or high-dose (child over 12 years)—with high doses of inhaled corticosteroid via a pressurised metered dose inhaler (pMDI), a spacer should be used, or
- add a leukotriene receptor antagonist, or
- add modified-release theophylline. p. 171, or
- add tiotropium (in children over 12 years).

If a trial of a further add-on treatment is ineffective, stop the drug (or in the case of increased dose of inhaled corticosteroid, reduce to the original dose) and refer to specialist care.

Continuous or frequent use of oral corticosteroids

BTS/SIGN (2016) recommend adding a regular oral corticosteroid (prednisolone p. 458) at the lowest dose to provide adequate control (under specialist care) in children with very severe asthma uncontrolled on a medium dose (child 5–12 years) or high dose (child over 12 years) of inhaled corticosteroid, and who have also tried (or are still receiving) a LABA, a leukotriene receptor antagonist, or modified-release theophylline. p. 171.

Monoclonal antibodies and immunosuppressants

BTS/SIGN (2016) recommend, that under specialist initiation, immunosuppressants such as methotrexate p. 563 (unlicensed), and monoclonal antibodies such as omalizumab p. 167 (child over 6 years for severe persistent allergic asthma) can be considered in children with severe asthma to achieve control and reduce the use of oral corticosteroids. See omalizumab p. 167 National funding/access decisions.

Child under 5 years

Intermittent reliever therapy

A short-acting beta, agonist (such as salbutamol p. 158) as reliever therapy should be offered to children under 5 years with suspected asthma. A short-acting beta, agonist should be used for symptom relief alongside maintenance treatment.

Children using more than one short-acting beta, agonist inhaler device a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.

Regular preventer (maintenance) therapy

NICE (2017) define inhaled corticosteroid doses for children under 5 years as paediatric low or moderate. BTS/SIGN (2016) instead define inhaled corticosteroid doses for children under 5 years as very low (refer to individual guidelines for inhaled corticosteroid dosing information).

Consider an 8-week trial of a paediatric moderate dose of inhaled corticosteroid in children presenting with any of the following features: asthma-related symptoms three times a week or more, experiencing night-time awakening at least once a week, or suspected asthma that is uncontrolled with a short-acting beta, agonist alone.

BTS/SIGN (2016) recommend the prescribing of inhalers by brand.

After 8 weeks, stop inhaled corticosteroid treatment and continue to monitor the child’s symptoms:

- if symptoms did not resolve during the trial period, review whether an alternative diagnosis is likely;
- if symptoms resolved then reoccurred within 4 weeks of stopping inhaled corticosteroid treatment, restart the inhaled corticosteroid at a paediatric low-dose as first-line maintenance therapy;
- if symptoms resolved but reoccurred beyond 4 weeks after stopping inhaled corticosteroid treatment, repeat the 8-week trial of a paediatric moderate dose of inhaled corticosteroid.

BTS/SIGN (2016) instead recommend starting a very low dose of inhaled corticosteroid as initial regular preventer therapy in children presenting with any one of the following features: using an inhaled short-acting beta, agonist three times a week or more, symptomatic three times a week or more, or waking at night due to asthma symptoms at least once a week. In children unable to take an inhaled corticosteroid, a leukotriene receptor antagonist (such as montelukast p. 168) may be used as an alternative.

Initial add-on therapy

If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid as maintenance therapy, consider a leukotriene receptor antagonist (such as montelukast p. 168) in addition to the inhaled corticosteroid.

If suspected asthma is uncontrolled in children under 5 years on a paediatric low dose of inhaled corticosteroid and a leukotriene receptor antagonist as maintenance therapy, stop the leukotriene receptor antagonist and refer the child to an asthma specialist.

Decreasing treatment

Consider decreasing maintenance therapy when a patient’s asthma has been controlled with their current maintenance therapy for at least three months. When deciding which drug to decrease first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effect achieved, and the patient’s preference, should be considered. Patients should be regularly reviewed when decreasing treatment.

Patients should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as patients deteriorate at different rates. Only consider stopping inhaled corticosteroid treatment completely for people who are using a paediatric or adult low dose inhaled corticosteroid alone as maintenance therapy and are symptom-free.

Exercise-induced asthma

For most patients, exercise-induced asthma is an illustration of poorly controlled asthma and regular treatment including inhaled corticosteroids should therefore
be reviewed. If exercise is a specific problem in patients already taking inhaled corticosteroids who are otherwise well controlled, consider adding either a leukotriene receptor antagonist, a long-acting beta agonist, an oral beta₂ agonist, sodium cromoglicate p. 169 or nedocromil sodium p. 169, or theophylline p. 171. An inhaled short-acting beta agonists used immediately before exercise is the drug of choice.  

Pregnancy

Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma be well controlled during pregnancy; when this is achieved there is little or no increased risk of adverse maternal or fetal complications.  

Women should be counselled about the importance and safety of taking their asthma medication during pregnancy to maintain good control. Women who smoke should be advised about the dangers to themselves and to their baby and be offered appropriate support to stop smoking.  

For further information, see Smoking cessation p. 304.

Short-acting beta agonists, LABAs, oral and inhaled corticosteroids, sodium cromoglicate p. 169 and nedocromil sodium p. 169, and oral and intravenous theophylline p. 171 (with appropriate monitoring) can be used as normal during pregnancy. There is limited information on use of a leukotriene receptor antagonist during pregnancy, however, where indicated to achieve adequate control, they should not be withheld.  

Advanced Pharmacy Services

Patients with asthma may be eligible for the New Medicines Service / Medicines Use Review service provided by a community pharmacist. For further information, see Advanced Pharmacy Services in Guidance on prescribing p. 1.

Asthma, acute

30-Nov-2016

Life-threatening acute asthma

Any one of the following in a child with a severe asthma:

- SpO₂ < 92%
- Peak flow < 33% best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

Management

Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or SpO₂ < 94% to achieve normal saturations of 94–98%.

First-line treatment for acute asthma is an inhaled short-acting beta agonist, agonist (salbutamol p. 158 or terbutaline sulfate p. 160) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently.

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone p. 458.

Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone p. 456 should be reserved for severely affected children who are unable to retain oral medication.

Nebulised ipratropium bromide p. 155 can be combined with beta; agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta; agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 618 to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%.

Children with continuing severe asthma despite frequent nebulised beta, agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in patients with unreliable inhalation or severe refractory asthma. Aminophylline p. 170 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate has been used for acute asthma [unlicensed use] although its place in management is not yet established.

Child under 2 years

Inhaled short-acting beta agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks. For more severe symptoms, inhaled ipratropium bromide in combination with an inhaled beta, agonist is also an option.

Follow up in all cases

Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further
episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Children and their carers should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the child’s GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Children who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission.

Bronchodilators

Adrenoceptor agonists (sympathomimetics)

Selective β2 agonists produce bronchodilation. A short-acting β2 agonist (such as salbutamol p. 158 and terbutaline sulphate p. 160) is used for immediate relief of asthma symptoms while a long-acting β2 agonist is used in addition to an inhaled corticosteroid in children requiring prophylactic treatment. Adrenaline/epinephrine p. 138 (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, and in cardiopulmonary resuscitation; it is also used as a nebuliser solution to treat severe croup.

Long-acting β2 agonists

Formoterol fumarate p. 156 and salmeterol p. 157 are longer-acting β2 agonists which are administered by inhalation. They should be used for asthma only in children who regularly use an inhaled corticosteroid.

Vilanterol is a long-acting β2 agonist available in a combination inhaler with fluticasone furoate.

Combination inhalers that contain a long-acting β2 agonist and a corticosteroid ensure that long-acting β2 agonists are not used without concomitant corticosteroids.

Oral

Oral preparations of β2 agonists may be used for children if an inhaler device cannot be used but inhaled β2 agonists are more effective and have fewer side-effects.

Parenteral

β2 agonists can be given intravenously in children with severe or life-threatening acute asthma.

Antimuscarinic bronchodilators

Ipratropium bromide p. 155 by nebulisation can be added to other standard treatment in life-threatening acute asthma or if acute asthma fails to improve with standard therapy. Ipratropium bromide can be used to provide short-term relief in chronic asthma, but short-acting β2 agonists act more quickly and are preferred.

The aerosol inhalation of ipratropium bromide has a maximum effect 30–60 minutes after use; its duration of action is 3 to 6 hours.

Theophylline

Theophylline p. 171 is a xanthine used as a bronchodilator in asthma. It may have an additive effect when used in conjunction with small doses of β2 agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 170, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations

In general, children are best treated with single-ingredient preparations, such as a selective β2 agonist or ipratropium bromide, so that the dose of each drug can be adjusted.

Oxygen

Overview

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; administration of an inappropriate concentration of oxygen may have serious or even fatal consequences. High concentrations of oxygen can cause pulmonary epithelial damage (bronchopulmonary dysplasia), convulsions, and retinal damage, especially in preterm neonates.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation. In most acutely ill children with an expected or known normal or low arterial carbon dioxide (PaCO₂), oxygen saturation should be maintained above 92%; some clinicians may aim for a target of 94–98%. In some clinical situations, such as carbon monoxide poisoning, it is more appropriate to aim for the highest possible oxygen saturation until the child is stable. Hypercapnic respiratory failure is rare in children; in those children at risk, a lower oxygen saturation target of 88–92% is indicated.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (PaO₂) is usually associated with low or normal arterial carbon dioxide (PaCO₂), and therefore there is little risk of hypoventilation and carbon dioxide retention. In severe acute asthma, the arterial carbon dioxide (PaCO₂) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide (PaCO₂) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Oxygen should not be given to neonates except under expert supervision. Particular care is required in preterm neonates because of the risk of hyperoxia.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for children at risk of hypercapnic respiratory failure, which is more likely in children with:

- advanced cystic fibrosis
- advanced non-cystic fibrosis bronchiectasis
- severe kyphoscoliosis or severe ankylosing spondylitis
- severe lung scarring caused by tuberculosis
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target concentration of 88–92%. The aim is to provide the child with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis.

Domiciliary oxygen

Oxygen should only be prescribed for use in the home after careful evaluation in hospital by a respiratory care specialist. Carers and children who smoke should be advised of the risks of smoking when receiving oxygen, including the risk of fire.
Smoking cessation p. 304 therapy should be recommended before home oxygen prescription.

**Long-term oxygen therapy**

The aim of long-term oxygen therapy is to maintain oxygen saturation of at least 92%. Children (especially those with chronic neonatal lung disease) often require supplemental oxygen, either for 24-hours a day or during periods of sleep; many children are eventually weaned off long-term oxygen therapy as their condition improves.

Long-term oxygen therapy should be considered for children with conditions such as:
- bronchopulmonary dysplasia (chronic neonatal lung disease);
- congenital heart disease with pulmonary hypertension;
- pulmonary hypertension secondary to pulmonary disease;
- idiopathic pulmonary hypertension;
- sickle-cell disease with persistent nocturnal hypoxia;
- interstitial lung disease and obliterator bronchiolitis;
- cystic fibrosis;
- obstructive sleep apnoea syndrome;
- neuromuscular or skeletal disease requiring non-invasive ventilation;
- pulmonary malignancy or other terminal disease with disabling dyspnoea.

Increased respiratory depression is seldom a problem in children with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; children and their carers should be warned to call for medical help if drowsiness or confusion occurs.

**Short-burst oxygen therapy**

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness.

**Ambulatory oxygen therapy**

Ambulatory oxygen is prescribed for children on long-term oxygen therapy who need to be away from home on a regular basis.

**Oxygen therapy equipment**

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for children who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a child who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred to a face mask for long-term oxygen therapy from an oxygen concentrator. Nasal cannulas can, however, cause dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the child to talk, eat, and drink, but the concentration of oxygen is not controlled and the method may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

**Arrangements for supplying oxygen**

The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the consent of the child or carers to pass on the child’s details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the child or carer to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the child or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the child no longer requires the home oxygen service.

HOOF and further instructions are available at www.bhrs.co.uk/oxygen.html.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989

- London East, Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In Scotland refer the child for assessment by a paediatric respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency.

Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services-scot.aspx.

In Northern Ireland oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

**Croup**

**Management**

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 455) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 458 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 163 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 138 should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.
Ipratropium bromide

**INDICATIONS AND DOSE**

Reversible airways obstruction
- **By inhalation of nebulised solution**
  - Child 1-month to 11-years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
  - Child 12–17 years: 500 micrograms every 4–6 hours as required

Acute bronchospasm
- **By inhalation of nebulised solution**
  - Child 1-month to 11-years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
  - Child 12–17 years: 500 micrograms every 4–6 hours as required

Severe or life-threatening acute asthma
- **By inhalation of nebulised solution**
  - Child 1-month to 11-years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
  - Child 12–17 years: 500 micrograms every 4–6 hours as required

**PHARMACOKINETICS**
- The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 5 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

**UNLICENSED USE**
- The dose of ipratropium for severe or life-threatening acute asthma is unlicensed.
- Ihalvent® not licensed for use in children under 5 years.

**IMPORTANT SAFETY INFORMATION**
- **MHRA/CMH Advice: Pressurised Metered Dose Inhalers (PMDI): Risk of Airway Obstruction From Aspiration of Loose Objects (July 2018)**
- See Respiratory system, drug delivery p. 147.

**CAUTIONS**
- Avoid spraying near eyes - cystic fibrosis
- **Glaucoma** - Acute angle-closure glaucoma has been reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta agonists); care needed to protect the patient’s eyes from nebulised drug or from drug powder.

**INTERACTIONS**
- **Appendix 1: Ipratropium**

**SIDE-EFFECTS**
- **Common or very common**
  - Gastrointestinal motility disorder
  - Throat complaints
- **Uncommon**
  - Corneal oedema, diarrhoea, eye disorders, eye pain, respiratory disorders, vision disorders, vomiting

**ALLERGY AND CROSS-SENSITIVITY**
- Contra-indicated in patients with hypersensitivity to atropine or its derivatives.

**PREGNANCY**
- Manufacturer advises only use if potential benefit outweighs the risk.

**BREAST FEEDING**
- No information available - manufacturer advises only use if potential benefit outweighs risk.

**DIRECTIONS FOR ADMINISTRATION**
- If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.

**PATIENT AND CARER ADVICE**
- Patients or carers should be counselled on appropriate administration technique and warned against accidental contact with the eye (due to risk of ocular complications).

**Driving and Skilled Tasks**
- Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks - increased risk of dizziness and vision disorders.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**
- Ipratropium bromide (Non-proprietary)
  - Ipratropium bromide 250 microgram per 1 ml Ipratropium bromide 500 micrograms/2 ml nebuliser liquid unit dose vials | 20 unit dose (PDR) £3.15 DT = £3.00
  - Ipratropium bromide 250 micrograms/1 ml nebuliser liquid unit dose vials | 20 unit dose (PDR) £4.98 DT = £4.90
  - Ipratropium 250 micrograms/1 ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose (PDR) £6.99 DT = £6.90
  - Ipratropium 500 micrograms/2 ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose (PDR) £15.99 DT = £15.00

Atrovent UDV (Boehringer Ingelheim Ltd)
- Ipratropium bromide 250 microgram per 1 ml Atrovent 500 micrograms/2 ml nebuliser liquid UDVs | 20 unit dose (PDR) £4.87 DT = £4.00
  - Atrovent 250 micrograms/1 ml nebuliser liquid UDVs | 20 unit dose (PDR) £4.14 DT = £4.90

**Pressurised inhalation**
- Atrovent (Boehringer Ingelheim Ltd)
  - Ipratropium bromide 20 microgram per 1 dose Atrovent 20 micrograms/dose inhaler CFC free | 200 dose (PDR) £5.56 DT = £5.56
  - Inhalevent (Alissa Healthcare Research Ltd)
    - Ipratropium bromide 20 microgram per 1 dose Inhalevent 20 micrograms/dose inhaler | 200 dose (PDR) £5.56 DT = £5.56

Tiotropium
Respiratory system

Beta-2-adrenoceptor agonists, selective

INDICATIONS AND DOSE
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

BY INHALATION OF POWDER

Child 6-11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

Child 12-17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

BY INHALATION OF AEROSOL

Child 12-17 years: 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

DOSAGE FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation

Spiriva Respimat (Boehringer Ingelheim Ltd)
Tiotropium (as Tiotropium bromide) 2.5 microgram per
1 dose Spiriva Respimat 2.5 micrograms/dose solution for inhalation cartridge with device | 60 dose pack £23.00 D+ £23.00

156 Airways disease, obstructive

BNFC 2019–2020
**OXIS**

**Chronic asthma**
- BY INHALATION OF POWDER
  - Child 6-17 years: 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day

**Relief of bronchospasm**
- BY INHALATION OF POWDER
  - Child 6-17 years: 6–12 micrograms

**Prophylaxis of exercise-induced bronchospasm**
- BY INHALATION OF POWDER
  - Child 6-17 years: 6–12 micrograms, dose to be taken before exercise

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)**
See Respiratory system, drug delivery p. 147.

**MEDICAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**
- Easyhaler (formoterol) (Orion Pharma (UK) Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose Easyhaler 12 micrograms/dose dry powder inhaler
  - 120 dose £23.75 DT = £23.75

  - Formoterol fumarate dihydrate 12 microgram per 1 dose Atimos Modulite 12 micrograms/dose inhaler
  - 100 dose £30.06 DT = £30.06

**Combinations available:** Budesonide with formoterol, p. 164 - Fluticasone with formoterol, p. 165

### Salmeterol

**INDICATIONS AND DOSE**
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy / Nighttime asthma in patients requiring long-term regular bronchodilator therapy / Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy / Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)
- BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER
  - Child 5-11 years: 50 micrograms twice daily
  - Child 12-17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

**PHARMACOKINETICS**
- At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

**UNLICENSED USE**
Neventor® not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)**
See Respiratory system, drug delivery p. 147.

MEDICINAL FORMS

PATIENT AND CARER ADVICE

BREAST FEEDING

SIDE-EFFECTS

PATIENT AND CARER ADVICE

Advise patients that inhaled salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta2-agonist.

Respiratory System

Airways disease, obstructive 159

SALBULIN NOVOLIZER®

Acute bronchospasm

- By inhalation of powder
- Child 6-11 years: 100–200 micrograms, up to 400 micrograms daily for persistent symptoms
- Child 12-17 years: Initially 100–200 micrograms, up to 800 micrograms daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- By inhalation of powder
- Child 6-11 years: 100–200 micrograms
- Child 12-17 years: 200 micrograms

VENTOLIN ACUHALER®

Acute bronchospasm

- By inhalation of powder
- Child 5-17 years: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm

- By inhalation of powder
- Child 5-17 years: 200 micrograms

PHARMACOKINETICS

- At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

- UNLICENSED USE

- Not licensed for use in hyperkalaemia.
- With oral use Syrup and tablets not licensed for use in children under 2 years.
- With intravenous use Injection and solution for intravenous infusion not licensed for use in children under 12 years. Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

- When used by inhalation
  See Respiratory system, drug delivery p. 147.

- CAUTIONS

- High doses of beta, agonists can be dangerous in some children

- INTERACTIONS

- Appendix 1: beta; agonists

- SIDE-EFFECTS

  GENERAL SIDE-EFFECTS
  
  - Common or very common Muscle cramps
  - Rare or very rare Akathisia - vasodilatation
  - Frequency not known Metabolic change

  SPECIFIC SIDE-EFFECTS
  
  - Uncommon
    - When used by inhalation Oral irritation - throat irritation
    - With parenteral use Pulmonary oedema
  - Frequency not known
    - With parenteral use Lactic acidosis (with high doses) - vomiting

- BREAST FEEDING

- Inhaled drugs for asthma can be taken as normal during breast-feeding.

- DIRECTIONS FOR ADMINISTRATION

  - For continuous intravenous infusion, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter [unlicensed]. For intravenous injection, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.
  - When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

- PATIENT AND CARER ADVICE

- When used by inhalation For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

- Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze www.medicinesforchildren.org.uk/salbutamol-inhaler-asthma-and-wheeze

Terbutaline sulfate

- **INDICATIONS AND DOSE**
  - **Acute asthma**
    - By subcutaneous injection, or by slow intravenous injection
      - Child 2-14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
      - Child 15-17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
    - By continuous intravenous infusion
      - Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
    - Moderate, severe, or life-threatening acute asthma
      - By inhalation of nebulised solution
        - Child 1 month–4 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
        - Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
        - Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
      - Exacerbation of reversible airways obstruction (including nocturnal asthma) Prevention of exercise-induced bronchospasm
        - By inhalation of powder
          - Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only
        - By mouth
          - Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended

- **SIDE-EFFECTS**
  - Common or very common
    - Hypotension, muscle spasms
  - Rare or very rare
    - Vasodilatation
  - Frequency not known
    - Angioedema, anxiety, behaviour abnormal, bronchospasm, circulatory collapse, oral irritation, skin reactions, sleep disorder, throat irritation
  - Specific side-effects
  - Uncommon
  - With parenteral use
    - Pulmonary oedema
  - Rare or very rare
    - With parenteral use
      - Lactic acidosis
    - With parenteral use
      - Akathisia, bleeding tendency
  - Pregnancy
    - Inhaled drugs for asthma can be taken as normal during pregnancy.
  - Breast-feeding
    - Inhaled drugs for asthma can be taken as normal during breast-feeding.
  - DIRECTIONS FOR ADMINISTRATION
    - With intravenous use
      - Continuous intravenous infusion
        - Dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
        - When used by inhalation
          - For nebulisation, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.
  - PATIENT AND CARER ADVICE
    - When used by inhalation
      - For inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

CORTICOSTEROIDS

Airways disease, use of corticosteroids

30-Nov-2017

Asthma, use of corticosteroids
Inhaled corticosteroids
Corticosteroids are effective in the management of asthma; they reduce airway inflammation.

An inhaled corticosteroid is used regularly for prophylaxis of asthma. Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current or previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit. Beclometasone dipropionate p. 152, budesonide p. 163, fluticasone p. 165, and mometasone furoate p. 165 appear to be equally effective. A spacer device should be used for administering inhaled corticosteroids in children under 15 years; a spacer device is also useful in children over 15 years, particularly if high doses are required.

Oral corticosteroids
Systemic therapy may be required during periods of stress, such as during severe infections, or when airways obstruction or mucus prevent drug access to smaller airways.

An acute attack of asthma should be treated with a short course (3–5 days) of oral corticosteroid. The dose can usually be stopped abruptly but it should be reduced gradually in children under 12 years who have taken corticosteroids for more than 14 days. Tapering is not needed in children 12–18 years provided that the child receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks).

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Some clinicians use alternate-day dosing of an oral corticosteroid.

Parenteral corticosteroids
Hydrocortisone injection p. 456 has a role in the emergency treatment of acute severe asthma.

Corticosteroids (inhaled)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CORTICOSTERI OIDS: RARE RISK OF CENTRAL SEROUS CHI ROIRETINOPATHY WITH LOCAL AS WELL AS SYSTEMIC ADMINISTRATION (AUGUST 2017)

Central serous chorioretinopathy is a retinal disorder that has been linked to the systemic use of corticosteroids. Recently, it has also been reported after local administration of corticosteroids via inhaled and intranasal, epidural, intra-articular, topical dermal, and periocular routes. The MHRA recommends that patients should be advised to report any blurred vision or other visual disturbances with corticosteroid treatment given by any route; consider referral to an ophthalmologist for evaluation of possible causes if a patient presents with vision problems.

▶ SIDE-EFFECTS
- Common or very common Headache · oral candidiasis · taste altered · voice alteration
- Uncommon Anxiety · bronchospasm paradoxical · cataract · vision blurred
- Rare or very rare Adrenal suppression · behaviour abnormal · glaucoma · growth retardation · sleep disorder
- Frequency not known Pneumonia (in patients with COPD)

SIDE-EFFECTS, FURTHER INFORMATION
Systemic absorption may follow inhaled administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind. Mild bronchospasm may be prevented by inhalation of a short-acting beta₂ agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.

BREAST FEEDING Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.

MONITORING REQUIREMENTS The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
▶ Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TA131
For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended.

For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta₂ agonist is considered appropriate, the following apply:
- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need and the likelihood of treatment adherence;
Airways disease, obstructive

- If a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual child is recommended. www.nice.org.uk/TA131
- Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138 For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TA’s 38 and 10), within its marketing authorisation is recommended.

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta agonist is considered appropriate, the following apply:
- The use of a combination inhaler within its marketing authorisation is recommended as an option;
- The decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- If a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended. www.nice.org.uk/TA138

**CLENIL MODULITE®**

Prophylaxis of asthma
- By inhalation of aerosol
- Child 2–11 years: 100–200 micrograms twice daily
- Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

**QVAR® PREPARATIONS**

Prophylaxis of asthma
- By inhalation of aerosol
- Child 12–17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**Potency**
- Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as Clenil Modulite®.

**SOPROBEC®**

Prophylaxis of asthma
- By inhalation of aerosol
- Child: 100 micrograms twice daily; increased if necessary up to 400 micrograms daily in 2–4 divided doses

**DOSE EQUIVALENCE AND CONVERSION**
- Dose adjustments may be required for some inhaler devices, see under individual preparations.

**Unlicensed use** Easyhaler® Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite®-200 and -250 are not licensed for use in children under 12 years.

**Important safety information**

MHRA/CHM Advice (July 2008)
Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Clenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite®.

MHRA/CHM Advice: Pressurised Metered Dose Inhalers (PMDI): Risk of Airway Obstruction from Aspiration of Loose Objects (July 2018)
See Respiratory system, drug delivery p. 147.

**Interactions** → Appendix 1: corticosteroids

**Side-effects**
- Common or very common Throat irritation
- Rare or very rare Wheezing

**Prescribing and dispensing information**
The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.

Soprobec® Soprobec® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

**QVAR® Preparations**
When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response.

**Clenil Modulite®** Clenil Modulite® is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

**Patient and carer advice**
Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children leaflet: Beclometasone inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

**Profession specific information**
Dental practitioners’ formulary Clenil Modulite® 50 micrograms/metered inhalation may be prescribed.

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment Inhalation powder

**INDICATIONS AND DOSE**

**Bronchopulmonary dysplasia with spontaneous respiration**

- **BY INHALATION OF NEBULISED SUSPENSION**
- **Neonate:** 500 micrograms twice daily.
- **Child 1–4 months:** 500 micrograms twice daily

**Bronchopulmonary dysplasia with spontaneous respiration (severe symptoms)**

- **BY INHALATION OF NEBULISED SUSPENSION**
- **Child 1–4 months (body-weight 2.5 kg and above):** 1 mg twice daily

**Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**

- **BY INHALATION OF POWDER**
- **Child 6–11 years:** 200–400 micrograms once daily, dose to be given in the evening
- **Child 12–17 years:** 200–800 micrograms twice daily, dose to be adjusted as necessary

**Prophylaxis of asthma**

- **BY INHALATION OF POWDER**
- **Child 6–11 years:** 100–400 micrograms twice daily, dose to be adjusted as necessary
- **Child 12–17 years:** 100–450 micrograms twice daily, dose to be adjusted as necessary

- **BY INHALATION OF NEBULISED SUSPENSION**
- **Child 6 months–11 years:** 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day
- **Child 12–17 years:** Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

**BUDELIN® NOVOLIZER®**

**Prophylaxis of asthma**

- **BY INHALATION OF POWDER**
- **Child 6–11 years:** 200–400 micrograms twice daily, dose is adjusted as necessary
- **Child 12–17 years:** 200–800 micrograms twice daily, dose is adjusted as necessary

**Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose**

- **BY INHALATION OF POWDER**
- **Child 6–11 years:** 200–400 micrograms once daily, to be taken in the evening
- **Child 12–17 years:** 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

**PULMICORT®® RESPULES**

**Prophylaxis of asthma**

- **BY INHALATION OF NEBULISED SUSPENSION**
- **Child 3 months–11 years:** Initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily
- **Child 12–17 years:** Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

**Croup**

- **BY INHALATION OF NEBULISED SUSPENSION**
- **Child:** 2 mg for 1 dose, alternatively 1 mg for 2 doses separated by a 30 minute interval, dose may be repeated every 12 hours until clinical improvement

**PULMICORT®® TURBOHALER**

**Prophylaxis of asthma**

- **BY INHALATION OF POWDER**
- **Child 5–11 years:** 100–400 micrograms twice daily, dose to be adjusted as necessary
- **Child 12–17 years:** 100–800 micrograms twice daily, dose to be adjusted as necessary

**Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose**

- **BY INHALATION OF POWDER**
- **Child 5–11 years:** 200–400 micrograms once daily, to be taken in the evening
- **Child 12–17 years:** 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

**POTENCY**

- **Dose adjustments may be required for some inhaler devices, see under individual preparations.**

**UNLICENSED USE**

- **Pulmicort®® nebuliser solution** not licensed for use in children under 3 months; not licensed for use in bronchopulmonary dysplasia.

**INTERACTIONS**

        - Child 12-17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

**INTERACTIONS** → Appendix 1: beta₂ agonists - corticosteroids

**PATIENT AND CARER ADVICE**

- Patient counselling is advised for budesonide with formoterol inhalation (administration).
- With high doses, a steroid card should be supplied.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (June 2017) that budesonide/formoterol 100 micrograms/6 micrograms and 200 micrograms/6 micrograms (Symbicort® SMART®) is accepted for use within NHS Scotland for regular treatment of asthma where use of a combination (inhaled corticosteroid and a long-acting β₂ adrenoceptor agonist) is appropriate: patients already adequately controlled on both or patients not adequately controlled with inhaled corticosteroids and "as needed" short-acting β₂ adrenoceptor agonists. This advice relates to the extension of the license for Symbicort maintenance and reliever therapy (SMART®) to adolescents aged 12 years and over.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- **Symicort Turbohaler®** (AstraZeneca UK Ltd)

    - Alvesco 160 inhaler | 60 dose [PMD] £38.62 DT + £38.62
Fluticasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone above, formoterol fumarate p. 156.

**INDICATIONS AND DOSE**

**FLUTIFORM® 125**

- Prophylaxis of asthma
  - BY INHALATION OF AEROSOL
    - Child 12-17 years: 2 puffs twice daily

**FLUTIFORM® 50**

- Prophylaxis of asthma
  - BY INHALATION OF AEROSOL
    - Child 12-17 years: 2 puffs twice daily

**INTERACTIONS** → Appendix 1: beta, agonists - corticosteroids

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer fluticasone with formoterol aerosol inhalation. With high doses, a steroid card should be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Pressurised inhalation**
  
  **CAUTIONARY AND ADVISORY LABELS** 8, 10 (high doses)
  
  **Flutiform** (Napp Pharmaceuticals Ltd)
  
  Formoterol fumarate dihydrate 5 microgram per 1 dose, Fluticasone propionate 50 microgram per 1 dose Flutiform 50micrograms/dose / 5micrograms/dose inhaler | 120 dose £28.00 DT = £28.00

- **Nebuliser**
  
  **CAUTIONARY AND ADVISORY LABELS** 8, 10
  
  **Flutiform Nebule (GlaxoSmithKline UK Ltd)**
  
  Fluticasone propionate 250 microgram per 1 ml Flutiform 250micrograms/dose Evohaler | 200 dose £36.14 DT = £36.14

Fluticasone with salmeterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone above, salmeterol p. 157.

**INDICATIONS AND DOSE**

**SERETIDE 100 ACCUHALER®**

- Prophylaxis of asthma
  - BY INHALATION OF POWDER
    - Child 5-17 years: 1 inhalation twice daily, reduced to 1 inhalation daily, use reduced dose only if control maintained

**SERETIDE 125 EVOHALER®**

- Prophylaxis of asthma
  - BY INHALATION OF AEROSOL
    - Child 12-17 years: 2 puffs twice daily

**SERETIDE 250 ACCUHALER®**

- Prophylaxis of asthma
  - BY INHALATION OF POWDER
    - Child 12-17 years: 1 inhalation twice daily

**SERETIDE 250 EVOHALER®**

- Prophylaxis of asthma
  - BY INHALATION OF AEROSOL
    - Child 12-17 years: 2 puffs twice daily

**SERETIDE 50 EVOHALER®**

- Prophylaxis of asthma
  - INITIALLY BY INHALATION OF AEROSOL
    - Child 5-17 years: 2 puffs twice daily, (by inhalation) reduced to 2 puffs once daily, use reduced dose only if control maintained

**INTERACTIONS**

- Appendix 1: corticosteroids

**DIRECTIONS FOR ADMINISTRATION**

- Fluticasone nebuliser

- BY INHALATION OF NEBULISED SUSPENSION
  - Child 4-15 years: 1 mg twice daily
  - Child 16-17 years: 0.5–2 mg twice daily

**INDICATIONS AND DOSE**

- Prophylaxis of asthma
  - BY INHALATION OF POWDER
    - Child 5-17 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
    - Child 16-17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
    - BY INHALATION OF AEROSOL
    - Child 4-15 years: Initially 50–100 micrograms twice daily (max. per dose 200 micrograms twice daily), dose to be adjusted as necessary
    - Child 16-17 years: Initially 100–500 micrograms twice daily (max. per dose 1 mg twice daily), dose may be increased according to severity of asthma. Doses above 500 micrograms twice daily initiated by a specialist
    - BY INHALATION OF NEBULISED SUSPENSION
    - Child 4-15 years: 1 mg twice daily
    - Child 16-17 years: 0.5–2 mg twice daily

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: PRESSURISED METERED DOSE INHALERS (PMDI): RISK OF AIRWAY OBSTRUCTION FROM ASPIRATION OF LOOSE OBJECTS (JULY 2018)

See Respiratory system, drug delivery p. 147.

**INTERACTIONS** → Appendix 1: corticosteroids

**DIRECTIONS FOR ADMINISTRATION**

- Fluticasone nebuliser

- BY INHALATION OF NEBULISED SUSPENSION
  - Child 4-15 years: 1 mg twice daily
  - Child 16-17 years: 0.5–2 mg twice daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
SERETIDE 500 ACCUHALER®

Prophylaxis of asthma

- By Inhalation of Powder
- Child 12-17 years: 1 inhalation twice daily

INTERACTIONS → Appendix 1: beta, agonists • corticosteroids

PRESCRIBING AND DISPENSING INFORMATION

SEREFLO® 125 Manufacturer advises spacer devices are not compatible—if spacer device required, switch to alternative fixed-dose combination preparation.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

A steroid card should be provided.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10
- Relvar Ellipta (GlaxoSmithKline UK Ltd)
  - Vilanterol 22 microgram per 1 dose, Fluticasone furoate 92 microgram per 1 dose
  - Relvar Ellipta 92micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose (POD) £22.00 DT = £22.00
  - Vilanterol 22 microgram per 1 dose, Fluticasone furoate 184 microgram per 1 dose
  - Relvar Ellipta 184micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose (POD) £29.50 DT = £29.50

Mometasone furoate

21-Dec-2017

INDICATIONS AND DOSE

Prophylaxis of asthma

- By Inhalation of Powder
- Child 12-17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained

Prophylaxis of severe asthma

- By Inhalation of Powder
- Child 12-17 years: Increased if necessary up to 400 micrograms twice daily

INTERACTIONS → Appendix 1: corticosteroids

SIDE-EFFECTS
- Common or very common Candida infection

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied.

Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-asthma-prevention-prophylaxis

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10
- Asmanex Twinhaler (Merck Sharp & Dohme Ltd)
  - Mometasone furoate 200 microgram per 1 dose
  - Asmanex 200micrograms/dose Twinhaler | 30 dose (POD) £15.70 DT = £15.70
  - 60 dose (POD) £23.54 DT = £23.54
- Mometasone furoate 400 microgram per 1 dose
  - Asmanex 400micrograms/dose Twinhaler | 30 dose (POD) £21.78 DT = £21.78
  - 60 dose (POD) £36.05 DT = £36.05

Fluticasone with vilanterol

01-Nov-2017

INDICATIONS AND DOSE

Prophylaxis of asthma

- By Inhalation of Powder
- Child 12-17 years: 1 inhalation once daily

INTERACTIONS → Appendix 1: beta, agonists • corticosteroids

SIDE-EFFECTS
- Common or very common Abdominal pain • arthralgia • back pain • bone fracture • cough • dysphonia • fever • increased risk of infection • muscle spasms • oropharyngeal pain
- Uncommon Vision blurred
- Rare or very rare Angioedema • anxiety

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.
**Mepolizumab**

**DRUG ACTION** Mepolizumab is a humanised anti-interleukin-5 (anti-IL-5) monoclonal antibody; it reduces the production and survival of eosinophils.

**INDICATIONS AND DOSE**

* Add on treatment for severe refractory eosinophilic asthma (under expert supervision)
  - **BY SUBCUTANEOUS INJECTION**
    - Child 6-11 years: 40 mg every 4 weeks
    - Child 12-17 years: 100 mg every 4 weeks

**CAUTIONS** Helminth infection

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain upper - administration related reaction - back pain - eczema - fever - headache - hypersensitivity - increased risk of infection - nasal congestion

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited data available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**PATIENT AND CARER ADVICE**

- Asthma Patients and their carers should be advised to seek medical advice if their asthma remains uncontrolled or worsens after initiation of treatment.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

- **SMC2139**
  - The **Scottish Medicines Consortium** has advised (April 2019) that mepolizumab (Nucala ™) is accepted for restricted use within NHS Scotland as an add-on treatment for severe refractory eosinophilic asthma in patients aged 6 years and older who have eosinophils of at least 150 cells per microlitre (0.15 × 10^9/L) at initiation of treatment and have had at least four asthma exacerbations in the preceding year or are receiving maintenance treatment with oral corticosteroids. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

- **All Wales Medicines Strategy Group (AWMSG) decisions**
  - **AWMSG No. 3750**
    - The **All Wales Medicines Strategy Group** has advised (April 2019) that mepolizumab (Nucala ™) is recommended as an option for restricted use within NHS Wales as an add-on treatment for severe refractory eosinophilic asthma in patients aged 6 years and older. It is restricted for use in a subpopulation of the licensed indication in line with NICE TA431 and is not recommended for use within NHS Wales outside of this subpopulation. This recommendation applies only in circumstances where the approved Patient Access Scheme (PAS) is utilised or where the list/contract price is equivalent or lower than the PAS price.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for injection**
  - EXCIPIENTS: May contain Polysorbates
  - **Nucala** (GliazoSmithKline UK Ltd) ▼
    - **Mepolizumab 100 mg** Nucala 100mg powder for solution for injection vials 1 vial (PHT) £840.00 (Hospital only)

**Omalizumab**

**INDICATIONS AND DOSE**

- **Prophylaxis of severe persistent allergic asthma**
  - **BY SUBCUTANEOUS INJECTION**
    - Child 6-17 years: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

**ADD-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment**

- **BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: 300 mg every 4 weeks

**CAUTIONS**

- Autoimmune disease - susceptibility to helminth infection—discontinue if infection does not respond to anthelmintic

**SIDE-EFFECTS**

- **Common or very common** Fever - gastrointestinal discomfort - headache - skin reactions
- **Uncommon** Cough - diarrhoea - dizziness - drowsiness - fatigue - flushing - increased risk of infection - influenza like illness - limb swelling - nausea - paraesthesia - photosensitivity reaction - postural hypotension - respiratory disorders - syncope - weight increased
- **Rare or very rare** Angioedema - hypersensitivity - systemic lupus erythematosus (SLE)
- **Frequency not known** Alopecia - eosinophilic granulomatosis with polyangiitis - immune thrombocytopenic purpura - joint disorders - lymphadenopathy - myalgia

**SIDE-EFFECTS, FURTHER INFORMATION**

Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

**Hypersensitivity reactions** Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

**PREGNANCY**

- Manufacturer advises avoid unless essential—crosses the placenta.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution (no information available).

**RENAL IMPAIRMENT**

- Manufacturer advises caution—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- **Omalizumab for severe persistent allergic asthma**
  - April 2013 NICE TA278

Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.

Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta, agonists, leukotriene receptor antagonists, theophyllines, oral...
corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA278

- Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:
- the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 26 or more,
- the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,
- omalizumab is stopped at or before the fourth dose if the condition has not responded,
- omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
- omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,
- the manufacturer provides omalizumab with the discount agreed in the patient access scheme.

Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Xolair (Novartis Pharmaceuticals UK Ltd)
  - Omalizumab 150 mg per 1 ml Xolair 150mg/ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£53) £326.15
  - Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£53) £128.07

LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonists

Overview

The leukotriene receptor antagonist montelukast below blocks the effects of cysteinyl leukotrienes in the airways.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in children with severe asthma who are also receiving high doses of other drugs.

There is some limited evidence to support the intermittent use of montelukast in children under 12 years with episodic wheeze associated with viral infections [unlicensed use]. Treatment is started at the onset of either asthma symptoms or of corzayl symptoms and continued for 7 days; there is no evidence to support this use in moderate or severe asthma.

Montelukast

- INDICATIONS AND DOSE
  - Prophylaxis of asthma
    - BY MOUTH
      - Child 6 months-5 years: 4 mg once daily, dose to be taken in the evening
      - Child 6-14 years: 5 mg once daily, dose to be taken in the evening
      - Child 15-17 years: 10 mg once daily, dose to be taken in the evening
  - Symptomatic relief of seasonal allergic rhinitis in patients with asthma.
    - BY MOUTH
      - Child 15-17 years: 10 mg once daily, dose to be taken in the evening

- INTERACTIONS → Appendix 1: montelukast
- SIDE-EFFECTS
  - Common or very common Diarrhoea - fever - gastrointestinal discomfort - headache - nausea - skin reactions - upper respiratory tract infection - vomiting
  - Rare or very rare Angioedema - concentration impaired - disorientation - eosinophilic granulomatosis with polyangiitis - erythema nodosum - haullcation - hepatic disorders - memory loss - palpitations - pulmonary eosinophilia - suicidal tendencies - tremor

SIDE-EFFECTS, FURTHER INFORMATION Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

- PREGNANCY Manufacturer advises avoid unless essential.
  - There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

- BREAST FEEDING Manufacturer advises avoid unless essential.

- DIRECTIONS FOR ADMINISTRATION Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

- PRESCRIBING AND DISPENSING INFORMATION Flavours of chewable tablet formulations may include cherry.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer montelukast granules. Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-asthma

- NATIONAL FUNDING/ACCESS DECISIONS SINGULAIR® GRANULES

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (June 2007) that SINGULAIR® granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral
corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® granules should be initiated by a specialist in paediatric asthma.

**SINGULAIR® CHEWABLE TABLETS**

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Granules**
- **Montelukast** (Non-proprietary)
  - Montelukast (as Montelukast sodium) 4 mg
  - Montelukast 4mg granules sachets sugar-free sugar-free | 28 sachet Pack £4.91–£13.99 DT = £5.25
- **Singulair** (Merck Sharp & Dohme Ltd)
  - Montelukast (as Montelukast sodium) 4 mg
  - Singulair Paediatric 4mg granules sachets sugar-free | 28 sachet Pack £25.69 DT = £5.25

**Tablet**
- **Montelukast** (Non-proprietary)
  - Montelukast (as Montelukast sodium) 10 mg
  - Montelukast 10mg tablets | 28 tablet Pack £26.97 DT = £1.17
- **Singulair** (Merck Sharp & Dohme Ltd)
  - Montelukast (as Montelukast sodium) 10 mg
  - Singulair 10mg tablets | 28 tablet Pack £26.97 DT = £1.17

**Chewable tablet**
- **CAUTIONARY AND ADVISORY LABELS**
  - 23, 24
- **EXCIPIENTS:** May contain Aspartame

- **Montelukast** (Non-proprietary)
  - Montelukast (as Montelukast sodium) 4 mg
  - Montelukast 4mg chewable tablets sugar free sugar-free | 28 tablet Pack £25.69 DT = £1.14
  - Montelukast 5mg chewable tablets sugar free sugar-free | 28 tablet Pack £25.69 DT = £1.26
- **Singulair** (Merck Sharp & Dohme Ltd)
  - Montelukast (as Montelukast sodium) 4 mg
  - Singulair Paediatric 4mg chewable tablets sugar-free | 28 tablet Pack £25.69 DT = £1.26
  - Montelukast (as Montelukast sodium) 5 mg
  - Singulair Paediatric 5mg chewable tablets sugar-free | 28 tablet Pack £25.69 DT = £1.26

**MAST-CELL STABILISERS**

**Cromoglicate and related therapy**

**Overview**
The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood; they may be of value as prophylaxis in asthma with an allergic basis, but the evidence for benefit of sodium cromoglicate in children is contentious. Prophylaxis with sodium cromoglicate or nedocromil sodium is less effective than with inhaled corticosteroids.

Nedocromil sodium may be of some benefit in the prophylaxis of exercise-induced asthma.

Sodium cromoglicate and nedocromil sodium may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.
Child 14-17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

**Severe acute asthma**

- **INDICATIONS AND DOSE**

Severe acute asthma in patients not previously treated with theophylline

- **BY SLOW INTRAVENOUS INJECTION**

Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

**PHARMACOKINETICS**

- Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water.
- Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of aminophylline are important because the toxic dose is close to the therapeutic dose.

**SIDE-EFFECTS**

- Arrhythmias following rapid intravenous injection.
- Cardiac arrhythmias or other cardiac disease.
- Seizure (more common when given too rapidly by intravenous injection).
- Somnolence.
- Nerving.
- Hypotension (more common when given too rapidly by intravenous injection).
- Fever.
- Hyperventilation.
- Electrolyte imbalance.
- Gastrointestinal haemorrhage.
- Gastroesophageal reflux disease.
- Hyperthermia.
- Hyperventilation.
- Hypotension (more common when given too rapidly by intravenous injection).
- Insomnia.
- Mania.
- Metabolic disorder.
- Pain.
- Skin reactions.
- Tachycardia.
- Thirst.
- Tremor.
- Vertigo.
- Visual impairment.
- Vomiting.

**OVERDOSE**

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity

**MEDICATIONS**

- Aminophylline

**INDICATIONS AND DOSE**

Severe acute asthma in patients not previously treated with theophylline

- **BY SLOW INTRAVENOUS INJECTION**

Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

**SIDE-EFFECTS**

- Arrhythmias.
- Central nervous system stimulation.
- Epigastric discomfort.

**INTERACTIONS**

Appendix 1: aminophylline
Theophylline

**INDICATIONS AND DOSE**

**NUELIN SA® 175MG TABLETS**

**Chronic asthma**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 175 mg every 12 hours
  - Child 12–17 years: 175–350 mg every 12 hours

**NUELIN SA® 250 TABLETS**

**Chronic asthma**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 250–500 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**SLO-PHYLLIN®**

**Chronic asthma**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 125–250 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**UNIPHILLY CONTINU®**

**Chronic asthma**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 2–5 years: 60–120 mg every 12 hours
  - Child 6–11 years: 125–250 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**Theophylline**

**Measurement of plasma-theophylline concentration** may be increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections.

**Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.**

**Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.**

**Modified release** The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, suppository

**Solution for injection**
- **Aminophylline (Non-proprietary)**
  - Aminophylline 25 mg per 1 ml
    - Aminophylline 250mg/10ml solution for injection ampoules | 10 ampoule £8.50 DT + £8.50

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS**

**ALLERGY AND CROSS-SENSITIVITY**
- Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

**PREGNANCY**
- Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

**BREAST FEEDING**
- Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution (risk of reduced clearance).

**Dose adjustments**
- With oral use Manufacturer advises consider dose reduction.
- With intravenous use Manufacturer advises maintenance dose reduction—consult product literature.

**MONITORING REQUIREMENTS**
- Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
- Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
- With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

**DIRECTIONS FOR ADMINISTRATION**
- **With intravenous use** For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
- For intravenous infusion, dilute to a concentration of 1 mg/ml with Glucose 5% or Sodium Chloride 0.9%.
- With intramuscular use Aminophylline is too irritant for intramuscular use.

**PRESCRIBING AND DISPENSING INFORMATION**
- Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.
- Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the
Respiratory system

Plasma-theophylline concentration is measured.

BREAST FEEDING

Theophylline can be taken as normal during breast-feeding.

PREGNANCY

Theophylline can be taken as normal during pregnancy as it is particularly important that asthma is well controlled. Neonatal irritability and apnoea have been reported.

SIDE-EFFECTS

Anxiety \textit{\&} arrhythmias \textit{\&} diarrhoea \textit{\&} dizziness \textit{\&} gastrointestinal discomfort \textit{\&} gastrooesophageal reflux disease \textit{\&} headache \textit{\&} hyperuricaemia \textit{\&} nausea \textit{\&} palpitations \textit{\&} seizures \textit{\&} skin reactions \textit{\&} sleep disorders \textit{\&} tremor \textit{\&} urinary disorders \textit{\&} vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Potentially serious hypokalaemia may result from beta-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose

Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see theophylline, under Emergency treatment of poisoning on p. 859.

UNLICENSED USE

SLO-PHYLlin \textregistered\textsuperscript{\textregistered} Slo-phyllin \textregistered\textsuperscript{\textregistered} capsules not licensed for use in children under 2 years.

CAUTIONS

Cardiac arrhythmias or other cardiac disease \textit{\&} epilepsy \textit{\&} fever \textit{\&} hypertension \textit{\&} hyperthyroidism \textit{\&} peptic ulcer \textit{\&} risk of hypokalaemia

INTERACTIONS

Appendix 1: theophylline

UNLICENSED USE

SLO-PHYLlin \textregistered\textsuperscript{\textregistered} Slo-phyllin \textregistered\textsuperscript{\textregistered} capsules not licensed for use in children under 2 years.

CAUTIONS

Cardiac arrhythmias or other cardiac disease \textit{\&} epilepsy \textit{\&} fever \textit{\&} hypertension \textit{\&} hyperthyroidism \textit{\&} peptic ulcer \textit{\&} risk of hypokalaemia

INTERACTIONS

Appendix 1: theophylline

SIDE-EFFECTS

Anxiety \textit{\&} arrhythmias \textit{\&} diarrhoea \textit{\&} dizziness \textit{\&} gastrointestinal discomfort \textit{\&} gastrooesophageal reflux disease \textit{\&} headache \textit{\&} hyperuricaemia \textit{\&} nausea \textit{\&} palpitations \textit{\&} seizure \textit{\&} skin reactions \textit{\&} sleep disorders \textit{\&} tremor \textit{\&} urinary disorders \textit{\&} vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Potentially serious hypokalaemia may result from beta-agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose

Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see theophylline, under Emergency treatment of poisoning on p. 859.

Pregnancy

Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

Breastfeeding

Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breastfeeding.

Hepatic Impairment

Manufacturer advises caution (risk of increased exposure).

Dose Adjustments

Manufacturer advises consider dose reduction.

Monitoring Requirements

In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (65–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

Directions for Administration

SLO-PHYLlin \textregistered\textsuperscript{\textregistered} Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

Prescribing and Dispensing Information

The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

Patient and Carer Advice

SLO-PHYLlin \textregistered\textsuperscript{\textregistered} Patient or carer should be given advice on how to administer theophylline modified release capsules.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVICE LABELS 21, 25

Theophylline 175 mg Nuelin SA 175mg tablets | 60 tablet £6.38 DT = £6.38

Theophylline 250 mg Nuelin SA 250 tablets | 60 tablet £8.92 DT = £8.92

Uniphyllin Continus (Napp Pharmaceuticals Ltd)

Theophylline 200 mg Uniphyllin Continus 200mg tablets | 56 tablet £12.96 DT + £12.96

Theophylline 300 mg Uniphyllin Continus 300mg tablets | 56 tablet £14.77 DT + £14.77

Theophylline 400 mg Uniphyllin Continus 400mg tablets | 56 tablet £16.65 DT + £16.65

Modified-release capsule

CAUTIONARY AND ADVICE LABELS 25

Slo-Phyllin (Merrick Serono Ltd)

Theophylline 60 mg Slo-Phyllin 60mg capsules | 56 capsule £2.76 DT = £2.76

Theophylline 125 mg Slo-Phyllin 125mg capsules | 56 capsule £3.48 DT = £3.48

Theophylline 250 mg Slo-Phyllin 250mg capsules | 56 capsule £4.34 DT = £4.34

Breathe

Theophylline inhaled 20 mg/litre (1 mg/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

INDICATIONS AND DOSE

MUCOCLEAR \textsuperscript{\textregistered} 3%

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) | Mild to moderate acute viral bronchiolitis in infants

BY INHALATION OF NEBULISED SOLUTION

Child: 4 mL 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Mucoclear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 30 mg per 1 ml | 20 ampoule - NHS indicative price = £12.98 \textit{\&} Drug Tariff (Part IXa) | 60 ampoule - NHS indicative price = £27.00 \textit{\&} Drug Tariff (Part IXa)

INDICATIONS AND DOSE

MUCOCLEAR \textsuperscript{\textregistered} 6%

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)

BY INHALATION OF NEBULISED SOLUTION

Child: 4 mL twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Mucoclear 6% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 60 mg per 1 ml | 20 ampoule - NHS indicative price = £12.98 \textit{\&} Drug Tariff (Part IXa) | 60 ampoule - NHS indicative price = £27.00 \textit{\&} Drug Tariff (Part IXa)

Nebuliser solutions
INDICATIONS AND DOSE

NEBUSALE
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
▶ BY INHALATION OF NEBULISED SOLUTION
▶ Child: 4 mL up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Resp Ease 6% inhalation solution 4ml vials (Venture Healthcare Ltd) | 60 vial - NHS indicative price = £21.60 - Drug Tariff (Part IXa)
Resp Ease 3% inhalation solution 4ml vials (Venture Healthcare Ltd) | 60 vial - NHS indicative price = £21.60 - Drug Tariff (Part IXa)
Resp Ease 7% inhalation solution 4ml vials (Venture Healthcare Ltd) | 60 vial - NHS indicative price = £21.60 - Drug Tariff (Part IXa)

Resp-Ease mobiliser can be used before treatment with bronchodilators to mobilise lower respiratory tract secretions in mucous consolidation.

PEAK FLOW METERS

Low Range

NEBUSALE 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial - NHS indicative price = £27.00 - Drug Tariff (Part IXa)

AirZone 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial - NHS indicative price = £27.00 - Drug Tariff (Part IXa)

MicroPeak 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial - NHS indicative price = £27.00 - Drug Tariff (Part IXa)

POCKETPEAK 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial - NHS indicative price = £27.00 - Drug Tariff (Part IXa)

nSpire Pocket Peak peak flow meter low range (nSpire Health Ltd) | 1 device - NHS indicative price = £6.53 - Drug Tariff (Part IXa) price = £4.50

MINI-WRIGHT STANDARD RANGE
Range 60–800 litres/minute.

MicroPeak peak flow meter standard range (Micro Medical Ltd) | 1 device - NHS indicative price = £6.50 - Drug Tariff (Part IXa) price = £4.50

MINI-WRIGHT STANDARD RANGE
Range 60–800 litres/minute.

MicroPeak peak flow meter standard range (Micro Medical Ltd) | 1 device - NHS indicative price = £6.50 - Drug Tariff (Part IXa) price = £4.50

Spacers

A2A SPACER
For use with all pressurised (aerosol) inhalers.

A2A Spacer (Clement Clarke International Ltd) | 1 device - NHS indicative price = £4.15 - Drug Tariff (Part IXa)

A2A Spacer with medium mask (Clement Clarke International Ltd) | 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

A2A Spacer with small mask (Clement Clarke International Ltd) | 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

ABLE SPACER
Small-volume device. For use with all pressurised (aerosol) inhalers.

Able Spacer (Clement Clarke International Ltd) | 1 device - NHS indicative price = £4.39 - Drug Tariff (Part IXa)

Able Spacer with medium mask (Clement Clarke International Ltd) | 1 device - NHS indicative price = £7.16 - Drug Tariff (Part IXa)

Able Spacer with small mask (Clement Clarke International Ltd) | 1 device - NHS indicative price = £7.16 - Drug Tariff (Part IXa)

AEROCHAMBER PLUS
Medium-volume device. For use with all pressurised (aerosol) inhalers.

AeroChamber Plus (Trudell Medical UK Ltd) | 1 device - NHS indicative price = £8.24 - Drug Tariff (Part IXa)

AeroChamber Plus with adult mask (Trudell Medical UK Ltd) | 1 device - NHS indicative price = £8.24 - Drug Tariff (Part IXa)
### Allergic conditions

**AeroChamber Plus with infant mask** (Trudell Medical UK Ltd)
1 device - NHS indicative price = £8.24 - Drug Tariff (Part IXa)

**BABYHALER®**
For paediatric use with *Fluixotide®,* and *Ventolin®* inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**
Not available for NHS prescription.

**Babyhaler** (GlaxoSmithKline UK Ltd)
1 device - No NHS indicative price available - Drug Tariff (Part IXa)

**HALERAI D®**
Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with *Fluixotide*, *Seretide®,* *Serevent®,* and *Ventolin®* inhalers.

**PRESCRIBING AND DISPENSING INFORMATION**
Not available for NHS prescription.

**Haleraid-120** (GlaxoSmithKline UK Ltd)
1 device - No NHS indicative price available - Drug Tariff (Part IXa)

**Haleraid-200** (GlaxoSmithKline UK Ltd)
1 device - No NHS indicative price available - Drug Tariff (Part IXa)

**OPTICHAMBER®**
For use with all pressurised (aerosol) inhalers.

**OptiChamber** (Respironics (UK) Ltd)
1 device - NHS indicative price = £4.28 - Drug Tariff (Part IXa)

**OptiChamber® DI AMOND**
For use with all pressurised (aerosol) inhalers.

**OptiChamber Diamond** (Respironics (UK) Ltd)
1 device - NHS indicative price = £4.49 - Drug Tariff (Part IXa)

**OptiChamber Diamond with large LiteTouch mask 5 years-old** (Respironics (UK) Ltd)
1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

**OptiChamber Diamond with medium LiteTouch mask 1–5 years** (Respironics (UK) Ltd)
1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

**OptiChamber Diamond with small LiteTouch mask 0–18 months** (Respironics (UK) Ltd)
1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

**POCKET CHAMBER®**
Small volume device. For use with all pressurised (aerosol) inhalers.

**Pocket Chamber** (nSpire Health Ltd)
1 device - NHS indicative price = £4.18 - Drug Tariff (Part IXa)

**Pocket Chamber with adult mask** (nSpire Health Ltd)
1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

**Pocket Chamber with child mask** (nSpire Health Ltd)
1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

**Pocket Chamber with infant mask** (nSpire Health Ltd)
1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

**Pocket Chamber with teenager mask** (nSpire Health Ltd)
1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

**SPACE CHAMBER PLUS®**
For use with all pressurised (aerosol) inhalers.

**Space Chamber Plus** (Medical Developments International Ltd)
1 device - NHS indicative price = £4.26 - Drug Tariff (Part IXa)

**Space Chamber Plus with large mask** (Medical Developments International Ltd)
1 device - NHS indicative price = £6.98 - Drug Tariff (Part IXa)

**Space Chamber Plus with medium mask** (Medical Developments International Ltd)
1 device - NHS indicative price = £6.98 - Drug Tariff (Part IXa)

**VOLUMATIC®**
Large-volume device. For use with *Clenil Modulate®,* *Fluixotide®,* *Seretide®,* *Serevent®,* and *Ventolin®* inhalers.

**Volumatic** (GlaxoSmithKline UK Ltd)
1 device - NHS indicative price = £3.88 - Drug Tariff (Part IXa)

**Volumatic with paediatric mask** (GlaxoSmithKline UK Ltd)
1 device - NHS indicative price = £6.63 - Drug Tariff (Part IXa)

**VORTEX®**
Medium-volume device. For use with all pressurised (aerosol) inhalers.

**Vortex Spacer** (Pari Medical Ltd)
1 device - NHS indicative price = £6.28 - Drug Tariff (Part IXa)

**Vortex with baby mask 0–2 years** (Pari Medical Ltd)
1 device - NHS indicative price = £7.29 - Drug Tariff (Part IXa)

**Vortex with child mask 2 years+** (Pari Medical Ltd)
1 device - NHS indicative price = £7.99 - Drug Tariff (Part IXa)

## Antihistamines, allergen immunotherapy and allergic emergencies

### Antihistamines

Antihistamines (histamine H₁-receptor antagonists) are classified as *sedating* or *non-sedating,* according to their relative potential for CNS depression. Antihistamines differ in their duration of action, incidence of drowsiness, and antimuscarinic effects; the response to an antihistamine may vary from child to child. Either a sedating or a non-sedating antihistamine may be used to treat an acute allergic reaction; for conditions with more persistent symptoms which require regular treatment, a non-sedating antihistamine should be used to minimise the risk of sedation and psychomotor impairment associated with sedating antihistamines.

Oral antihistamines are used in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and may be of some value in vasomotor rhinitis; rhinorrhoea and sneezing is reduced, but antihistamines are usually less effective for nasal congestion. Antihistamines are used topically to treat allergic reactions in the eye and in the nose. Topical application of antihistamines to the skin is not recommended.

An oral antihistamine may be used to prevent urticaria, and for the treatment of acute urticarial rash, pruritus, insect bites, and stings. Antihistamines are also used in the management of nausea and vomiting, of migraine, and the adjunctive management of anaphylaxis and angioedema.

The *non-sedating* antihistamine cetirizine hydrochloride p. 176 is safe and effective in children. Other non-sedating antihistamines that are used include acrivastine p. 176, bilastine p. 176, desloratadine p. 177 (an active metabolite of loratadine p. 178), fexofenadine hydrochloride p. 178 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 178 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 179. Most non-sedating antihistamines are long-acting (usually 12–24 hours). There is little evidence that desloratadine or levocetirizine hydrochloride confer any additional benefit—they should be reserved for children who cannot tolerate other therapies.

*Sedating* antihistamines are occasionally useful when insomnia is associated with urticaria and pruritus. Most of the sedating antihistamines are relatively short-acting, but promethazine may be effective for up to 12 hours. Alimemazine tartrate p. 180 and *promethazine* have a more sedative effect than chlorphenamine maleate p. 180 and cyclizine p. 266. Chlorphenamine maleate is used as an adjunct to adrenaline/epinephrine p. 138 in the emergency treatment of anaphylaxis and angioedema.

### Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can improve symptoms of asthma and...
allergic rhinoconjunctivitis in children. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in children with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Children requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 167 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed for use as additional therapy in children over 6 years with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta agonist. Omalizumab should be initiated by physicians experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H₁ antihistamine treatment.

**Anaphylaxis and allergic emergencies**

**Anaphylaxis**

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Children with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis (see Food allergy p. 62). Medicinal products particularly associated with anaphylaxis include blood products, vaccines, allergen immunotherapy preparations, antibacterials, aspirin p. 93 and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

**Treatment of anaphylaxis**

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema. First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the child flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine by intramuscular injection; the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function;
- administering high-flow oxygen and intravenous fluids;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection as adjunctive treatment given after adrenaline.

Administering an intravenous corticosteroid such as hydrocortisone p. 456 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected children. Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 158, inhaled ipratropium bromide p. 155, intravenous aminophylline p. 150, or intravenous magnesium sulfate p. 618 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a child is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route, or by the intramuscular route if venous access is difficult; for details see adrenaline/epinephrine.

On discharge, child should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. The child, or carer, should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Children who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine p. 138 in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Children with severe allergy, and their carers, should ideally be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

**Intravenous adrenaline (epinephrine)**

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

Where the child is severely ill and there is real doubt about adequacy of the circulation and absorption from the intramuscular injection site, adrenaline/epinephrine may be given by slow intravenous injection, repeated according to response; if multiple doses are required consider giving adrenaline by slow intravenous infusion.

It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Adrenaline/epinephrine is also given by the intravenous route for acute hypotension.

**Angioedema**

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection, oxygen, antihistamines and corticosteroids should be given as described under Anaphylaxis. Tracheal intubation may be necessary. In some children with laryngeal oedema, adrenaline 1 in 1000 (1 mg/mL) solution may be given by nebuliser. However, nebulised adrenaline/epinephrine cannot be relied upon for a systemic effect—intramuscular adrenaline/epinephrine should be used.

**Hereditary angioedema**

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks,
including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 186 (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical, or surgical procedures. Tranexamic acid p. 83 is used for short-term or long-term prophylaxis of hereditary angioedema; short-term prophylaxis is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards. Danazol [unlicensed indication] is best avoided in children because of its androgenic effects, but it can be used for short-term prophylaxis of hereditary angioedema.

**Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals**

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child 1 month–5 years</td>
<td>150 micrograms</td>
<td>0.15 mL 1 in 1000 (1 mg/mL) adrenaline¹</td>
</tr>
<tr>
<td>Child 6–11 years</td>
<td>300 micrograms</td>
<td>0.3 mL 1 in 1000 (1 mg/mL) adrenaline²</td>
</tr>
<tr>
<td>Child 12–17 years</td>
<td>500 micrograms</td>
<td>0.5 mL 1 in 1000 (1 mg/mL) adrenaline²</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

**ANTIHISTAMINES > NON-SEDATING**

**Acrivastine**

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria
  - **BY MOUTH**
  - Child 12–17 years: 8 mg 3 times a day

- **CONTRA-INDICATIONS**
  Avoid in Acute porphyrias p. 624

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

- **SIDE-EFFECTS**
  - **Common or very common** Drowsiness - dry mouth

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

- **PREGNANCY**
  - Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING**
  - Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION**
  Take tablet 1 hour before or 2 hours after food or fruit juice.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer bilastine tablets.

- **Driving and skilled tasks**
  Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Benadryl Allergy Relief** (McNeil Products Ltd)
  - Acrivastine 8 mg
  - Benadryl Allergy Relief 8mg capsules
  - 24 capsule £5.45 | 48 capsule £9.31

**Bilastine**

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergic rhinoconjunctivitis and urticaria
  - **BY MOUTH**
  - Child 12–17 years: 20 mg once daily

- **CONTRA-INDICATIONS**
  Avoid in Acute porphyrias p. 624

- **INTERACTIONS** → Appendix 1: antihistamines, non-sedating

- **SIDE-EFFECTS**
  - **Common or very common** Drowsiness - headache
  - **Uncommon** Anxiety - appetite increased - asthenia - bundle branch block - diarrhoea - dry mouth - dyspnoea - fever - gastritis - gastrointestinal discomfort - insomnia - nasal complaints - nausea - oral herpes - pre-existing condition improved - pruritus - QT interval prolongation - sinus arrhythmia - thirst - tinnitus - vertigo - weight increased

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

**Cetirizine hydrochloride**

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis
  - **BY MOUTH**
  - Child 1 year: 250 micrograms/kg twice daily
  - Child 2–5 years: 2.5 mg twice daily
  - Child 6–11 years: 5 mg twice daily
  - Child 12–17 years: 10 mg once daily
Desloratadine

INDICATIONS AND DOSE
Symptomatic relief of allergy such as allergic rhinitis, urticaria, chronic idiopathic urticaria

BY MOUTH
Child 1-5 years: 1.25 mg once daily
Child 6-11 years: 2.5 mg once daily
Child 12-17 years: 5 mg once daily

PHARMACOKINETICS
Desloratadine is a metabolite of loratadine.

INTERACTIONS → Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS
Common or very common Asthenia · dry mouth · headache
Rare or very rare Akathisia · arrhythmias · diarrhoea · dizziness · drowsiness · gastrointestinal discomfort · hallucination · hepatic disorders · insomnia · myalgia · nausea · palpitations · seizure · vomiting
Frequency not known Behaviour abnormal · photosensitivity reaction · QT interval prolongation

INTERACTIONS → Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS
Uncommon Agitation · asthenia · diarrhoea · malaise · paraesthesia · skin reactions
Rare or very rare Aggression · angioedema · confusion · depression · hallucination · hepatic function abnormal · insomnia · movement disorders · ocuolgyration · oedema · seizure · syncope · tachycardia · taste altered · thrombocytopenia · tic · tremor · urinary disorders · vision disorders · weight increased

Frequency not known Abdominal pain · appetite increased · dizziness · drowsiness · dry mouth · headache · memory loss · nausea · pharyngitis · suicidal ideation · vertigo

SIDE-EFFECTS, FURTHER INFORMATION
Non-sedating antihistamines such as cetirizine hydrochloride cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

RARE IMPAIRMENT
Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

Dose adjustments
Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m².

Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Cetirizine for hay fever

Driving and skilled tasks
Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
Cetirizine Tablets 10 mg may be prescribed.

Cetirizine Oral Solution 5 mg/5 mL may be prescribed.

■ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution
EXCIPIENTS: May contain Propylene glycol, sorbitol

■ Desloratadine (Non-proprietary)
Desloratadine 500 microgram per 1 ml
Cetirizine hydrochloride 1 mg per 1 ml
Cetirizine 1mg/ml oral solution sugar-free sugar-free | 200 ml (PO) £1.12 DT = £1.12

■ Tablet
Cetirizine hydrochloride (Non-proprietary)

Cetirizine hydrochloride 10 mg
Cetirizine 10mg tablets | 30 tablet (PO) £0.85–0.86 DT = £0.86

Cetirizine hydrochloride 10 mg
Benadryl Allergy Liquid Release 10mg capsules | 7 capsule (PO) £3.09 DT = £3.09

■ Capsule
Benadryl Allergy (McNeil Products Ltd)
Cetirizine hydrochloride 10 mg
Benadryl Allergy Liquid Release 10mg capsules | 7 capsule (PO) £3.09 DT = £3.09
Fexofenadine hydrochloride 22-May-2017

**INDICATIONS AND DOSE**
Symptomatic relief of seasonal allergic rhinitis
- **BY MOUTH**
  - Child 6-11 years: 30 mg twice daily
  - Child 12-17 years: 120 mg once daily
Symptomatic relief of chronic idiopathic urticaria
- **BY MOUTH**
  - Child 12-17 years: 180 mg once daily

**PHARMAKINETICS**
Fexofenadine is a metabolite of terfenadine.

**INTERACTIONS**
Appendix 1: antihistamines, non-sedating

**SIDE-EFFECTS**
- Common or very common: Dizziness, drowsiness, headache, nausea
- Uncommon: Fatigue
- Frequency not known: Diarrhoea, nervousness
- Palpitations, skin reactions, sleep disorders, tachycardia

**INTERACTIONS, FURTHER INFORMATION**
Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

**PREGNANCY**
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**SIDE-EFFECTS, FURTHER INFORMATION**
Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

**PREGNANCY**
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**RENAI IMPAIRMENT**
Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**Dose adjustments**
Reduce dose frequency to every 2 days if estimated glomerular filtration rate 30–50 mL/minute/1.73 m².
Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**
Driving and skilled tasks: Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Levocetirizine dihydrochloride 24-May-2017

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria
- **BY MOUTH**
  - Child 2-11 years (body-weight up to 31 kg): 5 mg once daily
  - Child 2-11 years (body-weight 31 kg and above): 10 mg once daily
  - Child 12-17 years: 10 mg once daily

**INTERACTIONS**
Appendix 1: antihistamines, non-sedating

**SIDE-EFFECTS**
- Common or very common: Drowsiness, fatigue, headache, nervousness
- Uncommon: Appetite increased, insomnia

Loratadine 22-May-2017

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria
- **BY MOUTH**
  - Child 2-11 years (body-weight up to 31 kg): 5 mg once daily
  - Child 2-11 years (body-weight 31 kg and above): 10 mg once daily
  - Child 12-17 years: 10 mg once daily
Rare or very rare Hypersensitivity

Frequency not known Asthma exacerbated - bronchospasm
- QT interval prolongation

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT Manufacturer advises initial dose adjustment in severe hepatic impairment.

PATIENT AND CARER ADVICE
- Driving and skilled tasks: Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution
- Loratadine (Non-proprietary)
  - Loratadine 1 mg per 1 ml Loratadine 5 mg/5 ml oral solution
  - 100 ml (P30) £1.95 DT + £1.55
  - Loratadine 5 mg/5 ml oral solution sugar free sugar-free
  - 100 ml (P30) N

Tablet
- Loratadine (Non-proprietary)
  - Loratadine 10 mg Loratadine 10 mg tablets | 30 tablet (P) £1.44 DT + £0.71

Oral lycopilisate
- Claritin (Loratadine) (Bayer Plc)
  - Loratadine 10 mg Claritin Rapid Allergy 10 mg tablets sugar-free
  - 10 tablet (G3) £3.24 DT + £3.24

Mizolastine

INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever, urticaria
- BY MOUTH
  - Child 12-17 years: 10 mg once daily

CONTRA-INDICATIONS Cardiac disease - hypokalaemia - susceptibility to QT-interval prolongation

INTERACTIONS Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS
Common or very common Appetite increased - asthenia
- diarrhoea - dizziness - drowsiness - dry mouth - gastrointestinal discomfort - headache - nausea - weight increased
- Uncommon Anxiety - arthropathies - arthralgia - depression - myalgia - palpitations

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as rupatadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

Rupatadine

DRUG ACTION Rupatadine is a second generation non-sedating antihistamine.

INDICATIONS AND DOSE
Symptomatic relief of allergic rhinitis and urticaria
- BY MOUTH USING TABLETS
  - Child 12-17 years: 10 mg once daily
  - BY MOUTH USING ORAL SOLUTION
  - Child 2-11 years (body-weight 10-24 kg): 2.5 mg once daily
  - Child 2-11 years (body-weight 25 kg and above): 5 mg once daily

CAUTIONS History of QT-interval prolongation - predisposition to arrhythmia - uncorrected hypokalaemia

INTERACTIONS Appendix 1: antihistamines, non-sedating

SIDE-EFFECTS
Common or very common Asthenia - dizziness - drowsiness - dry mouth - headache
- Uncommon Appetite increased - arthralgia - back pain - concentration impaired - constipation - cough - diarrhoea - dry throat - eosinophilia - epistaxis - fever - gastrointestinal discomfort - increased risk of infection - irritability - malaise - myalgia - nasal dryness - nausea - neutropenia - night sweats - oropharyngeal pain - skin reactions - thirst - vomiting - weight increased
- Rare or very rare Palpitations - tachycardia

SIDE-EFFECTS, FURTHER INFORMATION Non-sedating antihistamines such as rupatadine cause less sedation and psychomotor impairment than the older antihistamines, but can still occur; sedation is generally minimal. This is because non-sedating antihistamines penetrate the blood brain barrier to a much lesser extent.

PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
BREAST FEEDING  Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT  Manufacturer advises avoid (no information available).

RENAL IMPAIRMENT  Manufacturer advises avoid—no information available.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Oral solution
- Rupatadine (Non-proprietary)
  Rupatadine (as Rupatadine fumarate) 1 mg per 1 ml Rupatadine 1mg/ml oral solution | 120 ml (PO) £17.95

Tablet
- Rupatadine (Non-proprietary)
  Rupatadine (as Rupatadine fumarate) 10 mg  Rupatadine 10mg tablets | 30 tablet (PO) £30.00

SIDE-EFFECTS, FURTHER INFORMATION  Drowsiness may diminish after a few days.

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight.

Children are more susceptible to side-effects.

PREGNANCY  Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING  Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT  Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT  Manufacturer advises avoid—no information available.

CAUTIONARY AND ADVISORY LABELS

Driving and skilled tasks  Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Oral solution
- Alimemazine tartrate (Non-proprietary)
  Alimemazine tartrate 1.5 mg per 1 ml
  Alimemazine tartrate 6 mg per 1 ml

Tablet
- Alimemazine tartrate (Non-proprietary)
  Alimemazine tartrate 10 mg Alimemazine 10mg tablets | 28 tablet (PO) £112.85

INDICATIONS AND DOSE  Urticaria | Pruritus

BY MOUTH
- Child 6 months—1 year (specialist use only): 250 micrograms/kg 3–4 times a day (max. per dose 2.5 mg)
- Child 2–4 years: 2.5 mg 3–4 times a day
- Child 5–11 years: 5 mg 3–4 times a day
- Child 12–17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day

Premedication to anaesthesia

BY MOUTH
- Child 2–6 years: Up to 2 mg/kg, to be given 1–2 hours before operation

UNLICENSED USE  Not licensed for use in children under 2 years.

CONTRA-INDICATIONS  Children under 2 years except on specialist advice (safety of such use has not been established) - epilepsy - hepatic dysfunction - history of narrow angle glaucoma - hypothyroidism - myasthenia gravis - neonate (due to significant antimuscarinic activity) (in neonates) - Parkinson’s disease - phaeochromocytoma - renal dysfunction

CAUTIONS  Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) - exposure to sunlight should be avoided during treatment with high doses - pyloroduodenal obstruction - urinary retention - volume depleted patients who are more susceptible to orthostatic hypotension

INTERACTIONS  → Appendix 1: antihistamines, sedating

SIDE-EFFECTS  Agitation - agranulocytosis - amenorrhoea - ativoventricular block - autonomic dysfunction - bile thrombus - consciousness impaired - drug fever - dry mouth - eosinophilia - erectile dysfunction - eye disorder - galactorrhoea - gynaecomastia - hepatic disorders - hyperprolactinaemia - hyperthermia - hypotension - insomnia - leucopenia (on prolonged high dose) - movement disorders - muscle rigidity - nasal congestion - neuroleptic malignant syndrome - pallor - parkinsonism - photosensitivity reaction - postural hypotension (more common in the elderly or in volume depletion) - QT interval prolongation - respiratory depression - seizure - skin reactions - tardive dyskinesia (more common after long term high doses) - tremor - ventricular fibrillation

INCREDIBLE RISK THEMED ON PROLONGED INHALE - HYPOKALAMIA AND CARDIO- DEPRESSANTS

Chlorphenamine maleate

ICHORPHENAMINE MALEATE  (Chlorpheniramine maleate)
Emergency treatment of anaphylactic reactions

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1-5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
  - Child 6 months-5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
  - Child 6-11 years: 5 mg, repeated if necessary; maximum 4 doses per day
  - Child 12-17 years: 10 mg, repeated if necessary; maximum 4 doses per day

Driving and skilled tasks  Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary  Chlorphenamine tablets may be prescribed. Chlorphenamine oral solution may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

- With intramuscular use or intravenous use Prescription only medicine restriction does not apply to chlorphenamine injection where administration is for saving life in emergency.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- Chlorphenamine maleate (Non-proprietary)
  - Chlorphenamine maleate 400 microgram per 1 ml Chlorphenamine 10mg/1ml solution for injection ampoules | 5 ampoule £22.48-
  - Allerlie (Crescent Pharma Ltd)
    - Chlorphenamine maleate 400 microgram per 1 ml Allerlie 2mg/5ml oral solution sugar-free | 150 ml £2.78 DT + £2.21
  - Piriton (GlaxoSmithKline Consumer Healthcare)
    - Chlorphenamine maleate 400 microgram per 1 ml Piriton 2mg/5ml syrup | 150 ml £2.78 DT + £2.78

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 2**

- Chlorphenamine maleate (Non-proprietary)
  - Chlorphenamine maleate 400 microgram per 1 ml Chlorphenamine 2mg/5ml oral solution sugar free sugar-free | 150 ml £2.78 DT + £2.21
  - Allerlie (Crescent Pharma Ltd)
    - Chlorphenamine maleate 400 microgram per 1 ml Allerlie 2mg/5ml oral solution sugar-free | 150 ml £2.21 DT + £2.21

    - Chlorphenamine maleate 4 mg Piriton 4mg tablets | 500 tablet £6.96
    - Piriton Allergy 4mg tablets | 30 tablet £2.06 | 60 tablet £3.73
  - Pollenase (chlorphenamine) (EM Pharma)
    - Chlorphenamine maleate 4 mg Pollenase Antihistamine 4mg tablets | 30 tablet £1.00

**Hydroxyzine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Pruritus**
    - **BY MOUTH**
      - Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day
      - Child 6-17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day
      - Child 6-17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased continued →
Respiratory system

Frequency not known

SIDE-EFFECTS

CAUTIONS

CONTRA-INDICATIONS

Hydroxyzine is contra-indicated in patients with
predisposition to QT interval prolongation — including
atrial fibrillation, valve disease, or prior history of
ventricular arrhythmia. Hydroxyzine is also contra-
indicated in patients with QT prolongation
(>500ms) — include signiﬁcant electrolyte imbalance,
prolongation of the QT interval due to concurrent
administration of other medicines that effect the QT
interval, or signiﬁcant electrolyte imbalance,
especially hypokalaemia or hypomagnesaemia.

Hydroxyzine may also cause QT interval
prolongation and torsade de pointes; these events
are most likely to occur in patients who have risk
factors for QT prolongation, e.g. concomitant use of
drugs that prolong the QT interval, cardiovascular
disease, family history of sudden cardiac death,
signiﬁcant electrolyte imbalance (low plasma-potassium
or plasma-magnesium concentrations), or signiﬁcant
bradycardia.

To minimise the risk of such adverse effects, the
following dose restrictions have been made and new
cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with
prolonged QT-interval or who have risk factors for QT-
interval prolongation;
- Consider the risks of QT-interval prolongation and
torsade de points before prescribing to patients
taking drugs that lower heart rate or plasma-
potassium concentration;
- In children with body-weight up to 40 kg, the
maximum daily dose is 2 mg/kg;
- The lowest effective dose for the shortest period of
  time should be prescribed.

CONTRA-INDICATIONS

Acquired or congenital QT interval
prolongation — predisposition to QT interval prolongation

CONTRA-INDICATIONS, FURTHER INFORMATION

QT interval prolongation — Risk factors for QT interval
prolongation include signiﬁcant electrolyte imbalance,
bradycardia, cardiovascular disease, and family history of
sudden cardiac death.

CAUTIONS

Bladder outﬂow obstruction — breathing
problems — cardiovascular disease — children — decreased
gastrointestinal motility — dementia — epilepsy —
hypertension — hyperthyroidism — myasthenia gravis —
yloroduodenal obstruction — stenosing peptic ulcer —
susceptibility to angle-closure glaucoma — urinary
retention.

CAUTIONS, FURTHER INFORMATION

Children have an increased susceptibility to side-effects, particularly CNS
effects.

INTERACTIONS

Rare or very rare — Severe cutaneous adverse reactions
(SCARs) — skin reactions

Frequency not known — Agranulocytosis — alopecia —
anticholinergic syndrome — anxiety — appetite decreased —
arrhythmias — asthma — blood disorder — bronchial
secretion viscosity increased — chest tightness — chills —
coma — concentration impaired — confusion — constipation
— depression — diarrhoea — dizziness — drowsiness — dry mouth —
dry throat — dyskinesia (on discontinuation) — epigastric
pain — fever — flushing — gastrointestinal disorders —
haemolytic anaemia — hallucination — headache — hepatic
function abnormal — hyperhidrosis — hypotension —
irritability — labyrinthitis — leucopenia — malaise —
menstruation irregular — movement disorders — myalgia —
nasal congestion — nausea — palpitations — paraesthesia — QT
interval prolongation — respiratory disorders — respiratory
tract dryness — seizure (with high doses) — sexual
dysfunction — sleep disorders — speech slurred — taste bitter —
thrombocytopenia — tinnitus — tremor (with high doses) —
urinary disorders — vertigo — vision disorders — vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Paradoxical stimulation may occur rarely, especially with high doses.
Drowsiness may diminish after a few days of treatment.

ALLERGY AND CROSS-SENSITIVITY

Hydroxyzine should be avoided in patients with previous
hypersensitivity to cetirizine or other piperazine
derivatives, and aminophylline.

PREGNANCY

Manufacturers advise avoid—toxicity in animal studies with higher doses. Use in the latter part of
the third trimester may cause irritability, paradoxical
excitability, and tremor in the neonate.

BREAST FEEDING

Manufacturers advise avoid—expected to be present in milk but effect unknown.

HEPATIC IMPAIRMENT

Manufacturers advise caution in mild to moderate impairment (increased risk of
accumulation); avoid in severe impairment.

Dose adjustments — Manufacturer advises dose reduction of
33% in mild to moderate impairment.

RENAL IMPAIRMENT

Dose adjustments — Manufacturers advise reduce daily dose
by half in moderate to severe renal impairment.

EFFECT ON LABORATORY TESTS

May interfere with methacholine test — manufacturer advises stop treatment
96 hours prior to test. May interfere with skin testing for
allergy—manufacturer advises stop treatment one week
prior to test.

PATIENT AND CARER ADVISE

Driving and skilled tasks — Drowsiness may affect
performance of skilled tasks (e.g. cycling or driving);
seating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of
different medicines containing the same drug. Forms available
from special-order manufacturers include: oral suspension, oral
solution

Tablet

CAUTIONARY AND ADVISORY LABELS

Hydroxyzine hydrochloride (Non-proprietary)

Hydroxyzine hydrochloride 10 mg Hydroxyzine 10mg tablets 84 tablet (P) £1.20–£1.65 DT = £1.65

Hydroxyzine hydrochloride 25 mg Hydroxyzine 25mg tablets 28 tablet (P) £0.62–£0.85 DT = £0.85

Atarax (Alliance Pharmaceuticals Ltd)

Hydroxyzine hydrochloride 10 mg Atarax 10mg tablets 84 tablet (P) £1.20 DT = £1.65

Hydroxyzine hydrochloride 25 mg Atarax 25mg tablets 28 tablet (P) £0.62–£0.85

Ketotifen

INDICATIONS AND DOSE

Allergic rhinitis

BY MOUTH

Child 3–17 years: 1 mg twice daily

CONTRA-INDICATIONS

Avoid in Acute porphyrias p. 624—
neonate (due to signiﬁcant antimuscarinic activity)

CAUTIONS

Epilepsy — pyloroduodenal obstruction —
susceptibility to angle-closure glaucoma — urinary
retention

INTERACTIONS

Rare or very rare — Anxiety — insomnia — irritability

Uncommon — Cystitis — dizziness — dry mouth — skin reactions

SIDE-EFFECTS

Common or very common — Antihistamines, sedating

SIDE-EFFECTS, FURTHER INFORMATION

Drowsiness is a significant side-effect with most of the older
antihistamines although paradoxical stimulation may
occurs rarely, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

### PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

### BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

### PATIENT AND CARER ADVICE
Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

### Promethazine hydrochloride

#### INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

- **BY MOUTH**
  - Child 2–4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
  - Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
  - Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily

**Sedation (short-term use)**

- **BY MOUTH**
  - Child 2–4 years: 15–20 mg
  - Child 5–9 years: 20–25 mg
  - Child 10–17 years: 25–50 mg

**Sedation in intensive care**

- **BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1 month–11 years: 0.5–1 mg/kg 4 times a day (max. per dose 25 mg), adjusted according to response
  - Child 12–17 years: 25–50 mg 4 times a day, adjusted according to response

**Nausea, Vomiting, Vertigo, Labyrinthine disorders, Motion sickness**

- **BY MOUTH**
  - Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
  - Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
  - Child 10–17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN**

**Child 6 years** should not be given over-the-counter cough and cold medicines containing promethazine.

**CONTRA-INDICATIONS**
Neonate (due to significant antimuscarinic activity) should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established.

### CAUTIONS

#### GENERAL CAUTIONS
Epilepsy: pyloroduodenal obstruction; severe coronary artery disease; susceptibility to angle-closure glaucoma; urinary retention

#### SPECIFIC CAUTIONS

- With intravenous use: Avoid extravasation with intravenous injection

### INTERACTIONS
Appendix 1: antihistamines, sedating

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

#### SPECIFIC SIDE-EFFECTS

### PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

### BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

### HEPATIC IMPAIRMENT
Manufacturer advises caution.

### RENAL IMPAIRMENT
Use with caution.

### PATIENT AND CARER ADVICE
Driving and skilled tasks: Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

### PROFESSIONAL SPECIFIC INFORMATION

**Dental practitioners’ Formulary**

Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.

Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 ml may be prescribed.

### LESS SUITABLE FOR PRESCRIBING
Promethazine is less suitable for prescribing for sedation.

### EXCEPTIONS TO LEGAL CATEGORY
Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

**EXCIPIENTS:** May contain Sulfites
- **Phenergan** (Sanofi)
  - Promethazine hydrochloride 25 mg per 1 ml Phenergan 25mg/1ml solution for injection ampoules | 10 ampoule (P) £6.74

**Oral solution**

**EXCIPIENTS:** May contain Sodium
- **Phenergan** (Sanofi)
  - Promethazine hydrochloride 1 mg per 1 ml Phenergan 5mg/5ml elixir sugar-free | 100 ml (P) £2.85 OT + £2.85

**Tablet**

**EXCIPIENTS AND ADVISORY LABELS** 2
- **Promethazine hydrochloride 10 mg** Promethazine hydrochloride 10mg tablets | 56 tablet (P) £3.56 OT + £3.41
- **Promethazine hydrochloride 25 mg** Promethazine hydrochloride 25mg tablets | 56 tablet (P) £4.65 OT + £4.65
- **Phenergan** (Sanofi)
  - Promethazine hydrochloride 10 mg Promethazine hydrochloride 10mg tablets | 56 tablet (P) £2.96 OT + £3.41
- **Promethazine hydrochloride 25 mg** Promethazine hydrochloride 25mg tablets | 56 tablet (P) £4.65 OT + £4.65
- **Somineic** (Teva UK Ltd)
  - Promethazine hydrochloride 20 mg Somineic 20mg tablets | 8 tablet (P) £1.89 | 16 tablet (P) £2.69

**VACCINES > ALLERGEN-TYPE**

**Grass pollen extract**

**INDICATIONS AND DOSE**
- **Hypersensitivity to bee venom**
  - **BY SUBCUTANEOUS INJECTION**
  - Child: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- Hypersensitivity to wasp and bee venom.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS** Children under 5 years - consult product literature

**CAUTIONS** Consult product literature

**INTERACTIONS** → Appendix 1: bee venom extract

**SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Life-threatening hypersensitivity reactions can occur. Cardiopulmonary resuscitation must be immediately available. Manufacturer advises monitoring for at least 1 hour after injection.

**PREGNANCY** Avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing desensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- **Pharmalgen®** for the treatment of bee and wasp venom allergy (February 2012) NICE TA246

Pharmalgen® is an option for the treatment of IgE-mediated bee and wasp venom allergy in those who have had:
- A severe systemic reaction to bee or wasp venom, or
- A moderate systemic reaction to bee or wasp venom and who have a raised baseline serum-tryptase concentration, a high risk of future stings, or anxiety about future stings.

Treatment with Pharmalgen® should be initiated and monitored in a specialist centre experienced in venom immunotherapy, www.nice.org.uk/guidance/ta246

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Bee Venom** (ALK-Abello Ltd)
  - **Bee venom 120 nanogram** Pharmalgen Bee Venom 120nanogram powder and solvent for solution for injection vials | 1 vial (P) £65
  - **Bee venom 1.2 microgram** Pharmalgen Bee Venom 1.2microgram powder and solvent for solution for injection vials | 1 vial (P) £2.65
  - **Bee venom 12 microgram** Pharmalgen Bee Venom 12microgram powder and solvent for solution for injection vials | 1 vial (P) £3.85
  - **Bee venom 120 microgram** Pharmalgen Bee Venom maintenance set 120microgram powder and solvent for solution for injection vials | 4 vial (P) £150.00

**INDICATIONS AND DOSE**

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

- **BY SUBCUTANEOUS INJECTION**
- Child: (consult product literature)

Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

- **BY MOUTH**
  - Child 5-17 years: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

**IMPORTANT SAFETY INFORMATION**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- Hypersensitivity to wasp and bee venom.

Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS** Children under 5 years - consult product literature

**CAUTIONS** Consult product literature

**INTERACTIONS** → Appendix 1: grass pollen extract

**SIDE-EFFECTS**

SIDE-EFFECTS, FURTHER INFORMATION Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria,
bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

- **PREGNANCY** Should be avoided in pregnant women—consult product literature.

- **MONITORING REQUIREMENTS** The first dose of grass pollen extract (Grazax®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Suspension for Injection**
  - Pollinex Trees (Allergy Therapeutics (UK) Ltd)
  - Pollinex Grasses + Rye for injection treatment and extension course vials | 4 vial(£450.00)

  **Oral lyophilisate**
  - Grazax (ALK-Abello Ltd)
  - Phleum pratense 75,000 SQ-T Grazax 75,000 SQ-T oral lyophilisates sugar-free | 30 tablet(£80.12 DT = £80.12)

**Tree pollen extract**

- **INDICATIONS AND DOSE** Treatment of seasonal allergic hay fever due to tree pollen in patients who have failed to respond to anti-allergy drugs
  - **BY SUBCUTANEOUS INJECTION**
  - **Child:** (consult product literature)

**Wasp venom extract**

- **INDICATIONS AND DOSE**
  - Hypersensitivity to wasp venom
  - BY SUBCUTANEOUS INJECTION
  - Child: (consult product literature)

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:
- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venom.

Therapy should be observed until these have resolved completely.

- **CONTRA-INDICATIONS** Children under 5 years - consult product literature

- **CAUTIONS** Consult product literature

- **INTERACTIONS** Appendix 1: wasp venom extract

- **SIDE-EFFECTS**

  **FURTHER INFORMATION** Hypersensitivity reactions to wasp venom extracts can be life-threatening; cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

- **PREGNANCY** Avoid.

**PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

**CONTRA-INDICATIONS** Children under 5 years - consult product literature

**CAUTIONS** Consult product literature

**INTERACTIONS** Appendix 1: wasp venom extract

**SIDE-EFFECTS**

**FURTHER INFORMATION** Hypersensitivity reactions to wasp venom extracts can be life-threatening; cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

2.1 Angioedema

**DRUGS USED IN HEREDITARY ANGIOEDEMA**

**C1-esterase inhibitor**

**INDICATIONS AND DOSE**

**BERINERT®**

Acute attacks of hereditary angioedema (under expert supervision)
- **By slow intravenous injection, or by intravenous infusion**
  - Child: 20 units/kg

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- **By slow intravenous injection, or by intravenous infusion**
  - Child: 15–30 units/kg (max. per dose 1000 units) for 1 dose; to be administered less than 6 hours before procedure

**CINRYZE®**

Acute attacks of hereditary angioedema (under expert supervision)
- **By slow intravenous injection**
  - Child 2–11 years (body-weight 10–25 kg): 500 units for 1 dose, dose may be repeated if necessary after 60 minutes
  - Child 2–11 years (body-weight 26 kg and above): 1000 units for 1 dose, dose may be repeated if necessary after 60 minutes
  - Child 12–17 years: 1000 units for 1 dose, dose may be repeated if necessary after 60 minutes (or sooner for patients experiencing laryngeal attacks if treatment initiation is delayed)

Short-term prophylaxis of hereditary angioedema before dental, medical, or surgical procedures (under expert supervision)
- **By slow intravenous injection**
  - Child 2–11 years (body-weight 10–25 kg): 500 units for 1 dose, to be administered up to 24 hours before procedure

**INTERACTIONS**

- Appendix 1: icatibant

**SIDE-EFFECTS**

- Rare or very rare: Dyspnoea, flushing, headache, hypotension, hypertension, hypotension, nausea, tachycardia, thrombosis (with high doses), urticaria

**PREGNANCY**

Manufacturer advises avoid unless essential.

**NATIONAL FUNDING/ACCESS DECISIONS**

**CINRYZE®**

All Wales Medicines Strategy Group (AWMSG) decisions

The All Wales Medicines Strategy Group has advised (October 2017) that C1-esterase inhibitor (Cinryze®) is recommended as an option for use within NHS Wales for the treatment and pre-procedure prevention of angioedema attacks in patients 2 years old and above, with hereditary angioedema (HAE); routine prevention of angioedema attacks in patients 6 years old and above, with severe and recurrent attacks of HAE, who are intolerant to or insufficiently protected by oral prevention treatments, or patients who are inadequately managed with repeated acute treatment.

**INTERACTIONS**

- Appendix 1: icatibant

**CAUTIONS**

- Vaccination against hepatitis A and hepatitis B may be required.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Wasp Venom** (ALK-Abello Ltd)
  - Wasp venom 120 nanogram: Pharmalgen Wasp Venom 120 nanogram powder and solvent for solution for injection vials | 1 vial (POM) £150.00
  - Wasp venom 1.2 microgram: Pharmalgen Wasp Venom 1.2 microgram powder and solvent for solution for injection vials | 1 vial (POM) £550.00
  - Wasp venom 12 microgram: Pharmalgen Wasp Venom 12 microgram powder and solvent for solution for injection vials | 1 vial (POM) £550.00
  - Wasp venom 120 microgram: Pharmalgen Wasp Venom 120 microgram powder and solvent for solution for injection vials | 1 vial (POM) £550.00

- **Berinert** (CSL Behring UK Ltd)
  - C1-esterase inhibitor 500 unit: Berinert 500 unit powder and solvent for solution for injection vials | 1 vial (POM) £550.00 DT = £650.00
  - C1-esterase inhibitor 1500 unit: Berinert 1500 unit powder and solvent for solution for injection vials | 1 vial (POM) £1,650.00 DT = £1,650.00

- **Cinryze (Shire Pharmaceuticals Ltd)**
  - C1-esterase inhibitor 500 unit: Cinryze 500 unit powder and solvent for solution for injection vials | 2 vials (POM) £1,336.00

**DRUGS USED IN HEREDITARY ANGIOEDEMA**

**SELECTIVE BRADYKININ B2 ANTAGONISTS**

**ICATIBANT**

**INDICATIONS AND DOSE**

Acute attacks of hereditary angioedema in patients with C1-esterase inhibitor deficiency
- **By subcutaneous injection**
  - Child 2–17 years (body-weight 12 kg and above): (consult product literature)

**INTERACTIONS**

- Appendix 1: icatibant

**CAUTIONS**

- Ischaemic heart disease - stroke
3 Conditions affecting sputum viscosity

MUCOLYTICS

Carbocisteine

• INDICATIONS AND DOSE
  Reduction of sputum viscosity
    • BY MOUTH
      • Child 2–4 years: 62.5–125 mg 4 times a day
      • Child 5–11 years: 250 mg 3 times a day
      • Child 12–17 years: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

IMPORTANT SAFETY INFORMATION
Mucodyne Paediatric® syrup 250 mg/5 mL has replaced the 125 mg/5 mL formulation—take care to ensure the appropriate dose is administered.

• CONTRA-INDICATIONS
• Active peptic ulceration
• CAUTIONS
• History of peptic ulceration (may disrupt the gastric mucosal barrier)
• SIDE-EFFECTS
• Gastrointestinal haemorrhage • skin reactions • Stevens-Johnson syndrome • vomiting
• PREGNANCY
• Manufacturer advises avoid in first trimester.
• BREAST FEEDING
• No information available.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution
- Carbocisteine (Non-proprietary)
  Carbocisteine 50 mg per 1 ml Carbocisteine 250 mg/5 mL oral solution | 300 mL (POS) £18.55 DT = £8.55
  Carbocisteine 75 mg per 1 ml Carbocisteine 750 mg/10 mL oral solution 10 mL sachets sugar free sugar-free | 15 sachet (POS) £3.85 DT = £3.85
- Mucodyne (Sanofi)
  Mucodyne 50 mg per 1 mL Mucodyne Paediatric 250 mg/5 mL syrup | 125 mL (POS) £12.60
  Mucodyne 250 mg/5 mL syrup | 300 mL (POS) £8.39 DT = £8.55

Capsule
- Carbocisteine (Non-proprietary)
  Carbocisteine 375 mg Carbocisteine 375 mg capsules | 120 capsule (POS) £18.96 DT = £4.60
- Mucodyne (Sanofi)
  Mucodyne 375 mg Mucodyne 375 mg capsules | 120 capsule (POS) £18.96 DT = £4.60

3.1 Cystic fibrosis

Cystic fibrosis

Description of condition
Cystic fibrosis is a genetic disorder affecting the lungs, pancreas, liver, intestine, and reproductive organs. The main clinical signs are pulmonary disease, with recurrent infections and the production of copious viscous sputum, and malabsorption due to pancreatic insufficiency. Other complications include hepatobiliary disease, osteoporosis, cystic fibrosis-related diabetes, and distal intestinal obstruction syndrome.

Aims of treatment
The aim of treatment includes preventing and managing lung infections, loosening and removing thick, sticky mucus from the lungs, preventing or treating intestinal obstruction, and providing sufficient nutrition and hydration.

Lung function is a key predictor of life expectancy in people with cystic fibrosis and optimising lung function is a major aim of care.

Non-drug treatment
Specialist physiotherapists should assess patients with cystic fibrosis and provide advice on airway clearance, nebuliser use, musculoskeletal disorders, physical activity, and urinary incontinence. The importance of airway clearance techniques should be discussed with patients and their parents or carers and appropriate training provided. Patients should be advised that regular exercise improves both lung function and overall fitness.

Drug treatment
Treatment for cystic fibrosis lung disease is based on the prevention of lung infection and the maintenance of lung function. In patients with cystic fibrosis, who have clinical evidence of lung disease, the frequency of routine review should be based on their clinical condition, but children should be reviewed at least every 8 weeks. More frequent review is required immediately after diagnosis and during early life.

Mucolytics
Patients with cystic fibrosis who have evidence of lung disease should be offered a mucolytic. Dornase alfa p. 189 is the first choice mucolytic (unlicensed in children under...
Conditions affecting sputum viscosity

Respiratory system

5 years of age. If there is an inadequate response, dornase alfa p. 189 and hypertonic sodium chloride p. 610, or hypertonic sodium chloride p. 610 alone should be considered.

Manitol dry powder for inhalation p. 143 should be considered for children [unlicensed indication] who cannot use dornase alfa p. 189 and hypertonic sodium chloride p. 610 because of ineligibility, intolerance, or inadequate response. 

Lumacaftor with ivacaftor p. 190 is not recommended for treating cystic fibrosis within its marketing authorisation (see lumacaftor with ivacaftor p. 190 National funding/access decisions).

Pulmonary infection

Staphylococcus aureus

Flucloxacillin p. 357 [unlicensed indication] should be offered for prophylaxis against Staphylococcus aureus infection in children from the point of diagnosis up to 3 years of age. Continuing prophylaxis in children up to 6 years of age should also be considered. An alternative oral antibacterial should be given in children allergic to penicillin.

In children who are already taking prophylaxis and have a respiratory sample culture that is positive for Staph. aureus, prophylaxis adherence should be reviewed and antibacterial treatment started. A prophylactic antibacterial should be restarted after treatment (consult local protocol). Patients who are not taking prophylaxis and have a new Staph. aureus infection can be given an oral anti- Staph. aureus antibacterial, if they are clinically well. If they are clinically unwell and have pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against Staph. aureus should be given (consult local protocol).

A long-term antibacterial should be considered to suppress chronic Staph. aureus respiratory infection in patients whose pulmonary disease is stable. In patients with chronic Staph. aureus respiratory infection who become clinically unwell with pulmonary disease, oral or intravenous (depending on infection severity) broad-spectrum antibacterials with activity against Staph. aureus should be given. In those patients with new evidence of meticillin-resistant Staphylococcus aureus (MRSA) respiratory infection with or without pulmonary exacerbation, specialist microbiological advice should be sought. Antibacterials should not be routinely used to suppress chronic MRSA in patients with stable pulmonary disease.

If a patient with cystic fibrosis and chronic MRSA respiratory infection becomes unwell with a pulmonary exacerbation or shows a decline in pulmonary function, specialist microbiological advice should be sought. 

Pseudomonas aeruginosa

If a patient with cystic fibrosis develops a new Pseudomonas aeruginosa infection, eradication therapy with a course of oral antibacterial should be started (by intravenous injection, if they are clinically unwell), in combination with an inhaled antibacterial. An extended course of oral and inhaled antibacterial should follow (consult local protocol).

If eradication therapy is not successful, sustained treatment with an inhaled antibacterial should be offered. Nebulised colistimethate sodium p. 358 should be considered as first-line treatment (see also colistimethate sodium p. 358 by dry powder inhalation National funding/access decisions).

In patients with chronic Ps. aeruginosa infection (when treatment has not eradicated the infection) who become clinically unwell with pulmonary exacerbations, an oral antibacterial or a combination of two intravenous antibacterial drugs of different classes (depending on infection severity) should be used. Changing antibacterial regimens should be considered to treat exacerbations (consult local protocol).

Nebulised aztreonam p. 343, nebulised tobramycin p. 323, or tobramycin dry powder for inhalation p. 323 [unlicensed indication in child under 6 years] (see tobramycin p. 323 National funding/access decisions) should be considered for those who are deteriorating despite regular inhaled colistimethate sodium p. 358.

Burkholderia cepacia complex

[CGD] Patients who develop a new Burkholderia cepacia complex infection, should be given eradication therapy with a combination of intravenous antibacterial drugs (specialist microbiological advice should be sought on the choice of antibacterials). There is no evidence to support using antibacterials to suppress chronic Burkholderia cepacia complex infection in patients with cystic fibrosis who have stable pulmonary status.

Specialist microbiological advice should be sought for patients with chronic Burkholderia cepacia complex infection (when treatment has not eradicated the infection) and who become clinically unwell with a pulmonary disease exacerbation.

An inhaled antibacterial should be considered for those who have chronic Burkholderia cepacia complex infection and declining pulmonary status; treatment should be stopped if there is no observed benefit.

Haemophilus influenzae

Haemophilus influenzae infection in the absence of clinical evidence of pulmonary infection should be treated with an appropriate oral antibacterial drug. In those who are unwell with clinical evidence of pulmonary infection, an appropriate antibacterial should be given by mouth or intravenously depending on the severity of the illness (consult local protocol).

Non-tuberculous mycobacteria

Non-tuberculous mycobacterial eradication therapy should be considered for patients with cystic fibrosis who are clinically unwell and whose pulmonary disease has not responded to other recommended treatments. Specialist microbiological advice should be sought on the choice of antibacterial and on the duration of treatment.

Aspergillus fumigatus complex

Treatment with an antifungal drug should only be considered to suppress chronic Aspergillus fumigatus complex respiratory infection in patients with declining pulmonary status. Specialist microbiological advice should be sought on the choice of antifungal drug.

Unidentified infections

An oral or intravenous (depending on the exacerbation severity) broad-spectrum antibacterial should be used for patients who have a pulmonary disease exacerbation and no clear cause. If a causative pathogen is identified, an appropriate treatment should be selected (consult local protocol).

Immunomodulatory drugs

Long-term treatment with azithromycin p. 339 [unlicensed indication], at an immunomodulatory dose, should be offered to patients with deteriorating lung function or repeated pulmonary exacerbations. In those patients with continued deterioration in lung function or continuing pulmonary exacerbations, azithromycin p. 339 should be discontinued and the use of an oral corticosteroid considered.

Nutrition and exocrine pancreatic insufficiency

A cystic fibrosis specialist dietitian should offer advice on optimal nutrition.

Pancreatin p. 74 should be offered to patients with exocrine pancreatic insufficiency. Dose should be adjusted as needed to minimise any symptoms or signs of malabsorption (see Exocrine pancreatic insufficiency p. 73). An acid-suppressing drug, such as an H2 receptor antagonist or a
proton pump inhibitor [unlicensed indications] can be considered for patients who have persistent symptoms or signs of malabsorption.  

**Distal intestinal obstruction syndrome**

Oral or intravenous fluids should be offered to ensure adequate hydration for patients with distal intestinal obstruction syndrome. Meglumine amidotrizoate with sodium amidotrizoate solution p. 38 (orally or via an enteral tube) should be considered as first-line treatment for distal intestinal obstruction syndrome. An iso-osmotic polyethylene glycol electrolyte solution (macrogols) (orally or via an enteral tube) can be considered as a second-line treatment. Surgery is a last resort, if prolonged treatment with a polyethylene glycol solution is not effective. Suspected distal intestinal obstruction syndrome should be managed in a specialist cystic fibrosis centre.  

**Liver disease**

If liver function blood tests are abnormal in patients with cystic fibrosis, ursodeoxycholic acid p. 67 [unlicensed indication] can be given until liver function is restored.  

**Bone mineral density**

Patients should be monitored for cystic fibrosis-related low bone mineral density.  

**Cystic fibrosis-related diabetes**

Patients should be monitored for cystic fibrosis-related diabetes.  

**Useful Resources**

Cystic fibrosis: diagnosis and management. National Institute for Health and Care Excellence. NICE guideline 78. October 2017  

www.nice.org.uk/guidance/NG78

---

**Dornase alfa**

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

**DRUG ACTION** Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

**INDICATIONS AND DOSE**

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

- **BY INHALATION OF NEBULISED SOLUTION**
- **Child 5-17 years: 2500 units once daily, administered by jet nebuliser**

**DOSE EQUIVALENCE AND CONVERSION**

Dornase alfa 1000 units is equivalent to 1 mg

**SIDE-EFFECTS** Chest pain · conjunctivitis · dyspepsia · dysphonia · dysphoena · fever · increased risk of infection · skin reactions

**PREGNANCY** No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Amount probably too small to be harmful—manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION** Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment. For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

**PRESCRIBING AND DISPENSING INFORMATION** Not all children benefit from treatment with dornase alfa; improvement occurs within 2 weeks, but in more severely affected children a trial of 6–12 weeks may be required.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Dornase alfa for cystic fibrosis  

www.medicinesforchildren.org.uk/dornase-alfa-cystic-fibrosis

---

**Ivacaftor**

10-Apr-2019

**DRUG ACTION** Ivacaftor is a cystic fibrosis transmembrane conductance regulator (CFTR) protein potentiator that increases chloride transport in the abnormal CFTR protein.

**INDICATIONS AND DOSE**

Cystic fibrosis (specialist use only)

- **BY MOUTH**
  - Child 6–17 years (body-weight 25 kg and above): 150 mg every 12 hours

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- **Manufacturer advises reduce dose to 150 mg twice a week with concurrent use of potent inhibitors of CYP3A4.**
- **Manufacturer advises reduce dose to 150 mg once daily with concurrent use of moderate inhibitors of CYP3A4.**

**CONTRA-INDICATIONS** Organ transplantation (no information available)

**INTERACTIONS** →Appendix 1: ivacaftor

**SIDE-EFFECTS**

- **Common or very common** Breast abnormalities · diarrhoea · dizziness · ear discomfort · headache · ototoxicity · rash · tympanic membrane hyperaemia
- **Uncommon** Gynaecomastia
- **Frequency not known** Cataract · hepatic function abnormal

**SIDE-EFFECTS, FURTHER INFORMATION** Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—limited information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment (limited information available).

**DOSE ADJUSTMENTS** Manufacturer advises reduce dose to 150 mg once daily in moderate impairment; in severe impairment reduce starting dose to 150 mg on alternate days, adjust dosing interval according to clinical response and tolerability.

**RENAL IMPAIRMENT** Caution in severe impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function before treatment, every 3 months during the first year of treatment, then annually thereafter (more frequent monitoring should be considered in patients with a history of transaminase elevations).
- Manufacturer advises baseline and follow-up ophthalmic examinations in children.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
PRESCRIBING AND DISPENSING INFORMATION Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer ivacaftor tablets.

Driving and skilled tasks Manufacturer advises that patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 25
- Kalydeco (Vertex Pharmaceuticals (UK) Ltd) ▼

Lumacaftor with ivacaftor The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 189.

INDICATIONS AND DOSE Cystic fibrosis (specialist use only)
- BY MOUTH
  - Child 6–11 years: 200/250 mg every 12 hours
  - Child 12–17 years: 400/250 mg every 12 hours

DOSE ADJUSTMENTS DUE TO INTERACTIONS
- For children aged 6–11 years, manufacturer advises reduce initial dose to 100/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.
- For children aged 12–17 years, manufacturer advises reduce initial dose to 200/125 mg daily for the first week in those also taking a potent inhibitor of CYP3A4.

DOSE EQUIVALENCE AND CONVERSION
- Dose expressed as x/y mg of lumacaftor/ivacaftor.

CAUTIONS Forced expiratory volume in 1 second (FEV₁) less than 40% of the predicted normal value—additional monitoring required at initiation of treatment - pulmonary exacerbation—no information available

INTERACTIONS ➔ Appendix 1: Ivacaftor - lumacaftor

SIDE-EFFECTS
- Common or very common Breast abnormalities - diarrhoea - dizziness - ear discomfort - flatulence - headache - menstrual cycle irregularities - nausea - ototoxicity - rash - tympanic membrane hyperaemia - vomiting
- Uncommon Gynaecomastia - hepatic encephalopathy - hepatitis cholestatic - hypertension
- Frequency not known Cataract - chest pain

SIDE-EFFECTS, FURTHER INFORMATION Manufacturer advises interrupt treatment if transaminase levels more than 5 times the upper limit of normal or transaminase levels more than 3 times the upper limit of normal and blood bilirubin more than twice the upper limit of normal—consult product literature.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (risk of increased exposure).

Dose adjustments For children aged 6–11 years, manufacturer advises dose reduction of evening dose to 100/125 mg in moderate impairment; in severe impairment, dose reduction to 100/125 mg every 12 hours is advised.

For children aged 12–17 years, manufacturer advises dose reduction of evening dose to 200/125 mg in moderate impairment; in severe impairment, dose reduction to 200/125 mg every 12 hours is advised.

PRE-TREATMENT SCREENING If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the F508del mutation on both alleles of the CFTR gene before starting treatment.

MONITORING REQUIREMENTS Manufacturer advises monitor blood pressure periodically during treatment.

EFFECT ON LABORATORY TESTS False positive urine screening tests for tetrahydrocannabinol have been reported—manufacturer advises consider alternative confirmatory method.

DIRECTIONS FOR ADMINISTRATION Tablets should be taken with fat-containing food.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer tablets.

Missed doses Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
- Lumacaftor with ivacaftor for treating cystic fibrosis homozygous for the F508del mutation (July 2016) NICE TA398
- Lumacaftor with ivacaftor (Orkambi™) is not recommended, within its marketing authorisation, for treating cystic fibrosis in patients aged 12 years and older who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene.
- Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they (or their carers) and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta398

Scottish Medicines Consortium (SMC) decisions
- SMC No. 1136/16
- The Scottish Medicines Consortium has advised (May 2016) that lumacaftor with ivacaftor (Orkambi™) is not recommended within NHS Scotland for the treatment of cystic fibrosis in patients aged 12 years and older who are homozygous for the F508del mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene, as the economic case was not demonstrated.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 25
- Excipients: May contain Propylene glycol
- Orkambi (Vertex Pharmaceuticals (UK) Ltd) ▼
- Ivacaftor 125 mg, Lumacaftor 200 mg Orkambi 100mg/125mg tablets | 112 tablet [PBN] £8.00.00 (Hospital only)
- Ivacaftor 125 mg, Lumacaftor 200 mg Orkambi 200mg/125mg tablets | 112 tablet [PBN] £18.00.00 (Hospital only)

Tezacaftor with ivacaftor The properties listed below are those particular to the combination only. For the properties of the components please consider, ivacaftor p. 189.

INDICATIONS AND DOSE Cystic fibrosis (in combination with ivacaftor) (specialist use only)
- BY MOUTH
  - Child 12-17 years: 100/150 mg, to be taken in the morning and, Ivacaftor 150 mg to be taken in the evening

DOSE ADJUSTMENTS DUE TO INTERACTIONS
- With concurrent use of potent CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg
tezacaftor/ivacaftor twice a week, taken approximately 3–4 days apart; the evening dose of ivacaftor should not be taken.

With concurrent use of moderate CYP3A4 inhibitors, manufacturer advises reduce dose to 100/150 mg tezacaftor/ivacaftor every other morning, with ivacaftor 150 mg taken in the mornings alternate to tezacaftor/ivacaftor; the evening dose of ivacaftor should not be taken.

DOSE EQUIVALENCE AND CONVERSION

Combination dose expressed as x/y mg of tezacaftor/ivacaftor.

Cough preparations

Cough suppressants

Cough may be a symptom of an underlying disorder such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be associated with smoking or environmental pollutants. Cough can also result from bronchiectasis including that associated with cystic fibrosis; cough can also have a significant habit component. There is little evidence of any significant benefit from the use of cough suppressants in children with acute cough in ambulatory settings. Cough suppressants may cause sputum retention and this can be harmful in children with bronchiectasis.

The use of cough suppressants containing pholcodine p. 192 or similar opioid analgesics is not generally recommended in children and should be avoided in children under 6 years; the use of over-the-counter cough suppressants containing codeine phosphate p. 283 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Demulcent and expectorant cough preparations

Simple linctus and other demulcent cough preparations containing soothing substances, such as syrup or glycerol, may temporarily relieve a dry irritating cough. These preparations have the advantage of being harmless and inexpensive and sugar-free versions are available.

Expectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

An over-the-counter cough medicine containing the expectorant guaifenesin may be used for acute cough in children aged over 12 years; there is some evidence to suggest it may reduce symptoms.

Compound cough preparations for children are on sale to the public but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

MHRA/CHM advice (March 2008 and February 2009)

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 180, diphenhydramine, doxylamine, promethazine, or tripolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

Nasal decongestants, systemic

Nasal congestion in children due to allergic or vasomotor rhinitis should be treated with oral antihistamines, topical nasal preparations containing corticosteroids, or topical decongestants.

There is little evidence to support the use of systemic decongestants in children.
Pseudoephedrine hydrochloride has few sympathomimetic effects, and is commonly combined with other ingredients (including antihistamines) in preparations intended for the relief of cough and cold symptoms.

**COUGH AND COLD PREPARATIONS > COUGH SUPPRESSANTS**

**Pholcodine**

**INDICATIONS AND DOSE**

- **Dry cough**
  - BY MOUTH USING LIINCTUS
  - Child 6-11 years: 2–5 mg 3–4 times a day
  - Child 12-17 years: 5–10 mg 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN**

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

- **CONTRA-INDICATIONS** Bronchiectasis - bronchiolitis - chronic bronchitis - patients at risk of respiratory failure
- **CAUTIONS** Asthma - chronic cough - persistent cough - productive cough
- **INTERACTIONS** → Appendix 1: pholcodine
- **SIDE-EFFECTS** Agitation - confusion - constipation - dizziness - drowsiness - gastrointestinal disorder - nausea - skin reactions - sputum retention - vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution; avoid in hepatic failure.
- **RENAL IMPAIRMENT** Use with caution in renal impairment. Avoid in severe renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Pholcodine is not generally recommended for children.

Flavours of oral liquid formulations may include orange. When prepared extemporaneously, the BP states Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 ml linctus sugar-free, BP which contains citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 ml in a suitable flavoured vehicle, containing citric acid monohydrate 2%.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Pholcodine (Non-proprietary)**
  - Pholcodine 1 mg per 1 ml Pholcodine 5mg/5ml linctus | 200 ml (P) £1.24+£1.32 DT = £2.21 (CD5)
  - Pholcodine 5mg/5ml linctus sugar-free sugar-free | 200 ml (P) £1.34 DT + £1.34 (CD5) sugar-free | 2000 ml (P) £11.40 (CD5)
  - Pholcodine 2 mg per 1 ml Pholcodine 10mg/5ml linctus strong sugar-free sugar-free | 2000 ml (P) £3.98 DT + £3.88 (CD5)
  - Pholcodine 10mg/5ml linctus strong | 200 ml (P) £1.67 DT = £1.67 (CD5)

**MENTHOL AND DERIVATIVES**

**Eucalyptus with menthol**

**INDICATIONS AND DOSE**

- **BY INHALATION**
  - Child: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol or levomenthol 2 g, eucalyptus oil 10 ml, light magnesium carbonate 7 g, water to 100 ml. Not recommended (applied as a rub or to pillows) for infants under the age of 3 months.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.
Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants (analeptic drugs), such as caffeine citrate p. 194, reduce the frequency of neonatal apnoea, and the need for mechanical ventilation during the first 7 days of treatment. They are typically used in the management of very preterm neonates, and continued until a corrected gestational age of 24 to 35 weeks is reached (or longer if necessary). They should only be given under expert supervision in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, beractant below and poractant alfa below are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than ‘rescue treatment’ in preterm neonates of 29 weeks or less corrected gestational age. Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection. Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks corrected gestational age. Betamethasone p. 454 given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

### Beractant

#### INDICATIONS AND DOSE
- **Treatment of respiratory distress syndrome in preterm neonates, birth-weight over 700 g (specialist use only)**
  - BY ENDOTRACHEAL TUBE
  - Preterm neonate: 100 mg/kg, preferably administer within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

#### Prophylaxis of respiratory distress syndrome in preterm neonates (specialist use only)
- BY ENDOTRACHEAL TUBE
  - Neonate up to 32 weeks corrected gestational age: 100 mg/kg, preferably administer within 15 minutes of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

#### DOSE EQUIVALENCE AND CONVERSION
- Phospholipid 100 mg/kg is equivalent to a volume of 4 mL/kg.

#### CAUTIONS
- Consult product literature

#### SIDE-EFFECTS
- Uncommon Endotracheal tube obstruction
- Frequency not known Bradycardia - hypoxia

### Poractant alfa

#### INDICATIONS AND DOSE
- **Treatment of respiratory distress syndrome in neonates, birth weight over 700 g (specialist use only)**
  - BY ENDOTRACHEAL TUBE
  - Neonate: 100–200 mg/kg, then 100 mg/kg every 12 hours if required, maximum 300–400 mg/kg per course.

#### Prophylaxis of respiratory distress syndrome (specialist use only)
- BY ENDOTRACHEAL TUBE
  - Neonate 24 weeks to 31 weeks corrected gestational age: 100–200 mg/kg, administer soon after birth, preferably within 15 minutes, then 100 mg/kg after 6–12 hours if required, then 100 mg/kg after 12 hours if required, and if neonate still intubated. Max 300–400 mg/kg per course.

#### CAUTIONS
- Consult product literature

#### SIDE-EFFECTS
- Rare or very rare Bradycardia - hypotension
- Frequency not known Hyperoxia
194 Respiratory depression, respiratory distress syndrome and apnoea

5.1 Neonatal apnoea

**XANTHINES**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- Curosurf (Chiesi Ltd)
  - Poractant alfa 80 mg per 1 ml Curosurf 240mg/3ml endotracheopulmonary suspension vials | 1 vial £547.40 (Hospital only)
  - Curosurf 120mg/1.5ml endotracheopulmonary suspension vials | 1 vial £281.64 (Hospital only)

**INDICATIONS AND DOSE**

Neonatal apnoea (specialist supervision in hospital)

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Neonate: Loading dose 20 mg/kg, then maintenance 5 mg/kg once daily, started 24 hours after the loading dose; increased if necessary up to 20 mg/kg daily, a maintenance dose above 20 mg/kg daily can be considered if therapeutic efficacy is not achieved—the plasma-caffeine concentration should be monitored to ensure that a safe level is maintained.

**DOSE EQUIVALENCE AND CONVERSION**
- Caffeine citrate 2 mg ≡ caffeine base 1 mg

**PHARMACOKINETICS**
- Caffeine citrate is well absorbed when given orally.

**UNLICENSED USE** Higher maintenance doses differ from product literature and adhere to national guidelines.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SAFE PRACTICE**

From August 2013, all licensed preparations of caffeine are required to be labelled as caffeine citrate. To minimise the risk of dosing errors, always state dose in terms of caffeine citrate when prescribing caffeine.

Some stock packaged as caffeine base.

**CAUTIONS** Cardiovascular disease • gastro-oesophageal reflux • rhythm disorder • seizure disorders

**INTERACTIONS** → Appendix 1: caffeine citrate

**SIDE-EFFECTS**
- Common or very common Arrhythmias • hyperglycaemia
- Uncommon Seizure
- Frequency not known Brain injury • deafness • failure to thrive • feeding intolerance • feeling jittery • gastrointestinal disorders • hypoglycaemia • increased cardiac output • irritability • regurgitation • restless legs

**HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of increased frequency of side-effects).

**Dose adjustments** Manufacturer advises consider dose adjustment according to plasma-caffeine concentration.

**RENAL IMPAIRMENT** Manufacturer advises caution with impaired renal function—potential for accumulation of caffeine.

**Dose adjustments** Reduced daily maintenance dose required—consult product literature.

**MONITORING REQUIREMENTS**
- The therapeutic range for plasma-caffeine concentration is usually 10–20 mg/litre (50–100 micromol/litre), but a concentration of 25–35 mg/litre (130–180 micromol/litre) may be required. Signs of toxicity only normally occur at concentrations greater than 50 mg/litre (260 micromol/litre).
- Monitor for recurrence of apnoea for 1 week after stopping treatment.

**DIRECTIONS FOR ADMINISTRATION** Caffeine citrate injection may be administered by mouth or by intravenous infusion. For intravenous infusion, manufacturer advises giving load dose over 30 minutes and maintenance doses over 10 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions
SMC No. B14/12
The Scottish Medicines Consortium has advised (September 2013) that Peyona® is accepted for use within NHS Scotland for the treatment of primary apnoea of premature newborns only whilst Peyona® is available at the price agreed in the patient access scheme.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**
- Caffeine citrate (Non-proprietary)
  - Caffeine citrate 10 mg per 1 ml Caffeine citrate 10mg/1ml solution for injection ampoules | 10 ampoule £48.82

**Solution for infusion**
- Peyona (Chiesi Ltd)
  - Caffeine citrate 20 mg per 1 ml Peyona 20mg/ml solution for infusion ampoules | 10 ampoule £172.50 (Hospital only)

**Oral solution**
- Caffeine citrate (Non-proprietary)
  - Caffeine citrate 10 mg per 1 ml Caffeine citrate 50mg/5ml oral solution | 5 ml £25.99 DT + £25.99

**DOSE EQUIVALENCE AND CONVERSION**
- Caffeine citrate 2 mg ≡ caffeine base 1 mg

**PHARMACOKINETICS**
- Caffeine citrate is well absorbed when given orally.

**UNLICENSED USE** Higher maintenance doses differ from product literature and adhere to national guidelines.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: SAFE PRACTICE**

1 Epilepsy and other seizure disorders

Epilepsy

Epilepsy control

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The frequency of administration is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, the plasma-drug half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, the plasma-drug half-life, and should be kept as low as possible to encourage better adherence.

Usual dispensing practice can be followed when a special indication is not stated.

Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug.

Monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible and will achieve seizure control for the majority of children.

MHRA/CHM advice: Antiepileptic drugs: updated advice on switching between different manufacturers’ products (November 2017)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
  - If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
  - This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
  - Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
  - Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

Category 1
Carbamazepine p. 200, phenobarbital, phenytoin, primidone p. 224. For these drugs, doctors are advised to
ensure that their patient is maintained on a specific manufacturer’s product.

**Category 2**

Clobazam p. 225, clonazepam p. 226, eslicarbazepine acetate p. 202, lamotrigine, oscarbazepine p. 209, perampanel, rufinamide p. 212, topiramate p. 218, valproate, zonisamide p. 222. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency, treatment history, and potential implications to the patient of having a breakthrough seizure. Non-clinical factors as for Category 3 drugs should also be considered.

**Category 3**

Brivaracetam p. 200, ethosuximide p. 203, gabapentin p. 204, lacosamide p. 206, levetiracetam p. 208, pregabalin, tiagabine p. 217, vigabatrin p. 221. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product as therapeutic equivalence can be assumed, however, other factors are important when considering whether switching is appropriate. Differences between alternative products (e.g. product name, packaging, appearance, and taste) may be perceived negatively by patients and/or carers, and may lead to dissatisfaction, anxiety, confusion, dosing errors, and reduced adherence. In addition, difficulties for patients with co-morbid autism, mental health problems, or learning disability should also be considered.

**Antiepileptic hypersensitivity syndrome**

Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oscarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine acetate, stiripentol p. 217, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the child should not be re-exposed, and expert advice should be sought.

**Risk of suicidal thoughts and behaviour**

The MHRA has advised (August 2008) that all antiepileptic drugs are associated with a small increased risk of suicidal thoughts and behaviour. Symptoms may occur as early as one week after starting treatment. Children and their parents or carers should be advised to seek medical advice if the child develops any mood changes, distressing thoughts, or feelings about suicide or harming themselves, and should be referred for appropriate treatment if necessary.

**Interactions**

Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**

Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months. The decision to withdraw antiepileptic drugs from a seizure-free child, and its timing, is often difficult and depends on individual circumstances. Even in children who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

In children receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Monitoring**

Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma-drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Plasma concentration of some medications may change during pregnancy and monitoring may be required (see under *Pregnancy*).

**Driving**

If a driver has a seizure (of any type) they must stop driving immediately and inform the Driver and Vehicle Licensing Agency (DVLA).

Patients who have had a first unprovoked epileptic seizure or a single isolated seizure must not drive for 6 months; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive and investigations do not suggest a risk of further seizures.

Patients with established epilepsy may drive a motor vehicle provided they are not a danger to the public and are compliant with treatment and follow up. To continue driving, these patients must be seizure-free for at least one year (or have a pattern of seizures established for one year where there is no influence on their level of consciousness or the ability to act); also, they must not have a history of unprovoked seizures.

Patients who have had a seizure while asleep are not permitted to drive for one year from the date of each seizure unless:

- a history or pattern of sleep seizures occurring only ever while asleep has been established over the course of at least one year from the date of the first sleep seizure; or
- an established pattern of purely asleep seizures can be demonstrated over the course of three years if the patient has previously had seizures whilst awake (or awake and asleep).

The DVLA recommends that patients should not drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months after their last dose. If a seizure occurs due to a prescribed change or withdrawal of epilepsy treatment, the patient will have their driving license revoked for 1 year; relicensing may be considered earlier if treatment has been reinstated for 6 months and no further seizures have occurred.

**Pregnancy**

Young women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention
All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether. Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

**Focal seizures with or without secondary generalisation**

Carbamazepine p. 200 and lamotrigine p. 207 are the drugs of choice for focal seizures. Levetiracetam p. 208, oxcarbazepine p. 209 and sodium valproate p. 213 can be considered if these are unsuitable. These drugs may also be used as adjunctive treatment. Other adjunctive options include clobazam p. 225, gabapentin p. 204, and topiramate p. 218. If adjunctive treatment is ineffective or not tolerated, a tertiary specialist should be consulted who may consider eslicarbazepine acetate p. 202, lacosamide p. 206, phenobarbital p. 223, phenytoin p. 211, pregabalin [unlicensed], tiagabine p. 217, vigabatrin p. 221, and zonisamide p. 222.

**Generalised seizures**

**Tonic-clonic seizures**

The drug of choice for newly diagnosed tonic-clonic seizures in children is sodium valproate (except in female patients, see Valproate below), or lamotrigine where sodium valproate is unsuitable (but may exacerbate myoclonic seizures). In children with established epilepsy with generalised tonic-clonic seizures only, lamotrigine may be prescribed as the first-line choice. Carbamazepine or oxcarbazepine can also be considered but may exacerbate myoclonic or absence seizures. Clobazam, lamotrigine, levetiracetam, sodium valproate, or topiramate may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

**Absence seizures**

Ethosuximide p. 203 and sodium valproate (except in female patients, see Valproate below) are the drugs of choice for absence seizures and syndromes; lamotrigine can be used if these are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Second-line therapy includes clobazam, clonazepam p. 226, levetiracetam, topiramate or zonisamide which may be considered by a tertiary specialist if adjunctive treatment fails. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended in absence seizures or syndromes.

**Myoclonic seizures**

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice (except in female patients, see Valproate below); consider levetiracetam or topiramate if sodium valproate is unsuitable (but consider the less favourable side-effect profile of topiramate). A combination of two of these drugs may be used if
monotherapy is ineffective or poorly tolerated. Second-line therapy includes clobazam, clonazepam, piracetam or zonisamide which should be prescribed under the supervision of a tertiary specialist. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended for the treatment of myoclonic seizures.

**Tonic and atonic seizures**

Tonic or atonic seizures are treated with sodium valproate (except in female patients, see Valproate below); lamotrigine can be considered as adjunctive treatment if sodium valproate is ineffective or not tolerated. Adjunctive treatment fails, a tertiary specialist should be consulted who may consider rifinamide p. 212 or topiramate. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin are not recommended in atonic or tonic seizures.

**Epilepsy syndromes**

**Infantile spasms**

Vigabatrin is the drug of choice for infantile spasms associated with tuberous sclerosis. Corticosteroids, such as prednisolone p. 458 or tetracosactide p. 491, are second-line options if vigabatrin is ineffective. In spasms of other causes, vigabatrin, prednisolone or tetracosactide can be considered as first-line options. A tertiary specialist should be consulted before treating infantile spasms.

**Dravet syndrome**

A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome. Sodium valproate (except in pregnancy or females of childbearing potential, see Valproate below) or topiramate are first-line treatment options in Dravet syndrome. Clonazepam or stiripentol p. 217 may be considered as adjunctive treatment if first-line treatments are ineffective or not tolerated. Carbamazepine, gabapentin, lamotrigine, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin should not be used as they may exacerbate myoclonic seizures.

**Lennox-Gastaut syndrome**

A tertiary specialist should be involved in decisions regarding treatment of Lennox-Gastaut syndrome. Sodium valproate is the first-line drug for treating Lennox-Gastaut syndrome (except in pregnancy or females of childbearing potential, see Valproate below); lamotrigine can be used as adjunctive treatment if sodium valproate is unsuitable, ineffective or not tolerated. Adjunctive treatment is ineffective or not tolerated, rifinamide and topiramate may be considered by tertiary specialists. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used. Felbamate [unlicensed] may be used in tertiary specialist centres when all other treatment options have failed.

**Landau-Kleffner syndrome**

Always discuss with or refer to tertiary epilepsy specialists.

**Neonatal seizures**

Seizures can occur before delivery, but they are most common up to 24 hours after birth. Seizures in neonates occur as a result of biochemical disturbances, inborn errors of metabolism, hypoxic ischaemic encephalopathy, drug withdrawal, meningitis, stroke, cerebral haemorrhage or malformation, or severe jaundice (keratitis).

Seizures caused by biochemical imbalance and those in neonates with inherited abnormal pyridoxine or biotin metabolism should be corrected by treating the underlying cause. Seizures caused by drug withdrawal following intrauterine exposure are treated with a drug withdrawal regimen.

Phenobarbital can be used to manage neonatal seizures where there is a risk of recurrence; phenytoin is an alternative. Midazolam p. 229 and rectal paraldehyde p. 228 may also be useful in the management of acute neonatal seizures. Lidocaine hydrochloride p. 852 may be used if other treatments are unsuccessful; lidocaine hydrochloride should not be given to neonates who have received phenytoin infusion because of the risk of cardiac toxicity.

**Antiepileptic drugs**

**Carbamazepine and related antiepileptics**

Carbamazepine p. 200 is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly in small increments every 3–7 days. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present. Oxcarbazepine p. 209 is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

**Ethosuximide**

Ethosuximide is a first-line treatment option for absence seizures, and may be used as adjunctive treatment when monotherapy has failed.

**Gabapentin**

Gabapentin p. 204 is used as adjunctive therapy for the treatment of focal seizures with or without secondary generalisation; it is licensed as monotherapy in children over 12 years. It is not recommended if tonic, atonic, absence or myoclonic seizures are present.

**Lamotrigine**

Lamotrigine p. 207 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed as monotherapy for typical absence seizures in children (but efficacy may not be maintained in all children). It may be tried as an adjunctive treatment for atonic and tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

**Levetiracetam and brivaracetam**

Levetiracetam p. 208 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in children with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

Brivaracetam p. 200 is used as adjunctive therapy in the treatment of partial-onset seizures with or without secondary generalisation.

**Phenobarbital and primidone**

Phenobarbital p. 223 is effective for tonic-clonic, focal seizures and neonatal seizures but may cause behavioural disturbances and hyperkinesia. It may be tried for atypical absence, atonic, and tonic seizures. For therapeutic purposes phenobarbital and phenobarbital sodium should be considered equivalent in effect. Rebound seizures may be a problem on withdrawal.
Primidone p. 224 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. It is used rarely in children. A low initial dose of primidone is essential.

**Phenytoin**

Phenytoin p. 211 is licensed for tonic–clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 204, a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin should be given intravenously only, fosphenytoin sodium may also be given by intramuscular injection.

**Rufinamide**

Rufinamide p. 212 is licensed for the adjunctive treatment of seizures in Lennox–Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

**Topiramate**

Topiramate p. 218 can be given alone or as an adjunctive treatment in generalised tonic–clonic seizures or focal seizures. It can also be used for absence, tonic and atonic seizures under specialist supervision and as an option in myoclonic seizures [all unlicensed]. Female patients should be fully informed of the risks related to the use of topiramate during pregnancy and the need to use effective contraception—for further information, see *Conception and contraception* and *Pregnancy* in the topiramate drug monograph.

**Valproate**

Valproate (as either sodium valproate p. 213 or valproic acid p. 219) is effective in controlling tonic–clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic–clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Valproate should generally be avoided in children under 2 years especially with other antiepileptics, but it may be required in infants with continuing epileptic tendency. Sodium valproate has widespread metabolic effects, and monitoring of liver function tests and full blood count is essential. Because of its high teratogenic potential, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated. During pregnancy, it must not be used for epilepsy unless it is the only possible treatment. For further information see *Important safety information, Conception and contraception, and Pregnancy* in the sodium valproate and valproic acid drug monographs. Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

**Zonisamide**

Zonisamide p. 222 can be used as an adjunctive treatment for refractory focal seizures with or without secondary generalisation in children and adolescents aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

**Benzodiazepines**

Clobazam p. 225 may be used as adjunctive therapy in the treatment of generalised tonic–clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 226 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

**Other drugs**

Acetazolamide p. 707, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam is used as adjunctive treatment for cortical myoclonus.

**Status epilepticus**

**Convulsive status epilepticus**

Immediate measures to manage status epilepticus include positioning the child to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Pyridoxine hydrochloride p. 650 should be administered if the status epilepticus is caused by pyridoxine deficiency.

Seizures lasting 5 minutes should be treated urgently with buccal midazolam p. 229 or intravenous lorazepam p. 228 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 226 is effective but it carries a high risk of venous thromboembolitis (reduced by using an emulsion formulation of diazepam injection). Patients should be monitored for respiratory depression and hypotension.

**Important**

If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium should be used, or if the child is on regular phenytoin p. 211, give phenobarbital sodium intravenously over 5 minutes; the paediatric intensive care unit should be contacted. Paraldehyde p. 228 can be given after starting phenytoin infusion.

If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 228 should be instituted with full intensive care support.

**Phenytoin sodium** can be given by intravenous infusion over 20 minutes, followed by the maintenance dosage if appropriate.

Paraldehyde given rectally causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

**Non-convulsive status epilepticus**

The urgency to treat non-convulsive status epilepticus depends on the severity of the child’s condition. If there is incomplete loss of awareness, oral antiepileptic therapy should be continued or restarted. Children who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

**Febrile convulsions**

**Brief febrile convulsions** need no specific treatment; antipyretic medication (e.g. paracetamol p. 278), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. **Prolonged febrile convulsions** (those lasting 5 minutes or longer), or **recurrent febrile convulsions** without recovery must be treated actively (as for convulsive status epilepticus).

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.
200  Epilepsy and other seizure disorders

ANTIEPILEPTICS

Brivaracetam

19 Jul 2018

● INDICATIONS AND DOSE

Adjuvant therapy of focal seizures with or without secondary generalisation

BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Child 4–17 years (body-weight up to 50 kg): Initially 0.5–1 mg/kg twice daily, adjusted according to response; usual maintenance 1 mg/kg twice daily (max. per dose 2 mg/kg twice daily)

Child 4–17 years (body-weight 50 kg and above): Initially 25–50 mg twice daily, adjusted according to response; usual maintenance 50 mg twice daily (max. per dose 100 mg twice daily)

● INTERACTIONS  ➔ Appendix 1: antiepileptics

● SIDE-EFFECTS

» Common or very common  Anxiety, appetite decreased, constipation, cough, depression, diziness, drowsiness, fatigue, increased risk of infection, insomnia, irritability, nausea, vertigo, vomiting

» Uncommon  Aggression, psychotic disorder

● PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risks– limited information available. See also Pregnancy in Epilepsy p. 195.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

● HEPATIC IMPAIRMENT

Manufacturer advises caution (risk of increased exposure).

Dose adjustments

Manufacturer advises initial dose of 25 mg twice daily, max. maintenance dose of 75 mg twice daily in children body-weight 50 kg and above.

Manufacturer advises initial dose of 0.5 mg/kg twice daily, max. maintenance dose of 1.5 mg/kg twice daily in children with body-weight up to 50 kg (no information available).

● TREATMENT CESSATION

Manufacturer advises avoid abrupt withdrawal—reduce daily dose in steps of 50 mg at weekly intervals, then reduce to 20 mg daily for a final week.

● DIRECTIONS FOR ADMINISTRATION

» With intravenous use For intermittent intravenous infusion, manufacturer advises dilute in Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer’s solution; give over 15 minutes.

» With oral use Manufacturer advises oral solution can be diluted in water or juice shortly before swallowing.

● PRESCRIBING AND DISPENSING INFORMATION

Manufacturer advises if switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the total daily dose and the frequency of administration should be maintained.

● PATIENT AND CARER ADVICE

Missed doses

Manufacturer advises if one or more doses are missed, a single dose should be taken as soon as possible and the next dose should be taken at the usual time.

Driving and skilled tasks

Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 1160/16

The Scottish Medicines Consortium has advised (July 2016) that brivaracetam (Briviact®) is accepted for restricted use within NHS Scotland as adjuvative therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 16 years of age with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

SMC No. SMC2113

The Scottish Medicines Consortium has advised (December 2018) that brivaracetam (Briviact®) is accepted for restricted use within NHS Scotland as adjuvative therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 4 to 15 years of age with refractory epilepsy. Treatment should be initiated by physicians who have appropriate experience in the treatment of epilepsy.

All Wales Medicines Strategy Group (AWMSG) decisions

AWMSG No. 3387

The All Wales Medicines Strategy Group has advised (December 2018) that brivaracetam (Briviact®) is recommended as an option for restricted use within NHS Wales. Brivaracetam (Briviact®) should be restricted for use in the treatment of patients with refractory epilepsy, who remain uncontrolled with, or are intolerant to, other adjuvant anti-epileptic medicines, within its licensed indication as adjuvative therapy in the treatment of partial-onset seizures with or without secondary generalisation in patients from 4 years of age with epilepsy. Brivaracetam (Briviact®) is not recommended for use within NHS Wales outside of this subpopulation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

● INDICATIONS AND DOSE

Trigeminal neuralgia

» BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily

Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly
Prophylaxis of bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month-11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily.

Child 12-17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly.

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

Child 5-11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses.

Child 12-17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly.

TEGRETOL® PROLONGED RELEASE

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

Child 5-11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses.

Child 12-17 years: Initially 100–400 mg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses.

Trigeminal neuralgia

BY MOUTH

Child 5-11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses.

Child 12-17 years: Initially 100–400 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly.

UNLICENSED USE Not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.

CONTRA-INDICATIONS Acute porphyrias p. 624. AV conduction abnormalities (unless paced) - history of bone-marrow depression.

CAUTIONS Cardiac disease - history of haematological reactions to other drugs - may exacerbate absence and myoclonic seizures - skin reactions - susceptibility to angle-closure glaucoma.

CAUTIONS, FURTHER INFORMATION Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Blood, hepatic, or skin disorders. Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

INTERACTIONS | Appendix 1: antiepileptics.

SIDE-EFFECTS

Common or very common Dizziness - drowsiness - dry mouth - eosinophilia - fatigue - fluid imbalance - gastrointestinal discomfort - headache - hyponatraemia - leucopenia - movement disorders - nausea - oedema - skin reactions - thrombocytopenia - vision disorders - vomiting - weight increased.

Uncommon Constipation - diarrhoea - eye disorders - tic - tremor.

202 Epilepsy and other seizure disorders

erythematous (SLE) - taste altered - tinnitus - urinary disorders - vanishing bile duct syndrome - vasculitis

- Frequency not known Bone fracture - colitis - human herpesvirus 6 infection reactivation - memory loss - nail loss

SIDE-EFFECTS, FURTHER INFORMATION Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment.

Overdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 859.

- ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 195 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

- PREGNANCY See Pregnancy in Epilepsy p. 195. Monitoring Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- BREATHE FEEDING Amount probably too small to be harmful. Monitoring Monitor infant for possible adverse reactions.

- HEPATIC IMPAIRMENT Manufacturer advises caution and close monitoring—no information available.

- RENAL IMPAIRMENT Use with caution.

- PRE-TREATMENT SCREENING Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- MONITORING REQUIREMENTS Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks. Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

- TREATMENT CESSATION When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

- DIRECTIONS FOR ADMINISTRATION Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).

TEGRETOL® PROLONGED RELEASE Tegretol® Prolonged Release tablets can be halved but should not be chewed.

- PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

- PATIENT AND CARER ADVICE Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

Medicines for Children leaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

- PROFESSION SPECIFIC INFORMATION Dental practitioners’ formulary Carbamazepine Tablets may be prescribed.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Modified-release tablet

Suppository

CAUTION AND ADVISORY LABELS 3, 8

- Carbamazepine (Non-proprietary) Carbamazepine 125 mg Carbamazepine 125mg suppositories | 5 suppository (£12.20 DT = £12.00
Carbamazepine 250 mg Carbamazepine 250mg suppositories | 5 suppository (£14.00 DT = £14.00

Oral suspension

CAUTION AND ADVISORY LABELS 3, 8

- Carbamazepine (Non-proprietary) Carbamazepine 20 mg per 1 ml Carbamazepine 100mg/5ml oral suspension sugar free sugar-free | 300 ml (£8.25 DT = £8.04

- Tegretol (Novartis Pharmaceuticals UK Ltd) Carbamazepine 20 mg per 1 ml Tegretol 100mg/5ml liquid sugar-free | 300 ml (£6.12 DT = £6.04

Eslicarbazepine acetate

INDICATIONS AND DOSE

Adjunctive therapy of focal seizures with or without secondary generalisation

- BY MOUTH
  - Child 6–17 years (body-weight up to 60 kg): Initially 10 mg/kg once daily, then increased in steps of 10 mg/kg daily, every 1–2 weeks, increased if necessary up to 30 mg/kg daily (max. per dose 1.2 g)
  - Child 6–17 years (body-weight 60 kg and above): Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

- CONTRA-INDICATIONS Second- or third-degree AV block
- CAUTIONS Hyponatraemia - PR-interval prolongation
- INTERACTIONS Appendix 1: antiepileptics
- SIDE-EFFECTS
  - Common or very common Anxiety - appetite decreased - asthenia - concentration impaired - diarrhoea - dizziness - drowsiness - gait abnormal - gastrointestinal discomfort - headaches - movement disorders - nausea - skin reactions - sleep disorders - vertigo - vision disorders - vomiting
  - Uncommon Alopecia - anemia - bradycardia - chest pain - chills - confusion - constipation - depression - dry mouth - electrolyte imbalance - eye disorders - flushing - gastritis -
haemorrhage, hearing impairment, hyperhidrosis, hypertension, hypotension, hypothyroidism, increased risk of infection, liver disorder, malaise, mood altered, muscle weakness, myalgia, pain in extremity, palpitations, peripheral coldness, peripheral neuropathy, peripheral oedema, psychomotor retardation, psychotic disorder, sensation abnormal, speech impairment, tinnitus, toothache, weight decreased

- Frequency not known: Angioedema, leucopenia, pancreatitis, severe cutaneous adverse reactions (SCARs), thrombocytopenia

- ALLERGY AND CROSS-SENSITIVITY: Antiepileptic

- hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 195 for more information.

- PREGNANCY: Manufacturer advises minimum effective doses and monotherapy if possible—reproductive toxicity in animal studies.

- Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- BREAST FEEDING: Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT: Manufacturer advises caution in mild to moderate impairment—limited information; avoid in severe impairment—no information available.

- RENAL IMPAIRMENT: Manufacturer advises avoid if creatinine creatinine clearance less than 30 mL/minute.

- Dose adjustments: Manufacturer advises reduce initial dose to 5 mg/kg once daily or 10 mg/kg every other day for 2 weeks, then increase to 10 mg/kg once daily if creatinine clearance 30–60 mL/minute. The dose may be further increased based on individual response.

- PRE-TREATMENT SCREENING: Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- MONITORING REQUIREMENTS: Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

- PRESCRIBING AND DISPENSING INFORMATION: Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- PATIENT AND CARER ADVICE: Driving and skilled tasks: Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and visual disorders.

- NATIONAL FUNDING/ACCESS DECISIONS: Scottish Medicines Consortium (SMC) decisions

- SMC No. SMC2087: The Scottish Medicines Consortium has advised (February 2019) that eslicarbazepine acetate (Zebinix®) is accepted for restricted use within NHS Scotland as adjunctive therapy in patients aged above 6 years with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy in patients who have been heavily pre-treated and remain uncontrolled with existing anti-epileptic drugs.

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

- Oral suspension

- Zebinix (Eisai Ltd)

- Eslicarbazepine acetate 50 mg per 1 ml Zebinix 50mg/1ml oral suspension sugar-free 200 ml (PStk) £56.67

- Ethosuximide

- INDICATIONS AND DOSE: Absence seizures / Atypical absence seizures (adjunct) / Myoclonic seizures

- BY MOUTH: Child 1 month-5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses.

- Child 6-17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily.

- CAUTIONS: Avoid in Acute porphyrias p. 624.

- INTERACTIONS: Appendix 1: antiepileptics

- SIDE-EFFECTS: Aggression, agranulocytosis, appetite decreased, blood disorder, bone marrow disorders, concentration impaired, depression, diarrhoea, dizziness, drowsiness, erythema nodosum, fatigue, gastrointestinal discomfort, generalised tonic-clonic seizure, headache, hiccup, leucopenia, libido increased, lupus-like syndrome, mood altered, movement disorders, nausea, nephrotic syndrome, oral disorders, psychosis, rash, sleep disorders, Stevens-Johnson syndrome, vaginal haemorrhage, vision disorders, vomiting, weight decreased

- SIDE-EFFECTS, FURTHER INFORMATION: Blood counts required if features of fever, sore throat, mouth ulcers, bruising or bleeding.

- PREGNANCY: See also Pregnancy in Epilepsy p. 195.

- Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- BREAST FEEDING: Present in milk. Hyperexcretability and sedation reported.

- HEPATIC IMPAIRMENT: Use with caution.

- RENAL IMPAIRMENT: Use with caution.

- PATIENT AND CARER ADVICE: Blood disorders: Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

- Medicines for Children leaflet: ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ethosuximide-preventing-seizures

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug.

- Ethosuximide

- CAUTIONARY AND ADVISORY LABELS: 8

- Ethosuximide 50 mg per 1 ml Ethosuximide 250mg/5ml syrup | 200 ml (PStk) £173.00 DT + £173.00

- Ethosuximide 50mg/5ml oral solution sugar free sugar-free | 125 ml (PStk) £108.12–£108.13 sugar-free | 250 ml (PStk) £216.25

- Ethosuximide 250 mg Ethosuximide 250mg capsules | 56 capsule (PStk) £173.00 DT + £173.00
**Fosphenytoin sodium**

*DRUG ACTION*  Fosphenytoin is a pro-drug of phenytoin.

**INDICATIONS AND DOSE**

**Status epilepticus**
- **BY INTRAVENOUS INFUSION**
  - Child 5–17 years: Initially 20 mg(PE)/kg, dose to be administered at a rate of 2–3 mg(PE)/kg/minute, maximum 150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg (PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

**Prophylaxis or treatment of seizures associated with neurosurgery or head injury**
- **BY INTRAVENOUS INFUSION**
  - Child 5–17 years: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute

**DOSE EQUIVALENT AND CONVERSION**
- Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**UNLICENSED USE**  Fosphenytoin sodium doses in BNFC may differ from those in product literature.

**CONTRA-INDICATIONS**  Acute porphyrias p. 624; second-degree heart block; sino-atrial block; sinus bradycardia; Stokes-Adams syndrome; third-degree heart block.

**CAUTIONS**  Heart failure; hypotension; injection solutions alkaline (irritant to tissues); respiratory depression; resuscitation facilities must be available

**INTERACTIONS**  → Appendix 1: anti-epileptics

**SIDE-EFFECTS**
- **Common or very common**  Asthenia; chills; dizziness; drowsiness; dry mouth; dysarthria; euphoric mood; headache; hypotension; movement disorders; nausea; nystagmus; sensation abnormal; skin reactions; stupor; taste altered; tinnitus; tremor; vasodilation; vertigo; vision disorders; vomiting
- **Uncommon**  Cardiac arrest; confusion; hearing impairment; muscle complaints; muscle weakness; nervousness; oral disorders; reflexes abnormal; severe cutaneous adverse reactions (SCARs); systemic lupus erythematosus (SLE); thinking abnormal
- **Frequency not known**  Acute psychosis; agranulocytosis; appetite disorder; atrial conduction depression (more common if injection too rapid); atrioventricular block; bone disorders; bone fracture; bone marrow disorders; bradycardia; cardiac toxicity; cerebrovascular insufficiency; circulatory collapse (more common if injection too rapid); coarsening of the facial features; constipation; delirium; Dupuytren’s contracture; encephalopathy; granulocytopenia; groin tingling; hair changes; hepatic disorders; hyperglycaemia; hypersensitivity; insomnia; leucopenia; lymphadenopathy; nephritis; tubulo-interstitial; Peyronie’s disease; polyarteritis nodosa; polyarthritids; purple glove syndrome; respiratory disorders; sensory peripheral polynuropathy; thrombocytopenia; tonic seizure; ventricular conduction depression (more common if injection too rapid); ventricular fibrillation (more common if injection too rapid)

**SIDE-EFFECTS, FURTHER INFORMATION**  Fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended: monitor heart rate, blood pressure, and respiratory function for duration of infusion; observe patient for at least 30 minutes after infusion; if hypotension occurs, reduce infusion rate or discontinue; reduce dose or infusion rate in renal or hepatic impairment.

**ALLERGY AND CROSS-SENSITIVITY**  Cross-sensitivity reported with carbamazepine.

**PREGNANCY**  See also Pregnancy in Epilepsy p. 195.

**MONITORING**  Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**  Small amounts present in milk, but not known to be harmful.

**HEPATIC IMPAIRMENT**  Manufacturer advises caution—monitor free plasma-phenytoin concentration (rather than total plasma-phenytoin concentration) in hepatic impairment or hypoalbuminaemia and in hyperbilirubinaemia.

**Dose adjustments**  Manufacturer advises consider a 10–25% reduction in dose or infusion rate (except in the treatment of status epilepticus) in hepatic impairment or hypoalbuminaemia.

**RENAL IMPAIRMENT**  Dose adjustments Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**PRE-TREATMENT SCREENING**  HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless increased risk (e.g. individual or relative with Stevens-Johnson syndrome).

**MONITORING REQUIREMENTS**
- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.

**DIRECTIONS FOR ADMINISTRATION**  For intermittent intravenous infusion (Pro-Épanutin®), give in Glucose 5% or Sodium chloride 0.9%, dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.

**PRESCRIBING AND DISPENSING INFORMATION**  Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

| ELECTROLYTES: May contain Phosphate |
| Pro-Épanutin (Pfizer Ltd) |
| Fosphenytoin sodium 75 mg per 1 ml Pro-Épanutin 750mg/10ml concentrate for solution for injection vials | 10 vial  | £400.00 (Hospital only) |

**Gabapentin**

*INDICATIONS AND DOSE*  Adjunctive treatment of focal seizures with or without secondary generalisation
- **BY MOUTH**
  - Child 2–5 years: 10 mg/kg once daily on day 1, then 10 mg/kg twice daily on day 2, then 10 mg/kg 3 times a
day on day 3, then increased to 30–70 mg/kg daily in 3 divided doses, adjusted according to response, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

- Child 6-11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
- Child 12-17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

### Monotherapy for focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Child 12-17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

### IMPORTANT SAFETY INFORMATION

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

**MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®): RISK OF SEVERE RESPIRATORY DEPRESSION (OCTOBER 2017)**

Gabapentin has been associated with a rare risk of severe respiratory depression even without concomitant opioid medicines. Patients with compromised respiratory function, respiratory or neurological disease, renal impairment, and concomitant use of central nervous system (CNS) depressants might be at higher risk of experiencing severe respiratory depression and dose adjustments may be necessary in these patients.

**MHRA/CHM ADVICE: GABAPENTIN (NEURONTIN®) AND RISK OF ABUSE AND DEPENDENCE: NEW SCHEDULING REQUIREMENTS FROM 1 APRIL (APRIL 2019)**

Following concerns about abuse, gabapentin has been reclassified as a Class C controlled substance and is now a Schedule 3 drug, but is exempt from safe custody requirements. Healthcare professionals should evaluate patients carefully for a history of drug abuse before prescribing gabapentin, and observe patients for signs of abuse and dependence. Patients should be informed of the potentially fatal risks of interactions between gabapentin and alcohol, and with other medicines that cause CNS depression, particularly opioids.

### CAUTIONS

- Diabetes mellitus - high doses of oral solution in adolescents and adults with low body-weight - history of psychotic illness - history of substance abuse - mixed seizures (including absences)

### SIDE-EFFECTS

- **Uncommon** Cognitive impairment - palpitations
- **Frequency not known** Acute kidney injury - alopecia - angioedema - breast enlargement - drug use disorders - gynaecostasia - hallucination - hepatic disorders - hyponatraemia - pancreatitis - pancreatitis - severe cutaneous adverse reactions (SCARs) - thrombocytopenia - tinnitus - urinary incontinence

### PREGNANCY

Manufacturer advises avoid unless benefit outweighs risk — toxicity reported. See also Pregnancy in Epilepsy p. 195.

### BREAST FEEDING

Present in milk—manufacturer advises use only if potential benefit outweighs risk. See also Breast-feeding in Epilepsy p. 195.

### RENAL IMPAIRMENT

Dose adjustments: Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

### MONITORING REQUIREMENTS

Monitor for signs of gabapentin abuse.

### EFFECT ON LABORATORY TESTS

False positive readings with some urinary protein tests.

### DIRECTIONS FOR ADMINISTRATION

Capsules can be opened but the bitter taste is difficult to mask.

### PATIENT AND CARER ADVICE

Medicines for Children leaflet: Gabapentin for neuropathic pain
www.medicinesforchildren.org.uk/gabapentin-neuropathic-pain

Medicines for Children leaflet: Gabapentin for preventing seizures
www.medicinesforchildren.org.uk/gabapentin-preventing-seizures

Patient leaflet: NHS England has produced a patient leaflet with information on the reclassification of gabapentin.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

#### Tablet

**CAUTIONARY AND ADVISORY LABELS 3, 5, 8, 25**

- **Gabapentin (Non-proprietary)**
  - Gabapentin 600 mg Gabapentin 600 mg tablets  | 100 tablet £106.00 DT + £5.99 (3)
  - Gabapentin 800 mg Gabapentin 800 mg tablets  | 100 tablet £78.00 DT + £25.96 (3)
- **Neurontin® (Pfizer Ltd)**
  - Gabapentin 600 mg Neurontin 600 mg tablets  | 100 tablet £84.80 DT + £5.99 (3)
  - Gabapentin 800 mg Neurontin 800 mg tablets  | 100 tablet £98.13 DT + £25.96 (3)

#### Oral solution

**CAUTIONARY AND ADVISORY LABELS 3, 5, 8**

**EXCIPIENTS:** May contain Propylene glycol - ELECTROLYTES: May contain Potassium, sodium

- **Gabapentin (Non-proprietary)**
  - Gabapentin 50 mg per 1 ml Gabapentin 50 mg/ml oral solution sugar free sugar-free | 150 ml £59.00 DT + £66.05 (3)
Lacosamide

**206 Epilepsy and other seizure disorders**

**INDICATIONS AND DOSE**

**Monotherapy of focal seizures with or without secondary generalisation**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child (body-weight 50 kg and above): Initially 50 mg twice daily, then increased to 100 mg twice daily, after one week; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
  - Child 4-17 years (body-weight up to 50 kg): consult product literature

**Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals
  - Child 4-17 years (body-weight up to 50 kg): consult product literature

**Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child (body-weight 50 kg and above): Loading dose 200 mg, followed by 100 mg twice daily, to be given 12 hours after initial dose; increased in steps of 50 mg twice daily (max. per dose 300 mg twice daily) if necessary and if tolerated, dose to be increased at weekly intervals

**CONTRA-INDICATIONS**

- Second- or third-degree AV block

**CAUTIONS**

- Conduction problems • risk of PR-interval prolongation • severe cardiac disease

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Asthenia, concentration impaired, confusion, constipation, depression, diarrhoea, dizziness, drymouth, dysesthesia, flatulence, gait abnormal, headache, insomnia, mood altered, movement disorders, muscle spasms, nausea, nystagmus, sensation abnormal, skin reactions, tinnitus, vertigo, vision disorders, vomiting
- Uncommon: Agitation, alopecia, angioedema, arrhythmias, atrioventricular block, hallucination, psychotic disorder, suicidal tendencies, syncpe
- Frequency not known: Agranulocytosis

**ALLERGY AND CROSS-SENSITIVITY**

- Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 195 for more information.

**PREGNANCY**

- See also Pregnancy in Epilepsy p. 195.

**Monitoring**

- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution (risk of increased exposure), particularly in severe impairment (no information available).

**Dose adjustments**

- Manufacturer advises consider dose reduction—consult product literature.

**RENAL IMPAIRMENT**

- Consult product literature.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intermittent intravenous infusion, manufacturer advises give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9% or Lactated Ringer’s Solution; give over 15–60 minutes—doses greater than 200 mg over at least 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of syrup may include strawberry.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Lacosamide for preventing seizures

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

- SMC No. 532/09
  - The Scottish Medicines Consortium has advised (February 2009) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.
  - SMC No. 1301/18
  - The Scottish Medicines Consortium has advised (February 2018) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in adolescents and children from 4 years of age with epilepsy. It is restricted for specialist use in refractory epilepsy.

**All Wales Medicines Strategy Group (AWMSG) decisions**

- AWMSG No. 3343
  - The All Wales Medicines Strategy Group has advised (March 2018) that lacosamide (Vimpat®) is recommended as an option for use within NHS Wales as adjunctive therapy in the treatment of focal seizures with or without secondary generalisation in children from 4 years of age up to 15 years of age with epilepsy.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- ELECTROLYTES: May contain Sodium
  - Vimpat (UCB Pharma Ltd)

- Lacosamide 10 mg per 1 ml
  - Vimpat 200 mg/20 ml solution for infusion vials | 1 vial (PO) £29.70
**Lamotrigine**

**1. INDICATIONS AND DOSE**

**Monotherapy of focal seizures**
- Monotherapy of primary and secondary generalised tonic-clonic seizures

**Monotherapy of seizures associated with Lennox-Gastaut syndrome**
- **BY MOUTH**
  - Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Monotherapy of typical absence seizures**
- **BY MOUTH**
  - Child 2-11 years: Initially 300 micrograms/kg daily in 1-2 divided doses, for 14 days, then 600 micrograms/kg daily in 1-2 divided doses, for further 14 days, then increased in steps of up to 600 micrograms/kg every 7-14 days; maintenance 1-10 mg/kg daily in 1-2 divided doses, increased if necessary up to 15 mg/kg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures with valproate**
- **Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate**
- **Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate**
  - **BY MOUTH**
    - Child 2-11 years (body-weight up to 13 kg): Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
    - Child 2-11 years (body-weight 13 kg and above): Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7-14 days; maintenance 1-5 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
    - Child 12-17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7-14 days; maintenance 100-200 mg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate**
- **BY MOUTH**
  - Child 2-11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7-14 days; maintenance 5-15 mg/kg daily in 1-2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
  - Child 12-17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7-14 days; maintenance 200-400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate**
- **Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate**

**CAUTIONS** Myoclonic seizures (may be exacerbated)

**INTERACTIONS** → Appendix 1: antiepileptics

**SIDE-EFFECTS**
- Common or very common

antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 195 for more information.

- **PREGNANCY** See also Pregnancy in Epilepsy p. 195. Monitoring. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING** Present in milk, but limited data suggest no harmful effect on infant.

- **HEPATIC IMPAIRMENT** May accumulate. Dose adjustments Consider reducing maintenance dose in significant impairment.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product. Switching between formulations should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- **PATIENT AND CARER ADVICE** Skin react if rash or signs of hypersensitivity syndrome develop. Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine. Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-preventing-seizures

- **RENAI IMPAIRMENT** Caution in renal failure; metabolite may accumulate. Dose adjustments Consider reducing maintenance dose in significant impairment.

- **DISCONTINUATION** Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

- **PRESCRIBING AND DISPENSING INFORMATION** Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product. Switching between formulations should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- **PATIENT AND CARER ADVICE** Skin react if rash or signs of hypersensitivity syndrome develop. Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-preventing-seizures

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

### Dispersible tablet

**CAUTIONARY AND ADVISORY LABELS** 8, 13

- **Lamotrigine (Non-proprietary)**
  - Lamotrigine 5 mg | Lamotrigine 5mg dispersible tablets sugar free | 28 tablet (P) £5.90 DT + £0.86
  - Lamotrigine 25 mg | Lamotrigine 25mg dispersible tablets sugar free | 56 tablet (P) £20.00 DT + £2.20
  - Lamotrigine 100 mg | Lamotrigine 100mg dispersible tablets sugar free | 56 tablet (P) £50.68 DT + £3.99
  - Lamictal (GlaxoSmithKline UK Ltd)
    - Lamotrigine 2 mg | Lamotrigine 2mg dispersible tablets sugar free | 30 tablet (P) £18.81 DT + £18.81
    - Lamotrigine 5 mg | Lamotrigine 5mg dispersible tablets sugar free | 28 tablet (P) £8.38 DT + £6.86
    - Lamotrigine 25 mg | Lamotrigine 25mg dispersible tablets sugar free | 56 tablet (P) £23.53 DT + £2.20
    - Lamotrigine 100 mg | Lamotrigine 100mg dispersible tablets sugar free | 56 tablet (P) £63.04 DT + £3.99

**Levetiracetam**

03-Apr-2018

- **INDICATIONS AND DOSE**

  - **Monotherapy of focal seizures with or without secondary generalisation**
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child 16–17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
      - Child 6 months–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
      - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks
    - **BY INTRAVENOUS INFUSION**
      - Child 4–17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
      - Child 12–17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

- **Adjunctive therapy of myoclonic seizures and tonic-clonic seizures**

  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Child 12–17 years (body-weight 50 kg and above): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks

- **UNLICENSED USE**

  - **Initial dosing recommendations for levetiracetam**
    - With oral use Manufacturer advises granaules not licensed for use in children under 6 years, for initial treatment in
Epilepsy and other seizure disorders

Levetiracetam 750 mg | Levetiracetam 750mg tablets | 60 tablet P | £84.02 DT = £7.87
Levetiracetam 1 gram | Levetiracetam 1g tablets | 60 tablet P | £93.09 DT = £8.33
Keppra (UCB Pharma Ltd)
Levetiracetam 250 mg | Keppra 250mg tablets | 60 tablet P | £28.01 DT = £3.27
Levetiracetam 500 mg | Keppra 500mg tablets | 60 tablet P | £50.22 DT = £5.50
Levetiracetam 750 mg | Keppra 750mg tablets | 60 tablet P | £84.02 DT = £7.87
Keppra 1 gram | Keppra 1g tablets | 60 tablet P | £95.34 DT = £8.33

Solution for infusion
ELECTROLYTES: May contain Sodium
Levetiracetam (Non-proprietary)
Levetiracetam 500mg/5ml concentrate for solution for infusion vials | 10 vial P | £127.31 DT = £127.31 | 10 vial P | £114.57 £127.31 DT = £127.31 (Hospital only)
Desitrend (Desitin Pharma Ltd)
Levetiracetam 100 mg per 1 ml | Desitrend 500mg/5ml concentrate for solution for infusion ampoules | 10 ampoule P | £127.31 DT = £127.31
Keppra (UCB Pharma Ltd)
Levetiracetam 100 mg per 1 ml | Keppra 500mg/5ml concentrate for solution for infusion vials | 10 vial P | £127.31 DT = £127.31

Oral solution
CAUTIONARY AND ADVISORY LABELS 8
Levetiracetam (Non-proprietary)
Levetiracetam 100 mg per 1 ml | Levetiracetam 100mg/ml oral solution sugar-free sugar-free | 150 ml P | £27.00 sugar-free | 300 ml P | £60.26 DT = £28.94
Keppra (UCB Pharma Ltd)
Levetiracetam 100 mg per 1 ml | Keppra 100mg/ml oral solution sugar-free | 150 ml P | £33.48 sugar-free | 300 ml P | £66.95 DT = £28.94

Oxcarbazepine

INDICATIONS AND DOSE
Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH
Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH
Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day

DOSE ADJUSTMENTS DUE TO INTERACTIONS
In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

CAUTIONS
Avoid in Acute porphyrias p. 624 - cardiac conduction disorders, heart failure - hyponatraemia

INTERACTIONS → Appendix 1: antiepileptics

SIDE-EFFECTS
Common or very common Abdominal pain - agitation - alopecia - asthenia - ataxia - concentration impaired - constipation - depression - diarrhoea - dizziness - drowsiness - emotional lability - headache - hyponatraemia - nausea - nyctagmus - skin reactions - vertigo - vision disorders - vomiting

Uncommon Alopecia - concentration impaired - confusion - hallucination - leucopenia - muscle weakness - myalgia - paraesthesia - psychotic disorder - suicidal tendencies - thrombocytopenia - vision disorders - weight changes

Rare or very rare Acute kidney injury - agranulocytosis - hepatic disorders - hyponatraemia - neutropenia - pancreatitis - rhabdomyolysis - severe cutaneous adverse reactions (SCARs) - thinking abnormal

Appendix 1: antiepileptics
210 Epilepsy and other seizure disorders

- Rare or very rare: Angioedema, arthralgia, atrioventricular block, hepatitis, hypothyroidism, pancreatitis, severe cutaneous adverse reactions (SCARs), systemic lupus erythematosus (SLE), thrombocytopenia
- Frequency not known: Agranulocytosis, bone disorders, bone marrow disorders, hypertension, inappropriate antidiuretic hormone secretion like syndrome, neutropenia, speech impairment

**ALLERGY AND CROSS-SENSITIVITY**

Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 195 for more information.

**PREGNANCY**

See also *Pregnancy* in Epilepsy p. 195. Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Amount probably too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in patients with hepatic impairment.

**RENAL IMPAIRMENT**

Dose adjustments: Halve initial dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.

**PRE-TREATMENT SCREENING**

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

**MONITORING REQUIREMENTS**

- Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
- Monitor body-weight in patients with heart failure.

**PRESCRIBING AND DISPENSING INFORMATION**

Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product.

Switching between formulations: Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**

Blood, hepatic, or skin disorders: Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
- Oral suspension
  - CAUTIONARY AND ADVISORY LABELS 3, 8
  - EXCIPENTS: May contain Propylene glycol
  - Trileptal (Novartis Pharmaceuticals UK Ltd)
    - Oxcarbazepine 60 mg per 1 ml Trileptal 60mg/ml oral suspension sugar-free | 250 ml (POD) £48.96 DT = £48.96

- Tablet
  - CAUTIONARY AND ADVISORY LABELS 3, 8
  - Oxcarbazepine (Non-proprietary)
    - Oxcarbazepine 150 mg Oxcarbazepine 150mg tablets | 50 tablet (POD) £11.14 DT = £8.37
    - Oxcarbazepine 300 mg Oxcarbazepine 300mg tablets | 50 tablet (POD) £22.32 DT = £15.86
    - Oxcarbazepine 600 mg Oxcarbazepine 600mg tablets | 50 tablet (POD) £45.19 DT = £38.71

**INDICATIONS AND DOSE**

- **Adjunctive treatment of focal seizures with or without secondary generalised seizures**
  - **BY MOUTH**
    - Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

- **Adjunctive treatment of primary generalised tonic-clonic seizures**
  - **BY MOUTH**
    - Child 12-17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response, maintenance up to 8 mg once daily; maximum 12 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Titrate at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Anxiety, appetite abnormal, back pain, behaviour abnormal, confusion, dizziness, drowsiness, dysarthria, fatigue, gait abnormal, irritability, movement disorders, nausea, vertigo, vision disorders, weight increased

**PREGNANCY**

Manufacturer advises avoid. See also *Pregnancy* in Epilepsy p. 195. Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments**

Manufacturer advises maximum 8 mg per day in mild to moderate impairment.

**RENAL IMPAIRMENT**

Avoid in moderate or severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations: Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks: Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness and drowsines.
Phenytoin

19-Apr-2017

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 3, 8
EXCipients: May contain Sorbitol

▶ Fycompa (Eisai Ltd)
Perampanel 500 microgram per 1 ml Fycompa 0.5mg/ml oral suspension sugar-free | 340 ml PHS £12.75

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 3, 8, 25

▶ Fycompa (Eisai Ltd)
Perampanel 2 mg Fycompa 2mg tablets | 7 tablet PHS £35.00 DT + £35.00 | 28 tablet PHS £140.00 DT + £140.00
Perampanel 4 mg Fycompa 4mg tablets | 28 tablet PHS £140.00 DT + £140.00
Perampanel 6 mg Fycompa 6mg tablets | 28 tablet PHS £140.00 DT + £140.00

Perampanel 10 mg Fycompa 10mg tablets | 28 tablet PHS £140.00 DT + £140.00
Perampanel 12 mg Fycompa 12mg tablets | 28 tablet PHS £140.00 DT + £140.00

**Prevention and treatment of seizures during or following neurosurgery or severe head injury**

▶ BY MOUTH
Child: Initially 2.5 mg/kg twice daily, then adjusted according to response to 4–8 mg/kg daily, dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

**Status epilepticus / Acute symptomatic seizures associated with head trauma or neurosurgery**

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

Neonate: Loading dose 18 mg/kg, dose to be administered over 20–30 minutes, then (by mouth) 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), adjusted according to response, dose also adjusted according to plasma-phenytoin concentration.

**DOSE EQUIVALENT AND CONVERSION**

Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

**INDICATIONS AND DOSE**

**Tonic-clonic seizures / Focal seizures**

▶ BY MOUTH
Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day

Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

Neonate: Loading dose 18 mg/kg, dose to be administered over 20–30 minutes, then (by mouth) 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), adjusted according to response, dose also adjusted according to plasma-phenytoin concentration.

**INTERACTIONS**

Appendix 1: Antiepileptics

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

With oral use: Electrolyte imbalance - pneumonitis - vitamin D deficiency

With parenteral use: Arrhythmias - atrial conduction depression (more common if injection too rapid) - cardiac

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Acute porphyrias p. 624

**SPECIFIC CONTRA-INDICATIONS**

With intravenous use Second- and third-degree heart block - sino-atrial block - sinus bradycardia - Stokes-Adams syndrome

**CAUTIONS**

**GENERAL CAUTIONS**

Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

**SPECIFIC CAUTIONS**

With intravenous use: Heart failure - hypotension - injection solutions alkaline (irritant to tissues) - respiratory depression - resuscitation facilities must be available

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Intramuscular phenytoin should not be used (absorption is slow and erratic).

**IMPORTANCE SAFETY INFORMATION**

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF DEATH AND SEVERE HARM FROM ERROR WITH INJECTABLE PHENYTOIN

(NOVEMBER 2016)

Use of injectable phenytoin is error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.

**UNLICENSED USE**

With oral use: Licensed for use in children (age range not specified by manufacturer).

With intravenous use: Phenytoin doses in BNF publications may differ from those in product literature.

**SPECIFIC SIDE-EFFECTS**

With intravenous use (error-prone throughout the prescribing, preparation, administration and monitoring processes; all relevant staff should be made aware of appropriate guidance on the safe use of injectable phenytoin to reduce the risk of error.)
arrest • extravasation necrosis • hypotension • injection site necrosis • purple glove syndrome • respiratory arrest (more common if injection too rapid) • respiratory disorders • tonic seizure (more common if injection too rapid) • ventricular conduction depression (more common if injection too rapid) • ventricular fibrillation (more common if injection too rapid)•

SIDE-EFFECTS, FURTHER INFORMATION Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

Bradycardia and hypotension With intravenous use; reduce rate of administration if bradycardia or hypotension occurs.

Overdose Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

ALLERGY AND CROSS-SENSITIVITY Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 195 for more information.

Doses should be adjusted on the basis of plasma-drug concentration monitoring.

BREAST FEEDING Small amounts present in milk, but not known to be harmful.

HEPATIC IMPAIRMENT Manufacturer advises caution (increased risk of accumulation and toxicity due to decreased protein binding in hepatic impairment, hypalbuminaemia, or hyperbilirubinaemia). Dose adjustments • With oral use Manufacturer advises consider dose reduction.
• With intravenous use Manufacturer advises consider maintenance dose reduction.

PRE-TREATMENT SCREENING HLA* 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

MONITORING REQUIREMENTS • Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding.
• Trough plasma concentration for optimum response: neonate—3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
• Manufacturer recommends blood counts (but evidence of practical value uncertain).
• With intravenous use Monitor ECG and blood pressure.

DIRECTIONS FOR ADMINISTRATION Manufacturer advises each injection or infusion should be preceded and followed by an injection of Sodium Chloride 0.9% through the same needle or catheter to avoid local venous irritation.
• With intravenous use For intravenous injection, give into a large vein at a rate not exceeding 1 mg/minute (max. 50 mg/minute). Manufacturer advises for intravenous infusion, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron). Give at a rate not exceeding 1 mg/minute (max. 50 mg/minute).
• Complete administration within 1 hour of preparation.

PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

PATIENT AND CARER ADVICE Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-preventing-seizures

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet
CAUTIONARY AND ADVISORY LABELS 8
• Phenytoin (Non-proprietary) Phenytoin sodium 100 mg solution for injection ampoule | 28 table £30.00 DT = £1.11

Solution for injection
EXCIPIENTS: May contain Alcool, propylene glycol ELECTROLYTES: May contain Sodium
• Phenytoin (Non-proprietary) Phenytoin sodium 50 mg per 1 ml Phenytoin sodium 250mg/5ml solution for injection ampoules | 5 ampoule £24.40 (Hospital only)
• Epanutin (Pfizer Ltd) Phenytoin sodium 50 mg per 1 ml Epanutin Ready-Mixed Parenteral 250mg/5ml solution for injection ampoules | 10 ampoule £48.79 (Hospital only)

Oral suspension
CAUTIONARY AND ADVISORY LABELS 8
• Epanutin (Pfizer Ltd) Phenytoin 6 mg per 1 ml Epanutin 30mg/5ml oral suspension | 500 ml £4.27 DT = £0.87

Chewable tablet
CAUTIONARY AND ADVISORY LABELS 8, 24
• Epanutin (Pfizer Ltd) Phenytoin 50 mg Epanutin Infatabs 50mg chewable tablets | 200 tablet £13.18 DT = £0.65

Capsule
CAUTIONARY AND ADVISORY LABELS 8
• Phenytoin (Non-proprietary) Phenytoin sodium 25 mg Phenytoin sodium 25mg capsules | 28 capsule £7.24 DT = £0.26
• Phenytoin sodium 50 mg Phenytoin sodium 50mg capsules | 28 capsule £7.07 DT = £0.25
• Phenytoin sodium 100 mg Phenytoin sodium 100mg capsules | 84 capsule £67.50 DT = £0.81
• Phenytoin sodium 300 mg Phenytoin sodium 300mg capsules | 28 capsule £9.11 DT = £0.33

Rufinamide

INDICATIONS AND DOSE
Adjuvant treatment of seizures in Lennox-Gastaut syndrome without valproate (initiated by a specialist)
• BY MOUTH
  Child 1-3 years: Initially 5 mg/kg twice daily, then increased in steps of up to 5 mg/kg twice daily (max. per dose 22.5 mg/kg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days to the target dose (maximum dose), each dose should be given to the nearest 0.5 mg.
  Child 4-17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 3 days.
  Child 4-17 years (body-weight 30-50 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
  Child 4-17 years (body-weight 50.1-70 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily.
Epilepsy and other seizure disorders

Materials for Children leaflet: Rufinamide for preventing seizures
www.medicinesforchildren.org.uk/rufinamide-preventing-seizures

Driving and skilled tasks
Manufacturer advises patients and carers should be cautioned on the effects on driving and performance of skilled tasks—increased risk of dizziness, somnolence and blurred vision.

Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (November 2008) that rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

SMC No. 795/12
The Scottish Medicines Consortium has advised (July 2012) that rufinamide 40 mg/mL oral suspension (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

SMC No. SM2146
The Scottish Medicines Consortium has advised (April 2019) that rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients aged 1 year up to 4 years. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

Sodium valproate

Indications and dose

- Neurontin® 50 mg, 100 mg, 200 mg, 300 mg and 400 mg tablets
- Epilepsy and other seizure disorders

- Epilepsy p. 173
- Allergic and cross-sensitivity

- Antiepileptic

- Hypersensitivity

- Nervous system

- Side-effects
- Common or very common

- Anxiety, appetite decreased, back pain, constipation, diarrhea, dizziness, drowsiness, eating disorder, epistaxis, fatigue, gait abnormal, gastrointestinal discomfort, headache, increased risk of infection, insomnia, movement disorders, nausea, nyctagmus, oligomenorrhea, seizures, skin reactions, tremor, vertigo, vision disorders, vomiting, weight decreased

- Rare

- Drowsiness

- Hypersensitivity

- Allergic and cross-sensitivity

- Antiepileptic

- Hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 195 for more information.

- Pregnancy

- Breast feeding

- Hepatic impairment

- Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment (no information available).

- Dose adjustments

- Manufacturer advises cautious dose titration in mild to moderate impairment.

- Directions for administration

- Manufacturer advises tablets may be crushed and given in half a glass of water.

- Prescribing and dispensing information

- Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

- Patients may need to be maintained on a specific manufacturer’s branded or generic rufinamide product.

- Patient and carer advice

- Counselling on antiepileptic hypersensitivity syndrome is advised.

- Medicines for Children leaflet. Rufinamide for preventing seizures

- Driving and skilled tasks

- Patient and carer advice

- Counselling on antiepileptic hypersensitivity syndrome is advised.

214 Epilepsy and other seizure disorders

Chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12-17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- **BY MOUTH**
- **BY RECTUM**
- Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.

- Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- **BY MOUTH**
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION,**
- Neonate: Initially 40 mg/kg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day

**Initiation of valproate treatment**
- **INITIALLY BY INTRAVENOUS INJECTION**
- Neonate: 10 mg/kg twice daily.

- Child 1 month–11 years: Initially 10 mg/kg, then (by intravenous infusion or by intravenous injection) increased to 20–40 mg/kg daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) increased to 20–40 mg/kg daily, monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12-17 years: Initially 10 mg/kg, followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes

**Continuation of valproate treatment**
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION,** BY **CONTINUOUS INTRAVENOUS INFUSION**
- Children: If switching from oral therapy to intravenous therapy give the same dose as current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

EPILIM CHRONOSPHERE ®
**All forms of epilepsy**
- **BY MOUTH**
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPILIM CHRONO ®
**All forms of epilepsy**
- **BY MOUTH**
- **BY RECTUM**
- Child (body-weight 20 kg and above): Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA ® GRANULES
**All forms of epilepsy**
- **BY MOUTH**
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPIVAL ®
**All forms of epilepsy**
- **BY MOUTH**
- Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILD-BEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk). Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see Conception and contraception) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see Pregnancy). Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see Prescribing and dispensing Information). The MHRA advises that:
- **GP**s must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- **Specialists** must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- **Pharmacists** must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.

MHRA/CHM ADVICE: VALPROATE MEDICINES: ARE YOU ACTING IN COMPLIANCE WITH THE PREGNANCY PREVENTION MEASURES? (DECEMBER 2018)

The MHRA advises that all healthcare professionals must continue to identify and review all female patients on valproate, including when used outside licensed indications (off-label use) and provide them with the patient information materials every time they attend appointments or receive their medicines. Guidance for psychiatrists on the withdrawal of, and alternatives to, valproate in women of child-bearing potential who have a psychiatric illness is available from the Royal College of Psychiatrists.
MHRA/CHM ADVICE: VALPROATE MEDICINES AND SERIOUS HARMs IN PREGNANCY: NEW ANNUAL RISK ACKNOWLEDGMENT FORM AND CLINICAL GUIDANCE FROM PROFESSIONAL BODIES TO SUPPORT COMPLIANCE WITH THE PREGNANCY PREVENTION PROGRAMME (APRIL 2019)

The Annual Risk Acknowledgement Form has been updated and should be used for all future reviews of female patients on valproate. Specialists should comply with guidance given on the form if they consider the patient is not at risk of pregnancy, including the need for review in case her risk status changes.

Guidance has been published to support healthcare professionals with the use of valproate. These include a summary by NICE of their guidance and safety advice, pan-college guidance by national healthcare bodies, and paediatric guidance by the British Paediatric Neurology Association and the Royal College of Paediatrics and Child Health.

- **CONTRA-INDICATIONS** Acute porphyrias p. 624 • known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) • personal or family history of severe hepatic dysfunction

- **CAUTIONS** Systemic lupus erythematosus

**CAUTIONS, FURTHER INFORMATION** Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **Liver toxicity** Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal–discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- **INTERACTIONS** → Appendix 1: antiepileptics

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Abdominal pain • agitation • alopecia (regrowth may be curly) • anaemia • behaviour abnormal • confusion • deafness • diarrhoea • drowsiness • hallucination • headache • hepatic disorders • hypoglycaemia • memory loss • mental retardation • irregularities • movement disorders • nail disorder • nausea • oedema • oral disorders • seizures • stupor • thrombocytopenia • tremor • urinary disorders • vomiting • weight increased

- **Uncommon** Androgenetic alopecia • angiodema • bone disorders • bone fracture • bone marrow disorders • coma • encephalopathy • hair changes • hyperammonaemia • hypothyroidism • myelodysplastic syndrome • nephritis tubulointerstitial • polycystic ovaries • red blood cell abnormalities • rhabdomyolysis • severe cutaneous adverse reactions (SCARs) • systemic lupus erythematosus (SLE) • urine abnormalities

- **Frequency not known** Alertness increased

**SPECIFIC SIDE-EFFECTS**

- **Common or very common** With intravenous use Dizziness

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

- **Pancreatitis** Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.

- **PREGNANCY** For migraine prophylaxis [unlicensed] and bipolar disorder, the MHRA advises that valproate must not be used. For epilepsy, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia) reported. Neonatal hepatotoxicity also reported. See also Pregnancy in Epilepsy p. 195.

- **Monitoring** Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoidance.

- **RENAI IMPAIRMENT** Dose adjustments Reduce dose.

- **MONITORING REQUIREMENTS**

- **Plasma-valproate concentrations** are not a useful index of efficacy, therefore routine monitoring is unhelpful.

- **Monitor liver function before therapy and during treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia) reported. Neonatal hepatotoxicity also reported. See also Pregnancy in Epilepsy p. 195.

- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

- **TREATMENT CESSATION** Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

- **DIRECTIONS FOR ADMINISTRATION**

- **Intravenous use** Manufacturer advises for intravenous injection, give over 3–5 minutes. For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%. Reconstitute Epilim® with solvent provided then dilute with infusion fluid if required. Displacement value may be significant, consult local guidelines.

- **Rectal use** For rectal administration, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion). Epival® Tablets may be halved but not crushed or chewed.

**EPISINTA® CAPSULES** Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.
Epilepsy and other seizure disorders

**EPILIM® SYRUP** May be diluted, preferably in Syrup BP; use within 14 days.

**EPISENTA® GRANULES** Granules may be mixed with cold soft food or drink and swallowed immediately without chewing.

**EPILIM CHRONOSPHERE®** Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

### PRESCRIBING AND DISPENSING INFORMATION

The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: Patient Guide, Guide for Healthcare Professionals, Risk Acknowledgement Form, and for pharmacists, Patient Cards and Stickers with warning symbols; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgment and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product.

**EPILIM CHRONOSPHERE®** Prescribe dose to the nearest whole 50-mg sachet.

### PATIENT AND CARER ADVICE

Valproate use by women and girls The MHRA advises women and girls should not stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

Patients or their carers should be counselled on the administration of granules.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

### Modified-release tablet

**EPILIM Chrono (Sanofi)**

| Sodium valproate 200 mg | Epilim Chrono 200 tablets | 30 tablet (PST) £1.50 | 100 tablet (PST) £4.50 | £11.35 DT = £11.65 |
| Sodium valproate 300 mg | Epilim Chrono 300 tablets | 30 tablet (PST) £5.24 | 100 tablet (PST) £17.47 DT = £17.47 |

**Epival CR (Chanelle Medical UK Ltd)**

| Sodium valproate 300 mg | Epival CR 300mg tablets | 100 tablet (PST) £17.47 DT = £17.47 |
| Sodium valproate 500 mg | Epival CR 500mg tablets | 100 tablet (PST) £29.10 DT = £29.10 |

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS 5, 8, 10, 25**

### Sodium valproate (non-proproprietary)

| Sodium valproate 200 mg | Sodium valproate 200mg gastro-resistant tablets | 100 tablet (PST) £9.24 DT = £8.36 |

Stiripentol

13-Mar-2019

**INDICATIONS AND DOSE**

Adjuvant therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy (Dravet syndrome) in combination with clobazam and valproate (under expert supervision)

- BY MOUTH
  - Child 3-5 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased to 30 mg/kg daily in 2–3 divided doses for 1 week, then increased to 50 mg/kg daily in 2–3 divided doses
  - Child 6-11 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased in steps of 10 mg/kg daily in 2–3 divided doses, dose to be increased at intervals of 1 week to 50 mg/kg daily in 2–3 divided doses
  - Child 12-17 years: Initially 20 mg/kg daily in 2–3 divided doses for 1 week, then increased to 30 mg/kg daily in 2–3 divided doses for 1 week, then increased in steps of 5 mg/kg daily in 2–3 divided doses, dose to be increased at intervals of 1 week, until the optimum dose is reached based on clinical judgement; maximum 50 mg/kg per day

**DOSE EQUIVALENT AND CONVERSION**

- Stiripentol capsules and oral powder sachets are not bioequivalent. If a switch of formulation is required, manufacturer advises this is done under clinical supervision in case of intolerance.

**CONTRA-INDICATIONS**

History of psychosis in the form of episodes of delirium

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Agitation, appetite decreased, behaviour abnormal, drowsiness, irritability, movement disorders, muscle tone decreased, nausea, neutropenia, sleep disorders, vomiting, weight decreased
- Uncommon: Diplopia, fatigue, photosensitivity reaction, skin reactions
- Rare or very rare: Thrombocytopenia

**ALLERGY AND CROSS-SENSITIVITY**

Antiepileptic hypersensitivity syndrome theoretically associated with stiripentol. See under Epilepsy p. 195 for more information.

**PREGNANCY**

See also Pregnancy in Epilepsy p. 195.

Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid (no information available).

**RENAL IMPAIRMENT**

Avoid—no information available.

**MONITORING REQUIREMENTS**

- Perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter.
- Manufacturer advises monitor growth.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Stiripentol for preventing seizures www.medicinesforchildren.org.uk/stiripentol-preventing-seizures

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

The Scottish Medicines Consortium has advised (September 2017) that stiripentol (Diacomit®) is accepted for use within NHS Scotland in conjunction with clobazam and valproate as adjuvantive therapy of refractory generalised tonic-clonic seizures in patients with severe myoclonic epilepsy in infancy whose seizures are not adequately controlled with clobazam and valproate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

CAUTIONARY AND ADVISORY LABELS 1, 8, 13, 21

EXCipients: May contain Aspartame

- Diacomit (Alan Pharmaceuticals)
  - Stiripentol 250 mg Diacomit 250mg oral powder sachets 60 sachet £284.00 DT = £284.00
  - Stiripentol 500 mg Diacomit 500mg oral powder sachets 60 sachet £493.00 DT = £493.00

**Capsule**

  - Stiripentol 500 mg Diacomit 500mg capsules 60 capsule £493.00 DT = £493.00

**Tiagabine**

15-Mar-2019

**INDICATIONS AND DOSE**

Adjuvant treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

- BY MOUTH
  - Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 30–45 mg daily in 2–3 divided doses

Adjuvant treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

- BY MOUTH
  - Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every week; maintenance 15–30 mg daily in 2–3 divided doses

**CAUTIONS**

Avoid in Acute porphyrias p. 624

CAUTIONS, FURTHER INFORMATION: Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

- Common or very common: Abdominal pain, behaviour abnormal, concentration impaired, depression, diarrhoea, dizziness, emotional lability, fatigue, gait abnormal, insomnia, nausea, nervousness, speech disorder, tremor, vision disorders, vomiting
- Uncommon: Drowsiness, psychosis, skin reactions
- Rare or very rare: Delusions, hallucination

**PREGNANCY**

See also Pregnancy in Epilepsy p. 195.

Monitoring: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in mild to moderate impairment (risk of increased exposure); avoid in severe impairment.
**218 Epilepsy and other seizure disorders**

**Dose adjustments** Manufacturer advises dose reduction and/or longer dose interval with careful titration in mild to moderate impairment.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tiagabine for preventing seizures www.medicinesforchildren.org.uk/tiagabine-preventing-seizures

**Driving and skilled tasks** May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

**BY MOUTH**

- Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 25–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer intervals between steps may be used; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

**BY MOUTH**

- Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimens then smaller steps or longer interval between steps may be used; maximum 400 mg per day

**Migraine prophylaxis**

**BY MOUTH**

- Child 16–17 years: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses, if child cannot tolerate recommended titration regimens then smaller steps or longer interval between steps may be used; maximum 200 mg per day

**SIDE-EFFECTS**

- **Common or very common** Alopecia, anaemia, anxiety, appetite abnormal, asthenia, behaviour abnormal, cognitive impairment, concentration impaired, confusion, constipation, cough, depression, diarrhoea, dizziness, dryness, dry mouth, dysphoria, ear discomfort, eye disorders, feeling abnormal, fever, gait abnormal, gastrointestinal discomfort, gastrointestinal disorders, haemorrhage, hypersensitivity, joint disorders, malaise, memory loss, mood altered, movement disorders, muscle complaints, muscle weakness, nasal complaints, nasopharyngitis, nausea, oral disorders, pain, seizures, sensation abnormal, skin reactions, sleep disorders, speech impairment, taste altered, tinnitus, tremor, urinary disorders, urolithiasis, vertigo, vision disorders, vomiting, weight changes

- **Uncommon** Abnormal sensation in eye, ankle/hand, arthralgia, acute myopia, aura, cerebellar syndrome, consciousness impaired, crying, dizziness, dry eye, dysgraphia, dysphoria, eosinophilia, facial swelling, hallucinations, hearing impairment, hyperthermia, hypokalaemia, hypotension, influenza like illness, learning disability, leucopenia, lymphadenopathy, metabolic acidosis, musculoskeletal stiffness, palpitations, pancreatitis, paranasal sinus hyperperfusion, peripheral coldness, peripheral neuropathy, polydipsia, psychotic disorder, renal pain, sexual dysfunction, smell altered, suicidal tendencies, syncope, thinking abnormal, thirst, thrombocytopenia, vasodilation

- **Rare or very rare** Eye inflammation, face oedema, glaucoma, hepatic disorders, limb discomfort, neutropenia, Raynaud’s phenomenon, renal tubular acidosis, severe cutaneous adverse reactions (SCARs), unresponsive to stimuli

**SIDE-EFFECTS, FURTHER INFORMATION**

Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. If raised intraocular pressure occurs: seek specialist ophthalmological advice; use appropriate measures to reduce intraocular pressure and stop topiramate as rapidly as feasible.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises perform pregnancy test before the initiation of treatment—a highly effective contraceptive method is advised in women of child-bearing potential; patients should be fully informed of the risks related to the use of topiramate during pregnancy.

**PREGNANCY** Increased risk of major congenital malformations following exposure during the first trimester. For migraine prophylaxis manufacturer advises avoid. For epilepsy manufacturer advises consider alternative treatment options. See also Pregnancy in Epilepsy p. 195.

**Monitoring** Manufacturer advises in case of administration during first trimester, careful prenatal monitoring should be performed.

It is recommended that the fetal growth should be monitored.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment—clearance may be reduced.

**RENAL IMPAIRMENT** Use with caution.

**Dose adjustments** Half usual starting and maintenance dose if estimated glomerular filtration less than

---

**Topiramate**

25-Jan-2018

**INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

**BY MOUTH**

- Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 25–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer intervals between steps may be used; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

**BY MOUTH**

- Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimens then smaller steps or longer interval between steps may be used; maximum 400 mg per day

**Migraine prophylaxis**

**BY MOUTH**

- Child 16–17 years: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every week; usual dose 50–100 mg daily in 2 divided doses, if child cannot tolerate recommended titration regimens then smaller steps or longer interval between steps may be used; maximum 200 mg per day

---

**UNLICENSED USE** Not licensed for use in children for migraine prophylaxis.

**CAUTIONS** Avoid in Acute porphyrias p. 624 | risk of metabolic acidosis | risk of nephrolithiasis |— ensure adequate hydration (especially in strenuous activity or warm environment)

**INTERACTIONS** Appendix 1: antiepileptics
70 ml/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration.

**DIRECTIONS FOR ADMINISTRATION**

**TOPAMAX® Capsules** Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations. Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/topiramate-preventing-seizures

**TOPAMAX® Capsules** Patients or carers should be given advice on how to administer Topamax® Sprinkle capsules.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

- **Topiramate (Non-proprietary)**
  - Topiramate 10 mg per 1 ml Topiramate 50mg/5ml oral suspension sugar free sugar-free | 150 ml (POM) £129.00 DT = £129.00

    - **Topiramate 50 mg Topiramate 50mg sprinkle capsules | 60 capsule (POM) £36.45 DT = £33.08**

**INDICATIONS AND DOSE**

**CONVULEX®**

**Epilepsy**

- **By Mouth**
  - Child 1 month–11 years: Initially 10–15 mg/kg daily in 2–4 divided doses, max. 600 mg daily; usual maintenance 25–30 mg/kg daily in 2–4 divided doses, doses up to 60 mg/kg daily in 2–4 divided dose in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12–17 years: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

**DOSE EQUIVALENCE AND CONVERSION**

- **Convulx®** has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: VALPROATE MEDICINES: CONTRA-INDICATED IN WOMEN AND GIRLS OF CHILDBEARING POTENTIAL UNLESS CONDITIONS OF PREGNANCY PREVENTION PROGRAMME ARE MET (APRIL 2018)**

Valproate is highly teratogenic and evidence supports that use in pregnancy leads to neurodevelopmental disorders (approx. 30–40% risk) and congenital malformations (approx. 10% risk).

Valproate must not be used in women and girls of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met (see Conception and contraception) and only if other treatments are ineffective or not tolerated, as judged by an experienced specialist.

Use of valproate in pregnancy is contra-indicated for migraine prophylaxis [unlicensed] and bipolar disorder; it must only be considered for epilepsy if there is no suitable alternative treatment (see Pregnancy).

Women and girls (and their carers) must be fully informed of the risks and the need to avoid exposure to valproate medicines in pregnancy; supporting materials have been provided to use in the implementation of the Pregnancy Prevention Programme (see Prescribing and dispensing information). The MHRA advises that:

- GPs must recall all women and girls who may be of childbearing potential, provide the Patient Guide, check they have been reviewed by a specialist in the last year and are on highly effective contraception;
- Specialists must book in review appointments at least annually with women and girls under the Pregnancy Prevention Programme, re-evaluate treatment as necessary, explain clearly the conditions as outlined in the supporting materials and complete and sign the Risk Acknowledgement Form—copies of the form must be given to the patient or carer and sent to their GP;
- Pharmacists must ensure valproate medicines are dispensed in whole packs whenever possible—all packs dispensed to women and girls of childbearing potential should have a warning label either on the carton or via a sticker. They must also discuss risks in pregnancy with female patients each time valproate medicines are dispensed, ensure they have the Patient Guide and have seen their GP or specialist to discuss their treatment and the need for contraception.
Nervous system

INTERACTIONS

during valproate treatment are usually transient but

persistent vomiting and abdominal pain, anorexia,

alertness increased

anaemia

seizure

jaundice, oedema, malaise, drowsiness, or loss of seizure control.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

CONCEPTION AND CONCEPTION AND CONCEPTION

The MHRA advises that all women and girls of childbearing potential being treated with valproate medicines must be supported on a Pregnancy Prevention Programme—pregnancy should be excluded before treatment initiation and highly effective contraception must be used during treatment.

PREGNANCY For migraine prophylaxis [unlicensed] and bipolar disorder, the MHRA advises that valproate must not be used. For epilepsy, the MHRA advises valproate must not be used unless there is no suitable alternative treatment; in such cases, access to counselling about the risks should be provided (see Healthcare Professional Guide for more information) and a Risk Acknowledgement Form signed by both specialist and patient. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma–valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia). Neonatal hepatotoxicity also reported. See also Pregnancy in Epilepsy p. 195.

Monitoring Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING Present in milk—risk of haematological disorders in breast-fed newborns and infants.

HEPATIC IMPAIRMENT Manufacturer advises avoid.

RENNAL IMPAIRMENT Dose adjustment Reduce dose.

MONITORING REQUIREMENTS

Monitor closely if dose greater than 45 mg/kg daily.

Monitor liver function before therapy and during first 6 months especially in patients most at risk.

Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

EFFECT ON LABORATORY TESTS False-positive urine tests for ketones.

TREATMENT CESSATION In bipolar disorder, avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

PRESCRIBING AND DISPENSING INFORMATION The Pregnancy Prevention Programme is supported by the following materials provided by the manufacturer: Patient Guide, Guide for Healthcare Professionals, Risk Acknowledgement Form, and for pharmacists, Patient Cards and Stickers with warning symbols; the MHRA has also produced a patient information sheet providing advice for women and girls taking valproate medicines.

CONVULEX Patents being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.

PATIENT AND CARER ADVICE Valproate use by women and girls The MHRA advises women and girls should not stop taking valproate without first discussing it with their doctor.

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

CONTRA-INDICATIONS Acute porphyrias p. 624 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) personal or family history of severe hepatic dysfunction.

CAUTIONS Systemic lupus erythematosus.

CAUTIONS, FURTHER INFORMATION

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

INTERACTIONS SIDE-EFFECTS, FURTHER INFORMATION Hepatic dysfunction

Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia,
Vigabatrin

INDICATIONS AND DOSE

Adjuvant treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

By Mouth

- Neonate: Initially 15–20 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 1–3 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 2–11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g).
- Child 12–17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily.

By Rectum

- Child 1–3 months: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 2–11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g).
- Child 12–17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily.

Monotherapy in the management of infantile spasms in West’s syndrome (under expert supervision)

By Mouth

- Neonate: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 1 month–1 year: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).

UNLICENSED USE

Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

CONTRA-INDICATIONS

Visual field defects

CAUTIONS

History of behavioural problems · history of depression · history of psychosis

FURTHER INFORMATION

Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

INTERACTIONS

Appendix 1: antiepileptics

SIDE-EFFECTS

- Common or very common Abdominal pain · anaemia · anxiety · arthralgia · behaviour abnormal · concentration impaired · depression · dizziness · drowsiness · eye disorders · fatigue · headache · memory loss · mood altered · nausea · oedema · paraesthesia · speech disorder · thinking abnormal · tremor · vision disorders · vomiting · weight increased
- Uncommon Movement disorders · psychotic disorder · seizure (patients with myoclonic seizures at greater risk) · skin reactions
- Rare or very rare Angioedema · encephalopathy · hallucination · hepatitis · optic neuritis · suicide attempt
- Frequency not known Muscle tone increased

SIDE-EFFECTS, FURTHER INFORMATION

Encephalopathic symptoms Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely – reduce dose or withdraw.

Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

PREGNANCY

See also Pregnancy in Epilepsy p. 195.

MONITORING

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING

Present in milk — manufacturer advises avoid.

RENAL IMPAIRMENT

Dose adjustments Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Closely monitor neurological function.

DIRECTIONS FOR ADMINISTRATION

- With oral use: The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
- With rectal use: Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

PATIENT AND CARER ADVICE

Patients and their carers should be warned to report any new visual symptoms that develop.

Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-preventing-seizures

MEDIeCAL FORMS

**INDICATIONS AND DOSE**
Adjunctive treatment for refractory focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4.
  - Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4.

**CAUTIONS**
Low body-weight or poor appetite—monitor weight throughout treatment (fetal cases of weight loss reported in children) - metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) - risk factors for renal stone formation (particularly predisposition to nephrolithiasis).

**CAUTIONS, FURTHER INFORMATION**
Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fetal cases of heat stroke reported in children).

**INTERACTIONS**
Appendix 1: antiepileptics.

**SIDE-EFFECTS**
- Common or very common: Alopecia - anxiety - appetite decreased - ataxia - bradynphrenia - concentration impaired - confusion - constipation - depression - diarrhea - diziness - drowsiness - fatigue - fever - gastrointestinal discomfort - hypersensitivity - influenza like illness - insomnia - memory loss - mood altered - nausea - nystagmus - paraesthesia - peripheral oedema - psychosis - rash (consider discontinuation) - skin reactions - speech disorder - tremor - urolithiasis - vision disorders - vomiting - weight decreased
- Uncommon: Behaviour abnormal - gallbladder disorders - hallucination - hypokalaemia - increased risk of infection - leucopenia - respiratory disorders - seizures - suicidal tendencies - thrombocytopenia
- Rare or very rare: Agranulocytosis - angle closure glaucoma - anhidrosis - bone marrow disorders - coma - dysphoria - eye pain - heat stroke - hepatocellular injury - hydrenephrosis - leukocytosis - lymphadenopathy - metabolic acidosis - myasthenic syndrome - neuroleptic malignant syndrome - pancreatitis - renal failure - renal tubular acidosis - rhabdomyolysis - severe cutaneous adverse reactions (SCARs) - urine abnormal
- Frequency not known: Sudden unexplained death in epilepsy

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated in sulfonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 195 for more information.

**CONCEPTION AND CONCEPTION**
Manufacturer advises women of childbearing potential should use effective contraception during treatment and for one month after last dose—avoid in women of childbearing potential not using effective contraception unless clearly necessary and the potential benefit outweighs risk; patients should be fully informed of the risks related to the use of zonisamide during pregnancy.

**PREGNANCY**
Manufacturer advises use only if clearly necessary and the potential benefit outweighs risk—tobacco in animal studies; patients should be fully informed of the risks related to the use of zonisamide during pregnancy. See also Pregnancy in Epilepsy p. 195.

**Monitoring**
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**
Manufacturer advises avoid for 4 weeks after last dose.

**HEPATIC IMPAIRMENT**
Avoid in severe impairment. Dose adjustments: Initially increase dose at 2-week intervals if mild or moderate impairment.

**RENAL IMPAIRMENT**
Dose adjustments: Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

**TREATMENT CESSATION**
Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

**PRESCRIBING AND DISPENSING INFORMATION**
Switching between formulations: Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.

**PATIENT AND CARER ADVICE**
Children and their carers should be made aware of how to prevent and recognise overheating and dehydration. Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-preventing-seizures

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) decisions
SMC No. 949/14
The Scottish Medicines Consortium has advised (March 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged ≥6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**
- Zonisamide (Non-proprietary)
  - Zonisamide 25 mg Zonisamide 25mg capsules | 14 capsule £44.1
  - Zonisamide 50 mg Zonisamide 50mg capsules | 56 capsule £47.04 DT = £3.60
  - Zonisamide 100 mg Zonisamide 100mg capsules | 56 capsule £62.72 DT = £4.74
  - Zonegran (Eisai Ltd) Zonisamide 25 mg Zonegran 25mg capsules | 14 capsule £44.1
  - Zonisamide 25 mg Zonisamide 25mg capsules | 14 capsule £44.1
Phenobarbital (Phenobarbitone)

**INDICATIONS AND DOSE**

**All forms of epilepsy except typical absence seizures**

- **By mouth**
  - Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg as required; maintenance 2.5–4 mg/kg 1–2 times a day
  - Child 12-17 years: 60–180 mg once daily
  - Initially by slow intravenous injection

- Neonate: Initially 20 mg/kg, then (by slow intravenous injection or by mouth) 2.5–5 mg/kg once daily, adjusted according to response.

**Status epilepticus**

- Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

- Child 1 month-11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.

- Child 12-17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

- For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

**CAUTIONS**

- Avoid in Acute porphyrias p. 624.
- Children: debilitated, history of alcohol abuse, history of drug abuse, respiratory depression (avoid if severe).

**CAUTIONS, FURTHER INFORMATION**

- Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

**INTERACTIONS**

- Appendix 1: antiepileptics

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Agitation, agranulocytosis, anticonvulsant hypersensitivity syndrome, behaviour abnormal, bone disorders, bone fracture, cognitive impairment, confusion, depression, drowsiness, folate deficiency, hepatic disorders, memory loss, movement disorders, nystagmus, respiratory depression, skin reactions

**SPECIFIC SIDE-EFFECTS**

- With oral use: Hallucination, hypotension, megaloblastic anaemia, severe cutaneous adverse reactions (SCARs), thrombocytopenia

- With parenteral use: Anaemia, aplastic anaemia, Dupuytren’s contracture, hypocalcaemia, irritability, toxic epidermal necrolysis

**Overdose**

- For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 859.

**ALLERGY AND CROSS-SENSITIVITY**

- Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 195 for more information.

---

**PREGNANCY**

- **Monitoring**: The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

- Avoid if possible; drowsiness may occur.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**

- Use with caution.

**MONITORING REQUIREMENTS**

- Plasma phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

**TREATMENT CESSATION**

- Avoid abrupt withdrawal (dependence with prolonged use).

**DIRECTIONS FOR ADMINISTRATION**

- With oral use: For administration by mouth, tablets may be crushed.

- With intravenous use: For intravenous injection, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).

**PRESCRIBING AND DISPENSING INFORMATION**

- Some hospitals supply alcohol-free formulations of varying phenobarbital strengths.

  - The RCPCH and NPPG recommend that, when a liquid special of phenobarbital is required, the following strength is used: 50 mg/5 mL.

  Switching between formulations: Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-preventing-seizures

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 2, 8

  - **Phenobarbital (Non-proprietary)**

  - Phenobarbital 15 mg Phenobarbital 15 mg tablets | 28 tablet £24.95 DT + £16.71

  - Phenobarbital 30 mg Phenobarbital 30 mg tablets | 28 tablet £5.99 DT + £6.69

  - Phenobarbital 60 mg Phenobarbital 60 mg tablets | 28 tablet £7.99 DT + £6.67

**Solution for injection**

- EXCIPIENTS: May contain Propylene glycol

  - **Phenobarbital (Non-proprietary)**

  - Phenobarbital sodium 30 mg per 1 ml Phenobarbital 30 mg/1 ml solution for injection ampoules | 10 ampoule £98.42 DT + £98.42

  - Phenobarbital sodium 60 mg per 1 ml Phenobarbital 60 mg/1 ml solution for injection ampoules | 10 ampoule £103.84 DT + £103.84

  - Phenobarbital sodium 200 mg per 1 ml Phenobarbital 200 mg/1 ml solution for injection ampoules | 10 ampoule £84.66 DT + £84.66

**Oral solution**

- CAUTIONARY AND ADVISORY LABELS 2, 8

  - EXCIPIENTS: May contain Alcohol

  - **Phenobarbital (Non-proprietary)**

  - Phenobarbital 3 mg per 1 ml Phenobarbital 15 mg/5 ml elixir | 500 ml £83.00–£83.01 DT + £83.01

---

**Zonisamide 50 mg**  Zonegran capsules | 56 capsule £47.04 DT + £33.60

**Zonisamide 100 mg**  Zonegran 100 mg capsules | 56 capsule £62.72 DT + £4.74
Primidone

**INDICATIONS AND DOSE**

*All forms of epilepsy except typical absence seizures*

- **BY MOUTH**
  - Child 1 month–1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–250 mg twice daily
  - Child 2–4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
  - Child 5–8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
  - Child 9–17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response

**CAUTIONS** Avoid in Acute porphyrinas p. 624 - children - debilitated - history of alcohol abuse - history of drug abuse - respiratory depression (avoid if severe)

**SIDE-EFFECTS**

- Common or very common Apathy - ataxia - drowsiness - nausea - nystagmus - visual impairment
- Uncommon Dizziness - headache - hypersensitivity - skin reactions - vomiting
- Rare or very rare Arthralgia - blood disorder - bone disorders - Dupuytren’s contracture - megaloblastic anaemia (may be treated with folic acid) - personality change - psychotic disorder - severe cutaneous adverse reactions (SCARs) - systemic lupus erythematosus (SLE)
- Frequency not known Bone fracture

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 195 for more information.

**PREGNANCY**

Monitoring The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT** May precipitate coma.

**RENAI IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**

- Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).
- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

**Tablet**

**HYPNOTICS, SEDATIVES AND ANXIOLYSES**

Benzodiazepines

**CONTRA-INDICATIONS** Acute pulmonary insufficiency - marked neuromuscular respiratory weakness - sleep apnoea syndrome - unstable myasthenia gravis

**CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) - history of alcohol dependence or abuse - history of drug dependence or abuse - myasthenia gravis - personality disorder (within the fearful group – dependent, avoidant, obsessive-compulsive) may increase risk of dependence - respiratory disease

**SIDE-EFFECTS**

- Common or very common Alertness decreased - anxiety - ataxia - confusion - depression - dizziness - drowsiness - dysarthria - fatigue - gastrointestinal disorder - headache - hypotension - mood altered - muscle weakness - nausea - respiratory depression (particularly with high dose and intravenous use) – facilities for its treatment are essential – sleep disorders - suicidal ideation - tremor - vertigo - vision disorders - withdrawal syndrome
- Uncommon Agitation (more common in children and elderly) - anterograde amnesia - behaviour abnormal - hallucination - libido disorder - rash - urinary disorders
- Rare or very rare Aggression (more common in children and elderly) - blood disorder - delusions - jaundice - paradoxical drug reaction - psychosis
- Frequency not known Drug dependence

**OVERDOSE** Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 859.

**PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**HEPATIC IMPAIRMENT** In general, manufacturers advise caution in mild to moderate impairment; avoid in severe impairment. Benzodiazepines with a shorter half-life are considered safer.

**Dose adjustments** In general, manufacturers advise dose reduction in mild to moderate impairment, adjust dose according to response.

**RENAI IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.
Epilepsy and other seizure disorders

Clobazam

By Mouth
- Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
- Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

Monotherapy for cataminal (menstruation) seizures (usually for 7–10 days each month, just before and during menstruation) (under expert supervision)

Cluster seizures
- By Mouth
- Child 1 month–5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
- Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

Unlicensed Use
- Not licensed for use in children under 6 years. Not licensed as monotherapy.

Important Safety Information

Safe Practice
Clobazam has been confused with clonazepam; care must be taken to ensure the correct drug is prescribed and dispensed.

Contra-Indications
- Hyperkinesis · Obsessional states · Phobic states · Respiratory depression

Caution
- Muscle weakness · Organic brain changes

Contraindications
- The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

Interactions
- Appendix 1: clobazam

Side-Effects
- Appetite decreased · Consciousness impaired · Constipation · Drug abuse · Dry mouth · Fall · Gait unsteady · Libido loss · Movement disorders · Muscle spasms · Nystagmus · Respiratory disorder · Severe cutaneous adverse reactions (SCARs) · Skin reactions · Speech impairment · Weight increased

Breast Feeding
- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

Monitoring
- All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

Renal Impairment
- Dose adjustments: Start with small doses in severe impairment.

Monitoring Requirements
- Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Prescribing and Dispensing Information
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension.

Oral Suspension
- Clobazam (Non-proprietary)
  - Clobazam 1 mg per 1 ml: Clobazam 5mg/5ml oral suspension sugar free sugar-free | 150 ml (PSt) £90.00 DT = £90.00 (CDE-1) sugar-free | 250 ml (PSt) £150.00 (CDE-1)
  - Clobazam 2 mg per 1 ml: Clobazam 10mg/5ml oral suspension sugar free sugar-free | 150 ml (PSt) £95.00 DT = £95.00 (CDE-1) sugar-free | 250 ml (PSt) £150.33 (CDE-1)
- Perizam (Rosemont Pharmaceuticals Ltd)
  - Clobazam 1 mg per 1 ml: Perizam 1mg/ml oral suspension sugar-free | 150 ml (PSt) £90.00 DT = £90.00 (CDE-1)
  - Clobazam 2 mg per 1 ml: Perizam 2mg/ml oral suspension sugar-free | 150 ml (PSt) £95.00 DT = £95.00 (CDE-1)
- Tapclob (Martinida Pharmaceuticals Ltd)
  - Clobazam 1 mg per 1 ml: Tapclob 5mg/5ml oral suspension sugar-free | 150 ml (PSt) £90.00 DT = £90.00 (CDE-1) sugar-free | 250 ml (PSt) £150.00 (CDE-1)
  - Clobazam 2 mg per 1 ml: Tapclob 10mg/5ml oral suspension sugar-free | 150 ml (PSt) £95.00 DT = £95.00 (CDE-1) sugar-free | 250 ml (PSt) £150.34 (CDE-1)
- Zacco (Thame Laboratories Ltd)
  - Clobazam 1 mg per 1 ml: Zacco 5mg/5ml oral suspension sugar-free | 150 ml (PSt) £82.00 DT = £90.00 (CDE-1)
  - Clobazam 2 mg per 1 ml: Zacco 10mg/5ml oral suspension sugar-free | 150 ml (PSt) £87.00 DT = £95.00 (CDE-1)

Tablet
- Clobazam (Non-proprietary)
  - Clobazam 10 mg: Clobazam 10mg tablets | 30 tablet (PSt) £3.05 DT = £3.25 (CDE-1)
- Frisium (Sanofi)
  - Clobazam 10 mg: Frisium 10mg tablets | 30 tablet (PSt) £2.51 DT = £2.75 (CDE-1)
Clonazepam

**INDICATIONS AND DOSE**

**All forms of epilepsy**
- **BY MOUTH**
  - Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 1–4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 5–11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 3–6 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
  - Child 12–17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, dose usually taken at night; may be given in 3–4 divided doses if necessary

**SIDE-EFFECTS**
- Alopecia
- Bronchial secretion increased
- Concentration impaired
- Coordinated abnormal
- Drooling
- Hypersalivation
- Incomplete precocious puberty
- Muscle tone decreased
- Nystagmus
- Seizures
- Sexual dysfunction
- Skin reactions
- Speech impairment

**BREAST FEEDING**
- Present in milk, and should be avoided if possible during breast-feeding.

**MONITORING**
- All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

**RENAI IMPAIRMENT**
- Dose adjustments

**MONITORING REQUIREMENTS**
- Routine measurement of plasma concentration of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

**PRESCRIBING AND DISPENSING INFORMATION**
- The RCPCH and NPPG recommend that, when a liquid special of clonazepam is required, the following strength is used:
  - 2 mg/5 mL.
- Switching between formulations should be taken when changing between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Clonazepam for preventing seizures.

**UNLICENSED USE**
- Clonazepam doses in BNFC may differ from those in product literature.

**IMPACT SAFETY INFORMATION**

**SAFE PRACTICE**
- Clonazepam has been confused with clonazepam; care must be taken to ensure the correct drug is prescribed and dispensed.

**CONTRA-INDICATIONS**
- Coma
- Current alcohol abuse
- Current drug abuse
- Respiratory depression

**CAUTIONS**
- Acute porphyrias p. 624
- Airways obstruction
- Brain damage
- Cerebellar ataxia
- Depression
- Spinal ataxia
- Suicidal ideation

**CAUTIONS, FURTHER INFORMATION**
- The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.

**INTERACTIONS**
- Appendix 1: clonazepam

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: orodispersible, oral suspension, oral solution.

**TABLET**
- **CAUTIONARY AND ADVISORY LABELS** 2, 8
- **Clonazepam (Non-proprietary)**
  - **Clonazepam 500 microgram**
    - 100 tablet **£30.00 DT = $42.31 (C5-1)
  - **Clonazepam 2 mg**
    - 100 tablet **£30.00 DT = $59.23 (C5-1)

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS** 2, 8
- **EXCipients**: May contain ethanol.
- **Clonazepam (Non-proprietary)**
  - **Clonazepam 100 microgram per 1 ml**
    - Clonazepam 500micrograms/5ml oral solution sugar free sugar-free **£29.25 DT = $36.42 (C5-1)
  - **Clonazepam 400 microgram per 1 ml**
    - Clonazepam 2mg/5ml oral solution sugar free sugar-free **£108.36 DT = $135.36 (C5-1)

**Diazepam**

**INDICATIONS AND DOSE**

**Tetanus**
- **BY INTRAVENOUS INJECTION**
  - Child: 100–300 micrograms/kg every 1–4 hours
  - **BY INTRAVENOUS INFUSION, OR BY NASOPHARYNGEAL TUBE**
  - Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**
- **BY MOUTH**
  - Child 1–11 months: Initially 250 micrograms/kg twice daily
  - Child 1–4 years: Initially 2.5 mg twice daily
  - Child 5–11 years: Initially 5 mg twice daily
  - Child 12–17 years: Initially 10 mg twice daily; maximum 40 mg per day

**Status epilepticus**
- **Febrile convulsions**
- **Convulsions due to poisoning**
- **BY INTRAVENOUS INJECTION**
- **Neonate**: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
  - Child 1 month–11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
  - Child 12–17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes
  - **BY RECTUM**
  - Neonate: 1.25–2.5 mg, then 1.25–2.5 mg after 10 minutes if required.
  - Child 1 month–1 year: 5 mg, then 5 mg after 10 minutes if required
  - Child 2–11 years: 5–10 mg, then 5–10 mg after 10 minutes if required
**Epilepsy and other seizure disorders**

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: Diazepam is adsorbed by plastics of infusion bags and giving sets. Emulsion formulation preferred for intravenous injection.
  - For **continuous intravenous infusion** of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For **continuous intravenous infusion** of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how and when to administer rectal diazepam. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to **at least 24 hours** after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository

**ANTIEPILEPTICS**

**Paraldehyde**

**INDICATIONS AND DOSE**

**Status epilepticus**

- **BY RECTUM**
  - Neonate: 0.8 mL/kilogram for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes.
  - Child: 0.8 mL/kilogram (max. per dose 20 mL) for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes.

**SIDE-EFFECTS**

- Rash
- →

**UNLICENSED USE**

Not licensed for use in children as an enema.

**CONTRA-INDICATIONS**

Gastric disorders • rectal administration in colitis

**CAUTIONS**

Bronchopulmonary disease

**INTERACTIONS**

→ Appendix 1: antiepileptics

**PREGNANCY**

Avoid unless essential—crosses placenta. See also Pregnancy in Epilepsy p. 195.

**BREAST FEEDING**

Avoid unless essential—present in milk.

**HEPATIC IMPAIRMENT**

Use with caution.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Paraldehyde for seizures www.medicinesforchildren.org.uk/paraldehyde-seizures

**MEDICINAL FORMS**

Forms available from special-order manufacturers include: enema

**ANTIEPILEPTICS › BARBITURATES**

**Thiopental sodium**

(Thiopentone sodium)

**INDICATIONS AND DOSE**

**Prolonged status epilepticus**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially up to 2 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response.
  - Child: Initially up to 4 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response

**Induction of anaesthesia**

- **BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially up to 2 mg/kg, then 1 mg/kg, repeated if necessary; maximum 4 mg/kg per course.
  - Child: Initially up to 4 mg/kg, then 1 mg/kg, repeated if necessary; maximum 7 mg/kg per course

**SIDE-EFFECTS**

- Hypotension
- Respiratory disorders
- Skin eruption
- Sneezing
- Myocardial contractility decreased
- Crosses placenta
- May depress neonatal respiration when used during delivery.

**CONTRA-INDICATIONS**

Acute porphyrias p. 624 • myotonic dystrophy

**CAUTIONS**

Acute circulatory failure (shock) • avoid intra-arterial injection • cardiovascular disease • fixed cardiac output • hypovolaemia • reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)

**INTERACTIONS**

→ Appendix 1: thiopental

**SIDE-EFFECTS**

- Rash
- →

**MEDICINAL FORMS**

Forms available from special-order manufacturers include: enema

**UNLICENSED USE**

Not licensed for use in status epilepticus. Not licensed for use by intravenous infusion.

**IMPORTANT SAFETY INFORMATION**

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 624 • myotonic dystrophy

**HYPNOTICS, SEDATIVES AND ANXIOLYTICS › BENZODIAZEPINES**

**Lorazepam**

**INDICATIONS AND DOSE**

**Premedication**

- **BY MOUTH**
  - Child 1 month–11 years: 50–100 micrograms/kg (max. per dose 4 mg), to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure

**SIDE-EFFECTS**

- Rash
- →

**UNLICENSED USE**

Not licensed for use in status epilepticus. Not licensed for use by intravenous infusion.
BNFC 2019–2020

Status epilepticus 229

Breastfeeding

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

Renal Impairment

Dose adjustments

Start with small doses in severe impairment.

Directions for Administration

With intravenous use For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

Patient and Carer Advice

Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Solution for injection

Excipients: May contain Benzyl alcohol, propylene glycol

Midazolam

29-Mar-2018

**Indications and Dose**

**Status epilepticus | Febrile convulsions**

**By Buccal Administration**

- **Neonate:** 300 micrograms/kg, then 300 micrograms/kg after 10 minutes if required.
- Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required
- Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- Child 10-17 years: 10 mg, then 10 mg after 10 minutes if required

**Initially by Intravenous Injection**

- **Neonate:** Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled.
- Child: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, (by continuous intravenous infusion) increased in steps of continued →

**Contraindications**

Avoid injections containing benzyl alcohol in neonates - CNS depression - compromised airway - hyperkinesis - obsessional states - phobic states - respiratory depression

**Caution**

Muscle weakness - organic brain changes - parenteral administration

**Important Safety Information**

**Anaesthesia**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**Contra-Indications**

Avoid injections containing benzyl alcohol in neonates - CNS depression - compromised airway - hyperkinesis - obsessional states - phobic states - respiratory depression

**Caution**

Muscle weakness - organic brain changes - parenteral administration

**Paradoxical effects**

A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**Special precautions for parenteral administration**

When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

**Interactions**

Appendix 1: lorazepam

**Side-Effects**

**General Side-Effects**

- **Common or very common** Apnoea - asthenia - coma - disinhibition - extrapyramidal symptoms - hypothermia - memory loss - speech slurred - suicide attempt
- **Uncommon** Allergic dermatitis - constipation - sexual dysfunction
- **Rare or very rare** Agranulocytosis - hyponatraemia - pancytopenia - SIAHD - thrombocytopenia

**Specific Side-Effects**

- **Rare or very rare**
  - With oral use Saliva altered
  - Frequency not known
  - With parenteral use Leucopenia
230  Epilepsy and other seizure disorders

Nervous system

60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled

**Conscious sedation for procedures**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be administered 30–60 minutes before procedure

- **BY BUCAL ADMINISTRATION**
  - Child 6 months–9 years: 200–300 micrograms/kg (max. per dose 5 mg)
  - Child 10–17 years (body-weight up to 70 kg): 6–7 mg (max. per dose 8 mg)

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before procedure

- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1 month–5 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 6 mg per course
  - Child 6–11 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 10 mg per course
  - Child 12–17 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 7.5 mg per course

**Premedication**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be taken 15–30 minutes before the procedure

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before induction

**Induction of anaesthesia (but rarely used)**

- **BY SLOW INTRAVENOUS INJECTION**
  - Child 7–17 years: Initially 150 micrograms/kg (max. per dose 7.5 mg), dose to be given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes before subsequent dosing, then 50 micrograms/kg every 2 minutes (max. per dose 2.5 mg) if required; maximum 500 micrograms/kg per course; maximum 25 mg per course

**Sedation of patient receiving intensive care**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Child 6 months–11 years: Initially 50–200 micrograms/kg, to be administered over at least 3 minutes, followed by (by continuous intravenous infusion) 30–120 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasocostriction, or hypothermia
  - Child 12–17 years: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, followed by (by continuous intravenous infusion) 30–200 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasocostriction, or hypothermia

**Unlicensed use**

Oromucosal solution not licensed for use in children under 3 months. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature.

Injection not licensed for use in status epilepticus or febrile convulsions.

Not licensed for use in children under 6 months for premedication and conscious sedation.

Not licensed for use by mouth.

Not licensed for use by buccal administration for conscious sedation.

**Important safety information**

**Anaesthesia**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**Prescribing of midazolam in palliative care**

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**Contra-indications**

CNS depression - compromised airway - severe respiratory depression

**Caution**

Cardiac disease - children (particularly if cardiovascular impairment) - concentration of midazolam in children under 15 kg not to exceed 1 mg/mL - debilitated patients (reduce dose) - hypothermia - hypovolaemia (risk of severe hypotension) - neonates - risk of airways obstruction and hyperventilation in children under 6 months (monitor respiratory rate and oxygen saturation) - vasoconstriction

**Caution, further information**

Recovery when used for sedation  Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**Interactions**

Appendix 1: midazolam

**Side-effects**

**General side-effects**

- **Common or very common**  Level of consciousness decreased - vomiting
- **Uncommon**  Skin reactions
- **Rare or very rare**  Apnoea - bradycardia - cardiac arrest - constipation - dry mouth - dyspnoea - hiccups - movement disorders - physical assault - respiratory disorders - vasodilatation
- **Frequency not known**  Appetite increased - disinhibition (severe; with sedative and peri-operative use) - fall - saliva altered
**SPECIFIC SIDE-EFFECTS**
- With buccal use: Thrombosis
- With parenteral use: Angioedema, drug abuse, drug withdrawal seizure, embolism and thrombosis

**SIDE-EFFECTS, FURTHER INFORMATION**
Higher doses are associated with prolonged sedation and risk of hypoventilation. The co-administration of midazolam with other sedative, hypnotic, or CNS-depressant drugs results in increased sedation. Midazolam accumulates in adipose tissue, which can significantly prolong sedation, especially in patients with obesity, hepatic impairment or renal impairment.

**Overdose**
There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5mg/mL in 2mL and 10mL ampoules, or 2mg/mL in 5mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**BREAST FEEDING**
Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT**
For parenteral preparations, manufacturer advises caution in all degrees of impairment. Dose adjustments for parenteral preparations manufacturer advises consider dose reduction in all degrees of impairment.

**RENAI IMPAIRMENT**
Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous infusion (Hypnovel®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For intravenous injection in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate. For neonate and children under 15 kg dilute to a maximum concentration of 1 mg/mL. Neonatal intensive care, dilute 15 mg/kg body weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.
- With oral use: For administration by mouth for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.

**PRESCRIBING AND DISPENSING INFORMATION**
The RCPCH and NPPG recommend that, when a liquid special of midazolam is required, the following strength is used: 10 mg/5 mL.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how and when to administer midazolam oromucosal solution. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**MEDITICINAL USES**
- Midazolam is used in conscious sedation, in the treatment of prolonged, acute, convulsive seizures in patients aged 10 years to less than 18 years.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, oromucosal solution, solution for injection, infusion, solution for injection, solution for infusion.

**2.1 Attention deficit hyperactivity disorder**

**Attention deficit hyperactivity disorder**

**Description of condition**
Attention deficit hyperactivity disorder (ADHD) is a behavioural disorder characterised by hyperactivity, impulsivity and inattention, which can lead to functional impairment such as psychological, social, educational or occupational difficulties. While these symptoms tend to co-

---

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**
The Scottish Medicines Consortium has advised (November 2017) that midazolam oromucosal solution (Epistatus®) is accepted for use within NHS Scotland for the treatment of...
exist, some patients are predominantly hyperactive and impulsive, while others are principally inattentive. Symptoms typically appear in children aged 3–7 years, but may not be recognised until after 7 years of age, especially if hyperactivity is not present. ADHD is more commonly diagnosed in males than in females. ADHD is usually a persisting disorder and some children continue to have symptoms throughout adolescence and into adulthood, where inattentive symptoms tend to persist, and hyperactive-impulsive symptoms tend to recede over time. ADHD is also associated with an increased risk of disorders such as oppositional defiant disorder (ODD), conduct disorder, and possibly mood disorders such as depression, mania, and anxiety, as well as substance misuse.

Aims of treatment
The aims of treatment are to reduce functional impairment, severity of symptoms, and to improve quality of life.

Non-drug treatment
Children and their parents, or carers should be advised about the importance of a balanced diet, good nutrition and regular exercise. If hyperactivity appears to be influenced by certain foods or drinks, parents or carers should be advised to keep a diary of food or drinks consumed and the associated behaviour. A referral to a dietician should be made where appropriate.

Environmental modifications are changes made to the physical environment that can help reduce the impact of ADHD symptoms on a child’s day-to-day life. The modifications should be specific to the child’s circumstances, and may involve changes to seating arrangements, lighting and noise, reducing distractions, optimising education by having shorter periods of focus with movement breaks, and the appropriate use of teaching assistants at school. These changes should form part of the discussion at the time of diagnosis of ADHD and be trialled and reviewed for effectiveness before drug treatment is started.

In children aged under 5 years, an ADHD-focused parent-training programme that teaches parents or carers behaviour therapy techniques is recommended as first-line treatment. Specialist advice should be sought if symptoms are still causing significant impairment after completion of the programme and implementation of environmental modifications.

In children aged 5 years and over, advice about ADHD and ADHD-focused support should be given to all parents or carers. In children with ADHD and symptoms of oppositional defiant disorder or conduct disorder, a training programme specific for the coexisting condition, involving either the parent or carer with or without the child is also recommended. Drug treatment should be reserved for children whose symptoms are causing persistent and significant impairment of at least one area of function (such as interpersonal relationships, education attainment, and risk awareness) despite environmental modifications.

In adolescents, a course of cognitive behavioural therapy (CBT) in combination with drug treatment should be considered for those who have had some benefit from drug treatment, but still have symptoms causing significant impairment in at least one area of function (such as social skills with peers, problem-solving, self-control, active listening skills, or dealing with and expressing feelings).

Drug treatment
Child aged under 5 years
Drug treatment should only be considered in children under 5 years of age on advice from a specialist ADHD service.

Child aged 5 years and over
Drug treatment should be initiated by a specialist trained in the diagnosis and management of ADHD.

Following dose stabilisation, continuation and monitoring of drug treatment can be undertaken by the child’s general practitioner under a shared care arrangement. Children with ADHD and anxiety disorder, tic disorder, or autism spectrum disorder should be offered the same treatment options as other children with ADHD. Treatment options for ADHD are not licensed for use in children under 6 years of age. Methylphenidate hydrochloride p. 233 is recommended as first-line treatment. If a 6-week trial of methylphenidate hydrochloride p. 233 at the maximum tolerated dose does not reduce symptoms and associated impairment, consider switching to lisdexamfetamine mesilate p. 236. Dexamfetamine sulfate p. 235 can be given to children who are having a beneficial response to lisdexamfetamine mesilate but cannot tolerate its longer duration of effect.

Modified-release preparations of stimulants are preferred because of their pharmacokinetic profile, convenience, improved adherence, reduced risk of drug diversion (drugs being forwarded to others for non-prescription use or misuse), and the lack of need to be taken to school. Immediate-release preparations can be given when more flexible dosing regimens are required, or during initial dose titration. A combination of a modified-release and immediate-release preparation taken at different times of the day can be used to extend the duration of effect. The magnitude, duration of effect, and side-effects of stimulants vary between patients.

Atomoxetine p. 233 or guanfacine p. 237 can be given to children who are intolerant of both methylphenidate hydrochloride p. 233 and lisdexamfetamine mesilate, or if symptoms have not responded to separate 6-week trials of both drugs following adequate dose titration and consideration of alternative preparations. If sustained orthostatic hypotension or fainting episodes occur with guanfacine p. 237 treatment, the dose should be reduced or an alternative treatment offered.

Advice from, or referral to a tertiary specialist ADHD service should be considered if the child is unresponsive to one or more stimulant drugs (e.g. methylphenidate hydrochloride p. 233 and lisdexamfetamine mesilate) and one non-stimulant drug (e.g. atomoxetine p. 233 and guanfacine p. 237). A specialist service should also be consulted for advice before starting clonidine hydrochloride p. 103 [unlicensed] in children with ADHD and sleep disturbances, rages or tics, and before starting atypical antipsychotics in addition to stimulants in children with ADHD and co-existing pervasive aggression, rages or irritability.

Other treatment options such as bupropion hydrochloride, modafinil, and tricyclic antidepressants [all unlicensed] have been used in the management of ADHD, but due to limited evidence their use is not recommended without specialist advice.

Children should be monitored for effectiveness of treatment and side-effects, in addition to changes in sleep pattern, and the potential for stimulant diversion or misuse. If the child develops new, or has worsening of existing seizures, review drug treatment and stop any drug that might be contributing to the seizures; treatment can be cautiously reintroduced if it is unlikely to be the cause. Monitor children for the development of tics associated with stimulant use. If tics are stimulant related, consider a dose reduction, stopping treatment, or changing to a non-stimulant drug. If there is worsening of behaviour, consider adjusting drug treatment and reviewing the diagnosis.

Treatment should be reviewed by a specialist at least once a year and trials of treatment-free periods, or dose reductions considered where appropriate.
Atomoxetine (as Atomoxetine hydrochloride) 60 mg
Atomoxetine (as Atomoxetine hydrochloride) 40 mg
Atomoxetine (as Atomoxetine hydrochloride) 25 mg
Atomoxetine (as Atomoxetine hydrochloride) 18 mg
Atomoxetine (as Atomoxetine hydrochloride) 10 mg
Atomoxetine (as Atomoxetine hydrochloride) 7.5 mg
Atomoxetine (as Atomoxetine hydrochloride) 5 mg

Attention deficit hyperactivity disorder

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated by a specialist)

- **BY MOUTH**
  - Child 6-17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day.
  - Child 6-17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day.

**UNLICENSED USE**

Atomoxetine doses in BNFC may differ from those in product literature. Doses above 100 mg daily not licensed.

**CONTRA-INDICATIONS**

Phaeochromocytoma, severe cardiovascular disease, severe cerebrovascular disease.

**CAUTIONS**

Aggressive behaviour, cardiovascular disease, cerebrovascular disease, emotional lability, history of seizures, hostility, hypertension, mania, psychosis, QT-interval prolongation, structural cardiac abnormalities, susceptibility to angle-closure glaucoma, tachycardia.

**INTERACTIONS**

Appendix 1: atomoxetine

**SIDE-EFFECTS**

- Common or very common: Anxiety, appetite decreased, asthenia, chest pain, constipation, depression, dizziness, drowsiness, gastrointestinal discomfort, headaches, insomnia, mood altered, mydriasis, nausea, reactions, tic, vomiting, weight decreased.
- Uncommon: Behaviour abnormal, dyspnœa, hallucination, hyperhidrosis, hypersensitivity, palpitations, psychosis, QT-interval prolongation, seizure, sensation abnormal, sinus tachycardia, suicidal behaviour, syncope, tremor, vision blurred.
- Rare or very rare: Genital pain, hepatic disorders, priapism, Raynaud’s phenomenon, urinary disorders.
- Frequency not known: Sudden cardiac death.

**PREGNANCY**

Manufacturer advises halve dose in moderate impairment and quarter dose in severe impairment.

**BREAST FEEDING**

Avoid-preserved in milk in animal studies.

**HEPATIC IMPAIRMENT**

Dose adjustments: Manufacturer advises halve dose in moderate impairment and quarter dose in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for appearance or worsening of anxiety, depression or tics.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**PATIENT AND CARER ADVICE**

Suicidal ideation: Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

Hepatic impairment: Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1107/15
The Scottish Medicines Consortium has advised (December 2015) that atomoxetine oral solution (Strattera®) is accepted for restricted use within NHS Scotland for the treatment of attention deficit hyperactivity disorder (ADHD) in children of 6 years and older, in adolescents and in adults. It is restricted to patients who are unable to swallow capsules.

**Medications**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Oral solution**

Cautionary and advisory labels

- **Strattera** (Eli Lilly and Company Ltd)
  - Atomoxetine (as Atomoxetine hydrochloride) 4 mg per 1 ml
  - Strattera 4mg/1ml oral solution sugar-free | 300 ml
  - £85.00 DT = £85.00

- **Capsule**
  - Cautionary and advisory labels
  - **Strattera** (Eli Lilly and Company Ltd)
    - Atomoxetine (as Atomoxetine hydrochloride) 10 mg
      - Strattera 10 mg capsules | 7 capsule DT = £13.28

    - Atomoxetine (as Atomoxetine hydrochloride) 2.5 mg
      - Strattera 2.5 mg capsules | 7 capsule DT = £13.28
      - 28 capsule DT = £53.09
    - Atomoxetine (as Atomoxetine hydrochloride) 1.875 mg
      - Strattera 1.875 mg capsules | 7 capsule DT = £13.28
      - 28 capsule DT = £53.09
    - Atomoxetine (as Atomoxetine hydrochloride) 1.25 mg
      - Strattera 1.25 mg capsules | 7 capsule DT = £13.28
      - 28 capsule DT = £53.09
    - Atomoxetine (as Atomoxetine hydrochloride) 0.75 mg
      - Strattera 0.75 mg capsules | 7 capsule DT = £13.28
      - 28 capsule DT = £53.09

**Methylphenidate hydrochloride**

Attention deficit hyperactivity disorder

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated under specialist supervision)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 4-5 years: Initially 2.5 mg twice daily, increased in steps of 2.5 mg daily if required, at weekly intervals, increased if necessary up to 1.4 mg/kg daily in 2–3 divided doses, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation continued →
Child 6-17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation.

**DOSE EQUIVALENT AND CONVERSION**

- When switching from immediate-release preparations to modified-release preparations—consult product literature.

**CONCERTA® XL**

**Attention deficit hyperactivity disorder**

- **BY MOUTH**
  - Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 54 mg once daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 108 mg per day.
  
  **DOSE EQUIVALENT AND CONVERSION**
  - Total daily dose of 15 mg of standard-release formulation is considered equivalent to **Concerta® XL** 18 mg once daily.

**DELMOSART® PROLONGED-RELEASE TABLET**

**Attention deficit hyperactivity disorder (under expert supervision)**

- **BY MOUTH**
  - Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, then increased in steps of 18 mg every week if required, discontinue if no response after 1 month; maximum 54 mg per day.
  
  **DOSE EQUIVALENT AND CONVERSION**
  - Total daily dose of 15 mg of standard-release formulation is considered equivalent to **Delmosart®** 18 mg once daily.

**EQUASYM® XL**

**Attention deficit hyperactivity disorder**

- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day.

**MEDIKINET® XL**

**Attention deficit hyperactivity disorder**

- **BY MOUTH**
  - Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day.

**XAGGITIN® XL**

**Attention deficit hyperactivity disorder (under expert supervision)**

- **BY MOUTH**
  - Child 6-17 years: Initially 18 mg once daily, dose to be taken in the morning, increased in steps of 18 mg every week, adjusted according to response, discontinue if no response after 1 month; maximum 54 mg per day.

**DOSE EQUIVALENT AND CONVERSION**

- Total daily dose of 15 mg of standard-release formulation is considered equivalent to **Xaggitin® XL** 18 mg once daily.

**UNLICENSED USE**

- Doses over 60 mg daily not licensed.
- Doses of **Concerta XL** over 54 mg daily not licensed. Not licensed for use in children under 6 years.

**CONTRA-INDICATIONS**

- Anorexia nervosa • arrhythmias • cardiomyopathy • cardiovascular disease • cerebrovascular disorders • heart failure • hyperthyroidism • phaeochromocytoma • psychosis • severe depression • severe hypertension • structural cardiac abnormalities • suicidal ideation • uncontrolled bipolar disorder • vasculitis

**CAUTIONS**

- Agitation • alcohol dependence • anxiety • drug dependence • epilepsy (discontinue if increased seizure frequency) • family history of Tourette syndrome • susceptibility to angle-closure glaucoma • tics

**CONCERTA® XL, DELMOSART® PROLONGED-RELEASE TABLET**

- Dysphagia (dose form not appropriate)
- Restricted gastro-intestinal lumen (dose form not appropriate)

**XAGGITIN® XL**

- Dysphagia (dose form not appropriate)

**INTERACTIONS**

- Appendix 1: methylphenidate

**SIDE-EFFECTS**

- Common or very common
  - Alopecia • anxiety • appetite decreased • arrhythmias • arthralgia • behaviour abnormal • cough • depression • diarrhoea • dizziness • drowsiness • dry mouth • fever • gastrointestinal discomfort • growth retardation • headaches • hypertension • laryngeal pain • mood altered • movement disorders • nasopharyngitis • nausea • palpitations • sleep disorders • vomiting • weight decreased

- Uncommon
  - Chest discomfort • constipation • dysphagia • fatigue • haematuria • hallucinations • muscle complaints • psychiatric disorder • suicidal tendencies • tic • tremor • vision disorders

- Rare or very rare
  - Anaemia • angina pectoris • cardiac arrest • cerebrovascular insufficiency • confusion • gynaecomastia • hepatic coma • hyperfocus • hyperhidrosis • leucopenia • mydriasis • myocardial infarction • neuroleptic malignant syndrome • peripheral coldness • Raynaud’s phenomenon • seizures • sexual dysfunction • skin reactions • sudden cardiac death • thinking abnormal • thrombocytopenia

- Frequency not known
  - Delusions • drug dependence • hyperpyrexia • intracranial haemorrhage • logorhoea • pancytopenia • vasculitis

**PREGNANCY**

- Limited experience—avoid unless potential benefit outweighs risk

**BREAST FEEDING**

- Limited information available—avoid.

**MONITORING REQUIREMENTS**

- Monitor for psychiatric disorders.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION**

- Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

**MEDIKINET® XL**

- Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

**EQUASYM® XL**

- Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

**PRESCRIBING AND DISPENSING INFORMATION**

- Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these
different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

**CONCERTA XL** Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

**MEDIKINET XL** Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

**EQUASYM XL** Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Methylphenidate for attention deficit hyperactivity disorder (ADHD) [www.medicinesforchildren.org.uk/methylphenidate-attention-deficit-hyperactivity-disorder](http://www.medicinesforchildren.org.uk/methylphenidate-attention-deficit-hyperactivity-disorder)

**Driving and skilled tasks** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at [www.dvla.gov.uk](http://www.dvla.gov.uk).

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see *Drugs and driving* under Guidance on prescribing p. 1.

**CONCERTA XL** Tablet membrane may pass through gastro-intestinal tract unchanged.

**DELMOSART XL PROLONGED-RELEASE TABLET** Manufacturer advises tablet membrane may pass through gastrointestinal tract unchanged.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral suspension, oral solution

**Modified-release tablet**

**CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS > AMPHETAMINES**

| Dexamfetamine sulfate (Dexamphetamine sulfate) |

**INDICATIONS AND DOSE**

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

**BY MOUTH**

Child 6-17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required; usual maximum 1 mg/kg daily, up to 20 mg daily (40 mg daily has been required in some children); maintenance dose to be given in 2–4 divided doses

**CONTRA-INDICATIONS** Agitated states, cardiovascular disease, history of alcohol abuse, history of drug abuse, hyperexcitability, hyperthyroidism, moderate hypertension, severe hypertension, structural cardiac abnormalities

**CAUTIONS** Anorexia, bipolar disorder, history of epilepsy (discontinue if seizures occur), mild hypertension, psychosis, susceptibility to angle-closure glaucoma, tics; Tourette syndrome

**CAUTIONS, FURTHER INFORMATION**

Tics and Tourette syndrome: Discontinue use if tics occur.

Growth restriction in children: Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdrawal slowly to avoid inducing depression or renewed hyperactivity).

...
PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

DIRECTIONS FOR ADMINISTRATION

TREATMENT CESSATION

▶ Monitor for aggressive behaviour or hostility during initial treatment.
▶ Monitor growth in children.

MONITORING REQUIREMENTS

▶ PREGNANCY Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).
▶ BREAST FEEDING Significant amount in milk—avoid.
▶ RENAL IMPAIRMENT Use with caution.

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

▶ BY MOUTH
  ▶ Child 6–17 years: Initially 30 mg once daily, alternatively initially 20 mg once daily, increased in steps of 10–20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

Contra-indications

Advanced arteriosclerosis - agitation states - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

CAUTIONS

Bipolar disorder - history of cardiovascular disease - history of substance abuse - may lower seizure threshold (discontinue if seizures occur) - psychotic disorders - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

CAUTIONS, FURTHER INFORMATION

Cardiovascular disease Manufacturer advises caution in patients with underlying conditions that might be compromised by increases in blood pressure or heart rate; see also Contra-indications.

INTERACTIONS

▶ Appendix 1: amphetamines

SIDE-EFFECTS

▶ Common or very common Abdominal pain - anxiety - appetite decreased - arrhythmias - arthralgia - behaviour abnormal - depression - dry mouth - headache - mood altered - movement disorders - muscle cramps - nausea - palpitations - poor weight gain - sleep disorders - vertigo - vomiting - weight decreased

▶ Rare or very rare Anaemia - angina pectoris - cardiac arrest - cerebrovascular insufficiency - fatigue - growth retardation - hallucination - hepatic coma - hepatic function abnormal - intracranial haemorrhage - leucopenia - mydriasis - psychosis - seizure - skin reactions - suicidal tendencies - thrombocytopenia - tic (in those at risk) - vasculitis cerebral - vision disorders

Frequency not known

Causes wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 859.

Renal impairment

Use with caution.

Tourette syndrome

Dose adjustments

Manufacturer advises max. dose 50 mg daily in severe impairment.

Drug action

Lisdexamfetamine mesilate

23 Jan 2018

DRUG ACTION

Lisdexamfetamine is a prodrug of dexamfetamine.

INTERACTIONS

▶ Appendix 1: amphetamines

SIDE-EFFECTS

▶ Common or very common Abdominal pain upper - anxiety - appetite decreased - arrhythmias - arthralgia - depression - diarrhoea - dizziness - drug dependence - hyperhidrosis - hypermetabolism - hyperpyrexia - kidney injury - myocardial infarction - neuroleptic malignant syndrome - obsessive-compulsive disorder - reflexes increased - rhabdomyolysis - sexual dysfunction - sudden death - taste altered - tremor

Overdose

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

Manufacturer advises avoid—present in human milk.

RENAI IMPAIRMENT

Manufacturer advises max. dose 50 mg daily in severe impairment.

Attention deficit hyperactivity disorder 237

**SYMPATHOMIMETICS 》 ALPHÀ-2-ADRENOCEPTOR AGONISTS**

Guanfacine

14-Jul-2018

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)

- **BY MOUTH**
  - Child 6-12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- Manufacturer advises reduce dose by half with concurrent use of moderate and potent inhibitors of CYP3A4.
- Manufacturer advises increase dose up to max. 7 mg daily with concurrent use of potent inducers of CYP3A4—no specific recommendation made for children.

**CAUTIONS**

- Bradycardia (risk of torsade de pointes) - heart block (risk of torsade de pointes) - history of cardiovascular disease - history of QT-interval prolongation - hypokalaemia (risk of torsade de pointes)

**INTERACTIONS** 》 Appendix 1: guanfacine

**SIDE-EFFECTS**

- Common or very common
  - Anxiety
  - Appetite decreased
  - Arrhythmias
  - Asthenia
  - Constipation
  - Depression
  - Diarrhoea
  - Dizziness
  - Drowsiness
  - Dry mouth
  - Gastrointestinal discomfort
  - Headache
  - Hypotension
  - Mood altered
  - Nausea
  - Skin reactions
  - Sleep disorders
  - Urinary disorders
  - Vomiting
  - Weight increased

- Uncommon
  - Asthma
  - Atrioventricular block
  - Chest pain
  - Hallucination
  - Loss of consciousness
  - Pallor
  - Seizure
  - Syncope

- Rare or very rare
  - Hypertension
  - Hypertensive encephalopathy
  - Malaise

- Frequency not known
  - Erectile dysfunction

**SIDE-EFFECTS, FURTHER INFORMATION**

Somnolence and sedation may occur, predominantly during the first 2–3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS 》 3, 25**
  - **Elvanse (Shire Pharmaceuticals Ltd)**
    - Lisdexamfetamine dimesylate 20 mg: Elvanse 20 mg capsules

    - Lisdexamfetamine dimesylate 30 mg: Elvanse Adult 30 mg capsules
      - 28 capsule P38.58 DT + £58.24 CE
    - Lisdexamfetamine dimesylate 40 mg: Elvanse 40 mg capsules
      - 28 capsule P38.62 DT + £62.82 CT
    - Lisdexamfetamine dimesylate 50 mg: Elvanse Adult 50 mg capsules
      - 28 capsule P38.68 DT + £68.60 CE
    - Lisdexamfetamine dimesylate 70 mg: Elvanse Adult 70 mg capsules
      - 28 capsule P38.83 DT + £83.16 CE
discontinuation of treatment if symptoms are clinically significant or persistent.

**Overdose** Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in females of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid—tooxity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution (pharmacokinetics have not been assessed in paediatric patients with hepatic impairment).
- **DOSE ADJUSTMENTS** Manufacturer advises consider dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.

- **MONITORING REQUIREMENTS**
  - Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and 6 months thereafter. More frequent monitoring is advised following dose adjustments.
  - Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.
  - **TREATMENT CESSATION** Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises avoid administration with high fat meals (may increase absorption).

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of guanfacine modified-release tablets.
  - **Missed doses** Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.
  - **Driving and skilled tasks** Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

### 2.2 Bipolar disorder and mania

#### Mania and hypomania

**Overview**

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

**Benzodiazepines**

Use of benzodiazepines may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

**Antipsychotic drugs**

Antipsychotic drugs (normally olanzapine p. 257, quetiapine p. 258, or risperidone p. 260) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

See **Important safety information, Conception and contraception, and Pregnancy** in the valproic acid p. 219 and sodium valproate p. 213 monographs.

Atypical antipsychotics are the treatment of choice for the long-term management of bipolar disorder in children and adolescents; if the patient has frequent relapses or continuing functional impairment, consider concomitant therapy with lithium or valproate. An atypical antipsychotic that causes less weight gain and does not increase prolactin levels is preferred.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the child is continuing on other antimanic drugs; if the child is not continuing on other antimanic drugs, or has a history of manic relapse, a withdrawal period of up to 3 months is required.

**Carbamazepine**

Carbamazepine p. 200 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in children unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

**Valproate**

Valproic acid (as the semisodium salt) is licensed in adults for the treatment of manic episodes associated with bipolar disorder. Sodium valproate is unlicensed for the treatment of bipolar disorder. Valproate (valproic acid and sodium valproate) can also be used for the prophylaxis of bipolar disorder [unlicensed use]. It must be started and supervised by a specialist experienced in managing bipolar disorder.

Because of its teratogenic risk, valproate must not be used in females of childbearing potential unless the conditions of the Pregnancy Prevention Programme are met and alternative treatments are ineffective or not tolerated.

Valproic acid and sodium valproate must not be used during pregnancy in bipolar disorder. The benefit and risk of valproate therapy should be carefully reconsidered at regular treatment reviews. For further information, see **Important safety information, Conception and contraception, and**
Pregnancy in the valproic acid and sodium valproate monographs.

In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or an atypical antipsychotic, or adding lithium or an atypical antipsychotic to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

**Lithium**

Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder (manic-depressive disorder), and bipolar depression, and as concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder [unlicensed indication]. It is also used for the treatment of aggressive or self-harming behaviour [unlicensed indication].

The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual child, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. An atypical antipsychotic or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

**CONTRA-INDICATIONS**

- Addison’s disease
- cardiac insufficiency
- dehydration
- family history of Brugada syndrome
- rhythm disorder
- untreated hypothyroidism

**CAUTIONS**

- Avoid abrupt withdrawal
- cardiac disease
- concurrent ECT (may lower seizure threshold)
- diuretic treatment (risk of toxicity)
- epilepsy (may lower seizure threshold)
- myasthenia gravis
- psoriasis (risk of exacerbation)
- QT interval prolongation
- review dose as necessary in intercurrent infection (especially if sweating profusely)
- review dose as necessary in vomiting
- surgery

**CAUTIONS, FURTHER INFORMATION**

- Long-term use
- Long-term use of lithium has been associated with thyroid disorders and mild cognitive and memory impairment. Long-term treatment should therefore be undertaken only with careful assessment of risk and benefit, and with monitoring of thyroid function every 6 months (more often if there is evidence of deterioration).

The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

**SIDE-EFFECTS**

- Rare or very rare
  - Nephropathy
- **Frequency not known**
  - Abdominal discomfort
  - alopecia
  - angioedema
  - appetite decreased
  - arthralgias
  - atrioventricular block
  - cardiomyopathy
  - cerebellar syndrome
  - circulatory collapse
  - coma
  - delirium
  - diarrhoea
  - dizziness
  - dry mouth
  - electrolyte imbalance
  - encephalopathy
  - folliculitis
  - gastritis
  - goitre
  - hyperglycaemia
  - hyperparathyroidism
  - hypersalivation
  - hypotension
  - hypothyroidism
  - idiopathic intracranial hypertension
  - leucocytosis
  - memory loss
  - movement disorders
  - muscle weakness
  - myasthenia gravis
  - nausea
  - neoplasms
  - nystagmus
  - peripheral neuropathy
  - peripheral oedema
  - polycystic ovarian syndrome
  - QT interval prolongation
  - reflexes abnormal
  - renal disorders
  - renal impairment
  - rhabdomyolysis
  - sexual dysfunction
  - skin reactions
  - skin ulcer
  - speech impairment
  - taste altered
  - thyrotoxicosis
  - tremor
  - vertigo
  - vision disorders
  - vomiting
  - weight increased

**Overdose**

Signs of intoxication require withdrawal of treatment and include increasing gastrointestinal disturbances (vomiting, diarrhoea), visual disturbances, polynuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hyperpnea.

With severe intoxication, cardiac arhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 859.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during treatment for women of childbearing potential.

**PREGNANCY**

Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).

**Dose adjustments**

Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).

**Monitoring**

Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

**BREAST FEEDING**

Present in milk and risk of toxicity in infant—avoid.

**RENAL IMPAIRMENT**

Caution in mild to moderate impairment. Avoid in severe impairment.

**Monitoring**

In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

**MONITORING REQUIREMENTS**

- Serum concentrations
  - Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
  - Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).
  - A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
  - Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.
  - Manufacturer advises to assess renal, cardiac, and thyroid function before treatment initiation.
  - An ECG is recommended in patients with cardiovascular disease or risk factors for it. Body-weight or BMI, serum electrolytes, and a full blood count should also be measured before treatment initiation.
  - Monitor body-weight or BMI, serum electrolytes, eGFR, and thyroid function every 6 months during...
treatment, and more often if there is evidence of impaired renal or thyroid function, or raised calcium levels. Manufacturer also advises to monitor cardiac function regularly.

**TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

**PATIENT AND CARER ADVICE** Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance). Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

**Lithium treatment packs** A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M 0845 610 1112

Driving and skilled tasks May impair performance of skilled tasks (e.g. driving, operating machinery).

DOSE EQUIVALENCE AND CONVERSION

- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

**CAMCOLIT® MODIFIED-RELEASE TABLET**

| Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of prophylaxis of aggressive or self-harming behaviour |
| --- |
| **BY MOUTH** |
| Child 12–17 years: Initially 225–675 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised |

**LISKONUM®**

| Treatment of mania | Treatment of bipolar disorder | Treatment of recurrent depression | Treatment of prophylaxis of aggressive or self-harming behaviour |
| --- |
| **BY MOUTH** |
| Child 12–17 years: Initially 225–450 mg twice daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised |

**UNLICENSED USE** Not licensed for aggressive or self-harming behaviour. Not licensed for concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder. Camcolit® brand not licensed for use in children.

**INTERACTIONS** → Appendix 1: lithium

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Modified-release tablet**

**Lithium citrate**

- **INDICATIONS AND DOSE**
  - Treatment and prophylaxis of mania
  - Treatment and prophylaxis of bipolar disorder
  - Treatment and prophylaxis of recurrent depression
  - Treatment and prophylaxis of aggressive or self-harming behaviour
    - BY MOUTH
    - Child: Dose adjusted according to serum-lithium concentration; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**DOSE EQUIVALENCE AND CONVERSION**
- Preparations vary widely in bioavailability; changing the preparation requires the same precautions as initiation of treatment.

**LI- LIQUID**

- Treatment and prophylaxis of mania
- Treatment and prophylaxis of bipolar disorder
- Treatment and prophylaxis of recurrent depression
- Treatment and prophylaxis of aggressive or self-harming behaviour
  - BY MOUTH
  - Child: Dose adjusted according to serum-lithium concentration

**DOSE EQUIVALENCE AND CONVERSION**
- For Li-Liquid®: Lithium citrate tetrahydrate 509 mg is equivalent to lithium carbonate 200 mg.

**PRIADEL® LIQUID**

- Treatment and prophylaxis of mania
- Treatment and prophylaxis of bipolar disorder
- Treatment and prophylaxis of recurrent depression
- Treatment and prophylaxis of aggressive or self-harming behaviour
  - BY MOUTH
  - Child: Dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**DOSE EQUIVALENCE AND CONVERSION**
- For Priadel® liquid: Lithium citrate tetrahydrate 520 mg is equivalent to lithium carbonate 204 mg.

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** Appendix 1: lithium
- **SIDE-EFFECTS** Polydipsia

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

| CAUTIONARY AND ADVISORY LABELS | 10 |
| Li-Liquid (Rosemont Pharmaceuticals Ltd) |  |
| Lithium citrate 101.8 mg per 1 ml Li-Liquid 509mg/5ml oral solution | 150 ml (P) | £5.79 DT + £5.79 |
| Lithium citrate 203.6 mg per 1 ml Li-Liquid 1018mg/5ml oral solution | 150 ml (P) | £11.58 DT + £11.58 |
| Priadel (lithium citrate) (Essential Pharma M) |  |
| Lithium citrate 104 mg per 1 ml Priadel 520mg/5ml liquid sugar-free | 150 ml (P) | £6.73 DT + £6.73 |

**2.3 Depression**

**Antidepressant drugs**

**Overview**
Depression in children should be managed by an appropriate specialist and treatment should involve psychological therapy.

**Choice**
The major classes of antidepressant drugs include the tricyclics and related antidepressant drugs, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in children with a history of moderate or severe depression.

Choice of antidepressant drug should be based on the individual child’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy.

When drug treatment of depression is considered necessary in children, the SSRIs should be considered first-line treatment; following a safety and efficacy review, fluoxetine p. 243 is licensed to treat depression in children.

Tricyclic antidepressant drugs should be avoided for the treatment of depression in children.

**St John’s wort** *(Hypericum perforatum)* is a popular herbal remedy on sale to the public for treating mild depression in adults. It should not be used for the treatment of depression in children because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified.

Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a child stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

**Management**
Children should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks. Following remission, antidepressant treatment should be continued at the same dose for at least 6 months. Children with a history of recurrent depression should continue treatment for at least 2 years.

**Hyponatraemia and antidepressant therapy**

Hyponatraemia (possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressant drugs. Hyponatraemia should be considered in all children who develop drowsiness, confusion, or convulsions while taking an antidepressant.

**Suicidal behaviour and antidepressant therapy**
The use of antidepressant drugs has been linked with suicidal thoughts and behaviour. Where necessary, children should be monitored for suicidal behaviour, self-harm, and hostility, particularly at the beginning of treatment or if the dose is changed.

**Serotonin syndrome**
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually
UPTAKE INHIBITORS (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diaphoresis), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotoninergic medication and supportive care; specialist advice should be sought.

Important safety information: Depressive illness in children and adolescents
The balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment. Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

Anxiety
Management of acute anxiety in children with drug treatment is contentious. For chronic anxiety (of longer than 4 weeks’ duration), it may be appropriate to use an antidepressant drug before a benzodiazepine.

Tricyclic antidepressants are not effective for treating depression in children.

Some tricyclic antidepressant drugs may have a role in some forms of neuralgia, and in nocturnal enuresis in children.

Dosage
It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment. In most children the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary.

Other drugs used for Depression
- Lithium carbonate, p. 240
- Lithium Citrate, p. 241

ANTIDEPRESSANTS > SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

- **Drug Action** Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
- **Contra-Indications** Poorly controlled epilepsy. SSRIs should not be used if the patient enters a manic phase.
- **Caution** Cardiac disease. concurrent electroconvulsive therapy, diabetes mellitus, epilepsy (discontinue if convulsions develop). History of bleeding disorders (especially gastro-intestinal bleeding) - history of mania - susceptibility to angle-closure glaucoma

**Side-Effects**
- **Common or Very Common** Anxiety, appetite abnormal - arrhythmias, arthralgia, asthenia, concentration impaired, confusion, constipation, depersonalisation, diarrhoea, dizziness, drowsiness, dry mouth, fever, gastrointestinal discomfort, haemorrhage, headache, hyperhidrosis, malaise, mania, memory loss, menstrual cycle irregularities, myalgia, mydriasis, nausea (dose-related), palpitations, paraesthesia, QT interval prolongation, sexual dysfunction, skin reactions, sleep disorders, taste altered, tinnitus, tremor, urinary disorders, visual impairment, vomiting, weight changes, yawning.
- **Uncommon** Alopecia, angioedema, behaviour abnormal, hallucination, movement disorders, photosensitivity reaction, postural hypotension, seizure, suicidal tendencies, syncope.
- **Rare or Very Rare** Galactorrhoea, hepatitis, hyperprolactinaemia, hypoglycaemia, serotonin syndrome, severe cutaneous adverse reactions (SCARs), SIADH, thrombocytopenia.
- **Frequency Not Known** Withdrawal syndrome

**Overdose** Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nyctagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 859.

**Pregnancy** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

**Hepatic Impairment** In general, manufacturers advise caution (prolonged half-life).

**Treatment Cessation** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more.

**Patient and Carer Advice**
- Driving and skilled tasks May also impair performance of skilled tasks (e.g. driving, operating machinery).
Citalopram

**INDICATIONS AND DOSE**

**Major depression**
- **BY MOUTH USING TABLETS**
  - Child 12-17 years: Initially 10 mg once daily, increased if necessary to 20 mg once daily, dose to be increased over 2–4 weeks; maximum 40 mg per day
  - **BY MOUTH USING ORAL DROPS**
  - Child 12-17 years: Initially 8 mg once daily, increased if necessary to 16 mg once daily, dose to be increased over 2–4 weeks; maximum 32 mg per day

**DOSE EQUIVALENCE AND CONVERSION**
- 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

**SIDE-EFFECTS**
- **Common or very common** Acute angle closure glaucoma.
- **Rare or very rare** Cough.

**CAUTIONS**
- **SUSCEPTIBILITY TO QT-INTERVAL PROLONGATION**
- **SIDE-EFFECTS**
  - **Common or very common** Acute angle closure glaucoma.
  - **Rare or very rare** Cough.
  - **Frequency not known** Hypokalaemia

**INTERACTIONS**
- **Appendix 1: SSRIs**
- **CONTRA-INDICATIONS**
- **Dose adjustments** For tablets manufacturer advises lower initial doses, may be increased to max. 20 mg daily; use with extra caution and careful dose titration in severe impairment.
- **Renal impairment** No information available for estimated glomerular filtration rate less than 20 ml/minute/1.73 m².
- **Treatment cessation** The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

**DIRECTIONS FOR ADMINISTRATION**

- **Cipramil®** oral drops should be mixed with water, orange juice, or apple juice before taking.
- **Patient and carer advice** Counselling on administration of oral drops is advised. Patients should be advised of the effects of citalopram on driving and skilled tasks.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.
- **Oral drops**
  - **Excipients:** May contain alcohol
  - **Citalopram (non-proprietary)**
    - Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml Citalopram 40mg/ml oral drops sugar-free sugar-free | 15 ml (POS) £14.09 DT = £5.21
    - **Cipramil** (Lundbeck Ltd)
    - Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml Cipramil 40mg/ml drops sugar-free | 15 ml (POS) £11.08 DT = £5.21
- **Tablet**
  - **Citalopram (non-proprietary)**
    - Citalopram (as Citalopram hydrobromide) 10 mg Citalopram 10mg tablets | 28 tablet (POS) £6.00 DT = £0.89
    - Citalopram (as Citalopram hydrobromide) 20 mg Citalopram 20mg tablets | 28 tablet (POS) £9.00 DT = £0.88
    - Citalopram (as Citalopram hydrobromide) 40 mg Citalopram 40mg tablets | 28 tablet (POS) £15.12 DT = £0.96

**Fluoxetine**

**INDICATIONS AND DOSE**

**Major depression**
- **BY MOUTH**
  - Child 8–17 years: Initially 10 mg daily, increased if necessary up to 20 mg daily, dose to be increased after 1–2 weeks of initial dose, daily dose may be administered as a single or divided dose
- **Pharmacokinetics**
  - **Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).**

**Side-effects**
- **Common or very common** Chills, feeling abnormal, postmenopausal haemorrhage, uterine disorder, vasodilation, vision blurred
- **Uncommon** Cold sweat, dysphagia, dyspnoea, hypotension, mood altered, muscle twitching, self-injurious behaviour, temperature sensation altered, thinking abnormal
- **Rare or very rare** Bucconglossal syndrome, leucopenia, neutropenia, oesophageal pain, pharyngitis, respiratory disorders, serum sickness, speech disorder, vasculitis
- **Frequency not known** Growth retardation

**Breast feeding** Present in milk—use with caution.

**Hepatic impairment**
- **Dose adjustments** Manufacturer advises dose reduction or increasing dose interval.

**Directions for administration**
- **Dispersible tablets** can be dispersed in water for administration or swallowed whole with plenty of water.
- **Patient and carer advice** Patients and carers should be counselled on the administration of dispersible tablets.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.
- **Oral suspension**
  - **Fluoxetine (as Fluoxetine hydrochloride) 10 mg** Fluoxetine 10mg tablets | 30 tablet (POS) £44.00 DT = £44.00
  - **Dispersible tablet**
  - **Olena (Advanz Pharma)**
    - Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20mg dispersible tablets sugar-free | 28 tablet (POS) £3.44 DT = £3.44
  - **Oral solution**
    - **Fluoxetine (non-proprietary)**
      - Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Fluoxetine 20mg/5ml oral solution | 70 ml (POS) £12.75 DT = £2.93
      - Fluoxetine 20mg/5ml oral solution sugar-free | 70 ml (POS) £12.95 DT = £12.95
    - **Prozac (Es Lilly and Company Ltd)**
      - Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozac 20mg/5ml liquid | 70 ml (POS) £11.12 DT = £2.93
    - **Prozep (Chemidex Pharma Ltd)**
      - Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozep 20mg/5ml oral solution sugar-free | 70 ml (POS) £12.95 DT = £12.95
Fluvoxamine maleate

**INDICATIONS AND DOSE**

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Child 8-17 years: Initially 25 mg daily, then increased in steps of 25 mg every 4-7 days (max. per dose 100 mg twice daily) if required, dose to be increased according to response, doses above 50 mg should be given in 2 divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

- **SIDE-EFFECTS**
  - Rare or very rare: Hepatic function abnormal (discontinue)
  - Frequency not known: Bone fracture - glaucoma - hypomania - neuroleptic malignant-like syndrome - withdrawal syndrome neonatal

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Dose adjustments: Manufacturer advises low initial dose.

- **RENAL IMPAIRMENT**
  - Dose adjustments: Start with low dose.

- **TREATMENT CESSATION**
  - The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Patients should be counselled about the effects on driving and skilled tasks.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Fluvoxamine maleate (Non-proprietary)
  - Fluvoxamine maleate 50 mg Fluvoxamine 50mg tablets | 60 tablet [PST] £20.98 DT + £17.54
  - Fluvoxamine maleate 100 mg Fluvoxamine 100mg tablets | 30 tablet [PST] £20.98 DT + £17.69
  - Prozac (Eli Lilly and Company Ltd)
  - Fluvoxamine maleate 20 mg Prozac 20mg capsules | 30 capsule [PST] £1.50 DT + £0.93

Sertraline

**INDICATIONS AND DOSE**

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Child 6-11 years: Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day
  - Child 12-17 years: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

**Major depression**

- **BY MOUTH**
  - Child 12-17 years: Initially 50 mg once daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

**UNLICENSED USE**

Not licensed for use in children for depression.

- **INTERACTIONS** → Appendix 1: SSRIs

- **SIDE-EFFECTS**
  - Common or very common: Chest pain - depression - gastrointestinal disorders - increased risk of infection - mood altered - neuromuscular dysfunction - vasodilatation
  - Rare or very rare: Balanoposthitis - bone disorder - cardiac disorder - coma - conversion disorder - diabetes mellitus - drug dependence - dysphonia - eye disorders - gait abnormal - genital discharge - glaucoma - hair texture abnormal - hepatic disorders - hiccup - hypercholesterolaemia - hypoglycaemia - injury - lymphadenopathy - myocardial infarction - neoplasms - oliguria - peripheral ischaemia - psychotic disorder - vasodilatation procedure - vision disorders - vulvovaginal atrophy
  - Frequency not known: Cerebrovascular insufficiency - gynaecomastia - hyperglycaemia - leucopenia - neuroleptic malignant syndrome - pancreatitis

- **BREAST FEEDING**
  - Not known to be harmful but consider discontinuing breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment (no information available).

- **Dose adjustments**
  - Manufacturer advises dose reduction or increasing dose interval in mild to moderate impairment.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **TREATMENT CESSATION**
  - The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - The RCPCH and NPPG recommend that, when a liquid special of sertraline is required, the following strength is used: 50 mg/5 mL.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Sertraline for OCD (obsessive compulsive disorder) and depression www.medicinesforchildren.org.uk-sertraline-ocd-obsessive-compulsive-disorder-and-depression

**Driving and skilled tasks**

Patients should be counselled on the effects on driving and skilled tasks.
ANTIDEPRESSANTS

TRICYCLIC ANTIDEPRESSANTS

Amitriptyline hydrochloride

- **INDICATIONS AND DOSE**

  **Neuropathic pain**
  - **BY MOUTH**
  - Child 2-11 years: Initially 200–500 micrograms/kg once daily (max. per dose 10 mg), dose to be taken at night, increased if necessary; maximum 1 mg/kg twice daily on specialist advice
  - Child 12-17 years: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

- **UNLICENSED USE**
  - Not licensed for use in neuropathic pain.

- **CONTRA-INDICATIONS**
  - Arrhythmias - during manic phase of bipolar disorder - heart block

- **CAUTIONS**
  - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.

- **INTERACTIONS**
  - Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS**
  - Common or very common
    - Anticholinergic syndrome
    - Drowsiness
    - QT interval prolongation
  - **Frequency not known**
    - Agranulocytosis
    - Alopecia
    - Anxiety
    - Appetite abnormal
    - Arthralgia
    - Asthenia
    - Bone marrow depression
    - Breast enlargement
    - Cardiac conduction disorders
    - Coma
    - Concentration impaired
    - Confusion
    - Constipation
    - Delirium
    - Delusions
    - Diarrhoea
    - Dizziness
    - Dry mouth
    - Dysarthria
    - Eosinophilia
    - Epigastric distress
    - Face oedema
    - Galactorrhoea
    - Gynaecomastia
    - Hallucination
    - Headache
    - Hepatic disorders
    - Hyperhidrosis
    - Hyperpyrexia
    - Hypertension
    - Hypnotics
    - Leucopenia
    - Mood altered
    - Movement disorders
    - Mydriasis
    - Myocardial infarction
    - Nausea
    - Neuroleptic malignant syndrome
    - Oral disorders
    - Palpitations
    - Paralytic ileus
    - Peripheral neuropathy
    - Photosensitivity reaction
    - Seizure
    - Sensation abnormal
    - Sexual dysfunction
    - SIADH
    - Skin reactions
    - Sleep disorders
    - Stroke
    - Sudden cardiac death
    - Suicidal tendencies
    - Syncope
    - Taste altered
    - Testicular swelling
    - Thrombocytopenia
    - Tinnitus
    - Tremor
    - Urinary disorders
    - Urinary tract dilation
    - Vision disorders
    - Vomiting
    - Weight changes
    - Withdrawal syndrome

- **OVERDOSE**

  Overdose with amitriptyline is associated with a relatively high rate of mortality. Symptoms of overdose may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 859.

- **PREGNANCY**
  - Use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises use with caution in mild-to-moderate impairment; avoid in severe impairment.

- **TREATMENT CESSATION**
  - Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Amitriptyline for neuropathic pain
  - www.medicinesforchildren.org.uk/amitriptyline-neuropathic-pain-0

  - Driving and skilled tasks
    - Drowsiness may affect the performance of skilled tasks (e.g. driving).
    - Effects of alcohol enhanced.

  - **LESS SUITABLE FOR PRESCRIBING**
  - Amitriptyline hydrochloride is less suitable for prescribing, see Tricyclic and related antidepressant drugs in Antidepressant drugs p. 241.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Oral solution**

  **CAUTIONARY AND ADVISORY LABELS**

  - **Amitriptyline hydrochloride (Non-proprietary)**
    - Amitriptyline hydrochloride 2 mg per 1 ml Amitriptyline 10 mg/5ml oral solution sugar free sugar-free | 150 ml [POD] £131.90 DT = £131.90
    - Amitriptyline hydrochloride 5 mg per 1 ml Amitriptyline 25 mg/5ml oral solution sugar free sugar-free | 150 ml [POD] £18.00 DT = £18.00
    - Amitriptyline hydrochloride 10 mg per 1 ml Amitriptyline 50mg/5ml oral solution sugar free sugar-free | 150 ml [POD] £24.00 DT = £19.20

  **Tablet**

  **CAUTIONARY AND ADVISORY LABELS**

  - **Amitriptyline hydrochloride (Non-proprietary)**
    - Amitriptyline hydrochloride 10 mg Amitriptyline 10 mg tablets | 28 tablet [POD] £1.00 DT = £0.87
    - Amitriptyline hydrochloride 25 mg Amitriptyline 25 mg tablets | 28 tablet [POD] £1.75 DT = £0.72
    - Amitriptyline hydrochloride 50 mg Amitriptyline 50 mg tablets | 28 tablet [POD] £5.99 DT = £2.04
Doxepin

- **INDICATIONS AND DOSE**
  - Depressive illness (particularly where sedation is required)
  - BY MOUTH
    - Child 12-17 years: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 624
  - arrhythmias - during manic phase of bipolar disorder - heart block

- **CAUTIONS**
  - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with significant risk of suicide - pheochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

  **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.

- **INTERACTIONS**
  - Appendix 1: tricyclic antidepressants

- **SIDE-EFFECTS**

- **Overdose**
  - Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypertension, hyperthermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 859

- **PREGNANCY**
  - Use with caution—limited information available.

- **BREAST FEEDING**
  - The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

- **Dose adjustments**
  - Manufacturer advises consider dose reduction in mild to moderate impairment.

- **RENA L IMPAIRMENT**
  - Use with caution.

- **TREATMENT CESSATION**
  - Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

  **Capsule**
  - DOXEPIN HYDROCHLORIDE (Generic)
  - 25 mg capsules
  - £97.00 DT + £97.00
  - 50 mg capsules
  - £154.00 DT + £154.00

- **Imipramine hydrochloride**

  - **INDICATIONS AND DOSE**
    - Nocturnal enuresis
    - BY MOUTH
      - Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
      - Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
      - Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

  - **Attention deficit hyperactivity disorder (under expert supervision)**
    - BY MOUTH
    - Child 6–17 years: 10–30 mg twice daily

  - **UNLICENSED USE**
    - Not licensed for use for attention deficit hyperactivity disorder.

  - **CONTRA-INDICATIONS**
    - Acute porphyrias p. 624
    - arrhythmia - during the manic phase of bipolar disorder - heart block

  - **CAUTIONS**
    - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with a significant risk of suicide - pheochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

  **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.

  - **INTERACTIONS**
    - Appendix 1: tricyclic antidepressants

  - **SIDE-EFFECTS**
    - **Common or very common**
      - Anxiety - appetite decreased - arrhythmias - asthenia - cardiac conduction disorders - confusion - delirium - depression - dizziness - drowsiness - epilepsy - hallucination - headache - hepatic disorders - hypotension - mood altered - nausea - palpitations - paraesthesia - sexual dysfunction - skin reactions - sleep disorder - tremor - vomiting - weight changes

    - **Rare**
Nortriptyline

- **INDICATIONS AND DOSE**
  - **Depressive illness**
    - **BY MOUTH**
      - Child 12-17 years: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses, alternatively increased if necessary to 30–50 mg once daily; maximum 150 mg per day

- **CONTRA-INDICATIONS**
  - Arrhythmias · during the manic phase of bipolar disorder · heart block

- **CAUTIONS**
  - Cardiovascular disease · chronic constipation · diabetes · epilepsy · history of bipolar disorder · history of psychosis · hyperthyroidism (risk of arrhythmias) · patients with a significant risk of suicide · phaeochromocytoma (risk of arrhythmias) · susceptibility to angle-closure glaucoma · urinary retention

- **CAUTIONS, FURTHER INFORMATION**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution.

**Nervous system**

(Misleadingly) as managed under the close supervision of an appropriate effects of antipsychotic drugs on the developing nervous system have been extrapolated from adult antipsychotic drugs in children and adolescents and much of the information available has been gathered from studies in adults.

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs on the developing nervous system. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquilisers’.

In the short term they are used to calm disturbed children whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

**Schizophrenia**

The aim of treatment is to alleviate the suffering of the child (and carer) and to improve social and cognitive functioning. Many children require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Children with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a child with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

**First-generation antipsychotic drugs**

The first-generation antipsychotic drugs act predominantly by blocking dopamine D_2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1**: chlorpromazine hydrochloride p. 251, levomepromazine p. 275, and promazine hydrochloride, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2**: pericyazine p. 253, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3**: perphenazine, prochlorperazine p. 275, and trifluoperazine p. 254, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (e.g. haloperidol p. 252) resemble the group 3 phenothiazines in their clinical properties.

**Diphenylbutylpiperidines** (pimozide p. 253) and the substituted benzamides (sulpiride p. 253) have reduced sedative, antimuscarinic, and extrapyramidal effects.

**Second-generation antipsychotic drugs**

The second-generation antipsychotic drugs (also referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

**Prescribing of antipsychotic drugs in children with learning disabilities**

When prescribing for children with learning disabilities who are prescribed antipsychotic drugs and who are not experiencing psychotic symptoms, the following considerations should be taken into account:

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the child’s condition after dose reduction or discontinuation of an antipsychotic agent;
- referral to a psychiatrist experienced in working with children who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued.

**2.4 Psychoses and schizophrenia**

**Psychoses and related disorders**

06-Mar-2017

**Advice on doses of antipsychotic drugs above BNF for Children upper limit**

- Consider alternative approaches including adjuvant therapy.
- Bear in mind risk factors, including obesity. Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important**: When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the child is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

**Antipsychotic drugs**

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs on the developing nervous system. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.

Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquilisers’.

In the short term they are used to calm disturbed children whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

**Schizophrenia**

The aim of treatment is to alleviate the suffering of the child (and carer) and to improve social and cognitive functioning. Many children require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Children with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a child with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

**First-generation antipsychotic drugs**

The first-generation antipsychotic drugs act predominantly by blocking dopamine D_2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1**: chlorpromazine hydrochloride p. 251, levomepromazine p. 275, and promazine hydrochloride, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2**: pericyazine p. 253, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3**: perphenazine, prochlorperazine p. 275, and trifluoperazine p. 254, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (e.g. haloperidol p. 252) resemble the group 3 phenothiazines in their clinical properties.

**Diphenylbutylpiperidines** (pimozide p. 253) and the substituted benzamides (sulpiride p. 253) have reduced sedative, antimuscarinic, and extrapyramidal effects.

**Second-generation antipsychotic drugs**

The second-generation antipsychotic drugs (also referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

**Prescribing of antipsychotic drugs in children with learning disabilities**

- a reduction in dose or the discontinuation of long-term antipsychotic treatment;
- review of the child’s condition after dose reduction or discontinuation of an antipsychotic agent;
- referral to a psychiatrist experienced in working with children who have learning disabilities and mental health problems;
- annual documentation of the reasons for continuing a prescription if the antipsychotic is not reduced in dose or discontinued.

248 Mental health disorders

BNFC 2019–2020
Side effects of antipsychotic drugs

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

*Extrapyramidal symptoms*

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (Iphuphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophphenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility. Extrapyramidal symptoms consist of:

- *parkinsonian symptoms* (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- *dystonia* (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and appear after only a few doses;
- *akathisia* (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- *tardive dyskinesia* (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

*Parkinsonian symptoms* remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may mask or worsen tardive dyskinesia.

*Tardive dyskinesia* is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

*Hyperprolactinaemia*

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

*Sexual dysfunction*

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha-2-adrenoceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

*Cardiovascular side-effects*

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

*Hyperglycaemia and weight gain*

Hyperglycaemia, and sometimes diabetes, can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain. Olanzapine is associated with more weight gain than other second generation antipsychotic drugs. Weight gain happens soon after treatment with olanzapine has started.

*Hypotension and interference with temperature regulation*

Hypotension and interference with temperature regulation are dose-related side-effects. Clozapine, chlorpromazine, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some children.

*Neuroleptic malignant syndrome*

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

*Blood dyscrasias*

Perform blood counts if unexplained infection or fever develops.

*Choice*

The antipsychotic drugs most commonly used in children are haloperidol p. 252, risperidone p. 260, and olanzapine p. 257. There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 256), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all children. Choice of antipsychotic medication is influenced by the child’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

*Negative symptoms*

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

*Extrapyramidal side-effects*

Second-generation antipsychotic drugs may be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 255, clozapine, olanzapine, and quetiapine p. 258 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 254 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

*QT interval*

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, olanzapine, perphenazine, risperidone, and sulphiride p. 253.

*Diabetes*

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in children with...
schizophrenia who take antipsychotic drugs. First-
generation antipsychotic drugs are less likely to cause
diabetes than second-generation antipsychotic drugs, and of
the first-generation antipsychotic drugs, haloperidol has the
lowest risk. A amisulpride and aripiprazole have the lowest
risk of diabetes of the second-generation antipsychotic
drugs. A amisulpride, aripiprazole, haloperidol, sulpiride, and
trifluoperazine p. 254 are least likely to cause weight gain.

Sexual dysfunction and prolactin
The antipsychotic drugs with the lowest risk of sexual
dysfunction are aripiprazole and quetiapine. Olanzapine may be
considered if sexual dysfunction is judged to be
secondary to hyperprolactinaemia. Hyperprolactinaemia is
usually not clinically significant with aripiprazole, clozapine,
olanzapine, and quetiapine treatment. When changing from
other antipsychotic drugs, a reduction in prolactin
concentration may increase fertility.

Children should receive an antipsychotic drug for
4–6 weeks before it is deemed ineffective. Prescribing more
than one antipsychotic drug at a time should be avoided
except in exceptional circumstances (e.g. clozapine
augmentation or when changing medication during
titration) because of the increased risk of adverse effects
such as extrapyramidal symptoms, QT-interval
prolongation, and sudden cardiac death.

Clozapine is used for the treatment of schizophrenia in
children unresponsive to, or intolerant of, other
antipsychotic drugs. Clozapine should be introduced if
schizophrenia is not controlled despite the sequential use of
two or more antipsychotic drugs (one of which should be a
second-generation antipsychotic drug), each for at least
6–8 weeks. If symptoms do not respond adequately to an
optimised dose of clozapine, plasma-clozapine
concentration should be checked before adding a second
antipsychotic drug to augment clozapine; allow 8–10 weeks’
treatment to assess response. Children must be registered
with a clozapine patient monitoring service.

Monitoring
Full blood count, urea and electrolytes, and liver function
test monitoring is required at the start of therapy with
antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at
3 months (weight should be measured at frequent intervals
during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at
4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be
required, particularly if physical examination identifies
cardiovascular risk factors, if there is a personal history of
cardiovascular disease, or if the child is being admitted as an
inpatient.

Blood pressure monitoring is advised before starting
therapy and frequently during dose titration of antipsychotic
drugs.

Other uses
Nausea and vomiting, chorea, motor tics, and intractable
hiccup.

Equivalent doses of oral antipsychotics
These equivalences are intended only as an approximate
guide; individual dosage instructions should also be
checked; children should be carefully monitored after any
change in medication. Equivalent daily dose of antipsychotic
drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must not be extrapolated
beyond the maximum dose for the drug. Higher doses require
careful titration in specialist units and the equivalences
shown here may not be appropriate.

Dosage
After an initial period of stabilisation, the total daily oral
dose of antipsychotic drugs can be given as a single dose in
most children.

Antipsychotic depot injections
There is limited information on the use of antipsychotic
depot injections in children and use should be restricted to
specialist centres.

ANTIPSYCHOTICS

Antipsychotic drugs

- **CAUTIONS** Blood dyscrasias - cardiovascular disease -
  conditions predisposing to seizures - depression - diabetes
  (may raise blood glucose) - epilepsy - history of jaundice -
  myasthenia gravis - photosensitisation (may occur with
  higher doses) - severe respiratory disease - susceptibility
  to angle-closure glaucoma

- **CAUTIONS, FURTHER INFORMATION**
  Cardiovascular disease  An ECG may be required, particularly
  if physical examination identifies cardiovascular risk
  factors, personal history of cardiovascular disease, or if the
  patient is being admitted as an inpatient.

- **SIDE-EFFECTS**
  - Common or very common  Agitation - amenorrhoea -
    arrhythmias - constipation - dizziness - drowsiness - dry
    mouth - erectile dysfunction - galactorrhoea -
    gynaecomastia - hyperprolactinaemia - hypotension (dose-
    related) - insomnia - leucopenia - movement disorders -
    neutropenia - parkinsonism - QT interval prolongation -
    rash - seizure - tremor - urinary retention - vomiting -
    weight increased

  - Uncommon  Agranulocytosis - embolism and thrombosis -
    neuroleptic malignant syndrome (discontinue—potentially
    fatal)

  - Rare or very rare  Sudden death - withdrawal syndrome
    neonatal

  - **OVERDOSE** Phenothiazines cause less depression of
    consciousness and respiration than other sedatives.
    Hypotension, hyperthermia, sinus tachycardia, and
    arrhythmias may complicate poisoning. For details on the
    management of poisoning see Antipsychotics under
    Emergency treatment of poisoning p. 829.

  - **PREGNANCY** Extrapyramidal effects and withdrawal
    syndrome have been reported occasionally in the neonate
    when antipsychotic drugs are taken during the third
    trimester of pregnancy. Following maternal use of
    antipsychotic drugs in the third trimester, neonates should
    be monitored for symptoms including agitation, hypotonia
    hypotension, hyperthermia, tremor, drowsiness, feeding
    problems, and respiratory distress.

  - **BREAST FEEDING** There is limited information available on
    the short- and long-term effects of antipsychotic drugs on
    the breast-fed infant. Animal studies indicate possible
    adverse effects of antipsychotic medicines on the
    developing nervous system. Chronic treatment with
    antipsychotic drugs whilst breast-feeding should be
    avoided unless absolutely necessary.

  - **MONITORING REQUIREMENTS**
    - It is advisable to monitor prolactin concentration at the
      start of therapy, at 6 months, and then yearly. Patients
      taking antipsychotic drugs not normally associated with
      symptomatic hyperprolactinaemia should be considered
for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).

- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.
- Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

**TREATMENT CESSATION** There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

**PATIENT AND CARER ADVICE** As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

- **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

**ANTIPSYCHOTICS > FIRST-GENERATION**

| Chlorpromazine hydrochloride | 09-Jul-2018 |

**INDICATIONS AND DOSE**

**Childhood schizophrenia and other psychoses (under expert supervision)**

- **BY MOUTH**
  - Child 1–5 years: 500 micrograms/kg every 4–6 hours, adjusted according to response; maximum 40 mg per day
  - Child 6–11 years: 10 mg 3 times a day, adjusted according to response; maximum 75 mg per day
  - Child 12–17 years: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily

**Relief of acute symptoms of psychoses (under expert supervision)**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
  - Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
  - Child 12–17 years: 25–50 mg every 6–8 hours

**Nausea and vomiting in palliative care (where other drugs have failed or are not available)**

- **BY MOUTH**
  - Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
  - Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
  - Child 12–17 years: 10–25 mg every 4–6 hours

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day
  - Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day
  - Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

**DOSE EQUIVALENCE AND CONVERSION**

- For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository

**CONTRA-INDICATIONS** CNS depression - comatose states - hypothyroidism - phaeochromocytoma

**INTERACTIONS** > Appendix 1: phenothiazines

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Anxiety; glucose tolerance impaired; mood altered; muscle tone increased

- **Frequency not known** Accommodation disorder - angioedema - atrioventricular block - cardiac arrest - eye deposit - eye disorders - gastrointestinal disorders - hepatic disorders - hyperglycaemia - hypertriglyceridaemia - hypopituitarism - photosensitivity reaction - respiratory disorders - sexual dysfunction - SIADH - skin reactions - systemic lupus erythematosus (SLE) - temperature regulation disorder - trismus

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use Muscle rigidity; nasal congestion

**SIDE-EFFECTS, FURTHER INFORMATION** Acute dystonic reactions may occur; children are particularly susceptible.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe hepatic failure (increased risk of accumulation).

**RENAL IMPAIRMENT**

- **Dose adjustments** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**

- With intramuscular use Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

**PRESCRIBING AND DISPENSING INFORMATION**

- **Palliative care** For further information on the use of chlorpromazine hydrochloride in palliative care, see www.medicinescomplete.com/#/content/palliative/antipsychotics.

**HANDLING AND STORAGE** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution.

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 2, 11 |
| chlorpromazine hydrochloride (Non-proprietary) | 251 |
| Chlorpromazine hydrochloride 25 mg Chlorpromazine 25 mg tablets | 28 tablet | £44.78 DT = £41.72 |
| Chlorpromazine hydrochloride 50 mg Chlorpromazine 50 mg tablets | 28 tablet | £48.00 DT = £41.81 |
| Chlorpromazine hydrochloride 100 mg Chlorpromazine 100 mg tablets | 28 tablet | £46.25 DT = £41.56 |

**Solution for injection**

- **Largactil (Sanofi)**
  - Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50mg/2ml solution for injection ampoules | 10 ampoule | £7.51 |

**Oral solution**

| CAUTIONARY AND ADVISORY LABELS | 2, 11 |
| chlorpromazine hydrochloride (Non-proprietary) | 251 |
| Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 25 mg/5ml syrup | 150 ml | £2.35 DT = £2.35 |
| Chlorpromazine hydrochloride 10 mg per 1 ml Chlorpromazine 25 mg/5ml oral solution sugar free | 50 ml | £2.35 DT = £2.35 |
| Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 50 mg/5ml oral solution | 150 ml | £2.35 DT = £2.35 |
| Chlorpromazine hydrochloride 20 mg per 1 ml Chlorpromazine 100 mg/5ml oral solution | 150 ml | £5.50 DT = £5.50 |
Haloperidol

INDICATIONS AND DOSE

Nausea and vomiting in palliative care

BY MOUTH
- Child 12-17 years: 1.5 mg once daily, dose to be taken at night, increased if necessary to 1.5 mg twice daily (max. per dose 5 mg twice daily)
- BY CONTINUOUS INTRAVENOUS INFUSION, OR BY CONTINUOUS SUBCUTANEOUS INFUSION
  - Child 1 month-11 years: 25–85 micrograms/kg, to be administered over 24 hours
  - Child 12–17 years: 1.5–5 mg, to be administered over 24 hours

Schizophrenia (when alternatives ineffective or not tolerated) (under expert supervision)

BY MOUTH
- Child 13-17 years: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, individual benefit-risk should be assessed when considering doses above 3 mg daily; maximum 5 mg per day

Persistent, severe aggression in autism or pervasive developmental disorders (when other treatments ineffective or not tolerated) (under expert supervision)

BY MOUTH
- Child 6–11 years: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, the need for continued treatment must be reassessed after a maximum of 6 weeks and regularly thereafter
- Child 12-17 years: 0.25–2.5 mg twice daily, alternatively 0.16–1.6 mg 3 times a day, the need for continued treatment must be reassessed after a maximum of 6 weeks and regularly thereafter

Severe tic disorders, including Tourette’s syndrome (when educational, psychological and other pharmacological treatments ineffective) (under expert supervision)

BY MOUTH
- Child 10–17: 0.25–1.5 mg twice daily, alternatively 0.16–1 mg 3 times a day, the need for continued treatment must be reassessed every 6–12 months

Restlessness and confusion in palliative care

BY MOUTH
- Child 1-17 years: 10–20 micrograms/kg every 8–12 hours

Unlicensed Use

Not licensed for use in palliative care.

Contra-indications

CNS depression - comatose states - congenital long QT syndrome - history of torsade de pointes - history of ventricular arrhythmia - QTc-interval prolongation - recent acute myocardial infarction - uncompensated heart failure - uncorrected hypokalaemia

Cautionary

Bradyarrhythmia - electrolyte disturbances (correct before treatment initiation) - family history of QTc-interval prolongation - history of heavy alcohol exposure - hyperthyroidism - hypotension (including orthostatic hypotension) - prolactin-dependent tumours - prolactinaemia

INTERACTIONS

Appendix 1: haloperidol

SIDE-EFFECTS

General Side-effects

- Common or very common: Depression - eye disorders - headache - hypersalivation - nausea - neuromuscular dysfunction - psychotic disorder - vision disorders - weight decreased
- Rare or very rare: Hypoglycaemia - respiratory disorders - SIADH - trismus
- Frequency not known: Hypersensitivity vasculitis - pancytopenia - rhabdomyolysis - thrombocytopenia

Specific Side-effects

- With oral use: Antiepileptics
- With parenteral use: Severe cutaneous adverse reactions (SCARs)

Side-effects, Further Information

Haloperidol is a less sedating antipsychotic.

Pregnancy

Manufacturer advises it is preferable to avoid—moderate amount of data indicate no malformative or fetal/neonatal toxicity, however there are isolated case reports of birth defects following fetal exposure, mostly in combination with other drugs; reproductive toxicity shown in animal studies.

Hepatic Impairment

Manufacturer advises caution.

Dose adjustments

Manufacturer advises halve initial dose and then adjust if necessary with smaller increments and at longer intervals.

Renal Impairment

Manufacturer advises use with caution.

Dose adjustments

Manufacturer advises consider lower initial dose in severe impairment and then adjust if necessary with smaller increments and at longer intervals.

Monitoring Requirements

Manufacturer advises monitor electrolytes before treatment initiation and periodically during treatment.

Manufacturer advises perform ECG before treatment initiation and assess need for further ECGs during treatment on an individual basis.

Prescribing and Dispensing Information

Palliative care

For further information on the use of haloperidol in palliative care, see www.medicinescomplete.com/#/content/palliative/haloperidol.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Cautionary and Advisory Labels 2

Haloperidol (Non-proprietary)

Haloperidol 500 microgram | Haloperidol 500 microgram tablets | 28 tablet (PO) £22.95-£30.00 + DT = £29.59
Haloperidol 1.5 mg | Haloperidol 1.5 mg tablets | 28 tablet (PO) £15.10 DT + £15.10
Haloperidol 5 mg | Haloperidol 5 mg tablets | 28 tablet (PO) £16.58 DT + £16.50
Haloperidol 10 mg | Haloperidol 10 mg tablets | 28 tablet (PO) £19.85 DT + £19.36

Solution for injection

Haloperidol (Non-proprietary)

Haloperidol 5 mg per 1 ml | Haloperidol 5 mg/mL solution for injection ampoules | 10 ampoule (PO) £35.00 + DT = £35.00

Oral solution

Cautionary and Advisory Labels 2

Haloperidol (Non-proprietary)

Haloperidol 1 mg per 1 ml | Haloperidol 5 mg/mL oral solution sugar free: 100 ml (PO) £35.99 + DT = £6.47 sugar-free | 500 ml (PO) £22.35
Haloperidol 2 mg per 1 ml | Haloperidol 10 mg/mL oral solution sugar free: 100 ml (PO) £46.75 DT + £7.10 sugar-free | 500 ml (PO) £35.50

Haldol (Janssen-Cilag Ltd)

Haloperidol 2 mg per 1 ml | Haldol 2 mg/mL oral solution sugar-free | 100 ml (PO) £4.45 DT + £7.10

Halikid (Thame Laboratories Ltd)

Haloperidol 200 microgram per 1 ml | Halikid 200 micrograms/mL oral solution sugar-free | 100 ml (PO) £8.90

BNFC 2019-2020
PERICYZINE (PERICAZINE)

**INDICATIONS AND DOSE**

**Schizophrenia (under expert supervision) / Psychoses (severe mental or behavioural disorders only) (under expert supervision)**

- **BY MOUTH**
  - Child 1-11 years: Initially 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose; maximum 10 mg per day.
  - Child 12-17 years: Initially 25 mg 3 times a day, increased in steps of 25 mg every week, adjusted according to response, increased if necessary up to 100 mg 3 times a day; total daily dose may alternatively be given in 2 divided doses.

**UNLICENSED USE** Tablets not licensed for use in children.

**CONTRA-INDICATIONS** CNS depression, comatose states, history of arrhythmias, history of congenital QT prolongation, hypothyroidism, CNS depression.

**CAUTIONS**

- **Hepatic impairment** Can precipitate coma; phenothiazines are hepatotoxic.
- **Renal impairment** Avoid in renal impairment.

**SIDE-EFFECTS**

- Atioventricular block, cardiac arrest, consciousness impaired, contact dermatitis, glucose tolerance impaired, hepatic disorders, hyperglycaemia, hyperthermia, nasal congestion, priapism, respiratory depression.
- Hyperhidrosis.
- Hypertension.
- Libido decreased.
- Nausea.
- Tachycardia.
- Tachypnoea.
- Vision blurred.

**INTERACTIONS**

- Pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

- Pericyazine 2 mg per 1 ml
  - Pericyazine 10 mg/5ml oral solution
  - 100 ml £18.80 DT = £28.80

**Tablet**

- Pericyazine 2.5 mg
  - Pericyazine 2.5 mg tablets
  - 84 tablet £13.79 DT = £22.90
  - Pericyazine 10 mg
  - 84 tablet £13.79 DT = £22.90

**SULPIRIDE**

**INDICATIONS AND DOSE**

**Psychoses and schizophrenia**

- **BY MOUTH**
  - Child 14-17 years (under expert supervision): 200–400 mg twice daily; maximum 800 mg per day.

**Psychoses**

- **BY MOUTH**
  - Child 14-17 years (under expert supervision): 200–400 mg twice daily; maximum 2.4 g per day.

**Tourette syndrome (under expert supervision)**

- **BY MOUTH**
  - Child 2-11 years: 50-400 mg twice daily
  - Child 12-17 years: 100–400 mg twice daily.

**UNLICENSED USE** Not licensed for use in Tourette syndrome.

**CONTRA-INDICATIONS** CNS depression, comatose states, phaeochromocytoma.

**CAUTIONS** Aggressive patients (even low doses may aggravate symptoms), agitated patients (even low doses may aggravate symptoms), excited patients (even low doses may aggravate symptoms).
INTERACTIONS → Appendix 1: sulpiride

SIDE-EFFECTS
- Common or very common
  - Breast abnormalities
- Uncommon
  - Hyponatraemia - SIADH - trismus - urticaria
- Rare or very rare
  - Oculogyric crisis
- Frequency not known
  - Cardiac arrest - confusion - dyspnoea

RENAL IMPAIRMENT
- Dose adjustments
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
- Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- PRESCRIBING AND DISPENSING INFORMATION
  - Flavours of oral liquid formulations may include lemon and aniseed.
- PATIENT AND CARER ADVICE

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - Oral solution
    - CAUTIONARY AND ADVISORY LABELS 2
      - Sulpiride (Non-proprietary)
        - Sulpiride 40 mg per 1 ml Sulpiride 200mg/5ml oral solution sugar-free 150 ml £31.00 DT = £31.00
      - Tablet
        - CAUTIONARY AND ADVISORY LABELS 2
          - Sulpiride (Non-proprietary)
            - Sulpiride 200 mg Sulpiride 200mg tablets | 30 tablet £8.70 DT + £4.40
            - Sulpiride 400 mg Sulpiride 400mg tablets | 30 tablet £23.50 DT + £18.80
          - Dolmatil (Sandﬁ)
            - Sulpiride 200 mg Dolmatil 200mg tablets | 100 tablet £6.00
            - Sulpiride 400 mg Dolmatil 400mg tablets | 100 tablet £19.00

Trifluoperazine

INDICATIONS AND DOSE
- Schizophrenia and other psychoses: Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour
  - BY MOUTH
    - Child 12–17 years (under expert supervision): Initially 5 mg twice daily, dose may be increased by 5 mg after 1 week. If necessary, dose may be further increased in steps of 5 mg at intervals of 3 days. When satisfactory control has been achieved, reduce gradually until an effective maintenance level has been established

Short-term adjunctive management of severe anxiety
- BY MOUTH
  - Child 3–5 years (under expert supervision): Up to 500 micrograms twice daily
  - Child 6–11 years (under expert supervision): Up to 2 mg twice daily
  - Child 12–17 years (under expert supervision): 1–2 mg twice daily, increased if necessary to 3 mg twice daily

Severe nausea and vomiting unresponsive to other antiemetics
- BY MOUTH
  - Child 3–5 years: Up to 500 micrograms twice daily
  - Child 6–11 years: Up to 2 mg twice daily
  - Child 12–17 years: 1–2 mg twice daily (max. per dose 3 mg twice daily)

CONTRA-INDICATIONS
- CNS depression - comatose states - phaeochromocytoma

SIDE-EFFECTS → Appendix 1: phenothiazines

INTERACTIONS
- Alertness decreased - anxiety - appetite decreased - blood disorder - cardiac arrest - confusion - fatigue - hyponatraemia - jaundice cholestatic - lens opacity - muscle weakness - oedema - pancytopenia - photosensitivity reaction - postural hypotension (dose-related) - skin reactions - thrombocytopenia - urinary hesitation - vision blurred - withdrawal syndrome

SIDE-EFFECTS, FURTHER INFORMATION
- Extrapyramidal symptoms are more frequent at doses exceeding 6mg daily.
- Acute dystonias are more common with potent first generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.
- HEPATIC IMPAIRMENT
  - Manufacturer advises avoid.

RENAL IMPAIRMENT
- Dose adjustments
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MONITORING REQUIREMENTS
- Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
  - Oral solution
    - CAUTIONARY AND ADVISORY LABELS 2
      - Trifluoperazine (as Trifluoperazine hydrochloride)
        - 200 microgram per 1 ml Trifluoperazine 1mg/5ml oral solution sugar-free £112.25 DT + £112.25
      - Trifluoperazine (as Trifluoperazine hydrochloride) 1 mg per 1 ml Trifluoperazine 5mg/5ml oral solution sugar-free £25.50–£27.00 DT + £27.00
    - Table
      - CAUTIONARY AND ADVISORY LABELS 2
        - Trifluoperazine (as Trifluoperazine hydrochloride)
          - 1 mg Trifluoperazine 1mg tablets | 112 tablet £59.12–£99.80 DT + £59.12
          - 5 mg Trifluoperazine 5mg tablets | 112 tablet £134.89–£165.00 DT + £134.89

ANTIPSYCHOTICS → SECOND-GENERATION

Amisulpride

DRUG ACTION
- Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D2 and D3 receptors.

INDICATIONS AND DOSE
- Acute psychotic episode in schizophrenia
  - BY MOUTH
    - Child 15–17 years (under expert supervision): 200–400 mg twice daily, adjusted according to response; maximum 1.2 g per day

Schizophrenia with predominantly negative symptoms
- BY MOUTH
  - Child 15–17 years (under expert supervision): 50–300 mg daily

UNLICENSED USE
- Not licensed for use in children under 18 years.

CONTRA-INDICATIONS
- CNS depression - comatose states - phaeochromocytoma - pre-pubertal children - prolactin-dependent tumours

INTERACTIONS → Appendix 1: amisulpride
Aripiprazole

**DRUG ACTION** Aripiprazole is a dopamine D₂ partial agonist with weak 5-HT₁A partial agonism and 5-HT₂A receptor antagonism.

**INDICATIONS AND DOSE**

**Schizophrenia**

- **BY MOUTH**
  - Child 15-17 years (under expert supervision): Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, then increased in steps of 5 mg if required; maximum 30 mg per day

- For mania (under expert supervision)
  - **BY MOUTH**
    - Child 13-17 years: Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, increased in steps of 5 mg if required, maximum duration of treatment 12 weeks, doses above 10 mg daily should only be used in exceptional cases; maximum 36 mg per day

**SIDE-EFFECTS**

- **Common or very common** Anxiety, breast pain, hypersalivation, muscle rigidity, nausea, oculogyric crisis, orgasm abnormal, trismus
- **Uncommon** Hyperglycaemia
- **Frequency not known** Angiokeratoma, bone disorders, cardiomyopathy, confusion, dizziness, dyslipidaemia, hyponatraemia, nasal congestion, neoplasms, SIADH–urticaria–vision blurred

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid—no information available.

**RENAL IMPAIRMENT** No information available if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DOSE ADJUSTMENTS** Halve dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m². Use one-third dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**INTERACTIONS**

- **CAUTIONS**
  - **CONTRA-INDICATIONS** CNS depression, comatose state, phaeochromocytoma
  - **CAUTIONS** Cerebrovascular disease
  - **INTERACTIONS** + Appendix 1: aripiprazole

**SIDE-EFFECTS**

- **Common or very common** Anxiety, appetite abnormal, diabetes mellitus, fatigue, gastrointestinal discomfort, headache, hyponatraemia, nausea, vision disorders
- **Uncommon** Depression, hiccup, hyperglycaemia, sexual dysfunction
- **Frequency not known** Aggression, alopecia, cardiomyopathy, chest pain, diabetic hyperosmolar coma, diabetic ketoacidosis, diarrhoea, dysphagia, generalised tonic-clonic seizure, hepatic disorders, hyperhidrosis, hypertension, hyponatraemia, laryngospasm, musculoskeletal stiffness, myalgia, oropharyngeal spasm, pancreatitis, pathological gambling, peripheral oedema, photosensitivity reaction, pneumonia aspiration, rhombomylitis, serotonin syndrome, speech disorder, suicidal tendencies, syncope, temperature regulation disorder, thrombocytopenia, urinary incontinence, weight decreased

**SIDE-EFFECTS, FURTHER INFORMATION** Increased incidence of side-effects associated with doses of 30 mg daily; doses above 10 mg daily should only be used in exceptional cases and with close clinical monitoring.

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in milk.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (oral treatment preferred to intramuscular administration; limited information available).

**MONITORING REQUIREMENTS** Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**DIRECTIONS FOR ADMINISTRATION** Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

**IMPORTANT SAFETY INFORMATION**

When prescribing, dispensing, or administering, check that the correct preparation is used—the preparation usually used in hospital for the rapid control of an acute episode (solution for injection containing aripiprazole 7.5 mg/mL) should not be confused with depot preparations (aripiprazole 400-mg vial with solvent), which are usually used in the community or clinics for maintenance treatment.
Nervous system

**Mental health disorders**

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**
- Aripiprazole for the treatment of schizophrenia in people aged 15 to 17 years (January 2011) NICE TA23
- Aripiprazole is recommended as an option for the treatment of schizophrenia in adolescents aged 15 to 17 years who have not responded adequately to, or who are intolerant of, risperidone, or for whom risperidone is contra-indicated.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta223

- Aripiprazole for treating moderate to severe manic episodes in adolescents with bipolar I disorder (July 2013) NICE TA292
- Aripiprazole is recommended as an option for the treatment of moderate to severe manic episodes for up to 12 weeks in adolescents aged 13 years and older with bipolar I disorder.

www.nice.org.uk/guidance/ta292

**ABILIFY® ORAL SOLUTION**

Scottish Medicines Consortium (SMC) decisions
- With oral use The Scottish Medicines Consortium, has advised (August 2013) that oral aripiprazole (Abilify®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe manic episodes in Bipolar I Disorder in adolescents aged 13 years and older for a period of up to 12 weeks. It is restricted to initiation and management under the supervision of a child/adolescent psychiatrist.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

**Clozapine**

**DRUG ACTION**

Clozapine is a dopamine D2, dopamine D1, 5-HT2A, alpha1-adrenoceptor, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- **BY MOUTH**
  - Child 12-17 years (under expert supervision): 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

**LICENSED USE**

Not licensed for use in children under 16 years.

**IMPORTANT SAFETY INFORMATION**

Clozapine has been associated with varying degrees of impairment of intestinal peristalsis—see Cautions and Contra-indications for further information. Patients and their carers should be advised to seek immediate medical advice before taking the next dose of clozapine if constipation develops.

**CONTRA-INDICATIONS**

Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy.

**CAUTIONS**

Susceptibility to angle-closure glaucoma - taper off other antipsychotics before starting

**CAUTIONS, FURTHER INFORMATION**

- Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm3 or if absolute neutrophil count below 1500/mm3 discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

- Myocarditis and cardiomyopathy Fatal myocardis (most commonly in first 2 months) and cardiomyopathy reported. Perform physical examination and take full medical history before starting

Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy
- Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

**INTERACTIONS** → Appendix 1: clozapine

**SIDE-EFFECTS**
- Common or very common Appetite decreased - eosinophilia - fatigue - fever - headache - hypertension - leucocytosis - muscle complaints - nausea - oral disorders - postural hypotension (dose-related) - speech impairment - sweating abnormal - syncope - temperature regulation disorders - urinary disorders - vision blurred
- Rare or very rare Anaemia - cardiac arrest - cardiac inflammation - cardiomyopathy - circulatory collapse - confusion - delirium - diabetes mellitus - dyslipidaemia - dysphagia - gastrointestinal disorders - glucose tolerance impaired - hepatic disorders - hyperglycaemia - increased risk of infection - intestinal obstruction (including fatal cases) - ketoacidosis - nephritis tubulointerstitial - obsessive-compulsive disorder - pancreatitis - pericardial effusion - respiratory disorders - restlessness - sexual dysfunction - skin reactions - thrombocytopena - thrombocytosis

**SIDE-EFFECTS, FURTHER INFORMATION** Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

**PREGNANCY** Use with caution.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—monitor liver function (discontinue if liver enzymes are greater than 3 times the upper limit of normal or jaundice occurs); avoid in symptomatic or progressive impairment and in hepatic failure.

**RENAL IMPAIRMENT** Avoid in severe impairment.

**MONITORING REQUIREMENTS** Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
- Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.
- Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

**TREATMENT CESSATION** On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

**DIRECTIONS FOR ADMINISTRATION** Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

**PRESCRIBING AND DISPENSING INFORMATION** Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clozapine oral suspension.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Olanzapine**

**DRUG ACTION** Olanzapine is a dopamine D\(_2\), D\(_3\), D\(_4\), 5-HT\(_2\), histamine-1-, and muscarinic-receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia** | **Combination therapy for mania**
- **BY MOUTH**
  - Child 12–17 years (under expert supervision): Initially 5–10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

**Monotherapy for mania**
- **BY MOUTH**
  - Child 12–17 years (under expert supervision): 15 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors continued →
Fasting blood glucose should be measured at baseline, and more gradual dose increase; maximum 20 mg per day.

Blood lipids and weight should be measured at baseline, at 1 month for the

INTERACTIONS

▶ Appendix 1: olanzapine

SIDE-EFFECTS

▶ Common or very common Anticholinergic syndrome - appetite increased - arthralgia - asthenia - eosinophilia - fever - glycosuria - hypersonmia - oedema - sexual dysfunction

▶ Rare or very rare Hepatic disorders - hypothermia - pancreatitis - rhabdomyolysis - thrombocytopenia

PREGNANCY

Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

BREAST FEEDING

Avoid — present in milk.

HEPATIC IMPAIRMENT

Manufacturer advises caution.

Dose adjustments

In adults, manufacturer advises consider initial dose reduction — consult product literature.

RENAI IMPAIRMENT

Dose adjustments

Consider initial dose of 5 mg daily.

MONITORING REQUIREMENTS

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one month’s treatment, then every 4–6 months.

DIRECTIONS FOR ADMINISTRATION

Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer orodispersible tablets. Medicines for Children leaflet: Olanzapine for schizophrenia, bipolar disorder, mania and agitation www.medicinesforchildren.org.uk/olanzapine-schizophrenia-bipolar-disorder-mania-and-agitation

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Quetiapine

DRUG ACTION

Quetiapine is a dopamine D2, dopamine D3, 5-HT2, α1-adrenoceptor, and histamine-1 receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years (under expert supervision): Initially 25 mg twice daily, adjusted according to response.
### Medicinal Forms

- **HEPATIC IMPAIRMENT**
  - Dose adjustments should be made cautiously in patients with hepatic impairment.
- **PREGNANCY**
  - Use only if benefit outweighs risks.
- **BREAST FEEDING**
  - Use with caution.
- **UNLICENSED USE**
  - Use only if potential benefit outweighs risks.

### Treatment of mania in bipolar disorder

- **CHILD 12-17 years (under expert supervision):** Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily, usual dose 400–600 mg daily in 2 divided doses.

### Dose equivalence and conversion

- Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose.
- To maintain clinical response, dose titration may be required.

### Nervous system

- **Antipsychotics**
  - Use with caution.
- **Psychoses and schizophrenia**
  - Use with caution.
- **Dystonia**
  - Use with caution.
- **Dyskinesia**
  - Use with caution.
- **SIADH**
  - Use with caution.

### Appendix 1: quetiapine

- **Seroquel (as Quetiapine fumarate) 25 mg**
  - Brand: Seroquel (as Quetiapine fumarate) 25 mg (AstraZeneca UK Ltd)
  - Dose: 150 mg once daily for day 1, then 200 mg twice daily for days 2, 3, and 4.

### Nervous system

- **Side-effects**
  - Common or very common: Appetite increased, asthenia, dysarthria, dyspepsia, dyspnoea, fever, headache, hyperglycaemia, irritability, palpitations, peripheral oedema, rhinitis, sleep disorders, suicidal behaviour (particularly on initiation), suicidal ideation (particularly on initiation), syncope, vision blurred, withdrawal syndrome.
  - Uncommon: Anaemia, diabetes mellitus, dysphagia, hyponatraemia, hypothyroidism, sexual dysfunction, skin reactions, thrombocytopenia.

### Nervous system

- **Rare or very rare**
  - Angioedema, breast swelling, gastrointestinal disorders, hepatic disorders, hypothyria, mental disorder, metabolic syndrome, pancreatitis, rhabdomyolysis, severe cutaneous adverse reactions (SCARs), SIADH.

### Nervous system

- **Pregnancy**
  - Use only if benefit outweighs risks.

### Nervous system

- **Breast feeding**
  - Use with caution.

### Nervous system

- **Unlicensed use**
  - Not licensed for use in children.

### Nervous system

- **Cautions**
  - Cerebrovascular disease, patients at risk of aspiration pneumonia.
  - Treatment of depression in patients under 25 years (increased risk of suicide).

### Nervous system

- **Interactions**
  - Add to recommendations from other sources.

### Nervous system

- **Adverse reactions**
  - Dyspepsia, dysphagia, hyperglycaemia, irritability, palpitations, peripheral oedema, rhinitis, sleep disorders, suicidal behaviour (particularly on initiation), suicidal ideation (particularly on initiation), syncope, vision blurred, withdrawal syndrome.

### Nervous system

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

### Nervous system

- **Modified-release tablets**

  - Child 12-17 years (under expert supervision): 2 mg daily in 1–2 divided doses for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower tita...
Movement disorders

Cerebral palsy and spasticity

Description of condition

Cerebral palsy is a group of permanent, non-progressive abnormalities of the developing fetal or neonatal brain that lead to movement and posture disorders, causing activity limitation and functional impact. There can be accompanying clinical and developmental comorbidities. These include disturbances of sensation, perception, cognition, communication and behaviour; epilepsy; and secondary musculoskeletal problems (such as muscle contracture and abnormal torsion). Cerebral palsy is not curable and the comorbidities can impact on many areas of participation and quality of life, particularly eating, drinking, comfort, and sleep.

Spasticity

Spasticity in children is most commonly associated with cerebral palsy, but can also be associated with other non-progressive brain disorders.

Aims of treatment

Treatment involves managing spasticity to optimise movement and posture, while minimising potential secondary musculoskeletal deformity, as well as managing developmental and clinical comorbidities.

Drug treatment

Spasticity

Oral diazepam p. 226 or oral baclofen p. 573 can be used to treat discomfort, pain, muscle spasm and functional disability. If oral diazepam is initially used because of its rapid onset of action, consider changing to oral baclofen if a sustained, longer duration of effect is required or if long-term treatment is necessary. If the response to diazepam or baclofen after 4–6 weeks is unsatisfactory, a trial of combined treatment using both drugs can be considered. Consider reducing the dose if adverse effects such as drowsiness occur. Treatment cessation should be considered when management is reviewed and at least every six months.

If dystonia is considered to contribute significantly to problems with posture, function and pain, a trial of treatment with oral trihexyphenidyl hydrochloride p. 263, levodopa, or baclofen [unlicensed indications] can be considered.

Treatment with botulinum toxin type A p. 265 [unlicensed under 2 years] should be considered for those in whom focal spasticity of the upper or lower limbs is inhibiting fine motor function, affecting care and hygiene, causing pain or disturbing sleep, impeding tolerance of other treatments (such as orthoses), or causing cosmetic concerns. A trial of botulinum toxin type A treatment can also be considered in those with spasticity when focal dystonia is causing problems, such as postural or functional difficulties or pain. Ongoing assessment of muscle tone, range of movement and motor function is required. Botulinum toxin type A treatment should not be offered to children receiving treatment with Aminoglycosides p. 320.

Treatment with intrathecal baclofen [unlicensed under 4 years] (administered by continuous pump) can be considered in children with spasticity if (despite the use of non-invasive treatments) spasticity or dystonia are causing difficulties with pain, muscle spasm, posture, function or self-care. Before deciding to implant the intrathecal baclofen pump, an intrathecal baclofen test should be performed to assess the therapeutic effect and to check for adverse effects.

Developmental and clinical comorbidities

Regular assessment and appropriate nutritional support should be provided, especially if there are concerns about oral intake, growth or nutritional status. Enteral tube feeding can be provided if oral intake is insufficient to provide adequate nutrition.

Children with cerebral palsy are likely to have risk factors for low bone mineral density and can have an increased risk of low-impact fractures. Calcium and vitamin D supplementation (such as colecalciferol with calcium carbonate p. 655) may be required. Children with reduced bone density and a history of low-impact fracture can be considered for bisphosphonate therapy (under specialist guidance).

Pain is common in children with cerebral palsy, especially those with more severe motor impairment. Condition-specific causes of pain and discomfort include musculoskeletal problems (for example, scoliosis, hip subluxation and dislocation), increased muscle tone (including dystonia and spasticity), muscle fatigue and immobility, constipation, vomiting, and gastro-oesophageal reflux disease. Reversible causes of pain should be treated as appropriate, see Spasticity (above), Constipation p. 41, Gastro-oesophageal reflux disease p. 61, Urinary frequency, enuresis and incontinence p. 506, Nocturnal enuresis in children p. 506 and Urinary tract infections.

Other types of pain include non-specific back pain, headache, non-specific abdominal pain, dental pain and dysmenorrhea. Initially, a ‘stepped approach’ trial of

simple analgesia (such as paracetamol p. 278, ibuprofen p. 679, or both) for mild-to-moderate pain can be considered. If such a trial is unsuccessful, the child should be referred to a specialist pain team. 

In children with cerebral palsy, sleep disturbances are common. ECG If no treatable cause is found, a trial of melatonin p. 303 [unlicensed] can be considered to manage sleep disturbances, particularly for problems with falling asleep. Regular sedative medication should not be used to manage primary sleep disorders in children with cerebral palsy without seeking specialist advice. 

Epilepsy can be associated with cerebral palsy; for its management, see Epilepsy p. 195.

Children with cerebral palsy are at greater risk of mental health problems, in comparison with the general age comparison population. For management of these conditions, see Depression (Antidepressant drugs p. 241), Anxiety (Hypnotics and anxiolytics p. 302), and Attention deficit hyperactivity disorder p. 231.

Drooling: Drooling can be managed with an antimuscarinic drug, such as glycopyrronium bromide p. 774 [unlicensed in under 3 years] (oral or by enteral tube) or hyoscine hydrobromide p. 273 [unlicensed] (transdermal). For children with dyskinetic cerebral palsy, trihexyphenidyl hydrochloride [unlicensed] can be used (on specialist advice). If antimuscarinic drugs provide insufficient benefit or are not tolerated, botulinum toxin type A [unlicensed indication] injections to the salivary glands can be considered. High-dose botulinum toxin type A [unlicensed indication] injections to the salivary glands can, rarely, cause breathing and swallowing difficulties, which requires urgent hospital admission. Surgery can be an option in cases resistant to drug treatment.

Non-drug treatment: All children with spasticity should be offered physiotherapy and, where necessary, occupational therapy. They can also benefit from orthoses. Orthopaedic surgery can be used, as an adjunct to other interventions, to prevent deterioration and improve function.

Related drugs: Other drugs used for Cerebral palsy and spasticity: co-careldopa p. 264, dantrolene sodium p. 848.

Useful Resources:

Dystonias and related disorders

Dystonias:

Dystonias may result from conditions such as cerebral palsy or may be related to a deficiency of the neurotransmitter dopamine as in Segawa syndrome.

Dopaminergic drugs used in dystonias:

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitor most commonly used in children is carbidopa (in co-careldopa p. 264).

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual child.

In severe dystonias related to cerebral palsy, improvement can be expected within 2 weeks. Children with Segawa syndrome are particularly sensitive to levodopa; they may even become symptom free on small doses. Levodopa also has a role in treating metabolic disorders such as defects in tetrahydrobiopterin synthesis and dihydrobiopterin reductase deficiency. Tetrahydrobiopterin may have a role in metabolic disorders.

Children may experience nausea within 2 hours of taking a dose; nausea and vomiting with co-careldopa is rarely dose-limiting.

In dystonic cerebral palsy, treatment with larger doses of levodopa is associated with the development of potentially troublesome motor complications (including response fluctuations and dyskinesias). Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period.

Antimuscarinic drugs used in dystonias:

The antimuscarinic drugs procyclidine hydrochloride p. 263 and trihexyphenidyl hydrochloride p. 263 reduce the symptoms of dystonias, including those induced by antipsychotic drugs; there is no justification for giving them routinely in the absence of dystonic symptoms. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

There are no important differences between the antimuscarinic drugs, but some children tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 226 can be given for life-threatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders:

Haloperidol p. 252 can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozone p. 253 [unlicensed indication] (important: ECG monitoring required), and sulphpride p. 253 [unlicensed indication].

Propranolol hydrochloride p. 106 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremor associated with anxiety or thyrotoxicosis.

Botulinum toxin type A p. 265 should be used under specialist supervision. Treatment with botulinum toxin type A can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties, and in children with spasticity in whom focal dystonia causes postural or functional difficulties or pain.
Dystonias and other involuntary movements

**Other drugs used for Dystonias and other involuntary movements**  Chlorpropramide hydrochloride, p. 251 - Clonidine hydrochloride, p. 103 - Clozapine, p. 256 - Perisycaine, p. 253 - Prochlorperazine, p. 275 - Trifluoperazine, p. 254

**Antimuscarinics**

**Procyclidine hydrochloride**

- **Drug action** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **Indications and dose**
  - **Acute dystonia**
    - **By intramuscular injection, or by intravenous injection**
    - Child 1 month-1 year: 0.5–2 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief.
    - Child 2-9 years: 2–5 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief.
    - Child 10-17 years: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief.

- **Dystonia**
  - **By mouth**
    - Child 7-11 years: 1.25 mg 3 times a day.
    - Child 12-17 years: 2.5 mg 3 times a day.

- **Unlicenced use** Not licensed for use in children.

- **Contra-indications**
  - Gastro-intestinal obstruction - myasthenia gravis

- **Caution**
  - Cardiovascular disease - hypertension - liable to abuse - psychotic disorders - pyrexia - those susceptible to angle-closure glaucoma

- **Interactions**
  - Appendix 1: procyclidine

- **Side-effects**
  - Common or very common: Constipation - dry mouth - urinary retention - vision blurred
  - Uncommon: Anxiety - cognitive impairment - confusion - dizziness - gingivitis - hallucination - memory loss - nausea - rash - vomiting
  - Rare or very rare: Psychotic disorder

- **Pregnancy** Use only if potential benefit outweighs risk.

- **Breast feeding** Avoid.

- **Hepatic impairment** Manufacturer advises caution.

- **Renal impairment** Use with caution.

- **Treatment cessation** Avoid abrupt withdrawal in patients taking long-term treatment.

- **Patient and carer advice**
  - Driving and skilled tasks: May affect performance of skilled tasks (e.g. driving).

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- Procyclidine hydrochloride (Non-proprietary) Procyclidine hydrochloride 5 mg per 1 ml Procyclidine 10mg/2ml solution for injection ampoules | 5-ampoule POM £60.00–£78.75 DT = £72.50

**Oral solution**

- Procyclidine hydrochloride (Non-proprietary) Procyclidine hydrochloride 500 microgram per 1 ml Procyclidine 2.5mg/5ml oral solution sugar free sugar-free | 150 ml POM £11.00–£14.03 DT = £14.01

**Trihexyphenidyl hydrochloride**

**(Benzhexol hydrochloride)**

- **Drug action** Trihexyphenidyl exerts its effects by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

- **Indications and dose**
  - **Dystonia**
    - **By mouth**
      - Child 3 months-17 years: Initially 1–2 mg daily in 1–2 divided doses, then increased in steps of 1 mg every 3–7 days, dose to be adjusted according to response and side-effects; maximum 2 mg/kg per day.

- **Unlicenced use** Not licensed for use in children.

- **Contra-indications**
  - Gastro-intestinal obstruction - myasthenia gravis

- **Caution**
  - Cardiovascular disease - hypertension - liable to abuse - psychotic disorders - pyrexia - those susceptible to angle-closure glaucoma

- **Interactions**
  - Appendix 1: trihexyphenidyl

- **Side-effects**

- **Pregnancy** Use only if potential benefit outweighs risk.

- **Breast feeding** Avoid.

- **Hepatic impairment** Manufacturer advises caution.

- **Renal impairment** Use with caution.

- **Treatment cessation** Avoid abrupt withdrawal in patients taking long-term treatment.

- **Directions for administration** Tablets should be taken with or after food.

- **Patient and carer advice**

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral solution**

- Exciipients: May contain Propylene glycol
  - Trihexyphenidyl hydrochloride (Non-proprietary) Trihexyphenidyl hydrochloride 1 mg per 1 ml Trihexyphenidyl 5mg/5ml oral solution | 200 ml POM £24.00–£28.37 DT = £26.40

**Tablet**

- Trihexyphenidyl hydrochloride (Non-proprietary) Trihexyphenidyl hydrochloride 2 mg Trihexyphenidyl 2mg tablets | 84 tablet POM £4.20 DT = £3.46
  - Trihexyphenidyl hydrochloride 5 mg Trihexyphenidyl 5mg tablets | 84 tablet POM £17.01 DT = £17.01
DOPAMINERGIC DRUGS > DOPAMINE PRECURSORS

Co-careldopa

INDICATIONS AND DOSE

Dopamine-sensitive dystonias including Segawa syndrome and dystonias related to cerebral palsy (dose expressed as levodopa)

BY MOUTH

- Child: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months).

BY MOUTH

- Neonate: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months).

DOSE EQUIVALENT AND CONVERSION

- The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.
- 2 tablets Sinemet® 12.5 mg/50 mg is equivalent to 1 tablet Sinemet® Plus 25 mg/100 mg.

UNLICENSED USE

- Not licensed for use in children.

CAUTIONS

- Cardiovascular disease.
- Diabetes mellitus.
- History of myocardial infarction with residual arrhythmia.
- History of peptic ulcer.
- History of myocardial infarction with residual arrhythmia.
- Pulmonary disease.
- Susceptibility to angle-closure glaucoma.

INTERACTIONS

- Appendix 3: carbidopa - levodopa.

SIDE-EFFECTS

- Rare or very rare Drowsiness, seizure, sleep disorders.
- Frequency not known Agranulocytosis, Alertness decreased, Alopecia, Anaemia, Angioedema, Anxiety, Appetite decreased, Asthenia, Cardiac disorders, Chest pain, Compulsions, Confusion, Constipation, Delusions, Depression, Diarrhoea, Dizziness, Dry mouth, Dyskinesia, Hypnotic (may be dose-limiting), Dysphagia, Dysphoa, Eating disorders, Euphoric mood, Eye disorders, Faint, Focal tremor, Gait abnormal, Gastrointestinal discomfort, Gastrointestinal disorders, Gastrointestinal haemorrhage, Haemolytic anaemia, Hallucination, Headache, Henoch-Schönlein purpura, Hiccups, Hoarseness, Horner’s syndrome exacerbated, Hypertension, Hypotension, Leucopenia, Malaise, Malignant melanoma, Movement disorders, Muscle complaints, Nausea, Neuroleptic malignant syndrome (on abrupt discontinuation), Oedema, Oral disorders, Palpitations, Pathological gambling, Postural disorders, Psychotic disorders, Respiration abnormal, Sensation abnormal, Sexual dysfunction, Skin reactions, Suicidal ideation, Sweat changes, Syncope, Taste bitter, Teeth grinding, Thrombocytopenia, Trismus, urinary disorders, Urine dark, Vasodilation, Vision disorders, Vomiting, Weight changes.

PREGNANCY

- Use with caution — toxicity has occurred in animal studies.

BREAST FEEDING

- May suppress lactation; present in milk — avoid.

HEPATIC IMPAIRMENT

- Manufacturer advises use with caution in hepatic disease.

DUODOPA® Dose adjustments

- Manufacturer advises titrate dose with caution in severe impairment.

MONITORING REQUIREMENTS

- In prolonged therapy, psychiatric, hepatic, haematological, renal, and cardiovascular monitoring is advisable; warn patients to resume normal activities gradually.

EFFECT ON LABORATORY TESTS

- False positive tests for urinary ketones have been reported.

TREATMENT CESSATION

- Avoid abrupt withdrawal.

PRESCRIBING AND DISPENSING INFORMATION

- Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

PATIENT AND CARER ADVICE

- Warn patients to resume normal activity gradually.

Driving and skilled tasks

- Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

- Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery.

- Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

- Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication.

- Patients should be counselled on improving sleep behaviour.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

TABLET

CAUTIONARY AND ADVISORY LABELS 10, 14

- Co-careldopa (Non-proprietary)

| Carbidopa (as Carbidopa monohydrate) 12.5 mg, Levodopa 250 mg | 90 tablet blister pack | £6.28 – £8.25 DT = £8.13 |
| Carbidopa (as Carbidopa monohydrate) 10 mg, Levodopa 100 mg | 100 tablet blister pack | £11.50 DT = £11.20 |
| Carbidopa (as Carbidopa monohydrate) 25 mg, Levodopa 100 mg | 100 tablet blister pack | £5.71 – £6.99 DT = £6.02 |
| Carbidopa (as Carbidopa monohydrate) 50 mg | 100 tablet blister pack | £35.00 DT = £34.98 |
| Sinemet 110 (Merck Sharp & Dohme Ltd) | 100 mg Sinemet 10mg/100mg tablets | 100 tablet blister pack | £7.50 DT = £7.20 |
| Sinemet 275 (Merck Sharp & Dohme Ltd) | 250 mg Carbidopa 25mg/250mg tablets | 200 tablet blister pack | £4.98 |
| Sinemet Plus 50 (Merck Sharp & Dohme Ltd) | 12.5 mg, Levodopa 50 mg | 90 tablet blister pack | £6.28 DT = £6.13 |
| Sinemet Plus 62.5 (Merck Sharp & Dohme Ltd) | 12.5 mg, Levodopa 75 mg | 90 tablet blister pack | £11.88 DT = £11.40 |
**Nausea and labyrinth disorders**

**Drug treatment**

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoadsisis, or in digoxin p. 82 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting. Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics.

Prochlorperazine p. 275, perphenazine, and trifluperazine p. 254 are less sedating than chlorpromazine hydrochloride p. 251; severe dystonic reactions sometimes occur with phenothiazines. Some phenothiazines are available as rectal suppositories, which can be useful in children with persistent vomiting or with severe nausea; for children over 12 years prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 252 and levomepromazine p. 275 are used for the relief of nausea in palliative care.

**Metoclopramide hydrochloride p. 269 is an effective antiemetic and its activity closely resembles that of**
phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. Due to the risk of neurological side effects, metoclopramide hydrochloride should only be used in children as second line therapy in postoperative and cytotoxic induced nausea and vomiting. Domperidone p. 268 acts at the chemoreceptor trigger zone; it has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood–brain barrier.

Granisetron p. 271 and ondansetron p. 271 are specific 5HT₃-receptor antagonists which block 5HT₃ receptors in the gastro-intestinal tract and in the CNS. They are of value in the management of nausea and vomiting in children receiving cytotoxics and in postoperative nausea and vomiting.

Aprepitant p. 269 is a neurokinin 1-receptor antagonist, licensed for the prevention of nausea and vomiting associated with highly and moderately emetogenic cancer chemotherapy; it is given in combination with a 5HT₃-receptor antagonist (with or without a corticosteroid).

Nabilone is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Dexamethasone p. 455 has antiemetic effects. Dexamethasone may also have a role in cytotoxic-induced nausea and vomiting.

**Vomiting during pregnancy**

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Promethazine hydrochloride or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 650 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

**Postoperative nausea and vomiting**

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk. Drugs used include 5HT₃-receptor antagonists, droperidol p. 275, dexamethasone, some phenothiazines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

**Opioid-induced nausea and vomiting**

Cyclizine, ondansetron, and prochlorperazine are used to relieve opioid-induced nausea and vomiting; ondansetron has the advantage of not producing sedation.

**Motion sickness**

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develops. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 273. For children over 10 years old, a transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 272 is preferred. Domperidone, metoclopramide hydrochloride, 5HT₃-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

**Other vestibular disorders**

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are effective for prophylaxis and treatment of nausea and vertigo resulting from vestibular disorders; however, when nausea and vertigo are associated with middle ear surgery, treatment can be difficult.

**Nausea caused by cytotoxic chemotherapy, palliative care, and migraine**

Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

**Other drugs used for Nausea and labyrinth disorders**

Promethazine hydrochloride, p. 183

Nausea and vomiting in palliative care

- **BY SUBCUTANEOUS INFUSION**
  - Child 1-23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2-5 years: 50 mg, dose to be given over 24 hours
  - Child 6-11 years: 75 mg, dose to be given over 24 hours
  - Child 12-17 years: 150 mg, dose to be given over 24 hours
- **BY MOUTH**
  - Child 1 month-5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg)
  - Child 6-11 years: 25 mg up to 3 times a day
  - Child 12-17 years: 50 mg up to 3 times a day
- **BY INTRAVENOUS INJECTION**
  - Child 1 month-5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes
  - Child 6-11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes
  - Child 12-17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child 1-23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2-5 years: 50 mg, dose to be given over 24 hours
  - Child 6-11 years: 75 mg, dose to be given over 24 hours
  - Child 12-17 years: 150 mg, dose to be given over 24 hours
- **BY RECTUM**
  - Child 1-23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2-5 years: 50 mg, dose to be given over 24 hours
  - Child 6-11 years: 75 mg, dose to be given over 24 hours
  - Child 12-17 years: 150 mg, dose to be given over 24 hours
- **BY SUBCUTANEOUS INFUSION**
  - Child 1 month-5 years: 12.5 mg up to 3 times a day
  - Child 6-11 years: 25 mg up to 3 times a day
  - Child 12-17 years: 50 mg up to 3 times a day

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Injection not licensed for use in children.

- **CONTRA-INDICATIONS** Neonate (due to significant antimuscarinic activity) (in neonates)

- **CAUTIONS** Epilepsy - glaucoma - may counteract haemodynamic benefits of opioids - neuromuscular disorders - increased risk of transient paralysis with intravenous use - pyloroduodenal obstruction - severe heart failure - may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - urinary retention

- **INTERACTIONS** Appendix 1: antihistamines, sedating

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Agitation (more common at high doses) - angle closure glaucoma - depression
  - **FREQUENCY NOT KNOWN**

- **SPECIFIC SIDE-EFFECTS**
  - With oral use: Level of consciousness decreased
  - With parenteral use: Chills - consciousness impaired - injection site necrosis - pain - paralysis - sensation of pressure - thrombophlebitis

- **PREGNANCY**
  - Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING**
  - No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed.
  - Mixing and compatibility for the use of syringe drivers in palliative care: Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **Palliative care** For further information on the use of cyclizine in palliative care, see www.medicinescomplete.com/#/content/palliative/antihistaminic-antimuscarinic-antiemetics.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

  - **Tablet**
    - Cautionary and advisory labels 2
    - Cyclizine (Non-proprietary)
      - Cyclizine hydrochloride 50 mg
    - Cyclizine 50mg tablets | 30 tablet £2.04–4.50 | 100 tablet £13.64 DT = £6.81

  - **Solution for injection**
    - Cyclizine (Non-proprietary)
      - Cyclizine lactate 50 mg per 1 mL
      - Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule (POs) £16.25–17.78 DT = £16.25 | 10 ampoule (POs) £25.00

- **INDICATIONS AND DOSE**
  - Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)
    - By mouth
      - Child: (consult local protocol)

- **UNLICENSED USE**
  - Not licensed for use in children.

- **CAUTIONS**
  - Adverse effects on mental state can persist for 48–72 hours after stopping - heart disease - history of psychiatric disorder - hypertension

- **INTERACTIONS** Appendix 1: nabilone

- **SIDE-EFFECTS**

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Drowsiness and diziness occur frequently with standard doses.

- **PREGNANCY**
  - Avoid unless essential.

- **BREAST FEEDING**
  - Avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises avoid in severe impairment (primarily biliary excretion).
● PATIENT AND CARER ADVICE

Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and skilled tasks under Guidance on prescribing p. 1.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Capsule

CAUTIONARY AND ADVISORY LABELS 2

Nabilone (Non-proprietary)

Nabilone 250 microgram | 20 capsule | £150.00 DT + £150.00 COT

Nabilone 1 mg | 20 capsule | £100.00 DT + £150.00 COT

Nabilone 250 microgram capsules | 2 capsule | £100.00 DT + £150.00 COT

ANTIMETICS AND ANTINAUSEANTS ▶

DOPAMINE RECEPTOR ANTAGONISTS

Domperidone 10-Mar-2017

● INDICATIONS AND DOSE

Relief of nausea and vomiting

▶ BY MOUTH

Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day

Child 12-17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

Gastro-oesophageal reflux disease (but efficacy not proven)

▶ BY MOUTH

Neonate: 250 micrograms/kg 3 times a day, dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day, interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose

Child: 250 micrograms/kg 3 times a day (max. per dose 10 mg), dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day (max. per dose 20 mg), interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose

● UNLICENSED USE

Not licensed for use in children for gastro-oesophageal reflux disease.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and duration of treatment have been made, and new contra-indications added:

● Domperidone should only be used for the relief of the symptoms of nausea and vomiting;

● Domperidone should be used at the lowest effective dose for the shortest possible duration (max. treatment duration should not normally exceed 1 week);

● Domperidone is contra-indicated for use in conditions where cardiac conduction is, or could be, impaired, or where there is underlying cardiac disease, when administered concomitantly with drugs that prolong the QT interval or potent CYP3A4 inhibitors, and in severe hepatic impairment;

The recommended dose in adults and adolescents over 12 years and over 35 kg is 10 mg up to 3 times daily;

The recommended dose in children under 35 kg is 250 micrograms/kg up to 3 times daily;

Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of domperidone (e.g. palliative care).

● CONTRA-INDICATIONS

Cardiac disease · gastro-intestinal haemorrhage · mechanical obstruction · mechanical perforation · predisposition to cardiac conduction disorders · prolactinoma

● CAUTIONS

Children · if there are cardiac concerns, obtain ECG before and during treatment

● INTERACTIONS

Children → Appendix 1: domperidone

● SIDE-EFFECTS

Common or very common Dry mouth

Uncommon Anxiety · asthenia · breast abnormalities · diarrhoea · drowsiness · headache · lactation disorders · libido loss

Frequency not known Arrhythmias · depression · gynaecomastia · menstrual cycle irregularities · movement disorders · ocuolygic crisis · QT interval prolongation · seizure · sudden cardiac death · urinary retention

● PREGNANCY

Use only if potential benefit outweighs risk.

● BREAST FEEDING

Amount too small to be harmful.

● HEPATIC IMPAIRMENT

Manufacturer advises avoid in moderate to severe impairment.

● RENAL IMPAIRMENT

Dose adjustments Reduce frequency.

● PATIENT AND CARER ADVICE

Arrhythmia Patients and their carers should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop.

Medicines for Children leaflet: Domperidone for gastro-oesophageal reflux www.medicinesforchildren.org.uk/domperidone-gastro-oesophageal-reflux

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

Nausea and labyrinth disorders 269

Metoclopramide hydrochloride 10-Aug-2018

INDICATIONS AND DOSE
Second-line option for treatment of established postoperative nausea and vomiting | Prevention of delayed chemotherapy-induced nausea and vomiting

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child: 100–150 micrograms/kg up to 3 times a day (max. per dose 10 mg), when administered by slow intravenous injection, to be given over at least 3 minutes

- UNLICENSED USE Maxolon® tablets not licensed for use in children.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)
The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose and duration of use have been made:

- In children aged 1–18 years, metoclopramide should only be used as a second-line option for prevention of delayed chemotherapy-induced nausea and vomiting and for treatment of established postoperative nausea and vomiting;
- Use of metoclopramide is contra-indicated in children aged under 1 year;
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Recommended dose is 100–150 micrograms/kg (max. 10 mg), repeated up to 3 times daily;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).

- CONTRA-INDICATIONS 3–4 days after gastrointestinal surgery | gastro-intestinal haemorrhage | gastro-intestinal obstruction | gastro-intestinal perforation | phaeochromocytoma
- CAUTIONS Asthma | atopic allergy | bradycardia | cardiac conduction disturbances | epilepsy | may mask underlying disorders such as cerebral irritation | uncorrected electrolyte imbalance
- INTERACTIONS → Appendix 1: metoclopramide
- SIDE-EFFECTS
  - COMMON OR VERY COMMON Asthenia | depression | diarrhoea | drowsiness | hypotension | menstrual cycle irregularities | movement disorders | parkinsonism
  - UNCOMMON Arrhythmias | hallucination | hyperprolactinaemia | level of consciousness decreased
  - RARE OR VERY RARE Confusion | galactorrhoea | seizure
  - FREQUENCY NOT KNOWN Atrophic ventricular block | blood disorders | cardiac arrest | gynaecostasia | hypertension | neurolepetic malignant syndrome | QT interval prolongation | shock | syncope | tremor

SPECIFIC SIDE-EFFECTS
- With parenteral use Anxiety | dizziness | dyspnoea | oedema | skin reactions | visual impairment

SIDE-EFFECTS, FURTHER INFORMATION
Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogyric crises. These dystonic effects are more common in the young, especially girls and young women; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Use of an antimuscarinic drug such as procyclidine will abort dystonic attacks.

- PREGNANCY Not known to be harmful.
- BREAST FEEDING Small amount present in milk; avoid.
- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment (risk of accumulation).
- Dose adjustments Manufacturer advises dose reduction of 50% in severe impairment.
- RENAL IMPAIRMENT Dose adjustments Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.
- DIRECTIONS FOR ADMINISTRATION Oral liquid preparation to be given via a graduated oral dosing syringe.
- PATIENT AND CARER ADVICE Counselling on use of pipette advised with oral solution.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for Injection

ANTIMETICS AND ANTINAUSEANTS

NEUROKININ RECEPTOR ANTAGONISTS

Aprepitant

INDICATIONS AND DOSE
Adjunct treatment to prevent nausea and vomiting associated with moderately and highly emetogenic chemotherapy

- BY MOUTH
- Child 6 months–11 years (body-weight 6 kg and above): (consult product literature)
- Child 12–17 years: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days, dose to be taken 1 hour before chemotherapy or in the morning if no chemotherapy is given, consult product literature for dose of concomitant 5HT3- antagonist (and corticosteroid if required)

- CONTRA-INDICATIONS Acute porphyrias p. 624
- INTERACTIONS → Appendix 1: aprepitant
270 Nausea and labyrinth disorders

- **SIDE-EFFECTS**
  - Common or very common: Appetite decreased, asthenia, constipation, gastrointestinal discomfort, headache, hiccup.
  - Uncommon: Anaemia, anxiety, burping, dizziness, drowsiness, dry mouth, febrile neutropenia, gastrointestinal disorders, hot flush, malaise, nausea, palpitations, skin reactions, urinary disorders, vomiting.
  - Rare or very rare: Bradycardia, cardiovascular disorder, chest discomfort, cognitive disorder, conjunctivitis, cough, disorientation, euphoric mood, gait abnormal, hyperhidrosis, increased risk of infection, muscle spasms, muscle weakness, oedema, oropharyngeal pain, photosensitivity reaction, polydipsia, seborrhoea, severe cutaneous adverse reactions (SCARs), sneezing, stomatitis, taste altered, throat irritation, tinnitus, weight decreased.
  - Frequency not known: Dysarthria, dyspnoea, insomnia, miosis, sensation abnormal, visual acuity decreased, wheezing.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effectiveness of hormonal contraceptives may be reduced—alternative non-hormonal methods of contraception necessary during treatment and for 2 months after stopping aprepitant.

- **PREGNANCY** Manufacturer advises avoid unless clearly necessary—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) decisions**
  The Scottish Medicines Consortium has advised (June 2017) that aprepitant (Emend®) is accepted for use within NHS Scotland as part of combination therapy, for the prevention of nausea and vomiting associated with moderately emetogenic cancer chemotherapy in infants, toddlers and children from the age of six months to less than 12 years (powder for oral suspension) and adolescents from the age of 12 years to 17 years (hard capsules). The Scottish Medicines Consortium has advised (July 2017) that aprepitant (Emend®) is accepted for use within NHS Scotland as part of combination therapy, for the prevention of nausea and vomiting associated with highly emetogenic cancer chemotherapy in children from the age of six months to under 12 years (powder for oral suspension), and adolescents from the age of 12 years to 17 years (hard capsules).

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - Powder: Emend (Merck Sharp & Dohme Ltd).
    - Aprepitant 125 mg: Emend 125mg oral powder sachets | 1 sachet £15.81
  - Capsule: Emend (Merck Sharp & Dohme Ltd).
    - Aprepitant 80 mg: Emend 80mg capsules | 2 capsule £31.61
    - Aprepitant 125 mg: Emend 125mg capsules | 5 capsule £79.03

- **INDICATIONS AND DOSE**
  **Adjuvant to 5HT_3-receptor antagonist (with or without dexamethasone) in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy**
  - By intravenous infusion:
    - Child 6 months-11 years (body-weight 6 kg and above): Initially 3 mg/kg (max. per dose 115 mg) on day 1 of cycle, then 2 mg/kg (max. per dose 80 mg) on days 2 and 3 of cycle, dose to be administered over 60 minutes and completed 30 minutes before chemotherapy, consult product literature for dose of concomitant corticosteroid and 5HT_3-receptor antagonist and for information on alternative dosing for single and multi-day regimens.
    - Child 12-17 years: Initially 115 mg on day 1 of cycle, then 80 mg on days 2 and 3 of cycle, dose to be administered over 30 minutes and completed 30 minutes before chemotherapy, consult product literature for dose of concomitant corticosteroid and 5HT_3-receptor antagonist and for information on alternative dosing for single and multi-day regimens.

- **DRUG ACTION** Aprepitant is a prodrug of aprepitant.

- **CONTRA-INDICATIONS** Acute porphyrias p. 624

- **INTERACTIONS** → Appendix 1: fosaprepitant

- **SIDE-EFFECTS**
  - Common or very common: Appetite decreased, asthenia, constipation, flushing, gastrointestinal discomfort, headache, hiccup.
  - Uncommon: Anaemia, anxiety, burping, dizziness, drowsiness, dry mouth, febrile neutropenia, gastrointestinal disorders, malaise, nausea, palpitations, skin reactions, thrombophlebitis, urinary disorders, vomiting.
  - Rare or very rare: Bradycardia, cardiovascular disorder, chest discomfort, cognitive disorder, conjunctivitis, cough, disorientation, euphoric mood, gait abnormal, hyperhidrosis, increased risk of infection, muscle spasms, muscle weakness, oedema, oropharyngeal pain, photosensitivity reaction, polydipsia, seborrhoea, severe cutaneous adverse reactions (SCARs), sneezing, stomatitis, taste altered, throat irritation, tinnitus, weight decreased.
  - Frequency not known: Dysarthria, dyspnoea, insomnia, miosis, sensation abnormal, visual acuity decreased, wheezing.

- **CONCEPTION AND CONTRACEPTION** Effectiveness of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

- **PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—limited information available.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ivemend®), manufacturer advises give intermittently in Sodium chloride 0.9%; reconstitute each 150 mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; for volumes less than 150 mL, transfer the required volume to a bag or syringe prior to infusion; infuse through central venous catheter.

Fosaprepitant

**29-Aug-2018**

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.
Nausea and labyrinth disorders 271

**Ondansetron**

**DRUG ACTION** Ondansetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

**Prevention of postoperative nausea and vomiting**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds before, during, or after induction of anaesthesia

**Treatment of postoperative nausea and vomiting**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds

**Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—initial dose**
- **BY INTRAVENOUS INFUSION**
  - Child 6 months–17 years (body surface area up to 1.3 m²): 5 mg/m² for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally; maximum 32 mg per day
  - Child 6 months–17 years (body surface area 1.3 m² and above): 8 mg for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally, intravenous infusion to be administered over at least 15 minutes; maximum 32 mg per day

**Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body surface area)**
- **BY MOUTH**
  - Child 6 months–17 years (body surface area up to 0.6 m²): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months–17 years (body surface area 0.6–1.2 m²): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child 6 months–17 years (body surface area 1.3 m² and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting—(follow-on dose based on body weight)

▶ By mouth

Child 6 months–17 years (body-weight up to 10.1 kg): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day.

Child 6 months–17 years (body-weight 10.1–40 kg): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day.

Child 6 months–17 years (body-weight 41 kg and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day.

• UNLICENSED USE Not licensed for radiotherapy-induced nausea and vomiting in children.

• CONTRA-INDICATIONS Congenital long QT syndrome

• CAUTIONS Adenotonsillar surgery • subacute intestinal obstruction • susceptibility to QT-interval prolongation (including electrolyte disturbances)

• INTERACTIONS ▶ Appendix 1: ondansetron

• SIDE-EFFECTS

▶ Common or very common

Constipation • feeling hot • headache • sensation abnormal

▶ Uncommon

Arrhythmias • chest pain • hiccups • hypotension • movement disorders • oculogyric crisis • seizure

▶ Rare or very rare

Dizziness • QT interval prolongation • vision disorders

• PREGNANCY No information available; avoid unless potential benefit outweighs risks.

• BREAST FEEDING Present in milk in animal studies—avoid.

• HEPATIC IMPAIRMENT Manufacturer advises caution in moderate to severe impairment (decreased clearance).

Dose adjustments Manufacturer advises a reduced maximum daily dose in moderate to severe impairment—consult product literature.

• DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion, dilute to a concentration of 320–640 micrograms/mL with glucose 5% or Sodium Chloride 0.9%; give over at least 15 minutes.

With oral use Ondansetron hydrochloride syrup contains 43 micrograms/mL. Ondansetron 8 mg film coated tablets contain 8 mg ondansetron hydrochloride.

• PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

• PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

• MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Ondansetron (Non-proprietary)

▶ Ondansetron (Non-proprietary)

Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml Ondansetron 8 mg/4 ml solution for injection ampoules | 5 ampoule (Pack) £11.80–£38.45 DT = £59.95

Ondansetron 4 mg/2 ml solution for injection ampoules | 5 ampoule (Pack) £5.00–£29.97 DT = £29.97 | 1 ampoule (Pack) £15.00 DT = £15.00

Zofran Flexi-amp (Novartis Pharmaceuticals UK Ltd)

Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml Zofran Flexi-amp 8 mg/4 ml solution for injection | 5 ampoule (Pack) £39.95 DT = £39.95

Zofran Flexi-amp 4 mg/2 ml solution for injection | 5 ampoule (Pack) £29.97 DT = £29.97

Oral solution

▶ Ondansetron (Non-proprietary)

Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml Ondansetron 4 mg/5 ml oral solution sugar free sugar-free | 50 ml (Pack) £38.11 DT = £38.10

Zofran (Novartis Pharmaceuticals UK Ltd)

Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml Zofran 4 mg/5 ml syrup sugar-free | 50 ml (Pack) £35.97 DT = £38.10

Orodispersible film

▶ Setofilm (Norgine Pharmaceuticals Ltd)

Ondansetron 4 mg Setofilm 4 mg orodispersible films sugar-free | 10 film (Pack) £28.50 DT = £28.50

Ondansetron 8 mg Setofilm 8 mg orodispersible films sugar-free | 10 film (Pack) £57.00 DT = £57.00

Oral lyophilisate

EXCIPIENTS: May contain Aspartame

Zofran Melt (Novartis Pharmaceuticals UK Ltd)

Ondansetron 4 mg Zofran Melt 4 mg oral lyophilisates sugar-free | 10 tablet (Pack) £35.97 DT = £35.97

Ondansetron 8 mg Zofran Melt 8 mg oral lyophilisates sugar-free | 10 tablet (Pack) £71.94 DT = £71.94

Orodispersible tablet

▶ Ondansetron (Non-proprietary)

Ondansetron 4 mg Ondansetron 4 mg orodispersible tablets | 10 tablet (Pack) £43.46 DT = £43.46

Ondansetron 8 mg Ondansetron 8 mg orodispersible tablets | 10 tablet (Pack) £85.43 DT = £85.43

ANTIHISTAMINES ▶ SEDATING

Cinnarizine

09-Jul-2018

▶ INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease

▶ BY MOUTH

Child 5–11 years: 15 mg 3 times a day

Child 12–17 years: 30 mg 3 times a day

Motion sickness

▶ BY MOUTH

Child 5–11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey

Child 12–17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

• CONTRA-INDICATIONS Avoid in Acute porphyrias p. 624 (due to significant antimuscarinic activity) (in neonates)

• CAUTIONS

Epilepsy • glaucoma • pyloroduodenal obstruction • urinary retention

• INTERACTIONS ▶ Appendix 1: antihistamines, sedating

• SIDE-EFFECTS

▶ Common or very common

Drowsiness • gastrointestinal discomfort • nausea • weight increased

▶ Uncommon

Fatigue • hyperhidrosis • vomiting

Frequency not known

Dry mouth • gastrointestinal disorder • headache • jaundice cholestatic • movement disorders

BNFC 2019–2020
Promazine teoclate

- **INDICATIONS AND DOSE**
  - **Nausea | Vomiting | Labyrinthine disorders**
    - **BY MOUTH**
    - Child 5–9 years: 12.5–37.5 mg daily
    - Child 10–17 years: 25–75 mg daily; maximum 100 mg per day
  - **Motion sickness prevention (acts longer than promethazine hydrochloride)**
    - **BY MOUTH**
    - Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
    - Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
  - **Motion sickness treatment (acts longer than promethazine hydrochloride)**
    - **BY MOUTH**
    - Child 5–9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
    - Child 10–17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM advice (March 2008 and February 2009) over-the-counter cough and cold medicines for children

Children under 6 years should not be given over-the-counter cough and cold medicines containing promazine.

- **CONTRA-INDICATIONS**
  - Neonate (due to significant antimuscarinic activity) (in neonates) · should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

**CAUTIONS**

- Asthma · bronchiectasis · bronchitis · epilepsy · pyloroduodenal obstruction · Reye’s syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

**INTERACTIONS**

- **Appendix 1: antihistamines, sedating**
- **Anticholinergic syndrome**
- **Avoid:** sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

**SIDE-EFFECTS**

- **Anticholinergic syndrome** · anxiety · appetite decreased · arrhythmia · blood disorder · bronchial secretion viscosity increased · confusion · dizziness · drowsiness · dry mouth · epigastric discomfort · fatigue · haemolytic anaemia · headache · hypotension · jaundice · movement disorders · muscle spasms · nightmare · palpitations · photosensitivity reaction · urinary retention · vision blurred

**SIDE-EFFECTS, FURTHER INFORMATION**

Paradoxical stimulation may occur, especially with high doses.

**INTERACTIONS**

- Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BEST USAGE**

- Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in hepatic insufficiency — no information available.

**RENAL IMPAIRMENT**

- Use with caution — no information available.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks: Drowsiness may affect performance of skilled tasks (e.g., cycling, driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 2**
  - Cinnarizine (Non-proprietary)
    - Cinnarizine 15 mg Cinnarizine 15 mg tablets | 84 tablet | £15.40
  - **Stugeron** (Johnson & Johnson Ltd; Janssen-Cilag Ltd)
    - Cinnarizine 15 mg Stugeron 15 mg tablets | 15 tablet | £2.21 | 100 tablet | £4.18

**ANTIMUSCARINICS**

**Hyoscine hydrobromide**

(Scopolamine hydrobromide)

**30-Mar-2017**

- **INDICATIONS AND DOSE**
  - **Motion sickness**
    - **BY MOUTH**
    - Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
    - Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day
    - **BY TRANSDERMAL APPLICATION**
    - Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear
  - **Hypersalivation associated with clozapine therapy**
    - **BY MOUTH**
    - Child 12-17 years: 300 micrograms up to 3 times a day; maximum 900 micrograms per day

**CAUTIONS**

- Asthma · bronchiectasis · bronchitis · epilepsy · pyloroduodenal obstruction · Reye’s syndrome · severe coronary artery disease · susceptibility to angle-closure glaucoma · urinary retention

**INTERACTIONS**

- **Appendix 1: antihistamines, sedating**
- **Anticholinergic syndrome**

Nausea and labyrinth disorders  

274

Excessive respiratory secretions
- **BY MOUTH, OR BY SUBLINGUAL ADMINISTRATION**
  - Child 2-11 years: 10 micrograms/kg 4 times a day (max. per dose 300 micrograms)
  - Child 12-17 years: 300 micrograms 4 times a day
- **BY TRANSDERMAL APPLICATION**
  - Child 1-month-2 years: 250 micrograms every 72 hours, dose equates to a quarter patch
  - Child 3-9 years: 500 micrograms every 72 hours, dose equates to a half patch
  - Child 10-17 years: 1 mg every 72 hours, dose equates to one patch

Excessive respiratory secretion in palliative care
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child: 10 micrograms/kg every 4–8 hours (max. per dose 600 micrograms)
- **BY CONTINUOUS SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION**
  - Child: 40–60 micrograms/kg over 24 hours

Bowel colic pain in palliative care
- **BY MOUTH USING SUBLINGUAL TABLETS**
  - Child: 10 micrograms/kg 3 times a day (max. per dose 300 micrograms), as Kwells®

Premedication
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1-11 years: 15 micrograms/kg (max. per dose 600 micrograms), to be administered 30–60 minutes before induction of anaesthesia
  - Child 12-17 years: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
- **BY INTRAVENOUS INJECTION**
  - Child 1-11 years: 15 micrograms/kg (max. per dose 600 micrograms), to be administered immediately before induction of anaesthesia
  - Child 12-17 years: 200–600 micrograms, to be administered immediately before induction of anaesthesia

**SIDE-EFFECTS**
- With transdermal use: Balance impaired
- **PREGNANCY** Use only if potential benefit outweighs risk. Injection may depress neonatal respiration.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use: Patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.
  - With oral use: For administration by mouth, injection solution may be given orally.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewable tablet formulations may include raspberry.

**Palliative care** For further information on the use of hyoscine hydrobromide in palliative care, see www.medicinescomplete.com/#/content/palliative/hyoscine-hydrobromide.

**PATIENT AND CARER ADVICE**
- With transdermal use: Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time.
- Driving and skilled tasks: Use with transdermal use: Drowsiness may persist for up to 24 hours or longer after removal of patch; effects of alcohol enhanced.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 2
- **Kwells** (Bayer Plc)
  - Hyoscine hydrobromide 150 microgram
  - Kwells Kids 150 microgram tablets | 12 tablet | £1.84 DT = £1.84
  - Hyoscine hydrobromide 300 microgram
  - Kwells 300 microgram tablets | 12 tablet | £1.84 DT = £1.84
- **Travel Calm** (The Boots Company Plc)
  - Hyoscine hydrobromide 300 microgram
  - Travel Calm 300 microgram tablets | 12 tablet | £1.84 DT = £1.84

- **Hyoscine hydrobromide (Non-proprietary)**
  - Hyoscine hydrobromide 400 microgram per 1 ml
  - Hyoscine hydrobromide 400 micrograms/1ml solution for injection ampoules | 10 ampoule | £0.50–£47.21
  - Hyoscine hydrobromide 600 microgram per 1 ml
  - Hyoscine hydrobromide 600 micrograms/1ml solution for injection ampoules | 10 ampoule | £53.93 DT = £53.93

**Transdermal patch**

**CAUTIONARY AND ADVISORY LABELS** 19
- **Scopoderm** (GlaxoSmithKline Consumer Healthcare)
  - Hyoscine 1 mg per 72 hour
  - Scopoderm 1.5 mg patches | 2 patch | £2.87 DT = £2.87

**Chewable tablet**

**CAUTIONARY AND ADVISORY LABELS** 2, 24
- **Joy-Rides** (Teva UK Ltd)
  - Hyoscine hydrobromide 150 microgram
  - Joy-rides 150 microgram chewable sugar-free | 12 tablet | £1.55 DT = £1.55

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**UNLICENSED USE** Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.

**CAUTIONS**

**Epilepsy**

**CAUTIONS, FURTHER INFORMATION**

**Anticholinergic syndrome**

**With systemic use** In some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

**INTERACTIONS** → Appendix 1: hyoscine

**SIDE-EFFECTS**

**Common or very common**

**With transdermal use** Eye disorders - eyelid irritation

**Rare or very rare**

**With transdermal use** Concentration impaired - glaucoma - hallucinations - memory loss - restlessness

**Frequency not known**

**With oral use** Asthma - cardiovascular disorders - central nervous system stimulation - gastrointestinal disorder - hallucination - hypersensitivity - hyperthermia - hypohidrosis - mydriasis - oedema - respiratory tract reaction - restlessness - seizure

**With parenteral use** Agitation - angle closure glaucoma - arrhythmias - delirium - dysphagia - dysepsia - epilepsy exacerbated - hallucination - hypersensitivity - idiosyncratic drug reaction - loss of consciousness - mydriasis - neuroleptic malignant syndrome - psychotic disorders - thirst

**With transdermal use** Balance impaired
**ANTIPSYCHOTICS > FIRST-GENERATION**

**Droperidol**

15-Mar-2017

**DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

**INDICATIONS AND DOSE**

Prevention and treatment of postoperative nausea and vomiting

- **BY INTRAVENOUS INJECTION**
  - Child 2-17 years: 20–50 micrograms/kg (max. per dose 1.25 mg), dose to be given 30 minutes before end of surgery, then 20–50 micrograms/kg every 6 hours (max. per dose 1.25 mg) if required

**CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation

**CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure

**INTERACTIONS** → Appendix 1: droperidol

**SIDE-EFFECTS**

- Uncommon Anxiety · oculogyration
- Rare or very rare Blood disorder · cardiac arrest · confusion · dysphoria
- Frequency not known Coma · epilepsy · hallucination · oligomenorrhoea · respiratory disorders · SIADH · syncope

**BREAST FEEDING** Limited information available—avoid repeated administration.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

Dose adjustments Manufacturer advises maximum 625 micrograms repeated every 6 hours as required.

**RENAL IMPAIRMENT** Dose adjustments In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

**MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Droperidol (Non-proprietary)**
  - 2.5 mg per 1 ml Droperidol 2.5 mg/ml solution for injection ampoules | 10 ampoule £35.40
  - **Xomolix** (Kyowa Kirin Ltd)
    - Droperidol 2.5 mg per 1 ml Xomolix 2.5mg/ml solution for injection ampoules | 10 ampoule £39.40

**Levomepromazine**

(Methotrimeprazine)

12-Dec-2016

**INDICATIONS AND DOSE**

Restlessness and confusion in palliative care

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
  - Child 12-17 years: 12.5–200 mg, to be administered over 24 hours

Nausea and vomiting in palliative care

- **BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION**
  - Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
  - Child 12-17 years: 5–25 mg, to be administered over 24 hours

**CONTRA-INDICATIONS** CNS depression · comatose states · phaeochromocytoma

**CAUTIONS** Patients receiving large initial doses should remain supine

**INTERACTIONS** → Appendix 1: phenothiazines

**SIDE-EFFECTS**

- Common or very common Asthenia · heat stroke
- Rare or very rare Cardiac arrest · hepatic disorders
- Frequency not known Allergic dermatitis · confusion · delirium · gastrointestinal disorders · glucose tolerance impaired · hyperglycaemia · hypoaesthesia · photosensitivity reaction · priapism · SIADH

**HEPATIC IMPAIRMENT** Manufacturer advises consider avoiding.

**RENAL IMPAIRMENT**

Dose adjustments Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**DIRECTIONS FOR ADMINISTRATION** For administration by subcutaneous infusion dilute with a suitable volume of Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Palliative care For further information on the use of levomepromazine in palliative care, see www.medicinescomplete.com/#/content/palliative/levomepromazine.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Levomepromazine (Non-proprietary)**
  - Levomepromazine hydrochloride 25 mg per 1 ml Levomepromazine 25mg/1ml solution for injection ampoules | 10 ampoule £20.13 DT = £20.13
  - **Noziman** (Sanofi)
    - Levomepromazine hydrochloride 25 mg per 1 ml Noziman 25mg/1ml solution for injection ampoules | 10 ampoule £20.13 DT = £20.13

**Prochlorperazine**

**INDICATIONS AND DOSE**

Prevention and treatment of nausea and vomiting

- **BY MOUTH**
  - Child 1-11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
  - Child 12-17 years: 5–10 mg up to 3 times a day if required
  - **BY INTRAMUSCULAR INJECTION**
    - Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
    - Child 5–11 years: 5–6.25 mg up to 3 times a day if required
    - Child 12–17 years: 12.5 mg up to 3 times a day if required

**Nausea and vomiting in previously diagnosed migraine**

- **BY MOUTH USING BUCAL TABLET**
  - Child 12-17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

**DOSE EQUIVALENCE AND CONVERSION**

- Doses are expressed as prochlorperazine maleate or prochlorperazine mesilate.
  - 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

**UNLICENSED USE**

- With intramuscular use Injection not licensed for use in children.
- With buccal use Buccastem M® tablets not licensed for use in children.
CONTRA-INDICATIONS Avoid oral route in child under 10 kg
- children (in psychotic disorders) - CNS depression - comatose states - phaeochromocytoma

CAUTIONS Hypotension (more likely after intramuscular injection)

INTERACTIONS Appendix 1: phenothiazines

DIRECTIONS FOR ADMINISTRATION

RENAL IMPAIRMENT
- Frequency not known
- Rare or very rare
- With buccal use
- Oral disorders
- With intramuscular use
- Atroventricular block - cardiac arrest - eye disorders - jaundice - muscle rigidity - nasal congestion - respiratory depression
- With oral use
- Atroventricular block - autonomic dysfunction - cardiac arrest - consciousness impaired - hyperthermia - jaundice - muscle rigidity - nasal congestion - oculogyric crisis - respiratory depression

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Rare or very rare
- With buccal use
- Blood disorder - hepatic disorders
- Frequency not known
- With buccal use
- Oral disorders
- With intramuscular use
- Atroventricular block - cardiac arrest - eye disorders - jaundice - muscle rigidity - nasal congestion - respiratory depression
- With oral use
- Atroventricular block - autonomic dysfunction - cardiac arrest - consciousness impaired - hyperthermia - jaundice - muscle rigidity - nasal congestion - oculogyric crisis - respiratory depression

SIDE-EFFECTS, FURTHER INFORMATION

Acute dystonias are more common with first-generation antipsychotics. The risk is increased in men, young adults, children, antipsychotic-naïve patients, rapid dose escalation, and abrupt treatment discontinuation.

Hepatic Impairment

Manufacturer advises avoid.

Renal Impairment

Dose adjustments
- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

DIRECTIONS FOR ADMINISTRATION
- With buccal use
- Buccal tablets are placed high between upper lip and gum and left to dissolve.

PATIENT AND CARER ADVICE
- With buccal use
- Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2
- Prochlorperazine (Non-proprietary)
- Prochlorperazine maleate 5 mg
  - Prochlorperazine maleate 5 mg tablets | 28 tablet (£0.98) £0.73 | 84 tablet (£2.10–£2.58
- Stemetil (Sanofi)
- Prochlorperazine maleate 5 mg
  - Stemetil 5 mg tablets | 28 tablet (£1.98) £0.73 | 84 tablet (£5.94

Solution for injection
- Stemetil (Sanofi)
- Prochlorperazine mesilate 12.5 mg per 1 ml
  - Prochlorperazine mesilate 12.5 mg/1 ml solution for injection ampoules | 10 ampoule (£0.23) £0.23

Buccal tablet

CAUTIONARY AND ADVISORY LABELS 2
- Prochlorperazine (Non-proprietary)
- Prochlorperazine maleate 3 mg
  - Prochlorperazine maleate 3 mg buccal tablets | 50 tablet (£5.00–£37.23
- Buccastem (Alliance Pharmaceuticals Ltd)
- Prochlorperazine maleate 3 mg
  - Buccastem 3 mg tablets | 8 tablet (£4.01

Oral solution

CAUTIONARY AND ADVISORY LABELS 2
- Stemetil (Sanofi)
- Prochlorperazine mesilate 1 mg per 1 ml
  - Stemetil 1 mg/5 ml syrup | 100 ml (£3.34) £3.34

5 Pain

Analgescics

Pain relief

The non-opioid drugs, paracetamol p 278 and ibuprofen p 679 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in sickle-cell disease

The pain of mild sickle-cell crises is managed with paracetamol, an NSAID, codeine phosphate p 283, or dihydrocodeine tartrate p 285. Severe crises may require the use of morphine p 290 or diamorphine hydrochloride p 284; concomitant use of an NSAID may potentiate analgesia and allow lower doses of the opioid to be used. A mixture of nitrous oxide and oxygen (Entonox® , Equanox®) may also be used.

Dental and orooral pain

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-ossseous infection or abscess, reliance on analgesics alone is usually inappropriate. Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzoylamine hydrochloride p 731 or topical anaesthetics until the cause of the mucosal disorder has been dealt with. However, where a child is febrile, the antipyretic action of paracetamol or ibuprofen is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the child. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs) e.g. ibuprofen. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect. Opioid analgesics such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are relatively ineffective in dental pain and their side-effects can be unpleasant.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component given alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen is usually continued for about 24 to 72 hours.

Dysmenorrhoea

Paracetamol or a NSAID will generally provide adequate relief of pain from dysmenorrhoea. Alternatively use of a combined hormonal contraceptive in adolescent girls may prevent the pain.
Non-opioid analgesics and compound analgesic preparations

Paracetamol has analgesic and antipyretic properties but no demonstrable anti-inflammatory activity; unlike opioid analgesics, it does not cause respiratory depression and is less irritant to the stomach than the NSAIDs. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of children with chronic disease accompanied by pain and in children under 16 years except in Kawasaki disease or for its antiplatelet action. Several NSAIDs are also used for postoperative analgesia.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity.

Compound analgesic preparations containing paracetamol with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) may be used in older children but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain. A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Opioid analgesics and dependence

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the child should be assessed at regular intervals.

Strong opioids

Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 281 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in children dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 869. It is rarely used in children.

Diamorphine hydrochloride p. 284 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine p. 290. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated child. Diamorphine hydrochloride is sometimes given by the intranasal route to treat acute pain in children and is available as a nasal spray; intranasal administration of diamorphine injection has been [unlicensed].

Alfentanil p. 845, fentanyl p. 296 and remifentanil p. 845 are used by injection for intra-operative analgesia. Fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 307 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine when excitation (or exacerbation of pain) occurs with morphine. Methadone hydrochloride may also be used to treat children with neonatal abstinence syndrome.

Papaveretum p. 294 should not be used in children; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pethidine hydrochloride p. 295 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. Its use in children is not recommended. Pethidine hydrochloride is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tramadol hydrochloride p. 296 is used in older children and produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids

Codeine phosphate p. 283 can be used for the relief of short-term acute moderate pain in children older than 12 years where other painkillers such as paracetamol p. 278 or ibuprofen p. 679 have proved ineffective. Dihydrocodeine tartrate p. 285 has an analgesic efficacy similar to that of codeine phosphate.

Postoperative analgesia

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression. Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 281 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in neonates and in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.
Patient-controlled analgesia (PCA) and nurse-controlled analgesia (NCA) can be used to relieve postoperative pain—consult hospital protocols.

**Pain management and opioid dependence**

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**Other drugs used for Pain**

Diclofenac potassium, p. 275
Levomepromazine, p. 275
Mefenamic acid, p. 682

### ANALGESICS > NON-OPIOID

**Paracetamol**

(Paracetamol)

**INDICATIONS AND DOSE**

**Pain | Pyrexia with discomfort**

- **BY MOUTH**

  - **Neonate 28 weeks to 32 weeks corrected gestational age:**
    - 20 mg/kg for 1 dose, then 10–15 mg/kg every 6–12 hours as required, maximum daily dose to be given in divided doses; maximum 30 mg/kg per day.
  - **Neonate 32 weeks corrected gestational age and above:**
    - 20 mg/kg for 1 dose, then 10–15 mg/kg every 6–8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day.
  - **Child 1–2 months:**
    - 30–60 mg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day
  - **Child 3–5 months:**
    - 60 mg every 4–6 hours; maximum 4 doses per day
  - **Child 6–23 months:**
    - 120 mg every 4–6 hours; maximum 4 doses per day
  - **Child 2–3 years:**
    - 180 mg every 4–6 hours; maximum 4 doses per day
  - **Child 4–5 years:**
    - 240 mg every 4–6 hours; maximum 4 doses per day
  - **Child 6–7 years:**
    - 240–250 mg every 4–6 hours; maximum 4 doses per day
  - **Child 8–9 years:**
    - 360–375 mg every 4–6 hours; maximum 4 doses per day
  - **Child 10–11 years:**
    - 480–500 mg every 4–6 hours; maximum 4 doses per day
  - **Child 12–15 years:**
    - 480–750 mg every 4–6 hours; maximum 4 doses per day
  - **Child 16–17 years:**
    - 0.5–1 g every 4–6 hours; maximum 4 doses per day
  - **BY RECTUM**

  - **Neonate 28 weeks to 32 weeks corrected gestational age:**
    - 20 mg/kg for 1 dose, then 10–15 mg/kg every 12 hours as required, maximum daily dose to be given in divided doses; maximum 30 mg/kg per day.
  - **Neonate 32 weeks corrected gestational age and above:**
    - 30 mg/kg for 1 dose, then 15–20 mg/kg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day.
  - **Child 1–2 months:**
    - 30–60 mg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day.

**Pain in children with risk factors for hepatotoxicity | Pyrexia with discomfort in children with risk factors for hepatotoxicity**

- **BY INTRAVENOUS INFUSION**

  - **Neonate 32 weeks corrected gestational age and above:**
    - 7.5 mg/kg every 8 hours, dose to be administered over 15 minutes.
  - **Neonate:**
    - 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day.
  - **Child (body-weight up to 10 kg):**
    - 10 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 30 mg/kg per day
  - **Child (body-weight 10–50 kg):**
    - 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
  - **Child (body-weight 50 kg and above):**
    - 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

**Post-operative pain**

- **BY MOUTH**

  - **Child 1 month–5 years:**
    - 20–30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
  - **Child 6–11 years:**
    - 20–30 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
  - **Child 12–17 years:**
    - 1 g every 4–6 hours; maximum 4 doses per day
  - **BY RECTUM**

  - **Child 1–2 months:**
    - 30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
  - **Child 3 months–5 years:**
    - 30–40 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
  - **Child 6–11 years:**
    - 30–40 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
  - **Child 12–17 years:**
    - 1 g every 4–6 hours; maximum 4 doses per day
Prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine (Bexsero®) given as part of the routine immunisation schedule

- **By mouth**
  - Child 2 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort
  - Child 4 months: 60 mg, first dose to be given at the time of vaccination, then 60 mg after 4–6 hours, then 60 mg after 4–6 hours, use weight-based doses for preterm infants born at less than 32 weeks gestation and currently weighing less than 4 kg—see oral doses for pain and pyrexia with discomfort

Post-immunisation pyrexia in infants

- **By mouth**
  - Child 2–3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required
  - Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

- **Unlicensed use** Paracetamol oral suspension 500 mg/5 mL not licenced for use in children under 16 years. Not licenced for use in children under 2 months by mouth; under 3 months by rectum. Not licenced for use as prophylaxis of post-immunisation pyrexia following immunisation with meningococcal group B vaccine. 

- **Caution** Before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours · body-weight under 50 kg · chronic alcohol consumption · chronic dehydration · chronic malnutrition · hepatocellular insufficiency · long-term use (especially in those who are malnourished)

- **Caution, further information** Some patients may be at increased risk of experiencing toxicity at therapeutic doses, particularly those with a body-weight under 50 kg and those with risk factors for hepatotoxicity. Clinical judgement should be used to adjust the dose of oral and intravenous paracetamol in these patients.

- **Co-administration of enzyme-inducing antiepileptic medications may increase toxicity; doses should be reduced.**

- **Interactions** → Appendix 1: paracetamol

- **Side-effects**
  - **General side-effects**
  - Rare or very rare
  - Thrombocytopenia

  - **Specific side-effects**
  - Common or very common
  - With rectal use: Anorectal erythema
  - Rare or very rare
  - With intravenous use: Hypersensitivity · Hypotension · Leucopenia · Malaise · Neutropenia
  - With rectal use: Angioedema · Liver injury · Skin reactions
  - Frequency not known
  - With intravenous use: Flushing · Skin reactions · Tachycardia
  - With oral use: Agranulocytosis · Bronchospasm · Hepatic function abnormal · Rash · Severe cutaneous adverse reactions (SCARs)
  - With rectal use: Agranulocytosis · Blood disorder · Severe cutaneous adverse reactions (SCARs)

- **Overdose** Liver damage and less frequently renal damage can occur following overdose.

  - Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

  - **Pregnancy** Not known to be harmful.
  - **Breast feeding** Amount too small to be harmful.
  - **Hepatic impairment** Dose-related toxicity—avoid large doses.
  - **Renal impairment** Dose adjustments. Increase infusion dose interval to every 6 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **Directions for administration**
  - With intravenous use: For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.
  - **Prescribing and dispensing information** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

- **Patient and carer advice**
  - Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-mild-moderate-pain

- **Profession specific information**
  - Dental practitioners’ formulary
  - Paracetamol Tablets may be prescribed.
  - Paracetamol Soluble Tablets 500 mg may be prescribed.
  - Paracetamol Oral Suspension may be prescribed.

- **Exceptions to legal category**
  - Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, powder

**Tablet**

- **Cautionary and advisory labels** 29, 30
  - Paracetamol (Non-proprietary)
  - Paracetamol 500 mg Paracetamol 500 mg caplets | 100 tablet (PST) £3.05 DT = £1.81

### Opioids

- **CONTRA-INDICATIONS** Acute respiratory depression - comatose patients - head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) - raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) - risk of paralytic ileus

- **CAUTIONS** Adrenocortical insufficiency (reduced dose is recommended) - asthma (avoid during an acute attack) - convulsive disorders - diseases of the biliary tract - hypotension - hypothroidism (reduced dose is recommended) - impaired respiratory function (avoid in chronic obstructive pulmonary disease) - inflammatory bowel disorders - myasthenia gravis - obstructive bowel disorders - shock

**CAUTIONS, FURTHER INFORMATION**

- Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
- Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

- **SIDE-EFFECTS**
  - Common or very common Arrhythmias - confusion - constipation - dizziness - drowsiness - dry mouth - euphoric mood - flushing - hallucination - headache - hyperhidrosis - hypotension (with high doses) - miosis - nausea (more common on initiation) - palpitations - respiratory depression (with high doses) - skin reactions - urinary retention - vertigo - visual impairment - vomiting (more common on initiation)
  - Uncommon Drug dependence - dysphoria - withdrawal syndrome

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Respiratory depression** Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone. Neonates (particularly if pre-term) may be more susceptible.

**Dependence and withdrawal** Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief), but tolerance can develop during long-term treatment.

- **Overdose** Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 859 and consider the specific antidote, naloxone hydrochloride.

- **PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

- **TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

- **PRESCRIBING AND DISPENSING INFORMATION** The Faculty of Pain Medicine has produced resources for healthcare
Buprenorphine

**Indications and Dose**

Moderate to severe pain

- **By Sublingual Administration**
  - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
  - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
  - Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
  - Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours

- **By Intramuscular Injection, or by Slow Intravenous Injection**
  - Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
  - Child 12–17 years: 300–600 micrograms every 6–8 hours

**Unlicensed Use**

- With oral use: Sublingual tablets not licensed for use in children under 6 years.
- With intramuscular use or intravenous use: Injection not licensed for use in children under 6 months.

**Caution**

- Impaired consciousness

**Buvidal**

- Susceptibility to QT-interval prolongation

**Interactions**

- Appendix 1: opioids

**Side-effects**

- **General Side-effects**
  - Rare or very rare: Angioedema, bronchospasm
  - Frequency not known: Hepatic disorders

- **Specific Side-effects**
  - Common or very common
  - With parenteral use: Hypersensitivity, withdrawal syndrome, neonatal
  - With sublingual use: Fatigue, sleep disorders
  - Uncommon
  - With sublingual use: Anxiety, apnoea, appetite decreased, atrioventricular block, coma, conjunctivitis, coordination abnormal, cyanosis, depersonalisation, depression, diarrhoea, diplopia, dyspepsia, dysphonia, hypertension, pallor, paraesthesia, psychosis, seizure, speech slurred, tinnitus, tremor, urinary disorder
  - Frequency not known
  - With parenteral use: Psychotic disorder, vision blurred
  - With sublingual use: Cerebrospinal fluid pressure increased, circulation impaired, haemorrhagic diathesis, oral disorders, syncope

**Overdose**

- The effects of buprenorphine are only partially reversed by naloxone.

**Breast Feeding**

- Present in low levels in breast milk.

**Monitoring**

- Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

**Hepatic Impairment**

- Manufacturer advises caution; avoid in severe impairment (limited information available).

**Renal Impairment**

- Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**Pre-treatment Screening**

- Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

**Monitoring Requirements**

- Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

**Directions for Administration**

- Sublingual tablets may be halved.

**Patient and Carer Advice**

- Patients or carers should be given advice on how to administer buprenorphine products.
Co-codamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 278.

**INDICATIONS AND DOSE**

**Short-term treatment of acute moderate pain (using co-codamol 8/500 preparations only)**

- **BY MOUTH**
  - Child 12–15 years: 8/500 mg every 6 hours as required for maximum 3 days; maximum 32/2000 mg per day
  - Child 16–17 years: 8/500–16/1000 mg every 6 hours as required for maximum 3 days; maximum 64/4000 mg per day

**Short-term treatment of acute moderate pain (using co-codamol 15/500 preparations only)**

- **BY MOUTH**
  - Child 12–15 years: 15/500 mg every 6 hours as required for maximum 3 days; maximum 60/2000 mg per day
  - Child 16–17 years: 15/500–30/1000 mg every 6 hours as required for maximum 3 days; maximum 120/4000 mg per day

**Short-term treatment of acute moderate pain (using co-codamol 30/500 preparations only)**

- **BY MOUTH**
  - Child 12–15 years: 30/500 mg every 6 hours as required for maximum 3 days; maximum 120/2000 mg per day
  - Child 16–17 years: 30/500–60/1000 mg every 6 hours as required for maximum 3 days; maximum 240/4000 mg per day

**KAPAKE® 15/500**

**Short-term treatment of acute pain**

- **BY MOUTH**
  - Child 12–15 years: 1 tablet every 6 hours as required for maximum 3 days; maximum 4 tablets per day
  - Child 16–17 years: 2 tablets every 6 hours as required for maximum 3 days; maximum 8 tablets per day

**IMPORTANT SAFETY INFORMATION**

See codeine phosphate p. 283 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

**CONTRA-INDICATIONS**  Acute ulcerative colitis · antibiotic-associated colitis · children who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea · conditions where abdominal distention develops · conditions where inhibition of peristalsis should be avoided · known ultra-rapid codeine metabolisers

**CAUTIONS**  Acute abdomen · alcohol dependence · avoid abrupt withdrawal after long-term treatment · cardiac arrhythmias · chronic alcoholism · chronic dehydration · chronic malnutrition · convulsive disorders · gallstones · hepatic cellular insufficiency

**CAUTIONS, FURTHER INFORMATION**

- Variation in metabolism  The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

**INTERACTIONS**  → Appendix 1: opioids · paracetamol

**SIDE-EFFECTS**  Abdominal pain · addiction · agranulocytosis · blood disorder · irritability · pancreatitis · restlessness · severe cutaneous adverse reactions (SCARs) · thrombocytopenia

**Overdose**  Liver damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING**  Avoid — although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine — risk of morphine overdose in infant.

**HEPATIC IMPAIRMENT**  Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment. Dose adjustments  Manufacturer advises consider dose reduction in mild to moderate impairment.

**RENAL IMPAIRMENT**  Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION**

Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa.

**LESS SUITABLE FOR PRESCRIBING**  Co-codamol is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY**  Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS  (2 does not apply to the 8/500 tablet), 29, 30

- Co-codamol (Non-proprietary)
  - Codeine phosphate 8 mg, Paracetamol 500 mg
  - Co-codamol 8mg/500mg tablets | 100 tablet [PSt] £2.70 DT + £2.70 [DSt] | 500 tablet [PSt] £13.50 [DSt] | 1000 tablet [PSt] £27.00 [DSt]
  - Co-codamol 8mg/500mg caplets | 32 tablet [PSt] £0.81–10.95 [DSt]
  - Codeine phosphate 15 mg, Paracetamol 500 mg
  - Co-codamol 15mg/500mg tablets | 100 tablet [PSt] £15.00 DT + £4.12 [DSt]
  - Co-codamol 30 mg, Paracetamol 500 mg
  - Co-codamol 30mg/500mg caplets | 100 tablet [PSt] £3.90 DT + £3.63 [DSt]
  - Co-codamol 30mg/500mg tablets | 100 tablet [PSt] £1.17 DT + £1.09 [DSt] | 100 tablet [PSt] £7.53 DT + £3.63 [DSt]
  - Codeine phosphate 60 mg, Paracetamol 1 gram
  - Codeine phosphate 60mg/1000mg tablets | 100 tablet [PSt] £1.85 [DSt]
  - Codipar (Advanz Pharma)
  - Codeine phosphate 15 mg, Paracetamol 500 mg
  - Codipar 15mg/500mg tablets | 100 tablet [PSt] £8.25 DT + £4.12 [DSt]
  - Emcozin (M & A Pharmachen Ltd)
  - Codeine phosphate 30 mg, Paracetamol 500 mg
  - Emcozin 30mg/500mg tablets | 100 tablet [PSt] £2.55 DT + £3.63 [DSt]
  - Kapake (Galen Ltd)
  - Codeine phosphate 30 mg, Paracetamol 500 mg
  - Kapake 30mg/500mg tablets | 100 tablet [PSt] £7.10 DT + £3.63 [DSt]
  - Migraleve Yellow (McNeil Products Ltd)
  - Codeine phosphate 8 mg, Paracetamol 500 mg
  - Migraleve Yellow 16 tablet [PSt] £0.70 [DSt]
  - Panadol Ultra (GlaxoSmithKline Consumer Healthcare)
  - Codeine phosphate 12.8 mg, Paracetamol 500 mg
  - Panadol Ultra 12.8mg/500mg tablets | 20 tablet [PSt] £2.61 DT + £3.61 [DSt]

**Pain 283**

---

**Codeine phosphate**

- **INDICATIONS AND DOSE**
  - **Acute diarrhoea**
    - **BY MOUTH**
      - Child 12–17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

---

**Short-term treatment of acute moderate pain**

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION**
- **Child 12–17 years**: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

---

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY**

Codine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy:

- In children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days.
- Codeine is contraindicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea.
- Codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures.
- Codeine is contraindicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers).
- Codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk.
- Parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, ‘pin-point’ pupils, nausea, vomiting).

**MHRA/CHM ADVICE (APRIL 2015) CODEINE FOR COUGH AND COLD: RESTRICTED USE IN CHILDREN**

Do not use codeine in children under 12 years as it is associated with a risk of respiratory side effects. Codeine is not recommended for adolescents (12–18 years) who have problems with breathing. When prescribing or dispensing codeine-containing medicines for cough and cold, consider that codeine is contraindicated in:

- Children younger than 12 years old
- Patients of any age known to be CYP2D6 ultra-rapid metabolisers
- Breastfeeding mothers

---

**CONTRA-INDICATIONS**

- Acute ulcerative colitis - anti-biotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

**CAUTIONS**

- Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

**CAUTIONS, FURTHER INFORMATION**

- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Biliary spasm - hyperthermia - mood altered - sexual dysfunction - ureteral spasm

**SPECIFIC SIDE-EFFECTS**
- With oral use: Abdominal cramps - addiction - appetite decreased - depression - drug reaction with eosinophilia and systemic symptoms (DRESS) - dyskinesia - dyspnoea - face oedema - fatigue - fever - hyperglycaemia - hypersensitivity - intracranial pressure increased - lymphadenopathy - malaise - muscle rigidity (with high doses) - nightmare - pancreatitis - restlessness - seizure - splenomegaly - urinary disorders - vision disorders
- With parenteral use: Dysuria
- **HEPATIC IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION**
BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**
- Codeine phosphate (Non-proprietary)
  - Codeine phosphate 15 mg: Codeine 15mg tablets | 2 tablet [P](£1.40 DT = £0.83 [DD]) | 10 tablet [P](£2.96 DT = £2.96 [DD])
  - Codeine phosphate 30 mg: Codeine 30mg tablets | 2 tablet [P](£1.59 DT = £0.93 [DD]) | 10 tablet [P](£5.68 DT = £3.32 [DD]) | 500 tablet [P](£16.60 [DD])
  - Codeine phosphate 60 mg: Codeine 60mg tablets | 2 tablet [P](£1.89 DT = £1.53 [DD])

**Solution for injection**
- Codeine phosphate (Non-proprietary)
  - Codeine phosphate 60 mg per 1 ml: Codeine 60mg/1ml solution for injection ampoules | 10 ampoule [P](£24.10-£24.19 DT = £24.19 [DD])

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 2**
- Codeine phosphate (Non-proprietary)
  - Codeine phosphate 3 mg per 1 ml: Codeine 15mg/5ml linctus sugar free sugar-free | 200 ml [P](£1.90 DT = £1.62 [DD]) sugar-free | 2000 ml [P](£16.20 [DD])
  - Codeine phosphate 5 mg per 1 ml: Codeine 25mg/5ml linctus | 200 ml [P](£1.73-£1.90 DT = £1.90 [DD]) | 500 ml [P](£6.64 DT = £6.64 [DD])
  - Galcodeine (Thornton & Ross Ltd)
    - Codeine phosphate 3 mg per 1 ml: Galcodeine 15mg/5ml linctus sugar-free | 2000 ml [P](£9.90 [DD])

**Diamorphine hydrochloride**
(Heroin hydrochloride)

**INDICATIONS AND DOSE**

**Acute or chronic pain**
- **BY MOUTH**
  - Child 1 month-11 years: 100–200 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response.
  - Child 12-17 years: 5–10 mg every 4 hours, adjusted according to response.
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child 1 month-11 years: 12.5–25 micrograms/kg/hour, adjusted according to response.
  - Child 1 month-11 years: 20 micrograms/kg/hour, adjusted according to response.
- **BY INTRAVENOUS INJECTION**
  - Child 1-2 months: 20 micrograms/kg every 6 hours, adjusted according to response.
  - Child 3-5 months: 25–50 micrograms/kg every 6 hours, adjusted according to response.
  - Child 6-11 months: 75 micrograms/kg every 4 hours, adjusted according to response.
  - Child 11-17 years: 75–100 micrograms/kg every 4 hours (max. per dose 5 mg), adjusted according to response.
  - Child 12-17 years: 2.5–5 mg every 4 hours, adjusted according to response.
- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 12-17 years: 5 mg every 4 hours, adjusted according to response.

**Acute or chronic pain in ventilated neonates**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 50 micrograms/kg, dose to be administered over 30 minutes, followed by (by continuous intravenous infusion) 15 micrograms/kg/hour, adjusted according to response.

**Acute or chronic pain in non-ventilated neonates**
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate: 2.5–7 micrograms/kg/hour, adjusted according to response.

**Acute severe nociceptive pain in an emergency setting (specialist supervision in hospital)**
- **BY INTRANASAL ADMINISTRATION**
  - Child 2-5 years (body-weight 12-17 kg): 1.44 mg for 1 dose, spray into alternate nostrils.
  - Child 2-5 years (body-weight 18-23 kg): 2.16 mg for 1 dose, spray into alternate nostrils.
  - Child 2-5 years (body-weight 24-29 kg): 2.88 mg for 1 dose, spray into alternate nostrils.
  - Child 2-5 years (body-weight 30-39 kg): 3.2 mg for 1 dose, spray into alternate nostrils.
  - Child 2-5 years (body-weight 40-50 kg): 4.8 mg for 1 dose, spray into alternate nostrils.

**CONTRA-INDICATIONS**
- Delayed gastric emptying - phaeochromocytoma.

**CAUTIONS**
- CNS depression - severe cor pulmonale - severe diarrhoea - toxic psychosis.

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**
- **Common or very common**
  - **Uncommon**
Dihydrocodeine tartrate

- **INDICATIONS AND DOSE**
  - **Moderate to severe pain**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 1-3 years: 500 micrograms/kg every 4–6 hours
      - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)

- **UNLICENSED USE**
  - Most preparations not licensed for use in children under 4 years.

- **CAUTIONS**
  - Pancreatitis • severe cor pulmonale

- **INTERACTIONS**
  - Appendix 1: opioids

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Dysuria • mood altered
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use Biliary spasm • bronchospasm • hypothermia • sexual dysfunction • ureteral spasm
  - **BREAST FEEDING**
    - Use only if potential benefit outweighs risk.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution; consider avoiding.
    - Dose adjustments Manufacturer advises dose reduction, if used.
  - **RENAL IMPAIRMENT**
    - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary

Dihydrocodeine tablets 30 mg may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

Tablet

**CAUTIONARY AND ADVISORY LABELS** 2

- **Diamorphine hydrochloride (Non-proprietary)**
  - Diamorphine hydrochloride 10 mg: Diamorphine 10 mg tablets 100 tablet (P99) £37.13 DT = £37.13 (07)

**Powder for solution for injection**

- **Diamorphine hydrochloride (Non-proprietary)**
  - Diamorphine hydrochloride 5 mg: Diamorphine 5 mg powder for solution for injection ampoules 5 ampoule (P99) £11.36–£14.95 DT = £13.76 (07)
  - Diamorphine hydrochloride 10 mg: Diamorphine 10 mg powder for solution for injection ampoules 5 ampoule (P99) £16.56–£16.95 DT = £14.39 (07)
  - Diamorphine hydrochloride 30 mg: Diamorphine 30 mg powder for solution for injection ampoules 5 ampoule (P99) £16.52–£17.95 DT = £15.05 (07)
  - Diamorphine hydrochloride 100 mg: Diamorphine 100 mg powder for solution for injection ampoules 5 ampoule (P99) £42.39–£57.95 DT = £50.17 (07)
  - Diamorphine hydrochloride 500 mg: Diamorphine 500 mg powder for solution for injection ampoules 5 ampoule (P99) £187.70–£213.95 DT = £201.83 (07)

**Spray**

- EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
  - Ayendi (Wockhardt Ltd)
    - Diamorphine (as Diamorphine hydrochloride) 720 microgram per 1 dose Ayendi 720 micrograms/actuation nasal spray 68 dose (P99) £107.90 (Hospital only) (07) | 160 dose (P99) £112.90 (Hospital only) (07)
    - Diamorphine (as Diamorphine hydrochloride) 1.6 mg per 1 dose Ayendi 1600 micrograms/actuation nasal spray 68 dose (P99) £113.52 (Hospital only) (07) | 160 dose (P99) £123.75 (Hospital only) (07)

Dihydrocodeine tartrate

- **Child 12-17 years**: 30 mg every 4–6 hours
- **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
  - Child 1-3 years: 500 micrograms/kg every 4–6 hours
  - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
  - Child 12-17 years: 30 mg every 4–6 hours (max. per dose 50 mg)

**Chronic severe pain**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 60–120 mg every 12 hours
  - DF118 FORTE®

**Severe pain**

- **BY MOUTH**
  - Child 12-17 years: 40–80 mg 3 times a day; maximum dose 240 mg per day

- **UNLICENSED USE**
  - Most preparations not licensed for use in children under 4 years.

- **CAUTIONS**
  - Pancreatitis • severe cor pulmonale

- **INTERACTIONS**
  - Appendix 1: opioids

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Dysuria • mood altered
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use Biliary spasm • bronchospasm • hypothermia • sexual dysfunction • ureteral spasm
  - **BREAST FEEDING**
    - Use only if potential benefit outweighs risk.
  - **HEPATIC IMPAIRMENT**
    - Manufacturer advises caution; consider avoiding.
    - Dose adjustments Manufacturer advises dose reduction, if used.
  - **RENAL IMPAIRMENT**
    - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary

Dihydrocodeine tablets 30 mg may be prescribed.

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection
Dihydrocodeine with paracetamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 278.

**INDICATIONS AND DOSE**

**Mild to moderate pain (using 10/500 preparations only)**
- **By mouth**
  - Child 12-17 years: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

**Severe pain (using 20/500 preparations only)**
- **By mouth**
  - Child 12-17 years: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

**Severe pain (using 30/500 preparations only)**
- **By mouth**
  - Child 12-17 years: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

**DOSE EQUIVALENT AND CONVERSION**
- A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

**IMPORANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: Dihydrocodeine with paracetamol (Co-dydramol): prescribe and dispense by strength to minimise risk of medication error (January 2018)**
- The MHRA has advised that dihydrocodeine with paracetamol preparations are prescribed and dispensed by strength to minimise dispensing errors and the risk of accidental opioid overdose—see Prescribing and dispensing information.

**CAUTIONS**
- Alcohol dependence • before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours • chronic alcoholism • chronic dehydration • chronic malnutrition • hepatocellular insufficiency • pancreatitis • severe cor pulmonale

**INTERACTIONS**
- Appendix 1: opioids • paracetamol

**SIDE-EFFECTS**
- Abdominal pain • blood disorder • leucopenia • malaise • neutropenia • pancreatitis • paraesthesia • paralytic ileus • severe cutaneous adverse reactions (SCARs) • thrombocytopenia

**Overdose**
- Liver damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING**
- Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT**
- Manufacturer advises consider avoiding in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments**
- Manufacturer advises dose reduction in mild to moderate impairment, if used.

**RENAL IMPAIRMENT**
- Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION**
- The MHRA advises when prescribing dihydrocodeine with paracetamol, the tablet strength and dose must be clearly indicated; when dispensing dihydrocodeine with paracetamol, ensure the prescribed strength is supplied—contact the prescriber if in doubt.
- The BP defines Co-dydramol Tablets as containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg.

**LESS SUITABLE FOR PRESCRIBING**
- Dihydrocodeine with paracetamol is less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2, 29, 30**
- Dihydrocodeine with paracetamol (Non-proprietary)

  - Dihydrocodeine tartrate 10 mg, Paracetamol 500 mg | Eroset 500mg/10mg tablets | 30 tablet (P) £0.68 DT + £0.79 (C5) | 100 tablet (P) £1.48 DT + £2.63 (C5)
- Paramol (SSL International Plc)
  - Dihydrocodeine tartrate 7.46 mg, Paracetamol 500 mg
  - Paramol tablets | 12 tablet (P) £2.26 (C5) | 24 tablet (P) £3.86 (C5) | 32 tablet £4.52 (C5)
- Remedeine (Crescent Pharma Ltd)
  - Dihydrocodeine tartrate 20 mg, Paracetamol 500 mg
  - Remedeine tablets | 56 tablet (P) £5.87 (C5) | 112 tablet (P) £11.13 DT + £11.13 (C5)
  - Dihydrocodeine tartrate 30 mg, Paracetamol 500 mg
  - Remedeine Forte tablets | 56 tablet (P) £6.82 DT + £6.82 (C5)

**Fentanyl**

**INDICATIONS AND DOSE**

**Chronic intractable pain not currently treated with a strong opioid analgesic**
- **By transdermal application**
  - Child 16-17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 72 hours or more for the plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)

**Chronic intractable pain currently treated with a strong opioid analgesic**
- **By transdermal application**
  - Child 2-17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids under Prescribing in palliative care p. 22.
Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation

- By intravenous injection
  - Child 1 month–11 years: Initially 1–3 micrograms/kg, then 1 microgram/kg as required, dose to be administered over at least 30 seconds
  - Child 12–17 years: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required, dose to be administered over at least 30 seconds

Assisted ventilation: analgesia and enhancement of anaesthesia during operation

- By intravenous injection
  - Neonate: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds.

- Child 1 month–11 years: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds.
- Child 12–17 years: Initially 1–5 micrograms/kg, then 50–200 micrograms as required, dose to be administered over at least 30 seconds.

Assisted ventilation: analgesia and respiratory depression in intensive care

- Initially by intravenous injection
  - Neonate: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1.5 micrograms/kg/hour, adjusted according to response.
  - Child: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1–6 micrograms/kg/hour, adjusted according to response.

Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- By buccal administration using lozenges

  - Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia.

Dose equivalence and conversion

- Fentanyl films are not bioequivalent to other fentanyl preparations.
- Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

Doses at extremes of body-weight

- To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

Unlicensed use

- With intravenous use Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.

### IMPORTANT SAFETY INFORMATION

MHRA/CHM advice: Transdermal Fentanyl patches: Life-threatening and fatal opioid toxicity from accidental exposure, particularly in children (October 2018)

Accidental exposure to transdermal fentanyl can occur if a patch is swallowed or transferred to another individual. Always fully inform patients and their carers about directions for safe use of fentanyl patches, including the importance of:
- Not exceeding the prescribed dose;
- Following the correct frequency of patch application, avoiding touching the adhesive side of patches, and washing hands after application;
- Not cutting patches and avoiding exposure of patches to heat including via hot water;
- Ensuring that old patches are removed before applying a new one;
- Following instructions for safe storage and properly disposing of used patches or those which are not needed.

Patients and carers should be advised to seek immediate medical attention if overdose is suspected—see Side-effects and Patient and carer advice for further information.

### CAUTIONS

- Cerebral tumour - diabetes mellitus (with Actiq® and Cyonil® lozenges) - impaired consciousness

### CAUTIONS, FURTHER INFORMATION

- With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
- With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

### INTERACTIONS

- Appendices: opioids

### SIDE-EFFECTS

- Common or very common
  - With transdermal use Anxiety - appetite decreased - asthenia - depression - diarrhoea - dyspnoea - gastrointestinal discomfort - hypertension - insomnia - malaise - muscle complaints - peripheral oedema - sensation abnormal - temperature sensation altered - tremor
  - Uncommon
  - With parental use Airway complication of anaesthesia - chills - hiccups - hypothermia 
  - With transdermal use Consciousness impaired - cyanosis - fever - gastrointestinal disorders - influenza like illness - memory loss - respiratory disorders - seizures - sexual dysfunction - vision blurred
  - Rare or very rare
  - With transdermal use Apnoea
  - Frequency not known
  - With parental use Biliary spasm - cardiac arrest - cough - hyperalgesia - loss of consciousness - seizure
  - With transdermal use Myoclonus - withdrawal syndrome neonatal

### SIDE-EFFECTS, FURTHER INFORMATION

- Muscle rigidity

Intravenous administration of fentanyl can cause muscle rigidity, which may involve the thoracic muscles. Manufacturer advises administration by slow intravenous
injection to avoid; higher doses may require premedication with benzodiazepines and muscle relaxants.

**Transdermal use** Monitor patients using patches for increased side-effects if fever is present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).

- **BREAST FEEDING**
  - With buccal use Manufacturer advises avoid during treatment and for 5 days after last administration—present in milk.
  - With intravenous use Manufacturer advises avoid during treatment and for 24 hours after last administration—present in milk.
  - With transdermal use Manufacturer advises avoid during treatment and for 72 hours after removal of patch—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution (risk of accumulation).
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **DIRECTIONS FOR ADMINISTRATION**
  - With transdermal use For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and sitting replacement patch on a different area (avoid using the same area for several days).
  - With intravenous use For intravenous infusion, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%.
  - With buccal use Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

- **PATIENT AND CARER ADVICE**
  - With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

**EFFENTORA** Patients or carers should be given advice on how to administer Effentora® buccal tablets.

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **Scottish Medicines Consortium (SMC) decisions**
  - The Scottish Medicines Consortium has advised (September 2008) that PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

- **Instanyl®**
  - The Scottish Medicines Consortium has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

- **EFFENTORA**
  - The Scottish Medicines Consortium has advised that Effentora® buccal tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

- **Scottish Medicines Consortium (SMC) decisions**
  - The Scottish Medicines Consortium has advised (January 2009) that Abstral® sublingual tablets should be restricted for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short acting opioids are unsuitable.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

**Solution for injection**

- **Fentanyl (Non-proprietary)**
  - Fentanyl (as Fentanyl citrate) 50 microgram per 1 ml
  - Fentanyl 100 micrograms/2ml solution for injection ampoules | 10 ampoule (P) £7.00–£14.33 DT = £14.32 (Q)
  - Fentanyl 500 micrograms/10ml solution for injection ampoules | 10 ampoule (P) £15.00–£16.15 (Q)
  - Sublimaze (Piramal Critical Care Ltd)
  - Fentanyl (as Fentanyl citrate) 50 microgram per 1 ml
  - Sublimaze 500 micrograms/10ml solution for injection ampoules | 5 ampoule (P) £6.53 (Q)

**Solution for infusion**

- **Fentanyl (Non-proprietary)**
  - Fentanyl (as Fentanyl citrate) 50 microgram per 1 ml
  - Fentanyl 2.5mg/50ml solution for infusion vials | 1 vial (P) £3.50 (Q)

**Transdermal patch**

**CAUTIONARY AND ADVISORY LABELS 2**

- **Durogesic DTrans (Janssen-Cilag Ltd)**
  - Fentanyl 12 microgram per 1 hour
  - Durogesic DTrans 12micrograms/hour transdermal patches | 5 patch (P) £12.59 DT = £12.59 (Q)
  - Fentanyl 25 microgram per 1 hour
  - Durogesic DTrans 25 micrograms/hour transdermal patches | 5 patch (P) £17.99 DT = £17.99 (Q)
  - Fentanyl 50 microgram per 1 hour
  - Durogesic DTrans 50 micrograms/hour transdermal patches | 5 patch (P) £33.66 DT = £33.66 (Q)
  - Fentanyl 75 microgram per 1 hour
  - Durogesic DTrans 75 micrograms/hour transdermal patches | 5 patch (P) £46.99 DT = £46.99 (Q)
  - Fentanyl 100 microgram per 1 hour
  - Durogesic DTrans 100 micrograms/hour transdermal patches | 5 patch (P) £57.86 DT = £57.86 (Q)
  - Fencino (Ethpharm UK Ltd)
  - Fentanyl 12 microgram per 1 hour
  - Fencino 12 micrograms/hour transdermal patches | 5 patch (P) £8.46 DT = £12.59 (Q)
  - Fentanyl 25 microgram per 1 hour
  - Fencino 25 micrograms/hour transdermal patches | 5 patch (P) £12.10 DT = £17.99 (Q)

**Contraindications**: Acute abdomen

**Cautions**: Pancreatitis, toxic psychosis

**Interactions**: Appendix 1: opioids

**Side-effects**: Common or very common - Abdominal pain, anxiety, appetite decreased, asthenia, sleep disorders.

**Uncommon**: Depression, diarrhoea, dysphoria, erectile dysfunction, malaise, movement disorders, paraesthesia, peripheral oedema, taste altered, tremor.

**Frequency not known**: Hyperalgesia, paralytic ileus, seizure, withdrawal syndrome neonatal.

**Breast feeding**: Avoid - no information available.

**Renal impairment**: Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**Directions for administration**: For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).
Palladone SR

CAUTIONARY AND ADVISORY LABELS

1. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

2. Modified-release capsule

3. There are changes in the licensing of Palladone SR capsules. Palladone SR modified-release capsules were not licensed to treat children with cancer pain (age-range not specified by manufacturer).

Morphine

INICATIONS AND DOSE

Pain

- BY SUBCUTANEOUS INJECTION
  - Neonate: Initially 100 micrograms/kg every 6 hours, adjusted according to response.
  - Child 1–5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
  - Child 6 months–1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
  - Child 2–11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response
  - Child 12–17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response
  - INITIALLY BY INTRAVENOUS INJECTION
  - Neonate: 50 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 50 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 5–20 micrograms/kg/hour, adjusted according to response
  - Child 1–5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
  - Child 6 months–11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
  - Child 12–17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
  - Pain (with modified-release 12-hourly preparations)
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered
  - Pain (with modified-release 24-hourly preparations)
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered
  - Neonatal opioid withdrawal (under expert supervision)
    - BY MOUTH
      - Neonate: Initially 40 micrograms/kg every 4 hours until symptoms controlled, dose to be increased if necessary; reduce frequency gradually over 6–10 days, stop when 40 micrograms/kg once daily achieved, dose may vary—consult local guidelines.
  - Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)
    - BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
      - Child: 100 micrograms/kg
  - DOSE EQUIVALENCE AND CONVERSION
    - The doses stated refer equally to morphine hydrochloride and sulfate.

UNLICENSED USE

- With oral use Oramorph® solution and MXL® capsules not licensed for use in children under 3 years. Oramorph® unit dose vials and Filnarine® SR tablets not licensed for use in children under 6 years. MST Continus® preparations licensed to treat children with cancer pain (age-range not specified by manufacturer).
- With rectal use Suppositories are not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.

CONTRA-INDICATIONS

- Acute abdomen - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

CAUTIONS

- Cardiac arrhythmias - pancreatitis - severe cor pulmonale

INTERACTIONS

- Appendix 1: opioids
**SIDE-EFFECTS**
- Common or very common
- With oral use: Appetite decreased, asthenic conditions, gastrointestinal discomfort, insomnia, neuromuscular dysfunction
- Uncommon
- With oral use: Agitation, bronchospasm, ileus, mood altered, myoclonus, peripheral oedema, pulmonary oedema, seizure, sensation abnormal, syncope, taste altered
- Frequency not known
- With oral use: Amenorrhoea, biliary pain, cough decreased, hyperalgesia, hypertension, pancreatitis exacerbated, sexual dysfunction, thinking abnormal, urethral spasm
- With parental use: Alertness decreased, bile duct disorders, mood altered, myoclonus, sexual dysfunction, urethral spasm, urinary disorders, vision disorders

**BREAST FEEDING** Therapeutic doses unlikely to affect infant.

**HEPATIC IMPAIRMENT** Manufacturer advises caution. Avoid oral preparations in acute impairment; for injectable preparations—consult product literature.

**RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**MONITORING REQUIREMENTS** Possible association between acute chest syndrome in patients with sickle cell disease treated with morphine during a vaso-occlusive crisis—manufacturer advises close monitoring for acute chest syndrome symptoms during treatment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With intravenous use in neonates Neonatal intensive care, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
- With oral use For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION** Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include Filmarine® SR, MST Continus®, Morphgesic® SR and Zomorph®. Preparations that should be given 24-hourly include MXL®. Prescriptions must specify the ‘form’.
- With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**PATIENT AND CARER ADVICE**
- With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules. Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-pain

**EXCEPTIONS TO LEGAL CATEGORY**
- Morphine Oral Solutions Prescription—only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.
- Oral solutions of morphine can be prescribed by writing the formula:

  Morphine hydrochloride 5 mg 
  Chloroform water to 5 mL 

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 2, 25**
- **MST Continus** (Napp Pharmaceuticals Ltd)
  - Morphine sulfate 5 mg MST Continus 5mg tablets | 60 tablet (£12.29 DT = £3.29 COD)
  - Morphine sulfate 10 mg MST Continus 10mg tablets | 60 tablet (£5.20 DT = £3.00 COD)
  - Morphine sulfate 15 mg MST Continus 15mg tablets | 60 tablet (£9.10 DT = £3.10 COD)
  - Morphine sulfate 20 mg MST Continus 20mg tablets | 60 tablet (£12.47 DT = £4.72 COD)
  - Morphine sulfate 30 mg MST Continus 30mg tablets | 60 tablet (£18.65 DT = £4.23 COD)
  - Morphine sulfate 60 mg MST Continus 60mg tablets | 60 tablet (£24.32 DT = £4.32 COD)
  - Morphine sulfate 100 mg MST Continus 100mg tablets | 60 tablet (£38.50 DT = £6.50 COD)
  - Morphine sulfate 200 mg MST Continus 200mg tablets | 60 tablet (£61.34 DT = £10.22 COD)
  - **Morphgesic SR** (Advanz Pharma)
  - Morphine sulfate 10 mg Morphgesic SR 10mg tablets | 60 tablet (£9.65 DT = £3.20 COD)
  - Morphine sulfate 30 mg Morphgesic SR 30mg tablets | 60 tablet (£9.24 DT = £3.12 COD)
  - Morphine sulfate 60 mg Morphgesic SR 60mg tablets | 60 tablet (£18.04 DT = £3.04 COD)

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**
- **Sevredol** (Napp Pharmaceuticals Ltd)
  - Morphine sulfate 10 mg Sevredol 10mg tablets | 56 tablet (£5.31 DT = £5.31 COD)
  - Morphine sulfate 20 mg Sevredol 20mg tablets | 56 tablet (£10.61 DT = £10.61 COD)
  - Morphine sulfate 50 mg Sevredol 50mg tablets | 56 tablet (£28.02 DT = £28.02 COD)

**Suppository**

**CAUTIONARY AND ADVISORY LABELS 2**
- **Morphine (Non-proprietary)**
  - Morphine sulfate 10 mg Morphine sulfate 10mg suppositories | 12 suppository (£13.45 DT = £13.45 COD)

**Solution for injection**

**Morphine (Non-proprietary)**
- Morphine sulfate 1 mg per 1 ml Morphine sulfate 1mg/1ml solution for injection ampoules | 10 ampoule (£44.00 DT = £44.00 COD)
- Morphine sulfate 1mg/1ml solution for injection ampoules | 10 ampoule (£31.90 DT)
- Morphine sulfate 10mg/1ml solution for injection ampoules | 10 ampoule (£15.00 DT)
- Morphine sulfate 10 mg per 1 ml Morphine sulfate 10mg/1ml solution for injection ampoules | 10 ampoule (£12.36 DT = £10.46 COD)
- Morphine sulfate 15 mg per 1 ml Morphine sulfate 15mg/1ml solution for injection ampoules | 10 ampoule (£10.74–£13.10 DT = £10.74 COD)
- Morphine sulfate 20 mg per 1 ml Morphine sulfate 20mg/1ml solution for injection ampoules | 10 ampoule (£65.67 DT = £65.67 COD)
- Morphine sulfate 30 mg per 1 ml Morphine sulfate 30mg/1ml solution for injection ampoules | 10 ampoule (£14.02 DT = £11.49 COD)
- Morphine sulfate 60mg/2ml solution for injection ampoules | 5 ampoule (£29.15 DT = £29.15 COD)

**Modified-release capsule**

**CAUTIONARY AND ADVISORY LABELS 2**
- **MXL** (Napp Pharmaceuticals Ltd)
  - Morphine sulfate 30 mg MXL 30mg capsules | 28 capsule (£10.31 COD)
  - Morphine sulfate 60 mg MXL 60mg capsules | 28 capsule (£14.95 COD)
  - Morphine sulfate 90 mg MXL 90mg capsules | 28 capsule (£22.04 DT = £22.04 COD)
  - Morphine sulfate 120 mg MXL 120mg capsules | 28 capsule (£29.15 DT = £29.15 COD)
**Morphine with cyclizine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 290, cyclizine p. 266.

### Indications and dose

#### Cyclimorph-10

- **Moderate to severe pain (short-term use only)**
  - **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

#### Cyclimorph-15

- **Moderate to severe pain (short-term use only)**
  - **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

**Caution:** Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids). Not recommended in palliative care

**Interactions:** Appendix 1: antihistamines, sedating opioids

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Cyclimorph (AdvancPharma)**
  - Morphine tartrate 15 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
  - Cyclimorph 15 solution for injection 1 mL ampoules
    - 5 ampoules | £9.12 (CD)
  - Morphine tartrate 10 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL
  - Cyclimorph 10 solution for injection 1 mL ampoules
    - 5 ampoules | £8.77 (CD)

### Oxycodone hydrochloride

#### Indications and dose

**Moderate to severe pain in palliative care**

- **By mouth using immediate-release medicines**
  - Child 1 month–11 years: Initially 200 micrograms/kg every 4–6 hours (max. per dose 5 mg), dose to be increased if necessary according to severity of pain
  - Child 12–17 years: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain

- **By mouth using modified-release medicines**
  - Child 8–11 years: Initially 5 mg every 12 hours, dose to be increased if necessary according to severity of pain, use 12-hourly modified-release preparations for this dose; see Prescribing and dispensing information
  - Child 12–17 years: Initially 10 mg every 12 hours, dose to be increased if necessary according to severity of pain, use 12-hourly modified-release preparations for this dose; see Prescribing and dispensing information

**Dose equivalence and conversion**

- 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

**Oxenila XL**

#### Severe pain

- **By mouth**
  - Child 12–17 years: Initially 10 mg every 24 hours, dose to be increased if necessary according to severity of pain, some patients may require higher doses than the maximum daily dose; maximum 400 mg per day

**Unlicensed use**

Oxycodone preparations are not licensed for use in children under 12 years and some may not be licensed for use in children—further information can be found in the product literature of the individual preparations.

#### Important safety information

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations, see Prescribing and dispensing information.
Rare or very rare
- Haemorrhage
- Lymphadenopathy
- Muscle spasms
- Photosensitivity reaction
- Tooth discoloration
- Weight changes

Frequency known
- Aggression
- Amnorrhoea
- Cholestasis

Breast feeding
- Present in milk—avoid.

Hepatic impairment
- Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

Dose adjustments
- In adults, manufacturer advises initial dose reduction in mild impairment—consult product literature.

Renal impairment
- Opioid effects increased and prolonged and increased cerebral sensitivity occurs. Avoid if estimated glomerular filtration rate less than 10 ml/min/1.73 m².

Dose
- Initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild to moderate impairment.

Prescribing and dispensing information
- Modified-release preparations are available as 12-hourly or 24-hourly formulations. Preparations that should be given 12-hourly include Abtard™, Carexil™, Infosys™, Leveraxo™, Longtec™, Oceltra™, OxyContin™, Oxypro™, Oxylan™, Relubon™, and Renocontin®. Preparations that should be given 24-hourly include Onexila™ XL.

Palliative care
- For further information on the use of oxycodone in palliative care, see www.medicinescomplete.com/#/content/palliative/oxycodone.

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for infusion.

**Indications and Dose**

**Postoperative Analgesia** | Severe Chronic Pain

- **By Subcutaneous Injection, or by Intramuscular Injection**
- **Neonate:** 115 micrograms/kg every 4 hours if required.
- **Child 1-11 months:** 154 micrograms/kg every 4 hours if required.
- **Child 1-5 years:** 1.93–3.85 mg every 4 hours if required.
- **Child 6-11 years:** 3.85–7.7 mg every 4 hours if required.
- **By Intravenous Injection**
- **Neonate:** Use 25 to 50% of the corresponding subcutaneous/intramuscular dose.
- **Child:** Use 25 to 50% of the corresponding subcutaneous/intramuscular dose.
Pethidine hydrochloride  
(Meperidine)

**INDICATIONS AND DOSE**

**Obstetric analgesia**
- By subcutaneous injection, or by intramuscular injection
  - Child 12-17 years: 1 mg/kg (max. per dose 100 mg), then 1 mg/kg after 1–3 hours if required; maximum 400 mg per day

**CONTRA-INDICATIONS**
Phaeochromocytoma

**CAUTIONS**
Accumulation of metabolites may result in neurotoxicity - cardiac arrhythmias - not suitable for severe continuing pain - severe cor pulmonale

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**
Anxiety - asthenia - biliary spasm - coordination abnormal - delirium - dysuria - hypothermia - seizure - syncope - tremor

**Overdose**
Convulsions reported in overdosage.

**BREAST FEEDING**
Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment.

**Dose adjustments**
Manufacturer advises dose reduction in mild to moderate impairment.

**RENAL IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- Pethidine hydrochloride (Non-proprietary)
  - Pethidine hydrochloride 50 mg per 1 ml
  - Pethidine 50mg/1ml solution for injection ampoules | 10 ampoule [P] £5.11 DT + £5.11 [D]

- Pethidine 100mg/2ml solution for injection ampoules | 10 ampoule [P] £4.66 DT + £4.66 [D]

**TAPENTADOL**

**INDICATIONS AND DOSE**
Moderate to severe acute pain which can be managed only with opioid analgesics
- By mouth using oral solution
  - Child 2–17 years (specialist supervision in hospital): 1.25 mg/kg every 4 hours (max. per dose 100 mg) for up to 3 days, the dose for children with a high BMI must not exceed the calculated dose for a body-weight at the 97.5 percentile for the given age

**IMPORTANT SAFETY INFORMATION**
MHRA/CHM ADVICE: TAPENTADOL (PALEXIA®): RISK OF SEIZURES AND REPORTS OF SEROTONIN SYNDROME WHEN CO-ADMINISTERED WITH OTHER MEDICINES (JANUARY 2019)

Tapentadol can induce seizures and should be prescribed with caution in patients with a history of seizure disorders or epilepsy. Seizure risk may be increased in patients taking other medicines that lower seizure threshold, for example, antidepressants such as selective serotonin reuptake inhibitors (SSRIs), serotonin-noradrenaline reuptake inhibitors (SNRIs), tricyclic antidepressants, and antipsychotics.

Serotonin syndrome has been reported when tapentadol is used in combination with serotonergic antidepressants—withdrawal of the serotonergic medicine, together with supportive symptomatic care, usually brings about a rapid improvement in serotonin syndrome.

**CAUTIONS**
Obesity

**INTERACTIONS** → Appendix 1: opioids

**SIDE-EFFECTS**
Common or very common Anxiety · appetite decreased · asthenia · diarrhoea · feeling of body temperature change · gastrointestinal discomfort · muscle spasms · sleep disorders · tremor

Uncommon Concentration impaired · depressed mood · dysarthria · dyspnoea · feeling abnormal · irritability · memory loss · movement disorders · muscle contractions involuntary · oedema · sensation abnormal · urinary disorders

Rare or very rare Angioedema · impaired gastric emptying · level of consciousness decreased · seizure · thinking abnormal

**BREAST FEEDING**
Avoid—no information available.

**HEPATIC IMPAIRMENT**
Manufacturer advises avoid (no information available).

**RENAL IMPAIRMENT**
Manufacturer advises avoid (no information available).
Nervous system

MEDICATION FORMS

NATIONAL FUNDING/ACCESS DECISIONS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 2

EXCIPIENTS: May contain Propylene glycol

Palexia (Grunenthal Ltd)

Tramadol hydrochloride

07-Sep-2018

Tramadol hydrochloride

07-Sep-2018

Palexia

CAUTIONARY AND ADVISORY LABELS

2

Oral solution

24

Tapentadol (as Tapentadol hydrochloride) 20 mg per 1 ml Palexia

20mg/ml oral solution sugar-free | 100 ml (Pax) £17.80 DT = £17.80 (SR) sugar-free | 200 ml (Pax) £35.60 (SR)

CONTRA-INDICATIONS

Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - compromised respiratory function - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

CAUTIONS

Excessive bronchial secretions - history of epilepsy — use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - postoperative use - susceptibility to seizures — use tramadol only if compelling reasons - variation in metabolism

CAUTIONS, FURTHER INFORMATION

General anaesthesia

Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

Variation in metabolism

The capacity to metabolise tramadol can vary considerably between individuals; there is a risk of developing side-effects of opioid toxicity in patients who are ultra-rapid tramadol metabolisers (CYP 2D6 ultra-rapid metabolisers) and the therapeutic effect may be reduced in poor tramadol metabolisers.

Postoperative use

Manufacturer advises extreme caution when used for postoperative pain relief in children— reports of rare, but life threatening adverse events after tonsillectomy and/or adenoidectomy for obstructive sleep apnoea; if used, monitor closely for symptoms of opioid toxicity.

INTERACTIONS

Appendix 1: opioids

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common

Fatigue

Rare or very rare

Dyspnoea - epileptiform seizure - respiratory disorders - sleep disorders - vision blurred

Frequency not known

Asthma exacerbated - hypoglycaemia

SPECIFIC SIDE-EFFECTS

Uncommon

With parenteral use

Circulatory collapse - gastrointestinal discomfort

Rare or very rare

With parenteral use

Angioedema - appetite change - behaviour abnormal - cognitive disorder - dystonia - hypersensitivity - mood altered - movement disorders - muscle weakness - perception disorders - psychiatric disorder - sensation abnormal

Frequency not known

With oral use

Anxiety - blood disorder - gastrointestinal disorder - hyperkinesia - hypertension - paraesthesia - syncope - tremor - urinary disorder

PREGNANCY

Embryotoxic in animal studies — manufacturers advise avoid.

BREAST FEEDING

Amount probably too small to be harmful, but manufacturer advises avoid.

HEPATIC IMPAIRMENT

Manufacturers advise caution (risk of delayed elimination); some oral preparations should be avoided in severe impairment—consult product literature.

Dose adjustments

Manufacturers advise consider increasing dosage interval.

RENAL IMPAIRMENT

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

TREATMENT CESSATION

Manufacturer advises consider tapering the dose gradually to prevent withdrawal symptoms.

DIRECTIONS FOR ADMINISTRATION

Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) decisions

SMC No. 654/10

The Scottish Medicines Consortium has advised (June 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulfate modified-release has failed to provide adequate pain control or is not tolerated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

DIRECTIONS FOR ADMINISTRATION

Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed.
immediately without chewing—check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**Prescribing and dispensing information**
Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include **Invodol SR**, **Mabron**, **Maneo**®, **Marol**®, **Maxitram SR**, **Oldaram**, **Tilodol SR**, **Tramulief SR**, **Tramel SR**, **Zamirol SR**, **Zeridame SR**, **Zytramol SR**, **Zydol SR** and **Zydot SR**. Preparations that should be given 24-hourly include **Tradorec XL®**, **Zamadol® 24hr**, and **Zydot XL®**.

**Patient and carer advice**
Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets. Medicines for Children leaflet: Tramadol for pain

www.medicinesforchildren.org.uk/tramadol-pain

**Medicinal forms**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - Tramadol hydrochloride 75 mg, Paracetamol 650 mg Trapadex 75mg/650mg tablets | 30 tablet [Pax] £19.50 DT + £19.50 [CO]

5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesia such as paracetamol p. 278 (preferably in a soluble or dispersible form) or an NSAID, usually ibuprofen p. 679, is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as the 5HT1-receptor agonist sumatriptan p. 299. Ergot alkaloids are associated with many side-effects and should be avoided.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

5HT1-receptor agonists

5HT1-receptor agonists are used in the treatment of acute migraine attacks; treatment of children should be initiated by a specialist. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

If a child does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For children who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with an NSAID such as naproxen p. 683 can be considered. Sumatriptan and zolmitriptan p. 309 are used for migraine in children. They may also be of value in cluster headache.

Antiemetics

Antiemetics, including domperidone p. 268, phenothiazines, and antihistamines, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Domperidone has the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress should be sought; combined oral contraceptives may also provoke migraine. Preventive treatment should be considered if migraine attacks interfere with school and social life, particularly for children who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

In children it is often possible to stop prophylaxis after a period of treatment. Propranolol hydrochloride p. 106 may be effective in preventing migraine in children but it is contra-indicated in
those with asthma. Side-effects such as depression and postural hypotension can further limit its use.

Pizotifen below, an antihistamine and a serotonin-receptor antagonist, may also be used but its efficacy in children has not been clearly established. Common side-effects include drowsiness and weight gain.

Topiramate p. 218 is licensed for migraine prophylaxis; see Conception and contraception, and Pregnancy in the topiramate drug monograph for information on use in females of childbearing potential and pregnancy.

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray may be used. Treatment should be initiated by a specialist. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 681), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

Other drugs used for Migraine

Antihistamines

Paracetamol with buclizine hydrochloride and codeine phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 278, codeine phosphate p. 283.

● INDICATIONS AND DOSE

Migraleve®

Acute migraine

▷ BY MOUTH

Child 12-14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours

Child 15-17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

● INTERACTIONS → Appendix 1: antihistamines, sedating.

● PRESCRIBING AND DISPENSING INFORMATION See co-codemol p. 282 for Migraleve Yellow preparations.

LESS SUITABLE FOR PRESCRIBING

Migraleve® Migraleve® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Cautionary and Advisory Labels 2, 17, 30

Migraleve Pink (McNeil Products Ltd) Buclizine hydrochloride 6.25 mg, Codeine phosphate 8 mg, Paracetamol 500 mg. Migraleve Pink tablets 12 tablet (P) £3.79 (C01) 24 tablet (P) £6.08 (C01) 48 tablet (P) £3.97 (C01)

TRIPTANS

Sumatriptan

● INDICATIONS AND DOSE

Treatment of acute migraine

▷ BY MOUTH

Child 6-9 years: Initially 25 mg for 1 dose, followed by 25 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)

Child 10-11 years: Initially 50 mg for 1 dose, followed by 50 mg after at least 2 hours, to be taken only continued →
Nervous system

With intranasal use

Rare or very rare

Common or very common

CONTRA-INDICATIONS

Coronary vasospasm

Previous cerebrovascular accident

Prinzmetal

Tablets and injection not licensed for

Child 12–17 years: Initially 10–20 mg for dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

Treatment of acute cluster headache

BY SUBCUTANEOUS INJECTION

Child 10–17 years: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; maximum 12 mg per day

BY INTRANASAL ADMINISTRATION

Child 12–17 years: Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

TREATMENT OF ACUTE CLUSTER HEADACHE

BY SUBCUTANEOUS INJECTION

Child 10–17 years (under expert supervision): Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using auto-injector; maximum 12 mg per day

BY INTRANASAL ADMINISTRATION

Child 12–17 years (under expert supervision): Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

UNLICENSED USE

CONTRA-INDICATIONS

Coronary vasospasm - ischaemic heart disease - mild uncontrolled hypertension - moderate and severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal's angina

CAUTIONS

Conditions which predispose to coronary artery disease - history of seizures - mild, controlled hypertension - pre-existing cardiac disease - risk factors for seizures

INTERACTIONS → Appendix 1: sumatriptan

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Common or very common - Asthma - dizziness - drowsiness - dyspnoea - feeling abnormal - flushing - malaise - nausea - pain - sensation abnormal - skin reactions - temperature sensation altered - vomiting

Rare or very rare - Hypersensitivity - Frequency not known - Angina pectoris - anxiety - arrhythmias - arthralgia - colitis ischaemic - coronary vasospasm - diarrhoea - dystonia - hyperhidrosis - hypotension - myocardial infarction - myalgia - palpitations - Raynaud's phenomenon - seizure - tremor - vision disorders

SPECIFIC SIDE-EFFECTS

Common or very common - With intranasal use - Epistaxis - nasal irritation - taste altered - throat irritation - With subcutaneous use - Haemorrhage - swelling

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue if symptoms of heat, heaviness, pressure or tightness (including throat and chest) occur.

ALLERGY AND CROSS-SENSITIVITY

Caution in patients with sensitivity to sulfonamides.

PREGNANCY

There is limited experience of using 5HT1-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

BREAST FEEDING

Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

HEPATIC IMPAIRMENT

Manufacturer advises caution (reduced pre-systemic clearance increases exposure); avoid in severe impairment (no information available).

Dose adjustments → With oral use - In adults, manufacturer advises consider dose reduction—consult product literature.

RENAL IMPAIRMENT

Use with caution.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sumatriptan for migraine headaches www.medicinesforchildren.org.uk/sumatriptan-migraine-headaches

Driving and skilled tasks - Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

SOLUTION FOR INJECTION

Zolmitriptan

INDICATIONS AND DOSE

Treatment of acute migraine

BY MOUTH

Child 12–17 years: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, if response unsatisfactory after 3 attacks consider increasing dose to 5 mg or switching to alternative treatment; maximum 10 mg per day

BNFC 2019–2020

300 Pain
Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes compression neuropathies, peripheral neuropathies (e.g. due to Diabetic complications p. 466, HIV infection p. 425, chemotherapy), trauma, idiopathic neuropathy, central pain (e.g. pain following spinal cord injury and syringomyelia), postherpetic neuralgia, and phantom limb pain. The pain may occur in an area of sensory deficit and may be described as burning, shooting or scalding; it may be accompanied by pain that is evoked by a nonnoxious stimulus (allodynia).

Children with chronic neuropathic pain require multidisciplinary management, which may include physiotherapy and psychological support. Neuropathic pain is generally managed with a tricyclic antidepressant such as amitriptyline hydrochloride p. 245 or antiepileptic drugs such as carbamazepine p. 200. Children with localised pain may benefit from topical local anaesthetic preparations, particularly while awaiting specialist review. Neuropathic pain may respond only partially to opioid analgesics. A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporo mandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain (unlicensed indication), but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Children on long-term therapy need to be monitored both for progress and for side-effects.
6 Sleep disorders

6.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Hypnotics and anxiolytics should be reserved for short courses to alleviate acute conditions after causal factors have been established.

The role of drug therapy in the management of anxiety disorders in children and adolescents is uncertain; drug therapy should be initiated only by specialists after psychosocial interventions have failed. Benzodiazepines and tricyclic antidepressants have been used but adverse effects may be problematic.

Hypnotics

The prescribing of hypnotics to children, except for occasional use such as for sedation for procedures is not justified. There is a risk of habituation with prolonged use. Problems settling children at night should be managed with behavioural therapy.

Dental procedures

Some anxious children may benefit from the use of a hypnotic the night before a dental appointment.

Chloral and derivatives

Chloral hydrate below and derivatives were formerly popular hypnotics for children. Chloral hydrate is now mainly used for sedation during diagnostic procedures.

Antihistamines

Some antihistamines such as promethazine hydrochloride p. 183 are used for occasional insomnia in adults; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects. The use of hypnotics in children is not usually justified.

Melatonin

Melatonin p. 303 is a pineal hormone that may affect sleep pattern. Clinical experience suggests that when appropriate behavioural sleep interventions fail, melatonin may be of value for treating sleep onset insomnia and delayed sleep phase syndrome in children with conditions such as visual impairment, cerebral palsy, autism, and learning difficulties. It is also sometimes used before magnetic resonance imaging (MRI), computed tomography (CT), or EEG investigations. Little is known about its long-term effects in children, and there is uncertainty as to the effect on other circadian rhythms including endocrine or reproductive hormone secretion. The need to continue melatonin therapy should be reviewed every 6 months.

Anxiolytics

Anxiolytic treatment should be used in children only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery). Anxiolytic treatment should be limited to the lowest possible dose for the shortest possible time.

Buspirone

Buspironone hydrochloride is thought to act at specific serotonin (SHT1a) receptors; safety and efficacy in children have yet to be determined.
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, enema

**Tablet**

**HEPATIC IMPAIRMENT**

**RENAL IMPAIRMENT**

**PRESCRIBING AND DISPENSING INFORMATION**

**TREATMENT** with melatonin should be initiated and supervised by a specialist, but may be continued by general practitioners. The need to continue melatonin therapy should be reviewed every 6 months.

Melatonin is available as a modified-release tablet (**Circadin** and **Slenyto**) and also as unlicensed formulations. **Circadin** is licensed for the short-term treatment of primary insomnia in adults over 55 years. Unlicensed immediate-release preparations are available, however, there is variability in clinical effect of unlicensed formulations.

The RCPCH and NPPG recommend that, when a liquid special of melatonin is required, the following strength is used: 1 mg/mL.

**PATIENT AND CARER ADVICE**

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet

**Modified-release tablet**
- **Circadin (Fyln Pharma Ltd)**
  - Melatonin 3 mg: Melatonin 3mg modified-release tablets | 120 tablet (PBN) £41.20
- **Circadin (Fyln Pharma Ltd)**
  - Melatonin 2 mg: Melatonin 2mg modified-release tablets | 30 tablet (PBN) £15.39 DT + £15.39
- **Slenyto (Fyln Pharma Ltd)**
  - Melatonin 1 mg: Melatonin 1mg modified-release tablets | 60 tablet (PBN) £103.00

**7 Substance dependence**

**Substance dependence**

**Guidance on treatment of drug misuse**

**Nicotine dependence**

See Smoking cessation p. 304.

**Neonatal abstinence syndrome**

Neonatal abstinence syndrome occurs at birth as a result of intra-uterine exposure to opioids or high-dose benzodiazepines. Treatment is usually initiated if:

- Feeding becomes a problem and tube feeding is required;
- There is profound vomiting or watery diarrhoea;
- The baby remains very unsettled after two consecutive feeds despite gentle swaddling and the use of a pacifier.

Treatment involves weaning the baby from the drug on which it is dependent. Morphine p. 290 or methadone hydrochloride p. 307 can be used in babies of mothers who have been taking opioids. Morphine p. 290 is widely used because the dose can be easily adjusted, but methadone hydrochloride p. 307 may provide smoother control of symptoms. Weaning babies from opioids usually takes 7–10 days.

Weaning babies from benzodiazepines that have a long half-life is difficult to manage; chlorpromazine hydrochloride p. 251 may be used in these situations but
excessive sedation may occur. For babies who are dependent on barbiturates, phenobarbital p. 223 may be tried, although it does not control gastro-intestinal symptoms.

### 7.1 Nicotine dependence

#### Smoking cessation

**Overview**

Smoking tobacco is the main cause of preventable illness and premature death in the UK. It is linked to a number of diseases such as cancer (primarily lung cancer), chronic obstructive pulmonary disease, and cardiovascular disease, and can lead to complications during pregnancy. Smoking cessation reduces the risk of developing or worsening of smoking-related illnesses, and the benefits begin as soon as a person stops smoking.

Smoking cessation may be associated with temporary withdrawal symptoms caused by nicotine dependence, making it difficult for people to stop. These symptoms include nicotine cravings, irritability, depression, restlessness, poor concentration, light-headedness, sleep disturbances, and increased appetite. Weight gain is a concern for many people who stop smoking, however it is less likely to occur when drug treatment is used to aid smoking cessation.

**Non-drug treatment**

All smokers, including those who smoke e-cigarettes, should be advised to stop smoking and be offered support to facilitate smoking cessation. They should also be advised that stopping in one step (‘abrupt quitting’) offers the best chance of lasting success, and that a combination of drug treatment and behavioural support is likely to be the most effective approach. Abrupt quitting is when a smoker makes a commitment to stop smoking on or before a particular date (the quit date), rather than by gradually reducing their smoking.

Smokers who wish to stop smoking should be referred to their local NHS Stop Smoking Services, where they will be provided with advice, drug treatment, and behavioural support options such as individual counselling or group meetings. Smokers who decline to attend their local NHS Stop Smoking Services should be referred to a suitable healthcare professional who can also offer drug treatment and practical advice.

**Child aged over 12 years**

Nicotine replacement therapy (NRT) is the only drug treatment recommended to aid smoking cessation in children over 12 years of age. A combination of long-acting NRT (transdermal patch) and short-acting NRT (lozenges, gum, sublingual tablets, inhalator, nasal spray and oral spray) may be beneficial in children with a high-level of nicotine dependence, or in those who have previously failed to stop smoking despite NRT treatment. Nicotine transdermal patches are generally applied for 16 hours, with the patch removed overnight; if the child experiences strong nicotine cravings upon waking, a 24 hour patch can be used instead. Short-acting nicotine preparations are used whenever the urge to smoke occurs or to prevent cravings.

As all NRT preparations appear to be equally effective, the choice of preparation for each child should take into consideration the child’s likely adherence, preferences, and previous experience of smoking-cessation aids, as well as contra-indications, side-effects, and license of each preparation. Some preparations are not licensed in children under 18 years of age.

A quit date should be agreed when NRT is prescribed for smoking cessation, and treatment should be available before the child stops smoking. Children should be prescribed enough treatment to last 2 weeks after their agreed quit date, and be re-assessed shortly before the prescription ends.

Children who are unwilling or not ready to stop smoking may also benefit from the use of NRT as part of a ‘harm reduction approach’, because the amount of nicotine in NRT is much lower and less addictive than in smoking tobacco. Harm reduction approaches include stopping smoking whilst using NRT to prevent relapse, and smoking reduction or temporary abstinence, with or without the use of NRT. These children should be advised that NRT will make it easier to reduce how much they smoke and improve their chance of stopping in the long-term. In the UK, sale of e-cigarettes is prohibited in children under 18 years of age.

**Pregnancy**

Pregnant females should be advised to stop smoking completely, and be informed about the risks to the unborn child of smoking during pregnancy, and the harmful effects of exposure to second-hand smoke for both mother and baby. All pregnant females who smoke or have stopped smoking in the last 2 weeks should be referred to their local NHS Stop Smoking Services, and ongoing support should be offered during and following pregnancy. Smoking cessation should also be encouraged for all members of the household. Pregnant females who smoke should be advised to contact the NHS Pregnancy Smoking Helpline for further information (Tel: 0800 169 9169).

NRT should only be used in pregnant females if non-drug treatment options have failed. Clinical judgement should be used when deciding whether to prescribe NRT following a discussion about its risks and benefits. Subsequent prescriptions should only be given to pregnant females who have demonstrated they are still not smoking.

**Concomitant drugs**

Polycyclic aromatic hydrocarbons found in tobacco smoke increase the metabolism of some drugs by inducing hepatic enzymes, often requiring an increase in dose. Information about drugs interacting with tobacco smoke can be found under Interactions of the relevant drug monograph.

**Useful Resources**

National Centre for Smoking Cessation and Training. [www.ncsct.co.uk](http://www.ncsct.co.uk)

### NICOTINIC RECEPTOR AGONISTS

**Nicotine**

- **INDICATIONS AND DOSE**
  - Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day
    - Child 12-17 years: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose
    - By sublingual administration using sublingual tablets
      - Child 12-17 years: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - Child aged 12 years
      - 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By mouth using chewing gum
      - Child aged 12 years
        - 1 piece of gum every 1 hour, increased to 2 pieces of gum every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By inhalation
      - Child aged 12 years
        - 1 inhalator every 1 hour, increased to 2 inhalators every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By nasal spray
      - Child aged 12 years
        - 1 spray every 1 hour, increased to 2 sprays every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By oral inhalator
      - Child aged 12 years
        - 1 capsule every 1 hour, increased to 2 capsules every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By oral inhalator using aerosol propellant
      - Child aged 12 years
        - 1 inhalator every 1 hour, increased to 2 inhalators every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.

    - By sublingual tablets
      - Child aged 12 years
        - 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 12 weeks.
to 3 months before reducing the dose; maximum 40 tablets per day

**Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day**
- **BY INHALATION USING INHALATOR**
  - Child 12-17 years: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings; individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily
- **BY MOUTH USING LOZENGES**
  - Child 12-17 years: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; if attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day
- **BY MOUTH USING OROMUCOSAL SPRAY**
  - Child 12-17 years: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day
- **BY INTRanasAL ADMINISTRATION USING NASAL SPRAY**
  - Child 12-17 years: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day
- **BY TRANSdermal APPLICATION USING PATCHES**
  - Child 12-17 years: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

**UNLICENSED USE** All preparations are licensed for children over 12 years (with the exception of Nicotinell® lozenges which are licensed for children under 18 years only when recommended by a doctor).

**CAUTIONS**

**GENERAL CAUTIONS** Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment - haemodynamically unstable patients hospitalised with cerebrovascular accident - haemodynamically unstable patients hospitalised with myocardial infarction - haemodynamically unstable patients hospitalised with severe arrhythmias - phaeochromocytoma - uncontrolled hyperthyroidism

**SPECIFIC CAUTIONS**
- When used by inhalation Bronchospastic disease - chronic throat disease - obstructive lung disease
- With intranasal use Bronchial asthma (may exacerbate)
- With oral use Gastritis (can be aggravated by swallowed nicotine) - gum may also stick to and damage dentures - oesophagitis (can be aggravated by swallowed nicotine) - peptic ulcers (can be aggravated by swallowed nicotine)
- With transdermal use patches should not be placed on broken skin - patients with skin disorders

**CAUTIONS, FURTHER INFORMATION** Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Dizziness - headache - hyperhidrosis - nausea - palpitations - skin reactions - vomiting
- Uncommon Flushing

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - When used by inhalation Asthenia - cough - dry mouth - flatulence - gastrointestinal discomfort - hiccups - hypersensitivity - nasal complaints - oral disorders - taste altered - throat complaints
  - With intranasal use Chest discomfort - cough - dyspnoea - epistaxis - nasal complaints - paraesthesia - throat irritation
  - With oral use Anxiety - appetite abnormal - burping - diarrhoea - dyspepsia (may be caused by swallowed nicotine) - gastrointestinal disorders - hiccups - increased risk of infection - mood altered - oral disorders - sleep disorders
  - With sublingual use Asthenia - cough - dry mouth - flatulence - gastrointestinal discomfort - hiccups - hypersensitivity - oral disorders - rhinitis - taste altered - throat complaints
- Uncommon
  - When used by inhalation Abnormal dreams - arrhythmias - bronchospasm - burping - chest discomfort - dysphonia - dyspnoea - hypertension - malaise
  - With intranasal use Abnormal dreams - asthenia - hypertension - malaise
  - With sublingual use Abnormal dreams - arrhythmias - bronchospasm - burping - chest discomfort - dysphonia - dyspnoea - hypertension - malaise - nasal complaints
  - With transdermal use Arrhythmias - asthenia - chest discomfort - dyspnoea - hypertension - malaise - myalgia - paraesthesia
- Rare or very rare
  - When used by inhalation Dysphagia

BREAST FEEDING

When used by inhalation

▶

With sublingual use

▶

▶

With transdermal use

Abdominal discomfort - angioedema - pain in extremity

▶

Frequency not known

When used by inhalation

Angioedema - excessive tearing - vision blurred

▶

With transdermal use

Abdominal discomfort - angioedema - excessive tearing - oropharyngeal complaints

▶

With sublingual use

Excessive tearing - muscle tightness - vision blurred

SIDE EFFECTS, FURTHER INFORMATION

Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

PREGNANCY

The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without pregnancy is preferable to the continuation of smoking, and impaired concentration.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate to severe impairment (risk of decreased clearance).

RENAL IMPAIRMENT

Use with caution in severe renal impairment.

DIRECTIONS FOR ADMINISTRATION

Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.

Administration by transdermal patch. Patches should be applied to a dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray. Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray. The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet. Each tablet should be placed under the tongue and allowed to dissolve.

Administration by lozenge. Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation. Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum. Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

PRESCRIBING AND DISPENCING INFORMATION

Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.

PATIENT AND CARER ADVICE

Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

7.2 Opioid dependence

**ANALGESICS > OPIOIDS**

**Methadone hydrochloride**

- **INDICATIONS AND DOSE**

  **Neonatal opioid withdrawal**

  **BY MOUTH**

  - Neonate: Initially 100 micrograms/kg, then increased in steps of 50 micrograms/kg every 6 hours until symptoms are controlled, doses may vary, consult local guidelines, for maintenance, total daily dose that controls symptoms to be given in 2 divided doses.

- **DOSE EQUIVALENCE AND CONVERSION**

  - See buprenorphine p. 281 for dose adjustments in opioid substitution therapy, for patients taking methadone who want to switch to buprenorphine.

- **UNLICENSED USE**

  - Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS**

  - Phaeochromocytoma

- **CAUTIONS**

  - Family history of sudden death (ECG monitoring recommended) - history of cardiac conduction abnormalities.

- **CAUTIONS, FURTHER INFORMATION**

  - QT-interval prolongation: Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

- **INTERACTIONS**

  - Appendix 1: opioids

- **SIDE-EFFECTS**

  - Dry eye - dysuria - hyperprolactinaemia - hypothermia - intracranial pressure increased - mood altered - nasal dryness - QT interval prolongation

- **SIDE-EFFETS, FURTHER INFORMATION**

  - Methadone is a long-acting opioid therefore effects may be cumulative.

  - Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

- **Overdose**

  - Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING**

  - Withdrawal symptoms in infant; breastfeeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).

- **HEPATIC IMPAIRMENT**

  - Manufacturer advises caution; consider avoiding in severe impairment (risk of increased exposure).

- **Dose adjustments**

  - Manufacturer advises consider dose reduction.
RENAL IMPAIRMENT
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

TREATMENT CESSATION
Avoid abrupt withdrawal.
- In neonates When used for neonatal opioid withdrawal, reduce dose over 7–10 days.

DIRECTIONS FOR ADMINISTRATION
Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include tolu.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 2
- Physeptone (Martindale Pharmaceuticals Ltd)
  Methadone hydrochloride 5 mg Physeptone 5mg tablets | 50 tablet £2.84 DT = £2.84

Oral solution

CAUTIONARY AND ADVISORY LABELS 2
- Methadose (Rosemont Pharmaceuticals Ltd)
  Methadone hydrochloride 10 mg per 1 ml Methadose 10mg/ml oral solution concentrate sugar-free | 150 ml £12.01 DT = £12.01
  Methadone hydrochloride 20 mg per 1 ml Methadose 20mg/ml oral solution concentrate sugar-free | 150 ml £24.02 DT = £24.02
- Metharose (Rosemont Pharmaceuticals Ltd)
  Methadone hydrochloride 1 mg per 1 ml Metharose 1mg/ml oral solution sugar-free | 500 ml £6.82 DT = £4.45
- Physeptone (Martindale Pharmaceuticals Ltd)
  Methadone hydrochloride 1 mg per 1 ml Physeptone 1mg/ml oral solution sugar-free | 100 ml £1.27 DT = £0.90
  Methadone hydrochloride 1 mg per 1 ml Physeptone 1mg/ml mixture | 100 ml £1.27 DT = £0.90 | 500 ml £6.42 DT = £4.50

1 Bacterial infection

Antibacterials, principles of therapy
07-Mar-2017

Antibacterial drug choice
Before selecting an antibacterial the clinician must first consider three factors—the patient, the known or likely causative organism, and the risk of bacterial resistance with repeated courses.

Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, risk of complications, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the factors above, will provide one or more antibacterial option. In children receiving antibacterial prophylaxis, an antibacterial from a different class should be used.

Some children may be at higher risk of treatment failure. They include those who have had repeated antibacterial courses, a previous or current culture with resistant bacteria, or those at higher risk of developing complications.

Antibacterial policies
Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or paediatric infectious diseases specialist.

Antibacterials, considerations before starting therapy
The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);

- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;

- Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);

- The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection. The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;

- The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections often require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate (e.g. in neonates and young children). Whenever possible, painful intramuscular injections should be avoided in children;

- Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.
Advice to be given to children and their parents, or carers

If an antibacterial is given, advice should be given about:

- Possible adverse effects e.g. diarrhoea;
- An antibiotic not being needed currently;
- Seeking medical help if symptoms worsen rapidly or significantly at any time, if symptoms do not start to improve within an agreed time, or if the child becomes systemically very unwell.  
- Seeking medical help if symptoms worsen rapidly or significantly at any time, if symptoms do not start to improve within an agreed time, or if the child becomes systemically very unwell.  

Antibacterials, considerations during therapy

Review choice of antibacterial if susceptibility results indicate bacterial resistance and symptoms are not improving—consult local microbiologist as needed.  

Antibacterials, switching from parenteral to oral treatment

The ongoing parenteral administration of an antibacterial should be reviewed within 48 hours of treatment initiation and a switch to oral treatment considered if appropriate.  

Antibacterials for prophylaxis

In most situations, only a short course of prophylactic antibacterial is needed. Longer-term antibacterial prophylaxis is appropriate in specific indications such as vesico-ureteric reflux.

Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) or local health protection unit when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

Antibacterials for children

Note: It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Sepsis, early management

Children identified as being at high risk of severe illness or death due to suspected sepsis should be given a broad-spectrum antibacterial at the maximum recommended dose without delay (ideally within one hour). Microbiological samples and blood cultures must be taken prior to administration of antibiotics; the prescription should be adjusted subsequently according to susceptibility results. A thorough clinical examination should be carried out to identify sources of infection. If the cause of infection is identified, treat in line with local antibacterial guidance or susceptibility results.

Children aged up to 17 years with suspected community-acquired sepsis of any cause should be treated with ceftriaxone p. 332. If the child is already in hospital or is known to have previously been infected or colonised with ceftriaxone-resistant bacteria, an alternative antibiotic should be chosen following local guidelines. Children younger than 3 months should also receive an additional antibiotic that is active against listeria (such as ampicillin p. 353 or amoxicillin p. 351).

Neonates who are in hospital with suspected sepsis within 72 hours of birth, should be treated with intravenous benzylpenicillin sodium p. 349 and gentamicin p. 322. Community-acquired sepsis in neonates (who are more than 40 weeks corrected gestational age) should be treated with ceftriaxone, unless already receiving an intravenous calcium infusion. Neonates aged 40 weeks corrected gestational age or below, or receiving an intravenous calcium infusion, should receive cefotaxime p. 330, dosed according to age.

The need for intravenous fluids, inotropes, vasopressors and oxygen should also be assessed without delay, taking into consideration the child’s lactate concentration, systolic blood pressure (in children over 12 years) and their risk of severe illness or death. Children at high risk should be monitored continuously if possible, and no less than every 30 minutes.

Children with suspected sepsis who are not immediately deemed to be at high risk of severe illness or death, should be re-assessed regularly for the need for empirical treatment, taking into consideration all risk factors including lactate concentration and evidence of acute kidney injury.
Antibacterials, use for prophylaxis

**Rheumatic fever: prevention of recurrence**
- Phenoxyethylpenicillin p. 350 by mouth or erythromycin p. 341 by mouth.

**Invasive group A streptococcal infection: prevention of secondary cases**
- Phenoxyethylpenicillin by mouth.
  - If child penicillin allergic, either erythromycin by mouth or azithromycin p. 339 by mouth [unlicensed indication].
  - For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

**Meningococcal meningitis: prevention of secondary cases**
- Ciprofloxacin p. 361 by mouth [unlicensed indication] or rifampicin p. 379 by mouth or ceftriaxone p. 332 by intramuscular injection [unlicensed indication].
  - For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

**Haemophilus influenzae type b disease: prevention of secondary cases**
- Rifampicin by mouth or (if rifampicin cannot be used) ceftriaxone by intramuscular injection, or by intravenous injection, or by intravenous infusion [unlicensed indication].
  - For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

**Haemophilus influenzae type b disease**

**Pertussis, antibacterial prophylaxis**
- Clarithromycin (or azithromycin or erythromycin) by mouth.
  - Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

**Pneumococcal infection in asplenia or in patients with sickle-cell disease, antibacterial prophylaxis**
- Phenoxyethylpenicillin by mouth.
  - If cover also needed for H. influenzae in child give amoxicillin p. 351 instead.
  - If penicillin-allergic, erythromycin by mouth.
  - Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

**Staphylococcus aureus lung infection in cystic fibrosis, antibacterial prophylaxis**
- Primary prevention, flucloxacillin p. 357 by mouth. Secondary prevention, flucloxacillin by mouth.

**Tuberculosis antibacterial prophylaxis in susceptible close contacts or those who have become tuberculin positive**
- See Close contacts and Chemoprophylaxis for latent tuberculosis under Tuberculosis p. 375.

**Urinary-tract infection, antibacterial prophylaxis**
- Trimethoprim p. 373 by mouth or nitrofurantoin p. 384 by mouth.
  - Antibacterial prophylaxis may be considered in children with recurrent symptomatic urinary-tract infection, vesicoureteric reflux, or those awaiting imaging investigations.

**Animal and human bites, antibacterial prophylaxis**
- Co-amoxiclav p. 354 alone (or clindamycin p. 337 if penicillin-allergic).

  - Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 798 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

  - Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.
**Gastro-intestinal procedures, antibacterial prophylaxis**

**Operations on stomach or oesophagus**
- Single dose of i/v gentamicin p. 322 or i/v cefuroxime p. 329 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 334 (or vancomycin p. 335) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Open biliary surgery**
- Single dose of i/v cefuroxime + i/v metronidazole p. 344 or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Resections of colon and rectum, and resections in inflammatory bowel disease, and appendicectomy**
- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin (or vancomycin) p. 334 (or vancomycin p. 335) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Endoscopic retrograde cholangiopancreatography**
- Single dose of i/v gentamicin p. 322 or oral or i/v ciprofloxacin p. 361.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 351 or i/v teicoplanin (or vancomycin).

**Percutaneous endoscopic gastrostomy or jejunostomy**
- Single dose of i/v co-amoxiclav p. 354 or i/v cefuroxime p. 329.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

**Orthopaedic surgery, antibacterial prophylaxis**

**Closed fractures**
- Single dose of i/v cefuroxime or i/v flucloxacillin p. 357 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Open fractures**
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole p. 344 (or i/v clindamycin p. 337 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin and i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

**High lower-limb amputation**
- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days).

If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Obstetric surgery, antibacterial prophylaxis**

**Termination of pregnancy**
- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 364 postoperatively.

**Infective endocarditis, antibacterial prophylaxis**

**NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures** (March 2008, updated 2016)

- Chlorhexidine mouthwash is not recommended for the prevention of infective endocarditis in adult patients undergoing dental procedures.

Antibacterial prophylaxis is not routinely recommended for the prevention of infective endocarditis in children undergoing the following procedures:
- dental;
- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

While these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose children to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in children at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If children at risk of infective endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive...
appropriate antibacterial therapy that includes cover against organisms that cause endocarditis. Children at risk of infective endocarditis should:
- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and
- advised when to seek expert advice.

Patients at risk of infective endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Dermatological procedures**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

**Joint prostheses and dental treatment, antibacterial prophylaxis**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibacterial prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibacterials when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibacterials to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Immunosuppression and indwelling intraperitoneal catheters**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibacterial prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Blood infections, antibacterial therapy**

**Septicaemia (community-acquired)**
- Child 1 month–18 years, aminoglycoside + amoxicillin p. 351 (or ampicillin p. 353) or cefotaxime p. 330 (or ceftriaxone p. 332) alone
- If pseudomonas or resistant micro-organisms suspected, use a broad-spectrum antipseudomonal beta-lactam antibacterial.
- If anaerobic infection suspected, add metronidazole p. 344.
- If Gram-positive infection suspected, add flucloxacillin p. 357 or vancomycin p. 335 (or teicoplanin p. 334).
- Suggested duration of treatment at least 5 days.

**Septicaemia (hospital-acquired)**
- Child 1 month–18 years, a broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 348, ticarcillin with clavulanic acid p. 348, imipenem with cilastatin p. 325, or meropenem p. 326)
- If pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis, add aminoglycoside.
- If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to a broad-spectrum cephalosporin.
- Suggested duration of treatment at least 5 days.

**Septicaemia related to vascular catheter**
- Vancomycin (or teicoplanin)
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by *Staphylococcus aureus*, pseudomonas, or *Candida* species.

**Meningococcal septicaemia**
If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 349 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime may be an alternative in penicillin allergy; chloramphenicol p. 368 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
To eliminate nasopharyngeal carriage, ciprofloxacin p. 361, or rifampicin p. 379, or ceftriaxone may be used.

**Septicaemia in neonates**
- Neonate less than 72 hours old, benzylpenicillin sodium + gentamicin p. 322
- If Gram-negative septicaemia suspected, use benzylpenicillin sodium + gentamicin + cefotaxime; stop benzylpenicillin sodium if Gram-negative infection confirmed.
- Suggested duration of treatment usually 7 days.
- Neonate more than 72 hours old, flucloxacillin + gentamicin or amoxicillin (or ampicillin) + cefotaxime
- Suggested duration of treatment usually 7 days.

**Cardiovascular system infections, antibacterial therapy**

**Endocarditis: initial ‘blind’ therapy**
- Flucloxacillin p. 357 (or benzylpenicillin sodium p. 349 if symptoms less severe) + gentamicin p. 322
- If cardiac prostheses present, or if penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected, vancomycin p. 335 + rifampicin p. 379 + gentamicin

**Endocarditis caused by staphylococci**
- Flucloxacillin
- Add rifampicin for at least 2 weeks in prosthetic valve endocarditis
- Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
Endocarditis (native valve) caused by fully-sensitive streptococci e.g. viridans streptococci

- Benzylpenicillin sodium
- Suggested duration of treatment 4 weeks
- Alternative if a large vegetation, intracardial abscess, or infected emboli are absent, benzylpenicillin sodium + gentamicin
- Suggested duration of treatment 2 weeks
- If penicillin-allergic, vancomycin
- Suggested duration of treatment 4 weeks

Endocarditis (native valve) caused by less-sensitive streptococci

- Benzylpenicillin sodium + gentamicin
- Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks if micro-organisms moderately sensitive to penicillin)
- If aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, benzylpenicillin sodium
- Suggested duration of treatment 4 weeks
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin p. 334) + gentamicin
- Suggested duration of treatment 4–6 weeks (stop gentamicin after 2 weeks if micro-organisms moderately sensitive to penicillin)

Endocarditis (prosthetic valve) caused by streptococci

- Benzylpenicillin sodium + gentamicin
- Suggested duration of treatment at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)
- If penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
- Suggested duration of treatment at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)

Endocarditis caused by enterococci (e.g. Enterococcus faecalis)

- Amoxicillin p. 351 (or ampicillin p. 353) + gentamicin
- If gentamicin-resistant, substitute gentamicin with streptomycin p. 323
- Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
- If penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
- If gentamicin-resistant, substitute gentamicin with streptomycin
- Suggested duration of treatment at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Endocarditis caused by Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingiellaspecies ('HACEK' micro-organisms)

- Amoxicillin (or ampicillin) + gentamicin
- Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, antibacterial therapy

Meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) suspected, benzylpenicillin sodium p. 349 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 330 may be an alternative in penicillin allergy; chloramphenicol p. 368 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 455, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery. In hospital, if aetiology unknown:
  - Neonate and child 1–3 months, cefotaxime (or ceftriaxone p. 332) + amoxicillin p. 351 (or ampicillin p. 353)
  - Consider adding vancomycin p. 335 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
  - Suggested duration of treatment at least 14 days
  - Child 3 months–18 years cefotaxime (or ceftriaxone)
  - Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
  - Suggested duration of treatment at least 10 days

Meningitis caused by group B streptococcus

- Benzylpenicillin sodium + gentamicin p. 322 or cefotaxime (or ceftriaxone) alone
- Suggested duration of treatment at least 14 days; stop gentamicin after 5 days

Meningitis caused by meningococci

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
- Suggested duration of treatment 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- Suggested duration of treatment 7 days.

Meningitis caused by pneumococci

- Cefotaxime (or ceftriaxone)
- Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
- If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
- If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 379.
- Suggested duration of antibacterial treatment 14 days.
Meningitis caused by *Haemophilus influenzae*
- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibiotic.
  - **Suggested duration of antibacterial treatment** 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts.
  - If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibiotic.
  - **Suggested duration of antibacterial treatment** 10 days.
  - For *H. influenzae* type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts.

Meningitis caused by *Listeria*
- Amoxicillin (or ampicillin) + gentamicin
  - **Suggested duration of treatment** 21 days.
  - Consider stopping gentamicin after 7 days.
  - If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole p. 362
  - **Suggested duration of treatment** 21 days.

Ear infections, antibacterial therapy
**Otitis externa**
Otitis externa can be triggered by a bacterial infection caused by *Pseudomonas aeruginosa* or *Staphylococcus aureus*. Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

**Choice of antibacterial therapy**

**No penicillin allergy**
- Fluclouxacinil p. 357

**Penicillin allergy or intolerance**
- Clarithromycin p. 340 (or azithromycin p. 339 or erythromycin p. 341)

If *Pseudomonas* suspected
- Ciprofloxacin p. 361 (or an aminoglycoside)
  - For topical treatments, see *Otitis externa*, under Ear p. 712.

**Otitis media**
Acute otitis media is an inflammation in the middle ear associated with effusion and accompanied by an ear infection. Acute otitis media is commonly seen in children and is generally caused by viruses (respiratory syncytial virus and rhinovirus) or bacteria (*Haemophilus influenzae*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Moraxella catarrhalis*); both virus and bacteria often co-exist. For further information see *Acute otitis media* in Ear p. 712.

Antibacterial therapy should be offered to children with acute otitis media who are systemically very unwell, have signs and symptoms of a more serious illness, or those who are at high-risk of serious complications due to pre-existing comorbidities. Antibacterial therapy should also be considered if otorrhoea (discharge following perforation of the eardrum) is present, or in children under 2 years of age with bilateral otitis media.

Eye infections, antibacterial therapy

**Purulent conjunctivitis**
- Chloramphenicol p. 368 eye drops.

**Congenital chlamydial conjunctivitis**
- Erythromycin p. 341 (by mouth)
  - **Suggested duration of treatment** 14 days

**Congenital gonococcal conjunctivitis**
- Cefotaxime p. 330 (or ceftriaxone p. 332)
  - **Suggested duration of treatment** single dose.

Gastro-intestinal system infections, antibacterial therapy

**Gastro-enteritis**
Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated.

**Campylobacter enteritis**
Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 340 (or azithromycin p. 339 or erythromycin p. 341)
- Alternative, ciprofloxacin p. 361
- Strains with decreased sensitivity to ciprofloxacin isolated frequently

**Salmonella (non-typhoid)**
- Treatment for invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised children, those with haemoglobininopathy, or children under 6 months of age).
- Ciprofloxacin or cefotaxime p. 330

**Shigellosis**
- Antibacterial not indicated for mild cases.
- Azithromycin or ciprofloxacin
- Alternatives if micro-organism sensitive, amoxicillin p. 351 or trimethoprim p. 373

**Typhoid fever**
Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime (or ceftriaxone p. 332)
- Azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant micro-organisms
- Alternative if micro-organism sensitive, ciprofloxacin or chloramphenicol p. 368
Clostridium difficile infection
Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 353, amoxicillin, co-amoxiclav p. 354, second-and third-generation cephalosporins, clindamycin p. 337, and quinolones, but few antibacterials are free of this side-effect. Oral metronidazole p. 344 or oral vancomycin p. 335 are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

- For first episode of mild to moderate infection, oral metronidazole
  - Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in children intolerant of metronidazole, oral vancomycin
- Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin, or for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
  - Suggested duration of treatment 10–14 days

Peritonitis
- A cephalosporin + metronidazole or amoxicillin + gentamicin p. 322+ metronidazole or piperacillin with tazobactam p. 348 alone

Peritonitis: peritoneal dialysis-associated
- Vancomycin (or teicoplanin p. 334) + ceftriaxone p. 331 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
  - Suggested duration of treatment 14 days or longer

Necrotising enterocolitis in neonates
- Benzylpenicillin sodium p. 349+ gentamicin + metronidazole or amoxicillin (or ampicillin) + gentamicin + metronidazole or amoxicillin (or ampicillin) + cefotaxime + metronidazole

Pelvic inflammatory disease
Contact tracing recommended.
- Child 2–11 years, erythromycin + metronidazole p. 344+ single-dose of i/m ceftriaxone
  - Suggested duration of treatment 14 days (except i/m ceftriaxone)
- Child 12–17 years, doxycycline + metronidazole + single-dose of i/m ceftriaxone
  - If severely ill, seek specialist advice.
  - Suggested duration of treatment 14 days (except i/m ceftriaxone)

Syphilis
Contact tracing recommended.
- Child under 12 years, benzylpenicillin sodium p. 349 or procaine benzylpenicillin [unlicensed]
  - Suggested duration of treatment 10 days

Early syphilis (infection of less than 2 years)
- Child 12–17 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment single-dose (repeat dose after 7 days for females in the third trimester of pregnancy)
  - Alternatively, doxycycline or erythromycin
  - Suggested duration of treatment 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)
- Child 12–17 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment once weekly for 2 weeks
  - Alternatively, doxycycline
  - Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis
- Child 12–17 years, doxycycline
  - Suggested duration of treatment 14 days

Neonatal congenital syphilis
- Benzylpenicillin sodium
  - Also consider treating neonates with suspected congenital syphilis whose mothers were treated inadequately for syphilis, or whose mothers were treated for syphilis in the 4 weeks before delivery, or whose mothers were treated with non-penicillin antibacterials for syphilis.
  - Suggested duration of treatment 10 days.

Genital system infections, antibacterial therapy
Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection
Contact tracing recommended.
- Child under 12 years, erythromycin p. 341
  - Suggested duration of treatment 14 days
- Child 12–17 years, azithromycin p. 339 as a single dose or doxycycline p. 364 for 7 days
  - Alternatively, erythromycin for 14 days

Gonorrhoea: uncomplicated
Contact tracing recommended. Consider chlamydia co-infection. Choice of antibacterial depends on locality where infection acquired.
- Child under 12 years, single-dose of ceftriaxone p. 332
- Child 12–17 years, single-dose of cefixime p. 330
  - Alternatively, if micro-organism sensitive, single-dose of ciprofloxacin p. 361
- Child 12–17 years with pharyngeal infection, single-dose of ceftriaxone

Pelvic inflammatory disease
Contact tracing recommended.
- Child 2–11 years, erythromycin + metronidazole p. 344+ single-dose of i/m ceftriaxone
  - Suggested duration of treatment 14 days (except i/m ceftriaxone)
- Child 12–17 years, doxycycline + metronidazole + single-dose of i/m ceftriaxone
  - If severely ill, seek specialist advice.
  - Suggested duration of treatment 14 days (except i/m ceftriaxone)

Syphilis
Contact tracing recommended.
- Child under 12 years, benzylpenicillin sodium p. 349 or procaine benzylpenicillin [unlicensed]
  - Suggested duration of treatment 10 days

Early syphilis (infection of less than 2 years)
- Child 12–17 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment single-dose (repeat dose after 7 days for females in the third trimester of pregnancy)
  - Alternatively, doxycycline or erythromycin
  - Suggested duration of treatment 14 days

Late latent syphilis (asymptomatic infection of more than 2 years)
- Child 12–17 years, benzathine benzylpenicillin [unlicensed]
  - Suggested duration of treatment once weekly for 2 weeks
  - Alternatively, doxycycline
  - Suggested duration of treatment 28 days

Asymptomatic contacts of patients with infectious syphilis
- Child 12–17 years, doxycycline
  - Suggested duration of treatment 14 days

Neonatal congenital syphilis
- Benzylpenicillin sodium
  - Also consider treating neonates with suspected congenital syphilis whose mothers were treated inadequately for syphilis, or whose mothers were treated for syphilis in the 4 weeks before delivery, or whose mothers were treated with non-penicillin antibacterials for syphilis.
  - Suggested duration of treatment 10 days.

Genital system infections, antibacterial therapy
Uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection
Contact tracing recommended.
- Child under 12 years, erythromycin p. 341
  - Suggested duration of treatment 14 days
- Child 12–17 years, azithromycin p. 339 as a single dose or doxycycline p. 364 for 7 days
  - Alternatively, erythromycin for 14 days

Gonorrhoea: uncomplicated
Contact tracing recommended. Consider chlamydia co-infection. Choice of antibacterial depends on locality where infection acquired.
- Child under 12 years, single-dose of ceftriaxone p. 332
- Child 12–17 years, single-dose of cefixime p. 330
  - Alternatively, if micro-organism sensitive, single-dose of ciprofloxacin p. 361
- Child 12–17 years with pharyngeal infection, single-dose of ceftriaxone

Musculoskeletal system infections, antibacterial therapy
Osteomyelitis
Seek specialist advice if chronic infection or prostheses present.
- Flucloxacillin p. 357
  - Consider adding fusidic acid p. 371 or rifampicin p. 379 for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection
  - If penicillin–allergic, clindamycin p. 337
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - Suggested duration of treatment 6 weeks for acute infection
  - If meticillin–resistant Staphylococcus aureus suspected, vancomycin p. 335 (or teicoplanin p. 334)
Consider adding fusidic acid or rifampicin for initial 2 weeks.
- **Suggested duration of treatment** 6 weeks for acute infection

### Septic arthritis
Seek specialist advice if prostheses present.
- Flucloxacillin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin (or teicoplanin)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 330 (or ceftriaxone p. 332)
- **Suggested duration of treatment** 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

### Nose infections, antibacterial therapy

#### Sinusitis (acute)
Acute sinusitis is generally triggered by a viral infection, although occasionally it may become complicated by a bacterial infection caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Moraxella catharrhalis*, or *Staphylococcus aureus*. For further information see Sinusitis (acute) p. 721.

#### Treatment
- **Antibacterial therapy should only be offered to children with acute sinusitis who are systemically very unwell, have signs and symptoms of a more serious illness, those who are at high-risk of complications due to pre-existing comorbidities, or whenever bacterial sinusitis is suspected.**
- For further information see Sinusitis (acute) p. 721.

#### Choice of antibacterial therapy

**No penicillin allergy**
- **First line:** Non-life threatening symptoms: phenoxymethylpenicillin p. 350.
  - Systemically very unwell, signs and symptoms of a more serious illness, or at high-risk of complications: co-amoxiclav p. 354.
- **Second line** (worsening symptoms despite 2 or 3 days of antibiotic treatment):
  - Non-life threatening symptoms: co-amoxiclav.
  - Systemically very unwell, signs and symptoms of a more serious illness or at high-risk of complications: consult local microbiologist.

**Penicillin allergy or intolerance**
- **First line:** clarithromycin p. 340, or doxycycline p. 364 (for children above 12 years old).
- **Second line** (worsening symptoms despite 2 or 3 days of antibiotic treatment): Consult local microbiologist.

### Use of nasal drops
- Local decongestant nasal drops can be useful in both acute and chronic sinusitis, especially in children or those with atopic sensitivities.
- Do not use as chronic treatment.

### Coagulase-negative staphylococci
- More common from nasal carriage, it is less likely to be associated with serious complications than *S. aureus*.
- Usually treated with vancomycin or rifampicin.

### Septic arthritis
- **Suggested duration of treatment** 6 weeks for acute infection

### Oral bacterial infections

#### Antimicrobial drugs
- Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.
- The ‘blind’ prescribing of an antibiotic for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.
- Oral infections which may require antibacterial treatment include acute periapical or periodontal abscesses, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp).
- Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.
- Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.
- If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.
- Combination of a penicillin (or a macrolide) with metronidazole p. 344 may sometimes be helpful for the treatment of severe oral infections or oral infections.

#### Penicillins
- Phenoxymethylpenicillin p. 350 is effective for dentoalveolar abscess.

#### Broad-spectrum penicillins
- Amoxicillin p. 351 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.
- Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.
- Co-amoxiclav p. 354 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

#### Cephalosporins
- The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefadroxil p. 327 and cefadroxil p. 328 have been used in the treatment of oral infections.
Tetracyclines
In children over 12 years of age, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 364 has a longer duration of action than tetracycline p. 367 or oxytetracycline p. 367 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.
Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides
The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin
Clindamycin p. 337 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dental/veolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole
Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 346 is licensed for the treatment of acute ulcerative gingivitis.

Respiratory system infections, antibacterial therapy
Epiglottitis (Haemophilus influenzae)
- Cefotaxime p. 330 (or ceftriaxone p. 332)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 368

Bronchiectasis (non-cystic fibrosis), acute exacerbation
Bronchiectasis is a persistent or progressive condition, caused by chronic inflammatory damage to the airways and is characterised by thick-walled, dilated bronchi. Signs and symptoms may range from intermittent expectoration and infection, to chronic cough, persistent daily production of sputum, bacterial colonisation, and recurrent infections. An acute exacerbation is defined as sustained deterioration of the child’s signs and symptoms from their baseline and presents with worsening local symptoms, with or without increased wheeze, breathlessness or haemoptysis and may be accompanied by fever or pleurisy.

Treatment
Obtain a sputum sample and send for culture and susceptibility testing. Antibacterial therapy should be given to all children with an acute exacerbation.

For children receiving prophylactic antibacterial therapy, switching from intravenous to oral antibacterials, and for advice to be given to children and their parents, or carers, see Antibacterials, principles of therapy p. 309.

Reassessment
- Other diagnoses such as pneumonia, or signs and symptoms of a more serious illness such as cardiorespiratory failure, or sepsis;
- Previous antibacterial use that may have led to resistance.

Choice of antibacterial therapy

Oral first line:
- Amoxicillin p. 351, clarithromycin p. 340, or doxycycline p. 364 (child over 12 years).
- Alternative if at high risk of treatment failure (repeated courses of antibacterials, previous culture with resistant or atypical bacteria, or high risk of complications): co-amoxiclav p. 354, or ciprofloxacin p. 361 (on specialist advice).

Intravenous first line (severely unwell or unable to take oral treatment):
- Amoxiclav, piperacillin with tazobactam p. 348, or ciprofloxacin (on specialist advice).

Antibacterial prophylaxis
For children with repeated acute exacerbations, a trial of antibacterial prophylaxis may be given on specialist advice only.

Cough, acute
Acute cough is usually self-limiting and often resolves within 3–4 weeks without antibacterials. It is most commonly caused by a viral upper respiratory tract infection, but can have other infective causes such as acute bronchitis or pneumonia, or non-infective causes such as interstitial lung disease or gastro-oesophageal reflux disease.

Treatment
Children and their parents, or carers should be advised that an acute cough is usually self-limiting and to manage symptoms using self-care treatments. These include honey (for children under the age of 1 year) and over-the-counter cough medicines containing expectorants or cough suppressants, however there is limited evidence to support the use of such products. For more information, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 191.

Children with an acute cough who are systemically very unwell should be offered immediate antibacterial treatment.

Do not routinely offer an antibacterial to treat an acute cough associated with an upper respiratory tract infection or acute bronchitis in children who are not systemically very unwell or at higher risk of complications.

Children with a pre-existing co-morbidity or young children who were born prematurity are considered to be at a higher risk of complications if they present with an acute cough. In these patients, the need for immediate
antibacterial treatment should be considered based on the face-to-face clinical examination. A

For general advice to give to children and their parents, or carers, see Antibiocin, principles of therapy p. 309. B

Seek specialist advice, or refer children with an acute cough to hospital if they have signs or symptoms of a more serious illness or condition. A

Reassessment

B

Reassess if symptoms worsen rapidly or significantly taking into account alternative diagnoses, symptoms suggestive of a more serious condition, and previous antibacterial use which may have led to resistant bacteria. A

Choice of antibacterial therapy

- First line
  - Amoxicillin.
  - Alternative first line choices: clarithromycin, erythromycin p. 341, or doxycycline (child over 12 years). A

Choice during pregnancy:

- Amoxicillin or erythromycin. A

Community-acquired pneumonia

Children under 2 years with mild symptoms of lower respiratory tract infection (particularly those vaccinated with pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 819 and haemophilus type b conjugate vaccine) are unlikely to have pneumonia; antibacterial treatment may be considered if symptoms persist.

- Neonate, benzylpenicillin sodium p. 349 + gentamicin p. 322
- Child 1 month–18 years, amoxicillin (or ampicillin p. 353) by mouth
- Pneumococci with decreased penicillin sensitivity have been isolated in the UK, but are not common.
- If no response to treatment, add clarithromycin (or azithromycin p. 339 or erythromycin)
- If staphylococci suspected (e.g. in influenza or measles), give by mouth amoxicillin + flucloxacillin p. 357 or co-amoxiclav alone
- If septicaemia, complicated pneumonia, or if oral administration not possible, initiate treatment with i/v amoxicillin or i/v co-amoxiclav or i/v ceftriaxone p. 329 or i/v cefotaxime (or ceftiraxone)
- Suggested duration of treatment 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)
- Child 1 month–18 years, if penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)

Pneumonia possibly caused by atypical pathogens

- Clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment 10–14 days
- Alternative for chlamydia or mycoplasma infections in children over 12 years, doxycycline
- Suggested duration of treatment 10–14 days

Hospital-acquired pneumonia

- Early-onset infection (less than 5 days after admission to hospital), treat as for severe community-acquired pneumonia of unknown aetiology; if life-threatening infection, or if recent history of antibacterial treatment, or if resistant organisms suspected, treat as for late-onset hospital-acquired pneumonia
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam) or another antipseudomonal beta-lactam

- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 335.
- If severe illness caused by Pseudomonas aeruginosa, add an aminoglycoside.
- Suggested duration of treatment 7 days (longer if Pseudomonas aeruginosa confirmed)

Lung infection in cystic fibrosis (Staphylococcus spp.)

- Flucloxacillin
- If child already taking flucloxacillin prophylaxis or if severe exacerbation, add fusidic acid p. 371 or rifampicin p. 379; use flucloxacillin at treatment dose
- If penicillin-allergic, clarithromycin p. 340 (or azithromycin p. 339 or erythromycin p. 341) or clindamycin p. 337
- Use clarithromycin only if micro-organism sensitive

Lung infection in cystic fibrosis (Haemophilus influenzae)

- Amoxicillin p. 351 or a broad-spectrum cephalosporin
- In severe exacerbation use a third-generation cephalosporin (e.g. cefotaxime p. 330)

Lung infection in cystic fibrosis (Pseudomonas spp.)

- Ciprofloxacin p. 361 + nebulised colistimethate sodium p. 358
- For severe exacerbation, an antipseudomonal beta-lactam antibiotic + parenteral tobramycin p. 323

Skin infections, antibacterial therapy

Impetigo: small areas of skin infected

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 371
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant Staphylococcus aureus, topical mupirocin p. 748
- Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 357
- If streptococci suspected in severe infection, add phenoxybenzyl penicillin p. 350
- Suggested duration of treatment 7 days.
- If penicillin-allergic, oral clarithromycin p. 340 (or azithromycin p. 339 or erythromycin p. 341)
- Suggested duration of treatment 7 days.

Erysipelas

- Phenoxybenzyl penicillin or benzylpenicillin sodium p. 349
- If severe infection, replace phenoxybenzyl penicillin or benzylpenicillin sodium with high-dose flucloxacillin
- Suggested duration of treatment at least 7 days
- If penicillin-allergic, clindamycin p. 337 or clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment at least 7 days.
Cellulitis
- Flucloxacillin (high dose)
  - If streptococcal infection confirmed, replace flucloxacillin with phenoxybenzylpenicillin or benzylpenicillin sodium
  - If Gram-negative bacteria or anaerobes suspected (e.g. facial infection, orbital infection, or infection caused by animal or human bites), use broad-spectrum antibacterials; if periumbilical cellulitis, use flucloxacillin + gentamicin p. 322
- If penicillin-allergic, clindamycin or clarithromycin (or azithromycin or erythromycin)
- If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Staphylococcal scalded skin syndrome
- Flucloxacillin
  - Suggested duration of treatment 7–10 days.
- If penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
  - Suggested duration of treatment 7–10 days.

Animal and human bites
Cleanse wound thoroughly. For tetanus-prone wound, give appropriate prophylaxis to prevent viral spread.
- For tetanus-prone wound, give with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection. Consider rabies prophylaxis for animal or human bites), use broad-spectrum antibacterials; if periumbilical cellulitis, use flucloxacillin + gentamicin p. 322
- Co-amoxiclav p. 354
  - If penicillin-allergic, clindamycin

Surgical wound infection
- Flucloxacillin or co-amoxiclav

Paronychia or ‘septic spots’ in neonate
- Flucloxacillin
  - If systemically unwell, add an aminoglycoside.

ANTIBACTERIALS > AMINOGLYCOSIDES

Aminoglycosides

Overview
These include amikacin p. 321, gentamicin p. 322, neomycin sulfate p. 714, streptomycin p. 323, and tobramycin p. 323. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 344 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Cystic fibrosis
A higher dose of parenteral aminoglycoside is often required in children with cystic fibrosis because renal clearance of the aminoglycoside is increased. Aminoglycosides have a role in the treatment of pseudomonal lung infections in cystic fibrosis. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Once daily dosage
*Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and has largely superseded *multiple-daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once–daily, high-dose regimen of an aminoglycoside should be avoided in children with endocarditis or burns of more than 20% of the total body surface area. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations
Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and *must* be determined in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Neonates
As aminoglycosides are eliminated principally via the kidney, neonatal treatment must reflect the changes in glomerular filtration that occur with increasing gestational and postnatal age. The *extended interval dose regimen* is used in neonates, and serum-aminoglycoside concentrations *must* be measured. In patients on single daily dose regimens it may become necessary to prolong the dose interval to more than 24 hours if the trough concentration is high.
Aminoglycosides (by injection)

- **CONTRAINDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) - conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside - whenever possible, parenteral treatment should not exceed 7 days
- **SIDE-EFFECTS**
  - **Common or very common** Skin reactions - tinnitus
  - **Uncommon** Nausea - vomiting
  - **Rare or very rare** Anaemia - bronchospasm - eosinophilia - fever - headache - hearing loss - hypomagnesaemia - paraesthesia - renal impairment
  - **Frequency not known** Confusion - lethargy - nephrotoxicity

**SIDE-EFFECTS, FURTHER INFORMATION**
Otootoxicity and nephrotoxicity are important side-effects to consider with aminoglycoside therapy. Nephrotoxicity occurs most commonly in patients with renal impairment.

- **PREGNANCY** There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

**MONITORING** If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Otootoxicity and nephrotoxicity occur commonly in patients with renal failure. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children over 1 month of age with a creatinine clearance less than 20 mL/minute/1.73 m².

**Dose adjustments** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well.

**Monitoring** Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

**MONITORING REQUIREMENTS**
- Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.
- Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.
- Serum aminoglycoside concentrations must be determined in neonates.
- In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen.
- Blood samples should be taken just before the next dose is administered (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration). If the post-dose (‘peak’) concentration is high, the dose must be decreased.
- Renal function should be assessed before starting an aminoglycoside and during treatment.
- Auditory and vestibular function should also be monitored during treatment.

Amikacin

- **INDICATIONS AND DOSE**
  - **Serious Gram-negative infections resistant to gentamicin (multiple daily dose regimen)**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Child 1 month–11 years: 7.5 mg/kg every 12 hours, to be administered over 3–5 minutes
      - Child 12–17 years: 7.5 mg/kg every 12 hours; increased to 7.5 mg/kg every 8 hours (max. per dose 500 mg every 8 hours) for up to 10 days, higher dose to be used in severe infection, to be administered over 3–5 minutes; maximum 15 g per course
  - **Serious Gram-negative infections resistant to gentamicin (once daily dose regimen)**
    - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
      - Neonate: 15 mg/kg every 24 hours, intravenous injection to be administered over 3–5 minutes.
      - **Neonatal sepsis (extended interval dose regimen)**
        - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Neonate: Loading dose 10 mg/kg, then 7.5 mg/kg every 12 hours, intravenous injection to be administered over 3–5 minutes.
  - **Pseudomonal lung infection in cystic fibrosis**
    - **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child: 10 mg/kg every 8 hours (max. per dose 500 mg every 8 hours), intravenous injection to be administered over 3–5 minutes
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - **To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely**

- **UNLICENSED USE**
  - With intravenous use. Dose for cystic fibrosis not licensed.

- **INTERACTIONS** → Appendix 1: aminoglycosides

- **SIDE-EFFECTS**
  - **Uncommon** Superinfection
  - **Rare or very rare** Albuminuria - arthralgia - azotaemia - balance impaired - hearing impairment - hypotension - muscle twitching - tremor
  - **Frequency not known** Apnoea - neuromuscular blockade - paralysis

- **MONITORING REQUIREMENTS**
  - With intravenous use. Multiple daily dose regimen: one-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre. **Once daily dose regimen**: pre-dose (‘trough’) concentration should be less than 5 mg/litre.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use. For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 30–60 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in the dosing advice provided.
Infection

322 Bacterial infection

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- **Amikacin (Non-proprietary)**
  - Amikacin (as Amikacin sulfate) 250 mg per 1 ml
  - Amikacin 500mg/2ml solution for injection vials | 5 vial | £60.00 (Hospital only)
- **Aminikin** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Amikacin (as Amikacin sulfate) 50 mg per 1 ml
  - Amikin 100mg/2ml solution for injection vials | 5 vial | £10.33

INTERACTIONS → Appendix 1: aminoglycosides

SIDE-EFFECTS Antibiotic associated colitis - blood disorder - depression - encephalopathy - hallucination - hepatic reaction - neurotoxicity - peripheral neuropathy - seizure - stomatitis - vestibular damage

MONITORING REQUIREMENTS

- With intravenous use in neonates. Extended interval dose regimen in neonates: pre-dose (‘trough’) concentration should be less than 2 mg/litre (less than 1 mg/litre if more than 3 doses administered); consider monitoring one hour (‘peak’) concentration in neonates with poor response to treatment, with oedema, with Gram-negative infection, or with birth-weight greater than 4.5 kg (consider increasing dose if ‘peak’ concentration less than 8 mg/litre in severe sepsis).
- With intravenous use. Once daily dose regimen: pre-dose (‘trough’) concentration should be less than 1 mg/litre.
- With intramuscular or intravenous use. Multiple daily dose regimen: one hour (‘peak’) serum concentration should be 5–10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre. Multiple daily dose regimen for endocarditis: one hour (‘peak’) serum concentration should be 3–5 mg/litre; pre-dose (‘trough’) concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). Multiple daily dose regimen for cystic fibrosis: one hour (‘peak’) serum concentration should be 8–12 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
- With intrathecal use or intraventricular use Intrathecal/ intraventricular injection: cerebrospinal fluid concentration should not exceed 10 mg/litre.

DIRECTIONS FOR ADMINISTRATION

- With intrathecal or intraventricular use. For intrathecal or intraventricular injection, use preservative-free intrathecal preparations only.
- With intravenous use. For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

PRESCRIBING AND DISPENSING INFORMATION

Local guidelines may vary in the dosing advice provided.

- With intrathecal use. Only preservative-free intrathecal preparation should be used.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Gentamicin (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule | £36.28 DT + £36.28 (Hospital only)
- **Gentamicin (as Gentamicin sulfate)** 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule | £11.25 DT + £11.25
- **Gentamicin Paediatric** 20mg/2ml solution for injection vials | 5 vial | £11.25 DT + £11.25
- **Gentamicin (as Gentamicin sulfate)** 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial | £6.88 DT + £6.88
- **Gentamicin (as Gentamicin sulfate)** 10 mg per 1 ml Gentamicin 20mg/2ml solution for injection vials | 5 ampoule | £6.88 DT + £6.88
- **Gentamicin Adult Injection** 80mg/2ml solution for injection vials | 5 vial | £12.00
- **Cidomycin (Sanofi)**
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial | £6.88 DT + £6.88
  - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule | £6.88 DT + £6.88

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: POTENTIAL FOR HISTAMINE-RELATED ADVERSE DRUG REACTIONS WITH SOME BATCHES (NOVEMBER 2017)

Following reports that some batches of gentamicin sulphate active pharmaceutical ingredient (API) used to manufacture gentamicin may contain higher than expected levels of histamine, which is a residual from the manufacturing process, the MHRA advise to monitor patients for signs of histamine-related adverse reactions; particular caution is required in patients taking concomitant drugs known to cause histamine release, in children, and in patients with severe renal impairment.

INDICATIONS AND DOSE

Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis

- **BY INTRAVENOUS INFUSION**
  - Child: Initially 7 mg/kg, to be given in a once daily regimen (not suitable for endocarditis or meningitis), subsequent doses adjusted according to serum-gentamicin concentration.
  - **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 2.5 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes
  - Child 12–17 years: 2.5 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

Neonatal sepsis

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 5 mg/kg every 36 hours, to be given in an extended interval dose regimen.
  - Neonate 7 days to 28 days: 5 mg/kg every 24 hours, to be given in an extended interval dose regimen.

Pseudomonal lung infection in cystic fibrosis

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: 3 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

Bacterial ventriculitis and CNS infection (supplement to systemic therapy) (administered on expert advice)

- **BY INTRATHecal INJECTION, OR BY INTRAVENTRICULAR INJECTION**
  - Neonate: (consult local protocol).

Neonate: Initially 1 mg daily, then increased if necessary to 5 mg daily, seek specialist advice

DOSES AT EXTREMES OF BODY-WEIGHT

- With intramuscular use or intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-gentamicin concentration closely.
**Bacterial infection** 323

### Streptomycin

**INDICATIONS AND DOSE**

Tuberculosis, resistant to other treatment, in combination with other drugs

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child: 15 mg/kg once daily (max. per dose 1 g)

Adjunct to doxycycline in brucellosis (administered on expert advice)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child: 5–10 mg/kg every 6 hours, total daily dose may alternatively be given in 2–3 divided doses

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

**INTERACTIONS** → Appendix 1: aminoglycosides

**SIDE-EFFECTS**

- Hypersensitivity - oral paraesthesia

**RENAI IMPAIRMENT**

Dose adjustments Should preferably be avoided. If essential, use with great care and consider dose reduction.

**MONITORING REQUIREMENTS**

- One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment).

**MEDICINAL FORMS**

Forms available from special-order manufacturers include: powder for solution for injection

---

### Tobramycin

**INDICATIONS AND DOSE**

Chronic *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 6-17 years: 170 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

**Pseudomonal lung infection in cystic fibrosis**

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 8–10 mg/kg daily in 3 divided doses, to be given as a multiple daily dose regimen over 3–5 minutes

**SEPTICAEMIA | MENINGITIS AND OTHER CNS INFECTIONS | BILIARY-TRACT INFECTION | ACUTE PYLEONEPHRITIS | PNEUMONIA IN HOSPITAL PATIENTS**

- **BY SLOW INTRAVENOUS INJECTION**
  - Child 1 month-11 years: 2–2.5 mg/kg every 8 hours, to be given as a multiple daily dose regimen over 3–5 minutes

---

**CAUTIONS**

- When used by inhalation conditions characterised by muscular weakness—may impair neuromuscular transmission - history of prolonged previous or concomitant intravenous aminoglycosides—increased risk of otoxicity - renal impairment—limited information available - severe haemoptysis—risk of further haemorrhage

**INTERACTIONS** → Appendix 1: aminoglycosides

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare or very rare: Diarrhoea - dizziness

**SPECIFIC SIDE-EFFECTS**

- Common or very common
  - When used by inhalation: Dysphonia - malaise - respiratory disorder - sputum discolouration

- Uncommon
  - When used by inhalation: Cough

- Rare or very rare
  - When used by inhalation: Abdominal pain - aphony - appetite decreased - asthenia - asthma - chest discomfort - drowsiness - ear disorder - ear pain - haemorrhage - hypoxia - increased risk of infection - lymphadenopathy - oral ulceration - pain - taste altered

- Frequency not known
  - When used by inhalation: Oropharyngeal pain
With parenteral use: 
- Granulocytopenia
- Leucocytosis
- Leucopenia
- Nerve disorders
- Thrombocytopenia
- Urine abnormalities
- Vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

Manufacturer advises to monitor serum-tobramycin concentration in patients with known or suspected signs of auditory dysfunction; if ototoxicity develops — discontinue treatment until serum concentration falls below 2 mg/litre.

**RENAL IMPAIRMENT**

- When used by inhalation: Manufacturer advises monitor serum-tobramycin concentration; if nephrotoxicity develops — discontinue treatment until serum concentration falls below 2 mg/litre.

**MONITORING REQUIREMENTS**

- With intravenous use: Extended interval dose regimen in neonates: pre-dose (‘trough’) concentration should be less than 2 mg/litre.
- With intravenous use: Once daily dose regimen: pre-dose (‘trough’) concentration should be less than 1 mg/litre.
- Multiple daily dose regimen: one-hour (‘peak’) serum concentration should not exceed 10 mg/litre in cystic fibrosis; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
- When used by inhalation: Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Manufacturer advises monitor renal function before treatment and then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 20–60 minutes.
- When used by inhalation: Other inhaled drugs should be administered before tobramycin.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intravenous use or when used by inhalation: Local guidelines may vary in dosing advice provided.

**PATIENT AND CARER ADVICE**

- When used by inhalation: Patient counselling is advised for tobramycin dry powder for inhalation (administration).

**NEBULISER SOLUTION**

- When used by inhalation: Manufacturer advises monitor concentration in serum.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE decisions**

- Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
- When used by inhalation: Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA276](http://www.nice.org.uk/TA276)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- **Tobramycin (Non-proprietary)**
  - Tobramycin 40 mg per 1 ml: Tobramycin 80mg/2ml solution for injection vials: 5 vial ([PMS]) £20.80 DT + £20.80
  - Tobramycin 240mg/6ml solution for injection vials: 1 vial ([PMS]) £19.20 DT + £19.20
  - Nebcin (Flynn Pharma Ltd): Tobramycin 40 mg per 1 ml Nebcin 80mg/2ml solution for injection vials: 1 vial ([PMS]) £5.37 DT + £5.37

**Inhalation powder**

- Tobin Podhaler (Novartis Pharmaceuticals UK Ltd): Tobramycin 28 mg Tobin Podhaler 28mg inhalation powder capsules with device: 224 capsule ([PMS]) £1,790.00 DT + £1,790.00

**Nebuliser liquid**

- **Tobramycin (Non-proprietary)**
  - Tobramycin 60 mg per 1 ml: Tobramycin 300mg/5ml nebuliser liquid ampoules: 56 ampoule ([PMS]) £1,187.00 DT + £780.00
  - Bramitob (Chiesi Ltd): Tobramycin 75 mg per 1 ml Bramitob 300mg/4ml nebuliser solution 4ml ampoules: 56 ampoule ([PMS]) £1,187.00 DT + £1,187.00
  - TOBI (Novartis Pharmaceuticals UK Ltd): Tobramycin 60 mg per 1 ml Tobi 300mg/5ml nebuliser solution 5ml ampoules: 56 ampoule ([PMS]) £1,305.92 DT + £780.00
  - Tymbrineb (Teva UK Ltd): Tobramycin 60 mg per 1 ml Tymbrineb 300mg/5ml nebuliser solution 5ml ampoules: 56 ampoule ([PMS]) £780.00 DT + £780.00
  - Vantobra (Pari Medical Ltd): Tobramycin 100 mg per 1 ml Vantobra 170mg/1.7ml nebuliser solution 1.7ml ampoules: 56 ampoule ([PMS]) £1,305.00

**ANTIBACTERIALS**

**Carbenapens**

**Overview**

The carbenapens are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; *imipenem* (imipenem with cilastatin p. 325) and meropenem p. 326 have good activity against *Pseudomonas aeruginosa*. The carbenapens are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections caused by multiple-antibacterial resistant organisms (including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections).

Ertapenem p. 325 is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. Unlike the other carbenapens, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp*.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with *cilastatin* (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.
Ertapenem

**INDICATIONS AND DOSE**

- **Abdominal infections** | **Acute gynaecological infections** | **Community-acquired pneumonia**
  - By intravenous infusion
  - Child 3 months-12 years: 15 mg/kg every 12 hours; maximum 1 g per day
  - Child 13-17 years: 1 g once daily
- **Diabetic foot infections of the skin and soft-tissue**
  - By intravenous infusion
  - Child 13-17 years: 1 g once daily

**CAUTIONS**
- CNS disorders—risk of seizures
- Interaction → Appendix 1: carbapenems
- Side-effects
  - Common or very common: Diarrhoea, skin reactions
  - Uncommon: Faeces discoloured, headache, hot flush, hypertension, melaena
  - Frequency not known: Aggression, hallucinations, psychiatric disorder

**ALLERGY AND CROSS-SENSITIVITY**
- Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.
- Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**
- Present in milk—manufacturer advises avoid.

**RENAL IMPAIRMENT**
- Use with caution (risk of seizures); avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion (Invanz®), give intermittently in Sodium chloride 0.9%.
  - Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for infusion**
  - Ertapenem (Non-proprietary)
    - Ertapenem (as Ertapenem sodium) 1 g
    - Ertapenem (as Ertapenem sodium) 1 g
  - **Powder for solution for infusion vials**
    - Invanz (Merck Sharp & Dohme Ltd)
    - Ertapenem (as Ertapenem sodium) 1 g

Imipenem with cilastatin

**INDICATIONS AND DOSE**

- **Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections)** | **Hospital-acquired sepsicaemia**
  - By intravenous infusion
  - Neonate up to 7 days: 20 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 20 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 20 mg/kg every 6 hours.
  - Child 1-2 months: 20 mg/kg every 6 hours.
  - Child 3 months-17 years: 15 mg/kg every 6 hours (max. per dose 500 mg)

**UNLICENSED USE**
- Not licensed for use in children under 1 year.

**CAUTIONS**
- CNS disorders—epilepsy
- Interaction → Appendix 1: carbapenems

**SIDE-EFFECTS**
- Common or very common: Diarrhoea, eosinophilia, nausea, skin reactions, thrombophlebitis, vomiting
- Uncommon: Bone marrow disorders, confusion, dizziness, drowsiness, hallucinations, hypotension, leucopenia, movement disorders, psychiatric disorder, seizure, thrombocytopenia, thrombocytosis
- Rare or very rare: Agranulocytosis, anaphylactic reaction, angioedema, chest discomfort, colitis haemorrhagic, cyanosis, dyspnoea, encephalopathy, flushing, focal tremor, gastrointestinal discomfort, haemolytic anaemia, headache, hearing loss, hepatic disorders, hyperhidrosis, hyperventilation, increased risk of infection, myasthenia gravis aggravated, oral disorders, palpitations, paraesthesia, polynephritis, polynia, pseudomembranous enterocolitis, renal impairment, severe cutaneous adverse reactions (SCARs), spinal pain, tachycardia, taste altered, tinnitus, tongue discolouration, tooth discoloration, urine discolouration, vertigo
- Frequency not known: Agitation

**ALLERGY AND CROSS-SENSITIVITY**
- Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.
- Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY**
- Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**
- Present in milk but unlikely to be absorbed.

**RENAL IMPAIRMENT**
- Clinical data are insufficient to recommend dosing for children with impairment (serum creatinine greater than 2 mg/dL)—in adults, manufacturer advises reduce dose (consult product literature).

**EFFECT ON LABORATORY TESTS**
- Positive Coombs’ test.

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for infusion**
  - Imipenem with cilastatin (Non-proprietary)
    - Cilastatin (as Cilastatin sodium) 500 mg, imipenem (as imipenem monohydrate) 500 mg Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials | 10 vial (£24.10)
    - Primaxin IV (Merck Sharp & Dohme Ltd)
      - Cilastatin (as Cilastatin sodium) 500 mg, imipenem (as imipenem monohydrate) 500 mg Primaxin IV 500mg powder for solution for infusion vials | 1 vial (£12.00)
Meropenem

06-Aug-2018

● INDICATIONS AND DOSE

Aerobic and anaerobic Gram-positive and Gram-negative infections: Hospital-acquired septicaemia

▶ By intravenous infusion, or by intravenous injection

Neonate up to 7 days: 20 mg/kg every 12 hours.

Neonate 7 days to 28 days: 20 mg/kg every 8 hours.

Child 1 month–11 years (body-weight up to 50 kg): 10–20 mg/kg every 8 hours.

Child 1 month–11 years (body-weight 50 kg and above): 0.5–1 g every 8 hours.

Child 12–17 years: 0.5–1 g every 8 hours.

Severe aerobic and anaerobic Gram-positive and Gram-negative infections

▶ By intravenous infusion, or by intravenous injection

Neonate up to 7 days: 40 mg/kg every 12 hours.

Neonate 7 days to 28 days: 40 mg/kg every 8 hours.

Child 12–17 years: 2 g every 8 hours.

Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis

▶ By intravenous infusion

Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours.

Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours.

Child 12–17 years: 2 g every 8 hours.

Meningitis

▶ By intravenous infusion

Neonate up to 7 days: 40 mg/kg every 12 hours.

Neonate 7 days to 28 days: 40 mg/kg every 8 hours.

Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours.

Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours.

Child 12–17 years: 2 g every 8 hours.

● UNLICENSED USE

Not licensed for use in children under 3 months.

● INTERACTIONS ➔ Appendix 1: carbapenems

● SIDE-EFFECTS

▶ Common or very common

Abdominal pain, diarrhoea, headache, inflammation, nausea, pain, skin reactions, thrombocytopenia, vomiting

▶ Uncommon

Agranulocytosis, antibiotic associated colitis, eosinophilia, haemolytic anaemia, increased risk of infection, leucopenia, neutropenia, paraesthesia, severe cutaneous adverse reactions (SCARs), thrombocytopenia, thrombophlebitis

▶ Rare or very rare

Seizure

● ALLERGY AND CROSS-SENSITIVITY

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

● PREGNANCY

Use only if potential benefit outweighs risk—no information available.

● BREASTFEEDING

Unlikely to be absorbed (however, manufacturer advises avoid).

● RENAL IMPAIRMENT

Dose adjustments

Use normal dose every 12 hours if estimated glomerular filtration rate 26–50 mL/minute/1.73 m².

Use half normal dose every 12 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m².

Use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

Monitor liver function—risk of hepatotoxicity.

● EFFECT ON LABORATORY TESTS

Positive Coombs’ test.

● DIRECTIONS FOR ADMINISTRATION

Intravenous injection to be administered over 5 minutes.

Displacement value may be significant when reconstituting injection, consult local guidelines. For intravenous infusion, dilute reconstituted solution further to a concentration of 1–20 mg/mL in Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

ELECTROLYTES: May contain Sodium

Meropenem (non-proprietary)

Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500 mg powder for solution for injection vials | 10 vial POM £83.00–£103.14 DT + £88.90 (Hospital only) | 10 vial POM £88.90–£103.14 DT + £88.90

Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1 g powder for solution for injection vials | 10 vial POM £117.80–£206.28 DT = £177.80 (Hospital only) | 10 vial POM £177.80–£206.30 DT = £177.80

Meropenem (Pfizer Ltd)

Meropenem (as Meropenem trihydrate) 500 mg Meropenem 500 mg powder for solution for injection vials | 10 vial POM £103.14 DT = £88.90

Meropenem (as Meropenem trihydrate) 1 gram Meropenem 1 g powder for solution for injection vials | 10 vial POM £206.28 DT = £177.80

ANTIBACTERIALS ➔ CEPHALOSPORINS

Cephalosporins

Overview

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 330 and ceftriaxone p. 332 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 330, cefotaxime, ceftriaxone p. 331, ceftriaxone, or cefuroxime p. 329 can be used with caution; cefaclor p. 328, cefadroxil p. 327, cefalexin p. 327, and cefadroxil p. 328 should be avoided.

The orally active ‘first generation’ cephalosporins, cefalexin, cefadine, and cefadroxil and the ‘second generation’ cephalosporin, cefaclor have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, and skin and soft-tissue infections. Cefaclor has good activity against H. influenzae. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against H. influenzae. Cefuroxime axetil, an ester of the ‘second generation’ cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.
Cefixime is an orally active ‘third generation’ cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftriaxone and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria. Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections also active against other Gram-negative bacteria. However, they are less active than cephalosporins against certain Gram-negative bacteria which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and resolve when the antibacterial is stopped. In neonates, bladder which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and resolve when the antibacterial is stopped.

### Cephalosporins

- **DRUG ACTION** Cephalosporins are antibacterials that attach to penicillin binding proteins to interrupt cell wall biosynthesis, leading to bacterial cell lysis and death.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - diarrhoea - dizziness - eosinophilia - headache - increased risk of infection - leucopenia - nausea - neutropenia - skin reactions - thrombocytopena - vomiting
  - **Uncommon** Anaphylactic reaction - antibiotic associated colitis
  - **Rare or very rare** Agranulocytosis - angioedema - nephritis tubulointerstitial (reversible) - severe cutaneous adverse reactions (SCARs)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cefixime hypersensitivity. Cross-sensitivity with other beta-lactam antibacterials. About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs’ test.

### ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

#### Cefadroxil

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
    - **BY MOUTH**
      - Child 6–17 years (body-weight up to 40 kg): 0.5 g twice daily
      - Child 6–17 years (body-weight 40 kg and above): 0.5–1 g twice daily

- **SIDE-EFFECTS**
  - **Common or very common** Dyspepsia - glossitis
  - **Rare or very rare** Arthralgia - drug fever - fatigue - hepatic disorders - insomnia - nervousness - serum sickness-like reaction

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

#### Cefalexin (Cephalexin)

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
    - **BY MOUTH**
      - Neonate up to 7 days: 25 mg/kg twice daily (max. per dose 125 mg).
      - Neonate 7 days to 20 days: 25 mg/kg 3 times a day (max. per dose 125 mg).
      - Neonate 21 days to 28 days: 25 mg/kg 4 times a day (max. per dose 125 mg).
      - Child 1–11 months: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
      - Child 1–4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
      - Child 5–11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
      - Child 12–17 years: 500 mg 2–3 times a day

- **SERIOUS SUSCEPTIBLE INFECTIONS**
  - **BY MOUTH**
    - Child 1 month–11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
    - Child 12–17 years: 1–1.5 g 3–4 times a day
Prophylaxis of recurrent urinary-tract infection

- BY MOUTH
  - Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night

- INTERACTIONS → Appendix 1: cephalosporins
- SIDE-EFFECTS Agitation - arthritis - confusion - fatigue - gastrointestinal discomfort - genitai pruritus - hallucination - hepatitis (transient) - hypersensitivity - jaundice cholestatic (transient) - joint disorders - vaginal discharge
- PREGNANCY Not known to be harmful.
- BREAST FEEDING Present in milk in low concentration, but appropriate to use.
- RENAL IMPAIRMENT Dose adjustments Reduce dose in moderate impairment.
- PATIENT AND CARER ADVICE Medicines for Children leaflet: Cefalexin for bacterial infections www.medicinesforchildren.org.uk/cefalexin-bacterial-infections-0

- PROFESSION SPECIFIC INFORMATION
  Dental practitioners’ formulary
  Cefalexin Capsules may be prescribed. Cefalexin Tablets may be prescribed. Cefalexin Oral Suspension may be prescribed.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

### Oral suspension

**CAUTIONARY AND ADVISORY LABELS**

- Cefalexin (Non-proprietary)
  - Cefalexin 25 mg per 1 ml Cefalexin 125mg/5ml oral suspension sugar free sugar-free | 100 ml (POD) £0.84–£1.65
  - Cefalexin 125mg/5ml oral suspension | 100 ml (POD) £1.64 DT = £0.84
  - Cefalexin 50 mg per 1 ml Cefalexin 250mg/5ml oral suspension sugar free sugar-free | 100 ml (POD) £1.72–£2.03
  - Keflex (Flynn Pharma Ltd) Keflex 125mg/5ml oral suspension | 100 ml (POD) £0.84 DT = £0.84
  - Cefalexin 50 mg per 1 ml Keflex 250mg/5ml oral suspension | 100 ml (POD) £1.40 DT = £1.40

#### Tablet

### Cefradine (Cephadrine)

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis
    - BY MOUTH
      - Child 7-11 years: 25–50 mg/kg daily in 2-4 divided doses
      - Child 12-17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
  - Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis
    - BY MOUTH
      - Child 7-17 years: 2 g twice daily

- **UNLICENSED USE** Not licensed for use in children for prevention of *Staphylococcus aureus* lung infection in cystic fibrosis.
- **INTERACTIONS** → Appendix 1: cephalosporins
- **SIDE-EFFECTS** Akathisia - aplastic anaemia - arthralgia - blood disorder - chest tightness - confusion - gastrointestinal discomfort - glossitis - hepatitis (transient) - hypersensitivity - jaundice cholestatic - muscle tone increased - nervousness - oedema - sleep disorder
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAI IMPAIRMENT** Dose adjustments Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **PROFESSION SPECIFIC INFORMATION**
  Dental practitioners’ formulary
  Cefradine Capsules may be prescribed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

### Capsule

**CAUTIONARY AND ADVISORY LABELS**

- Cefradine (Non-proprietary)
  - Cefradine 250 mg Cefradine 250mg capsules | 20 capsule (POD) £6.00 DT = £2.86
  - Cefradine 500 mg Cefradine 500mg capsules | 20 capsule (POD) £8.75 DT = £4.04

### ANTIBACTERIALS > CEPHALOSPORINS, SECOND-GENERATION

### Cefaclor

- **INDICATIONS AND DOSE**
  - Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 1-11 months: 20 mg/kg daily divided doses, usually 62.5 mg 3 times a day
      - Child 1-4 years: 20 mg/kg daily divided doses, alternatively 125 mg 3 times a day
      - Child 5-11 years: 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
      - Child 12-17 years: 250 mg 3 times a day; maximum 4 g per day
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child 12-17 years: 375 mg every 12 hours, dose to be taken with food
Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1-11 months: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
  - Child 1-4 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day
  - Child 5-11 years: 40 mg/kg daily in 3 divided doses, usual max. 1 g daily
  - Child 12-17 years: 500 mg 3 times a day; maximum 4 g per day

**Pneumonia**

- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child 12-17 years: 750 mg every 12 hours, dose to be taken with food

**Lower urinary-tract infections**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 375 mg every 12 hours, dose to be taken with food

Asymptomatic carriage of *Haemophilus influenzae* or mild exacerbations in cystic fibrosis

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1-11 months: 125 mg every 8 hours
  - Child 1-6 years: 250 mg 3 times a day
  - Child 7-17 years: 500 mg 3 times a day

**INTERACTIONS**

- **Appendix 1: cephalosporins**

**SIDE-EFFECTS**

- Akathisia
- Anxiety
- Aplastic anaemia
- Arthralgia
- Arthritis
- Asthenia
- Colitis
- Confusion
- Drowsiness
- Dyspnoea
- Fever
- Genital pruritus
- Hallucination
- Hepatitis (transient)
- Hypersensitivity
- Insomnia
- Jaundice
- Cholestatic (transient)
- Lymphadenopathy
- Lymphocytosis
- Muscle tone increased
- Nausea
- Paraesthesia
- Proteinuria
- Syncope
- Vasodilatation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Cefaclor is associated with protracted skin reactions, especially in children.

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Present in milk in low concentration, but not known to be harmful.

**GENERAL SIDE-EFFECTS**

- Frequency not known

**Drug fever**

- **Surgical prophylaxis**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child: 50 mg/kg (max. per dose 1.5 g), to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 30 mg/kg every 8 hours (max. per dose 750 mg) if required for up to 3 doses (for high-risk procedures)

**INDICATIONS AND DOSE**

Susceptible infections due to Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 3 months-1 year: 10 mg/kg twice daily (max. per dose 125 mg)
  - Child 2-11 years: 15 mg/kg twice daily (max. per dose 250 mg)
  - Child 12-17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Neonate up to 7 days: 25 mg/kg every 12 hours, increased if necessary to 50 mg/kg every 12 hours, increased dose used in severe infection.

- **Neonate 7 days to 28 days**: 25 mg/kg every 6 hours, increased if necessary to 50 mg/kg every 8 hours, increased dose used in severe infection.

- **Neonate 28 days to 1 month**: 25 mg/kg every 6 hours, increased if necessary to 50 mg/kg every 8 hours, increased dose used in severe infection.

- **Neonate 1 month to 11 years**: 50 mg/kg (max. per dose 750 mg) for up to 3 days in Lyme disease (for high-risk procedures)

- **11 years to 17 years**: 15 mg/kg twice daily (max. per dose 500 mg) for 14–21 days (for 28 days in Lyme arthritis)

- **Child 12-17 years**: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

**Lower urinary-tract infection**

- **BY MOUTH**
  - Child 3 months-11 years: 15 mg/kg twice daily (max. per dose 500 mg) for 14–21 days (for 28 days in Lyme arthritis)
  - Child 12-17 years: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

**Surgical prophylaxis**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child: 50 mg/kg (max. per dose 1.5 g), to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 30 mg/kg every 8 hours (max. per dose 750 mg) if required for up to 3 doses (for high-risk procedures)

**UNLICENSED USE**

- With oral use
  - Not licensed for treatment of Lyme disease in children under 12 years. Duration of treatment in Lyme disease is unlicensed.

**INTERACTIONS**

- **Appendix 1: cephalosporins**

**SIDE-EFFECTS**

- Frequency not known
  - Drug fever

**SPECIFIC SIDE-EFFECTS**

- **Uncommon**
  - With parenteral use
    - Gastrointestinal disorder
  - Frequency not known
  - With oral use
    - Hepatic disorders
    - Jarisch-Herxheimer reaction
    - Serum sickness
  - With parenteral use
    - Cutaneous vasculitis

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Present in milk in low concentration, but appropriate to use.
Infection

ANTIBACTERIALS

• MEDICINAL FORMS
  - With intramuscular use or intravenous use, single doses over 750 mg should be administered by the intravenous route only.
  - With intravenous use, displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

• PRESCRIBING AND DISPENSING INFORMATION
  - With oral use, see Lyme disease p. 374 for information on treatment.

• MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion.

Tablet

CAUTIONARY AND ADVISORY LABELS
  - 9, 21, 25
  - Cefuroxime (as Cefuroxime axetil) 250 mg: Cefuroxime 250 mg tablets | 14 tablet (PMD) £17.27 DT = £17.72
  - Zinnat (GlaxoSmithKline UK Ltd) Cefuroxime (as Cefuroxime axetil) 125 mg: Zinnat 125 mg tablets | 14 tablet (PMD) £4.56 DT = £4.56
  - Cefuroxime (as Cefuroxime axetil) 250 mg: Zinnat 250 mg tablets | 14 tablet (PMD) £9.11 DT = £9.72

Powder for injection

ELECTROLYTES: May contain Sodium
  - Cefuroxime (as Cefuroxime sodium) 250 mg: Cefuroxime 250 mg powder for injection vials | 10 vial (PMD) £3.25 (Hospital only)
  - Cefuroxime (as Cefuroxime sodium) 750 mg: Cefuroxime 750 mg powder for injection vials | 1 vial (PMD) £2.52 | 10 vial (PMD) £25.20 | 100 vial (PMD) £249.40 (Hospital only)
  - Cefuroxime (as Cefuroxime sodium) 1.5 g: Cefuroxime 1.5 g powder for injection vials | 1 vial (PMD) £5.05 | 10 vial (PMD) £50.50 (Hospital only)
  - Zinacef (GlaxoSmithKline UK Ltd) Cefuroxime (as Cefuroxime sodium) 250 mg: Zinacef 250 mg powder for injection vials | 5 vial (PMD) £4.70
  - Cefuroxime (as Cefuroxime sodium) 750 mg: Zinacef 750 mg powder for injection vials | 5 vial (PMD) £11.72 (Hospital only)
  - Cefuroxime (as Cefuroxime sodium) 1.5 g: Zinacef 1.5 g powder for injection vials | 1 vial (PMD) £4.70

Oral suspension

CAUTIONARY AND ADVISORY LABELS
  - 9, 21
EXCipients: May contain Aspartame, sucrose
  - Zinacef (GlaxoSmithKline UK Ltd) Cefuroxime (as Cefuroxime axetil) 25 mg per 1 ml: Zinacef 125 mg/ml oral suspension | 70 ml (PMD) £5.20 DT = £5.20

ANTIBACTERIALS

Cefixime

• INDICATIONS AND DOSE
  - Acute infections due to sensitive Gram-positive and Gram-negative bacteria
    - By mouth
      - Child 6–11 months: 75 mg daily
      - Child 1–4 years: 100 mg daily
      - Child 5–9 years: 200 mg daily
      - Child 10–17 years: 200–400 mg daily, alternatively 100–200 mg twice daily
  - Uncomplicated gonorrhoea
    - By mouth
      - Child 12–17 years: 400 mg for 1 dose

• UNLICENSED USE
  - Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

• INTERACTIONS
  - Appendix 1: cephalosporins

• SIDE-EFFECTS
  - Acute kidney injury, arthralgia, drug fever, dyspepsia, dyspnœa, face oedema, flatulence, genital pruritus, hypeerosinophilia, jaundice, serum sickness-like reaction, thrombocytosis

• PREGNANCY
  - Not known to be harmful.

• BREAST FEEDING
  - Manufacturer advises avoid unless essential — no information available.

• RENAL IMPAIRMENT
  - Dose adjustments: Reduce dose if estimated glomerular filtration rate less than 20 ml/minute/1.73 m².

• MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS
  - 9, 21, 25
  - Suprax (Sanofi) Cefixime 200 mg: Suprax 200 mg tablets | 7 tablet (PMD) £13.23 DT = £13.23

Cefotaxime

• INDICATIONS AND DOSE
  - Uncomplicated gonorrhoea
    - By intramuscular injection
      - Child 12–17 years: 500 mg for 1 dose

  - Severe exacerbations of Haemophilus influenzae infection in cystic fibrosis
    - By intravenous injection, or by intravenous infusion
      - Child: 50 mg/kg every 6–8 hours; maximum 12 g per day

  - Congenital gonococcal conjunctivitis
    - By intramuscular injection
      - Neonate: 100 mg/kg (max. per dose 1 g) for 1 dose.

Infections due to sensitive Gram-positive and Gram-negative bacteria: Surgical prophylaxis | Haemophilus epiglottitis
  - By intramuscular injection, or by intravenous infusion, or by intravenous infusion
  - Neonate up to 7 days: 25 mg/kg every 12 hours.

  - Neonate 7 days to 20 days: 25 mg/kg every 8 hours.

  - Neonate 21 days to 28 days: 25 mg/kg every 6–8 hours.

  - Child: 50 mg/kg every 8–12 hours

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Meningitis
  - By intramuscular injection, or by intravenous infusion, or by intravenous infusion
  - Neonate up to 7 days: 50 mg/kg every 12 hours.

  - Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

  - Neonate 21 days to 28 days: 50 mg/kg every 6–8 hours.

  - Child: 50 mg/kg every 6 hours; maximum 12 g per day

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)
  - By intravenous injection, or by intramuscular injection
  - Child 1 month–11 years: 50 mg/kg for 1 dose
  - Child 12–17 years: 1 g for 1 dose

• INTERACTIONS
  - Appendix 1: cephalosporins

• SIDE-EFFECTS
  - Uncommon: Drug fever, Jarisch-Hersheimer reaction, renal impairment, seizure
**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Cefotaxime (Non-proprietary)**
  - Ceftazidime (as Ceftazidime pentahydrate) 500 mg: Ceftazidime 500 mg powder for solution for injection vials | 10 vial (PO) £30.00 |
  - Ceftazidime (as Ceftazidime pentahydrate) 1 gram: Ceftazidime 1 g powder for solution for injection vials | 10 vial (PO) £35.00 | 10 vial (PO) £42.00 (Hospital only)
  - Ceftazidime (as Ceftazidime pentahydrate) 2 gram: Ceftazidime 2 g powder for solution for injection vials | 10 vial (PO) £37.50

---

### Ceftazidime

**INDICATIONS AND DOSE**

**Pseudomonal lung infection in cystic fibrosis**

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Child: 50 mg/kg every 8 hours; maximum 9 g per day

**Febrile neutropenia**

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child: 50 mg/kg every 8 hours; maximum 6 g per day

**Meningitis**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 24 hours.

- Neonate 7 days to 20 days: 50 mg/kg every 12 hours.

- Neonate 21 days to 28 days: 50 mg/kg every 8 hours.

- Child: 50 mg/kg every 8 hours; maximum 6 g per day

**Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Neonate up to 7 days: 25 mg/kg every 24 hours.

- Neonate 7 days to 20 days: 25 mg/kg every 12 hours.

- Neonate 21 days to 28 days: 25 mg/kg every 8 hours.

- Child: 25 mg/kg every 8 hours; maximum 6 g per day

**Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 24 hours.

- Neonate 7 days to 20 days: 50 mg/kg every 12 hours.

- Neonate 21 days to 28 days: 50 mg/kg every 8 hours.

- Child: 50 mg/kg every 8 hours; maximum 6 g per day

---

### Chronic Burkholderia cepacia infection in cystic fibrosis

- **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 1 g twice daily

---

**INTERACTIONS**

- **Appendix 1: cephalosporins**

**SIDE-EFFECTS**

- **Common or very common**
  - Thrombocytosis - thrombophlebitis

- **Rare or very rare**
  - Acute kidney injury

**FREQUENCY not known**

- **Coma, eunephropathy, jaundice, lymphocytosis, myoclonus, neurological effects, paraesthesia, seizure, taste altered, tremor**

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Present in milk in low concentration, but appropriate to use.

**HEPATIC IMPAIRMENT**

- Manufacturer advises close monitoring in severe impairment—no information available.

**RENAL IMPAIRMENT**

- Dose adjustments
  - Manufacturer advises reduce dose if creatinine clearance 50 mL/minute or less—consult product literature.

**DIRECTIONS FOR ADMINISTRATION**

- Intramuscular

- For nebulisation, dissolve dose in water and administer over 30 minutes.

**ELECTROLYTES**

- May contain Sodium

**Powder for solution for injection**

- **Ceftazidime (Non-proprietary)**
  - Ceftazidime (as Ceftazidime pentahydrate) 500 mg: Ceftazidime 500 mg powder for solution for injection vials | 1 vial (PO) £4.26–£4.68 (Hospital only)
  - Ceftazidime (as Ceftazidime pentahydrate) 1 gram: Ceftazidime 1 g powder for solution for injection vials | 1 vial (PO) £13.90–£17.00 | 10 vial (PO) £78.10 (Hospital only)
  - Ceftazidime (as Ceftazidime pentahydrate) 2 gram: Ceftazidime 2 g powder for solution for injection vials | 1 vial (PO) £19.09 (Hospital only) | 5 vial (PO) £79.15 (Hospital only) | 10 vial (PO) £27.79–£176.00
  - Ceftazidime (as Ceftazidime pentahydrate) 3 gram: Ceftazidime 3 g powder for solution for injection vials | 10 vial (PO) £257.60 (Hospital only)
  - **Fortum** (GlaxoSmithKline UK Ltd)
    - Ceftazidime (as Ceftazidime pentahydrate) 500 mg: Fortum 500 mg powder for solution for injection vials | 1 vial (PO) £4.40 (Hospital only)
    - Ceftazidime (as Ceftazidime pentahydrate) 1 gram: Fortum 1 g powder for solution for injection vials | 1 vial (PO) £8.79 (Hospital only)
    - Ceftazidime (as Ceftazidime pentahydrate) 2 gram: Fortum 2 g powder for solution for injection vials | 1 vial (PO) £17.59 (Hospital only)
    - Ceftazidime (as Ceftazidime pentahydrate) 3 gram: Fortum 3 g powder for solution for injection vials | 1 vial (PO) £25.76 (Hospital only)

Surgical prophylaxis

- BY INTRAVENOUS INFUSION
- Neonate up to 15 days: 20–50 mg/kg for 1 dose, to be administered 30–90 minutes before procedure.
- Neonate 15 days to 28 days: 50–80 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure.
- Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg (max. per dose 2 g) for 1 dose, dose to be administered 30–90 minutes before procedure.
- Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure.
- Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure.
- BY INTRAVENOUS INJECTION
- Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure.
- Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure.
- Uncomplicated gonorrhoea | Pelvic inflammatory disease
  - BY DEEP INTRAMUSCULAR INJECTION
  - Child 1 month–11 years (body-weight up to 45 kg): 125 mg for 1 dose.
  - Child 9–11 years (body-weight 45 kg and above): 250 mg for 1 dose.
  - Child 12–17 years: 500 mg for 1 dose.
- Syphilis
  - BY INTRAVENOUS INFUSION
  - Neonate up to 15 days: 50 mg/kg once daily for 10–14 days.
  - Neonate 15 days to 28 days: 75–100 mg/kg once daily for 10–14 days.
  - Child 1 month–11 years (body-weight up to 50 kg): 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day.
  - Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.
  - Child 12–17 years: 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.
  - BY INTRAVENOUS INJECTION
  - Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.
  - Child 12–17 years: 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.
  - BY DEEP INTRAMUSCULAR INJECTION
  - Child 1 month–11 years (body-weight up to 50 kg): 75–100 mg/kg daily for 10–14 days; maximum 4 g per day.
  - Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.
  - Child 12–17 years: 0.5–1 g once daily for 10–14 days; dose increased to 2 g once daily for neurosyphilis.

Disseminated Lyme borreliosis (early [Stage II] and late [Stage III]) (administered on expert advice)
  - BY INTRAVENOUS INFUSION
  - Neonate up to 15 days: 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration.

Lyme disease [affecting central nervous system]
  - BY INTRAVENOUS INFUSION
  - Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 4 g) for 21 days.
  - Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days.
  - Child 12–17 years (administered on expert advice): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days.
  - BY INTRAVENOUS INJECTION
  - Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g twice daily for 21 days.
  - Child 12–17 years (administered on expert advice): 2 g twice daily for 21 days, alternatively 4 g once daily for 21 days.

Lyme arthritis | Acrodermatitis chronica atrophicans
  - BY INTRAVENOUS INFUSION
  - Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 2 g) for 28 days.
  - BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  - Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g once daily for 28 days.
  - Child 12–17 years (administered on expert advice): 2 g once daily for 28 days.

Lyme carditis
  - BY INTRAVENOUS INFUSION
  - Child 1 month–11 years (administered on expert advice) (body-weight up to 50 kg): 80 mg/kg once daily (max. per dose 2 g) for 21 days.
  - BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  - Child 1 month–11 years (administered on expert advice) (body-weight 50 kg and above): 2 g once daily for 21 days.
  - Child 12–17 years (administered on expert advice): 2 g once daily for 21 days.

Congenital gonococcal conjunctivitis
  - BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
  - Neonate: 25–50 mg/kg (max. per dose 125 mg) for 1 dose, intravenous infusion to be administered over 60 minutes.

Prevention of secondary case of meningococcal meningitis
  - BY INTRAMUSCULAR INJECTION
  - Child 1 month–11 years: 125 mg for 1 dose.
  - Child 12–17 years: 250 mg for 1 dose.

Prevention of secondary case of Haemophilus influenzae type b disease
  - BY INTRAVENOUS INFUSION
  - Child 1 month–11 years: 50 mg/kg daily (max. per dose 1 g) for 2 days.
  - BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Child 12–17 years: 1 g daily for 2 days.

Acute otitis media
  - BY DEEP INTRAMUSCULAR INJECTION
  - Child 1 month–11 years (body-weight up to 50 kg): 50 mg/kg (max. per dose 2 g) for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed.

continued →
Bacterial infection

334

- Child 9–11 years (body-weight 50 kg and above): 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed.
- Child 12–17 years: 1–2 g for 1 dose, dose can be given for 3 days if severely ill or previous therapy failed.

- **UNLICENSED USE** Not licensed for prophylaxis of Haemophilus influenzae type b disease. Not licensed for prophylaxis of meningococcal meningitis.
- **SIDE-EFFECTS**
  - **Uncommon** Anaemia, coagulation disorder
  - **Rare or very rare** Bronchospasm, glycosuria, haematuria, oedema
  - **Frequency not known** Cholelithiasis, hypersensitivity, kernicterus (in neonates), nephrolithiasis, oral disorders, pancreatitis, seizure, vertigo

- **PRESCRIBING AND DISPENSING INFORMATION** Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.
- **PREGNANCY** Manufacturer advises use only if benefit outweighs risk—limited data available but not known to be harmful in animal studies. Specialist sources indicate suitable for use in pregnancy.
- **BREAST FEEDING** Specialist sources advise ceftriaxone is compatible with breastfeeding—present in milk in low concentration but limited effects to breast-fed infant.
- **RENAL IMPAIRMENT** Dose adjustments Manufacturer advises reduce dose and monitor efficacy in patients with severe renal impairment in combination with hepatic impairment—no information available. Manufacturer advises reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m² max. 50 mg/kg daily or max. 2 g daily.
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor full blood count regularly during prolonged treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
  - With intravenous use For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates)—may displace bilirubin from serum albumin. Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if infusion lines at different sites are used, or if the infusion lines are replaced or thoroughly flushed between infusions with Sodium Chloride 0.9% to avoid precipitation—consult product literature.

- **INTERACTIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fatal reactions) of full-term neonates with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy—premature neonates less than 41 weeks corrected gestational age.

- **SIDE-EFFECTS, FURTHER INFORMATION** Precipitates of calcium ceftriaxone can occur in the gall bladder and urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic.

- **CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in premature and full-term neonates—risk of precipitation in urine and lungs (fatal reactions) of full-term neonates with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding—risk of developing bilirubin encephalopathy—premature neonates less than 41 weeks corrected gestational age.

- **CAUTIONS** History of hypercalciuria, history of kidney stones, use with caution in neonates.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

  - **Powder for solution for injection ELECTROLYTES** May contain Sodium

    - Ceftriaxone (Non-proprietary)
      - Ceftriaxone (as Ceftriaxone sodium) 250 mg Ceftriaxone 250mg powder for solution for injection vials | 1 vial (£8.50) | £2.30 DT = £2.40 (Hospital only)
      - Ceftriaxone (as Ceftriaxone sodium) 1 gram Ceftriaxone 1g powder for solution for injection vials | 1 vial (£28.50) | £9.50 DT = £9.58 | 10 vial (£28.50) | £9.50 DT = £9.58 (Hospital only)
      - Ceftriaxone (as Ceftriaxone sodium) 2 gram Ceftriaxone 2g powder for solution for injection vials | 1 vial (£47.20) | £18.30 DT = £18.18 | 10 vial (£47.20) | £18.30 DT = £18.18 (Hospital only)
      - Ceftriaxone 2g powder for solution for infusion vials | 1 vial (£58.00) | £19.18 DT = £19.18 | 10 vial (£58.00) | £19.18 DT = £19.18 (Hospital only)
      - Rocephin (Roche Products Ltd)
        - Ceftriaxone (as Ceftriaxone sodium) 250 mg Rocephin 250mg powder for solution for injection vials | 1 vial (£4.00) | £2.40 DT = £2.40
        - Ceftriaxone (as Ceftriaxone sodium) 1 gram Rocephin 1g powder for solution for injection vials | 1 vial (£18.00) | £6.98 DT = £6.98 (Hospital only)
        - Ceftriaxone (as Ceftriaxone sodium) 2 gram Rocephin 2g powder for solution for injection vials | 1 vial (£36.00) | £13.98 DT = £13.98 (Hospital only)

  - **GLYCOPEPTIDE**

    - **Teicoplanin** 27-Nov-2017

      - **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

      - **INDICATIONS AND DOSE** Clostridium difficile infection
        - **BY MOUTH** Child 12–17 years: 100–200 mg twice daily for 7–14 days
Serious infections caused by Gram-positive bacteria (e.g., complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections)
- By intravenous injection, or by intramuscular injection
  - Child 12-17 years: Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Streptococcal or enterococcal endocarditis (in combination with another antibacterial) | Bone and joint infections
- Initially by intravenous injection, or by intravenous infusion
  - Child 12-17 years: 12 mg/kg every 12 hours for 3–5 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 12 mg/kg once daily

Surgical prophylaxis
- By intravenous injection
- Child: (consult local protocol)

Serious infections caused by Gram-positive bacteria (including endocarditis, complicated skin and soft-tissue infections, pneumonia, complicated urinary tract infections, bone and joint infections)
- By intravenous injection, or by intravenous infusion

Neonate: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion.
- Child 1-month: Initially 16 mg/kg for 1 dose, followed by 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose, doses to be given by intravenous infusion.
- Child 2 months–11 years: Initially 10 mg/kg every 12 hours for 3 doses, then 6–10 mg/kg once daily

Peritonitis associated with peritoneal dialysis (added to dialysis fluid)
- By intraperitoneal infusion
- Child 12-17 years: (consult local protocol)

PHARMACOKINETICS
- Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

- UNLICENSED USE Not licensed for surgical prophylaxis.
- INTERACTIONS → Appendix 1: teicoplanin
- SIDE-EFFECTS
  - Common or very common: Fever, pain, skin reactions
  - Uncommon: Bronchospasm, diarrhoea, dizziness, eosinophilia, headache, hearing impairment, hypersensitivity, leucopenia, nausea, otorrhea, thrombocytopenia, vomiting
  - Rare or very rare: Abcess, red man syndrome
  - Frequency not known: Agranulocytosis, angioedema, chills, neutropenia, overgrowth of nonsusceptible organisms, renal impairment, seizure, severe cutaneous adverse reactions (SCARs) - thrombophlebitis

SIDE-EFFECTS, FURTHER INFORMATION: Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

- ALLERGY AND CROSS-SENSITIVITY: Caution if history of vancomycin sensitivity.
- PREGNANCY: Manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING: No information available.
- RENAL IMPAIRMENT
  - Dose adjustments: Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
  - Monitoring: Monitor renal and auditory function during prolonged treatment in renal impairment.

- MONITORING REQUIREMENTS
  - With intramuscular use or intravenous use: Manufacturer advises monitor serum-teicoplanin trough concentration at steady state after completion of loading dose and during maintenance treatment—consult product literature.
  - Blood counts and liver and kidney function tests required.
  - Manufacturer advises monitoring for adverse reactions when doses of 12 mg/kg twice daily are administered.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use: For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5%; give over 30 minutes.
  - With oral use: Injection can be used to prepare solution for oral administration.

- MEDICINAL FORMS: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Powder and solvent for solution for injection
ELECTROLYTES: May contain Sodium
  - Teicoplanin (non-proprietary) ▼
    - Teicoplanin 200 mg Teicoplanin 200 mg powder and solvent for solution for injection vials | 1 vial £0.80 DT = £3.93
    - Teicoplanin 400 mg Teicoplanin 400 mg powder and solvent for solution for injection vials | 1 vial £1.17 DT = £7.32
  - Targocid (Sanofi) ▼
    - Teicoplanin 200 mg Targocid 200 mg powder and solvent for solution for injection vials | 1 vial £0.93 DT = £3.93
    - Teicoplanin 400 mg Targocid 400 mg powder and solvent for solution for injection vials | 1 vial £1.32 DT = £7.32

Vancomycin

- DRUG ACTION: The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of Staphylococcus aureus with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

- INDICATIONS AND DOSE
  - Clostridium difficile infection
    - By mouth
      - Neonate: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients.
      - Child 1 month–11 years: 10 mg/kg every 6 hours for 10 days, treatment duration may need to be tailored to the clinical course of individual patients; maximum 2 g per day.
      - Clostridium difficile infection [first episode]
        - By mouth
          - Child 12–17 years: 125 mg every 6 hours for 10 days; increased if necessary to 500 mg every 6 hours for 10 days, increased dose if severe or complicated infection
      - Clostridium difficile infection [multiple recurrences]
        - By mouth
          - Child 12–17 years: 125 mg every 6 hours for 10 days, followed by, either tapering the dose (gradually reducing until 125 mg daily) or a pulse regimen (125–500 mg every 2–3 days for at least 3 weeks)

continued ▶
Complicated skin and soft tissue infections | Bone infections | Joint infections | Community-acquired pneumonia | Hospital-acquired pneumonia | Including ventilator-associated pneumonia | Infective endocarditis | Acute bacterial meningitis | Bacteraemia [occuring in association with or suspected to be associated with the licensed indications]

- By Intravenous Infusion
  - Neonate up to 29 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 24 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 29 weeks to 35 weeks corrected gestational age (administered on expert advice): 15 mg/kg every 12 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Neonate 35 weeks corrected gestational age and above (administered on expert advice): 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information.

- Child 1 month–11 years: 10–15 mg/kg every 6 hours adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, doses higher than 60 mg/kg/day cannot be generally recommended as the safety of increased dosing has not been fully assessed

- Child 12–17 years: 15–20 mg/kg every 8–12 hours (max. per dose 2 g) adjusted according to plasma-concentration monitoring, duration should be tailored to type and severity of infection and the individual clinical response—consult product literature for further information, in seriously ill patients, a loading dose of 25–30 mg/kg (usual max. 2 g) can be used to facilitate rapid attainment of the target trough serum-vancomycin concentration

Perioperative prophylaxis of bacterial endocarditis [in patients at high risk of developing bacterial endocarditis when undergoing major surgical procedures]

- By Intravenous Infusion
  - Neonate: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery.

- Child: 15 mg/kg, to be given prior to induction of anaesthesia, a second dose may be required depending on duration of surgery

Surgical prophylaxis (when high risk of MRSA)

- By Intravenous Infusion
  - Child: (consult local protocol)

CNS infection e.g. ventriculitis (administered on expert advice)

- By Intraventricular Administration

- Neonate: 10 mg every 24 hours.

- Child: 10 mg every 24 hours, for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased, adjust dose according to CSF concentration after 3–4 days; aim for pre-dose (‘trough’) concentration less than 10 mg/litre. If CSF not draining free reduce dose frequency to once every 2–3 days

Peritonitis associated with peritoneal dialysis

- By intraperitoneal administration

- Child: Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre

Eradication of meticillin-resistant Staphylococcus aureus from the respiratory tract in cystic fibrosis

- By inhalation of nebulised solution

- Child: 4 mg/kg twice daily (max. per dose 250 mg) for 5 days, alternatively 4 mg/kg 4 times a day (max. per dose 250 mg) for 5 days

Pharmacokinetics

- Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

- Unlicensed Use Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route. Not licensed for intravenous use or inhalation. Not licensed for use by the intrathecal route for the treatment of meningitis.

Important safety information

Safe practice

For intraventricular administration, seek specialist advice.

Contra-indications

- With intravenous use Previous hearing loss

Caution

- With intravenous use premature neonates (monitor serum-concentration carefully) · young infants (monitor serum-concentration carefully)

- With oral use systemic absorption may be enhanced in patients with inflammatory disorders of the intestinal mucosa or with Clostridium difficile-induced pseudomembranous colitis (increased risk of adverse reactions)

Interactions → Appendix 1: vancomycin

Side-effects

General side-effects
Agranulocytosis · dizziness · drug fever · eosinophilia · hypersensitivity · nausea · nephritis tubulointerstitial · neutropenia (more common after 1 week or cumulative dose of 25 g) · renal failure · severe cutaneous adverse reactions (SCARs) · skin reactions · thrombocytopenia · tinnitus (discontinue) · vasculitis · vertigo

Specific side-effects

- With intravenous use Back pain · bradycardia · cardiac arrest (on rapid intravenous injection) · cardiogenic shock (on rapid intravenous injection) · chest pain · dyspnoea · hearing loss · hypotension · muscle complaints · pseudomembranous enterocolitis · red man syndrome · wheezing

Side-effects, further information
Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

Allergy and cross-sensitivity
Caution if teicoplanin sensitivity.

Pregnancy
Manufacturer advises use only if potential benefit outweighs risk

Monitoring Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

Breast feeding
Present in milk—significant absorption following oral administration unlikely.
**Renal impairment** Manufacturer advises serial monitoring of renal function.

- With intravenous use Manufacturer advises use with caution — increased risk of toxic effects with prolonged high blood concentration.

**Dose adjustments** With oral use Manufacturer advises dose adjustment is unlikely to be required unless substantial oral absorption occurs in inflammatory disorders of the intestinal mucosa or with *Clostridium difficile*-induced pseudomembranous colitis, see Monitoring.

- With intravenous use Manufacturer advises initial dose must not be reduced — consult product literature.

**Monitoring requirements**

- With intravenous use Manufacturer advises initial doses should be based on body-weight; subsequent dose adjustments should be based on serum-vancomycin concentrations to achieve targeted therapeutic concentrations. All patients require serum-vancomycin measurement (on the second day of treatment, immediately before the next dose if renal function normal, earlier if renal impairment — consult product literature).

Frequency of monitoring depends on the clinical situation and response to treatment; regular monitoring indicated in high-dose therapy and longer-term use, particularly in patients with impaired renal function, impaired hearing, or concurrent use of nephrotoxic or ototoxic drugs.

Manufacturer advises pre-dose (‘trough’) concentration should normally be 10–20 mg/litre depending on the site of infection and the susceptibility of the pathogen; trough concentration of 15–20 mg/litre is usually recommended to cover susceptible pathogens with MIC greater than or equal to 1 mg/litre — consult product literature.

Manufacturer advises periodic testing of auditory function. Manufacturer advises monitor blood counts, urinalysis, hepatic and renal function periodically in all patients; monitor leucocyte count regularly in patients receiving long-term vancomycin or if given concurrently with other drugs that may cause neutropenia or agranulocytosis.

- With oral use Manufacturer advises monitoring serum-vancomycin concentration in inflammatory intestinal disorders.

Manufacturer advises serial tests of auditory function may be helpful to minimise the risk of ototoxicity in patients with an underlying hearing loss, or who are receiving concomitant therapy with other ototoxic drugs.

- With intravenous use Aim for pre-dose (‘trough’) concentration less than 10 mg/litre.

- When used by inhalation Measure lung function before and after initial dose of vancomycin and monitor for bronchospasm.

**Directions for administration**

- With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites. Displacement value may be significant, consult product literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/mL; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not available (limited evidence); 10 mg/mL can be used if infused via a central venous line over at least 1 hour.

- With oral use Injection can be used to prepare solution for oral administration — consult product literature.

- When used by inhalation For nebulisation administer required dose in 4 mL of sodium chloride 0.9% (or water for injections). Administer inhaled bronchodilator before vancomycin.

**Antibacterials > Lincosamides**

**Clindamycin**

- **Drug action** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

- **indications and dose** Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | Intra-abdominal sepsis | Metcillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)

  - **By mouth**

  - Neonate up to 14 days: 3–6 mg/kg 3 times a day.

  - Neonate 14 days to 28 days: 3–6 mg/kg 4 times a day.

    - Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)

    - By deep intramuscular injection, or by intravenous infusion

    - Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used for severe infections, total daily dose may alternatively be given in 3 divided doses, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g

  - Staphylococcal lung infection in cystic fibrosis

    - **By mouth**

    - Child: 5–7 mg/kg 4 times a day (max. per dose 600 mg)
Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. If *Clostridium difficile* infection is suspected or confirmed, discontinue the antibiotic if appropriate. Seek specialist advice if the antibiotic cannot be stopped and the diarrhoea is severe.

**Pregnancy** Manufacturer advises not known to be harmful in the second and third trimesters; use with caution in the first trimester—limited data.

**Breastfeeding** Specialist sources indicate use with caution—present in milk. Monitor infant for effects on the gastrointestinal flora such as diarrhoea, candidiasis, or rarely, blood in the stool indicating possible antibiotic-associated colitis.

**Monitoring Requirements** Monitor liver and renal function if treatment exceeds 10 days. Monitor liver and renal function in neonates and infants.

**Directions for Administration**
- With intravenous use: Avoid rapid intravenous administration. For intravenous infusion, dilute to a concentration of not more than 18 mg/ml with glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.
- With oral use: Capsules should be swallowed with a glass of water.

**Profession Specific Information**
- Dental practitioners’ formulary
  - With oral use: Clindamycin capsules may be prescribed.

**Antibacterials > Macrolides**

### Overview
The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many—penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections. Erythromycin p. 341 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin p. 339 is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, typhoid [unlicensed indication], trachoma [unlicensed indication], and Lyme disease [unlicensed indication].

Clarithromycin p. 340 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.
Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

**Macrolides**

**CAUTIONS**
- With intravenous use or oral use electrolyte disturbances (predisposition to QT interval prolongation) may aggravate myasthenia gravis; predisposition to QT interval prolongation
- Common or very common Appetite decreased; diarrhoea; dizziness; gastrointestinal discomfort; gastrointestinal disorders; headache; hearing impairment; insomnia; nausea; pancreatitis; paraesthesia; skin reactions; taste altered; vasodilation; vision disorders; vomiting
- Uncommon Angioedema; anxiety; arrhythmias; candida infection; chest pain; constipation; drowsiness; eosinophilia; hepatic disorders; leucopenia; neutropenia; palpatitions; QT interval prolongation; severe cutaneous adverse reactions (SCARs); tinnitus; vertigo
- Rare or very rare Antibiotic associated colitis; myasthenia gravis; nephritis tubulointerstitial
- Frequency not known Hallucination; hypotension; seizure; smell altered; thrombocytopenia; tongue discolouration

**Azithromycin**

11-Jul-2018

**INDICATIONS AND DOSE**

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin
- **BY MOUTH**
  - Child 6-months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
  - Child 12-17 years: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections
- **BY MOUTH**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
  - Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

Infection in cystic fibrosis
- **BY MOUTH**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days, repeated after 1 week to complete course, treatment may be repeated as necessary

Chronic *Pseudomonas aeruginosa* infection in cystic fibrosis
- **BY MOUTH**
  - Child 6-17 years (body-weight 25-40 kg): 250 mg 3 times a week
  - Child 6-17 years (body-weight 41 kg and above): 500 mg 3 times a week

Uncomplicated genital chlamydial infections; Non-gonococcal urethritis
- **BY MOUTH**
  - Child 12-17 years: 1 g for 1 dose

---

**Lyme disease [erythema migrans and/or non-focal symptoms]**
- **BY MOUTH**
  - Child 1 month-11 years (administered on expert advice) (body-weight up to 51 kg): 10 mg/kg daily for 17 days
  - Child 1 month-11 years (administered on expert advice) (body-weight 51 kg and above): 500 mg daily for 17 days
  - Child 12-17 years (administered on expert advice): 500 mg daily for 17 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms
- **BY MOUTH**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7 days

---

**SIDE-EFFECTS**
- **Common or very common** Angioedema; anxiety; arrhythmias; candida infection; chest pain; constipation; drowsiness; eosinophilia; hepatic disorders; leucopenia; neutropenia; palpatitions; QT interval prolongation; severe cutaneous adverse reactions (SCARs); tinnitus; vertigo
- **Uncommon** Angioedema; anxiety; arrhythmias; candida infection; chest pain; constipation; drowsiness; eosinophilia; hepatic disorders; leucopenia; neutropenia; palpatitions; QT interval prolongation; severe cutaneous adverse reactions (SCARs); tinnitus; vertigo
- **Rare or very rare** Antibiotic associated colitis; myasthenia gravis; nephritis tubulointerstitial
- **Frequency not known** Hallucination; hypotension; seizure; smell altered; thrombocytopenia; tongue discolouration

---

**UNLICENSED USE** Azithromycin may be used as detailed below, although these situations are considered outside the scope of its licence:
- Prevention of group A streptococcal infection;
- chronic *Pseudomonas aeruginosa* infection in cystic fibrosis:
  - **BY MOUTH** Lyme disease [erythema migrans and/or non-focal symptoms];
  - mild to moderate typhoid due to multiple-antibacterial resistant organisms.

**INTERACTIONS** ➔ Appendix 1: macrolides

**PRESCRIBING AND DISPENSING INFORMATION** See Lyme disease p. 374 for place in therapy and further information on treatment. Flavours of oral liquid formulations may include cherry or banana.

**PATIENT AND CARER ADVICE** Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary
Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 5, 9

**Azithromycin (Non-proprietary)**

Azithromycin 250 mg Azithromycin 250mg tablets | 4 tablet [PO2] £10.11 DT = £11.24 | 6 tablet [PO2] £2.01-E14.46
Azithromycin 500 mg Azithromycin 500mg tablets | 3 tablet [PO2] £9.80 DT = £11.09
Oral suspension
CAUTIONARY AND ADVISORY LABELS 5, 9
- Azithromycin (Non-proprietary)
  Azithromycin 40 mg per 1 ml Azithromycin 200mg/5ml oral suspension | 15 ml (P65) £6.16 DT = £6.06 | 30 ml (P65) £11.04 DT = £11.04
- Zithromax (Pfizer Ltd)
  Azithromycin 40 mg per 1 ml Zithromax 200mg/5ml oral suspension | 15 ml (P65) £4.06 DT = £4.06 | 22.5 ml (P65) £6.10 DT = £6.10 | 30 ml (P65) £11.04 DT = £11.04

Capsule
CAUTIONARY AND ADVISORY LABELS 5, 9, 23
- Azithromycin (as Azithromycin dihydrate) 250 mg Azithromycin (Non-proprietary)

  Azithromycin (as Azithromycin dihydrate) 250 mg Zithromax 250mg capsules | 4 capsule (P82) £1.16 | 6 capsule (P82) £10.74 DT = £10.74

Clarithromycin

**INDICATIONS AND DOSE**
Respiratory-tract infections | Mild to moderate skin and soft-tissue infections

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Neonate: 7.5 mg/kg twice daily.
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
  - Child 12–17 years: 250–500 mg twice daily for 5 days

*Acute otitis media*

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Neonate: 7.5 mg/kg twice daily.
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5–7 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5–7 days
  - Child 12–17 years: 250–500 mg twice daily for 5–7 days

*Helicobacter pylori eradication in combination with omeprazole, and amoxicillin or metronidazole*

**BY MOUTH**
- Child 1–5 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- Child 6–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
- Child 12–17 years: 500 mg twice daily

*Acute sinusitis*

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- Child 12–17 years: 250 mg twice daily for 5 days

**Prevention of pertussis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Neonate: 7.5 mg/kg twice daily for 7 days.
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
  - Child 12–17 years: 500 mg twice daily for 7 days

**Acute exacerbation of bronchiectasis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7–14 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7–14 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7–14 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7–14 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7–14 days
- Child 12–17 years: 250–500 mg twice daily for 7–14 days

**Acute cough**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days

**Acute sinusitis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 5 days
- Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 5 days
- Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 5 days
- Child 12–17 years: 250 mg twice daily for 5 days, alternatively 500 mg twice daily for 5 days

**UNLICENSED USE** Duration of treatment for acute sinusitis differs from product literature and adheres to
**Erythromycin**

**INDICATIONS AND DOSE**

Sustainable infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- **By Mouth**
  - Neonate: 12.5 mg/kg every 6 hours.
    - Child 1-2 months: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
    - Child 2-7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
    - Child 8-17 years: 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections

- **By Intravenous Infusion**
  - Neonate: 10–12.5 mg/kg every 6 hours.
    - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Acute cough [if systemically very unwell or at higher risk of complications]**

- **By Mouth**
  - Child 1-2 months: 125 mg 4 times a day for 5 days, alternatively 250 mg twice daily for 5 days
  - Child 2-7 years: 250 mg 4 times a day for 5 days, alternatively 500 mg twice daily for 5 days
  - Child 8-17 years: 250–500 mg 4 times a day for 5 days, alternatively 500–1000 mg twice daily for 5 days

**Granules**

**CAUTIONARY AND ADVISORY LABELS** 9, 13

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS** 9

- **Clarithromycin (Non-proprietary)**
  - Clarithromycin 25 mg per 1 ml Clarithromycin 125mg/5ml oral suspension 70 ml [PBM] £3.75 DT = £3.36
  - Clarithromycin 50 mg per 1 ml Clarithromycin 250mg/5ml oral suspension 70 ml [PBM] £5.25 DT = £4.46

- **Klaricid (Mylan)**
  - Clarithromycin 25 mg per 1 ml Klaricid Paediatric 125mg/5ml oral suspension 70 ml [PBM] £3.26 DT = £3.16 | 100 ml [PBM] £9.04
  - Clarithromycin 50 mg per 1 ml Klaricid Paediatric 250mg/5ml oral suspension 70 ml [PBM] £10.51 DT = £4.46

**Powder for solution for infusion**

**ELECTROLYTES** May contain Sodium

- **Clarithromycin (Non-proprietary)**
  - Clarithromycin 500 mg Clarithromycin 500mg powder for solution for infusion vials 1 vial [PBM] £11.25 DT = £9.45 (Hospital only)
  - Clarithromycin 500mg powder for concentrate for solution for infusion vials 1 vial [PBM] £11.15 DT = £9.45 | 10 vial [PBM] £111.50

- **Klaricid (Mylan)**
  - Clarithromycin 500 mg Klaricid IV 500mg powder for solution for infusion vials 1 vial [PBM] £9.45 DT = £9.45

**National guidelines. See Sinusitis (acute) p. 721 for further information.**

- With oral use Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. See Ear infections, antibacterial therapy p. 315 for further information. Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.

- With intravenous use Intravenous infusion not licensed for use in children under 12 years.

**INTERACTIONS** Appendix 1: macrodides

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Uncommon** Burping - dry mouth - muscle complaints - oral disorders - thrombocytopenia - tremor

- **Frequency not known** Abnormal dreams - agranulocytosis - depersonalisation - depression - mania - myopathy - psychotic disorder - renal failure - tooth discoloration - urine discolouration

**SPECIFIC SIDE-EFFECTS**

- **Uncommon**
  - With oral use Epistaxis
  - With parenteral use Cardiac arrest - dyskinesia - haemorrhage - loss of consciousness - pulmonary embolism

- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment; avoid in severe failure if renal impairment also present.

- **RENAI IMPAIRMENT** Avoid if severe hepatic impairment also present.

- With oral use Avoid Klaricid XL® or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Dose adjustments Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

Bacterial infection

**Acute otitis media**
- **BY MOUTH**
  - Child 1–23 months: 125 mg 4 times a day for 5–7 days, alternatively 250 mg twice daily for 5–7 days
  - Child 2–7 years: 250 mg 4 times a day for 5–7 days, alternatively 500 mg twice daily for 5–7 days
  - Child 8–17 years: 250–500 mg 4 times a day for 5–7 days, alternatively 500–1000 mg twice daily for 5–7 days

**Chlamydial ophthalmia**
- **BY MOUTH**
  - Neonate: 12.5 mg/kg every 6 hours.

**Early syphilis**
- **BY MOUTH**
  - Child 12–17 years: 500 mg 4 times a day for 14 days

**Uncomplicated genital chlamydia / Non-gonococcal urethritis**
- **BY MOUTH**
  - Child 1–23 months: 12.5 mg/kg 4 times a day for 14 days
  - Child 2–11 years: 250 mg twice daily for 14 days
  - Child 12–17 years: 500 mg twice daily for 14 days

**Pelvic inflammatory disease**
- **BY MOUTH**
  - Child 1–23 months: 12.5 mg/kg 4 times a day for 14 days
  - Child 2–11 years: 250 mg twice daily for 14 days
  - Child 12–17 years: 500 mg twice daily for 14 days

**Prevention and treatment of pertussis**
- **BY MOUTH**
  - Neonate: 12.5 mg/kg every 6 hours.

**Prevention of secondary case of diphtheria in non-immune patient**
- **BY MOUTH**
  - Child 1–23 months: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

**Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**
- **BY MOUTH**
  - Child 1–23 months: 125 mg every 6 hours for 10 days
  - Child 2–7 years: 250 mg every 6 hours for 10 days
  - Child 8–17 years: 250–500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)**
- **BY MOUTH**
  - Child 1–23 months: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - Child 2–7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - Child 8–17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

**Prevention of recurrence of rheumatic fever**
- **BY MOUTH**
  - Child 1–23 months: 125 mg twice daily
  - Child 2–17 years: 250 mg twice daily

**Acne**
- **BY MOUTH**
  - Child 1–23 months: 250 mg once daily, alternatively 125 mg twice daily
  - Child 12–17 years: 500 mg twice daily

**Gastro-intestinal stasis**
- **BY MOUTH**
  - Neonate: 3 mg/kg 4 times a day.
  - Child: 3 mg/kg 4 times a day.
  - **BY INTRAVENOUS INFUSION**

  - Neonate: 3 mg/kg 4 times a day.
  - Child: 1–11 months: 3 mg/kg 4 times a day

**UNLICENSED USE** Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. See Ear infections, antibacterial therapy p. 315 for further information.

**CAUTIONS**
- Avoid in Acute porphyrias p. 624 - neonate under 2 weeks (risk of hypertrophic pyloric stenosis)
- **INTERACTIONS** → Appendix 1: macrolides
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare or very rare Hearing loss (can occur after large doses)
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use Cerebral impairment
    - With parenteral use Atrioventricular block
  - **PREGNANCY** Not known to be harmful.
  - **BREAST FEEDING** Only small amounts in milk—not known to be harmful.
  - **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity
  - **RENAl IMPAIRMENT** Dose adjustments Reduce dose in severe renal impairment (ototoxicity)
Bacterial infection 343

Antibacterials > monobactams

Aztreonam

**Drug Action** Aztreonam is a monocyclic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**Indications and Use**

- **Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis***
  - By intravenous injection, or by intravenous infusion
  - Neonate up to 7 days: 30 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.

- **Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis***
  - By intravenous infusion, or by intravenous injection
  - Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2 g 4 times a day)
  - Child 12–17 years: 2 g every 6–8 hours

**Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**

- By inhalation of nebulised solution
  - Child 6–17 years: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

**Unlicensed Use**

- With systemic use Injection not licensed for use in children under 7 days.

**Caution**

- When used by inhalation Haemoptysis—risk of further haemorrhage

**Side-effects**

**General side-effects**

- Common or very common Dyspnoea · respiratory disorders

**Specific side-effects**

- Common or very common
  - When used by inhalation Cough · haemoptysis · joint disorders · laryngeal pain · nasal complaints · rash
  - Rare or very rare
    - With parental use Anaemia · asthenia · breast tenderness · chest pain · confusion · diplopia · dizziness · eosinophilia · haemorrhage · headache · hepatic disorders · hypotension · insomnia · leucocytosis · myalgia · nasal congestion · neutropenia · oral disorders · pancyclopenia · paraesthesia · pseudemembranous enterocolitis · seizure · thromboctopenia · thromboctyosis · tinnitus · vertigo · vulvovaginal candidiasis

Powder for solution for infusion

- **Erythromycin (Non-proprietary)**
  - Erythromycin (as Erythromycin lactobionate)
    - 1 gram Erythromycin 1g powder for solution for infusion vials
      - 1 vial [POT] £18.45–£22.92

**Patient and Carer Advice**

**Prescribing and dispensing information**

- Flavours of oral liquid formulations may include banana.
Bacterial infection

- Frequency not known
- With parenteral use: Abdominal pain, angioedema, diarrhea, nausea, skin reactions, taste altered, toxic epidermal necrolysis, vomiting.
- **ALLERGY AND CROSS-SENSITIVITY**: Contra-indicated in aztreonam hypersensitivity. Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).
- **PREGNANCY**
  - With systemic use: No information available; manufacturer of injection advises avoid.
  - When used by inhalation: No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.
- **BREAST FEEDING**: Amount in milk probably too small to be harmful.
- **HEPATIC IMPAIRMENT**
  - With systemic use: Manufacturer advises caution in chronic impairment with cirrhosis, especially in alcoholic cirrhosis and concomitant renal impairment.
- **RENAL IMPAIRMENT**
  - Dose adjustments: With systemic use: Manufacturer advises dose reduction of 20–25% for long-term treatment of patients with chronic impairment with cirrhosis, especially in alcoholic cirrhosis and concomitant renal impairment.
- **MONITORING REQUIREMENTS**
  - When used by inhalation: Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: For intravenous injection, give over 3–5 minutes. Displacement value of injection may be significant, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of less than 20 mg/mL to be given over 20–60 minutes.
  - When used by inhalation: Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) decisions**

SMC No. 753/12
The Scottish Medicines Consortium has advised (January 2015) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as ≥2% decline in forced expiratory volume in 1 second). This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**MEDICINAL FORMS**

- **Powder and solvent for nebuliser solution**
  - **Aztreonam (as Aztreonam lysine) 75 mg**: Cayston 75 mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset – 84 vial (£218.53 DT = £218.53)
  - **Powder for solution for injection**
    - **Azactam (Bristol-Myers Squibb Pharmaceuticals Ltd)**
      - **Aztreonam 1 gram**: Azactam 1g powder for solution for injection vials – 1 vial (£30.40 (Hospital only))

**ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES**

**Metronidazole**

- **DRUG ACTION**: Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**INDICATIONS AND DOSE**

**Anaerobic infections**

- **BY MOUTH**
  - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - Child 2 months–1 year: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
  - **BY RECTUM**
    - Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
    - Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
    - Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
    - Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
  - **BY INTRAVENOUS INFUSION**
    - Neonate up to 26 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 24 hours, then 7.5 mg/kg daily usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection)
    - Neonate 26 weeks to 34 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 12 hours, then 7.5 mg/kg every 12 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection)
    - Neonate 34 weeks corrected gestational age and above: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in *Clostridium difficile* infection)
- **Helicobacter pylori eradication; in combination with clarithromycin and omeprazole**
  - **BY MOUTH**
    - Child 1–5 years: 100 mg twice daily
    - Child 6–11 years: 200 mg twice daily
    - Child 12–17 years: 400 mg twice daily

**Helicobacter pylori eradication; in combination with amoxicillin and omeprazole**

- **BY MOUTH**
  - Child 1–5 years: 100 mg 3 times a day
  - Child 6–11 years: 200 mg 3 times a day

---

**Aztreonam 2 gram**: Azactam 2g powder for solution for injection vials – 1 vial (£30.40 (Hospital only))
Bacterial prophylaxis

- Child 12-17 years: 400 mg 3 times a day
- Fistulating Crohn’s disease
  - BY MOUTH
  - Child: 7.5 mg/kg 3 times a day usually given for 1 month but should not be used for longer than 3 months because of concerns about peripheral neuropathy

Bacterial vaginosis
- BY VAGINA USING VAGINAL GEL
- Child: 1 applicatorful daily for 5 days, dose to be administered at night

Pelvic inflammatory disease
- BY MOUTH
- Child 12-17 years: 400 mg twice daily for 14 days

Acute ulcerative gingivitis
- BY MOUTH
- Child 1-2 years: 50 mg every 8 hours for 3–7 days
- Child 3–6 years: 100 mg every 12 hours for 3–7 days
- Child 7–9 years: 100 mg every 8 hours for 3–7 days
- Child 10-17 years: 200–250 mg every 8 hours for 3–7 days

Acute oral infections
- BY MOUTH
- Child 1-2 years: 50 mg every 8 hours for 3–7 days
- Child 3–6 years: 100 mg every 12 hours for 3–7 days
- Child 7–9 years: 100 mg every 8 hours for 3–7 days
- Child 10-17 years: 200–250 mg every 8 hours for 3–7 days

Surgical prophylaxis
- BY MOUTH
- Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered 2 hours before surgery
- Child 12-17 years: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- BY RECTUM
- Child 5–9 years: 500 mg, to be administered 2 hours before surgery, then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
- Child 10-17 years: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)
- BY INTRAVENOUS INFUSION
- Neonate up to 40 weeks corrected gestational age: 10 mg/kg, to be administered up to 30 minutes before the procedure.
- Neonate 40 weeks corrected gestational age and above: 20–30 mg/kg, to be administered up to 30 minutes before the procedure.

Invasive intestinal amoebiasis/Extra-intestinal amoebiasis (including liver abscess)
- BY MOUTH
- Child 1-2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
- Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis
- BY MOUTH
- Child 1-2 years: 50 mg 3 times a day for 7 days
- Child 3–6 years: 100 mg twice daily for 7 days
- Child 7–9 years: 100 mg 3 times a day for 7 days
- Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis
- BY MOUTH
- Child 1-2 years: 500 mg once daily for 3 days
- Child 3–6 years: 600–800 mg once daily for 3 days
- Child 7–9 years: 1 g once daily for 3 days
- Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus
- BY INTRAVENOUS INFUSION
- Child: consult product literature

- UNLICENSED USE
  - With vaginal use Metronidazole vaginal gel not licensed for use in children under 18 years.

- CAUTIONS
  - With vaginal use avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative - not recommended during menstruation - some systemic absorption may occur with vaginal gel

- INTERACTIONS
  - Appendix 1: metronidazole

- SIDE-EFFECTS
  - Common or very common
    - With systemic use Dry mouth - myalgia - nausea - oral disorders - taste altered - vomiting
    - With vaginal use Pelvic discomfort - vulvovaginal candidiasis - vulvovaginal disorders
  - Uncommon
    - With systemic use Asthenia - headache - leucopenia (with long term or intensive therapy)
    - With vaginal use Menstrual cycle irregularities - vaginal haemorrhage
  - Rare or very rare
    - With systemic use Agranulocytosis - angioedema - appetite decreased - ataxia - cerebellar syndrome - confusion - diarrhoea - dizziness - drowsiness - encephalopathy - epigastric pain - epileptiform seizure (with long term or intensive therapy) - flushing - hallucination - hepatic disorders - meningitis aseptic - mucositis - nerve disorders - neutropenia - pancreatitis - pancytopenia - peripheral neuropathy (with long term or intensive therapy) - psychiatric disorder - seizure - severe cutaneous adverse reactions (SCARs) - skin reactions - thrombocytopenia - urine dark - vision disorders
  - Frequency not known
    - With systemic use Depressed mood - gastrointestinal disorder - hearing impairment

- PREGNANCY
  - With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.

- BREAST FEEDING
  - With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.

- HEPATIC IMPAIRMENT
  - With systemic use Use with caution in hepatic encephalopathy.

Dose adjustments
- With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily.
**MONITORING REQUIREMENTS**

- With systemic use: Clinical and laboratory monitoring advised if treatment exceeds 10 days.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intravenous infusion, give over 20–30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

- With systemic use: Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.

**PATIENT AND CARER ADVISE**

Medicines for Children leaflet: Metronidazole for bacterial infections: www.medicinesforchildren.org.uk/metronidazole

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary:
  - With oral use: Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository.

**Tablet**

- Metronidazole (Non-proprietary)
  - Metronidazole 200 mg: Metronidazole 200mg tablets | 21 tablet (P) £4.99 DT = £1.83
  - Metronidazole 400 mg: Metronidazole 400mg tablets | 21 tablet (P) £13.03 DT = £5.47
  - Metronidazole 500 mg: Metronidazole 500mg tablets | 21 tablet (P) £39.27 DT = £19.27
  - Flagyl (Sanofi
  - Metronidazole 200 mg: Flagyl 200mg tablets | 21 tablet (P) £4.49 DT = £1.83
  - Metronidazole 400 mg: Flagyl 400mg tablets | 14 tablet (P) £6.34

- Suppository

- Metronidazole (Non-proprietary)
  - Metronidazole 500 mg: Flagyl 500mg suppositories | 10 suppository (P) £16.18 DT = £15.18
  - Metronidazole 1 gram: Flagyl 1g suppositories | 10 suppository (P) £23.06

**Oral suspension**

- Metronidazole (Non-proprietary)
  - Metronidazole (as Metronidazole benzoate) 40 mg per 1 ml: Metronidazole 200mg/5ml oral suspension | 100 ml (P) £37.50 DT = £35.22

**Vaginal gel**

- Excipients: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol
  - Zidovudine (Sanofi
  - Metronidazole 25 mg per 1 gram: Zidovudine 0.75% vaginal gel | 40 gram (P) £4.31 DT = £4.31

**Infusion**

- Electrolytes: May contain Sodium
  - Metronidazole (Non-proprietary)
  - Metronidazole 5 per 1 ml: Metronidazole 500mg/100ml infusion 100ml bags | 20 bag (P) £63.86 DT = £63.86

---

**Tinidazole**

- **Drug Action**: Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

- **Indications and Dose**
  - **Intestinal amoebiasis**
    - **By mouth**
      - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
      - Child 12–17 years: 2 g once daily for 2–3 days
  - **Amoebic involvement of liver**
    - **By mouth**
      - Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
      - Child 12–17 years: 1.5–2 g once daily for 3–6 days
  - **Urogenital trichomoniasis / Giardiasis**
    - **By mouth**
      - Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
      - Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary

**Interactions**

- Appendices: tinidazole

**Side-effects**

- **Common or very common**: Abdominal pain · appetite decreased · diarrhoea · headache · nausea · skin reactions · vertigo · vomiting

- **Frequency not known**:
  - Angioedema · ataxia · dizziness · fatigue · flushing · leucopenia · oral disorders · peripheral neuropathy · seizure · sensation abnormal · taste altered · tongue discolouration · urine discolouration

**Pregnancy**

- Manufacturer advises avoid in first trimester.

**Breast feeding**

- Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

**Monitoring requirements**

- Clinical and laboratory monitoring advised if treatment exceeds 10 days.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository.

**Tablet**

- Metronidazole (Non-proprietary)
  - Metronidazole 500 mg: Metronidazole 500mg tablets | 174 tablet (P) £11.04 DT = £11.04
  - Metronidazole 300 mg: Metronidazole 300mg tablets | 174 tablet (P) £11.04 DT = £11.04
  - Metronidazole 200 mg: Metronidazole 200mg tablets | 174 tablet (P) £11.04 DT = £11.04

**Antibacterials**

**Penicillins**

**Benzylpenicillin and phenoxymethylpenicillin**

- Benzylpenicillin sodium p. 349 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamas. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas, gangrene, and leptospirosis. It is also used in combination with gentamicin p. 322 for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 344 is preferred. Benzylpenicillin sodium is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.
Benzathine benzylpenicillin or procaine benzylpenicillin are used in the treatment of syphilis. Phenoxymethylpenicillin p. 350 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

Penicillinase-resistant penicillins
Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 357, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Broad-spectrum penicillins
Ampicillin p. 353 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by Staphylococcus aureus and by common Gram-negative bacilli such as Escherichia coli. Ampicillin is also active against Listeria spp. and enterococci. Almost all staphylococci, approx. 60% of E. coli strains and approx. 20% of Haemophilus influenzae strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

Amoxicillin p. 351 is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

Amoxicillin or ampicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to Streptococcus pneumoniae and H. influenzae, and for urinary-tract infections. They are also used in the treatment of endocarditis and lobar meningitis. Amoxicillin is also used for the treatment of Lyme disease.

Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in children with acute or chronic lymphoid leukemia or in cytomegalovirus infection.

Co-amoxiclav p. 354 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staph. aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-flumacillin p. 354) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins
Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 348 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 348 and it is more active against Pseudomonas aeruginosa. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary-tract, skin and soft tissue, or intra-abdomen. They may be used for the empirical treatment of septicaemia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin) since they have a synergistic effect.

Piperacillin with tazobactam is used in cystic fibrosis for the treatment of Ps. aeruginosa colonisation when ciprofloxacin p. 361 and nebulised colistimethate sodium p. 358 have been ineffective; it can also be used in infective exacerbations, when it is combined with an aminoglycoside.

Mecillinams
Pivmecillinam hydrochloride p. 356 has significant activity against many Gram-negative bacteria including Escherichia coli, klebsiella, enterobacter, and salmonellae. It is not active against Pseudomonas aeruginosa or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

**Penicillins**

- **Drug Action** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

- **Caution** History of allergy

- **Side-effects**
  - Common or very common Diarrhoea · hypersensitivity · nausea · skin reactions · thrombocytopenia · vomiting
  - Uncommon Antibiotic associated colitis · leucopenia
  - Rare or very rare Agranulocytosis · angioedema · haemolytic anaemia · hepatic disorders · nephritis · tubulointerstitial · neutropenia · seizure · severe cutaneous adverse reactions (SCARs)

**Side-effects, further information** Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can cause antibiotic-associated colitis.

- **Allergy and Cross-Sensitivity** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should
not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

**ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA-LACTAMASE INHIBITOR**

**Piperacillin with tazobactam**

**INDICATIONS AND DOSE**

- **Hospital-acquired pneumonia | Septicaemia | Complicated infections involving the urinary-tract | Complicated infections involving the skin | Complicated infections involving the soft-tissues**
  - **By intravenous infusion**
  - **Neonate:** 90 mg/kg every 8 hours.
  - **Child 1 month-11 years:** 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
  - **Child 12-17 years:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

- **Complicated intra-abdominal infections**
  - **By intravenous infusion**
  - **Child 2-11 years:** 112.5 mg/kg every 8 hours (max. per dose 4.5 g)
  - **Child 12-17 years:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

- **Acute exacerbation of bronchiectasis**
  - **By intravenous infusion**
  - **Child 1 month-11 years:** 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
  - **Child 12-17 years:** 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

- **Infections in neutropenic patients**
  - **By intravenous infusion**
  - **Child:** 90 mg/kg every 6 hours (max. per dose 4.5 g)

**UNLICENSED USE** Not licensed for use in children under 12 years (except for children 2–12 years with neutropenia and complicated intra-abdominal infections). Piperacillin with tazobactam is used for the treatment of acute exacerbation of bronchiectasis, but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 318 for further information.

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations).

**INTERACTIONS** → Appendix 1: penicillins

**SIDE-EFFECTS**
- **Common or very common** Anaemia | candida infection | constipation | gastrointestinal discomfort | headache | insomnia
- **Uncommon** Arthralgia | flushing | hypokalaemia | hypotension | myalgia | thrombophlebitis
- **Rare or very rare** Epistaxis | stomatitis
- **Frequency not known** Eosinophilia | pancytopenia | pneumonia eosinophilic | renal failure | thrombocytosis

**PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**RENAL IMPAIRMENT**

- **Dose adjustments**
  - **Child under 12 years:** 78.75 mg/kg (max. 4.5 g) every 8 hours if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
  - **Child 12–18 years:** max. 4.5 g every 8 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; max. 4.5 g every 12 hours if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **Effect on laboratory tests** False-positive urinary glucose (if tested for reducing substances).

- **Directions for administration** Displacement value may be significant when reconstituting injection, consult local guidelines. For intravenous infusion, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

- **Prescribing and dispensing information** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Piperacillin with tazobactam (Non-proprietary)**
  - **Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram** Piperacillin 4 g / Tazobactam 500mg powder for solution for infusion vials | 1 vial (£3.75–£3.97) (Hospital only) | 1 vial (Pfizer) £12.90 | 10 vial (Pfizer) £48.00–£53.00 | 10 vial (Pfizer) £163.30 (Hospital only)

- **Tazocin (Pfizer Ltd)**
  - **Tazobactam (as Tazobactam sodium) 500 mg, Piperacillin (as Piperacillin sodium) 4 gram** Tazocin 4g/0.5g powder for solution for infusion vials | 1 vial (£3.75–£4.17) (Hospital only)

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- **Piperacillin with tazobactam (Non-proprietary)**
  - **Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram** Piperacillin 2g / Tazobactam 250mg powder for solution for infusion vials | 1 vial (£3.95 DT + £7.65) (Hospital only) | 10 vial (£3.95 DT + £48.20) (Hospital only)

- **Tazocin (Pfizer Ltd)**
  - **Tazobactam (as Tazobactam sodium) 250 mg, Piperacillin (as Piperacillin sodium) 2 gram** Tazocin 2g/0.25g powder for solution for infusion vials | 1 vial (£7.65 DT + £7.65)

**Ticarcillin with clavulanic acid**

**INDICATIONS AND DOSE**

- **Infections due to Pseudomonas and Proteus spp.**
  - **By intravenous infusion**
  - **Preterm neonate (body-weight up to 2 kg):** 80 mg/kg every 12 hours.
  - **Preterm neonate (body-weight 2 kg and above):** 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe
**BENZYL Penicillin sodium**

**Indications and dose**

*Mild to moderate susceptible infections*  
*Throat infections*  
*Otitis media*  
*Cellulitis*  
*Pneumonia*

- **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
- **Neonate up to 7 days:** 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.
- **Neonate up to 7 days:** 50 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.
- **Child:** 25 mg/kg every 6 hours; increased if necessary to 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours) in severe infection, intravenous route recommended in infants.

**Endocarditis (in combination with other antibacterial if necessary)**

- **By slow intravenous injection, or by intravenous infusion**
- **Child:** 25 mg/kg every 4 hours; increased if necessary to 50 mg/kg every 4 hours (max. per dose 2.4 g every 4 hours).

**Meningitis/Meningococcal disease**

- **By intravenous infusion**
- **Neonate up to 7 days:** 50 mg/kg every 12 hours.

**Neonate 7 days to 28 days:** 50 mg/kg every 8 hours.

- **Child:** 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

**Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital**

- **By intravenous injection, or by intramuscular injection**
- **Child 1–11 months:** 300 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer.
- **Child 1–9 years:** 600 mg, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer.
- **Child 10–17 years:** 1.2 g, administer as single dose prior to urgent transfer to hospital so long as does not delay transfer.

**Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently**

- **By intravenous injection, or by intramuscular injection**
- **Child 1–11 months:** 300 mg, administer as single dose prior to transfer to hospital.
- **Child 1–9 years:** 600 mg, administer as single dose prior to transfer to hospital.
- **Child 10–17 years:** 1.2 g, administer as single dose prior to transfer to hospital.
**Phenoxymethylpenicillin**  
(Penicillin V)

### Indications and Dose

**Oral infections** | **Tonsillitis** | **Otitis media** | **Erysipelas** | **Cellulitis**
---|---|---|---|---
**By Mouth**
- Child 1-11 months: 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- Child 1-5 years: 125 mg 4 times a day; increased if necessary up to 25 mg/kg 4 times a day
- Child 6-11 years: 250 mg 4 times a day; increased if necessary up to 25 mg/kg 4 times a day
- Child 12-17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day

### Prevention of recurrence of rheumatic fever
- **By Mouth**
- Child 1 month to 5 years: 125 mg twice daily
- Child 6-17 years: 250 mg twice daily

### Prevention of secondary case of invasive group A streptococcal infection
- **By Mouth**
- Neonate: 12.5 mg/kg every 6 hours (max. per dose 62.5 mg) for 10 days.

### Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
- **By Mouth**
- Child 1-11 months: 62.5 mg every 6 hours for 10 days
- Child 1-5 years: 125 mg every 6 hours for 10 days
- Child 6-11 years: 250 mg every 6 hours for 10 days
- Child 12-17 years: 500–500 mg every 6 hours for 10 days

### Acute sinusitis
- **By Mouth**
- Child 1-11 months: 62.5 mg 4 times a day for 5 days
- Child 1-5 years: 125 mg 4 times a day for 5 days
- Child 6-11 years: 250 mg 4 times a day for 5 days
- Child 12-17 years: 500 mg 4 times a day for 5 days

### Important Safety Information

- **Intrathecal Injection** of phenoxymethylpenicillin is **not** recommended.

### Cautions

- Accumulation of sodium from injection can occur with high doses.
- **Interactions** | Appendix 1: penicillins
- **Side-effects**
  - Common or very common | Fever, Jarisch-Herxheimer reaction
  - Rare or very rare | Neurotoxicity
  - Frequency not known | Coma
- **Pregnancy** | Not known to be harmful.
- **Breast Feeding** | Trace amounts in milk, but appropriate to use.

### Renal Impairment

- Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.

### Dose Adjustments

### Effect on Laboratory Tests

- False-positive urinary glucose (if tested for reducing substances).

### Directions for Administration

- With intravenous use | Intravenous route recommended in neonates and infants. For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion
  - Phenoxymethylpenicillin sodium (Non-proprietary) | Benzylpenicillin sodium 600 mg | Benzylpenicillin 600mg powder for solution for injection vials | 2 vial (£1.62–£1.68 DT + £1.08) | 25 vial (£75.12–£76.00)
  - Benzylpenicillin sodium 1.2 gram | Benzylpenicillin 1.2g powder for solution for injection vials | 25 vial (£109.49–£113.92 DT + £113.92)

### Unlicensed Use

- Duration of treatment for acute sinusitis adheres to national guidelines. | See Sinusitis (acute) p. 721 for further information.

- **Interactions** | Appendix 1: penicillins
- **Side-effects**
  - Arthralgia
  - Respiratory infection
  - Skin rash
  - Increased risk of infection, neurotoxicity, oral disorders, paraesthesia
- **Pregnancy** | Not known to be harmful.
- **Breast Feeding** | Trace amounts in milk, but appropriate to use.

- **Effect on Laboratory Tests** | False-positive urinary glucose (if tested for reducing substances).

### Patient and Carer Advice

- **Medicines for Children leaflet: Penicillin V for bacterial infections**
- **Penicillin V for prevention of pneumococcal infection**
- **Penicillin V-prevention-pneumococcal-infection**

### Profession Specific Information

- Dental practitioners’ formulation
  - Phenoxympenilicillin Tablets may be prescribed.
  - Phenoxympenilicillin Oral Solution may be prescribed.

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug.

### Oral Solution

- **Cautionary and Advisory Labels** 9, 23
  - Phenoxympenilicillin (Non-proprietary): Phenoxympenilicillin (as Phenoxympenilicillin potassium) | 25 mg per 1 ml | Phenoxympenilicillin 125mg/5ml oral solution | 100 ml (£34.00 DT + £14.29)
  - Phenoxympenilicillin 125mg/5ml oral solution sugar free | 100 ml (£25.00 DT + £7.10)
BROAD-SPECTRUM ANTIBACTERIALS

Amoxicillin
(Amoxycillin)

**INDICATIONS AND DOSE**

Susceptible infections (including urinary-tract infections, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection
  - Neonate 7 days to 28 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection
  - Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

**Acute exacerbation of bronchiectasis**

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 7–14 days
  - Child 1-4 years: 250 mg 3 times a day for 7–14 days
  - Child 5-7 years: 500 mg 3 times a day for 7–14 days

**Acute cough [if systemically very unwell or at higher risk of complications]**

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 5 days
  - Child 1-4 years: 250 mg 3 times a day for 5 days
  - Child 5-7 years: 500 mg 3 times a day for 5 days

**Acute otitis media**

- **BY MOUTH**
  - Child 1-11 months: 125 mg 3 times a day for 5–7 days
  - Child 1-4 years: 250 mg 3 times a day for 5–7 days
  - Child 5-7 years: 500 mg 3 times a day for 5–7 days

**Neonate up to 7 days:** BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

**Child 1-11 months:**

- 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

**Child 1-4 years:**

- 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

**Child 5-11 years:**

- 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)

**Child 12-17 years:**

- 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection

**Lyme disease [erythema migrans and/or non-focal symptoms] [Lyme disease [affecting cranial nerves or peripheral nervous system]]**

- **BY MOUTH**
  - Child 1 month-11 years (administered on expert advice) (body-weight up to 34 kg): 30 mg/kg 3 times a day for 21 days
  - Child 1 month-11 years (administered on expert advice) (body-weight 34 kg and above): 1 g 3 times a day for 21 days
  - Child 12-17 years (administered on expert advice): 1 g 3 times a day for 21 days

**Lyme arthritis / Acrodermatitis chronica atrophicans**

- **BY MOUTH**
  - Child 1 month-11 years (administered on expert advice) (body-weight up to 34 kg): 30 mg/kg 3 times a day for 28 days
  - Child 1 month-11 years (administered on expert advice) (body-weight 34 kg and above): 1 g 3 times a day for 28 days
  - Child 12-17 years (administered on expert advice): 1 g 3 times a day for 28 days

**Anthrax (treatment and post-exposure prophylaxis)**

- **BY MOUTH**
  - Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
  - Child (body-weight 20 kg and above): 500 mg 3 times a day

**Cystic fibrosis (treatment of asymptomatic Haemophilus influenzae carriage or mild exacerbation)**

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

  - Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

  - Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day

  - Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)

  - Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections

  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Neonate 7 days to 28 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection.
**Lisztial meningitis (in combination with another antibiotic)**

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50–100 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 50–100 mg/kg every 8 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

**Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibiotic)**

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 50 mg/kg every 8 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

**UNLICENSED USE**

- Amoxicillin doses in BNF Publications may differ from those in product literature. [Read more](#).
- Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. [Read more](#).
- Amoxicillin is used for the treatment of acute exacerbation of bronchiectasis, but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 318 for further information.

**CAUTIONS**

- **GENERAL CAUTIONS**
  - Acute lymphocytic leukaemia (increased risk of erythematous rashes) – chronic lymphocytic leukaemia (increased risk of erythematous rashes) – cytomegalovirus infection (increased risk of erythematous rashes) – glandular fever (erythematous rashes common) – maintain adequate hydration with high doses (particularly during parenteral therapy)

**SPECIFIC CAUTIONS**

- With intravenous use accumulation of sodium can occur with high parenteral doses
- [INTERACTIONS](#) 

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Rare or very rare Colitis haemorrhagic, crystalluria, dizziness, hypokinesia, hypersensitivity vasculitis, mucocutaneous candidiasis

- **Frequency not known** Jarisch–Herxheimer reaction

- **Rare or very rare**
  - With oral use Black hairy tongue

**PREGNANCY**

- Not known to be harmful.

**PRESCRIBING AND DISPENSING INFORMATION**

- See Lyme disease p. 374 for place in therapy and further information on treatment.

**PATIENT AND CARER ADVICE**

- Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary
- Amoxicillin capsules may be prescribed.
- Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder.
- Amoxicillin Oral Suspension may be prescribed.

**MUSCULAR FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **ELECTROLYTES:** May contain Sodium
  - Amoxicillin (Non-proprietary) Amoxicillin (as Amoxicillin sodium) 250 mg Amoxicillin 250 mg powder for solution for injection vials | 10 vial (P) £4.80 | 10 vial (P) £4.50 (Hospital only)
  - Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500 mg powder for solution for injection vials | 10 vial (P) £9.60 DT + £5.48 | 10 vial (P) £12.00 DT + £5.48 (Hospital only)
  - Amoxicillin (as Amoxicillin sodium) 1 gram Amoxicillin 1g powder for solution for injection vials | 1 vial (P) £1.82 | 10 vial (P) £16.50 DT + £10.96 (Hospital only)
  - Amoxicillin (GlaxoSmithKline UK Ltd) Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500 mg powder for solution for injection vials | 10 vial (P) £5.48 DT + £5.48
  - Amoxicillin (as Amoxicillin sodium) 1 gram Amoxicillin 1g powder for solution for injection vials | 10 vial (P) £10.96 DT + £10.96

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS**
  - 9
  - Exipients: May contain Sucrose
  - Amoxicillin (Non-proprietary)

Bacterial infection 353

Ampicillin

- INDICATIONS AND DOSE

Susceptible infections (including bronchitis, urinary-tract infections, otitis media, sinusitis, uncomplicated community-acquired pneumonia, salmonellosis)

- BY MOUTH

  - Neonate 7 days to 20 days: 30 mg/kg 3 times a day (max. per dose 125 mg).

  - Neonate 21 days to 28 days: 30 mg/kg 4 times a day (max. per dose 125 mg).

  - Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

  - Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day

  - Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)

  - Child 12-17 years: 500 mg 4 times a day; increased if necessary to 1 g 4 times a day, use increased dose in severe infection

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

  - Neonate up to 7 days: 30 mg/kg every 12 hours, increased if necessary to 60 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis

  - Neonate 7 days to 20 days: 30 mg/kg every 8 hours, increased if necessary to 60 mg/kg every 8 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis

  - Neonate 21 days to 28 days: 30 mg/kg every 6 hours, increased if necessary to 60 mg/kg every 6 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis

  - Child: 25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours), increased if necessary to 50 mg/kg every 6 hours (max. per dose 1 g every 6 hours), increased dose used in severe infection

- Group B streptococcal infection / Enterococcal endocarditis (in combination with another antibacterial)

  - BY INTRAVENOUS INFUSION

  - Neonate up to 7 days: 50 mg/kg every 12 hours.

  - Neonate 7 days to 20 days: 50 mg/kg every 8 hours.

  - Neonate 21 days to 28 days: 50 mg/kg every 6 hours.

  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

Listerial meningitis

- BY INTRAVENOUS INFUSION

  - Neonate up to 7 days: 100 mg/kg every 12 hours.

  - Neonate 7 days to 20 days: 100 mg/kg every 8 hours.

  - Neonate 21 days to 28 days: 100 mg/kg every 6 hours.

  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

- CAUTIONS

  - GENERAL CAUTIONS Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common)

  - SPECIFIC CAUTIONS With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses

- INTERACTIONS

  -Appendix 1: penicillins

- SIDE-EFFECTS

  - Colitis haemorrhagic

- PREGNANCY

  - Not known to be harmful.

- BREAST FEEDING

  - Trace amounts in milk, but appropriate to use.

- RENAL IMPAIRMENT

  - With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

  -Dose adjustments If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

- DIRECTIONS FOR ADMINISTRATION

  - With oral use Administer at least 30 minutes before food.

  - With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

Co-fluampicil

**INDICATIONS AND DOSE**

Mixed infections involving beta-lactamase-producing staphylococci

- **BY MOUTH**
  - Child 1 month–9 years: 125/250 mg every 6 hours
  - Child 10–17 years: 250/500 mg every 6 hours
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child 1 month–1 year: 62.5/125 mg every 6 hours
  - Child 2–9 years: 125/250 mg every 6 hours
  - Child 10–17 years: 250/500 mg every 6 hours

Severe mixed infections involving beta-lactamase-producing staphylococci

- **BY MOUTH**
  - Child 1 month–9 years: 250/500 mg every 6 hours
  - Child 10–17 years: 500/1000 mg every 6 hours
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child 1 month–1 year: 125/250 mg every 6 hours
  - Child 2–9 years: 250/500 mg every 6 hours
  - Child 10–17 years: 500/1000 mg every 6 hours

**SIDE-EFFECTS**

- Jarisch-Herxheimer reaction
- Dyspnoea
- Arthralgia
- Acute lymphocytic leukaemia
- Glomerular nephritis
- Chronic electrolyte imbalance
- Bronchospasm
- Electrolyte imbalance
- Coma
- Hallucination
- Fever
- Seizure
- Hypersensitivity reactions

**INTERACTIONS**

- **Rhabdomyolysis**
- **Hepatic failure**
- **Renal failure**
- **Hypersensitivity**

**EFFECT ON LABORATORY TESTS**

- False-positive urinary glucose (if tested for reducing substances).

**PRESCRIBING AND DISPENSING INFORMATION**

- Co-fluampicil is expressed as a combination of equal parts by mass of flucloxacillin and ampicillin.

- Medicinal forms: There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS:** 9, 22
- Co-fluampicil (Non-proprietary)
  - Ampicillin (as Ampicillin trihydrate) 25 mg per 1 ml, Flucloxacillin (as Flucloxacillin magnesium) 25 mg per 1 ml
  - Co-fluampicil 250mg/250mg powder for solution for injection vials 10 ml (POM) £23.93 DT + £23.93

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS:** 9, 22
- Co-fluampicil (Non-proprietary)
  - Ampicillin (as Ampicillin magnesium) 250 mg, Flucloxacillin (as Flucloxacillin sodium) 250 mg
  - Co-fluampicil 250mg/250mg capsules 28 capsule (POM) £13.33

**Antibacterials > Penicillins, broad-spectrum with beta-lactamase inhibitor**

Co-amoxiclav

**INDICATIONS AND DOSE**

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

- **BY MOUTH USING TABLETS**
  - Child 12–17 years: 250/125 mg every 8 hours; increased to 500/125 mg every 8 hours, increased dose used for severe infection
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months.

- Child 1–2 months: 30 mg/kg every 12 hours, intravenous infusion recommended in children less than 3 months
- Child 3 months–17 years: 30 mg/kg every 8 hours (max. per dose 1.2 g every 8 hours)

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 125/31 suspension)

- **BY MOUTH USING ORAL SUSPENSION**
  - Neonate: 0.25 mL/kilogram 3 times a day.
  - Child 1–11 months: 0.25 mL/kilogram 3 times a day, dose doubled in severe infection
  - Child 1–5 years: 0.25 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

**IMPORTANT SAFETY INFORMATION**

**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than two weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- Flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin.
- Flucloxacillin should be used with caution in patients with hepatic impairment.
- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

**CAUTIONS**

**GENERAL CAUTIONS**

- Acute lymphocytic leukaemia
- Increased risk of erthythematous rashes
- Chronic lymphocytic leukaemia
- Increased risk of erthythematous rashes
- Cyto-megalovirus infection
- Increased risk of erthythematous rashes
- Glandular fever (erythematous rashes common)

**SPECIFIC CAUTIONS**

- With intravenous use: accumulation of electrolytes contained in parenteral preparations can occur with high doses.

**INTERACTIONS**

- **Appendix 1: penicillins**

**SIDE-EFFECTS**

- Arthralgia
- Bronchospasm
- Coma
- Dyspnoea
- Electrolyte imbalance
- Eosinophilia
- Erythema nodosum
- Gastrointestinal disorder
- Hallucination
- Jarisch-Herxheimer reaction
- Myalgia
- Purpura
- Non-thrombocytopenic vasculitis

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Trace amount in milk, but appropriate to use.

**HEPATIC IMPAIRMENT**

- Manufacturer advises use with caution in hepatic dysfunction.

**RENAL IMPAIRMENT**

- With intravenous use: accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

- **Dose adjustments**
  - Reduce dose or frequency if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²; rashes more common.
Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 6-11 years: 0.15 mL/kilogram 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 400/57 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 2-23 months: 0.15 mL/kilogram twice daily, doubled in severe infection
- Child 2-6 years (body-weight 13-21 kg): 2.5 mL twice daily, doubled in severe infection
- Child 7-12 years (body-weight 22-40 kg): 5 mL twice daily, doubled in severe infection
- Child 12 years (body-weight 41 kg and above): 10 mL twice daily; increased if necessary to 10 mL 3 times a day, increased frequency to be used in severe infection

Severe dental infection with spreading cellulitis: Dental infection not responding to first-line antibacterial
- BY MOUTH USING TABLETS
- Child 12-17 years: 250/125 mg every 8 hours for 5 days

Acute exacerbation of bronchiectasis (doses for 125/31 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 1-11 months: 0.25 mL/kilogram 3 times a day for 7–14 days
- Child 1-5 years: 5 mL 3 times a day for 7–14 days, alternatively 0.25 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis (doses for 250/62 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 6-11 years: 5 mL 3 times a day for 7–14 days, alternatively 0.15 mL/kilogram 3 times a day for 7–14 days

Acute exacerbation of bronchiectasis
- BY MOUTH USING TABLETS
- Child 12-17 years: 250/125 mg 3 times a day for 7–14 days, alternatively 500/125 mg 3 times a day for 7–14 days
- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child 1-2 months: 30 mg/kg every 12 hours, intravenous infusion is recommended in children less than 3 months
- Child 3 months-17 years: 30 mg/kg every 12 hours, intravenous infusion is recommended in children less than 3 months

Acute sinusitis (doses for 125/31 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5 days
- Child 1-5 years: 5 mL 3 times a day for 5 days, alternatively 0.25 mL/kilogram 3 times a day for 5 days

Acute sinusitis (doses for 250/62 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 6-11 years: 5 mL 3 times a day for 5 days, alternatively 0.15 mL/kilogram 3 times a day for 5 days

Acute sinusitis
- BY MOUTH USING TABLETS
- Child 12-17 years: 250/125 mg 3 times a day for 5 days, alternatively 500/125 mg 3 times a day for 5 days

Acute otitis media (doses for 125/31 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 1-11 months: 0.25 mL/kilogram 3 times a day for 5–7 days
- Child 1-5 years: 5 mL 3 times a day for 5–7 days, alternatively 0.25 mL/kilogram 3 times a day for 5–7 days

Acute otitis media (doses for 250/62 suspension)
- BY MOUTH USING ORAL SUSPENSION
- Child 6-11 years: 5 mL 3 times a day for 5–7 days, alternatively 0.15 mL/kilogram 3 times a day for 5–7 days

Dose equivalence and conversion
- Doses are expressed as co-amoxiclav.
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

UNLICENSED USE (see product literature and adhere to national guidelines)
- See Sinusitis (acute) p. 721 for further information.
- Duration of treatment for acute otitis media differs from product literature and adheres to national guidelines. See Ear infections, antibacterial therapy p. 315 for further information.
- Co-amoxiclav is used for the treatment of acute exacerbation of bronchiectasis, but is not licensed for this indication. See Respiratory system infections, antibacterial therapy p. 318 for further information.

CONTRA-INDICATIONS
- History of co-amoxiclav-associated jaundice or hepatic dysfunction - history of penicillin-associated jaundice or hepatic dysfunction

CAUTIONS
- Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS
- With intravenous use accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION
- Cholestatic jaundice: Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

INTERACTIONS
- Appendix 1: clavulanic acid - penicillins

SIDE-EFFECTS
- GENERAL SIDE-EFFECTS
- Common or very common: Increased risk of infection
- Uncommon: Dizziness - dyspepsia - headache
- Frequency not known: Colitis haemorrhagic - crystalluria - hypersensitivity vasculitis - meningitis aseptic
SPECIFIC SIDE-EFFECTS

- With oral use: Akathisia • black hairy tongue
- PREGNANCY: Not known to be harmful.
- BREAST FEEDING: Trace amount in milk, but appropriate to use.
- HEPATIC IMPAIRMENT: Manufacturer advises caution.
- MONITORING: Monitor liver function in liver disease.
- RENAL IMPAIRMENT: Risk of crystalluria with high doses (particularly during parenteral therapy).
- With intravenous use: Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

Dose adjustments

- With oral use: Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 tablets, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- With oral use: Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- With intravenous use: Co-amoxiclav injection: use normal initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use normal initial dose and then use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

- With intravenous use: For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.

PRESCRIBING AND DISPENSING INFORMATION

Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- With oral use: Flavours of oral liquid formulations may include raspberry and orange.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Co-amoxiclav for bacterial infections www.medicinesforchildren.org.uk/co-amoxiclav-bacterial-infections-0

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary
Co-amoxiclav 250/125 Tablets may be prescribed.
Co-amoxiclav 125/31 Suspension may be prescribed.
Co-amoxiclav 250/62 Suspension may be prescribed.

MEDIcINAL FORMs

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9
EXCIPiENTS: May contain Aspartame

Clavulanic acid (as Potassium clavulanate) 6.25 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 mL Co-amoxiclav 125mg/31mg/5ml oral suspension | 100 mL (PON) £1.65 DT + £1.65

Clavulanic acid (as Potassium clavulanate) 12.5 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 mL Co-amoxiclav 250mg/62mg/5ml oral suspension | 100 mL (PON) £5.00 DT + £5.00

Clavulanic acid (as Potassium clavulanate) 25 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 mL Co-amoxiclav 500mg/125mg/5ml oral suspension | 100 mL (PON) £8.50 DT + £8.50

Clavulanic acid (as Potassium clavulanate) 37.5 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 250 mg per 1 mL Co-amoxiclav 750mg/250mg/5ml oral suspension | 100 mL (PON) £10.00 DT + £10.00

Clavulanic acid (as Potassium clavulanate) 100 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 500 mg per 1 mL Co-amoxiclav 1250mg/250mg/5ml oral suspension | 100 mL (PON) £16.50 DT + £16.50

Clavulanic acid (as Potassium clavulanate) 200 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 1000 mg per 1 mL Co-amoxiclav 2500mg/500mg/5ml oral suspension | 100 mL (PON) £29.00 DT + £29.00

Augmentin (GlaxoSmithKline UK Ltd)
Clavulanic acid (as Potassium clavulanate) 6.25 mg per 1 mL, Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 mL Augmentin 125/25 5F oral suspension sugar-free | 35 mL (PON) £4.13 DT + £4.13 sugar-free | 70 mL (PON) £6.97 DT + £5.79

Powder for solution for injection

ELECTROLYTES: May contain Potassium, sodium

Co-amoxiclav (Non-proprietary)
Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg Co-amoxiclav 500mg/100mg powder for solution for injection vials | 10 vial (PON) £10.60–£14.90 | 10 vial (PON) £13.50 (Hospital only)

Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Co-amoxiclav 1000mg/200mg powder for solution for injection vials | 10 vial (PON) £16.00–£29.70 | 10 vial (PON) £27.50 (Hospital only)

Augmentin IntraVenous (GlaxoSmithKline UK Ltd)
Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg Augmentin IntraVenous 600mg powder for solution for injection vials | 10 vial (PON) £10.60

Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg Augmentin IntraVenous 1.2g powder for solution for injection vials | 10 vial (PON) £10.60

ANTIBACTERIALS > PEniCILLINS, MECiLLiNAM-TYPE

Pivmecillinam hydrochloride

18-Sep-2018

INDICATIONS AND DOSE

Acute uncomplicated cystitis

- BY MOUTH

Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours to a total of 10 tablets

Chronic or recurrent bacteriuria

- BY MOUTH

Child (body-weight 40 kg and above): 400 mg every 6–8 hours

Urinary-tract infections

- BY MOUTH

Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses
UNLICENSED USE Not licensed for use in children under 3 months.

CONTRA-INDICATIONS Carnitine deficiency • gastrointestinal obstruction • infants under 3 months • oesophageal strictures

CAUTIONS Avoid in Acute porphyrias p. 624

INTERACTIONS • penicillins

SIDE-EFFECTS
• Common or very common Vulvovaginal fungal infection
• Uncommon Dizziness • fatigue • gastrointestinal discomfort • gastrointestinal disorders • headache • oral ulceration • vertigo

PREGNANCY Not known to be harmful, but manufacturer advises avoid.

BREAST FEEDING Trace amount in milk, but appropriate to use.

MONITORING REQUIREMENTS Liver and renal function tests required in long-term use.

EFFECT ON LABORATORY TESTS False positive urinary glucose (if tested for reducing substances). False positive newborn screening results for isovaleric acidemia may occur in neonates born to mothers receiving pivmecillinam during late pregnancy.

DIRECTIONS FOR ADMINISTRATION Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

PATIENT AND CARER ADVICE Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

ANTIBACTERIALS > PENICILLINS, PENICILLINASE-RESISTANT

Flucloxacillin

INDICATIONS AND DOSE

Infections due to beta-lactamase-producing staphylococci including otitis externa • Adjunct in pneumonia • Adjunct in impetigo • Adjunct in cellulitis

BY MOUTH

• Neonate up to 7 days: 25 mg/kg twice daily.
• Neonate 7 days to 20 days: 25 mg/kg 3 times a day.
• Neonate 21 days to 28 days: 25 mg/kg 4 times a day.
• Child: 2.5–25 mg/kg every 6 hours (max. per dose 1 g every 6 hours)

Severe infections due to beta-lactamase-producing staphylococci including otitis externa • Adjunct in pneumonia (severe infection) • Adjunct in impetigo (severe infection) • Adjunct in cellulitis (severe infection)

• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

• Neonate up to 7 days: 50 mg/kg every 12 hours.
• Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
• Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
• Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Endocarditis (in combination with other antibacterial if necessary)

• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
• Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Osteomyelitis

• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

• Neonate up to 7 days: 50–100 mg/kg every 12 hours.
• Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
• Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
• Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

CHILDRAEBALABSCES • STAPHYLOCOCCAL MENSINGITIS

• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

• Neonate up to 7 days: 50–100 mg/kg every 12 hours.
• Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
• Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
• Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

STAPHYLOCOCCAL LUNG INFECTION IN CYSTIC FIBROSIS

• BY MOUTH
• Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day
• BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
• Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

Prevention of Staphylococcus aureus lung infection in cystic fibrosis—primary prevention

• BY MOUTH
• Neonate: 125 mg twice daily.
• Child 1 month–3 years: 125 mg twice daily

Prevention of Staphylococcus aureus lung infection in cystic fibrosis—secondary prevention

• BY MOUTH
• Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

IMPORTANT SAFETY INFORMATION

HEPATIC DISORDERS

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has
been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- Fluocoxacin should not be used in patients with a history of hepatic dysfunction associated with fluocoxacin.
- Fluocoxacin should be used with caution in patients with hepatic impairment.
- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

### CAUTIONS
- With intravenous use, accumulation of electrolytes can occur with high doses - risk of kernicterus in jaundiced neonates when high doses given parenterally.
- **INTERACTIONS** → Appendix 1: penicillins.

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS
- Rare or very rare: Arthralgia - fever

#### SPECIFIC SIDE-EFFECTS
- Common or very common:
  - With oral use: Gastrointestinal disorder
  - Rare or very rare:
    - With oral use: Eosinophilia - myalgia
- Frequency not known:
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.

#### HEPATIC IMPAIRMENT
Manufacturer advises caution; including in those with risk factors for hepatic reactions.

#### RENAL IMPAIRMENT
With intravenous use, accumulation of electrolytes can occur in patients with renal failure.
- **Dose adjustments** Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

#### EFFECT ON LABORATORY TESTS
False-positive urinary glucose (if tested for reducing substances).

### DIRECTIONS FOR ADMINISTRATION
With intravenous use:
- For intravenous infusion, dilute reconstituted solution in Glucose 5% or Sodium Chloride 0.9% and give intermittently over 30–60 minutes.

### PATIENT AND CARER ADVICE

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

#### Oral solution

- **Fluocoxacin (Non-proprietary)**
  - Fluocoxacin (as Fluocoxacin sodium) 25 mg per 1 ml Fluocoxacin 125mg/5ml oral solution | 100 ml (PFS) £20.39 DT + £5.37
  - Fluocoxacin 125mg/5ml oral solution sugar free sugar-free | 100 ml (PFS) £26.70 DT + £21.05
  - Fluocoxacin (as Fluocoxacin sodium) 50 mg per 1 ml Fluocoxacin 250mg/5ml oral solution sugar free sugar-free | 100 ml (PFS) £32.19 DT + £25.47
  - Fluocoxacin 250mg/5ml oral solution | 100 ml (PFS) £35.09 DT + £31.71

### Capsule

#### CAUTIONARY AND ADVISORY LABELS 9, 23
- **Fluocoxacin (Non-proprietary)**
  - Fluocoxacin (as Fluocoxacin sodium) 250 mg Fluocoxacin 250mg capsules | 28 capsule (PFS) £1.42 DT + £1.42
  - Fluocoxacin (as Fluocoxacin sodium) 500 mg Fluocoxacin 500mg capsules | 28 capsule (PFS) £10.50 DT + £2.34

### Powder for solution for injection

- **Fluocoxacin (Non-proprietary)**
  - Fluocoxacin (as Fluocoxacin sodium) 250 mg Fluocoxacin 250 mg powder for solution for injection vials | 10 vial (PFS) £8.60 DT + £8.60
  - Fluocoxacin (as Fluocoxacin sodium) 500 mg Fluocoxacin 500 mg powder for solution for injection vials | 10 vial (PFS) £24.30–£35.00 DT + £11.20
  - Fluocoxacin (as Fluocoxacin sodium) 1 gram Fluocoxacin 1g powder for solution for injection vials | 10 vial (PFS) £34.50 DT + £34.50

**Combinations available:** Co-fluampicil, p. 354

### ANTIBACTERIALS > POLYMXYINS

#### Colistimethate sodium

- **(Colistin sulphomethate sodium)**

#### DRUG ACTION
The polymyxin antibiotic, colistimethate sodium, is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

#### INDICATIONS AND DOSE

**Serious infections due to selected aerobic Gram-negative bacteria in patients with limited treatment options**
- Child (body-weight up to 41 kg): 75 000–150 000 units/kg daily in 3 divided doses, the data supporting the dose regimen are very limited—consult product literature for available information, including recommendation to use lean body-weight for dosing.
- Child (body-weight 41 kg and above): 9 million units daily in 2–3 divided doses, the data supporting the dose regimen are very limited—consult product literature for available information, including recommendation to use lean body-weight for dosing.

**Management of chronic pulmonary infections due to Pseudomonas aeruginosa in patients with cystic fibrosis**
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 1–2 years: 0.5–1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
  - Child 2–7 years: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day
- **BY INHALATION OF POWDER**
  - Child 6–17 years: 1.66 million units twice daily

#### CONTRA-INDICATIONS
Myasthenia gravis

#### CAUTIONS

- **General Caution** Children under 1 year of age (effects of immature renal and metabolic function on conversion to active colistin not known)

#### SPECIFIC CAUTIONS
- When used by inhalation: Severe haemoptysis—risk of further haemorrhage
● INTERACTIONS ➔ Appendix 1: colistimethate

● SIDE-EFFECTS
  ➔ Common or very common
  ➔ When used by inhalation Arthralgia · asthenia · asthma · balance impaired · chest discomfort · cough · dysphonia · dyspnoea · fever · haemorrhage · headache · lower respiratory tract infection · nausea · respiratory disorders · taste altered · throat complaints · tinnitus · vomiting
  ➔ Uncommon
  ➔ When used by inhalation Anxiety · appetite decreased · diarrhoea · drowsiness · ear congestion · flatulence · oral disorders · proteinuria · seizure · sputum purulent · thirst · weight change
  ➔ Rare or very rare
  ➔ With parenteral use Confusion · nephrotoxicity · presyncope · psychosis · speech slurred · visual impairment
  ➔ Frequency not known
  ➔ With parenteral use Apnoea · neurological effects · neurotoxicity · renal disorder · sensory disorder
  ➔ SIDE-EFFECTS, FURTHER INFORMATION Neurotoxicity and nephrotoxicity are dose-related.

● PREGNANCY
  ➔ When used by inhalation Clinical use suggests probably safe.
  ➔ With intravenous use Manufacturer advises use only if potential benefit outweighs risk.

● BREAST FEEDING
  ➔ Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

● HEPATIC IMPAIRMENT
  ➔ With intravenous use Manufacturer advises caution (no information available).

● RENAL IMPAIRMENT
  ➔ When used by inhalation Manufacturer advises caution.
  ➔ With intravenous use Consult product literature.
  ➔ Monitoring ➔ With intravenous use In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment—consult product literature. Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre; pre-dose (‘trough’) concentration 2–6 mg/litre.

● MONITORING REQUIREMENTS
  ➔ With intravenous use Monitor renal function.
  ➔ When used by inhalation Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

● DIRECTIONS FOR ADMINISTRATION
  ➔ When used by inhalation Manufacturer advises if other treatments are being administered, they should be taken in the order recommended by the physician. For nebulisation, consult product literature for information on reconstitution and dilution.
  ➔ With intravenous use For intravenous infusion, dilute to a concentration of 40,000 units/mL with Sodium Chloride 0.9%; give over 30–60 minutes. Patients fitted with a totally implantable venous access device may tolerate an injection. For slow intravenous injection into a totally implantable venous access device, dilute to a concentration of 90,000 units/mL with Sodium Chloride 0.9% for child under 12 years (200,000 units/mL for child over 12 years); give over at least 5 minutes.

● PRESCRIBING AND DISPENCING INFORMATION
  ➔ Colistimethate sodium is included in some preparations for topical application.

● PATIENT AND CARER ADVICE
  ➔ When used by inhalation Patient should be advised to rinse mouth with water after each dose of dry powder inhalation. Patients or carers should be given advice on how to administer colistimethate sodium; first dose should be given under medical supervision.

Driving and skilled tasks ➔ Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness, confusion and visual disturbances.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE decisions
  ➔ Colistimethate sodium and tobramycin dry powders for inhalation for treating Pseudomonas lung infection in cystic fibrosis (March 2013) NICE TA276
  ➔ Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by Pseudomonas aeruginosa in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their NHS clinician consider it appropriate to stop.

www.nice.org.uk/guidance/ta276

● MEDICINAL FORMS
  ➔ There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

| ELECTROLYTES: May contain Sodium | Colistimethate sodium (Non-proprietary) |
| Colistimethate sodium 1000000 unit | Colistimethate 1 million unit powder for solution for injection vials | 10 vial | £18.00 DT + £30.00 (hospital only) |
| Colistimethate sodium 2000000 unit | Colistin 2 million unit powder for solution for injection vials | 10 vial | £32.40 DT + £32.40 |

Promixin (Profile Pharma Ltd)

| Colistimethate sodium 1000000 unit | Promixin 1 million unit powder for solution for injection vials | 10 vial | £37.50 DT + £18.00 (hospital only) |

Inhalation powder

| Colobreathe (Teva UK Ltd) |
| Colistimethate sodium 1662500 unit | Colobreathe 1,662,500 unit inhalation powder capsules | 56 capsule | £968.80 DT + £968.80 |

| Promixin (Profile Pharma Ltd) |
| Colistimethate sodium 1000000 unit | Promixin 1 million unit powder for nebuliser solution unit dose vials | 30 unit dose | £204.00 DT + £204.00 |

ANTIBACTERIALS ➔ QUINOLONES

Quinolones

MHRA/CHM advice: Systemic and inhaled fluoroquinolones (November 2018, and March 2019)

The MHRA and CHM have released important safety information regarding the use of systemic and inhaled fluoroquinolones. For restrictions and precautions, see Important safety information for all quinolones (ciprofloxacin p. 361).

Overview

In the UK, only fluoroquinolones are available; the recommendations below therefore refer to the use of fluoroquinolones.

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including Salmonella, Shigella,
**Quinolones**

**IMPORTANT SAFETY INFORMATION**

- With intravenous use or oral use or when used by inhalation

  The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

**TENDON DAMAGE**

- With intravenous use or oral use

  Tendon damage (including rupture) has been reported very rarely with fluoroquinolone. The MHRA advises that benefit-risk should be assessed and other therapeutic options considered before using fluoroquinolones in patients at risk of aortic aneurysm and dissection. Patients (particularly those at risk) and their carers should be informed about rare events of aortic aneurysm and dissection, and advised to seek immediate medical attention if sudden-onset severe abdominal, chest, or back pain develops.

**MHRA/CHM ADVICE: SYSTEMIC AND INHALED FLUOROQUINOLONES: SMALL INCREASED RISK OF AORTIC ANEURYSM AND DISSECTION; ADVICE FOR PRESCRIBING IN HIGH-RISK PATIENTS (NOVEMBER 2018)**

- With intravenous use or oral use

  The MHRA advises that benefit-risk should be assessed and other therapeutic options considered before using fluoroquinolones in patients at risk of aortic aneurysm and dissection. Patients (particularly those at risk) and their carers should be informed about rare events of aortic aneurysm and dissection, and advised to seek immediate medical attention if sudden-onset severe abdominal, chest, or back pain develops.

**MHRA/CHM ADVICE: FLUOROQUINOLONE ANTIBIOTICS: NEW RESTRICTIONS AND PRECAUTIONS FOR USE DUE TO VERY RARE REPORTS OF DISABLING AND POTENTIALLY LONG-LASTING OR IRREVERSIBLE SIDE EFFECTS (MARCH 2019)**

- With intravenous use or oral use

  Disabling, long-lasting or potentially irreversible adverse reactions affecting musculoskeletal and nervous systems have been reported very rarely with fluoroquinolone antibiotics. Healthcare professionals are advised to inform patients to stop treatment at the first signs of a serious adverse reaction, such as tendonitis or tendon rupture, muscle pain, muscle weakness, joint pain, joint swelling, peripheral neuropathy, and CNS effects, and to contact their doctor immediately. Fluoroquinolones should not be prescribed for non-severe or self-limiting infections, or non-bacterial conditions. Unless other commonly recommended antibiotics are inappropriate, fluoroquinolones should not be prescribed for mild to moderate infections. Fluoroquinolones should be avoided in patients who have previously had serious adverse reactions. Use of fluoroquinolones with corticosteroids should also be avoided as it may exacerbate fluoroquinolone-induced tendonitis and tendon rupture. Fluoroquinolones should be prescribed with caution in patients with renal impairment or solid-organ transplants as they are at a higher risk of tendon injury.

- **CONTRA-INDICATIONS**
  - With intravenous use or oral use or when used by inhalation
  - History of tendon disorders related to quinolone use

- **CAUTIONS**
  - With intravenous use or oral use or when used by inhalation
  - Can prolong the QT interval · conditions that predispose to seizures · diabetes (may affect blood glucose) · exposure to excessive sunlight should be avoided (discontinue if photosensitization occurs) · G6PD deficiency · history of epilepsy · myasthenia gravis (risk of exacerbation)
  - With intravenous use or oral use
  - Children or adolescents (arthropathy has developed in weight-bearing joints in young animals)

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea · eye discomfort · eye disorders · nausea · skin reactions · taste altered · vision disorders · vomiting

- **Uncommon** Anxiety · appetite decreased · arrhythmias · arthralgia · asthenia · chest pain · confusion · dizziness · dry eye · eosinophilia · eye inflammation · fever · flattulence · gastrointestinal discomfort · hallucination · headache · hearing impairment · hepatic disorders · hypotension · movement disorders · oedema · pain · renal impairment · rhinitis · seizure · sensation abnormal · sleep disorders · thrombocytopenia · thrombocytosis · tinnitus · vasodilatation · vertigo

- **Rare or very rare** Agranulocytosis · anaemia · angioedema · antibiotic associated colitis · arthritis · asthma · depression · dyspnoea · gait abnormal · haemolytic anaemia · hyperglycaemia · hyperhidrosis · hypersensitivity · hypoglycaemia · idiopathic intracranial hypertension · laryngeal oedema · leucopenia · muscle complaints · muscle weakness · myasthenia gravis aggravated · nephritis · tubulointerstitial · neutropenia · pancreatitis · pancytopenia · photosensitization reaction · psychotic disorder · severe cutaneous adverse reactions (SCARs) · suicidal tendencies · syncope · tendon disorders · tremor · vasculitis

- **Frequency not known** Cornal deposits (reversible after completion of treatment) · increased risk of aortic aneurysm · increased risk of aortic dissection · palpitations · peripheral neuropathy (sometimes irreversible) · polynuropathy · QT interval prolongation

**SIDE-EFFECTS, FURTHER INFORMATION**

The drug should be discontinued if neurological, psychiatric, tendon disorders or hypersensitivity reactions (including severe rash) occur. For more information regarding the safety of fluoroquinolones, please see Important Safety Information.

- **ALLERGY AND CROSS-SENSITIVITY** Use of quinolones contra-indicated in quinolone hypersensitivity.

- **PREGNANCY**
  - With intravenous use or oral use or when used by inhalation
  - Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.
PATIENT AND CARER ADVICE
With intravenous use or oral use The MHRA has produced an advice sheet on serious adverse reactions affecting musculoskeletal and nervous systems associated with fluoroquinolone use, which should be provided to patients and their carers.

Ciprofloxacin

INDICATIONS AND DOSE

Fistulating Crohn’s disease
BY MOUTH
Child: 5 mg/kg twice daily

Severe respiratory-tract infections, gastro-intestinal infection
BY MOUTH
Neonate: 15 mg/kg twice daily.
Child: 20 mg/kg twice daily (max. per dose 750 mg)
BY INTRAVENOUS INFUSION
Neonate: 10 mg/kg every 12 hours, to be given over 60 minutes.
Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Acute exacerbation of bronchiectasis (administered on expert advice)
BY MOUTH
Child 1-17 years: 20 mg/kg twice daily (max. per dose 750 mg) for 7-14 days
BY INTRAVENOUS INFUSION
Child 1-17 years: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Pseudomonal lower respiratory-tract infection in cystic fibrosis
BY MOUTH
Child: 20 mg/kg twice daily (max. per dose 750 mg)
BY INTRAVENOUS INFUSION
Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes

Complicated urinary-tract infections
BY MOUTH
Neonate: 10 mg/kg twice daily.
Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)
BY INTRAVENOUS INFUSION
Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.
Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection

Gonorrhoea
BY MOUTH
Child 12-17 years: 500 mg for 1 dose

Anthrax (treatment and post-exposure prophylaxis)
BY MOUTH
Child: 15 mg/kg twice daily (max. per dose 500 mg)
BY INTRAVENOUS INFUSION
Child: 10 mg/kg every 12 hours (max. per dose 400 mg)

Prevention of secondary case of meningococcal meningitis
BY MOUTH
Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.
Child 1 month-4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
Child 5-11 years: 250 mg for 1 dose
Child 12-17 years: 500 mg for 1 dose

UNLICENSED USE

CAUTIONS
Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - ensure adequate fluid intake (risk of crystalluria) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS
Appendix 1: quinolones

SIDE-EFFECTS
Common or very common Arthropy
Uncommon Fungal superinfection
Rare or very rare Bone marrow depression - crystalluria - erythema nodosum - haematuria - intracranial pressure increased - leucocytosis - migraine - muscle tone increased - olfactory nerve disorder - status epilepticus
Frequency not known Mood altered
PREGNANCY
A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

BREAST FEEDING
Amount too small to be harmful but manufacturer advises avoid.

RENAL IMPAIRMENT
Dose adjustments Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² - consult product literature.

PRESCRIBING AND DISPENSING INFORMATION
With oral use Flavours of oral liquid formulations may include strawberry.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infection
Driving and skilled tasks May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Tablet

CAUTIONARY AND ADVISORY LABELS
7, 9, 25
Ciprofloxacin (Non-proprietary)
Ciprofloxacin (as Ciprofloxacin hydrochloride)
100 mg Ciprofloxacin 100mg tablets | 6 tablet £2.11 DT = £2.11

362 Bacterial infection

Infection

DRUG ACTION

ANTIBACTERIALS

Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

INDICATIONS AND DOSE

TREATMENT OF SUSCEPTIBLE INFECTIONS

BY MOUTH

Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
Child 12–17 years: 960 mg twice daily

BY INTRavenous INFUSION

Child 6–17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection.

TREATment of Pneumocystis jirovecii (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

BY MOUTH, OR BY INTRavenous INFUSION

Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections

BY MOUTH

Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

UNLICENSED USE

Not licensed for Burkholderia cepacia infections in cystic fibrosis. Not licensed for Stenotrophomonas maltophilia infections.

Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION

RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia; it is also indicated for nocardiosis, Stenotrophomonas maltophilia infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by Burkholderia cepacia in cystic fibrosis [unlicensed indication].

CONTRA-INDICATIONS

Acute porphyrias p. 624

CAUTIONS

Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency

INTERACTIONS

Appendix 1: sulfonamides - trimethoprim

SIDE-EFFECTS

Common or very common

Diarrhoea - electrolyte imbalance - fungal overgrowth - headache - nausea - skin reactions

Uncommon

Vomiting

Rare or very rare

SIDE-EFFECTS, FURTHER INFORMATION

Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome or toxic epidermal necrolysis) develop.

PREGNANCY

Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

BREAST FEEDING

Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).

HEPATIC IMPAIRMENT

Manufacturer advises avoid in severe liver disease.

RENAL IMPAIRMENT

Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if
**Sulfadiazine**

**Drug Action** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

**Indications and Dose**

- **Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid)**
  - By mouth
  - Child 12–17 years: 1 g 3 times a day until delivery
  - Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid)
    - By mouth
    - Neonate: 50 mg/kg twice daily for 12 months.

**Unlicensed Use** Not licensed for use in toxoplasmosis.

**Important Safety Information**

**Safe Practice**

Sulfadiazine has been confused with sulfasalazine; care must be taken to ensure the correct drug is prescribed and dispensed.

**Contra-Indications**

- Acute porphyrias p. 624

**Caution**

- Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency

**Interactions**

- → Appendix 1: Sulphonamides

**Side-Effects**

- Rare or very rare
  - Haemolytic anaemia
  - Frequency not known

**Side-effects, Further Information**

Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis) develop.

**Pregnancy**

Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

**Breast Feeding**

Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

**Hepatic Impairment**

Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment or jaundice.
Tetracyclines

Overview
The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psitacosis, salpingitis), urethritis, and lymphogranuloma venereum, rickettsia (including Q-fever), brucella (doxycycline below with either streptomycin p. 323 or rifampicin p. 379), and the spirochaete, Borrelia burgdorferi (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 341).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 366 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant Staphylococcus aureus (MRSA) infections.

Demeclocycline hydrochloride

INDICATIONS AND DOSE
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
» BY MOUTH
- Child 12-17 years: 150 mg 4 times a day, alternatively 300 mg twice daily

CONTRA-INDICATIONS
Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

CAUTIONS
Photosensitivity more common than with other tetracyclines
INTERACTIONS → Appendix 1: tetracyclines

SIDE-EFFECTS
» Rare or very rare
  - Agranulocytosis - aplastic anaemia - hearing impairment - nephritis - severe cutaneous adverse reactions (SCARs)
  - Frequency not known
    - Intracranial pressure increased
    - Muscle weakness - nephrogenic diabetes insipidus - vision disorders

HEPATIC IMPAIRMENT
Dose adjustments Max. 1 g daily in divided doses.

RENAL IMPAIRMENT
May exacerbate renal failure and should not be given to patients with renal impairment.

PATIENT AND CARER ADVICE
Patients should be advised to avoid exposure to sunlight or sun lamps.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution
Tablet
- Demeclocycline hydrochloride (Non-proprietary)
  - Demeclocycline hydrochloride 150 mg Demeclocycline 150mg tablets | 100 tablet (POH)
- Capsule
  - Demeclocycline hydrochloride (Non-proprietary)
    - Demeclocycline hydrochloride 150 mg Demeclocycline 150mg capsules | 28 capsule (POH) £200.66 DT £200.66

Doxycycline

INDICATIONS AND DOSE
Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
» BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 8-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 4.4 mg/kg daily in 1–2 divided doses for 1 day, then maintenance 2.2 mg/kg daily in 1–2 divided doses
- Child 8-11 years (administered on expert advice) (body-weight 45 kg and above): Initially 200 mg daily in
1–2 divided doses for 1 day, then maintenance 100 mg daily

- Child 12-17 years: Initially 200 mg daily in 1–2 divided doses for 1 day, then maintenance 100 mg daily

**Acute sinusitis** / **Acute cough** [if systemically very unwell or at higher risk of complications]
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 5 days in total

**Acute exacerbation of bronchiectasis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily for 7–14 days in total

**Severe infections** (including refractory urinary-tract infections)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 8-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 4.4 mg/kg daily in 1–2 divided doses for 1 day, then maintenance 2.2–4.4 mg/kg daily in 1–2 divided doses
- Child 8-11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily
- Child 12-17 years: 200 mg daily

**Acne**

- Child 9-11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily in 1–2 divided doses for 21 days
- Child 12-17 years (administered on expert advice): 200 mg daily in 1–2 divided doses for 21 days

**Lyme disease** [affecting central nervous system]
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 9-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 5 mg/kg in 2 divided doses on day 1, then 2.5 mg/kg daily in 1–2 divided doses for a total of 21 days, increased if necessary up to 5 mg/kg daily, increased dose used in severe infections
- Child 9-11 years (administered on expert advice) (body-weight 45 kg and above): 400 mg daily in 1–2 divided doses for 21 days
- Child 12-17 years (administered on expert advice): 400 mg daily in 1–2 divided doses for 21 days

---

**Lyme arthritis** / **Acrodermatitis chronica atrophicans**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 9-11 years (administered on expert advice) (body-weight up to 45 kg): Initially 5 mg/kg in 2 divided doses on day 1, then 2.5 mg/kg daily in 1–2 divided doses for a total of 28 days, increased if necessary up to 5 mg/kg daily for 28 days, increased dose used in severe infections; maximum 200 mg per day
- Child 9-11 years (administered on expert advice) (body-weight 45 kg and above): 200 mg daily in 1–2 divided doses for 28 days
- Child 12-17 years (administered on expert advice): 200 mg daily in 1–2 divided doses for 28 days

**Anthrax** (treatment or post-exposure prophylaxis)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 9-11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
- Child 12-17 years: 100 mg twice daily

**Prophylaxis of malaria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

**Adjunct to quinine in treatment of Plasmodium falciparum malaria**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 12-17 years: 200 mg daily for 7 days

**Periodontitis** (as an adjunct to gingival scaling and root planing)
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Child 12-17 years: 20 mg twice daily for 3 months

**Rocky Mountain spotted fever**
- **BY MOUTH USING DISPERSIBLE TABLETS**
- Child (administered on expert advice) (body-weight up to 45 kg): 2.2 mg/kg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5–7 days
- Child (administered on expert advice) (body-weight 45 kg and above): 100 mg twice daily, continue treatment for at least 3 days after fever subsides, minimum treatment duration is 5–7 days

---

**UNLICENSED USE** Doxycycline may be used as detailed below, although these situations are considered outside the scope of its licence:

- **DOS** Duration of treatment for acute sinusitis, see Sinusitis (acute) p. 721 for further information;
- Lyme disease
- treatment or post-exposure prophylaxis of anthrax;
- malaria prophylaxis during pregnancy;
- recurrent aphthous ulceration.

**CAUTIONS** Alcohol dependence - children 8–11 years—use only in acute or severe infections when there are no adequate alternatives (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia) - children under 8 years—use only in severe or life-threatening conditions (e.g. Rocky Mountain spotted fever) when there are no adequate alternatives (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)

**INTERACTIONS**

- Appendix 1: tetracyclines

**SIDE-EFFECTS**

- Common or very common Dyspnoea - hypotension - peripheral oedema - tachycardia
- Uncommon Gastrointestinal discomfort
- Rare or very rare Antibiotic associated colitis - anxiety - arthralgia - flushing - intracranial pressure increased with papilloedema - Jarisch-Herxheimer reaction - myalgia -
photoonycholysis • severe cutaneous adverse reactions (SCARs) • skin hyperpigmentation (long term use) • tinnitus • vision disorders

- PREGNANCY When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 12 weeks’ gestation.
- RENAL IMPAIRMENT Use with caution (avoid excessive doses).
- MONITORING REQUIREMENTS When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- DIRECTIONS FOR ADMINISTRATION Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- PRESCRIBING AND DISPENSING INFORMATION See Lyme disease p. 374 for place in therapy and further information on treatment.
- PATIENT AND CARER ADVICE Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- PROFESSIONAL SPECIFIC INFORMATION
  - Dental practitioners’ formulary
  - Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.
  - Tablets may be prescribed as Doxycycline Tablets 20 mg.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - Capsule
    - CAUTIONARY AND ADVISORY LABELS 6, 9
    - Doxycycline (as Doxycycline hyclate) 100 mg
      - Periostat
      - Vibramycin-D
      - Lymecycline
      - Minocycline (Non-proprietary)
      - Doxycycline (as Doxycycline hyclate) 50 mg
        - Lymecycline
        - Vibramycin-D
        - Lymecycline
        - Minocycline (Non-proprietary)
      - Doxycycline (as Doxycycline hyclate) 20 mg
        - Vibramycin-D
        - Lymecycline
        - Minocycline (Non-proprietary)
      - Doxycycline hyclate 100 mg
        - Vibramycin-D
        - Lymecycline
        - Periostat
        - Minocycline (Non-proprietary)
      - Doxycycline hyclate 50 mg
        - Vibramycin-D
        - Lymecycline
        - Minocycline (Non-proprietary)
      - Doxycycline hyclate 20 mg
        - Vibramycin-D
        - Lymecycline
        - Minocycline (Non-proprietary)

Minocycline

- INDICATIONS AND DOSE
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 12-17 years: 100 mg twice daily
    - Acne
      - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
      - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child 12-17 years: 100 mg daily

- CONTRA-INDICATIONS
  - Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- CAUTIONS
  - Systemic lupus erythematosus
- INTERACTIONS
  - Appendix 1: tetracyclines
- SIDE-EFFECTS
  - Rare or very rare
    - Acute kidney injury • hearing impairment • respiratory disorders • tinnitus
  - Frequency not known
    - Alopecia • antibiotic associated colitis • arthralgia • ataxia • breast secretion • conjunctival discoloration • drug reaction with eosinophilia and systemic symptoms (DRESS) • dyspepsia • hyperbilirubinaemia • hyperhidrosis • polyarteritis nodosa • sensation abnormal • tear discoloration • tongue discoloration • vertigo
- RENAL IMPAIRMENT
  - Use with caution (avoid excessive doses).
- MONITORING REQUIREMENTS
  - If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.
- DIRECTIONS FOR ADMINISTRATION
  - Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.
- PATIENT AND CARER ADVICE
  - Counselling on administration advised (posture).
- LESS SUITABLE FOR PRESCRIBING
  - Less suitable for prescribing compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation.

Lymecycline

- INDICATIONS AND DOSE
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
    - BY MOUTH
      - Child 12-17 years: 408 mg twice daily, increased to 1.224–1.632 g daily, (in severe infection)
    - Acne
      - BY MOUTH
      - Child 12-17 years: 408 mg daily for at least 8 weeks
- CONTRA-INDICATIONS
  - Children under 8 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- INTERACTIONS
  - Appendix 1: tetracyclines
- SIDE-EFFECTS
  - Common or very common
    - Gastrointestinal discomfort
  - Frequency not known
    - Visual impairment
  - RENAL IMPAIRMENT
    - May exacerbate renal failure and should not be given to patients with renal impairment.

MINOCYCLINE

- INDICATIONS AND DOSE
  - Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 12-17 years: 100 mg twice daily
    - Acne
      - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
      - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child 12-17 years: 100 mg daily
- CONTRA-INDICATIONS
  - Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- CAUTIONS
  - Systemic lupus erythematosus
- INTERACTIONS
  - Appendix 1: tetracyclines
- SIDE-EFFECTS
  - Rare or very rare
    - Acute kidney injury • hearing impairment • respiratory disorders • tinnitus
  - Frequency not known
    - Alopecia • antibiotic associated colitis • arthralgia • ataxia • breast secretion • conjunctival discoloration • drug reaction with eosinophilia and systemic symptoms (DRESS) • dyspepsia • hyperbilirubinaemia • hyperhidrosis • polyarteritis nodosa • sensation abnormal • tear discoloration • tongue discoloration • vertigo
  - RENAL IMPAIRMENT
    - Use with caution (avoid excessive doses).
- MONITORING REQUIREMENTS
  - If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.
- DIRECTIONS FOR ADMINISTRATION
  - Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.
- PATIENT AND CARER ADVICE
  - Counselling on administration advised (posture).
- LESS SUITABLE FOR PRESCRIBING
  - Less suitable for prescribing compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation.

MINOCYCLINE
Tigecycline

**DRUG ACTION** Tigecycline is a glycyclcline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus* spp are resistant to tigecycline.

**INDICATIONS AND DOSE**

Complicated skin and soft tissue infections (when other antibiotics are not suitable) | Complicated intra-abdominal infections (when other antibiotics are not suitable)
---|---
**BY INTRAVENOUS INFUSION**
* Child 8–11 years (under expert supervision): 1.2 mg/kg every 12 hours (max. per dose 50 mg) for 5–14 days
* Child 12–17 years (under expert supervision): 50 mg every 12 hours for 5–14 days

**CONTRA-INDICATIONS** Children under 8 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia) - Diabetic foot infections
Infection

Drugs Action

Antibacterials

Directions for Administration

Monitoring Requirements

Hepatic Impairment

Breast Feeding

Pregnancy

Side-effects

Side-effects, Further Information

Allergy and Cross-sensitivity

Contra-indications

Caution

Contra-indications

Contraindicated

Antibacterials

Chloramphenicol

Drug Action

Chloramphenicol is a potent broad-spectrum antibiotic.

Indications and Dose

Life-threatening infections particularly those caused by Haemophilus influenzae
  
  ➢ By mouth, or by intravenous injection, or by intravenous infusion
  
  Child: 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

  ➢ By intravenous injection
  
  • Neonate up to 14 days: 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.

  • Neonate 14 days to 28 days: 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory Burkholderia cepacia infection resistant to other antibacterials

• By mouth, or by intravenous infusion, or by intravenous injection
  
  Child: (consult product literature)

Contra-indications

Acute porphyrias p. 624

Caution

Avoid repeated courses and prolonged treatment

Interactions

➢ Appendix 1: chloramphenicol

Side-effects

➢ Rare or very rare

With parenteral use
  
  • Agranulocytosis
  
  • Aplastic anaemia (reversible or irreversible, with reports of resulting leukaemia)

• Frequency not known

• With oral use
  
  • Bone marrow disorders – circulatory collapse - diarrhea - enterocolitis - nausea - optic neuritis - oral disorders - ototoxicity - vomiting

• With parenteral use
  
  • Agranulocytosis - bone marrow disorders - depression - diarrhea - dry mouth - fungal superinfection - headache - nausea - nerve disorders - thrombocytopenic purpura - urticaria - vision disorders - vomiting

Side-effects, further information

Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

Grey Syndrome

Grey baby syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

Pregnancy

Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

Breast Feeding

Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

Hepatic Impairment

Avoid if possible—increased risk of bone-marrow depression.

Dose adjustments

Reduce dose.

Monitoring

Monitor plasma-chloramphenicol concentration in hepatic impairment.

Renal Impairment

Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoesis.

Monitoring Requirements

• Plasma concentration monitoring preferred in those under 4 years of age.

• Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre. Blood counts required before and periodically during treatment.

• In neonates Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.
**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

**Chloramphenicol (Non-proprietary)**
- Chloramphenicol (as Chloramphenicol sodium succinate) 1 gram
- Chloramphenicol 1g powder for solution for injection vials | 1 vial £3.00

**Capsule**
- Chloramphenicol (Non-proprietary)
- Chloramphenicol 250 mg
- Chloramphenicol 250mg capsules | 60 capsule £3.77

---

**Daptomycin**

21-Feb-2019

**DRUG ACTION**
Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

**INDICATIONS AND DOSE**
Complicated skin and soft-tissue infections caused by Gram-positive bacteria

- **BY INTRAVENOUS INFUSION**
  - Child 12-25 months: 10 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with Staphylococcus aureus bacteraemia—duration of treatment in accordance with risk of complications in individual patients
  - Child 2-6 years: 9 mg/kg once daily for up to 14 days, alternatively 12 mg/kg once daily, higher dose only if associated with Staphylococcus aureus bacteraemia—duration of treatment in accordance with risk of complications in individual patients
  - Child 7-11 years: 7 mg/kg once daily for up to 14 days, alternatively 9 mg/kg once daily, higher dose only if associated with Staphylococcus aureus bacteraemia—duration of treatment in accordance with risk of complications in individual patients
  - Child 12-17 years: 5 mg/kg once daily for up to 14 days, alternatively 7 mg/kg once daily, higher dose only if associated with Staphylococcus aureus bacteraemia—duration of treatment in accordance with risk of complications in individual patients

**SIDE-EFFECTS**
- **FURTHER INFORMATION**
  If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

**PREGNANCY**
Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**
Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in severe impairment—no information available.

**RENAL IMPAIRMENT**
Manufacturer advises the dosage regimen has not been established—use with caution and monitor renal function regularly.

**MONITORING REQUIREMENTS**
- Manufacturer advises monitor plasma creatine kinase (CPK) before treatment and then at least weekly during treatment; monitor CPK more frequently in patients at higher risk of developing myopathy, including those with renal impairment, taking other drugs associated with myopathy, or if CPK elevated more than 5 times upper limit of normal before treatment.
- Manufacturer advises monitor renal function regularly during concomitant administration of potentially nephrotoxic drugs.

**EFFECT ON LABORATORY TESTS**
Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion, manufacturer advises give intermittently in Sodium Chloride 0.9%; reconstitute with Sodium Chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 60 minutes for children aged 1–6 years and over 30 minutes for children aged 7–17 years.

**HANDLING AND STORAGE**
Manufacturer advises store in a refrigerator (2–8 °C)—consult product literature for further information regarding storage after reconstitution and dilution.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Daptomycin (Non-proprietary)**
  - Daptomycin 350 mg: Daptomycin 350mg powder for solution for infusion vials | 1 vial £6.00
  - Daptomycin 500 mg: Daptomycin 500mg powder for solution for infusion vials | 1 vial £8.88
- **Cubicin (Merck Sharp & Dohme Ltd)**
  - Daptomycin 350 mg Cubicin 350mg powder for concentrate for solution for infusion vials | 1 vial £62.00
  - Daptomycin 500 mg Cubicin 500mg powder for concentrate for solution for infusion vials | 1 vial £88.57

---

**Fosfomycin**

25-Apr-2019

**DRUG ACTION**
Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including Staphylococcus aureus and Enterobacteriaceae.

**INDICATIONS AND DOSE**
Acute uncomplicated lower urinary-tract infections (in females)
- **BY MOUTH USING GRANULES**
  - Child 12-17 years (female): 3 g for 1 dose.
Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

- **BY INTRAVENOUS INFUSION**
- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age:
  - Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses.
  - Child 1-11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.
  - Child 12-17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

- **BY INTRAVENOUS INFUSION**
- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age:
  - Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses.
  - Child 1-11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.
  - Child 12-17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.

Bacterial meningitis when first-line treatment ineffective or inappropriate

- **BY INTRAVENOUS INFUSION**
- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age:
  - Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses.
  - Child 1-11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms.
  - Child 12-17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms.

**High-dose regimen in severe infection suspected or known to be caused by less sensitive organisms**

- **CAUTIONS**
  - With intravenous use Cardiac insufficiency, hyperaldosteronism, hypernatremia, hypertension, pulmonary oedema
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Abdominal pain, diarrhoea, headache, nausea, vomiting
    - Uncommon Skin reactions
  - **Frequency not known** Antibiotic-associated colitis
- **SPECIFIC SIDE-EFFECTS**
  - Common or very common
    - With oral use Dizziness, vulvovaginal infection
  - Uncommon
    - With parenteral use Bone marrow disorders, eosinophilia, hepatic disorders, visual impairment
  - **Frequency not known**
    - With parenteral use Agranulocytosis, asthmatic attack, confusion, leucopenia, neutropenia, tachycardia, thrombocytopenia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.
- **RENAI IMPAIRMENT**
  - With oral use Avoid oral treatment if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
  - With intravenous use Age under 12 years (body-weight under 40 kg)—no information available. Age 12–18 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
  - With intravenous use Monitor electrolytes and fluid balance.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.
  - With oral use Manufacturer advises granules should be taken on an empty stomach (about 2–3 hours before or after a meal), preferably before bedtime and after emptying the bladder. The granules should be dissolved into a glass of water and taken immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) decisions

SMC No. 1033/15

The Scottish Medicines Consortium has advised (March 2015) that fosfomycin (Fomicyt®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

SMC No. 1163/16

The Scottish Medicines Consortium has advised (September 2016) that fosfomycin trometamol (Monuril®) is accepted for use within NHS Scotland for the treatment of acute lower uncomplicated urinary tract infections, caused by pathogens sensitive to fosfomycin in adult and adolescent females and for prophylaxis in diagnostic and surgical transurethral procedures.
**Fusidic acid**

**DRUG ACTION**  Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**
- **BY MOUTH USING TABLETS**
  - Child: 250 mg every 12 hours for 5–10 days, dose expressed as sodium fusidate.
  - Child: Apply 3–4 times a day usually for 7 days.

**Penicillin-resistant staphylococcal infection including osteomyelitis; Staphylococcal endocarditis in combination with other antibacterials**
- **BY MOUTH USING ORAL SUSPENSION**
  - Neonate: 15 mg/kg 3 times a day.
  - Child 1–11 months: 15 mg/kg 3 times a day.
  - Child 1–4 years: 250 mg 3 times a day.
  - Child 5–11 years: 500 mg 3 times a day.
  - Child 12–17 years: 750 mg 3 times a day.

**Staphylococcal infections due to susceptible organisms**
- **BY INTRAVENOUS INFUSION**
  - Child (body-weight up to 50 kg): 6–7 mg/kg 3 times a day, dose expressed as sodium fusidate.
  - Child (body-weight 50 kg and above): 500 mg 3 times a day, dose expressed as sodium fusidate.

**DOSE EQUIVALENCE AND CONVERSION**
- Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

**CAUTIONS**
- With systemic use: Impaired transport and metabolism of bilirubin.
- With topical use: Avoid contact of cream or ointment with eyes.

**CAUTIONS, FURTHER INFORMATION**
- Avoiding resistance: To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

**INTERACTIONS**  Appendix 1: fusidic acid

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Uncommon  Skin reactions.

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - With intravenous use: Dizziness, drowsiness, hepatic disorders, hyperbilirubinaemia, thrombophlebitis, vascular pain (reduced if given via central vein).
  - With oral use: Diarrhoea, dizziness, drowsiness, gastrointestinal discomfort, nausea, vomiting.

- Uncommon
  - With intravenous use: Appetite decreased, asthenia, headache, malaise.
  - With oral use: Appetite decreased, asthenia, headache, malaise, rash, purpur.

- Rare or very rare
  - With topical use: Angioedema, conjunctivitis.

- Frequency not known
  - With intravenous use: Agranulocytosis, anaemia, leucopenia, neutropenia, pancytopenia, renal failure, rhabdomyolysis, thrombocytopenia.

  - With oral use: Agranulocytosis, anaemia, hepatic disorders, hyperbilirubinaemia, leucopenia, neutropenia, pancytopenia, renal failure, rhabdomyolysis, thrombocytopenia.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Elevated liver enzymes, hyperbilirubinaemia and jaundice can occur with systemic use—these effects are usually reversible following withdrawal of therapy.

**PREGNANCY**
- With systemic use: Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- With systemic use: Present in milk—manufacturer advises caution.

**HEPATIC IMPAIRMENT**
- With systemic use: Manufacturer advises caution.

**MONITORING REQUIREMENTS**
- With systemic use: Manufacturer advises monitor liver function with high doses or on prolonged therapy; monitoring also advised for patients with biliary tract obstruction, those taking potentially hepatotoxic medication, or those taking concurrent medication with a similar excretion pathway.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: Manufacturer advises for intravenous infusion, give intermittently in Sodium chloride 0.9% or Glucose 5%; reconstitute each vial with 10 mL buffer solution, then add contents of vial to 500 mL infusion fluid to give a solution containing approximately 1 mg/mL. Give requisite dose via a central line over 2 hours (give over at least 6 hours if administered via a large peripheral vein).

**PRESCRIBING AND DISPENSING INFORMATION**
- With oral use: Flavours of oral liquid formulations may include banana and orange.

**PROFESSION SPECIFIC INFORMATION**
- Dental practitioners’ formulary: May be prescribed as Sodium Fusidate ointment.

**MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Expiry**

  - **Sodium fusidate**
    - 250 mg 5 sachets
    - 250 mg 10 sachets
  - **Fosfomycin trometamol** 3 g 10 sachets
  - **Fosfomycin sodium** 5 g 10 sachets

**Granules**
- **Expiry**
  - **Fosfomycin trometamol** 3 g 10 sachets
  - **Fosfomycin sodium** 5 g 10 sachets

**Infectofos**
- **Expiry**
  - **Fosfomycin trometamol** 3 g 10 sachets
  - **Fosfomycin sodium** 5 g 10 sachets

**BNFC 2019–2020**
**Linezolid**

**DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

**INDICATIONS AND DOSE**

- **Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision)** Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
    - Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.
    - Neonate 7 days to 28 days: 10 mg/kg every 8 hours.
    - Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
    - Child 12–17 years: 600 mg every 12 hours

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVISE (OPTIC NEUROPATHY)** Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:
- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS** Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:
- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CAUTIOUS** Acute confusional states · bipolar depression · carcinoid tumour · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**

- Close observation. Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

**INTERACTIONS** 

**SIDE-EFFECTS**

- Common or very common
  - Anaemia · constipation · diarrhoea · dizziness · gastrointestinal discomfort · headache · hypertension · increased risk of infection · insomnia · localised pain · nausea · skin reactions · taste altered · vomiting
- Uncommon
  - Arrhythmia · chills · dry mouth · eosinophilia · fatigue · gastritis · hyperhidrosis · hyponatraemia · leucopenia · neutropenia · oral disorders · pancreatitis · polyaenia · renal failure · seizure · sensation abnormal · thirst · thrombocytopenia · thrombophlebitis · tinnitus · tongue discolouration · transient ischaemic attack · vision disorders · vulvovaginal disorder
- Rare or very rare
  - Antibiotic associated colitis · bone marrow disorders · tooth discolouration
- Frequency not known
  - Alopecia · angioedema · lactic acidosis · nerve disorders · serotonin syndrome · severe cutaneous adverse reactions (SCARs)

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk — no information available.

**BREAST FEEDING** Manufacturer advises avoid — present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment (no information available).

**RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: Infusion to be administered over 30–120 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange. There is limited information on use in children and expert advice should be sought.

**PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
**INDICATIONS AND DOSE**

**Urinary-tract infections | Respiratory-tract infections**

- **BY MOUTH**
  - Child: 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)  
  - Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily  
  - Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily  
  - Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily  
  - Child 12–17 years: 200 mg twice daily

**Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)**

- **BY MOUTH**
  - Neonate: 2 mg/kg once daily, dose to be taken at night.

**Respiratory-tract infections**

- **BY MOUTH**
  - Child: 5 mg/kg every 6–8 hours

**Shigellosis | Invasive salmonella infection**

- **BY MOUTH**
  - Child: (consult product literature)

**UNLICENSED USE**

**CONTRA-INDICATIONS**

- Blood dyscrasias

**CAUTIONS**

- Acute porphyrias p. 624 | neonates (specialist supervision required) | predisposition to folate deficiency

**INTERACTIONS**

- Appendix 1: trimethoprim

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea | electrolyte imbalance | fungal overgrowth | headache | nausea | skin reactions | vomiting

- **Rare or very rare** Agranulocytosis | angioedema | anxiety | appetite decreased | arthralgia | behaviour abnormal | bone marrow disorders | confusion | constipation | cough | depression | dizziness | dysphoria | eosinophilia | erythema nodosum | fever | haemolysis | haemolytic anaemia | haemorrhage | hallucination | hepatic disorders | hypoglycaemia | lethargy | leukopenia | meningitis aseptic | movement disorders | myalgia | neutropenia | oral disorders | pancreatitis | paraesthesia | peripheral neuritis | photosensitivity reaction | pseudomembranous enterocolitis | renal impairment | seizure | severe cutaneous adverse reactions (SCARs) | sleep disorders | syncpe | systemic lupus erythematosus (SLE) | thrombocytopenia | tinnitus | tremor | uveitis | vasculitis | vertigo | wheezing

- **Frequency not known** Gastrointestinal disorder | megaloblastic anaemia | methaemoglobinemia

**PREGNANCY**

Teratogenic risk in first trimester (folic acid antagonist). Manufacturers advise avoid during pregnancy.

**BREAST FEEDING**

Present in milk—short-term use not known to be harmful.

**RENAL IMPAIRMENT**

- **Dose adjustments** Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m².
  - Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

**PATIENT AND CARER ADVICE**

Blood disorders (On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.)

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-bacterial-infections

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Oral suspension**

- **CAUTIONARY AND ADVISORY LABELS 9**
  - **Trimethoprim (Non-proprietary)**
    - Trimethoprim 10 mg per 1 ml
      - Trimethoprim 50 mg/5 ml oral suspension sugar-free $3.60
      - Trimethoprim 50 mg/5 ml oral suspension $3.60
    - **Monotrime** (Chemixde Pharma Ltd)
      - Trimethoprim 10 mg per 1 ml
        - Monotrime 50 mg/5 ml oral suspension sugar-free $3.60
        - Monotrime 50 mg/5 ml oral suspension $3.60

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 9**
  - **Trimethoprim (Non-proprietary)**
    - Trimethoprim 100 mg
      - Trimethoprim 100 mg tablets $9.99
    - Trimethoprim 200 mg
      - Trimethoprim 200 mg tablets $9.99

**Combinations available:**

- Co-trimoxazole, p. 362
1.1 Anthrax

**Anthrax**

**Treatment and post-exposure prophylaxis**

_Inhalation or gastro-intestinal anthrax_ should be treated initially with either ciprofloxacin p. 361 or, in patients over 12 years, doxycycline p. 364 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 351, benzylpenicillin sodium p. 349, chloramphenicol p. 368, clarithromycin p. 340, clindamycin p. 337, imipenem with cilastatin p. 325, rifampicin p. 379 [unlicensed indication], and vancomycin p. 335). When the condition improves and the sensitivity of the _Bacillus anthracis_ strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

_Cutaneous anthrax_ should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

_Ciprofloxacin_ or _doxycycline_ may be given for _post-exposure prophylaxis_. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antimicrobial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of _B. anthracis_ is susceptible. Vaccination against anthrax may allow the duration of antimicrobial prophylaxis to be shortened.

1.2 Lyme disease

**Lyme disease**

_Description of condition_:

Lyme disease, also known as Lyme borreliosis, is an infection caused by bacteria called _Borrelia burgdorferi_. It is transmitted to humans by the bite of an infected tick. Ticks are mainly found in grassy and wooded areas including urban gardens and parks. Most tick bites do not cause Lyme disease, and the prompt and correct removal of the tick reduces the risk of infection.

Lyme disease usually presents with a characteristic erythema migrans rash. This usually becomes visible 1–4 weeks after a tick bite, but can appear from 3 days to 3 months, and last for several weeks. It may be accompanied by non-focal (non-organ related) symptoms, such as fever, swollen glands, malaise, fatigue, neck pain or stiffness, joint or muscle pain, headache, cognitive impairment, or paraesthesia.

Other signs and symptoms of Lyme disease may also appear months or years after the initial infection and are typically characterised by focal symptoms (relating to at least 1 organ system). These include neurological (affecting cranial nerves, peripheral and central nervous systems), joint (Lyme arthritis), cardiac (Lyme carditis), or skin (acrodematitis chronica atrophicans) manifestations.

**Drug treatment**

*If symptoms continue to persist or worsen after antibiotic treatment, patients should be assessed for possible alternative causes, re-infection with Lyme disease, treatment failure or non-adherence to previous antibiotic treatment, or progression to organ damage caused by Lyme disease (such as nerve palsy).*

In children presenting with _erythema migrans rash with or without non-focal symptoms_ oral doxycycline p. 364 [unlicensed] is recommended as first-line treatment. If doxycycline p. 364 cannot be given, oral amoxicillin p. 351 should be used as an alternative. Oral azithromycin p. 339 [unlicensed] should be given if both doxycycline p. 364 and amoxicillin p. 351 are unsuitable.

In children presenting with focal symptoms of _cranial nerve or peripheral nervous system_ involvement, oral doxycycline p. 364 [unlicensed] is recommended as first-line treatment. If doxycycline p. 364 cannot be given, oral amoxicillin p. 351 should be used as an alternative.

In children presenting with _symptoms of central nervous system_ involvement, intravenous ceftriaxone p. 332 is recommended as first-line treatment. Oral doxycycline p. 364 [unlicensed] should be used as an alternative if ceftriaxone p. 332 cannot be given, or when switching to oral antibacterial treatment.

In children with symptoms of _Lyme arthritis or acrodematitis chronica atrophicans_, oral doxycycline p. 364 [unlicensed] is recommended as first-line treatment. If doxycycline p. 364 cannot be given, oral amoxicillin p. 351 should be used as an alternative. Intravenous ceftriaxone p. 332 should be used if both doxycycline p. 364 and amoxicillin p. 351 are unsuitable.

In children with symptoms of _Lyme carditis who are haemodynamically stable_, oral doxycycline p. 364 [unlicensed] is recommended as first-line treatment. If doxycycline p. 364 cannot be given, intravenous ceftriaxone p. 332 should be used as an alternative.

In children with symptoms of _Lyme carditis who are haemodynamically unstable_, intravenous ceftriaxone p. 332 is recommended. If ceftriaxone p. 332 cannot be given, oral doxycycline p. 364 [unlicensed] should be used as an alternative.

**Ongoing symptom management**
